Rev.1.20 Oct 2023

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.
   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.
   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (“Vulnerability Issues”). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.
(Note2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.
2. Processing at power-on
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.
3. Input of signal during power-off state
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.
4. Handling of unused pins
   Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.
5. Clock signals
   After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.
6. Voltage application waveform at input pin
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).
7. Prohibition of access to reserved addresses
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.
8. Differences between products
   Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Preface

1. About this document

This manual is generally organized into an overview of the product, descriptions of the CPU, system control functions, peripheral functions, electrical characteristics, and usage notes. This manual describes the product specification of the microprocessors (MPUs) superset. Depending on your product, some pins, registers, or functions might not exist. Address space that store unavailable registers are reserved.

2. Audience

This manual is written for system designers who are designing and programming applications using the Renesas MPU. The user is expected to have basic knowledge of electrical circuits, logic circuits, and the MPU.

3. Renesas Publications

Renesas provides the following documents. Before using any of these documents, visit www.renesas.com for the most up-to-date version of the document.

Component	Document Type	Description
Hardware	Datasheet	Features, overview, and electrical characteristics
	User's Manual: Hardware	Specifications such as pin assignments, memory maps, peripheral functions, electrical characteristics, timing diagrams, and operation descriptions
	Application Notes	Technical notes, board design guidelines, and software migration information
	Technical Update (TU)	Preliminary reports on product specifications such as restriction and errata
Software	User's Manual: Software	API reference and programming information
	Application Notes	Project files, guidelines for software programming, and application examples to develop embedded software applications
Tools & Kits, Solutions	User's Manual: Development Tools	User's manuals and quick start guides for developing embedded software applications with Software Packages, Development Kits, Starter Kits, Promotion Kits, Product Examples, and Application Examples
	Quick Start Guide	
	Application Notes	Project files, guidelines for software programming, and application examples to develop embedded software applications

4. Numbering Notation

The following numbering notation is used throughout this manual:

Example	Description
011b	Binary number. For example, the binary equivalent of the number 3 is 011b.
0x1F	Hexadecimal number. For example, the hexadecimal equivalent of the number 31 is described 0x1F. In some cases, a hexadecimal number is shown with the suffix "h".
1234	Decimal number. A decimal number is followed by this symbol only when the possibility of confusion exists. Decimal numbers are generally shown without a suffix.

5. Typographic Notation

The following typographic notation is used throughout this manual:

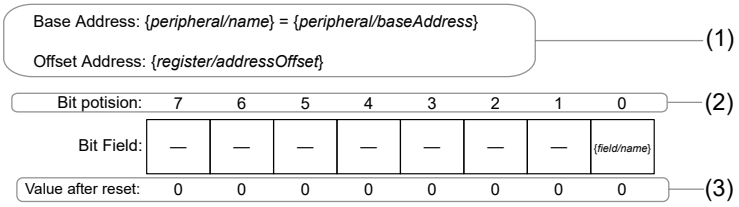
Example	Description
AAA.BBB.CCC	Periods separated a function module symbol (AAA), register symbol (BBB), and bit field symbol (CCC).
AAA.BBB	A period separated a function module symbol (AAA) and register symbol (BBB).
BBB.DDD	A period separated a register symbol (BBB) and bit field symbol (DDD).
EEE[3:0]	Numbers in brackets expresses a bit number. For example, EEE[3:0] occupies bits 3 to 0.

6. Unit and Unit Prefix

The following units and unit prefixes are sometimes misleading. Those unit prefixes are described throughout this manual with the following meaning:

Symbol	Name	Description
b	Binary Digit	Single 0 or 1
B	Byte	This unit is generally used for memory specification and address space.
k	kilo-	$1000 = 10^3$. k is also used to denote 1024 (2^{10}) but this unit prefix is used to denote 1000 (10^3) throughout this manual.
K	Kilo-	$1024 = 2^{10}$. This unit prefix is used to denote 1024 (2^{10}) not 1000 (10^3) throughout this manual.

7. Special Terms



The following terms have special meanings.

Term	Description
NC	Not connected pin. This pin should be left floating unless specified otherwise.
Hi-Z	High impedance.
x	Don't care or undefined.

8. Register Description

Each register description includes both a register diagram that shows the bit assignments and a register bit table that describes the content of each bit. The example of symbols used in these tables are described in the sections that follow. The following is an example of a register description and associated bit field definition.

XX.X.X {*register/name*} : {*register/description*}

(4) (5) (6)

Bit	Symbol	Function	R/W
0	{*field/name*}	{*field/description*} 0: {*enumeratedValue/description*} 1: {*enumeratedValue/description*}	{*access*}
7:1	—	These bits are read as 0. The write value should be 0.	R/W

(1) Function module symbol, register symbol, and address assignment

Function module symbol, {*pheripheral/name*}, register symbol, {*register/name*}, and address assignment of this register are generally expressed. Base Address and Offset Address mean {*regiser/name*} : {*register/description*} of {*peripheral/name*} is assigned to address {*peripheral/baseAddress*} + {*register/addressOffset*}.

(2) Bit number

This number indicates the bit number. This bits are shown in order from bits 31 to 0 for 32-bit register, from bits 15 to 0 for 16-bit register, and from bits 7 to 0 for 8-bit register.

(3) Value after reset

This symbol or number indicate the value of each bit after a hard reset. The value is shown in binary unless specified otherwise.

- 0: Indicates that the value is 0 after a reset.
- 1: Indicates that the value is 1 after a reset.
- x: Indicates that the value is undefined after a reset.

(4) Symbol

{*filed/name*} indicates the short name of bit field. Reserved bit is expressed with a —.

(5) Function

Function indicates the full name of the bit field, {*field/description*}, and enumerated values.

(6) R/W

The R/W column indicates access type whether the bit field is readable or writable.

- R/W: The bit field is readable and writable.
- R: The bit field is readable only. Writing to this bit field has no effect.
- W: The bit field is writable only. The read value is the same as after a reset unless specified otherwise.

9. Abbreviations

Abbreviations used in this document are shown in the following table.

Abbreviation	Description
AES	Advanced Encryption Standard
AHB	Advanced High-performance Bus
AHB-AP	AHB Access Port
APB	Advanced Peripheral Bus
ATB	Advanced Trace Bus
AXI	Advanced eXtensible Interface
BCD	Binary Coded Decimal
BSDL	Boundary Scan Description Language
CTI	Cross Trigger Interface
DAP	Coresight Debug Access Port
DES	Data Encryption Standard
DSA	Digital Signature Algorithm
ECDSA	Elliptic Curve Digital Signature Algorithm
ETM	Embedded Trace Macrocell
JTAG	Joint Test Action Group
LSB	Least Significant Bit
MSB	Most Significant Bit
PLL	Phase Locked Loop
PWM	Pulse Width Modulation
RSA	Rivest Shamir Adleman
S/H	Sample and Hold
SHA	Secure Hash Algorithm
SWD	Serial Wire Debug
TRNG	True Random Number Generator
UART	Universal Asynchronous Receiver/Transmitter

6.2.4 PLL1MON : PLL1 Monitor Register 127
6.2.5 PLL1EN : PLL1 Enable Register 127
6.2.6 LOCOCR : Low-Speed On-Chip Oscillator Control Register 128
6.2.7 HIZCTRLEN : High-Impedance Control Enable Register 128
6.3 Selecting Input to Main Clock Oscillator 129

6.3.1 Connecting a Crystal Resonator 129
6.3.2 External Clock Input 130
6.4 PLL Circuit 130
6.5 Low-Speed On-Chip Oscillator (LOCO) 130
6.6 Oscillation Abnormality Detection Function for the Main Clock 130
6.6.1 Main Clock Oscillation Abnormality Detection and Operation after Detection 130
6.6.2 Main Clock Oscillation Abnormality Detection Interrupt 131
6.7 PLL Oscillation Abnormality Detection Function 131
6.8 Low-Speed On-Chip Oscillator Oscillation Abnormality Detection Function 131
6.9 Internal Clock 131
6.10 Reference Clock to the External Ethernet PHY 133
6.11 Usage Notes 134
6.11.1 Notes on Clock Generation Circuit 134
6.11.2 Notes on Resonator 134
6.11.3 Notes on Designing the Board 134

7. Clock Monitor Circuit (CLMA) 136
7.1 Overview 136
7.2 Register Descriptions 137
7.2.1 CTL0 : CLMA Control Register 0 137
7.2.2 CMPL : CLMA Compare Register L 138
7.2.3 CMPH : CLMA Compare Register H 138
7.2.4 PCMD : CLMA Command Register 139
7.2.5 PROTSR : CLMA Protection Status Register 139
7.3 Operation 139
7.3.1 CLMAm Operation 139
7.3.2 Detecting Error Clock Frequency 140
7.3.3 Detecting Error Clock Frequency 142
7.4 Notes on Using CLMAm 142

8. Low-Power Consumption Function 143
8.1 Overview 143
8.2 Register Descriptions 144
8.2.1 MSTPCRA : Module Stop Control Register A 144
8.2.2 MSTPCRB : Module Stop Control Register B 145
8.2.3 MSTPCRC : Module Stop Control Register C 146
8.2.4 MSTPCRD : Module Stop Control Register D 147
8.2.5 MSTPCRE : Module Stop Control Register E 148
8.2.6 MSTPCRF : Module Stop Control Register F 148
8.2.7 MSTPCRG : Module Stop Control Register G 149
8.2.8 MSTPCRI : Module Stop Control Register I 150

8.2.9 MSTPCRJ : Module Stop Control Register J 150
8.2.10 MSTPCRK : Module Stop Control Register K 151
8.2.11 MSTPCRL : Module Stop Control Register L 151
8.3 Operation 152
8.3.1 Module-Stop Function 152
8.3.2 Cortex-R52 Standby Mode 154
8.4 Usage Notes 154
8.4.1 I/O Port State 154
8.4.2 On-Chip Peripheral Module Interrupts in Module-Stop State 154
8.4.3 USB Low Power Consumption 154
8.4.4 Low Power Consumption for Ethernet-Related Functions 154
8.4.5 Low Power Consumption for HIPERFACE DSL and EnDat 2.2 154
8.4.6 Write Protection Function 155
9. Debugging Interface 156
9.1 Overview 156
9.2 Register Descriptions 158
9.2.1 OIRn : OCD Authentication ID Code Register n (n = 0 to 3) 158
9.2.2 OSR : OCD Status Register 159
9.3 Operation 159
9.3.1 JTAG Interface 159
9.3.2 SWD Interface 159
9.3.3 Trace Port Interface 160
9.3.4 Reset Configuration and the Method of Connecting with the Emulator 161
9.3.5 JTAG Pin Treatment When No Emulator Is Connected 162
9.3.6 Noise Reduction of the TRST# Pin 162
9.3.7 Available Trace Functions 162
9.3.8 Debug Authentication 162
9.3.9 Debug Authentication Procedure 163
9.4 Usage Notes 164
9.4.1 Access to the Main Bus 164
9.4.2 Authentication Level 164
9.4.3 Debug Reset 164
10. Register Write Protection Function 165
10.1 Overview 165
10.2 Register Descriptions 165
10.2.1 PRCRN : Non_Safety Area Protect Register 165
10.2.2 PRCRS : Safety Area Protect Register 166
11. Interrupt Controller (ICU) 168
11.1 Overview 168

11.2 Register Descriptions 169
11.2.1 Interrupt Control Unit Register 0 (Safety Region) 169
11.2.2 Interrupt Control Unit Register 1 (Non-Safety Region) 215
11.3 Operations 221
11.3.1 Event Handling 221
11.3.2 Event Table 221
11.3.3 Error Events 239
11.3.4 Noise Filter 247
12. Internal Buses 249
12.1 Overview 249
12.2 Register Descriptions 250
12.2.1 STADDm : Master MPU Safety Region Start Address Register m (m = 0 to 7) 250
12.2.2 ENDADDm : Master MPU Safety Region End Address Register m (m = 0 to 7) 251
12.2.3 ERRINF : Master MPU Error Information Register for AHB type 251
12.2.4 ERRINF_x : Master MPU Error Information Register for AXI type (x = R, W) 252
12.3 Operation 252
12.3.1 Bus Connection 252
12.3.2 Master MPU 253
12.3.3 Interrupt 254
12.4 Usage Notes 255
12.4.1 Release of Register Write Protection 255
12.4.2 Initial Setting of Master MPU 255
12.4.3 New MPU Error Detection While Preserving Valid Error Information 255
12.4.4 TCM Access via AXIS Interface of Cortex-R52 255
13. Bus State Controller 257
13.1 Overview 257
13.2 Area Overview 259
13.2.1 Address Map 259
13.2.2 Data Bus Width and Related Pin Setting for Each Area Depending on Boot Mode 259
13.3 Register Descriptions 260
13.3.1 CSnBCR : CSn Space Bus Control Register (n = 0, 2, 3, 5) 260
13.3.2 CSn Space Wait Control Register (CSnWCR) (n = 0, 2, 3, 5) 262
13.3.3 SDCR : SDRAM Control Register 271
13.3.4 RTCSR : Refresh Timer Control/Status Register 272
13.3.5 RTCNT : Refresh Timer Counter 273
13.3.6 RTCOR : Refresh Time Constant Register 274
13.3.7 TOSCORn : Timeout Cycle Constant Register n (n = 0, 2, 3, 5) 274
13.3.8 TOSTR : Timeout Status Register 275
13.3.9 TOENR : Timeout Enable Register 276

13.4 Operation 276
13.4.1 Access Size and Data Alignment 276
13.4.2 SRAM Interface 277
13.4.3 Access Wait Control 281
13.4.4 CSn# Assert Period Expansion 283
13.4.5 MPX-I/O Interface 284
13.4.6 SDRAM Interface 288
13.4.7 Burst ROM (Clocked Asynchronous) Interface 313
13.4.8 SRAM Interface with Byte Selection 315
13.4.9 Burst ROM (Clocked Synchronous) Interface 319
13.4.10 Wait between Access Cycles 320
13.4.11 Others 322

14. DMA Controller (DMAC) 324
14.1 Overview 324
14.2 Register Descriptions 325
14.2.1 NmSA_n : Nextm Source Address Register n (m = 0, 1) (n = 0 to 15) 325
14.2.2 NmDA_n : Nextm Destination Address Register n (m = 0, 1) (n = 0 to 15) 325
14.2.3 NmTB_n : Nextm Transaction Byte Register n (m = 0, 1) (n = 0 to 15) 325
14.2.4 CRSA_n : Current Source Address Register n (n = 0 to 15) 326
14.2.5 CRDA_n : Current Destination Address Register n (n = 0 to 15) 326
14.2.6 CRTB_n : Current Transaction Byte Register n (n = 0 to 15) 327
14.2.7 CHSTAT_n : Channel Status Register n (n = 0 to 15) 327
14.2.8 CHEXT_n : Channel Extension Register n (n = 0 to 15) 331
14.2.9 DMAC0_RSSELi : DMAC Unit 0 Resource Select Register i (i = 0 to 5) 331
14.2.10 DMAC1_RSSELi : DMAC Unit 1 Resource Select Register i (i = 0 to 5) 332
14.2.11 CMNCR : Common Control Register 333
14.2.12 CHCTRL_n : Channel Control Register n (n = 0 to 15) 334
14.2.13 CHCFG_n : Channel Configuration Register n (n = 0 to 15) 335
14.2.14 CHITVL_n : Channel Interval Register n (n = 0 to 15) 338
14.2.15 NXLA_n : Next Link Address Register n (n = 0 to 15) 338
14.2.16 CRLA_n : Current Link Address Register n (n = 0 to 15) 339
14.2.17 DCTRL_x : DMA Control Register x (x = A, B) 339
14.2.18 DSTAT_EN_x : DMA Status EN Register x (x = A, B) 340
14.2.19 DSTAT_ER_x : DMA Status ER Register x (x = A, B) 340
14.2.20 DSTAT_END_x : DMA Status END Register x (x = A, B) 341
14.2.21 DSTAT_SUS_x : DMA Status SUS Register x (x = A, B) 342
14.3 Operation 342
14.3.1 DMA Mode 342
14.3.2 Transfer Mode 353
14.3.3 DMA Channel Priority Control 354

14.3.4 DMA Transfer Request 357
14.3.5 DMA Acknowledge Output/DMA Transaction Completion Output Function 368
14.3.6 DMA Transaction Completion Signal Output 370
14.3.7 Interval Count Function 371
14.3.8 Differences in Operation According to the Transfer Data Size 372
14.3.9 DMA Transfer Status 373
14.3.10 Suspending a Transfer 374
14.3.11 Aborting a Transfer 375
14.4 Interrupts 378
14.4.1 Interrupt Sources 378
14.4.2 DMA Transfer Completion Interrupts 379
14.4.3 DMA Error Interrupt 379
14.5 DMA Setting Examples 379
14.5.1 Setting Example 1 (Register Hardware Request) 380
14.5.2 Setting Example 2 (Register Mode Software Request) 381
14.5.3 Setting Example 3 (Register Mode Continuous Execution) 383
14.5.4 Setting Example 4 (Link Mode) 385
14.5.5 Next Register Continuous Execution Settings 388
14.6 Usage Notes 390
14.6.1 When the DACK Signal is Divided and Output 390
15. Event Link Controller (ELC) 392
15.1 Overview 392
15.2 Register Descriptions 392
15.2.1 ELC_SSELn : ELC Event Source Select Register n (n = 0 to 18) 393
15.2.2 ELOPA : Event Link Option Setting Register A 399
15.2.3 ELOPB : Event Link Option Setting Register B 400
15.2.4 ELC_PGRn : ELC Port Group Setting Register n (n = 1, 2) 400
15.2.5 ELC_PGCn : ELC Port Group Control Register n (n = 1, 2) 401
15.2.6 ELC_PDBFn : ELC Port Buffer Register n (n = 1, 2) 401
15.2.7 ELC_PELn : ELC Port Setting Register n (n = 0 to 3) 402
15.2.8 ELC_DPTC : ELC Edge Detection Control Register 402
15.2.9 ELC_ELSR2 : ELC Port Event Control Register 403
15.3 Operation 403
15.3.1 Event Linkage 403
15.3.2 Operation of MTU When Event is Input 405
15.3.3 Operation of GPT When Event is Input 405
15.3.4 Operation of A/D Converter When Event is Input 405
15.3.5 I/O Port Operation on Event Input and Event Generation 405
15.3.6 Example of Procedure for Linking Events 408
15.4 Usage Notes 409

15.4.1 Setting Clocks 409

16. I/O Ports 410

16.1 Overview 410

16.2 I/O Port Configuration 410

16.3 Register Descriptions 433

16.3.1 Pm : Port m Register (m = 00 to 24) 433

16.3.2 PMm : Port m Mode Register (m = 00 to 24) 434

16.3.3 PMCm : Port m Mode Control Register (m = 00 to 24) 434

16.3.4 PFCm : Port m Function Control Register (m = 00 to 24) 435

16.3.5 PINm : Port m Input Register (m = 00 to 24) 435

16.3.6 DRCTLm : I/O Buffer m Function Switching Register (m = 00 to 24) 436

16.3.7 RSELPm : Port m Region Select Register (m = 00 to 24) 438

16.4 Multiplexed Pin Configurations 438

16.4.1 Port 00 Function Assignment 438

16.4.2 Port 01 Function Assignment 439

16.4.3 Port 02 Function Assignment 439

16.4.4 Port 04 Function Assignment 440

16.4.5 Port 05 Function Assignment 440

16.4.6 Port 06 Function Assignment 440

16.4.7 Port 07 Function Assignment 441

16.4.8 Port 08 Function Assignment 441

16.4.9 Port 09 Function Assignment 442

16.4.10 Port 10 Function Assignment 442

16.4.11 Port 13 Function Assignment 443

16.4.12 Port 14 Function Assignment 443

16.4.13 Port 15 Function Assignment 444

16.4.14 Port 16 Function Assignment 444

16.4.15 Port 17 Function Assignment 444

16.4.16 Port 18 Function Assignment 445

16.4.17 Port 20 Function Assignment 445

16.4.18 Port 21 Function Assignment 446

16.4.19 Port 22 Function Assignment 446

16.4.20 Port 23 Function Assignment 447

16.4.21 Port 24 Function Assignment 447

16.5 Handling of Unused Pins 447

16.6 Usage Notes 448

16.6.1 Release of Register Write Protection 448

16.6.2 Examples of Port Setting 448

16.6.3 Notes on Port Register Setting 450

16.6.4 Pin Assignment of each Boot Mode 450

17. Multi-Function Timer Pulse Unit 3 (MTU3) 453
17.1 Overview 453
17.2 Register Descriptions 460
17.2.1 TCR : Timer Control Register 460
17.2.2 TCRx : Timer Control Register x (x = U, V, W) 462
17.2.3 TCR2 — Timer Control Registers 462
17.2.4 TMDR1 : Timer Mode Register 1 468
17.2.5 TMDR2x : Timer Mode Register 2x (x = A, B) 470
17.2.6 TMDR3 : Timer Mode Register 3 470
17.2.7 TIOR — Timer I/O Control Registers 472
17.2.8 TCNTCMPCLR : Timer Compare Match Clear Register 490
17.2.9 TIER — Timer Interrupt Enable Registers 491
17.2.10 TSR : Timer Status Register 494
17.2.11 TBTM : Timer Buffer Operation Transfer Mode Register 496
17.2.12 TICCR : Timer Input Capture Control Register 497
17.2.13 TSYCR : Timer Synchronous Clear Register 497
17.2.14 TCNT — Timer Counters 498
17.2.15 TCNTLW : Timer Longword Counter 499
17.2.16 TGR — Timer General Registers 499
17.2.17 TGRxLW : Timer Longword General Register x (x = A, B) 501
17.2.18 TSTR — Timer Start Registers 502
17.2.19 TSYRA : Timer Synchronous Register A 503
17.2.20 TSYRB : Timer Synchronous Register B 504
17.2.21 TCSYSTR : Timer Counter Synchronous Start Register 505
17.2.22 TRWERx : Timer Read/Write Enable Register x (x = A, B) 506
17.2.23 TOERA : Timer Output Master Enable Register A 507
17.2.24 TOERB : Timer Output Master Enable Register B 508
17.2.25 TOCR1x : Timer Output Control Register 1x (x = A, B) 508
17.2.26 TOCR2x : Timer Output Control Register 2x (x = A, B) 510
17.2.27 TOLBRx : Timer Output Level Buffer Register x (x = A, B) 512
17.2.28 TGCRA : Timer Gate Control Register A 513
17.2.29 TCNTSx : Timer Subcounter x (x = A, B) 515
17.2.30 TCDRx : Timer Cycle Data Register x (x = A, B) 515
17.2.31 TCBRx : Timer Cycle Buffer Register x (x = A, B) 515
17.2.32 TDDRx : Timer Dead Time Data Register x (x = A, B) 516
17.2.33 TDERx : Timer Dead Time Enable Register x (x = A, B) 516
17.2.34 TBTERx : Timer Buffer Transfer Set Register x (x = A, B) 516
17.2.35 TWCRx : Timer Waveform Control Register x (x = A, B) 517
17.2.36 NFCR — Noise Filter Control Registers 518
17.2.37 TADCR — Timer A/D Converter Start Request Control Registers 522

17.2.38 TADCORx : Timer A/D Converter Start Request Cycle Set Register x (x = A, B) 525
17.2.39 TADCOBRx : Timer A/D Converter Start Request Cycle Set Buffer Register x (x = A, B) .. 526
17.2.40 TITMRx : Timer Interrupt Skipping Mode Register x (x = A, B) 526
17.2.41 TITCR1A : Timer Interrupt Skipping Set Register 1A 527
17.2.42 TITCR1B : Timer Interrupt Skipping Set Register 1B 527
17.2.43 TITCNT1A : Timer Interrupt Skipping Counter 1A 528
17.2.44 TITCNT1B : Timer Interrupt Skipping Counter 1B 529
17.2.45 TITCR2A : Timer Interrupt Skipping Set Register 2A 530
17.2.46 TITCR2B : Timer Interrupt Skipping Set Register 2B 530
17.2.47 TITCNT2A : Timer Interrupt Skipping Counter 2A 531
17.2.48 TITCNT2B : Timer Interrupt Skipping Counter 2B 531
17.2.49 Bus Master Interface 532
17.3 Operations 532
17.3.1 Basic Functions 532
17.3.2 Synchronous Operation 536
17.3.3 Buffer Operation 538
17.3.4 Cascaded Operation 541
17.3.5 PWM Modes 545
17.3.6 Phase Counting Mode 549
17.3.7 Reset-Synchronized PWM Mode 561
17.3.8 Complementary PWM Mode 564
17.3.9 A/D Converter Start Request Delaying Function 599
17.3.10 Synchronous Operation of MTU0 to MTU4, MTU6, and MTU7 605
17.3.11 External Pulse Width Measurement 608
17.3.12 Dead Time Compensation 609
17.3.13 TCNTU, TCNTV, and TCNTW Capture at Crest and/or Trough in Complementary PWM Mode 611
17.3.14 Noise Filter Function 611
17.4 Interrupt Sources 612
17.4.1 Interrupt Sources and Priorities 612
17.4.2 DMAC Trigger Sources 614
17.4.3 A/D Converter Trigger Sources 614
17.5 Operation Timing 615
17.5.1 Input/Output Timing 615
17.5.2 Interrupt Signal Timing 621
17.6 Usage Notes 623
17.6.1 Module Stop Function Setting 623
17.6.2 Input Clock Restrictions 623
17.6.3 Note on Period Setting 624
17.6.4 Contention between TCNT Write and Clear Operations 624

17.6.5 Contention between TCNT Write and Increment Operations 624
17.6.6 Contention between TGR Write Operation and Compare Match 625
17.6.7 Contention between Buffer Register Write Operation and Compare Match 625
17.6.8 Contention between Buffer Register Write and TCNT Clear Operations 626
17.6.9 Contention between TGR Read Operation and Input Capture 626
17.6.10 Contention between TGR Write Operation and Input Capture 627
17.6.11 Contention between Buffer Register Write Operation and Input Capture 627
17.6.12 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation 628
17.6.13 Counter Value When Count Operation is Stopped in Complementary PWM Mode 629
17.6.14 Buffer Operation Setting in Complementary PWM Mode 630
17.6.15 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode 630
17.6.16 Overflow in Reset-Synchronized PWM Mode 631
17.6.17 Contention between Overflow/Underflow and Counter Clearing 631
17.6.18 Contention between TCNT Write Operation and Overflow/Underflow 632
17.6.19 Note on Transition from Normal Mode or PWM Mode 1 to Reset-Synchronized PWM Mode 632
17.6.20 Output Level in Complementary PWM Mode and Reset-Synchronized PWM Mode 633
17.6.21 Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection 633
17.6.22 Interrupt Skipping Function 2 633
17.6.23 Notes When Complementary PWM Mode Output Protection Function is Not Used 633
17.6.24 Notes Regarding Timer Counter (MTU5.TCNT) and Timer General Register (MTU5.TGR) 633
17.6.25 Notes to Prevent Malfunctions in Synchronous Clearing for Complementary PWM Mode 634
17.6.26 Notes on Timer Mode Register Setting for ELC Event Input 635
17.6.27 Continuous Output of Interrupt Signal in Response to a Compare Match 635
17.7 MTU Output Pin Initialization 636
17.7.1 Operating Modes 636
17.7.2 Operation in Case of Re-Setting Due to Error during Operation 636
17.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error During Operation 637
17.8 Operations Linked by the ELC 655
17.8.1 Event Signal Output to the ELC 655
17.8.2 MTU Operations in Response to Receiving Event Signals from the ELC 655
17.8.3 Usage Notes on MTU Operation by Event Signal Reception from the ELC 655

18. Port Output Enable 3 (POE3) 657

18.1 Overview 657
18.2 Register Descriptions 659
18.2.1 ICSR1 : Input Level Control/Status Register 1 659
18.2.2 ICSR2 : Input Level Control/Status Register 2 660
18.2.3 ICSR3 : Input Level Control/Status Register 3 661

18.2.4 ICSR4 : Input Level Control/Status Register 4 662
18.2.5 ICSR5 : Input Level Control/Status Register 5 663
18.2.6 ICSR6 : Input Level Control/Status Register 6 664
18.2.7 ICSR7 : Input Level Control/Status Register 7 665
18.2.8 OCSR1 : Output Level Control/Status Register 1 666
18.2.9 OCSR2 : Output Level Control/Status Register 2 667
18.2.10 ALR1 : Active Level Setting Register 1 668
18.2.11 SPOER : Software Port Output Enable Register 669
18.2.12 POECR1 : Port Output Enable Control Register 1 670
18.2.13 POECR2 : Port Output Enable Control Register 2 671
18.2.14 POECR4 : Port Output Enable Control Register 4 672
18.2.15 POECR5 : Port Output Enable Control Register 5 675
18.2.16 M0SELR1 : MTU0 Pin Select Register 1 676
18.2.17 M0SELR2 : MTU0 Pin Select Register 2 677
18.2.18 M3SELR : MTU3 Pin Select Register 677
18.2.19 M4SELR1 : MTU4 Pin Select Register 1 678
18.2.20 M4SELR2 : MTU4 Pin Select Register 2 678
18.2.21 M6SELR : MTU6 Pin Select Register 679
18.2.22 M7SELR1 : MTU7 Pin Select Register 1 680
18.2.23 M7SELR2 : MTU7 Pin Select Register 2 680
18.3 Operation 681
18.3.1 MTU3 Pin Selection 684
18.3.2 Input-Level Detection Operation 684
18.3.3 Output-Level Compare Operation 685
18.3.4 High-Impedance Control Using Registers 686
18.3.5 High-Impedance Control through Detection of Stopped Oscillation and Oscillation Abnormality 686
18.3.6 Additional Functions for High-Impedance Control 686
18.3.7 Recover from High-Impedance State 686
18.4 POE3 Setting Procedure 686
18.5 Interrupts 687
18.6 Usage Notes 687
18.6.1 High-Impedance Control when the MTU is not Selected 687
19. General PWM Timer (GPT) 688
19.1 Overview 688
19.2 Register Descriptions 692
19.2.1 GTWP : General PWM Timer Write-Protection Register 692
19.2.2 GTSTR : General PWM Timer Software Start Register 692
19.2.3 GTSTP : General PWM Timer Software Stop Register 694
19.2.4 GTCLR : General PWM Timer Software Clear Register 695

19.2.5 GTSSR : General PWM Timer Start Source Select Register 696
19.2.6 GTPSR : General PWM Timer Stop Source Select Register 698
19.2.7 GTCSR : General PWM Timer Clear Source Select Register 699
19.2.8 GTUPSR : General PWM Timer Count-Up Source Select Register 701
19.2.9 GTDNSR : General PWM Timer Count-Down Source Select Register 703
19.2.10 GTICASR : General PWM Timer Input Capture Source Select Register A 704
19.2.11 GTICBSR : General PWM Timer Input Capture Source Select Register B 707
19.2.12 GTCR : General PWM Timer Control Register 709
19.2.13 GTUDDTYC : General PWM Timer Count Direction and Duty Setting Register 710
19.2.14 GTIOR : General PWM Timer I/O Control Register 711
19.2.15 GTINTAD : General PWM Timer Interrupt Output Setting Register 714
19.2.16 GTST : General PWM Timer Status Register 715
19.2.17 GTBER : General PWM Timer Buffer Enable Register 716
19.2.18 GTITC : General PWM Timer Interrupt and A/D Converter Start Request Skipping Setting Register 718
19.2.19 GTCNT : General PWM Timer Counter 719
19.2.20 GTCCRm : General PWM Timer Compare Capture Register m (m = A to F) 720
19.2.21 GTPR : General PWM Timer Cycle Setting Register 720
19.2.22 GTPBR : General PWM Timer Cycle Setting Buffer Register 720
19.2.23 GTPDBR : General PWM Timer Cycle Setting Double-Buffer Register 721
19.2.24 GTADTRm : A/D Converter Start Request Timing Register m (m = A, B) 721
19.2.25 GTADTBRm : A/D Converter Start Request Timing Buffer Register m (m = A, B) 721
19.2.26 GTADTDBRm : A/D Converter Start Request Timing Double-Buffer Register m (m = A, B) 722
19.2.27 GTDTCR : General PWM Timer Dead Time Control Register 722
19.2.28 GTDVm : General PWM Timer Dead Time Value Register m (m = U, D) 723
19.2.29 GTDBm : General PWM Timer Dead Time Value Buffer Register m (m = U, D) 723
19.2.30 GTSOS : General PWM Timer Output Protection Function Status Register 724
19.2.31 GTSOTR : General PWM Timer Output Protection Function Temporary Release Register 724
19.2.32 GTADSMR : General PWM Timer A/D Conversion Start Request Signal Monitoring Register 725
19.2.33 GTEITC : General PWM Timer Extended Interrupt Skipping Counter Control Register 726
19.2.34 GTEITLI1 : General PWM Timer Extended Interrupt Skipping Setting Register 1 727
19.2.35 GTEITLI2 : General PWM Timer Extended Interrupt Skipping Setting Register 2 728
19.2.36 GTEITLB : General PWM Timer Extended Buffer Transfer Skipping Setting Register 729
19.2.37 GTSECSR : General PWM Timer Operation Enable Bit Simultaneous Control Channel Select Register 731
19.2.38 GTSECR : General PWM Timer Operation Enable Bit Simultaneous Control Register 732
19.2.39 GTSWSR : General PWM Timer Switch Source Select Register 733
19.2.40 GTSWOS : General PWM Timer Switch Offset Setting Register 734
19.3 Operation 734

19.3.1 Basic Operation ... 734
19.3.2 Buffer Operation ... 742
19.3.3 PWM Output Operating Mode ... 752
19.3.4 Automatic Dead Time Setting Function ... 762
19.3.5 Count Direction Changing Function ... 766
19.3.6 Function of Output Duty 0% and 100% ... 767
19.3.7 Hardware Count Start/Count Stop and Clear Operation ... 769
19.3.8 Hardware Count Switch Operation ... 774
19.3.9 Synchronous Operation ... 782
19.3.10 PWM Output Operation Examples ... 785
19.3.11 Phase Counting Mode ... 791
19.4 Interrupt Sources ... 799
19.4.1 Interrupt Sources ... 799
19.4.2 Interrupt and A/D Conversion Start Request Skipping Function ... 802
19.5 A/D Converter Start Request ... 807
19.6 Operations Linked by the ELC ... 809
19.6.1 Event Signal Output to the ELC ... 809
19.6.2 Operations in Response to Receiving Event Signals from the ELC ... 810
19.7 Noise Filter Function ... 810
19.8 Protection Function ... 810
19.8.1 Write-Protection for Registers ... 810
19.8.2 Disabling of Buffer Operation ... 811
19.8.3 GTIOCnm Pin Output Negate Control (n = 0 to 17, m = A, B) ... 816
19.8.4 GTIOCnm Protection Function for GTIOCnm Pin Output (n = 0 to 17, m = A, B) ... 817
19.9 Initialization Method of Output Pins ... 824
19.9.1 Pin Settings after Reset ... 824
19.9.2 Pin Initialization Due to Error during Operation ... 825
19.10 Usage Notes ... 825
19.10.1 Module-Stop Function Setting ... 825
19.10.2 Settings of the GTCCRn Register During Compare Match Operation (n = A to F) ... 825
19.10.3 Setting Range of the GTCNT Counter ... 827
19.10.4 The GTCNT Counter Start/Stop ... 827
19.10.5 Order of Priority in Events ... 827

20. Port Output Enable for GPT (POEG) ... 829

20.1 Overview ... 829
20.2 Register Descriptions ... 834
20.2.1 POEG0Gn : POEG0 Group n Setting Register (n = A to D) ... 834
20.2.2 POEGmGn : POEGm Group n Setting Register (m = 1, 2) (n = A to D) ... 836
20.3 Operation ... 837
20.3.1 Output-Disable Control Operation ... 837

20.3.2 Output-Disable Requests from the GPT 838
20.3.3 Output-Disable Control Using Detection of Stopped Oscillation 838
20.3.4 Output-Disable Control Using DSMIF Error Detection 838
20.3.5 Output-Disable Control Using Registers 838
20.3.6 Release from Output-Disable 838

21. Trigonometric Function Unit (TFU) 840
21.1 Overview 840
21.1.1 Precautions on Use of the Trigonometric Function Unit 841
21.2 Register Descriptions 841
21.2.1 FXSCIOC : Fixed-point Sine Cosine Input/Output Setting Register 841
21.2.2 FXATIOC : Fixed-point Arctangent hypot_k Input/Output Setting Register 842
21.2.3 TRGSTS : Trigonometric Status Register 842
21.2.4 FPSCDT0 : Floating-point Sine Cosine Data Register 0 843
21.2.5 FPSCDT1 : Floating-point Sine Cosine Data Register 1 844
21.2.6 FPATDT0 : Floating-point Arctangent hypot_k Data Register 0 844
21.2.7 FPATDT1 : Floating-point Arctangent hypot_k Data Register 1 845
21.2.8 FXSCDT0 : Fixed-point Sine Cosine Data Register 0 845
21.2.9 FXSCDT1 : Fixed-point Sine Cosine Data Register 1 846
21.2.10 FXATDT0 : Fixed-point Arctangent hypot_k Data Register 0 846
21.2.11 FXATDT1 : Fixed-point Arctangent hypot_k Data Register 1 847
21.2.12 DTSR0 : Data Save Restore Register 0 847
21.2.13 DTSR1 : Data Save Restore Register 1 848
21.3 Operation 848
21.3.1 Arithmetic Processing 848
21.3.2 Input and Output Value Formats 848
21.3.3 Angle Unit 849
21.3.4 Relationship Between Input and Output Values for Sincos Operation 850
21.3.5 Relationship Between Input and Output Values for Atan Operation 850
21.3.6 Relationship Between Input and Output Values for hypot_k Operation 851
21.3.7 Procedure for Trigonometric Function Operation 851
21.3.8 Usage of Interrupt 853

22. Compare Match Timer (CMT) 855
22.1 Overview 855
22.2 Register Descriptions 856
22.2.1 CMSTRn : Compare Match Timer Start Register (n = 0, 2, 4) 856
22.2.2 CMCR : Compare Match Timer Control Register 856
22.2.3 CMCNT : Compare Match Timer Counter Register 857
22.2.4 CMCOR : Compare Match Timer Constant Register 857
22.3 Operation 857

22.3.1 Periodic Count Operation 857
22.3.2 CMCNT Count Timing 858
22.4 Interrupts 858
22.4.1 Interrupt Sources 858
22.4.2 Timing of Compare Match Interrupt Generation 859
22.5 Usage Notes 859
22.5.1 Setting the Module Stop Function 859
22.5.2 Conflict between Write and Compare-Match Processes of CMCNT 859
22.5.3 Conflict between Write and Count-Up Processes of CMCNT 860
23. Compare Match Timer W (CMTW) 861
23.1 Overview 861
23.2 Register Descriptions 862
23.2.1 CMWSTR : Timer Start Register 862
23.2.2 CMWCR : Timer Control Register 862
23.2.3 CMWIOR : Timer I/O Control Register 864
23.2.4 CMWCNT : Timer Counter 865
23.2.5 CMWCOR : Compare Match Constant Register 865
23.2.6 CMWICRn : Input Capture Registers (n = 0, 1) 866
23.2.7 CMWOCRn : Output Compare Registers (n = 0, 1) 866
23.3 Operation 866
23.3.1 Period Counting Operation 866
23.3.2 Compare Match Function 867
23.3.3 Output Compare Function 868
23.3.4 Input Capture Function 869
23.3.5 Counter Size 870
23.3.6 Count Timing Based on CMWCNT 870
23.3.7 Output Compare Output Timing 870
23.3.8 Input Capture Signal Timing 871
23.4 Interrupts 871
23.4.1 CMTW Interrupt Sources and DMAC Transfer Requests 871
23.4.2 Timing of Compare Match Interrupt Generation 872
23.4.3 Timing of Output Compare Interrupt Generation 872
23.4.4 Timing of Input Capture Interrupt Generation 873
23.5 Usage Notes 873
23.5.1 Module-Stop Function 873
23.5.2 Contention Between CMWCNT Counter Writing and Compare Match 873
23.5.3 Contention Between CMWCNT Counter Writing and Incrementing or Clearing 874
23.5.4 Contention Between CMWCOR Register Writing and Compare Match 874
23.5.5 Contention Between CMWOCRn Register Writing and Compare Match 875
23.5.6 Contention Between CMWCNT Counter Reading and Incrementing or Clearing 875

23.5.7 Contention Between CMWICRn Register Reading and Input Capture 876

24. Watchdog Timer (WDT) 878

24.1 Overview 878

24.2 Register Descriptions 879

24.2.1 WDTRR : WDT Refresh Register 879

24.2.2 WDTCR : WDT Control Register 879

24.2.3 WDTSR : WDT Status Register 882

24.2.4 WDTRCR : WDT Reset Control Register 883

24.3 Operation 884

24.3.1 Count Operation in Start Mode 884

24.3.2 Control over Writing to the WDTCR and WDTRCR Registers 885

24.3.3 Refresh Operation 885

24.3.4 Status Flag 886

25. Real Time Clock (RTC) 887

25.1 Overview 887

25.2 Register Descriptions 888

25.2.1 RTCA0CTL0 : RTC Control Register 0 888

25.2.2 RTCA0CTL1 : RTC Control Register 1 889

25.2.3 RTCA0CTL2 : RTC Control Register 2 889

25.2.4 RTCA0SUBC : RTC Sub Count Register 890

25.2.5 RTCA0SRBU : RTC Sub Count Register Read Buffer 891

25.2.6 RTCA0SEC : RTC Sec Count Buffer Register 891

25.2.7 RTCA0MIN : RTC Min Count Buffer Register 892

25.2.8 RTCA0HOUR : RTC Hour Count Buffer Register 892

25.2.9 RTCA0WEEK : RTC Week Count Buffer Register 893

25.2.10 RTCA0DAY : RTC Day Count Buffer Register 893

25.2.11 RTCA0MONTH : RTC Month Count Buffer Register 893

25.2.12 RTCA0YEAR : RTC Year Count Buffer Register 894

25.2.13 RTCA0TIME : RTC Time Set Register 894

25.2.14 RTCA0CAL : RTC Calendar Set Register 894

25.2.15 RTCA0SCMP : RTC Sub Count Compare Register 895

25.2.16 RTCA0ALM : RTC Alarm Min Set Register 895

25.2.17 RTCA0ALH : RTC Alarm Hour Set Register 896

25.2.18 RTCA0ALW : RTC Alarm Week Set Register 896

25.2.19 RTCA0SECC : RTC Second Count Register 897

25.2.20 RTCA0MINC : RTC Minute Count Register 897

25.2.21 RTCA0HOURC : RTC Hour Count Register 897

25.2.22 RTCA0WEEKC : RTC Week Count Register 898

25.2.23 RTCA0DAYC : RTC Day Count Register 898

25.2.24 RTCA0MONC : RTC Month Count Register 898
25.2.25 RTCA0YEARC : RTC Year Count Register 899
25.2.26 RTCA0TIMEC : RTC Time Count Register 899
25.2.27 RTCA0CALC : RTC Calendar Count Register 899
25.3 Operation 900
25.3.1 Programming RTC 900
26. Ethernet Subsystem 909
26.1 Overview 909
26.2 Register Descriptions 911
26.2.1 PRCMD : Ethernet Protect Register 911
26.2.2 MODCTRL : Mode Control Register 912
26.2.3 PTPMCTRL : PTP Mode Control Register 913
26.2.4 PHYLNK : Ethernet PHY Link Mode Register 913
26.2.5 CONVCTRLn : RGMII/RMII Converter n Control Register (n = 0 to 2) 914
26.2.6 CONVRST : RGMII/RMII Converter Reset Control Register 915
26.3 Operation 915
26.3.1 Ethernet Initializing Operation 915
27. Ethernet MAC (GMAC) 917
27.1 Overview 917
27.2 Register Map 919
27.2.1 GMAC register map 919
27.3 Register Description 922
27.3.1 MAC_Configuration : MAC Configuration Register 922
27.3.2 MAC_Frame_Filter : MAC Frame Filter Register 925
27.3.3 GMII_Address : GMII Address Register 927
27.3.4 GMII_Data : GMII Data Register 928
27.3.5 Flow_Control : Flow Control Register 929
27.3.6 VLAN_Tag : VLAN Tag Register 930
27.3.7 Version : Version Register 931
27.3.8 Debug : Debug Register 931
27.3.9 Remote_Wake_Up_Frame_Filter : Remote Wake-Up Frame Filter Register 932
27.3.10 PMT_Control_Status : PMT Control and Status Register 933
27.3.11 LPI_Control_Status : LPI Control and Status Register 934
27.3.12 LPI_Timers_Control : LPI Timers Control Register 935
27.3.13 Interrupt_Status : Interrupt Status Register 935
27.3.14 Interrupt_Mask : Interrupt Mask Register 936
27.3.15 MAR0_H : MAC Address 0 High Register 937
27.3.16 MAR0_L : MAC Address 0 Low Register 937
27.3.17 MARn_H : MAC ADDRESS High Register (n = 1 to 17) 937

27.3.18 MARn_L : MAC ADDRESS Low Register (n = 1 to 17) 938
27.3.19 WDog_Timeout : Watchdog Timeout Register 938
27.3.20 MMC_Control : MMC Control Register 939
27.3.21 MMC_Receive_Interrupt : MMC Receive Interrupt Register 940
27.3.22 MMC_Transmit_Interrupt : MMC Transmit Interrupt Register 942
27.3.23 MMC_Receive_Interrupt_Mask : MMC Receive Interrupt Mask Register 944
27.3.24 MMC_Transmit_Interrupt_Mask : MMC Transmit Interrupt Mask Register 946
27.3.25 Tx_Octet_Count_Good_Bad : Transmit Octet Count for Good and Bad Frames 947
27.3.26 Tx_Frame_Count_Good_Bad : Transmit Frame Count for Good and Bad Frames 948
27.3.27 Tx_Broadcast_Frames_Good : Transmit Frame Count for Good Broadcast Frames 948
27.3.28 Tx_Multicast_Frames_Good : Transmit Frame Count for Good Multicast Frames 948
27.3.29 Tx_64Octets_Frames_Good_Bad : Transmit Octet Count for Good and Bad 64 Byte Frames 949
27.3.30 Tx_65To127Octets_Frames_Good_Bad : Transmit Octet Count for Good and Bad 65 to 127 Bytes Frames 949
27.3.31 Tx_128To255Octets_Frames_Good_Bad : Transmit Octet Count for Good and Bad 128 to 255 Bytes Frames 949
27.3.32 Tx_256To511Octets_Frames_Good_Bad : Transmit Octet Count for Good and Bad 256 to 511 Bytes Frames 950
27.3.33 Tx_512To1023Octets_Frames_Good_Bad : Transmit Octet Count for Good and Bad 512 to 1023 Bytes Frames 950
27.3.34 Tx_1024ToMaxOctets_Frames_Good_Bad : Transmit Octet Count for Good and Bad 1024 to Maxsize Bytes Frames 950
27.3.35 Tx_Unicast_Frames_Good_Bad : Transmit Frame Count for Good and Bad Unicast Frames 951
27.3.36 Tx_Multicast_Frames_Good_Bad : Transmit Frame Count for Good and Bad Multicast Frames 951
27.3.37 Tx_Broadcast_Frames_Good_Bad : Transmit Frame Count for Good and Bad Broadcast Frames 951
27.3.38 Tx_Underflow_Error_Frames : Transmit Frame Count for Underflow Error Frames 951
27.3.39 Tx_Single_Collision_Good_Frames : Transmit Frame Count for Frames Transmitted after Single Collision 952
27.3.40 Tx_Multiple_Collision_Good_Frames : Transmit Frame Count for Frames Transmitted after Multiple Collision 952
27.3.41 Tx_Deferred_Frames : Transmit Frame Count for Deferred Frames 952
27.3.42 Tx_Late_Collision_Frames : Transmit Frame Count for Late Collision Error Frames 953
27.3.43 Tx_Excessive_Collision_Frames : Transmit Frame Count for Excessive Collision Error Frames 953
27.3.44 Tx_Carrier_Error_Frames : Transmit Frame Count for Carrier Sense Error Frames 953
27.3.45 Tx_Octet_Count_Good : Transmit Octet Count for Good Frames 954
27.3.46 Tx_Frame_Count_Good : Transmit Frame Count for Good Frames 954
27.3.47 Tx_Excessive_Deferral_Error : Transmit Frame Count for Excessive Deferral Error Frames 954
27.3.48 Tx_Pause_Frames : Transmit Frame Count for Good PAUSE Frames 954

27.3.49 Tx_VLAN_Frames_Good : Transmit Frame Count for Good VLAN Frames 955
27.3.50 Tx_OSize_Frames_Good : Transmit Frame Count for Good Oversize Frames 955
27.3.51 Rx_Frames_Count_Good_Bad : Receive Frame Count for Good and Bad Frames 955
27.3.52 Rx_Octet_Count_Good_Bad : Receive Octet Count for Good and Bad Frames..... 956
27.3.53 Rx_Octet_Count_Good : Receive Octet Count for Good Frames 956
27.3.54 Rx_Broadcast_Frames_Good : Receive Frame Count for Good Broadcast Frames 956
27.3.55 Rx_Multicast_Frames_Good : Receive Frame Count for Good Multicast Frames 956
27.3.56 Rx_CRC_Error_Frames : Receive Frame Count for CRC Error Frames..... 957
27.3.57 Rx_Alignment_Error_Frames : Receive Frame Count for Alignment Error Frames 957
27.3.58 Rx_Runt_Error_Frames : Receive Frame Count for Runt Error Frames 957
27.3.59 Rx_Jabber_Error_Frames : Receive Frame Count for Jabber Error Frames 957
27.3.60 Rx_Undersize_Frames_Good : Receive Frame Count for Undersize Frames 958
27.3.61 Rx_Oversize_Frames_Good : Receive Frame Count for Oversize Frames 958
27.3.62 Rx_64Octets_Frames_Good_Bad : Receive Frame Count for Good and Bad 64 Byte Frames 958
27.3.63 Rx_65To127Octets_Frames_Good_Bad : Receive Frame Count for Good and Bad 65 to 127 Bytes Frames 959
27.3.64 Rx_128To255Octets_Frames_Good_Bad : Receive Frame Count for Good and Bad 128 to 255 Bytes Frames 959
27.3.65 Rx_256To511Octets_Frames_Good_Bad : Receive Frame Count for Good and Bad 256 to 511 Bytes Frames 959
27.3.66 Rx_512To1023Octets_Frames_Good_Bad : Receive Frame Count for Good and Bad 512 to 1,023 Bytes Frames 960
27.3.67 Rx_1024ToMaxOctets_Frames_Good_Bad : Receive Frame Count for Good and Bad 1,024 to Maxsize Bytes Frames 960
27.3.68 Rx_Unicast_Frames_Good : Receive Frame Count for Good Unicast Frames..... 960
27.3.69 Rx_Length_Error_Frames : Receive Frame Count for Length Error Frames 960
27.3.70 Rx_Out_Of_Range_Type_Frames : Receive Frame Count for Out of Range Frames..... 961
27.3.71 Rx_Pause_Frames : Receive Frame Count for PAUSE Frames 961
27.3.72 Rx_FIFO_Overflow_Frames : Receive Frame Count for FIFO Overflow Frames 961
27.3.73 Rx_VLAN_Frames_Good_Bad : Receive Frame Count for Good and Bad VLAN Frames 962
27.3.74 Rx_Watchdog_Error_Frames : Receive Frame Count for Watchdog Error Frames 962
27.3.75 Rx_Receive_Error_Frames : Receive Frame Count for Receive Error Frames 962
27.3.76 Rx_Control_Frames_Good : Receive Frame Count for Good Control Frames 962
27.3.77 HASH_TABLE_REGn : Hash Table Register n (n = 0 to 7) 963
27.3.78 VLAN_Hash_Table_Reg : VLAN Hash Table Register 963
27.3.79 Timestamp_Control : Timestamp Control Register 963
27.3.80 Sub_Second_Increment : Sub-Second Increment Register 965
27.3.81 System_Time_Seconds : System Time - Seconds Register..... 965
27.3.82 System_Time_Nanoseconds : System Time - Nanoseconds Register..... 966
27.3.83 System_Time_Seconds_Update : System Time - Seconds Update Register..... 966
27.3.84 System_Time_Nanoseconds_Update : System Time - Nanoseconds Update Register..... 966

27.3.85 Timestamp_Addend : Timestamp Addend Register 967
27.3.86 Target_Time_Seconds : Target Time Seconds Register 967
27.3.87 Target_Time_Nanoseconds : Target Time Nanoseconds Register 967
27.3.88 Timestamp_Status : Timestamp Status Register 968
27.3.89 Auxiliary_Timestamp_Nanoseconds : Auxiliary Timestamp – Nanoseconds Register 969
27.3.90 Auxiliary_Timestamp_Seconds : Auxiliary Timestamp - Seconds Register 969
27.3.91 Bus_Mode : Bus Mode Register 969
27.3.92 Transmit_Poll_Demand : Transmit Poll Demand Register 971
27.3.93 Receive_Poll_Demand : Receive Poll Demand Register 971
27.3.94 Receive_Descriptor_List_Address : Receive Descriptor List Address Register 971
27.3.95 Transmit_Descriptor_List_Address : Transmit Descriptor List Address Register 972
27.3.96 Status : Status Register 972
27.3.97 Operation_Mode : Operation Mode Register 975
27.3.98 Interrupt_Enable : Interrupt Enable Register 977
27.3.99 Missed_Frame_And_Buffer_Overflow_Counter : Missed Frame and Buffer Overflow Counter Register 979
27.3.100 Receive_Interrupt_Watchdog_Timer : Receive Interrupt Watchdog Timer Register 979
27.3.101 AXI_Bus_Mode : AXI Bus Mode Register 980
27.3.102 AXI_Status : AXI Status Register 981
27.3.103 Current_Host_Transmit_Descriptor : Current Host Transmit Descriptor Register 981
27.3.104 Current_Host_Receive_Descriptor : Current Host Receive Descriptor Register 981
27.3.105 Current_Host_Transmit_Buffer_Address : Current Host Transmit Buffer Address Register 982
27.3.106 Current_Host_Receive_Buffer_Address : Current Host Receive Buffer Address Register 982
27.3.107 HW_Feature : HW Feature Register 982
27.3.108 GMACTRGSEL : GMAC PTP Trigger Select Register 983
27.3.109 PTP Timer Pulse Control Registers 984
27.4 Operation 987
27.4.1 Initializing 987
27.4.2 Initializing DMA 987
27.4.3 Initializing GMAC 988
27.4.4 Performing Normal Receive and Transmit Operation 988
27.4.5 Stopping and Starting Transmission 989
27.4.6 Programming Guidelines for GMII Link Transitions 989
27.4.7 Programming Guidelines for IEEE 1588 Timestamping 990
27.4.8 System Time Register Module 990
27.4.9 Programming Guidelines for Energy Efficient Ethernet 992
27.4.10 Enhanced Descriptors 993
27.4.11 PTP Pulse Generator 1002
27.5 Usage Notes 1003
27.5.1 Configurations 1003

27.5.2 Restriction 1003
27.5.3 MAC Management Counters 1004
27.5.4 MMC Registers 1005
27.5.5 Power Management Block 1005
27.5.6 DMA Register 1007
27.5.7 MAC Register 1009
27.5.8 IEEE 1588 Timestamp Registers 1012
27.5.9 Known Issue and Workaround 1014

28. EtherCAT Slave Controller (ESC) 1015
28.1 Overview 1015
28.2 Functional Overview 1016
28.3 Description of Registers 1018
28.3.1 ECATOFFADR : EtherCAT PHY Offset Address Setting Register 1018
28.3.2 ECATOPMOD : EtherCAT Operation Mode Register 1019
28.3.3 ECATDBGC : EtherCAT Debug Control Register 1019
28.3.4 ECATTRGSEL : EtherCAT DC Latch Trigger Select Register 1020
28.4 ESC Information Register 1020
28.4.1 TYPE : Type Register 1020
28.4.2 REVISION : Revision Register 1021
28.4.3 BUILD : Build Register 1021
28.4.4 FMMU_NUM : FMMU Supported Register 1021
28.4.5 SYNC_MANAGER : SyncManager Supported Register 1022
28.4.6 RAM_SIZE : RAM Size Register 1022
28.4.7 PORT_DESC : Port Descriptor Register 1022
28.4.8 FEATURE : ESC Features Supported Register 1023
28.5 Station Address Registers 1024
28.5.1 STATION_ADR : Configured Station Address Register 1024
28.5.2 STATION_ALIAS : Configured Station Alias Register 1024
28.6 Write Protection Registers 1024
28.6.1 WR_REG_ENABLE : Write Register Enable Register 1024
28.6.2 WR_REG_PROTECT : Write Register Protection Register 1025
28.6.3 ESC_WR_ENABLE : ESC Write Enable Register 1025
28.6.4 ESC_WR_PROTECT : ESC Write Protection Register 1026
28.7 Data Link Layer Registers 1026
28.7.1 ESC_RESET_ECAT_W : ESC Reset ECAT Register for write 1026
28.7.2 ESC_RESET_ECAT_R : ESC Reset ECAT Register for read 1026
28.7.3 ESC_RESET_PDI_W : ESC Reset PDI Register for write 1027
28.7.4 ESC_RESET_PDI_R : ESC Reset PDI Register for read 1027
28.7.5 ESC_DL_CONTROL : ESC DL Control Register 1028
28.7.6 PHYSICAL_RW_OFFSET : Physical Read/Write Offset Register 1029

28.7.7 ESC_DL_STATUS : ESC DL Status Register 1029
28.8 Application Layer Registers 1031
28.8.1 AL_CONTROL : AL Control Register 1031
28.8.2 AL_STATUS : AL Status Register 1031
28.8.3 AL_STATUS_CODE : AL Status Code Register 1032
28.8.4 RUN_LED_OVERRIDE : RUN LED Override Register 1032
28.8.5 ERR_LED_OVERRIDE : ERR LED Override Register 1033
28.9 PDI Registers 1033
28.9.1 PDI_CONTROL : PDI Control Register 1033
28.9.2 ESC_CONFIG : ESC Configuration Register 1034
28.9.3 PDI_CONFIG : PDI Configuration Register 1034
28.9.4 SYNC_LATCH_CONFIG : SYNC/LATCH PDI Configuration Register 1035
28.9.5 EXT_PDI_CONFIG : Extended PDI Configuration Register 1035
28.10 Interrupt Registers 1036
28.10.1 ECAT_EVENT_MASK : ECAT Event Mask Register 1036
28.10.2 AL_EVENT_MASK : AL Event Mask Register 1036
28.10.3 ECAT_EVENT_REQ : ECAT Event Request Register 1037
28.10.4 AL_EVENT_REQ : AL Event Request Register 1038
28.11 Error Counter Registers 1039
28.11.1 RX_ERR_COUNTn : RX Error Counter n Register (n = 0 to 2) 1039
28.11.2 FWD_RX_ERR_COUNTn : Forwarded RX Error Counter n Register (n = 0 to 2) 1039
28.11.3 ECAT_PROC_ERR_COUNT : ECAT Processing Unit Error Counter Register 1040
28.11.4 PDI_ERR_COUNT : PDI Error Counter Register 1040
28.11.5 LOST_LINK_COUNTn : Lost Link Counter n Register (n = 0 to 2) 1040
28.12 Watchdog Registers 1041
28.12.1 WD_DIVIDE : Watchdog Divider Register 1041
28.12.2 WDT_PDI : Watchdog Time PDI Register 1041
28.12.3 WDT_DATA : Watchdog Time Process Data Register 1042
28.12.4 WDS_DATA : Watchdog Status Process Data Register 1042
28.12.5 WDC_DATA : Watchdog Counter Process Data Register 1042
28.12.6 WDC_PDI : Watchdog Counter PDI Register 1043
28.13 SII EEPROM Interface Registers 1043
28.13.1 EEP_CONF : EEPROM Configuration Register 1043
28.13.2 EEP_STATE : EEPROM PDI Access State Register 1044
28.13.3 EEP_CONT_STAT : EEPROM Control/Status Register 1044
28.13.4 EEP_ADR : EEPROM Address Register 1045
28.13.5 EEP_DATA : EEPROM Data Register 1046
28.14 MII Management Interface Registers 1046
28.14.1 MII_CONT_STAT : MII Management Control/Status Register 1046
28.14.2 PHY_ADR : PHY Address Register 1047

28.14.3 PHY_REG_ADR : PHY Register Address Register 1048
28.14.4 PHY_DATA : PHY Data Register 1048
28.14.5 MII_ECAT_ACS_STAT : MII Management ECAT Access State Register 1048
28.14.6 MII_PDI_ACS_STAT : MII Management PDI Access State Register 1049
28.15 FMMU Registers 1049
28.15.1 FMMUn_L_START_ADR : FMMU Logical Start Address n Register (n = 0 to 7) 1049
28.15.2 FMMUn_LEN : FMMU Length n Register (n = 0 to 7) 1049
28.15.3 FMMUn_L_START_BIT : FMMU Logical Start Bit n Register (n = 0 to 7) 1050
28.15.4 FMMUn_L_STOP_BIT : FMMU Logical Stop Bit n Register (n = 0 to 7) 1050
28.15.5 FMMUn_P_START_ADR : FMMU Physical Start Address n Register (n = 0 to 7) 1050
28.15.6 FMMUn_P_START_BIT : FMMU Physical Start Bit n Register (n = 0 to 7) 1051
28.15.7 FMMUn_TYPE : FMMU Type n Register (n = 0 to 7) 1051
28.15.8 FMMUn_ACT : FMMU Activate n Register (n = 0 to 7) 1052
28.16 SyncManager Registers 1052
28.16.1 SMn_P_START_ADR : SyncManager Physical Start Address n Register (n = 0 to 7) 1052
28.16.2 SMn_LEN : SyncManager Length n Register (n = 0 to 7) 1052
28.16.3 SMn_CONTROL : SyncManager Control n Register (n = 0 to 7) 1053
28.16.4 SMn_STATUS : SyncManager Status n Register (n = 0 to 7) 1053
28.16.5 SMn_ACT : SyncManager Activate n Register (n = 0 to 7) 1054
28.16.6 SMn_PDI_CONT : SyncManager PDI Control n Register (n = 0 to 7) 1055
28.17 Distributed Clock Registers 1055
28.17.1 DC Receive Time Registers 1055
28.17.2 DC Time Loop Control Unit Registers 1056
28.17.3 Cyclic Unit Control Registers 1060
28.17.4 SYNC Output Unit Registers 1061
28.17.5 Latch Input Unit Registers 1065
28.17.6 SyncManager Event Time Registers 1069
28.18 Other Registers 1070
28.18.1 PRODUCT_ID : Product ID Register 1070
28.18.2 VENDOR_ID : Vendor ID Register 1070
28.18.3 USER_RAM : User RAM 1070
28.18.4 DATA_RAM : Process Data RAM 1071
28.18.5 Setting the Module-Stop Function 1072
28.19 Initial Settings 1072
28.20 Configuration of the Reset Circuit 1072
28.21 Usage Notes 1073

29. USB 2.0 Host Module (USBHC) 1074

29.1 Overview 1074
29.1.1 Precautions on the Use of USB Host Controller 1074
29.2 Register Descriptions 1075

29.2.1 OHCI Operational Registers 1075
29.2.2 EHCI Operational Registers 1093
29.2.3 AHB Bridge Registers 1107
29.2.4 Core Defined Registers 1111
29.2.5 UCOM Registers 1112
29.3 Clock Lines 1116
29.3.1 Externally Supplied Clocks 1116
29.4 Interrupts 1116
29.4.1 Interrupt Control Registers 1116
29.4.2 U2H_BIND_INT 1117
29.4.3 Time Required to Clear Interrupt Signals 1118
29.5 Overcurrent Control and VBUS Control 1118
29.5.1 Overcurrent Control 1118
29.5.2 VBUS Control 1119
29.5.3 Initial Settings of PPON1 1120
29.5.4 Procedure for USB_VBUSEN Control for Overcurrent Detection 1121
29.5.5 Procedure for USB_VBUSEN Setting 1121
29.6 Initial Setting Sequence 1122
29.6.1 Sample of Initial Settings 1122
29.7 OTG Control 1123
29.7.1 Port Power (VBUS) Control and Connection with External Power-Supply IC 1123
29.7.2 OTG System Configuration Example 1123
29.7.3 OTG Initial Setting Procedure 1124
29.7.4 A-Device/B-Device Recognition Procedure 1125
29.7.5 Disconnect Detection Procedure 1126
29.7.6 HNP Control Procedure (Conforming to OTG Revision 2.0) 1127
29.7.7 SRP Control Procedure (Conforming to OTG Revision 2.0) 1135

30. USB 2.0 HS Function Module (USBf) 1138

30.1 Overview 1138
30.1.1 Identification of the USB Transfer Speed 1139
30.1.2 Bus Interface 1139
30.1.3 USB Event 1139
30.1.4 USB Data Transfer 1139
30.1.5 DMA Transfer 1140
30.2 Register Descriptions 1140
30.2.1 System Configuration Control 1140
30.2.2 USB Signal Control 1143
30.2.3 Test Mode 1144
30.2.4 FIFO Ports 1145
30.2.5 Enabling Interrupts 1152

30.2.6 SOF Control Register 1154
30.2.7 Interrupt Status 1155
30.2.8 Frame Number Registers 1162
30.2.9 USB Address 1163
30.2.10 USB Request Registers 1163
30.2.11 DCP Configuration 1165
30.2.12 Pipe Configuration Register 1168
30.2.13 Pipe Control Registers 1176
30.2.14 Transaction Counters 1182
30.2.15 Next Register Set 1184
30.2.16 Current Register Set 1185
30.2.17 Channel Register Set 1187
30.2.18 Link Register Set 1198
30.2.19 Skip Register Set 1198
30.2.20 DMA Register Set 1202
30.3 Operation 1205
30.3.1 System Controls and Oscillation Controls 1205
30.3.2 Resets 1206
30.3.3 USB Data Bus Resistor Controller 1206
30.3.4 Notes on Stopping Clocks 1207
30.4 Interrupt Functions 1207
30.4.1 Overview of Interrupt Functions 1207
30.4.2 Device State Transition Interrupt 1209
30.4.3 Control Transfer Stage Transition Interrupt 1210
30.5 Pipe Control 1211
30.5.1 Maximum Packet Size Setting 1212
30.5.2 Response PID 1213
30.5.3 Pipe Control Register Switching Procedures 1213
30.5.4 Data PID Sequence Bit 1214
30.6 FIFO Buffers 1214
30.6.1 FIFO Buffer Allocation 1214
30.6.2 Clearing FIFO Buffers 1215
30.7 FIFO Port Function 1215
30.7.1 FIFO Port Selection 1216
30.7.2 DxFIFO Automatic Clear Mode (DxFIFO Port Read Direction) 1217
30.7.3 BRDY Interrupt Timing Selection 1217
30.8 Control Transfer (DCP) 1218
30.8.1 Setup Stage 1218
30.8.2 Data Stage 1218
30.8.3 Status Stage 1218

30.8.4 Control Transfer Automatic Response 1219
30.9 Bulk Transfer (Pipes 1 to 5) 1219
30.9.1 NYET Handshake Control 1219
30.10 Interrupt Transfer (Pipes 6 to 9) 1219
30.11 Isochronous Transfer (Pipes 1 and 2) 1220
30.11.1 Isochronous Transfer Error Detection 1220
30.11.2 DATA-PID 1220
30.11.3 Interval Counter 1221
30.11.4 Isochronous Transfer Transmission Data Setup 1222
30.11.5 Isochronous Transfer Transmission Buffer Flush 1223
30.12 SOF Interpolation 1224
30.13 Link Power Management Processing 1224
30.13.1 Descriptor 1225
30.13.2 Basic Processing 1225
30.13.3 HIRD Value Negotiation 1225
30.14 DMA Mode 1226
30.14.1 Register Mode/Link Mode 1226
30.15 DMA Transfer 1240
30.15.1 Transfer Mode 1240
30.15.2 DMA Channel Priority Control 1240
30.15.3 Forced Ejection Request 1242
30.15.4 DMA Transfer Completion Interrupt (USB_FDMAn) 1242
30.15.5 DMA Error Interrupt (USB_FDMAERR) 1243
30.15.6 Interval Count Function 1243
30.15.7 Differences in Operation According to the Transfer Data Size 1244
30.15.8 Transfer Status 1246
30.16 Access Type 1248
30.16.1 AHB Master DMA Transfer Combinations 1248

31. Serial Communications Interface (SCI) 1251

31.1 Overview 1251
31.2 Register Descriptions 1254
31.2.1 RSR : Receive Shift Register 1255
31.2.2 RDR : Receive Data Register 1255
31.2.3 TDR : Transmit Data Register 1256
31.2.4 TSR : Transmit Shift Register 1257
31.2.5 CCR0 : Common Control Register 0 1257
31.2.6 CCR1 : Common Control Register 1 1260
31.2.7 CCR2 : Common Control Register 2 1263
31.2.8 CCR3 : Common Control Register 3 1269
31.2.9 CCR4 : Common Control Register 4 1273

31.2.10 ICR : Simple I2C Control Register 1275
31.2.11 FCR : FIFO Control Register 1277
31.2.12 DCR : Driver Control Register 1279
31.2.13 CSR : Common Status Register 1280
31.2.14 ISR : Simple I2C Status Register 1285
31.2.15 FRSR : FIFO Receive Status Register 1286
31.2.16 FTSR : FIFO Transmit Status Register 1287
31.2.17 CFCLR : Common Flag Clear Register 1288
31.2.18 ICFCLR : Simple I2C Flag Clear Register 1289
31.2.19 FFCLR : FIFO Flag Clear Register 1289
31.3 Asynchronous Mode 1289
31.3.1 Serial Data Transfer Format 1290
31.3.2 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode 1291
31.3.3 Clock 1292
31.3.4 Double-Speed Operation and frequency of 6 times the bit rate 1293
31.3.5 CTS and RTS Function 1293
31.3.6 Address Match (receive data match detection) Function 1293
31.3.7 SCI Initialization (Asynchronous Mode) 1296
31.3.8 Serial Data Transmission (Asynchronous Mode) 1299
31.3.9 Serial Data Reception (Asynchronous Mode) 1305
31.3.10 The function of adjust receive sampling timing (Asynchronous Mode) 1311
31.3.11 The function of adjust transmit timing (Asynchronous Mode) 1315
31.4 Multi-Processor Communication Function 1319
31.4.1 Multi-Processor Serial Data Transmission 1320
31.4.2 Multi-Processor Serial Data Reception 1323
31.5 Smart Card Interface Mode 1329
31.5.1 Sample Connection 1329
31.5.2 Data Format (Except in Block Transfer Mode) 1330
31.5.3 Block Transfer Mode 1332
31.5.4 Receive Data Sampling Timing and Reception Margin 1332
31.5.5 Initialization of SCI (Smart Card Interface Mode) 1333
31.5.6 Serial Data Transmission (Except in Block Transfer Mode) 1335
31.5.7 Serial Data Reception (Except in Block Transfer Mode) 1337
31.5.8 Clock Output Control 1339
31.6 Simple I2C mode 1340
31.6.1 Generation of Start, Restart, and Stop Conditions 1341
31.6.2 Clock Synchronization 1342
31.6.3 SDA Output Delay 1343
31.6.4 SCI Initialization (Simple I2C mode) 1344
31.6.5 Operation in Master Transmission (Simple I2C mode) 1345

31.6.6 Master Reception (Simple I2C mode) 1349
31.7 Clock Synchronous Mode 1352
31.7.1 Clock 1353
31.7.2 CTS and RTS Functions 1353
31.7.3 Initializing the SCI (Clock Synchronous Mode) 1354
31.7.4 Serial Data Transmission (Clock Synchronous Mode) 1355
31.7.5 Serial Data Reception (Clock Synchronous Mode) 1359
31.7.6 Serial Data Transmission and Reception (Clock Synchronous Mode) 1363
31.7.7 Reception Sampling Timing Adjustment Function in Clock Synchronous Mode with Internal Clock Used 1365
31.8 Simple-SPI Mode 1366
31.8.1 Pin Status in Master and Slave Mode 1367
31.8.2 SS Function in Master Mode 1367
31.8.3 SS Function in Slave Mode 1368
31.8.4 Relationship between Clock and Transmit/Receive Data 1368
31.8.5 SCI Initialization in Simple-SPI Mode 1369
31.8.6 Serial Data Transmission and Reception in Simple-SPI Mode 1369
31.8.7 Reception Sampling Timing Adjustment Function in Simple-SPI Mode with Internal Clock Used 1370
31.9 Bit Rate Modulation Function 1370
31.10 Noise Cancellation Function 1370
31.11 RS-485 Driver Control Function 1371
31.12 Loopback Function 1372
31.13 Half-Duplex communication Function 1373
31.14 Synchronizer Bypass Function 1373
31.15 Interrupt signal 1374
31.15.1 Buffer Operations for TXI and RXI interrupts 1375
31.15.2 Interrupt in Asynchronous Mode, Clock Synchronous Mode, and Simple-SPI Mode 1375
31.15.3 Interrupt in Smart Card Interface Mode 1376
31.15.4 Interrupts in Simple-I2C Mode 1377
31.16 Usage Notes 1378
31.16.1 SCI Operations during Low Power Consumption State 1378
31.16.2 Break Detection and Processing 1382
31.16.3 Mark State and Production of Breaks 1383
31.16.4 Receive Error Flags and Transmit Operations (Clock Synchronous Mode and Simple SPI Mode) 1383
31.16.5 Writing Data to TDR (Transmit FIFO) 1383
31.16.6 Restrictions on Clock Synchronous Transmission (Clock Synchronous Mode and Simple SPI Mode) 1383
31.16.7 Notes on Starting Transfer 1384
31.16.8 Limitations on Simple SPI Mode 1385

31.16.9 Notes on Transmit Enable bit (TE) 1385
31.16.10 Notes on RS-485 Driver Control function 1386
31.16.11 Notes on Loopback function 1386
31.16.12 Notes Regarding Register Access When Operation Clock (PCLKSCIn) Is Slower Than Bus Clock (PCLKM) 1386
31.16.13 Notes on interrupting operation 1386
31.16.14 Notes on communication mode transition 1386

32. I2C Bus Interface (IIC) 1387

32.1 Overview 1387
32.2 Register Descriptions 1390
32.2.1 ICCR1 : I2C Bus Control Register 1 1390
32.2.2 ICCR2 : I2C Bus Control Register 2 1392
32.2.3 ICMR1 : I2C Bus Mode Register 1 1395
32.2.4 ICMR2 : I2C Bus Mode Register 2 1395
32.2.5 ICMR3 : I2C Bus Mode Register 3 1397
32.2.6 ICFER : I2C Bus Function Enable Register 1399
32.2.7 ICSER : I2C Bus Status Enable Register 1400
32.2.8 ICIER : I2C Bus Interrupt Enable Register 1401
32.2.9 ICSR1 : I2C Bus Status Register 1 1402
32.2.10 ICSR2 : I2C Bus Status Register 2 1405
32.2.11 SARLy : Slave Address Register L y (y = 0 to 2) 1408
32.2.12 SARUy : Slave Address Register U y (y = 0 to 2) 1408
32.2.13 ICBRL : I2C Bus Bit Rate Low-Level Register 1409
32.2.14 ICBRH : I2C Bus Bit Rate High-Level Register 1410
32.2.15 ICDRT : I2C Bus Transmit Data Register 1411
32.2.16 ICDRR : I2C Bus Receive Data Register 1411
32.2.17 ICDRS : I2C Bus Shift Register 1412
32.3 Operation 1412
32.3.1 Communication Data Format 1412
32.3.2 Initial Settings 1413
32.3.3 Master Transmit Operation 1414
32.3.4 Master Receive Operation 1418
32.3.5 Slave Transmit Operation 1423
32.3.6 Slave Receive Operation 1425
32.4 SCL Synchronization Circuit 1427
32.5 SDA Output Delay Function 1428
32.6 Digital Noise Filter Circuits 1429
32.7 Address Match Detection 1430
32.7.1 Slave-Address Match Detection 1430

32.7.2 Detection of General Call Address ... 1432
32.7.3 Device ID Address Detection ... 1433
32.7.4 Host Address Detection ... 1434
32.8 Automatic Low-Hold Function for SCL ... 1435
32.8.1 Function to Prevent Wrong Transmission of Transmit Data ... 1435
32.8.2 NACK Reception Transfer Suspension Function ... 1436
32.8.3 Function to Prevent Failure to Receive Data ... 1437
32.9 Arbitration-Lost Detection Functions ... 1438
32.9.1 Master Arbitration-Lost Detection (MALE Bit) ... 1438
32.9.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit) ... 1440
32.9.3 Slave Arbitration-Lost Detection (SALE Bit) ... 1441
32.10 Start, Restart, and Stop Condition Issuing Function ... 1442
32.10.1 Issuing a Start Condition ... 1442
32.10.2 Issuing a Restart Condition ... 1442
32.10.3 Issuing a Stop Condition ... 1444
32.11 Bus Hanging ... 1444
32.11.1 Timeout Function ... 1444
32.11.2 Extra SCL Clock Cycle Output Function ... 1445
32.11.3 IIC Reset and Internal Reset ... 1446
32.12 SMBus Operation ... 1446
32.12.1 SMBus Timeout Measurement ... 1447
32.12.2 Packet Error Code (PEC) ... 1448
32.12.3 SMBus Host Notification Protocol (Notify ARP Master Command) ... 1448
32.13 Interrupt Sources ... 1448
32.14 Resets, Registers, and Function States When Issuing Each Condition ... 1449
32.15 Usage Notes ... 1450
32.15.1 Settings for the Module-Stop Function ... 1450

33. CAN-FD Interface (CANFD) ... 1451

33.1 Overview ... 1451
33.2 Register Descriptions ... 1454
33.2.1 CFDCnNCFG : Channel n Nominal Bit Rate Configuration Register (n = 0, 1) ... 1454
33.2.2 CFDCnCTR : Channel n Control Register (n = 0, 1) ... 1455
33.2.3 CFDCnSTS : Channel n Status Register (n = 0, 1) ... 1459
33.2.4 CFDCnERFL : Channel n Error Flag Register (n = 0, 1) ... 1462
33.2.5 CFDCnDCFG : Channel n Data Bit Rate Configuration Register (n = 0, 1) ... 1467
33.2.6 CFDCnFDCFG : Channel n CAN-FD Configuration Register (n = 0, 1) ... 1468
33.2.7 CFDCnFDCTR : Channel n CAN-FD Control Register (n = 0, 1) ... 1472
33.2.8 CFDCnFDSTS : Channel n CAN-FD Status Register (n = 0, 1) ... 1473
33.2.9 CFDCnFDCRC : Channel n CAN-FD CRC Register (n = 0, 1) ... 1475
33.2.10 CFDGIPV : Global IP Version Register ... 1475

33.2.11 CFDGCFG : Global Configuration Register 1476
33.2.12 CFDGCTR : Global Control Register 1478
33.2.13 CFDGSTS : Global Status Register 1480
33.2.14 CFDGERFL : Global Error Flag Register 1481
33.2.15 CFDGTINTSTS0 : Global TX Interrupt Status Register 0 1483
33.2.16 CFDGTSC : Global Timestamp Counter Register 1486
33.2.17 CFDGAFLECTR : Global Acceptance Filter List Entry Control Register 1486
33.2.18 CFDGAFLCFG0 : Global Acceptance Filter List Configuration Register 0 1487
33.2.19 CFDGAFLIDn : Global Acceptance Filter List ID Register n (n = 1 to 16) 1488
33.2.20 CFDGAFLMn : Global Acceptance Filter List Mask Register n (n = 1 to 16) 1489
33.2.21 CFDGAFLP0n : Global Acceptance Filter List Pointer 0 Register n (n = 1 to 16) 1490
33.2.22 CFDGAFLP1n : Global Acceptance Filter List Pointer 1 Register n (n = 1 to 16) 1492
33.2.23 CFDRMNB : RX Message Buffer Number Register 1494
33.2.24 CFDRMND0 : RX Message Buffer New Data Register 0 1495
33.2.25 CFDRFCCn : RX FIFO Configuration/Control Register n (n = 0 to 7) 1496
33.2.26 CFDRFSTSn : RX FIFO Status Register n (n = 0 to 7) 1498
33.2.27 CFDRFPCTRn : RX FIFO Pointer Control Register n (n = 0 to 7) 1499
33.2.28 CFDCFCCn : Common FIFO Configuration/Control Register n (n = 0 to 5) 1500
33.2.29 CFDCFCCEn : Common FIFO Configuration/Control Enhancement Register n (n = 0 to 5) 1503
33.2.30 CFDCFSTSn : Common FIFO Status Register n (n = 0 to 5) 1504
33.2.31 CFDCFPCTRn : Common FIFO Pointer Control Register n (n = 0 to 5) 1508
33.2.32 CFDFESTS : FIFO Empty Status Register 1509
33.2.33 CFDFFSTS : FIFO Full Status Register 1509
33.2.34 CFDFMSTS : FIFO Message Lost Status Register 1510
33.2.35 CFDRFISTS : RX FIFO Interrupt Flag Status Register 1510
33.2.36 CFDCFRISTS : Common FIFO RX Interrupt Flag Status Register 1511
33.2.37 CFDCFTISTS : Common FIFO TX Interrupt Flag Status Register 1512
33.2.38 CFDFFFSTS : FIFO FDC Full Status Register 1512
33.2.39 CFDCFMOWSTS : Common FIFO Message Overwrite Status Register 1513
33.2.40 CFDCFOFRISTS : Common FIFO One Frame RX Interrupt Flag Status Register 1513
33.2.41 CFDCFOFTISTS : Common FIFO One Frame TX Interrupt Flag Status Register 1514
33.2.42 CFDCDTCT : DMA Transfer Control Register 1514
33.2.43 CFDCDTSTS : DMA Transfer Status Register 1515
33.2.44 CFDCDTTCT : DMA TX Transfer Control Register 1517
33.2.45 CFDCDTTSTS : DMA TX Transfer Status Register 1518
33.2.46 CFDGRINTSTSn : Global RX Interrupt Status Register n (n = 0, 1) 1519
33.2.47 CFDTMCn : TX Message Buffer Control Register n (n = 0 to 127) 1521
33.2.48 CFDTMSTSn : TX Message Buffer Status Register n (n = 0 to 127) 1522
33.2.49 CFDTMTRSTSf : TX Message Buffer Transmission Request Status Register f (f = 0 to 3) 1523

33.2.50 CFDTMTARSTSf : TX Message Buffer Transmission Abort Request Status Register f (f = 0 to 3) 1524
33.2.51 CFDTMTCSTSf : TX Message Buffer Transmission Completion Status Register f (f = 0 to 3) 1525
33.2.52 CFDTMTASTSf : TX Message Buffer Transmission Abort Status Register f (f = 0 to 3) 1526
33.2.53 CFDTMIECf : TX Message Buffer Transmission Interrupt Enable Register f (f = 0 to 3) 1527
33.2.54 CFDTXQCC0n : TX Queue Configuration/Control Register 0n (n = 0, 1) 1528
33.2.55 CFDTXQCC1n : TX Queue Configuration/Control Register 1n (n = 0, 1) 1530
33.2.56 CFDTXQCC2n : TX Queue Configuration/Control Register 2n (n = 0, 1) 1533
33.2.57 CFDTXQCC3n : TX Queue Configuration/Control Register 3n (n = 0, 1) 1535
33.2.58 CFDTXQSTS0n : TX Queue Status Register 0n (n = 0, 1) 1537
33.2.59 CFDTXQSTS1n : TX Queue Status Register 1n (n = 0, 1) 1540
33.2.60 CFDTXQSTS2n : TX Queue Status Register 2n (n = 0, 1) 1543
33.2.61 CFDTXQSTS3n : TX Queue Status Register 3n (n = 0, 1) 1545
33.2.62 CFDTXQPCTR0n : TX Queue Pointer Control Register 0n (n = 0, 1) 1547
33.2.63 CFDTXQPCTR1n : TX Queue Pointer Control Register 1n (n = 0, 1) 1548
33.2.64 CFDTXQPCTR2n : TX Queue Pointer Control Register 2n (n = 0, 1) 1548
33.2.65 CFDTXQPCTR3n : TX Queue Pointer Control Register 3n (n = 0, 1) 1549
33.2.66 CFDTXQESTS : TX Queue Empty Status Register 1549
33.2.67 CFDTXQFISTS : TX Queue Full Interrupt Status Register 1550
33.2.68 CFDTXQMSTS : TX Queue Message Lost Status Register 1551
33.2.69 CFDTXQISTS : TX Queue Interrupt Status Register 1551
33.2.70 CFDTXQOFTISTS : TX Queue One Frame TX Interrupt Status Register 1552
33.2.71 CFDTXQOFRISTS : TX Queue One Frame RX Interrupt Status Register 1553
33.2.72 CFDTXQFSTS : TX Queue Full Status Register 1554
33.2.73 CFDTHLCCn : TX History List Configuration/Control Register n (n = 0, 1) 1554
33.2.74 CFDTHLSTSn : TX History List Status Register n (n = 0, 1) 1556
33.2.75 CFDTHLACC0n : Channel n TX History List Access Register 0 (n = 0, 1) 1557
33.2.76 CFDTHLACC1n : Channel n TX History List Access Register 1 (n = 0, 1) 1558
33.2.77 CFDTHLPCTRn : TX History List Pointer Control Register n (n = 0, 1) 1559
33.2.78 CFDGRSTC : Global Reset Control Register 1559
33.2.79 CFDGFCMC : Global Flexible CAN Mode Configuration Register 1560
33.2.80 CFDGFTBAC : Global Flexible Transmission Buffer Assignment Configuration Register 1560
33.2.81 CFDGTSTCFG : Global Test Configuration Register 1561
33.2.82 CFDGTSTCTR : Global Test Control Register 1562
33.2.83 CFDGFDCFG : Global FD Configuration Register 1563
33.2.84 CFDGLOCKK : Global Lock Key Register 1563
33.2.85 CFDRPGACCn : RAM Test Page Access Register n (n = 0 to 63) 1564
33.2.86 CFDCnBLCT : Channel n Bus Load Control Register (n = 0, 1) 1564
33.2.87 CFDCnBLSTS : Channel n Bus Load Status Register (n = 0, 1) 1565
33.2.88 Identifier Bits Alignment 1565

33.2.89 Message Buffer Component Structure 1566
33.3 Operation 1580
33.3.1 Overview 1580
33.3.2 Global Modes 1581
33.3.3 Channel Modes 1587
33.3.4 Global Mode and Channel Mode Transition Interactions 1592
33.4 Initialization 1594
33.4.1 Initialization of CAN Clock, Bit Timing and Baud Rate 1594
33.4.2 CAN Module Configuration after Hardware Reset 1601
33.5 Acceptance Filtering Function using Global Acceptance Filter List (AFL) 1603
33.5.1 Overview 1603
33.5.2 Allocation of AFL Entries to each CAN Channel 1604
33.5.3 AFL Entry Description 1604
33.5.4 Entering Entries in the AFL 1606
33.5.5 Loopback Modes 1609
33.5.6 IDE Masking 1609
33.6 FIFO Buffers and Normal Message Buffer Configuration 1610
33.6.1 Normal RX Message Buffers 1611
33.6.2 FIFO Buffer 1611
33.7 Interrupt and DMA 1616
33.7.1 Interrupts 1616
33.7.2 DMA Transfer 1619
33.8 Reception and Transmission 1622
33.8.1 Reception 1622
33.8.2 Transmission 1628
33.9 Test Mode 1648
33.9.1 Channel Specific Test Modes 1648
33.9.2 Global Test Modes 1651
33.10 Bus Traffic Measurement 1656
33.10.1 How to count the CAN Bus Idle Time 1656
33.10.2 Operations and Measurement Procedure 1656
33.11 Flexible CAN Mode 1657
33.12 Flexible Transmission Buffer Assignment 1658
34. Serial Peripheral Interface (SPI) 1663
34.1 Overview 1663
34.1.1 Features 1663
34.2 Register Descriptions 1666
34.2.1 SPDR/SPDR_HA/SPDR_BY : SPI Data Register 1666
34.2.2 SPCKD : SPI Clock Delay Register 1668
34.2.3 SSLND : SPI Slave Select Negation Delay Register 1669

34.2.4 SPND : SPI Next-Access Delay Register 1670
34.2.5 MRCKD : SPI ClocK Digital control Register for Master Receive 1670
34.2.6 SPCR : SPI Control Register 1671
34.2.7 SPCRRM : SPI Control Register for Master Receive only 1676
34.2.8 SPDRCR : SPI Control Register for Received Data Ready Detection 1677
34.2.9 SPPCR : SPI Pin Control Register 1678
34.2.10 SPCR2 : SPI Control Register 2 1679
34.2.11 SSLP : SPI Slave Select Polarity Register 1679
34.2.12 SPBR : SPI Bit Rate Register 1680
34.2.13 SPSCR : SPI Sequence Control Register 1681
34.2.14 SPCMDm : SPI Command Register m (m = 0 to 7) 1682
34.2.15 SPDCR : SPI Data Control Register 1684
34.2.16 SPDCR2 : SPI Data Control Register 2 1686
34.2.17 SPSSR : SPI Sequence Status Register 1686
34.2.18 SPSR : SPI Status Register 1687
34.2.19 SPTFSR : SPI Transfer FIFO Status Register 1693
34.2.20 SPRFSR : SPI Receive FIFO Status Register 1693
34.2.21 SPPSR : SPI Poling Register 1694
34.2.22 SPSRC : SPI Status Clear Register 1694
34.2.23 SPFCR : SPI FIFO Clear Register 1695
34.3 Operation 1695
34.3.1 Overview of SPI Operations 1695
34.3.2 SPI Pin Control 1696
34.3.3 SPI System Configuration Examples 1697
34.3.4 Data Format 1703
34.3.5 Transfer Format (Frame Format) 1716
34.3.6 Communications Operating Mode 1718
34.3.7 Transmission Buffer Empty/Receive Buffer Full Interrupt 1721
34.3.8 Idle Interrupt 1722
34.3.9 Communication End Interrupt 1724
34.3.10 Error Detection 1733
34.3.11 Received Data Ready Detection 1739
34.3.12 SPI Initialization 1739
34.3.13 SPI Operation 1740
34.3.14 Clock Synchronous Operation 1759
34.3.15 Loopback Mode 1765
34.3.16 Self-Diagnosis of Parity Function 1766
34.3.17 Interrupt Requests 1767
34.4 Usage Notes 1768
34.4.1 Notes on Communication Start 1768

34.4.2 Notes on the Module-Stop Function ... 1768
34.4.3 Notes on SPRF and SPTEF Flags ... 1768
34.4.4 Notes on Receive Sampling Function ... 1768
34.4.5 Notes on Burst Transfer in Master Mode ... 1768
34.4.6 Notes on TI-SSP in Slave Mode ... 1768
34.4.7 Notes at SPE = 1 ... 1769

35. Expanded Serial Peripheral Interface (xSPI) ... 1771
35.1 Overview ... 1771
35.2 Register Descriptions ... 1772
35.2.1 xSPI Configuration Registers ... 1772
35.2.2 xSPI Control Registers ... 1778
35.2.3 xSPI Status Registers ... 1792
35.2.4 xSPI Interrupt Registers ... 1794
35.3 Operation ... 1798
35.3.1 xSPI Bus ... 1798
35.3.2 Manual-command ... 1808
35.3.3 Memory-mapping ... 1809
35.3.4 Pattern Control ... 1814
35.3.5 Integrity Checking ... 1816
35.3.6 Interrupts ... 1816
35.3.7 Flows of Operations ... 1817
35.3.8 Usage Notes ... 1824

36. CRC Operation Unit (CRC) ... 1825
36.1 Overview ... 1825
36.2 Register Descriptions ... 1826
36.2.1 CRCCR0 : CRC Control Register 0 ... 1826
36.2.2 CRCDIR/CRCDIR_BY : CRC Data Input Register ... 1826
36.2.3 CRCDOR/CRCDOR_HA/CRCDOR_BY : CRC Data Output Register ... 1827
36.3 Operation ... 1827
36.4 Usage Notes ... 1830
36.4.1 Module-Stop Function Setting ... 1830
36.4.2 Note on Transmission ... 1830

37. Boundary Scan ... 1832
37.1 Overview ... 1832
37.2 Register Descriptions ... 1833
37.2.1 JTIR : Instruction Register ... 1833
37.2.2 JTIDR : ID Code Register ... 1834
37.2.3 JTBPR : Bypass Register ... 1834
37.2.4 JTBSR : Boundary Scan Register ... 1834

37.3 Operation 1834
37.3.1 TAP Controller 1834
37.3.2 List of Commands 1836
37.4 Usage Notes 1837
38. ΔΣ Interface (DSMIF) 1838
38.1 Overview 1838
38.2 Register Descriptions 1841
38.2.1 DSMIF Common Control Registers 1841
38.2.2 DSMIF Channel Control Registers 1859
38.3 Operation 1875
38.3.1 Start Flow 1875
38.3.2 Normal Processing Flow 1876
38.3.3 Stop Flow 1877
38.3.4 Error Flow 1879
38.3.5 Clock Specification 1880
38.3.6 Channel Start and Channel Stop 1881
38.3.7 Channel Synchronization 1881
38.3.8 Data Input Control 1881
38.3.9 Sinc Filter 1881
38.3.10 Available Settings of Sinc Filter 1882
38.3.11 Current Measurement Data Processing 1885
38.3.12 Short-circuit Detection 1885
38.3.13 Overcurrent Detection 1885
38.3.14 Overcurrent Sum Error Detection 1887
38.3.15 Settling Time 1888
38.3.16 Common Interrupt 1888
39. 12-Bit A/D converter (ADC12) 1890
39.1 Overview 1890
39.2 Register Descriptions 1894
39.2.1 ADCSR : A/D Control Register 1894
39.2.2 ADANSA0 : A/D Channel Select Register A0 1895
39.2.3 ADADS0 : A/D-Converted Value Addition/Average Function Channel Select Register 0 1895
39.2.4 ADADC : A/D-Converted Value Addition/Average Count Select Register 1896
39.2.5 ADCER : A/D Control Extended Register 1896
39.2.6 ADSTRGR : A/D Conversion Start Trigger Select Register 1897
39.2.7 ADANSB0 : A/D Channel Select Register B0 1899
39.2.8 ADDBLDR : A/D Data Duplication Register 1899
39.2.9 ADDRn : A/D Data Register n (n = 0 to 3) 1900
39.2.10 ADSHCR : A/D Sample and Hold Control Register 1900

39.2.11 ADELCCR : A/D Event Link Control Register 1901
39.2.12 ADGSPCR : A/D Group Scan Priority Control Register 1901
39.2.13 ADDBLDRA : A/D Data Duplication Register A 1902
39.2.14 ADDBLDRB : A/D Data Duplication Register B 1902
39.2.15 ADWINMON : A/D Compare Function Window A/B Status Monitoring Register 1903
39.2.16 ADCMPCR : A/D Compare Function Control Register 1903
39.2.17 ADCMPANSR0 : A/D Compare Function Window A Channel Select Register 0 1904
39.2.18 ADCMPLR0 : A/D Compare Function Window A Comparison Condition Setting Register 0 1904
39.2.19 ADCMPDR0 : A/D Comparison Function Window A Lower Level Setting Register 1905
39.2.20 ADCMPDR1 : AD Comparison Function Window A Upper Level Setting Register 1905
39.2.21 ADCMPSR0 : A/D Comparison Function Window A Channel Status Register 0 1905
39.2.22 ADWINLLB : A/D Compare Function Window B Lower-Side Level Setting Register 1906
39.2.23 ADWINULB : A/D Compare Function Window B Upper-Side Level Setting Register 1906
39.2.24 ADCMPBSR : A/D Compare Function Window B Status Register 1906
39.2.25 ADCMPBNSR : A/D Compare Function Window B Channel Select Register 1907
39.2.26 ADANSC0 : A/D Channel Select Register C0 1907
39.2.27 ADGCTRGR : A/D Group C Trigger Select Register 1908
39.2.28 ADSSTRn : A/D Sampling State Register n (n = 0 to 3) 1909
39.3 Operation 1909
39.3.1 Scanning Operation 1909
39.3.2 Single Scan Mode 1910
39.3.3 Continuous Scan Mode 1913
39.3.4 Group Scan Mode 1915
39.3.5 Compare Function (Window A, Window B) 1921
39.3.6 A/D Data Register Automatic Clearing Function 1924
39.3.7 A/D-converted Value Addition/Average Function 1925
39.3.8 Starting A/D Conversion with Asynchronous Trigger 1925
39.3.9 Starting A/D Conversion with Synchronous Trigger from Peripheral Module 1925
39.3.10 Event Link Function 1925
39.4 Usage Notes 1926
39.4.1 Notes on Reading Data Registers 1926
39.4.2 Notes on Stopping A/D Conversion 1926
39.4.3 A/D conversion forced stop and operation timing at starts 1928
39.4.4 Notes on Scan End Interrupt Processing 1928
39.4.5 Module-Stop Function Setting 1928
39.4.6 Notes on Entering Low Power Consumption States 1928
40. Temperature Sensor Unit (TSU) 1929
40.1 Overview 1929
40.2 Register Descriptions 1929

40.2.1 TSUSM : Sensor Mode Register 1929
40.2.2 TSUST : Sensor Trigger Register 1930
40.2.3 TSUSCS : Sensor Configuration Setting Register 1930
40.2.4 TSUSAD : Sensor ADC Data Register 1930
40.2.5 TSUSS : Sensor Status Register 1931
40.3 Operation 1931
40.3.1 Startup Sequence 1931
40.3.2 Stop Sequence 1931
40.3.3 A/D Start and Stop Timing 1932
40.3.4 A/D Output Data Store Timing 1932
40.3.5 A/D Conversion Status (CONV) 1932
40.3.6 Using the Temperature Sensor 1933
41. Data Operation Circuit (DOC) 1935
41.1 Overview 1935
41.2 Register Descriptions 1936
41.2.1 DOCR : DOC Control Register 1936
41.2.2 DODIR : DOC Data Input Register 1936
41.2.3 DODSR : DOC Data Setting Register 1937
41.3 Operation 1937
41.3.1 Data Comparison Mode 1937
41.3.2 Data Addition Mode 1937
41.3.3 Data Subtraction Mode 1938
41.4 Interrupt Requests 1939
41.5 Usage Note 1939
41.5.1 Module Stop Function Setting 1939
42. System SRAM (SYSRAM) 1940
42.1 Overview 1940
42.2 Register Descriptions 1941
42.2.1 SYSRAM_CTRLn : System SRAM Control Register n (n = 0, 1) 1941
42.2.2 Wn_EC710CTL : ECC Control Register n (n = 0 to 3) 1942
42.2.3 Wn_EC710TMC : ECC Test Mode Control Register n (n = 0 to 3) 1944
42.2.4 Wn_EC710TRC : ECC Redundancy Bit Data Control Test Register n (n = 0 to 3) 1945
42.2.5 Wn_EC710TED : ECC Encode/Decode Input/Output Switchover Test Register n (n = 0 to 3) 1946
42.2.6 Wn_EC710EADm : ECC Error Address m Register n (n = 0 to 3, m = 0 to 7) 1946
42.3 Operation 1947
42.3.1 Initialization 1947
42.3.2 Access Cycle to System SRAM with ECC Function Enabled 1947
42.3.3 ECC Error Address Calculation Method 1947
42.3.4 Notes on ECC Error Address Register 1947

42.3.5 Notes on ECC Error Detection 1947
42.3.6 Test Function (Error Injection) 1949
42.3.7 Interrupt 1950
42.4 Usage Notes 1950
42.4.1 Release of Register Write Protection 1950
42.4.2 Note on Setting the Register 1950
42.4.3 Access in Bit Size Units 1950
43. One-Time Programmable Memory (OTP) 1951
43.1 Overview 1951
43.2 Register Descriptions 1951
43.2.1 OTPPWR : OTP Power Control Register 1951
43.2.2 OTPSTR : OTP Access Status Register 1952
43.2.3 OTPSTAWR : OTP Write Command Register 1953
43.2.4 OTPADRWR : OTP Write Address Register 1953
43.2.5 OTPDATAWR : OTP Write Data Register 1954
43.2.6 OTPADRRD : OTP Read Address Register 1954
43.2.7 OTPDATARD : OTP Read Data Register 1954
43.3 OTP Memory Map 1955
43.3.1 Unique ID (UID) 1955
43.3.2 JTAG Authentication Mode (AUTHMODEJ) 1956
43.3.3 JTAG Authentication Level 1 Plaintext ID (JID1P) 1956
43.3.4 JTAG Authentication Level 2 Plaintext ID (JID2P) 1956
43.3.5 SCI/USB Boot Mode Disable (SUDIS) 1957
43.3.6 Anti-rollback Counter (ARBC) 1957
43.3.7 Part Number (PN) 1958
43.3.8 Product Version (VER) 1958
43.3.9 SHOSTIF Boot Mode Setting (SHBMS) 1958
43.3.10 User Area (USERAREA) 1959
43.4 Operation 1959
43.4.1 Write procedure 1959
43.4.2 Read procedure 1960
44. Serial Host Interface (SHOSTIF) 1961
44.1 Overview 1961
44.2 Register Descriptions 1962
44.2.1 CTRLR0 : Control Register 0 1962
44.2.2 ENR : Enable Register 1963
44.2.3 RXFBTR : Receive FIFO Burst Threshold Register 1963
44.2.4 TXFTLR : Transmit FIFO Threshold Level Register 1964
44.2.5 RXFTLR : Receive FIFO Threshold Level Register 1964

44.2.6 SR : Status Register 1965
44.2.7 IMR : Interrupt Mask Register 1965
44.2.8 ISR : Interrupt Status Register 1966
44.2.9 RISR : Raw Interrupt Status Register 1967
44.2.10 TXUICR : Transmit FIFO Underflow Interrupt Clear Register 1968
44.2.11 RXOICR : Receive FIFO Overflow Interrupt Clear Register 1968
44.2.12 SPIMECR : SPI Master Interrupt Clear Register 1969
44.2.13 AHBECR : AHB Error Clear Register 1969
44.2.14 ICR : Interrupt Clear Register 1970
44.2.15 SHCFG : SHOSTIF Configuration Register 1970
44.3 Operations 1971
44.3.1 Instruction Phase 1971
44.3.2 Address Phase 1972
44.3.3 Data Phase 1973
44.3.4 Bridge Operation 1973
44.3.5 Write Operation 1973
44.3.6 Read Operation 1975
44.3.7 External SPI Master Expectations 1979
44.3.8 AHB Master Interface 1980
44.3.9 Interrupt 1980
44.4 Usage Notes 1982
45. Mailbox and Semaphore (MBXSEM) 1983
45.1 Overview 1983
45.2 Register Descriptions 1984
45.2.1 SEMn : Semaphore Register n (n = 0 to 7) 1984
45.2.2 SEMRCEN : Semaphore Read Clear Enable Register 1985
45.2.3 MBXH2Cn : Host to CR52 Mailbox Register n (n = 0 to 3) 1985
45.2.4 MBXISETH2C : Host to CR52 Mailbox Interrupt Set Register 1986
45.2.5 MBXICLRH2C : Host to CR52 Mailbox Interrupt Clear Register 1987
45.2.6 MBXC2Hn : CR52 to Host Mailbox Register n (n = 0 to 3) 1987
45.2.7 MBXISETC2H : CR52 to Host Mailbox Interrupt Set Register 1988
45.2.8 MBXICLRC2H : CR52 to Host Mailbox Interrupt Clear Register 1989
45.3 Operation 1989
45.3.1 Semaphore 1989
45.3.2 Mailbox 1990
45.3.3 Interrupt 1990
46. Encoder Interface Subsystem 1991
46.1 Overview 1991
46.2 Register Descriptions 1993

46.2.1 ENCODER_CFG : Encoder IF Configuration Register 1993
46.2.2 BISS_STAT : BiSS-C Status Register 1994
46.2.3 HDSL_STAT : HIPERFACE DSL Status Register 1995
46.2.4 ENDAT_CFG : EnDat Configuration Register 1996
46.2.5 AFMT_STAT : A-Format Status Register 1997
46.2.6 HDSLn_OS_D : HIPERFACE_DSL (SSn) Online Status (Drive) Register (n = 0, 1) 1998
46.2.7 HDSL0_OS_1 : HIPERFACE_DSL (SS0) Online Status (Safe1) Register 1999
46.2.8 HDSL0_OS_2 : HIPERFACE_DSL (SS0) Online Status (Safe2) Register 2000
46.3 Usage Notes 2001
46.3.1 Release of Register Write Protection 2001
47. EnDat 2.2 (ENDAT) 2002
47.1 Overview 2002
47.2 Register Descriptions 2004
47.2.1 SEND : Send Register 2004
47.2.2 Receive Registers 2006
47.2.3 Configuration Registers 2008
47.2.4 STATR : Status Register 2011
47.2.5 INTMR : Interrupt Mask Register 2014
47.2.6 SWSTRBR : SW Strobe Register 2015
47.2.7 IDR : ID Register 2015
47.3 Operation 2015
47.3.1 Control Sequence 2015
47.3.2 EnDat Data Transfer 2016
47.3.3 Interrupt 2019
47.3.4 Timer for Sampling Rate 2019
47.3.5 Watchdog Timer 2020
48. BiSS-C (BISS) 2021
48.1 Overview 2021
48.2 Register Descriptions 2022
48.2.1 SCDATALn : Sensor Data L (n = 1 to 8) 2022
48.2.2 SCDATAHn : Sensor Data H (n = 1 to 8) 2023
48.2.3 RDATAn : Register Data n (n = 1 to 16) 2023

Revision History 2221

200/400/800 MHz, Single Arm® Cortex®-R52 on-chip FPU and NEON™, 1.0 MB of on-chip SRAM, Ethernet MAC, EtherCAT, USB 2.0 high-speed, CAN/CANFD, various communications interfaces such as an xSPI and ΔΣ interface, encoder interfaces, and security functions

Features

On-chip 32-bit Arm Cortex-R52 processor

- High-speed realtime control with operating frequency of 200/400/800 MHz
- On-chip Single 32-bit Arm Cortex-R52 (revision r1p2)
- Tightly coupled memory (TCM) with ECC
  - 512 KB/64 KB
- Instruction cache/data cache with ECC
  - 16 KB per cache
- High-speed interrupt
- The FPU supports addition, subtraction, multiplication, division, multiply-and-accumulate, and square-root operations at single-precision and double-precision.
- The NEON, Advanced SIMD, supports integer or single precision results.
- Harvard architecture with 8-stage pipeline
- Supports the memory protection unit (MPU)
- Arm CoreSight architecture, includes support for debugging through JTAG and SWD interfaces.

Low power consumption

- Standby mode and module stop function

On-chip SRAM

- 1.0 MB of the on-chip SRAM with ECC
- 150/200 MHz

Data transfer

- DMAC: 16 channels × 2 units

Event link controller

- Module operations can be started by event signals rather than by interrupt handlers.
- Linked operation of modules is available even while the CPU is in the standby state.

Reset and power supply voltage control

- Four reset sources including a pin reset

Clock functions

- External clock/oscillator input frequency: 25 MHz
- CPU clock frequency: 200/400/800 MHz or 150/300/600 MHz
- System clock frequency: 200 MHz or 150 MHz
- Low-speed on-chip oscillator (LOCO): 240 kHz

Safety functions

- Register write protection, input clock oscillation stop detection and CRC
- Master Memory Protection Unit (MPU)

Security functions (optional)

- Boot mode with security through encryption
- JTAG authentication
- Cryptologic accelerator
- TRNG

Encoder interfaces

- Up to 2 channels
- EnDat 2.2, BiSS-C, A-format, and HIPERFACE DSL-compliant interfaces
- Frequency-divided output from an encoder

Various communications interfaces

- Ethernet
  - EtherCAT slave Controller: 3 ports
  - Ethernet MAC: 1 port
- USB 2.0 high-speed host/functions: 1 channel
- CAN/CANFD (compliant with ISO11898-1): 2 channels
- SCI with 16-byte transmission and reception FIFOs: 6 channels
- I2C bus interface: 3 channel for transfer at up to 400 kbps
- SPI: 4 channels
- xSPI: 2 channels

External host interfaces

- Serial host interface (SHOSTIF)

External address space

- Buses for high-speed data transfer at up to 100 MHz
- Support for up to 4 CS areas
- 8- or 16-bit bus space is selectable per area

Up to 35 extended-function timers

- 16-bit × 8 + 32-bit MTU3 (9 channels), 32-bit GPT (18 channels): Input capture, output compare, PWM waveform output
- 16-bit CMT (6 channels), 32-bit CMTW (2 channels)

ΔΣ interface

- Up to 6 ΔΣ modulators are connectable externally.

Trigonometric function unit

- Simultaneous calculation of sine and cosine
- Simultaneous calculation of arctangent and hypot_k

12-bit A/D converter

- 12 bits × 2 unit (4 channels for unit 0 and 1)

Temperature sensor for measuring temperature within the chip

General-purpose I/O ports

- Input pull-up/pull-down
- The locations of input/output functions for peripheral modules are selectable from among multiple pins.

Operating temperature range

- Tj = -40 to +125°C

1. Overview

1.1 Outline of Specifications

The MPU is a high-performance ASSP that has Arm Cortex®-R52 processor with Floating-Point Unit (FPU) and NEON™. It incorporates integrated peripheral functions necessary for system configuration.

Table 1.1 CPU

Feature	Functional description
Arm® Cortex®-R52	• Single processor • Operating frequency – 200 MHz/400 MHz/800 MHz (in case of 200 MHz system clock) – 150 MHz/300 MHz/600 MHz (in case of 150 MHz system clock) • 32-bit CPU Cortex-R52 designed by Arm (core revision r1p2) • Address space: 4 GB • Instruction cache – 16 KB (with ECC) • Data cache – 16 KB (with ECC) • Tightly coupled memory (TCM) – ATCM: 512 KB (with ECC) 1 wait (0 wait selectable if less than 400 MHz) – BTCM: 64 KB (with ECC) 0 wait – CTCM: 0 KB (with ECC) • Instruction set: Arm v8-R architecture, so support includes Thumb® and Thumb-2 • Data arrangement – Instructions: Little endian – Data: Little endian • 2-stage memory protection unit (MPU)
FPU	• Supports addition, subtraction, multiplication, division, multiply-and-accumulate, and square-root operations at single- and double-precision. • Registers 64-bit single-word registers: 64 bits × 32 (can be used as 16 double-word registers: 128 bits × 16)
NEON	The Advanced SIMD supporting integer or single precision results

Table 1.2 Memory

Feature	Functional description
On-chip system SRAM with ECC	• Capacity: Up to 1.0 MB (512 KB × 2 units) (with ECC) • Operating frequency: 150 MHz/200 MHz • SEC-DED (single error correction/double error detection) Error injection supported
One-time programmable memory	• Overwrite protection • Redundancy support • ECC support • Available information – Unique ID – Authentication settings – Trimming data – Boot mode setting – User area

Table 1.3 System (1 of 2)

Feature	Functional description
Operating modes	The operating mode can be selected from the following seven boot modes: • xSPI0 boot mode (CS0 × 1 boot Serial Flash) • xSPI0 boot mode (CS0 × 8 boot Serial Flash) • 16-bit bus boot mode (CS0 NOR Flash) • xSPI1 boot mode (CS0 × 1 boot Serial Flash) • SHOSTIF boot mode • SCI boot mode • USB boot mode

Table 1.3 System (2 of 2)

Feature	Functional description
Clock generation circuit	• The input clock can be selected from an external clock or external resonator. • Detection of input clock oscillation stopping • The following clocks are generated: – CPU0 clock: System clock ×1, ×2, or ×4 – System clock: 150 or 200 MHz – High-speed peripheral module clock: 150 or 200 MHz – Middle-speed peripheral module clock: 75 or 100 MHz – Low-speed peripheral module clock: 37.5 or 50 MHz – ADC clock in the 12-bit A/D converter: 18.75 or 25 MHz – External bus clock: 100 MHz (max.) – Low-speed on-chip oscillator: 240 kHz (fixed)
Reset	RES# pin reset, software reset, error reset, CPU0 software reset
Low-power consumption function	• Standby mode (Cortex-R52) • Module stop function
Interrupt controller (ICU)	• Connect an interrupt to the GIC (Generic Interrupt Controller) for Cortex-R52 CPU0 • Connect an activating trigger to the DMAC and ELC • Peripheral function interrupts: 448 sources • External interrupts: 16 sources (IRQ0 to IRQ15 pins) • Software interrupts: 8 sources • Non-maskable interrupts: 1 sources • 16 levels specifiable for the order of priority in the GIC
Bus state controller (BSC)	• The external address space is divided into four areas (CS0, CS2, CS3, and CS5) for management. • The following features are configurable for each area independently: Bus size (8 or 16 bits): Available sizes depend on the area. Number of access wait cycles (different wait cycles can be specified for read and write access cycles in some areas). Idle wait cycle insertion (between same area access cycles or different area access cycles). Specifying the memory to be connected to each area enables direct connection to SRAM, SRAM with byte selection, SDRAM, and burst ROM (clocked synchronous or asynchronous). The address/data multiplexed I/O (MPX) interface is also available. • Outputs a chip select signal (CS0# to CS5#) according to the target area (CS assert or negate timing can be selected by software). • Connectable memory type for each area CS0: SRAM, burst ROM CS2: SRAM CS2 + CS3: SRAM, SDRAM (CS2 only for SDRAM is not supported) CS3: SRAM, SDRAM CS5: SRAM, MPX-IO • SDRAM refresh Auto refresh or self-refresh mode selectable • SDRAM burst access

Table 1.4 Direct memory access

Feature	Functional description
Direct memory access controller (DMAC)	• 2 unit (16 channels each unit) • Transfer modes: Single transfer mode and block transfer mode • Transfer size - Unit 0: 1/2/4/8/16/32/64 bytes - Unit 1: 1/2/4/8/16/32 bytes • Activation sources: Software trigger, external DMA requests (DREQ), external interrupts, and interrupt requests from peripheral functions

Table 1.5 I/O Ports

Feature	Functional description
General-purpose I/O ports	• 196-pin FBGA – I/O pins: 110 – Input pins: 1 – Pull-up/pull-down resistors: 111 • The locations of input/output functions are selectable from among multiple pins.

Table 1.6 Event link

Feature	Functional description
Event link controller (ELC)	● Up to 213 event signals can be interlinked with the operation of modules. ● In particular, the operation of timer modules can be started by input event signals. ● Event-linked operation of signals of ports 16 and port 18 is to be possible.

Table 1.7 Timers (1 of 2)

Feature	Functional description
Multi-function timer pulse unit 3 (MTU3)	● 9 channels (16 bits × 8 channels, 32 bits × 1 channel) ● Maximum of 28 pulse-input/output and 3 pulse-input possible ● Select from among 10, 11, 12, or 14 counter-input clock signals for each channel (with maximum operating frequency of 200 MHz) ● Input capture function ● 39 output compare/input capture registers ● Counter clear operation (synchronous clearing by compare match/input capture) ● Simultaneous writing to multiple timer counters (TCNT) ● Simultaneous register input/output by synchronous counter operation ● Buffered operation ● Support for cascade-connected operation ● Automatic transfer of register data ● Pulse output mode Toggle/PWM/complementary PWM/reset-synchronized PWM ● Complementary PWM output mode - Outputs non-overlapping waveforms for controlling 3-phase inverters - Automatic specification of dead times - PWM duty cycle: Selectable as any value from 0% to 100% - Delay can be applied to requests for A/D conversion. - Non-generation of interrupt requests at peak or trough values of counters can be selected. - Double buffer configuration ● Reset synchronous PWM mode Six phases of positive and negative PWM waveforms can be output with desired duty cycles. ● Phase-counting mode: 16-bit mode (channels 1 and 2), 32-bit mode (channels 1 and 2 in cascade connection) ● Counter functionality for dead-time compensation ● Generation of triggers for A/D converter conversion ● A/D converter start triggers can be skipped ● Digital noise filter function for signals on the input capture and external counter clock pins ● Event linking by the ELC

Table 1.7 Timers (2 of 2)

Feature	Functional description
General PWM timer (GPT)	• 32 bits × 18 channels • Counting up or down (saw-wave), counting up and down (triangle-wave) selectable for all channels • Select from among four counter-input clock signals for each channel (with maximum operating frequency of 400 MHz for LLPP) • 2 input/output pins per channel • 2 output compare/input capture registers per channel • For the 2 output compare/input capture registers of each channel, 4 registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use. • In output compare operation, buffer switching can be at peaks or troughs, enabling the generation of laterally asymmetrically PWM waveforms. • Registers for setting up frame intervals on each channel (with capability for generating interrupts on overflow or underflow) • Synchronizable operation of the several counters • Modes of synchronized operation (synchronized, or displaced by desired times for phase shifting) • Generation of dead times in PWM operation • Through combination of 3 counters, generation of automatic 3-phase PWM waveforms incorporating dead times • Starting, clearing, stopping, switching, up/down counters, and input capture in response to external or internal triggers • Starting, clearing, stopping, switching, up/down counters, and input capture in response to input level comparison • Internal trigger sources: software and compare-match • Generation of triggers for A/D converter conversion • Digital noise filter function for signals on the input capture and external trigger pins • Event linking by the ELC • Function of output duty 0% and 100% is selectable from troughs or crests/troughs. (all units)
Compare match timer (CMT)	• (16 bits × 2 channels) × 3 units • Select from among four counter-input clock signals for each channel
Compare match timer W (CMTW)	• (32 bits × 1 channel) × 2 units • Compare-match, input-capture input, and output-comparison output are available. • Select from among four counter-input clock signals for each channel • Interrupt requests can be output in response to compare-match, input-capture, and output-comparison events.
Watchdog timer (WDT)	• 14 bits × 1 channel • Select from among six counter-input clock signals for each channel
Port output enable 3 (POE3)	• Control of the high-impedance state of the MTU3 waveform output pins • 5 pins for input from signal sources: POE0#, POE4#, POE8#, POE10#, POE11# • Initiation on detection of short-circuited outputs (detection of simultaneous PWM output to the active level) • Initiation by input clock oscillation-stoppage detection, PLL oscillation anomaly detection, two types of DSMIF error detection, or software • Additional programming of output control target pins is enabled
Port output enable for GPT (POEG)	• Controlling the output disable for GPT waveform output • Initiation by input level detection of GTETRG pins • Initiation by output disable request from GPT • Initiation by detection of oscillation stop, two types of DSMIF error detection (unit in LLPP only), or by software
Real time clock (RTC)	• A 100 year calendar from 2000 to 2099 • BCD code display • Clock source is division of main oscillator. • Automatic adjustment function for leap years

Table 1.8 Communication interfaces (1 of 2)

Feature	Functional description
Ethernet MAC (GMAC)*2	• 1 port • IEEE802.3 • IEEE1588-2008 • IEEE802.3-az-2010 for EEE • Support for 10/100/1000 Mbps data transfer • Full duplex and half duplex are supported • Programmable frame length to support both standard and jumbo frames up to 16 KB • 17 MAC address registers for the address filter block • Variety of flexible addresses filtering modes are supported • Advanced IEEE 1588-2002 & 2008 Ethernet frame time-stamping supported • MII/RMII/RGMII interface is supported by RMII/RGMII converter • Timer module
EtherCAT slave controller (ESC)*1 *2	• 1 channel (3 ports) • EtherCAT Slave Controller IP core (made by Beckhoff Automation GmbH) implemented • MII interface is supported. MII/RMII interface is supported by RGMII converter in Ethernet Subsystem.
USB 2.0 HS host/function module	• 1 port • Compliance with the USB 2.0 specification • OTG support • Transfer rate High speed (480 Mbps), full speed (12 Mbps), low speed (1.5 Mbps, host only) • Communications buffer – Incorporates 1 KB of RAM for host mode – Incorporates 8 KB of RAM for function mode • DMAC (2 channels) incorporated
Serial communication interface (SCI)	• 6 channels • 5 communication mode – Asynchronous interfaces – 8-bit clock synchronous interface – Simple I2C (master-only) – Simple SPI – Smart card interface • Clock source is select from among four internal clock signals • Bit rate specifiable with the on-chip baud rate generator • Full-duplex and half-duplex communication • Data length: 7 to 9 bits (Asynchronous mode) • Bit rate modulation • Double speed mode (Asynchronous, Clock Synchronous, Simple SPI mode) • RS-485 driver control function (Asynchronous mode) • Loopback function to enable self-diagnosis (Asynchronous, Clock synchronous mode)
I^2C bus interface (IIC)	• 3 channels • Communication formats: I2C bus format or SMBus format • Master or slave mode selectable • Supports the multi-master • Maximum transfer rate: 400 kbps (Standard mode and Fast mode)
CAN-FD module (CANFD)*3	• 2 channels • Comply with CAN-FD ISO 11898-1 (2015) • Communication speed – Classical CAN mode: 1 Mbps – CAN FD mode: Nominal bit rate: max. 1 Mbps Data bit rate: max. 8 Mbps • Total 192 message buffers (in case frame size is 76 bytes) – Individual buffers: 64 for TX – Shared buffers: 128 for TX and RX including FIFO • Selectable ID type with 11-bit Standard and 18-bit Extended • Selectable Frame type: Data Frame and Remote Frame • Up to 256 receive rules

Table 1.8 Communication interfaces (2 of 2)

Feature	Functional description
Serial peripheral interface (SPI)	• 4 channels • SPI transfer facility Using the MOSI (master out slave in), MISO (master in slave out), SSL (slave select), and RSPCK (SPI clock) signals enables serial transfer through SPI operation (four lines) or clock-synchronous operation (three lines) capable of handling serial transfer as a master or slave • Data formats – Switching between MSB first and LSB first – Transfer bit length selectable to 4 - 32 bits – 32 bits × 4-stage FIFO transmit and receive buffers – Up to four frames can be transmitted or received in a single transfer operation (with each frame having up to 32 bits) • RSPCK can be stopped automatically with the reception buffer full for master reception
Expanded serial peripheral interface (xSPI)	• 2 channels • Comply with JESD251 • Multiple slave up to 2 slaves • Protocol mode: 1/4/8pin with SDR/DDR 1S-1S-1S, 4S-4D-4D, 8D-8D-8D • Support OctaFlash, OctaRAM, HyperFlash and HyperRAM • Protocol mode: 2/4pin with SDR compatible with QSPI 1S-2S-2S, 2S-2S-2S 1S-4S-4S, 4S-4S-4S • Configurable address length • Configurable initial access latency cycle • Support XiP mode • Support up to 256 MB address space • Prefetch function for burst-read with low latency • Outstanding buffer for burst-write with high throughput • Manual command configurable up to 4 commands • Output clock/input strobe port timing shift • Automatic command after released reset: up to 4 commands • 1.8 V/3.3 V selectable for xSPI0 and 3.3 V fix for xSPI1

Note 1. EtherCAT is a registered trademark of Beckhoff Automation GmbH, Germany.
Note 2. The product has a device which do not support GMAC and ESC.
Note 3. The product have a device with Classical CAN mode only.

Table 1.9 Analog

Feature	Functional description
12-bit A/D converter (ADC12)	• 12 bits × 2 units (unit 0: 4 channels, unit 1: 4 channels) • 12-bit resolution • Conversion time 0.84 µs per channel • Operating mode Scan mode (single scan mode, continuous scan mode, or 3 group scan mode) Group priority control • Sample-and-hold function Common sample-and-hold circuit included In addition, channel-dedicated sample-and-hold function (3 channels: in both unit 0 and unit 1) included • Sampling variable Sampling time can be set up for each channel • Double trigger mode (A/D conversion data duplicated) • Three ways to start A/D conversion Software trigger, timer (MTU3, ELC) trigger, external trigger • Event linking by the ELC
Temperature sensor unit (TSU)	• 1 channel • Relative precision: ±1°C (typ)

Table 1.10 Hardware accelerator for industrial interfaces

Feature	Functional description
ΔΣ interface (DSMIF)	• 3 channels × 2 units • Selectable 2 inputs (U/V) or 3 inputs (U/V/W) • Up to 6 ΔΣ modulators are externally connectable • Sinc filter can be selected as first, second or third order • Direct error connection to POE3 and POEG • Enhancement of current error detection
Trigonometric function unit (TFU)	Calculation of sine, cosine, arctangent, hypot_k ($\sqrt{x^2+y^2}/k$) • Simultaneous calculation of sine and cosine • Simultaneous calculation of arctangent and hypot_k
Encoder interfaces	• EnDat 2.2 (2 units) • BiSS-C (2 units) • A-format (2 units) • HIPERFACE DSL (2 units) • ENCOUT (1 unit)

Table 1.11 Safety

Feature	Functional description
Memory protection unit (MPU)	• Cortex-R52 MPU Two stages MPUs (EL2 and EL1) 24 regions each MPU • Master MPU Memory protection for masters except Cortex-R52 (DMAC, USB, Ethernet MAC, CoreSight, SHOSTIF)
Register write protection function	Protects important registers from being overwritten for in case a program runs out of control.
CRC calculator (CRC)	• 2 channels • CRC code generation for arbitrary amounts of data in 8-, 16-, or 32-bit units • Select any of four generating polynomials: – $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$ (32-Ethernet) – $X^{32} + X^{28} + X^{27} + X^{26} + X^{25} + X^{23} + X^{22} + X^{20} + X^{19} + X^{18} + X^{14} + X^{13} + X^{11} + X^{10} + X^9 + X^8 + X^6 + 1$ (CRC-32C) – $X^{16} + X^{15} + X^2 + 1$ (CRC-16) – $X^{16} + X^{12} + X^5 + 1$ (CRC-CCITT) – $X^8 + X^2 + X + 1$ (CRC-8)
Clock monitor circuit (CLMA)	• Monitors the abnormal output clock frequency from the input clock (main clock oscillator), PLL circuit, or low-speed on-chip oscillator. • Input clock oscillation stop detection: Available
Data operation circuit (DOC)	The function to compare, add, or subtract 16-bit data
Isolated peripherals	• Safety dedicated peripherals are available: – GPT: 4 ch – SCI: 1 ch – IIC: 1 ch – SPI: 1 ch – CRC: 1 unit – RTC: 1 unit – GPIO: Sharable with normal GPIO – On-chip system SRAM with ECC • They are mapped independently from normal peripherals so that access protection can be done by EL2 MPU.

Table 1.12 Security

Feature	Functional description
Security[*1]	• Secure boot • JTAG authentication • Cryptographic accelerators – Symmetric Cipher: AES 128/192/256 bits with CBC/ECB/CTR/GCM/XTS – Asymmetric Cipher: ECC 256 bits, RSA 1024/2048/3072 bits, RSAES-OAEP – Hash: SHA-1, SHA-2 – Message authentication: HMAC, CMAC, GMAC – Signature algorithms: ECDSA with NIST P-256, RSASSA-PSS, RSASSA-PKCS1 • TRNG

Note 1. For details, contact our sales representative.

Table 1.13 Debug

Feature	Functional description
Debugging interface	• CoreSight architecture designed by Arm • Debugging function by the JTAG/SWD interface, and trace function by the trace port interface

Table 1.14 External host interface

Feature	Functional description
Serial host interface (SHOSTIF)	• Serial communication is possible in slave mode. • Supported interface – Motorola Serial Peripheral Interface (4-wire SPI) – Enhanced SPI Modes with Dual, Quad, or Octal SPI • Serial clock polarity switching • Serial clock phase switching • Single Data Transfer • Data size is up to 32 bits × 64 burst
Mailbox and semaphore (MBXSEM)	• Eight semaphores • Four 32-bit mailboxes for both external host CPU to Cortex-R52 and Cortex-R52 to external host CPU • Interrupts can be generated and cleared from both external host CPU and Cortex-R52

Table 1.15 Others

Feature	Functional description
Power supply voltage	VDD = 1.1 V (Core) VCC18 = 1.8 V (PLL, USB, ADC, TSU) VCC33 = 3.3 V (I/O, USB) VCC1833 = 1.8 V (RGMII, xSPI) or 3.3 V (RMII/MII, xSPI[*1])
Operating temperature	Tj = −40 to +125°C
Packages	196 pin FBGA 12 × 12 mm, 0.8-mm pitch

Note 1. Maximum xSPI clock frequency is 75 MHz at 3.3 V.

1.2 Product Lineup

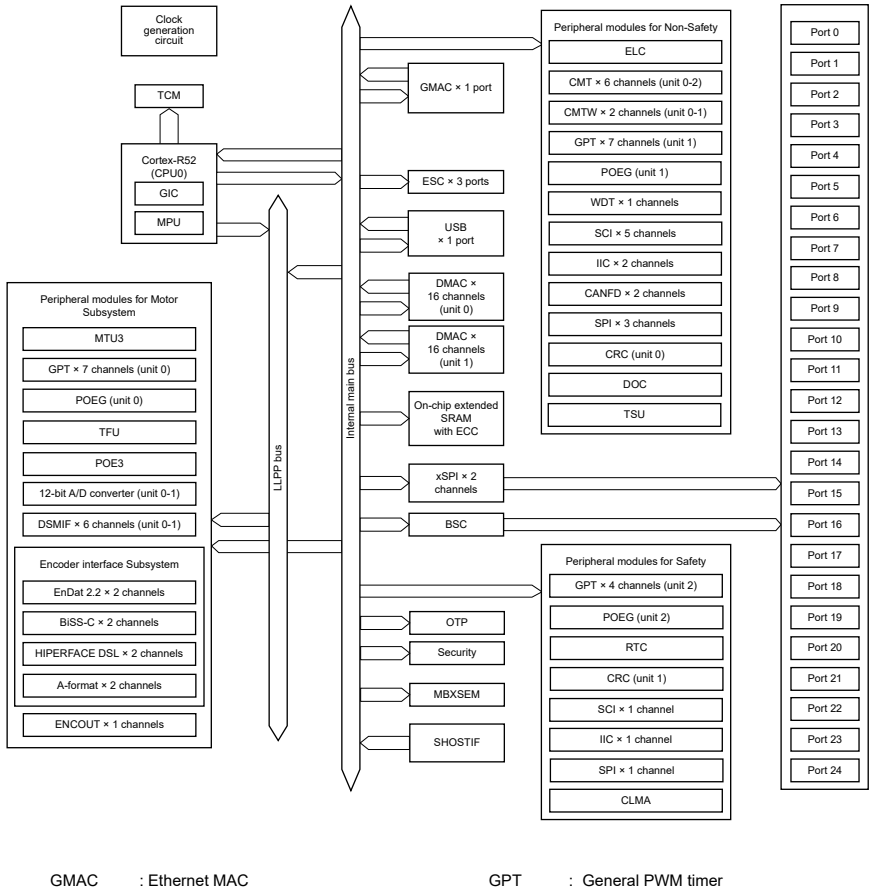

Table 1.16 shows a product lineup.

Table 1.16 Product lineup

Part Number	Package	CPU	System SRAM Capacity	CAN	EtherCAT	Security
R9A07G074M08GBG	PLBG0196GC-A	Single Cortex-R52	1.0 MB	CAN-FD	Available	Available
R9A07G074M05GBG	PLBG0196GC-A	Single Cortex-R52	1.0 MB	Classical CAN	Not available	Available
R9A07G074M04GBG	PLBG0196GC-A	Single Cortex-R52	1.0 MB	CAN-FD	Available	Not available

1.3 Block Diagram

Figure 1.1 shows a block diagram.

GMAC : Ethernet MAC
ETHSW : Ethernet switch
ESC : EtherCAT slave controller
DMAC : DMA controller
BSC : Bus state controller
xSPI : Expanded serial peripheral interface
WDT : Watchdog timer
SCI : Serial communication interface
SPI : Serial peripheral interface
USB : USB 2.0 HS host/function module
GIC : Generic interrupt controller
MPU : Memory protection unit
ELC : Event link controller
MTU3 : Multi-function timer pulse unit 3
SHOSTIF : Serial host interface
MBXSEM : Mailbox and Semaphore

GPT : General PWM timer
CMT : Compare match timer
CMTW : Compare match timer W
POE3 : Port output enable 3
POEG : Port output enable for GPT
RTC : Real time clock
IIC : I^2C bus interface
CANFD : CANFD module
DSMIF : ΔΣ interface
TFU : Trigonometric function unit
CRC : CRC (cyclic redundancy check) calculator
CLMA : Clock monitor circuit
DOC : Data operation circuit
TSU : Temperature sensor unit
OTP : One-time programmable memory

Figure 1.1 Block diagram

1.4 Pin Functions

Table 1.17 lists the pin functions.

Table 1.17 Pin functions (1 of 7)

Classification	Pin name	I/O	Description
Power supply	VDD	Input	Power supply pin. Connect this pin to the system power supply.
	VSS	Input	Ground pin. Connect this pin to the system power supply (0 V).
	VCC1833_2 VCC1833_3	Input	Power supply pin for each I/O domains. (1.8 V or 3.3 V)
	VCC33	Input	Power supply pin for I/O pins.
	VCC18_PLL0, VCC18_PLL1	Input	Power supply pins for the on-chip PLL oscillator
	AVCC18_TSU	Input	Power supply pin for the temperature sensor unit
Clock	XTAL	Output	Connected to a crystal resonator. When external clock signal is used, EXTAL pin should be driven low. XTAL pin should never be driven or loaded by anything other than crystal oscillator. The voltage level of EXTAL must not exceed core VDD (1.16 V).
	EXTAL	Input	
	EXTCLKIN	Input	Inputs the external clock. When a crystal resonator is connected, it should be driven low.
	CKIO	Output	Outputs the external bus clock for external devices.
	ETH0_REFCLK	Output	Outputs 25 MHz clock for EtherPHY 0
	ETH1_REFCLK	Output	Outputs 25 MHz clock for EtherPHY 1
	ETH2_REFCLK	Output	Outputs 25 MHz clock for EtherPHY 2
	RMII0_REFCLK	Output	Outputs 50 MHz clock for RMII0
	RMII1_REFCLK	Output	Outputs 50 MHz clock for RMII1
	RMII2_REFCLK	Output	Outputs 50 MHz clock for RMII2
Operating mode control	MDX	Input	This signal should be driven low.
	MD0 to MD2	Input	Input the operating mode select signal. The signal level on these pins must not be changed during operation mode transition on release from the reset state.
	MDV2, MDV3	Input	Input the operating voltage select signal. The signal level on these pins must not be changed during operation mode transition on release from the reset state.
	MDW	Input	Input the ATCM wait cycle select signal. The signal level on this pin must not be changed during operation mode transition on release from the reset state.
	MDD	Input	Input the enabling JTAG authentication by hash signal. The signal level on this pin must not be changed during operation mode transition on release from the reset state.
System control	RES#	Input	Inputs the reset signal. This MPU enters the reset state when this signal goes low.
	BSCANP	Input	Inputs the boundary scan enable signal. Boundary scan is enabled when this pin goes high. When boundary scan is not used, this pin should be driven low.
	RSTOUT#	Output	Outputs the reset signal externally

Table 1.17 Pin functions (2 of 7)

Classification	Pin name	I/O	Description
Debugging interface	TRST#	Input	Test reset pin for the on-chip emulator
	TMS	I/O	Test mode select pin for the on-chip emulator Functions as the SWDIO pin in serial wire debug (SWD) mode
	TDI	Input	Test data input pin for the on-chip emulator
	TDO	Output	Test data output pin for the on-chip emulator
	TCK	Input	Test clock pin for the on-chip emulator Functions as the SWCLK pin in serial wire debug (SWD) mode
	TRACECLK	Output	Outputs the clock for synchronization with trace data
	TRACECTL	Output	Outputs the enable signal for trace control
	TRACEDATA0 to TRACEDATA7	Output	Output trace data
Bus state controller (BSC)	A25 to A0	Output	Output the address
	D15 to D0	I/O	Input and output the data
	CS0#, CS2#, CS3#, CS5#	Output	Output the chip select signal for the external memory or device.
	RD#	Output	Outputs the strobe signal which indicates a read is in progress.
	RD/WR#	Output	Outputs the strobe signal which indicates a read or write access
	BS#	Output	Outputs the status signal which indicates the start of the bus cycle
	AH#	Output	Outputs the address hold signal for the device that uses the multiplexed I/O interface
	WAIT#	Input	Inputs the external wait control signal which inserts a wait cycle into the bus cycle
	WE0#	Output	Outputs the write strobe signal to D7 to D0
	WE1#	Output	Outputs the write strobe signal to D15 to D8
	DQMLL	Output	Outputs the data mask enable signal to D7 to D0 when SDRAM is connected
	DQMLU	Output	Outputs the data mask enable signal to D15 to D8 when SDRAM is connected
	RAS#	Output	Outputs the row-address strobe signal to the SDRAM. This pin should be connected to the RAS# pin on the SDRAM.
	CAS#	Output	Outputs the column-address strobe signal to the SDRAM. This pin should be connected to the CAS# pin on the SDRAM.
	CKE	Output	Outputs the clock enable signal to the SDRAM. This pin should be connected to the CKE pin on the SDRAM.
Direct memory access controller (DMAC)	DREQ	Input	Inputs the DMA transfer request signal from the external device
	DACK	Output	Outputs the acknowledge signal which indicates acceptance of the DMA transfer request from the external device
	TEND	Output	Outputs the DMA transfer end signal
Interrupt	NMI	Input	Inputs the non-maskable interrupt request signal
	IRQ0 to IRQ15	Input	Input the external interrupt request signal

Table 1.17 Pin functions (3 of 7)

Classification	Pin name	I/O	Description
Multi-function timer pulse unit 3 (MTU3)	MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D	I/O	TGRA0 to TGRD0 input capture input, output compare output, and PWM output pins
	MTIOC1A, MTIOC1B	I/O	TGRA1 and TGRB1 input capture input, output compare output, and PWM output pins
	MTIOC2A, MTIOC2B	I/O	TGRA2 and TGRB2 input capture input, output compare output, and PWM output pins
	MTIOC3A, MTIOC3B, MTIOC3C, MTIOC3D	I/O	TGRA3 to TGRD3 input capture input, output compare output, and PWM output pins
	MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D	I/O	TGRA4 to TGRD4 input capture input, output compare output, and PWM output pins
	MTIC5U, MTIC5V, MTIC5W	Input	TGRU5, TGRV5, and TGRW5 input capture input and dead time compensation input pins
	MTIOC6A, MTIOC6B, MTIOC6C, MTIOC6D	I/O	TGRA6 to TGRD6 input capture input/output compare output/PWM output pins
	MTIOC7A, MTIOC7B, MTIOC7C, MTIOC7D	I/O	TGRA7 to TGRD7 input capture input/output compare output/PWM output pins
	MTIOC8A, MTIOC8B, MTIOC8C, MTIOC8D	I/O	TGRA8 to TGRD8 input capture input/output compare output/PWM output pins
	MTCLKA, MTCLKB, MTCLKC, MTCLKD	Input	External clock input pins for MTU3
Port output enable 3 (POE3)	POE0#, POE4#, POE8#, POE10#, POE11#	Input	Input the request signal to place the MTU3 in the high-impedance state
General PWM timer (GPT)/ Port output enable for GPT (POEG)	GTETRGA, GTETRGB, GTETRGC, GTETRGD	Input	External trigger input and output-disable request input pins
	GTETRGSA, GTETRGSB	Input	External trigger input and output-disable request input pins (SAFETY)
	GTIOC0A to GTIOC17A, GTIOC0B to GTIOC17B	I/O	Input capture input/output compare output/PWM output pins
	GTADSML0, GTADSML1, GTADSMP0, GTADSMP1	Output	Output pins for monitoring A/D conversion start requests
Compare match timer W (CMTW)	CMTW0_TIC0, CMTW0_TIC1, CMTW1_TIC0, CMTW1_TIC1	Input	CMTW input capture input pins
	CMTW0_TOC0, CMTW0_TOC1, CMTW1_TOC0, CMTW1_TOC1	Output	CMTW output compare output pins
Real time clock (RTC)	RTCAT1HZ	Output	RTC 1 Hz output pin

Table 1.17 Pin functions (4 of 7)

Classification	Pin name	I/O	Description
Serial communication interface (SCI)	SCK0 to SCK5	I/O	Clock I/O pins (clock synchronous mode/simple SPI mode/smart card mode)
	RXD0 to RXD5	Input	Input the receive data (asynchronous mode/clock synchronous mode/smart card mode)
	TXD0 to TXD5	Output	Output the transmit data (asynchronous mode/clock synchronous mode/smart card mode)
	CTS0# to CTS5#	Input	Input the start of transmission (asynchronous mode/ clock synchronous mode) active-low
	RTS0# to RTS5#	Output	Output the reception (asynchronous mode/clock synchronous mode) active-low
	SCL0 to SCL5	I/O	Input/output the I2C clocks (simple I2C mode)
	SDA0 to SDA5	I/O	Input/output the I2C data (simple I2C mode)
	MISO0 to MISO5	I/O	Input/output the data for slave transmission (simple SPI mode)
	MOSI0 to MOSI5	I/O	Input/output the data for master transmission (simple SPI mode)
	SS0# to SS5#	Input	Chip-select input pins (simple SPI mode) active-low
	DE0 to DE5	Output	Driver enable output pins (asynchronous mode)
I2C bus interface (IIC)	IIC_SCL0 to IIC_SCL2	I/O	Clock I/O pins
	IIC_SDA0 to IIC_SDA2	I/O	Data I/O pins
Ethernet (RGMII is supported for port-2 only.)	ETH0_TXCLK to ETH2_TXCLK	I/O	TX clock input pins (MII mode) TX clock output pins (RGMII mode)
	ETH0_TXD0 to ETH2_TXD0	Output	TX data 0 pins (RGMII, RMII, and MII modes)
	ETH0_TXD1 to ETH2_TXD1	Output	TX data 1 pins (RGMII, RMII, and MII modes)
	ETH0_TXD2 to ETH2_TXD2	Output	TX data 2 pins (RGMII and MII modes)
	ETH0_TXD3 to ETH2_TXD3	Output	TX data 3 pins (RGMII and MII modes)
	ETH0_TXEN to ETH2_TXEN	Output	TX data enable pins (RMII and MII modes) TX data enable/TX data error (TX_CTL) pins (RGMII mode)
	ETH2_TXER	Output	TX data error pins (MII mode)
	ETH0_RXCLK to ETH2_RXCLK	Input	RX clock pins (RGMII, RMII, and MII modes)
	ETH0_RXD0 to ETH2_RXD0	Input	RX data 0 pins (RGMII, RMII, and MII modes)
	ETH0_RXD1 to ETH2_RXD1	Input	RX data 1 pins (RGMII, RMII, and MII modes)
	ETH0_RXD2 to ETH2_RXD2	Input	RX data 2 pins (RGMII and MII modes)
	ETH0_RXD3 to ETH2_RXD3	Input	RX data 3 pins (RGMII and MII modes)
	ETH0_RXDV to ETH2_RXDV	Input	RX data valid pins (MII mode) Carrier sense/RX data valid (CRS_DV) pins (RMII mode) RX data valid/RX error (RX_CTL) pins (RGMII mode)
	ETH0_RXER to ETH2_RXER	Input	RX data error pins (RMII and MII modes)
	ETH2_CRS	Input	Carrier sense pins (MII mode)
	ETH2_COL	Input	Collision detection pins (MII mode)

Table 1.17 Pin functions (5 of 7)

Classification	Pin name	I/O	Description
Ethernet MAC (GMAC)	GMAC_PTPTRG0	Input	PTP timer trigger external input 0
	GMAC_PTPTRG1	Input	PTP timer trigger external input 1
	GMAC_PTPOUT0 to GMAC_PTPOUT3	Output	PTP timer pulse output
	GMAC_MDC	Output	Management data clock output pin
	GMAC_MDIO	I/O	Management data I/O pin
EtherCAT slave controller (ESC)	ESC_LEDRUN	Output	Outputs the EtherCAT RUN LED signal
	ESC_IRQ	Output	Outputs the EtherCAT IRQ signal
	ESC_LEDSTER	Output	Outputs the EtherCAT Dual-color state LED signal
	ESC_LEDERR	Output	Outputs the EtherCAT error LED signal
	ESC_LINKACT0 to ESC_LINKACT2	Output	Output the EtherCAT link/activity LED signal
	ESC_SYNC0, ESC_SYNC1	Output	Output the EtherCAT SYNC signal
	ESC_LATCH0, ESC_LATCH1	Input	Input the EtherCAT LATCH signal
	ESC_RESETOUT#	Output	Output the EtherCAT reset signal
	ESC_I2CCLK	Output	Outputs the EtherCAT EEPROM I2C clock signal
	ESC_I2CDATA	I/O	Inputs and outputs the EtherCAT EEPROM I2C data signal
	ESC_PHYLINK0 to ESC_PHYLINK2	Input	Inputs the EtherCAT PHY link status signal.
	ESC_MDC	Output	Management data clock output pin
	ESC_MDIO	I/O	Management data I/O pin
USB 2.0 host/function module	VCC33_USB	Input	Power supply input pin for USB
	VCC18_USB	Input	Power supply input pin for USB
	VSS_USB	Input	Ground input pins for USB
	AVCC18_USB	Input	Analog power supply input pin for USB
	USB_RREF	Input	Reference current input pin for USB. Connect this pin to the VSS_USB pin with 1.8 kΩ (±1%).
	USB_DP	I/O	USB bus D+ data I/O pin
	USB_DM	I/O	USB bus D- data I/O pin
	USB_VBUSEN	Output	Outputs the VBUS power enable signal for USB
	USB_OVRCUR	Input	Inputs the overcurrent signal for USB
	USB_VBUSIN	Input	USB cable connection/disconnection detection input pin
	USB_EXICEN	Output	OTG power supply IC control pin
	USB_OTGID	Input	OTG ID pin
CANFD module (CANFD)	CANRX0, CANRX1	Input	Receive data input pins
	CANTX0, CANTX1	Output	Transmit data output pins
	CANRXDP0, CANRXDP1	Output	Receive data phase output pins
	CANTXDP0, CANTXDP1	Output	Transmit data phase output pins

Table 1.17 Pin functions (6 of 7)

Classification	Pin name	I/O	Description
Serial peripheral interface (SPI)	SPI_RSPCK0 to SPI_RSPCK3	I/O	Clock I/O pins
	SPI_MOSI0 to SPI_MOSI3	I/O	Master transmit data I/O pins
	SPI_MISO0 to SPI_MISO3	I/O	Slave transmit data I/O pins
	SPI_SSL00 to SPI_SSL30	I/O	Slave select signal I/O pins
	SPI_SSL01 to SPI_SSL31, SPI_SSL02 to SPI_SSL32, SPI_SSL03 to SPI_SSL33	Output	Slave select signal output pins
Expanded serial peripheral interface (xSPI)	XSPI0_CKP, XSPI1_CKP, XSPI0_CKN	Output	Clock output pins
	XSPI0_CS0#, XSPI0_CS1#, XSPI1_CS0#	Output	Chip select output pins
	XSPI0_DS, XSPI1_DS	I/O	Read data strobe/write data mask input/output pin
	XSPI0_IO0 to XSPI0_IO7, XSPI1_IO0 to XSPI1_IO7	I/O	Data0 to Data7 input/output pins
	XSPI0_RESET0#, XSPI0_RESET1#	Output	Master reset status output pins
	XSPI0_RSTO0#, XSPI0_RSTO1#	Input	Slave reset status input pins
	XSPI0_INT0#, XSPI0_INT1#	Input	Interrupt input pins
	XSPI0_ECS0#, XSPI0_ECS1#	Input	Error correction status input pins
	XSPI0_WP0#, XSPI0_WP1#	Output	Write protect output pins
ΔΣ interface (DSMIF)	MCLK0 to MCLK5	I/O	Clock I/O pins
	MDAT0 to MDAT5	Input	Data input pins
12-bit A/D converter (ADC12)	AN000 to AN003, AN100 to AN103	Input	Analog input pins for the A/D converter
	ADTRG0#, ADTRG1#	Input	External trigger input pins for the start of A/D conversion
Analog power supply	VCC18_ADC0, VCC18_ADC1	Input	Analog power supply input pin for the 12-bit A/D converter. Connect this pin to the 1.8 V power supply if the 12-bit A/D converter is not to be used.
	VREFH0, VREFH1	Input	Reference voltage input pin for the 12-bit A/D converter. Connect this pin to the 1.8 V power supply if the 12-bit A/D converter is not to be used.
I/O ports	P00_0 to P24_2	I/O	General-purpose input/output pins
Serial host interface (SHOSTIF)	HSPI_CK	Input	Clock input pin
	HSPI_CS#	Input	Chip select input pin
	HSPI_IO0 to HSPI_IO7	I/O	Data0 to Data7 input/output pins
	HSPI_INT#	Output	Interrupt output pin
Mailbox	MBX_HINT#	Output	Mailbox (Cortex-R52 to Host) interrupt output pin
Encoder I/F common	ENCIFCK0, ENCIFCK1	Output	Encoder I/F clock output pins
	ENCIFOE0, ENCIFOE1	Output	Encoder I/F data output enable pins
	ENCIFDO0, ENCIFDO1	Output	Encoder I/F data output pins
	ENDIFDI0, ENDIFDI1	Input	Encoder I/F data input pins
EnDat 2.2 (ENDAT)	DUEI0, DUEI1	Output	EnDat 2.2 Data transfer
	TST_OUT0, TST_OUT1	Output	EnDat 2.2 Data input after internal synchronization
	SI0#, SI1#	Output	EnDat 2.2 Start pulse

Table 1.17 Pin functions (7 of 7)

Classification	Pin name	I/O	Description
Hiperface DSL (HDSL)	HSDL0_LINK, HSDL1_LINK	Output	HDSL LINK
	HDSL0_SMPL, HDSL1_SMPL	Output	HDSL Test signal line sampler
	HDSL0_CLK1, HDSL1_CLK1	Input	HDSL SPI clock safe 1
	HDSL0_SEL1, HDSL1_SEL1	Input	HDSL SPI selection safe 1
	HDSL0_MISO1, HDSL1_MISO1	Output	HDSL SPI data output safe 1
	HDSL0_MOSI1, HDSL1_MOSI1	Input	HDSL SPI data input safe 1
	HDSL0_CLK2, HDSL1_CLK2	Input	HDSL SPI clock safe 2
	HDSL0_SEL2, HDSL1_SEL2	Input	HDSL SPI selection safe 2
	HDSL0_MISO2, HDSL1_MISO2	Output	HDSL SPI data output safe 2
	HDSL0_MOSI2, HDSL1_MOSI2	Input	HDSL SPI data input safe 2
ENCOUT	POUTA	Output	ENCOUT A-phase output pin
	POUTB	Output	ENCOUT B-phase output pin
	POUTZ	Output	ENCOUT C-phase output pin

1.5 FBGA 196 Pin Assignments

Figure 1.2 shows the pin arrangement. Table 1.18 shows the lists of pins and the pin functions.

2. CPU

2.1 Overview

The LSI includes one Cortex®-R52 CPU. The revision of module is r1p3-00rel0.

Table 2.1 shows the specifications of the CPU.

Table 2.1 CPU specifications

Item		Description
Cortex-R52	Minimum instruction execution time	One clock per instruction
	Address space	4 GB
	Instruction cache size	16 KB (with ECC)
	Data cache size	16 KB (with ECC)
	Tightly coupled memory (TCM) size	ATCM: 512 KB (with ECC) BTCM: 64 KB (with ECC)
	Instruction set	Armv8-R architecture supporting Thumb®/Thumb-2
	Data arrangement	Instruction: Little-endian Data: Little-endian
	Memory protection	2-stage memory protection unit (MPU)
	FPU	• Supports addition, subtraction, multiplication, division, product-sum operation, and square-root operation in single-precision and double-precision • 64-bit single word register: 32 registers • Can also be used as sixteen 128-bit double word registers
	NEON	• The advanced SIMD supporting integer or single precision results

For details, see the following Arm documents:

- Arm® Architecture Reference Manual Armv8, for Armv8-A architecture profile
- Arm® Architecture Reference Manual Supplement Armv8, for the Armv8-R architecture profile
- Arm® Cortex®-R52 Processor Technical Reference Manual

2.2 Configuration Information

Table 2.2 lists the configuration options for the Cortex-R52 CPU of this LSI.

Table 2.2 Configuration options (1 of 2)

Feature	Setting value
Number of cores	1
Lock-step	No redundant logic included
EL1-controlled MPU	24
EL2-controlled MPU	24
AXI bus protection	No bus protection included
RAM protection	Included for all RAMs
Number of interrupts (SPIs) into the interrupt controller	448
AXIS ID bits	8
Advanced SIMD and floating-point capabilities for each core	Supported
Size of each of the three TCMs on each core	ATCM: 512 KB BTCM: 64 KB CTCM: 0 KB

Table 2.2 Configuration options (2 of 2)

Feature	Setting value
TCM wait states for each core	ATCM: 0 wait state (less than or equal to 400 MHz only) or 1 wait state[*1] BTCM: 0 wait states
Instruction cache size for each core	16 KB
Data cache size for each core	16 KB
External device interfaces to GIC	0
Flash ECC scheme	Not available
Vector table base address out of reset (after running boot ROM)	0x0000_0000

Note 1. It depends on the MDW pin setting at release of reset. If more than 400 MHz operation is required, 1 wait state is mandatory.

2.3 Restrictions on the CPU

For details on restrictions of the Cortex-R52 CPU implemented in this LSI, see the information provided on the Arm website.

2.4 Register Descriptions

2.4.1 WAIT : ATCM Wait State Register

Base address: TCMAW = 0x8128_1900

Offset address: 0x10

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WAIT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x[*1]

Bit	Symbol	Function	R/W
0	WAIT	ATCM Wait state 0: 0-wait state (MDW = 0) 1: 1-wait state (MDW = 1)	R
31:1	—	These bits are read as 0.	R

Note 1. It depends on the state of MDW pin latched at release of RES# pin on power on.

The WAIT is a register that indicates ATCM access wait. It is set by the state of the MDW pin latched at release of RES# pin on power on.

2.4.2 CNTCR : Global System Counter Control Register

Base address: GSC = 0xC006_0000

Offset address: 0x00

Bit position:	31	…	1	0
Bit field:	—	…	HDBG	EN
Value after reset:	0	…	0	0

Bit	Symbol	Function	R/W
0	EN	Counter Enable 0: The counter is disabled and not incrementing 1: The counter is enabled and is incrementing	R/W
1	HDBG	Halt on Debug HLTDBG is internal signal and it is driven high when CTI trigger output[4] (TSG-CNT HALTREQ) is asserted. It is driven low when CTI trigger output[5] (TSG-CNT RESTARTREQ) is asserted. 0: Do not halt on debug, HLTDBG signal into the counter has no effect 1: Halt on debug, when HLTDBG is driven high, the count value is held static	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

The CNTCR register controls the global system counter (TSG-CNT) increments.

2.4.3 CNTSR : Global System Counter Status Register

Base address: GSC = 0xC006_0000

Offset address: 0x04

Bit position:	31																												1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DBGH	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0.	R
1	DBGH	Debug Halted 0: Not halt on debug 1: Halt on debug	R
31:2	—	These bits are read as 0.	R

The CNTSR register indicates the global system counter (TSG-CNT) status.

2.4.4 CNTCVL : Global System Counter Current Value Lower Register

Base address: GSC = 0xC006_0000

Offset address: 0x08

Bit position:	31																													0
Bit field:	CNTCVL_L_32[31:0]																													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	CNTCVL_L_32[31:0]	Current value of the counter, lower 32 bits To change the current value, write the lower 32 bits of the new value to this register before writing the upper 32 bits to CNTCVU. The counter value is not changed until the CNTCVU register is written to.	R/W

The CNTCVL register reads or writes the lower 32 bits of the current global system counter (TSG-CNT) value. Before writing to this register, clear the CNTCR.EN bit.

2.4.5 CNTCVU : Global System Counter Current Value Upper Register

Base address: GSC = 0xC006_0000

Offset address: 0x0C

Bit position:	31																											0
Bit field:	CNTCVU_U_32[31:0]																											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	CNTCVU_U_32[31:0]	Current value of the counter, upper 32 bits To change the current value, write the lower 32 bits of the new value to CNTCVL before writing the upper 32 bits to this register. The 64-bit value is updated with the value from both writes when this register is written to.	R/W

The CNTCVU register reads or writes the upper 32 bits of the current global system counter (TSG-CNT) value. Before writing to this register, clear the CNTCR.EN bit.

2.4.6 CNTFID0 : Global System Counter Base Frequency ID Register

Base address: GSC = 0xC006_0000

Offset address: 0x20

Bit position:	31																											0
Bit field:	FREQ[31:0]																											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	FREQ[31:0]	Frequency in number of ticks per second Clock for generic timer counter is the main oscillator clock (25 MHz). Write 0x017D7840 for 25 MHz clock.	R/W

The CNTFID0 register specifies the clock frequency of the global system counter (TSG-CNT) in ticks per second.

2.5 Usage Notes

2.5.1 Global System Counter (TSG-CNT)

The global system counter (TSG-CNT) is a 64-bit counter that provides system counter value to generic timers of Cortex-R52 CPU0. Before using generic timer, the global system counter related registers must be set. Clock for global system counter is the main oscillator clock (25 MHz). Therefore, the Global System Counter Base Frequency ID register (CNTFID0) must be set to 0x017D7840.

TSG-CNT is implemented in CoreSight. For details, see section 9, Debugging Interface.

2.5.2 Caution of Interrupt Service Routine

In case of level interrupt, it is needed to clear interrupt factor in the interrupt service routine (ISR) generally. It may take some time to complete it due to write data buffering in the CPU and internal bus. If interrupt handler exits before completion of clearing interrupt factor at the peripheral, interrupt handler starts again. And if clearing interrupt factor is completed before GIC register is read in the interrupt handler, INTID of 1023 (0x3FF) may be read since no pending interrupt is available at this moment. To avoid this situation, make sure that interrupt factor is cleared definitely by reading related register before exiting ISR.

3. Operating Modes

3.1 Overview

The LSI is intended for booting up from an external flash memory. Seven boot modes are available for the types of flash memory that supports seven different operating modes. In each of the boot modes, the user program stored in the corresponding external flash memory is booted up and runs. Secure boot mode (in which a user program is protected by encryption) can also be selected for the products that support security functions.

3.2 Types and Selection of Operating Modes

One of the seven types of operating modes can be selected, depending on the method of connecting to an external flash memory and device. An operating mode is selected based on the input levels of the mode setting pins (MD2, MD1, and MD0) at the time pin reset (except software reset) is released.

Table 3.1 describes the relationship between the input levels of the mode setting pins (MD2, MD1, and MD0) at the time reset is released and the selected operating mode. Value of the pins (MD2 to MD0) are latched to the registers when reset is released. For details on individual operating modes, see section 3.5. Operating Mode Descriptions.

Table 3.1 Selection of operating mode for each combination of levels of mode setting pins (MD2, MD1, and MD0)

Mode setting pins			Operating mode
MD2	MD1	MD0	
Low	Low	Low	xSPI0 boot mode (x1 boot serial flash) Boots a program from x1 boot serial flash memory connected to the xSPI0 CS0 space. Supporting voltage (3.3 V or 1.8 V)
Low	Low	High	xSPI0 boot mode (x8 boot serial flash) Boots a program from x8 boot serial flash memory such as HyperFlash memory connected to the xSPI0 CS0 space. Supporting voltage (3.3 V or 1.8 V)
Low	High	Low	16-bit bus boot mode (NOR flash) Boots a program from a NOR flash memory (bus width: 16 bits) connected to the CS0 space.
Low	High	High	Serial host interface boot mode Boots a program downloaded from an external host CPU connected to SHOSTIF.
High	Low	Low	xSPI1 boot mode (x1 boot serial flash) Boots a program from x1 boot serial flash memory connected to the xSPI1 CS0 space.
High	Low	High	SCI (UART) boot mode Boots a program from host PC through UART communication connected to the SCI0. For flash writer use.
High	High	Low	USB boot mode Boots a program from host PC through USB. For flash writer use.
High	High	High	Reserved (setting prohibited)

Additionally, operating voltage of I/O domain 2 and 3 are selected based on the input levels of the voltage setting pins (MDV3 and MDV2). Table 3.2 shows the selection of operating voltage of I/O domain 2 and 3. Value of the pins (MDV3 and MDV2) are latched to the registers when reset is released.

Table 3.2 Selection of operating voltage of I/O domain 2 and 3 (MDV3 and MDV2)

MDVn	Operation voltage of I/O domain n
Low	1.8 V
High	3.3 V

Table 3.3 Selection of operating voltage of I/O domain 2 and 3 (MDV3 and MDV2) (1 of 2)

I/O Domain	MDVn value	Operating voltage of I/O domain
	196 FBGA	196 FBGA
ETH0 (MDV0)*1	High	3.3 V
ETH1 (MDV1)*1	High	3.3 V

Table 3.3 Selection of operating voltage of I/O domain 2 and 3 (MDV3 and MDV2) (2 of 2)

I/O Domain	MDVn value	Operating voltage of I/O domain
	196 FBGA	196 FBGA
ETH2 (MDV2)	Low/High	1.8 V or 3.3 V
XSPI0 (MDV3)	Low/High	1.8 V or 3.3 V
XSPI1 (MDV4)*1	High	3.3 V

Note 1. MDV4, MDV1, and MDV0 pins are not available. I/O voltage is fixed to 3.3 V.

Wait cycle for ATCM is selectable from 0 wait or 1 wait only during reset. So ATCM wait cycle setting pin (MDW) is used to capture the value. The value of this pin is latched to the register when reset is released as well as MDn and MDVn.

Mode setting pins and voltage setting pins can be shared with other peripheral function pins as strap option. The I/O voltage of this pin is 3.3 V. The value of this pin is latched to the register when reset is released.

Table 3.4 Selection of ATCM wait cycle setting pin (MDW)

MDW	ATCM wait cycle
0	0 wait Valid for CPU operating frequency equal to or less than 400 MHz.
1	1 wait

JTAG authentication by hash is handled by boot ROM. Boot ROM must identify whether JTAG is connected at boot sequence. JTAG authentication by hash enabling pin (MDD) is used to notify the CPU of whether JTAG is connected securely. The value of this pin is latched to the register when reset is released as well as other mode setting pins. This pin is valid for products that support security functions.

Table 3.5 Selection of JTAG authentication by Hash

MDD	JTAG mode
Low	Normal mode JTAG authentication by Hash is disabled
High	JTAG authentication by Hash mode

Mode setting pins and voltage setting pins can be shared with other peripheral function pins as strap option. The I/O voltage of these pins is 3.3 V.

3.3 Hardware Used in Individual Operating Modes

Table 3.6 describes hardware used in individual operating modes. Pins to be used indicates pins required to execute each operating mode. At boot, the initial values defined for each operating mode are automatically set to these pins by hardware.

Table 3.6 Hardware used in individual operating modes (1 of 2)

Operating mode	Peripheral module	Pins to be used
xSPI boot mode (x1 boot Serial flash)	Expanded serial peripheral interface (xSPI0)	XSPI0_CKP XSPI0_CS0# XSPI0_IO0, XSPI0_IO1
xSPI boot mode (x8 boot Serial flash)	Expanded serial peripheral interface (xSPI0)	XSPI0_CKP, XSPI0_CKN XSPI0_CS0#, XSPI0_DS XSPI0_IO0 to XSPI0_IO7 XSPI0_RESET0#
16-bit bus boot mode (NOR flash)	Bus state controller (BSC)	A20 to A1, D15 to D0 CS0#, RD#
Serial host interface boot mode	Serial host interface (SHOSTIF)	HSPI_CK, HSPI_CS#, HSPI_IO[n:0], MBX_HINT# (Number of HSPI_IO (n) is dependent on OTP setting (SHBMS).)
xSPI boot mode (x1 boot Serial flash)	Expanded serial peripheral interface (xSPI1)	XSPI1_CKP, XSPI1_CS0#, XSPI1_IO0, XSPI1_IO1

Table 3.6 Hardware used in individual operating modes (2 of 2)

Operating mode	Peripheral module	Pins to be used
SCI (UART) boot mode	Serial communication interface (SCI)	TXD0, RXD0
USB boot mode	USB 2.0 HS function module	USB_DP USB_DM

Note: For relationship between pin function and I/O port on boot mode, see section 16.6.4. Pin Assignment of each Boot Mode.

3.4 Register Descriptions

3.4.1 MD_MON : Operating Mode Monitor Register

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x1100

Bit position:	31											20	19	18	17	16		14	13	12							4				0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	MDV4MON	MDV3MON	MDV2MON	MDV1MON	MDV0MON	—	MD2MON	MD1MON	MD0MON	—	—	—	—	—	—	—	MDWMON	—	—	—	MDDMON
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	*1	*1	*1	*1	*1	0	*1	*1	*1	0	0	0	0	0	0	0	*1	0	0	0	*1

Bit	Symbol	Function	R/W
0	MDDMON	MDD status flag This bit holds a value that indicates the level on the external MDD pin latched when reset is released.	R
3:1	—	These bits are read as 0.	R
4	MDWMON	MDW status flag This bit holds a value that indicates the level on the external MDW pin latched when reset is released.	R
11:5	—	These bits are read as 0.	R
12	MD0MON	MD0 pin status flag This bit holds a value that indicates the level on the external MD0 pin latched when reset is released.	R
13	MD1MON	MD1 pin status flag This bit holds a value that indicates the level on the external MD1 pin latched when reset is released.	R
14	MD2MON	MD2 pin status flag This bit holds a value that indicates the level on the external MD2 pin latched when reset is released.	R
15	—	This bit is read as 0.	R
16	MDV0MON	MDV0 status flag (ETH0 domain) This bit holds a value that indicates the level on the external MDV0 pin latched when reset is released. This bit is reserved and read as 1.	R
17	MDV1MON	MDV1 status flag (ETH1 domain) This bit holds a value that indicates the level on the external MDV1 pin latched when reset is released. This bit is reserved and read as 1.	R
18	MDV2MON	MDV2 status flag (ETH2 domain) This bit holds a value that indicates the level on the external MDV2 pin latched when reset is released.	R
19	MDV3MON	MDV3 status flag (xSPI0 domain) This bit holds a value that indicates the level on the external MDV3 pin latched when reset is released.	R

Bit	Symbol	Function	R/W
20	MDV4MON	MDV4 status flag (xSPI1 domain) This bit holds a value that indicates the level on the external MDV4 pin latched when reset is released. This bit is reserved and read as 1.	R
31:21	—	These bits are read as 0.	R

Note 1. The value depends on whether the signal is being externally pulled up or down, and the value at the time of latching on deassertion of the reset signal.

The MD_MON register is for checking the mode (externally pulled up or down) of the MDn, MDVn, and MDD pins by the CPU.

This register latches the values at the same time as deassertion of the signal on the external reset pin (RES#). Afterwards, it holds the values until the signal is asserted again. For reset sources and the timing of release from the reset state, see section 5, Reset.

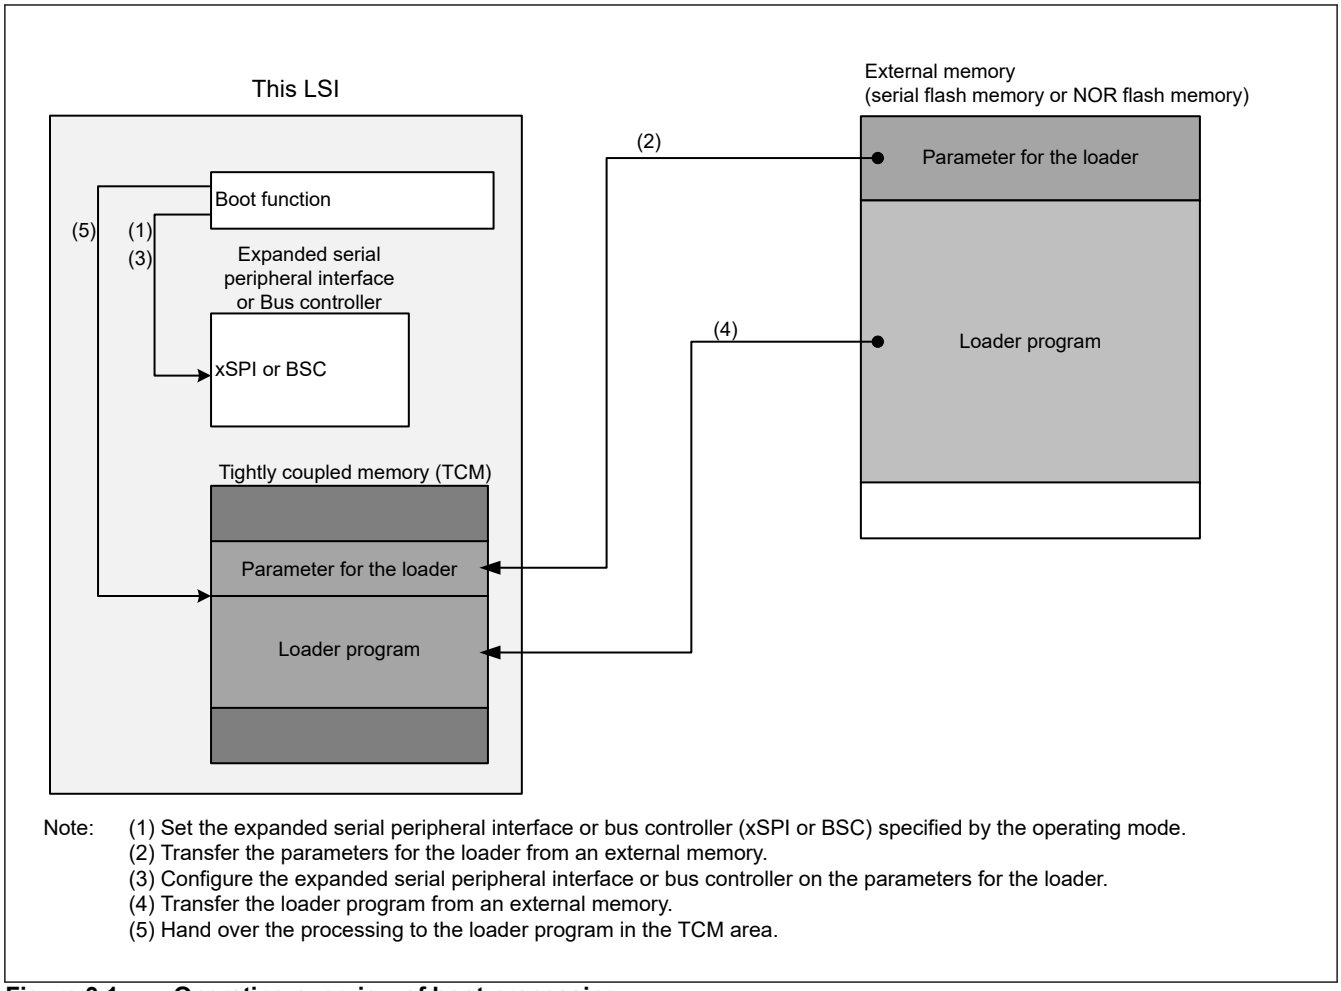
3.5 Operating Mode Descriptions

3.5.1 Boot Function

After reset is released on this LSI, the boot function executes the boot processing on CPU0 as described below. The boot processing can extract a loader program that was stored in an external memory in advance by the user, to the internal tightly coupled memory (TCM) area, and hand over the processing to the loader program at the start address of that program.

(1) Setting the expanded serial peripheral interface or bus controller (xSPI or BSC) specified by the mode setting pins (MD2, MD1, and MD0)

(2) Loading parameters for the loader from an external memory, and checking CHECK_SUM value



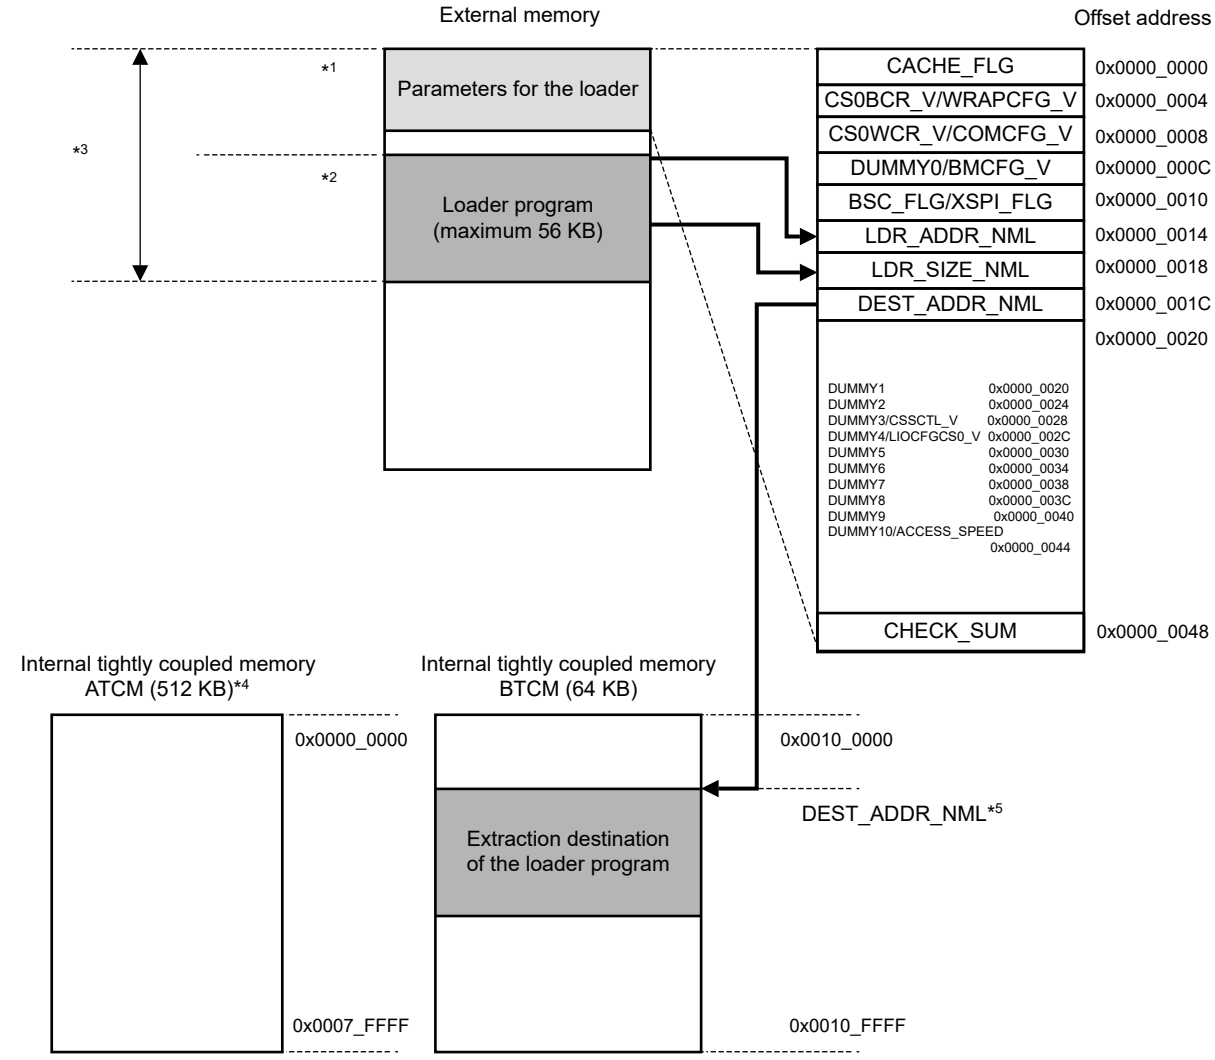
(3) Setting for speeding up the expanded serial peripheral interface or bus controller (xSPI or BSC) by using parameters for the loader

(4) Loading the loader program from an external memory

(5) Branching off to the start address of the loader program extracted to the tightly coupled memory (TCM)

Parameters for the loader can have configuration information that is suited for the user system, such as loader program information, cache setting for speeding up the boot processing, and expanded serial peripheral interface or bus controller (xSPI or BSC) settings. Parameters for the loader must be stored in an external memory in advance by the user.

Figure 3.1 shows the operating overview of boot processing.



Note: (1) Set the expanded serial peripheral interface or bus controller (xSPI or BSC) specified by the operating mode.
(2) Transfer the parameters for the loader from an external memory.
(3) Configure the expanded serial peripheral interface or bus controller on the parameters for the loader.
(4) Transfer the loader program from an external memory.
(5) Hand over the processing to the loader program in the TCM area.

Figure 3.1 Operating overview of boot processing

3.5.2 Parameters for the Loader

The parameters for the loader are setting parameters for boot processing, which are loaded from an external memory during boot processing and used by the boot function. The parameters for the loader specify information, such as the cache settings during boot processing in individual operating modes, setting of the expanded serial peripheral interface or bus controller (xSPI or BSC) used for communication with an external memory, and the size of the loader program.

Figure 3.2 shows memory assignment of the loader program and parameters for the loader.

Note 1. The parameters for the loader must be stored in the following address range:
Serial flash boot mode: xSPI0 or xSPI1 space (0x6000_0000 and higher or 0x6800_0000 and higher)
Parallel flash boot mode: External address space (CS0) (0x7000_0000 and higher)
Note 2. The loader program can be stored in any address (LDR_ADDR_NML). However, the program size (LDR_SIZE_NML) must be multiples of 512 bytes but no more than 56 KB.
Note 3. In 16-bit bus boot mode, use addresses in the range from 0x7000_0000 to 0x701F_FFFF because the address output pins (A1 to A20) of the bus state controller (BSC) is used in this mode.
Note 4. The ATCM area is assumed to be used for storing user application programs.
Note 5. Specify the extraction destination area of the loader program so that the area falls in the range from 0x0010_2000 to 0x0010_FFFF.

Figure 3.2 Memory assignment of the loader program and parameters for the loader

Table 3.7 describes parameter information for the loader in 16-bit bus boot mode and Table 3.8 describes parameter information for the loader in xSPI boot mode.

Table 3.7 Parameter information for the loader in 16-bit bus boot mode (1 of 2)

Offset address	Parameter name	Description
0x0000_0000	CACHE_FLG	Selects whether to enable the I1 cache and D1 cache of Cortex-R52 during boot processing (for speeding up). 0x0000_0001: Enables the I1 and D1 caches. Setting values other than above: Disables the I1 and D1 caches.

Table 3.7 Parameter information for the loader in 16-bit bus boot mode (2 of 2)

Offset address	Parameter name	Description
0x0000_0004	CS0BCR_V	Setting value of the CS0 Space Bus Control Register (CS0BCR) This parameter value is set to the CS0BCR register during the setting for speeding up of BSC in (3) of section 3.5.1. Boot Function.*1
0x0000_0008	CS0WCR_V	Setting value of the CS0 Space Wait Control Register (CS0WCR) This parameter value is set to the CS0WCR register during the setting for speeding up of BSC in (3) of section 3.5.1. Boot Function.*1
0x0000_000C	DUMMY0	Option (not used in this mode)
0x0000_0010	BSC_FLG	Selects whether to change the BSC setting back to the initial value after the boot processing finishes. 0x2236_0679: Changes the BSC setting value back to the initial value after the boot processing finishes. Setting values other than above: Retains the BSC setting value used in the boot processing.*2
0x0000_0014	LDR_ADDR_NML	Sets the start address of the loader program stored in the external memory.*3
0x0000_0018	LDR_SIZE_NML	Specifies the size of the loader program. Note that the program size must be multiples of 512 bytes but no more than 56 KB.*3
0x0000_001C	DEST_ADDR_NML	Specifies the start address of the tightly coupled memory (BTCM) that is used as the extraction destination of the loader program. Specify the extraction destination area of the loader program so that the area falls in the range from 0x0010_2000 to 0x0010_FFFF.
0x0000_0020	DUMMY1	Option (not used in this mode)
0x0000_0024	DUMMY2	Option (not used in this mode)
0x0000_0028	DUMMY3	Option (not used in this mode)
0x0000_002C	DUMMY4	Option (not used in this mode)
0x0000_0030	DUMMY5	Option (not used in this mode)
0x0000_0034	DUMMY6	Option (not used in this mode)
0x0000_0038	DUMMY7	Option (not used in this mode)
0x0000_003C	DUMMY8	Option (not used in this mode)
0x0000_0040	DUMMY9	Option (not used in this mode)
0x0000_0044	DUMMY10	Option (not used in this mode)
0x0000_0048	CHECK_SUM	CHECK_SUM value for the parameters for the loader This parameter specifies the sum of the upper-order 16 bits and the lower-order 16 bits of the parameters (in unsigned long (32-bit) format) in the range of the offset addresses 0x0000 to 0x0044.*4

Note 1. For details on the CS0BCR and CS0WCR registers, see section 13, Bus State Controller.
Note 2. For details on the setting status of individual peripheral modules after the boot processing finishes, see section 3.5.5.1. Operation Settings in 16-Bit Bus Boot Modes.
Note 3. The loader program must be in the range from 0x7000_004C to 0x701F_FFFF in the external address space (CS0).
Note 4. An example for calculating CHECK_SUM is as follows:

If CS0BCR_V = 0x36DB_0C00, CS0WCR_V = 0x0000_0340, LDR_ADDR_NML = 0x7000_004C, LDR_SIZE_NML = 0x0000_6000, DEST_ADDR_NML = 0x0080_2000, and others = 0x0000_0000

CHECK_SUM is calculated as below (0x0000 is omitted in the formula):

CHECK_SUM = 0x36DB + 0x0C00 + 0x0340 + 0x7000 + 0x004C + 0x6000 + 0x0080 + 0x2000 = 0x0001_36E7

Table 3.8 Parameter information for the loader in xSPI boot mode (1 of 3)

Offset address	Parameter name	Description
0x0000_0000	CACHE_FLG	Selects whether to enable the I1 cache and D1 cache of Cortex-R52 at boot processing (for speeding up). 0x0000_0001: Enables the I1 and D1 caches. Setting values other than above: Disables the I1 and D1 caches.

Table 3.8 Parameter information for the loader in xSPI boot mode (2 of 3)

Offset address	Parameter name	Description
0x0000_0004	WRAPCFG_V	Setting value of the xSPI Wrapper Configuration register (WRAPCFG). This parameter value is set to the DSSFTCS0[4:0] bits in the WRAPCFG register during the setting for speeding up of xSPI in (3) of section 3.5.1. Boot Function *1. The bit 13 of WRAPCFG_V is used as the flag. In case of WRAPCFG_V[13] = 0: This parameter value is ignored and kept the reset value. In case of WRAPCFG_V[13] = 1: This parameter value is valid and set to the WRAPCFG register. The DSSFTCS1[4:0] bits in the WRAPCFG register remain the reset value.
0x0000_0008	COMCFG_V	Setting value of the xSPI Common Configuration register (COMCFG). This parameter value is set to the COMCFG register during the setting for speeding up of xSPI in (3) of section 3.5.1. Boot Function *1.
0x0000_000C	BMCFG_V	Setting value of the xSPI Bridge Map Configuration register (BMCFG). This parameter value is set to the PREEN bit in the BMCFG register during the setting for speeding up of xSPI in (3) of section 3.5.1. Boot Function *1. The other bits in the BMCFG register remain the reset value.
0x0000_0010	xSPI_FLG	Selects whether to change the xSPI setting back to the initial value after the boot processing finishes. 0x2236_0679: Changes the xSPI setting value back to the initial value after the boot processing finishes. Setting values other than above: Retains the xSPI setting value used during boot processing.*2
0x0000_0014	LDR_ADDR_NML	Sets the start address of the loader program stored in the external memory.
0x0000_0018	LDR_SIZE_NML	Specifies the size of the loader program. Note that the program size must be multiples of 512 bytes but no more than 56 KB*3.
0x0000_001C	DEST_ADDR_NML	Specifies the start address of the tightly coupled memory (BTCM) that is used as the extraction destination of the loader program. Specify the extraction destination area of the loader program so that the area falls in the range from 0x0010_2000 to 0x0010_FFFF.
0x0000_0020	DUMMY1	Option (not used in this mode)
0x0000_0024	DUMMY2	Option (not used in this mode)
0x0000_0028	CSSCTL_V	Setting value of the xSPI CS Size Control register (CSSCTL). This parameter value is set to the CS0SIZE[5:0] bits in the CSSCTL register during the setting for speeding up of xSPI in (3) of section 3.5.1. Boot Function*1. The CS1SIZE[5:0] bits in the CSSCTL register remain the reset value.
0x0000_002C	LIOCFGCS0_V	Setting value of the xSPI link I/O Configuration Register CS0 (LIOCFGCS0). This parameter value is set to the LIOCFGCS0 register during the setting for speeding up of xSPI in (3) of section 3.5.1. Boot Function*1. This parameter is effective on only bit 31 to bit 16 of LIOCFGCS0 register. Bit 11 to bit 0 are fixed each boot mode (x1 or x8). The bit 14 of LIOCFGCS0_V is used as the flag. In case of LIOCFGCS0_V[14] = 0: This parameter value is ignored and kept the reset value. In case of LIOCFGCS0_V[14] = 1: This parameter value is valid and set to the LIOCFGCS0 register.
0x0000_0030	DUMMY5	Option (not used in this mode)
0x0000_0034	DUMMY6	Option (not used in this mode)
0x0000_0038	DUMMY7	Option (not used in this mode)
0x0000_003C	DUMMY8	Option (not used in this mode)
0x0000_0040	DUMMY9	Option (not used in this mode)

Table 3.8 Parameter information for the loader in xSPI boot mode (3 of 3)

Offset address	Parameter name	Description
0x0000_0044	ACCESS_SPEED	This parameter is used to adjust access speed for the external memory. For xSPI boot mode using xSPI0, this value is set to FSELXSPI0[2:0] bits and DIVSELXSPI0 bit of SCKCR register. For example, Bit 6: DIVSELXSPI0 = 0 The base clock to generate serial clock is 800 MHz. Bits [2:0]: FSELXSPI0[2:0] = 100b. The clock frequency is 50.0 MHz. Other bit: Is not used to set SCKCR register. For xSPI boot mode using xSPI1, set bit 6 and bits [2:0] of this parameter as well as xSPI0 to set FSELXSPI1[2:0] bits and DIVSELXSPI1 bit of SCKCR register. Bit 14 and bits [10:8] of this parameter are ignored.
0x0000_0048	CHECK_SUM	CHECK_SUM value of the parameters for the loader This parameter specifies the sum of the upper-order 16 bits and the lower-order 16 bits of the parameters (in unsigned long (32-bit) format) in the range of the offset addresses 0x0000 to 0x0044.

Note 1. For details on the WRAPCFG, COMCFG, MBCFG, CMCFG0CS0, CMCFG1CS0, and LIOCFGCSn registers, see section 35, Expanded Serial Peripheral Interface (xSPI) (n = 0, 1).
Note 2. For details about the setting status of the individual peripheral modules after the boot processing finishes, see section 3.5.7.1. Operation Setting in SCI Boot Mode.
Note 3. The loader program must be in the range from 0x6000_004C to 0x60FF_FE00 (xSPI0) or 0x6800_004C to 0x68FF_FE00 (xSPI1) in the external address space.

3.5.3 Loader Program

The loader program is a user program that is transferred from an external memory to the internal tightly coupled memory (TCM) by the boot function and starts its processing after the boot processing finishes. The loader program can execute such processing that suits the user system, for example, extracting a user application program from an external memory to the internal TCM area and executing it at high speed.

Set the loader program so that the following conditions are satisfied:

Program size (LDR_SIZE_NML)	Multiples of 512 bytes but no more than 56 KB
Storage address in the external memory (LDR_ADDR_NMI) in 16-bit boot mode	Address range from A1 to A20 for 16-bit Bus boot mode
Storage address in the external memory (LDR_ADDR_NML) in xSPI0 boot mode	Address range from 0x6000_004C to 0x60FF_FE00
Storage address in the external memory (LDR_ADDR_NML) in xSPI1 boot mode	Address range from 0x6800_004C to 0x68FF_FE00

These setting values must be stored in an external memory as parameters for the loader. For details, see section 3.5.2. Parameters for the Loader.

3.5.4 xSPI Boot Mode (Serial Flash)

3.5.4.1 x1 Boot Serial Flash

In xSPI boot mode with x1 boot serial flash, this LSI boots a program from an external serial flash memory connected to the expanded Serial Peripheral Interface (xSPI0 or xSPI1) space CS0 with single, dual, quad, or octal data signals. In this mode, used protocol is 1S-1S-1S regardless of number of data signals of the flash. The xSPI controller is set to the mode of reading the external address space, and the XSPI0_CKP, XSPI0_CS0#, and XSPI0_IO[1:0] pins are enabled for MD[2:0] = 000b. XSPI1_CKP, XSPI1_CS0#, and XSPI1_IO[1:0] pins are enabled for MD[2:0] = 111b.

After the reset is released, the LSI executes the boot processing on CPU0. The program stored in a serial flash memory connected to the expanded SPI space is extracted to the internal tightly coupled memory (TCM), and then the processing is executed.

Figure 3.3 shows the connection diagram of this LSI with a serial flash memory.

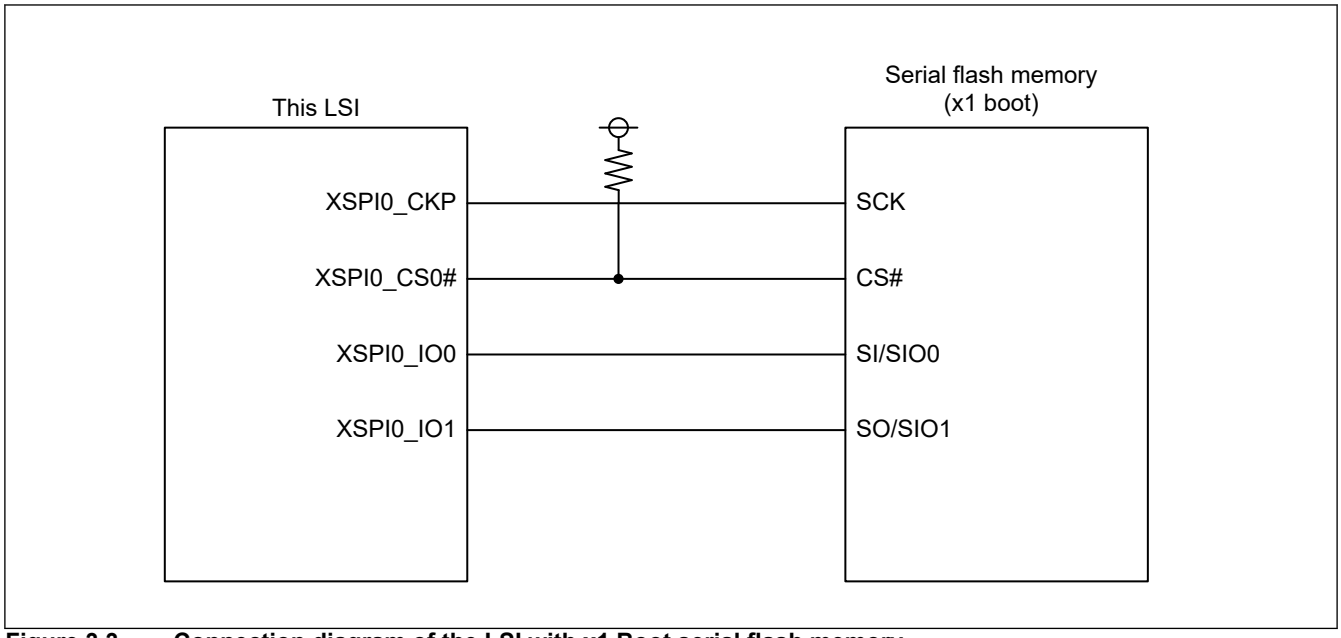


Figure 3.3 Connection diagram of the LSI with x1 Boot serial flash memory

3.5.4.2 x8 Boot Serial Flash

In xSPI boot mode with x8 boot serial flash, this LSI boots a program from an external x8 serial flash memory such as HyperFlash and xSPI 8D-8D-8D profile 2.0 compliant device connected to the expanded Serial Peripheral Interface (xSPI0) space CS0 with octal data signals. In this mode, the xSPI0 controller is set to the mode of reading the external address space, and the XSPI0_CKP, XSPI0_CKN, XSPI0_CS0#, XSPI0_IO[7:0], XSPI0_DS, and XSPI0_RESET0# pins are enabled.

After the reset is released, the LSI executes the boot processing on CPU0. The program stored in a serial flash memory connected to the expanded SPI space is extracted to the internal tightly coupled memory (TCM), and then the processing is executed.

Figure 3.4 shows the connection diagram of this LSI with a serial flash memory.

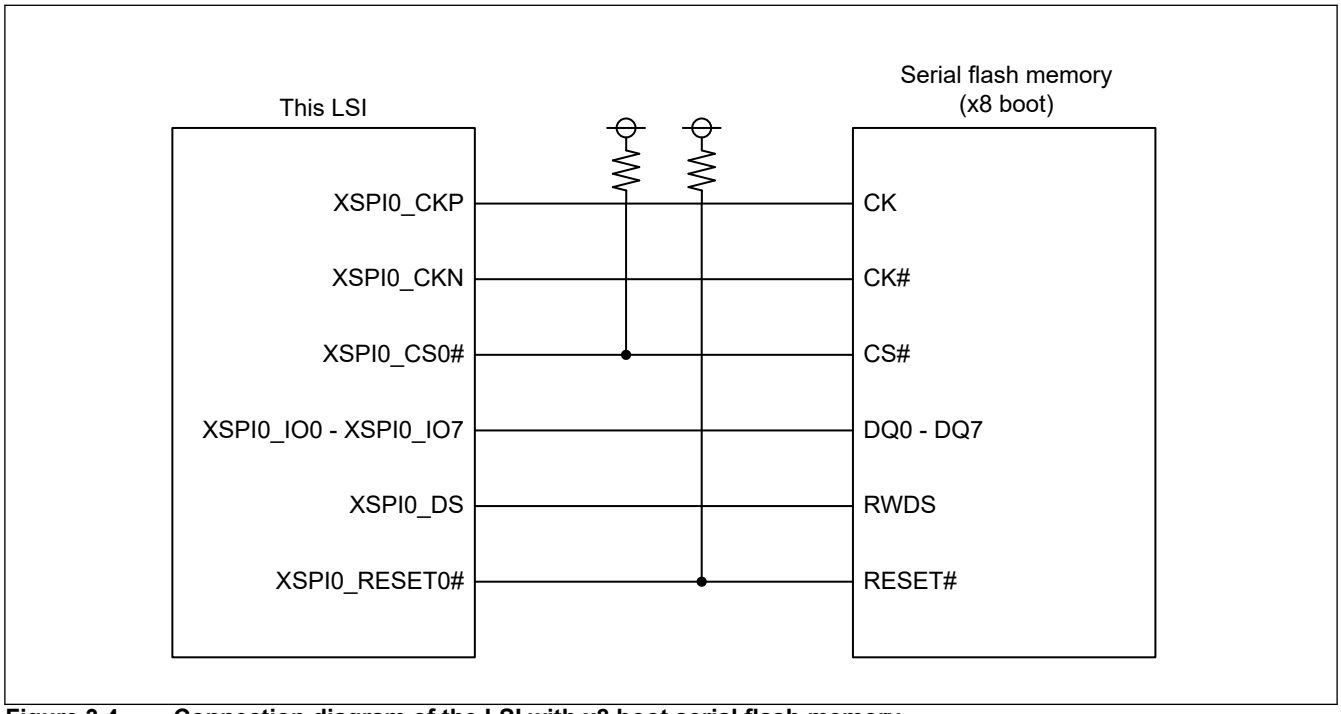

Figure 3.4 Connection diagram of the LSI with x8 boot serial flash memory

3.5.4.3 Operation Settings in xSPI Boot Mode

Immediately after the boot processing starts in xSPI boot mode after the reset is released, the LSI operates with the following initial setting values and executes processing until it transfers parameters for the loader.

Items	x1 boot	x8 boot
CPU clock (CPU0CLK)	200 MHz	
xSPI bit rate (XSPI_CLKn)	12.5 MHz*1	
Supported command	Read (0x03)	Read (CA[47:45] = 101b)
Command output	1 byte	6 bytes
Address output	3 bytes	
Dummy cycle (Read latency cycle)	0	10 Latency cycle increments from CA[23:16]
Initial data width	1 bit	8 bits
Protocol	1S-1S-1S	8D-8D-8D profile 2.0
Driving edge	Falling edge of XSPIn_CKP	Both edges of XSPI0_CKP
Sampling edge	Falling edge of XSPIn_CKP	Both edges of XSPI0_DS with shift*2
Flash reset	Software (0x66 + 0x99)	Hardware by XSPI0_RESET0#

Note 1. Serial clock frequency is configurable in parameter.
Note 2. DS shift size is configurable in parameter.

Table 3.9 describes the setting values of the related peripheral modules and registers at the time the xSPI boot mode finishes.

Table 3.9 Setting register values of the related peripheral modules when xSPI boot mode finishes (1 of 2)

Peripheral module	Register	When xSPI is initialized (xSPI_FLG = 0x22360679)		When xSPI is not initialized (xSPI_FLG ≠ 0x22360679)	
		x1	x8	x1	x8
Low power consumption	MSTPCRA	xSPI0: 0x00001F21 xSPI1: 0x00001F11	xSPI0: 0x00001F21	xSPI0: 0x00001F21 xSPI1: 0x00001F11	xSPI0: 0x00001F21
xSPI	WRAPCFG	0x00000000 (initial value)	0x00000000 (initial value)	Setting value of WRAPCFG_V (only DSSFTCS0[4:0] bits) If flag bit is not set, 0x00000000.	Setting value of WRAPCFG_V (only DSSFTCS0[4:0] bits) If flag bit is not set, 0x00001F00.
	COMCFG	0x00000000 (initial value)	0x00000000 (initial value)	Setting value of COMCFG_V	Setting value of COMCFG_V

Note 1. See section 16.6.4.2. Pin Assignment for xSPI Boot Mode in detail.

3.5.5 16-Bit Bus Boot Modes (NOR Flash Memory)

In 16-bit bus boot mode, this LSI boots a program from an external NOR flash memory connected to the external address space (CS0). The bus width is fixed to 16 bits.

In 16-bit Bus boot mode, the A20 to A1, D15 to D0, CS0#, and RD# of the bus state controller are enabled.

After the reset is released, the LSI executes the boot processing. The loader program stored in a NOR flash memory connected to the CS0 space is extracted to the internal tightly coupled memory (TCM), and then the processing is executed.

Figure 3.5 shows the connection diagrams of the LSI with NOR flash memory.

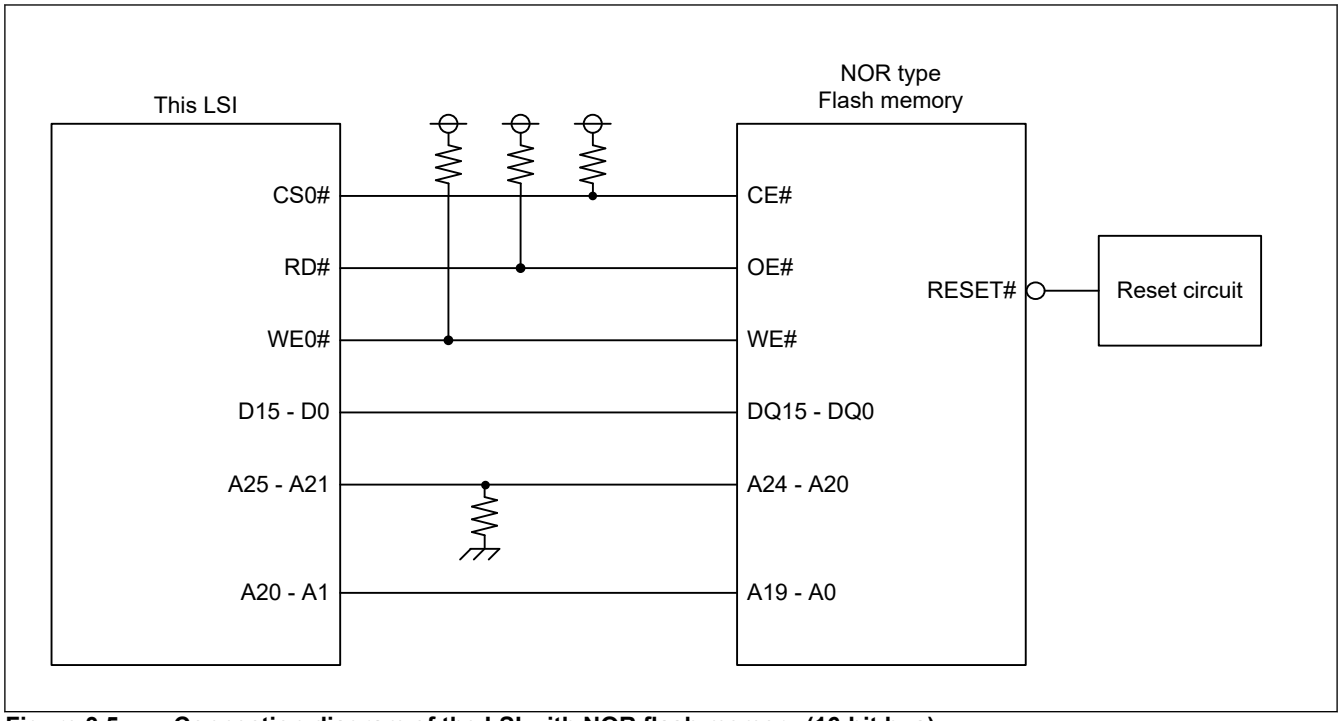

Figure 3.5 Connection diagram of the LSI with NOR flash memory (16-bit bus)

3.5.5.1 Operation Settings in 16-Bit Bus Boot Modes

After the reset is released, if the boot processing starts in 16-bit bus boot mode, the following setting values are used:

- CPU clock (CPU0CLK): 200 MHz
- External bus clock (CKIO): 50 MHz

After the parameters for the loader are loaded, the settings for the I1 and D1 caches of Cortex-R52 and for the CS0BCR and CS0WCR registers are performed based on the values of the CACHE_FLG, CS0BCR_V, and CS0WCR_V parameters so that the processing can be sped up.

Table 3.10 describes the setting values of the related peripheral modules and registers at the time when 16-bit bus boot mode finishes.

Table 3.10 Setting register values of the related peripheral modules when bus boot mode finishes

Peripheral module	Register	When BSC is initialized (BSC_FLG = 0x22360679)	When BSC is not initialized (BSC_FLG ≠ 0x22360679)
Low power consumption	MSTPCRA	0x00001F30	0x00001F30
BSC	CS0BCR	0x36DB0C00 (initial value)	Setting value of CS0BCR_V
	CS0WCR	0x00000500 (initial value)	Setting value of CS0WCR_V
I/O ports	PMCm	Only the corresponding bits are 1*1	Only the corresponding bits are 1*1
	PFCm	Only the corresponding bits are 0000b, 0001b, 0010b, 0011b, or 1000b*1	Only the corresponding bits are 0000b, 0001b, 0010b, 0011b, or 1000b*1
	DRCTLm	Only the corresponding DRV[1:0] bits are 01b if IO Type is Type A.	Only the corresponding DRV[1:0] bits are 01b if IO Type is Type A.

Note 1. The bits corresponding to A1 to A20 pins, D0 to D15 pins, RD# pin, and CS0# pin in 16-bit bus boot mode. See section 16.6.4.1. Pin Assignment for BSC Boot Mode.

3.5.6 Host Interface Boot Mode

In host interface boot mode, loader program and user program are transferred from external host CPU as master device to the RZ/T2L as slave device via host interface. Then Cortex-R52 on this LSI executes those programs.

This LSI configures the host interface based on the operation mode setting stored in OTP after releasing reset first. After receiving the reception ready mailbox interrupt from this LSI, external host CPU can transfer parameter and loader program to the System SRAM. After external host CPU informs the completion of the transfer via mailbox, Cortex-R52 transfers the loader programs from System SRAM to BTCM. Then loader program on BTCM is executed.

Loader program should inform the status of the boot and further requests to the external host CPU via mailbox and its interrupt.

3.5.6.1 Boot Sequence

Figure 3.6 is the boot sequence of host interface boot mode.

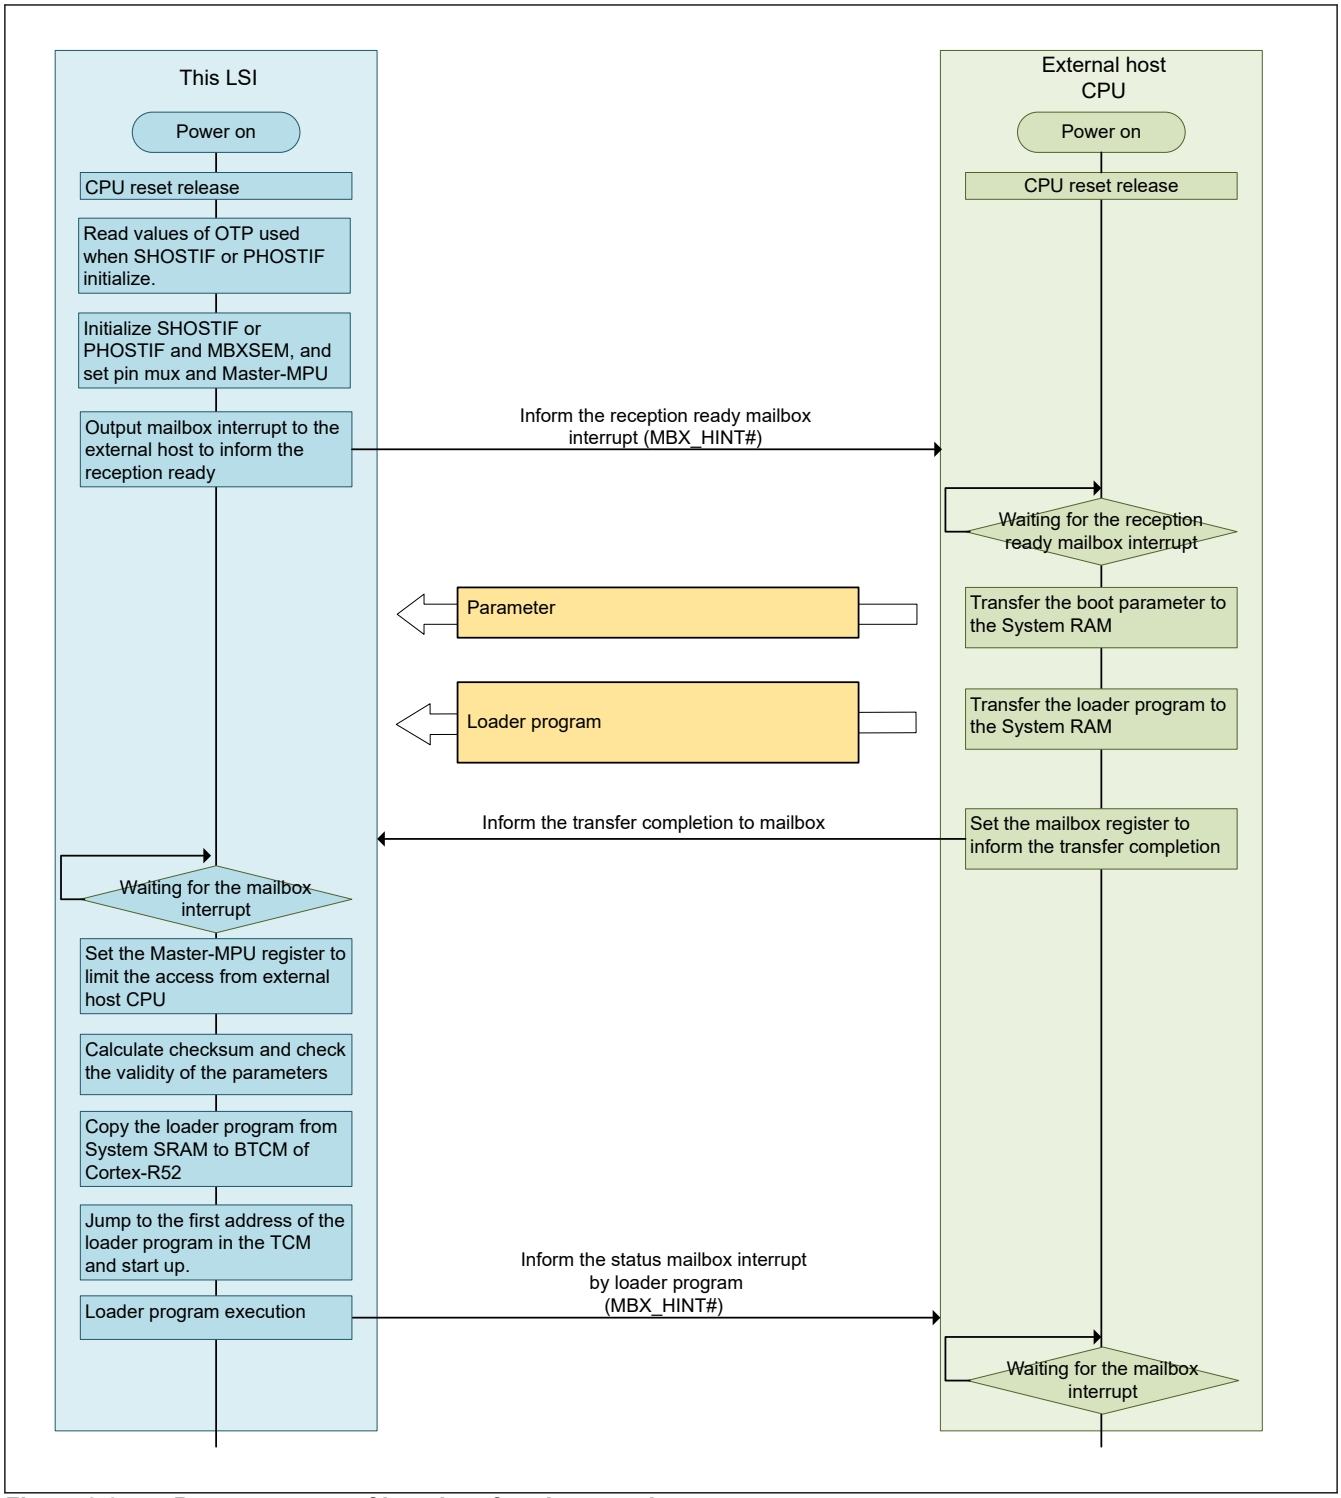

Figure 3.6 Boot sequence of host interface boot mode

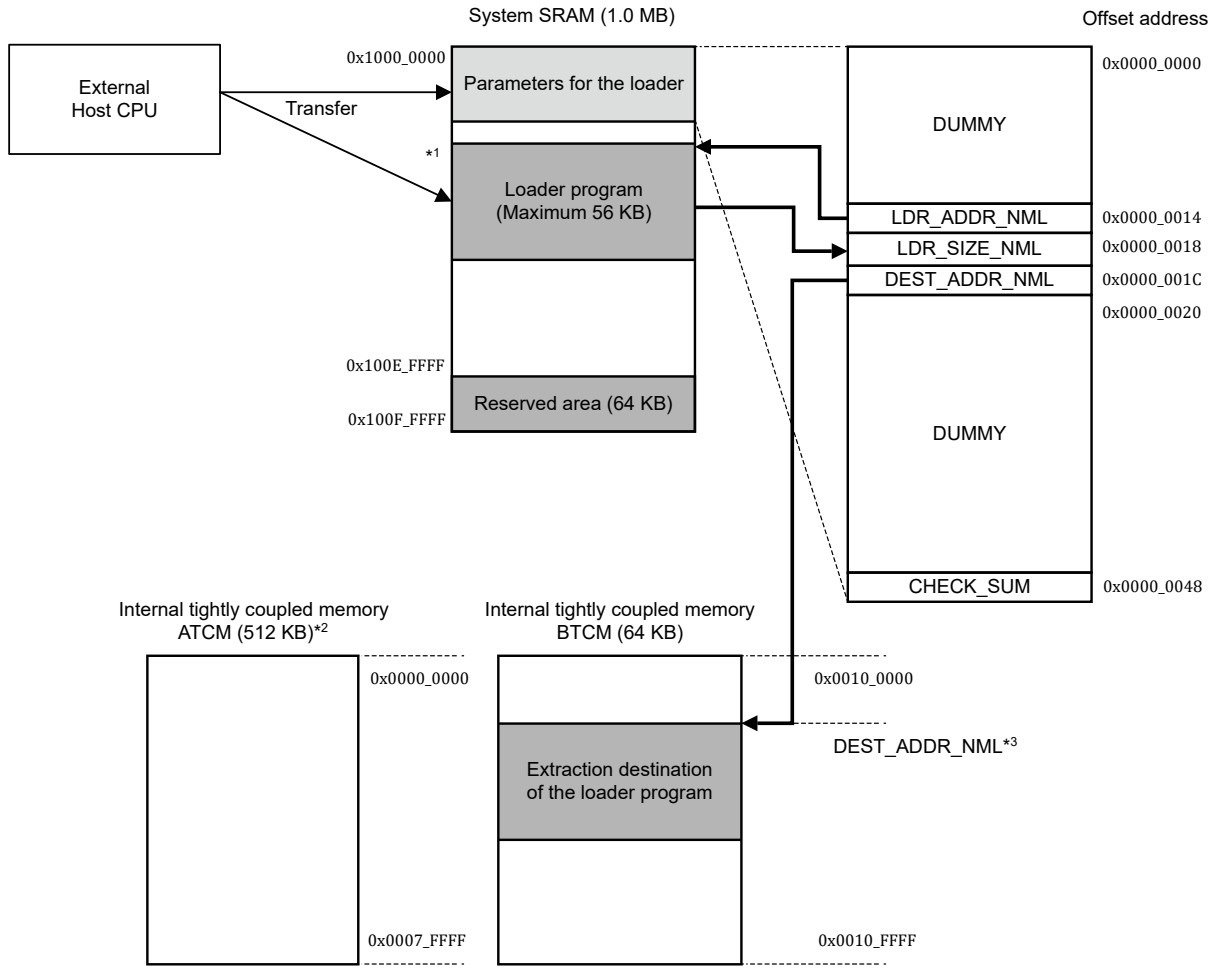
3.5.6.2 Parameter and Loader Program

Parameter for the loader program is transferred from external host CPU to the System SRAM to set the size and address of the loader program. Transferred address of parameter is fixed to 0x1000_0000.



The loader program is a user program that is transferred from external host CPU to the System SRAM, and starts its processing after the boot processing finishes. Set the loader program so that the following conditions are satisfied:

- Program size (LDR_SIZE_NML)

  Multiples of 512 bytes and no more than 56 KB

- Storage address in the System SRAM (LDR_ADDR_NMI)
  Address range from 0x1000_004C to 0x100E_FFFF

Figure 3.7 shows memory assignment of the loader program and parameters for the loader.

Note 1. The loader program should be transferred in any address (LDR_ADDR_NML) in System SRAM from external host CPU. Note that, however, the program size (LDR_SIZE_NML) must be multiples of 512 bytes and no more than 56 KB.
Note 2. The ATCM area is assumed to be used for storing user application programs.
Note 3. Specify the extraction destination area of the loader program so that the area falls in the range from 0x0010_2000 to 0x0010_FFFF.

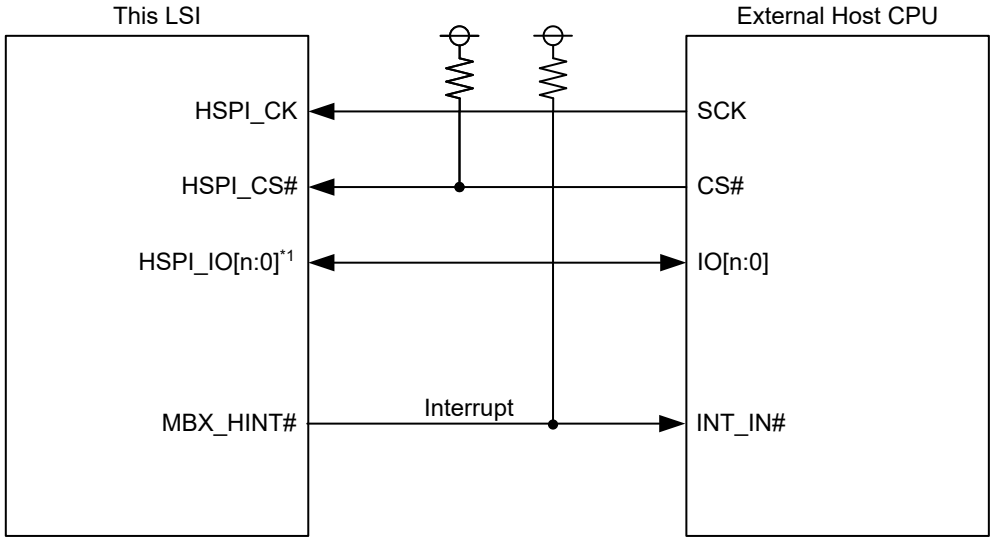
Figure 3.7 Memory assignment of the loader program and parameters for the loader

Table 3.11 describes parameter information for the loader in host interface boot mode.

Table 3.11 Parameter information for the loader in host interface boot mode (1 of 2)

Offset address	Parameter name	Description
0x0000_0000	DUMMY	Option (not used in this mode)
0x0000_0004	DUMMY	Option (not used in this mode)
0x0000_0008	DUMMY	Option (not used in this mode)
0x0000_ 000C	DUMMY	Option (not used in this mode)
0x0000_ 0010	DUMMY	Option (not used in this mode)
0x0000_ 0014	LDR_ADDR_NML	Sets the start address of the loader program stored in the System SRAM. Allowable address range is from 0x1000_004C to 0x100E_FFFF.

Table 3.11 Parameter information for the loader in host interface boot mode (2 of 2)



Offset address	Parameter name	Description
0x0000_ 0018	LDR_SIZE_NML	Specifies the size of the loader program. Note that the program size must be multiples of 512 bytes and no more than 56 KB.
0x0000_ 001C	DEST_ADDR_NML	Specifies the start address of the tightly coupled memory (BTCM) that is used as the extraction destination of the loader program. Specify the extraction destination area of the loader program so that the area falls in the range from 0x0010_2000 to 0x0010_FFFF.
0x0000_ 0020	DUMMY	Option (not used in this mode)
0x0000_ 0024	DUMMY	Option (not used in this mode)
0x0000_ 0028	DUMMY	Option (not used in this mode)
0x0000_ 002C	DUMMY	Option (not used in this mode)
0x0000_ 0030	DUMMY	Option (not used in this mode)
0x0000_ 0034	DUMMY	Option (not used in this mode)
0x0000_ 0038	DUMMY	Option (not used in this mode)
0x0000_ 003C	DUMMY	Option (not used in this mode)
0x0000_ 0040	DUMMY	Option (not used in this mode)
0x0000_ 0044	DUMMY	Option (not used in this mode)
0x0000_ 0048	CHECK_SUM	Checksum value for the parameters for the loader This parameter specifies the sum of the higher-order 16 bits and the lower-order 16 bits of the parameters (in unsigned long (32-bit) format) in the range of the offset addresses 0x0000 to 0x0044.*1

Note 1. An example for calculating CHECK_SUM is given below.
If LDR_ADDR_NML = 0x1000_004C, LDR_SIZE_NML = 0x0000_6000, DEST_ADDR_NML= 0x0010_2000, and others = 0x0000_0000,
CHECK_SUM is calculated as below ((0x0000_) is omitted in the formula):
CHECK_SUM = (0x1000) + (0x004C) + (0x6000) + (0x0010) + (0x2000) = (0x0000_905C)

3.5.6.3 Serial Host Interface Boot Mode

In serial host interface boot mode, this LSI is connected to external host CPU via serial host interface (SHOSTIF). Parameter and the loader program are transferred from external host CPU to this LSI via SHOSTIF, and this LSI boots that program.

Figure 3.8 shows the connection diagram of this LSI with external host CPU via serial host interface. At booting, x1, x2, x4, or x8 connection is available according to the SHOSTIF Boot Mode Setting (SHBMS) in OTP. SHBMS includes other boot mode setting as well as width of IO as shown in Table 3.12. During boot processing, values are set to the corresponding registers. To enable to change the setting, 4 areas (OTP address: 0x1B5 to 0x1B8) are available. If VALID bit of either address is 1, setting of the valid address is applied. If VALID bits of multiple addresses are 1, setting of the highest address in the valid addresses is applied. If no VALID bit in 4 areas, all the configuration bits are set to 0.

Note 1. Used I/Os are dependent on setting of the SPIMODE[1:0].

Figure 3.8 Connection diagram of this LSI with external host CPU (serial host interface)

Table 3.12 SHBMS contents

Bit	Bit name	Description
0	SCPH	Clock Phase Specifies value of SCPH bit in CTRLR0 register.
1	SCPOL	Clock Polarity Specifies value of SCPOL bit in CTRLR0 register.
2	—	Reserved
4:3	SPIMODE[1:0]	Width of IOs Specifies value of SPIMODE[1:0] bits in SHCFG register.
5	BYTESWAP	Byteswap mode Specifies value of BYTESWAP bit in SHCFG register.
6	ADDRESSING	Addressing mode (8-bit or 32-bit) Specifies value of ADDRESSING bit in SHCFG register.
14:7	—	Reserved
15	VALID	Valid flag to show the setting is valid. Writes 1 to indicate setting values of this area is valid.

Table 3.13 describes the setting values of the individual peripheral modules and registers at the time serial host interface boot mode finishes.

Table 3.13 Setting values of the individual peripheral modules and registers at the time serial host interface boot mode finishes (1 of 2)

Peripheral module	Register	Setting value at the time the boot processing finishes
Low power consumption	MSTPCRI	0x0000 0000
Module Reset	MRCTLI	0x0000 0000
SHOSTIF	CTRLR0	0x0000 0X00 X: Corresponding bits to the bit 0 and/or bit 1 in the SHBMS set 1b are 1b.
	ENR	0x0000 0001
	SHCFG	0x0000 000X X: Corresponding bits to either or multiples of bit 3 to bit 6 in the SHBMS set 1b are 1b.

Table 3.13 Setting values of the individual peripheral modules and registers at the time serial host interface boot mode finishes (2 of 2)

Peripheral module	Register	Setting value at the time the boot processing finishes
I/O ports	PMCm	Only the corresponding bits are 1b.
	PFCm	Only the corresponding bits are 0011b, 0100b, 0110b to 1001b, or 1100b.
	DRCTLm	Only the corresponding DRVn[1:0] bits are 10b and SRn bits are 1b.

3.5.7 SCI (UART) Boot Mode

The SCI (UART) Boot mode supports download and executes the loader program using SCI0 (UART) interface, which can be directly executed in internal memory. When the LSI transmits the start message to the PC by serial communication, the PC starts to transmit the loader program and it is transferred to the internal tightly coupled memory (TCM). After completion of the transmission, the processing of the loader program is executed.

Figure 3.9 shows the connection diagram of this LSI with a PC.

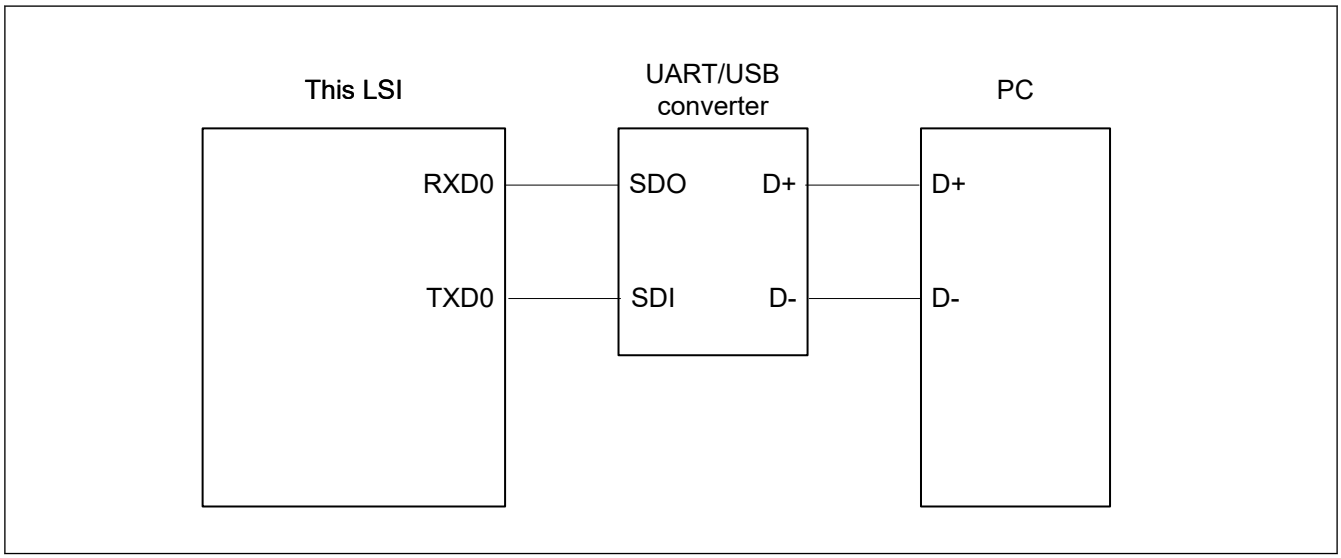


Figure 3.9 Connection diagram of this LSI with a PC

3.5.7.1 Operation Setting in SCI Boot Mode

After the reset is released, if the boot processing starts in SCI boot mode, the following setting values are used:

- CPU clock (CPU0CLK): 200 MHz
- SCI mode: Asynchronous mode
- Start bit: 1 bit
- Parity bit: None
- Data: 8 bits
- Stop bit: 1 bit
- Baud rate: 115200 bps

3.5.8 USB Boot Mode

The USB Boot mode supports download and executes the loader program using the USB 2.0 interface, which can be directly executed in internal memory. When the LSI receives the Open request from PC, the LSI transmits the start message to the PC. The PC starts to transmit the loader program and it is transferred to the internal tightly coupled memory (TCM). After completion of the transmission, the processing of the loader program is executed.

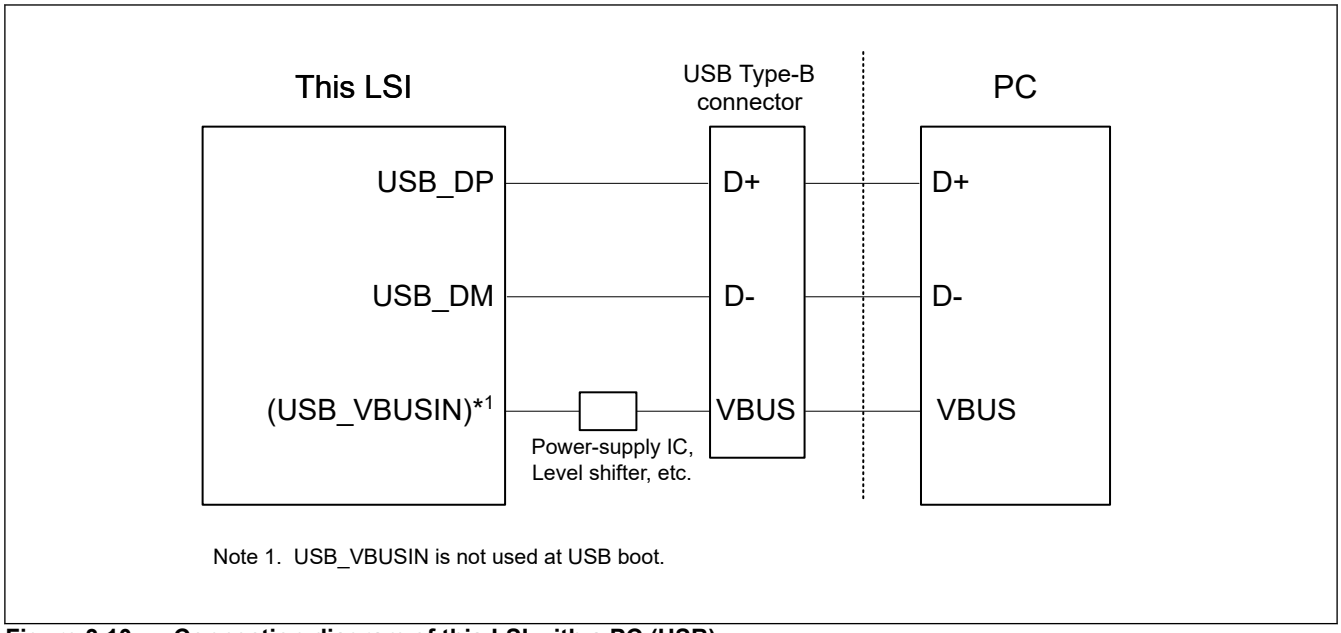

Figure 3.10 Connection diagram of this LSI with a PC (USB)

3.5.8.1 Operation Setting in USB Boot Mode

After the reset is released, if the boot processing starts in USB boot mode, the following setting values are used:

- CPU clock (CPU0CLK): 200 MHz
- USB mode: High speed, function mode
- USB function: USB Communication Device Class (CDC)

Note: After USB cable is connected with the LSI, USB cable should not be disconnected until the loader program is executed.

3.5.9 Motorola S-record Format for SCI/USB Boot

SCI/USB boot uses S0, S3, and S7 record type only. The record field is shown in Figure 3.11.

S-record Format

S-Type	Byte Count	Address	Data	Check sum
S0	2 byte	2 byte	2 byte × n (n = 1, 2, …)	2 byte

S-Type	Byte Count	Address	Data	Check sum
S3	2 byte	4 byte	2 byte × n (n = 1, 2, …)	2 byte

S-Type	Byte Count	Address	Check sum
S7	2 byte	4 byte	2 byte

Figure 3.11 S-record format for SCI/USB boot

3.5.10 SCI Boot Procedure

This boot procedure assumes using terminal emulator.

Table 3.14 SCI boot procedure

Steps	What to do
1	PC will receive "SCI Download mode (Normal SCI boot)" message after power-on-reset is released and LSI initialization is done on SCI boot mode.
2	The LSI waits to receive "HDR NM" data of Motorola S-record format, S0 record type, from the PC.
3	After received the data, the LSI will send out the following message to the PC. "--- Load Program to BTCM ----------"
4	The LSI can receive a loader program by Motorola S-record format, S3 record type, from the PC. The received data will be changed to binary data and forwarded to internal memory.
5	When SCI boot program receives Motorola S-record format, S7 record type, that is a notification from the PC to terminate the transfer.
6	The LSI will send out the following message to the PC. "--- Start Boot Program on BTCM ----------"
7	An end process is executed and the loader program is transferred to BTCM.

When an error happens, an error code is returned and the boot program is aborted. The error condition is below.

- SCI communication error
- Receive Motorola S-record format except S0, S3, and S7 record
- Check sum error of S-record format
- Addressing: Outside of BTCM area
- Loader program size: Outside of BTCM capacity

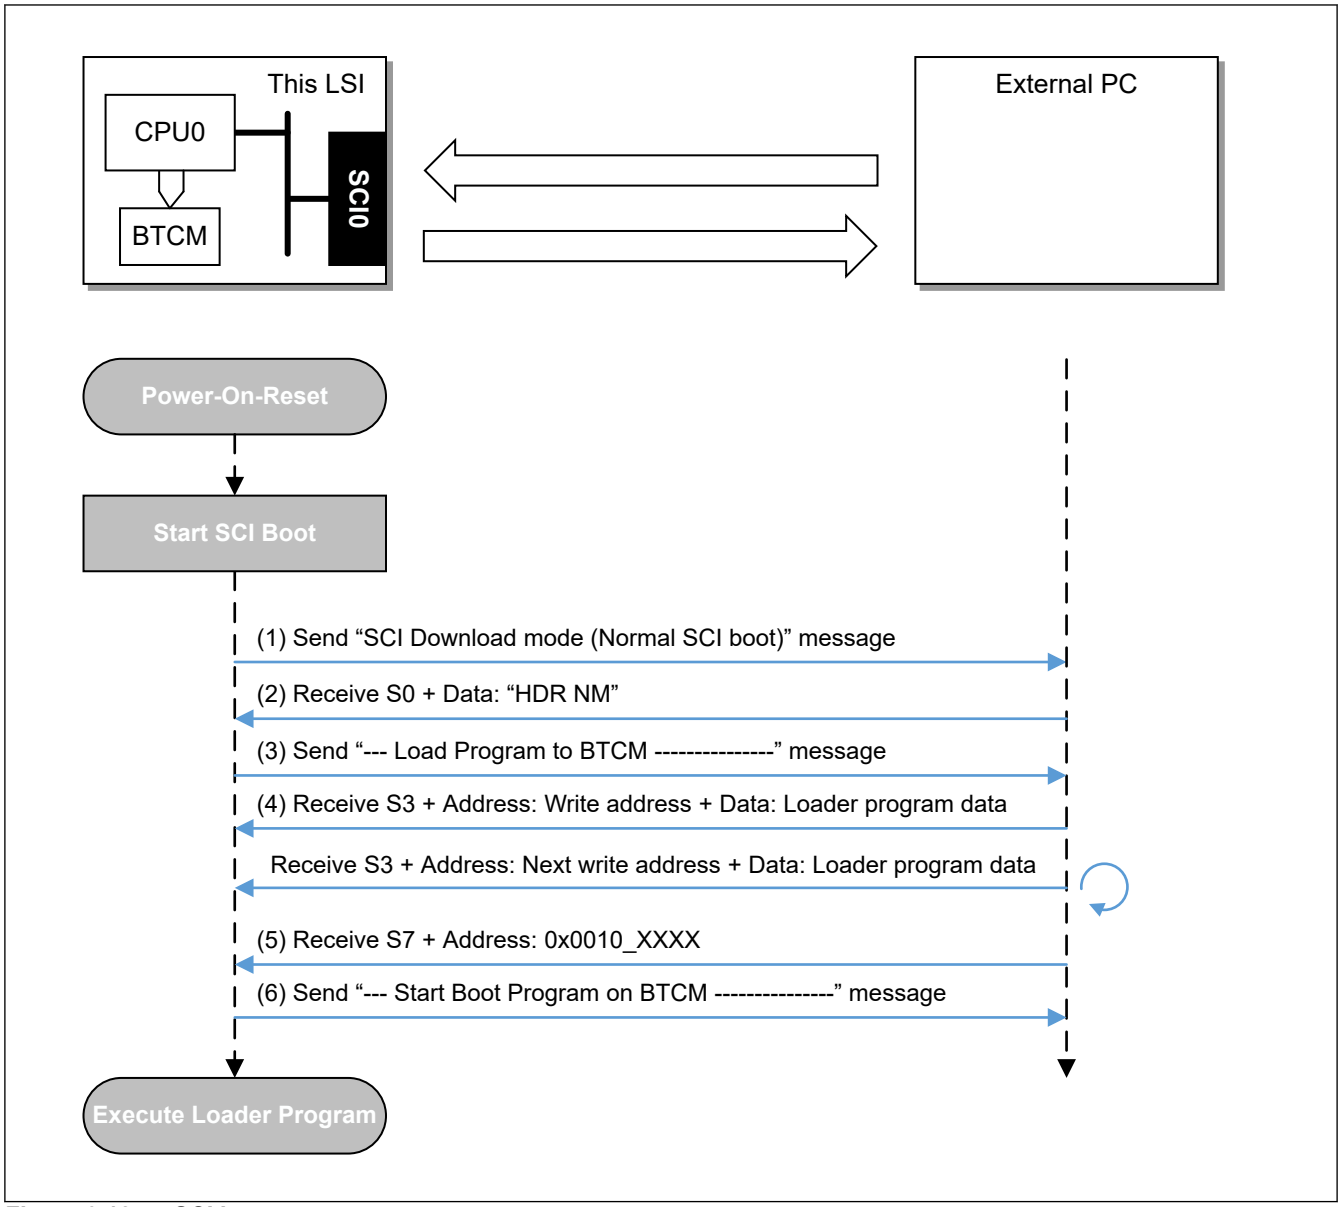

Figure 3.12 SCI boot sequence

3.5.11 USB Boot Procedure

This boot procedure assumes using terminal emulator.

Table 3.15 USB boot procedure (1 of 2)

Steps	What to do
1	After power-on-reset is released, LSI initialization and USB enumeration are performed on USB boot mode. Then, the LSI waits to receive "OPEN" data of Motorola S-record format, S0 record type, from the PC.
2	PC will receive "USB Download mode (Normal USB boot)" message.
3	The LSI waits to receive "HDR NM" data of Motorola S-record format, S0 record type, from the PC.
4	After received the data, the LSI will send out the following message to the PC. "--- Load Program to BTCM ----------"
5	The LSI can receive a loader program by Motorola S-record format, S3 record type, from the PC. The received data will be changed to binary data and forwarded to internal memory.
6	When USB boot program receives Motorola S-record format, S7 record type, that is a notification from the PC to terminate the transfer.

Table 3.15 USB boot procedure (2 of 2)

Steps	What to do
7	The LSI will send out the following message to the PC. "--- Start Boot Program on BTCM ----------"
8	An end process is executed and the loader program is transferred to BTCM.

When an error happens, an error code is returned and the boot program is aborted. The error condition is below.

- USB communication error
- Receive Motorola S-record format except S0, S3, and S7 record
- Check sum error of S-record format
- Addressing: Outside of BTCM area
- Loader program size: Outside of BTCM capacity

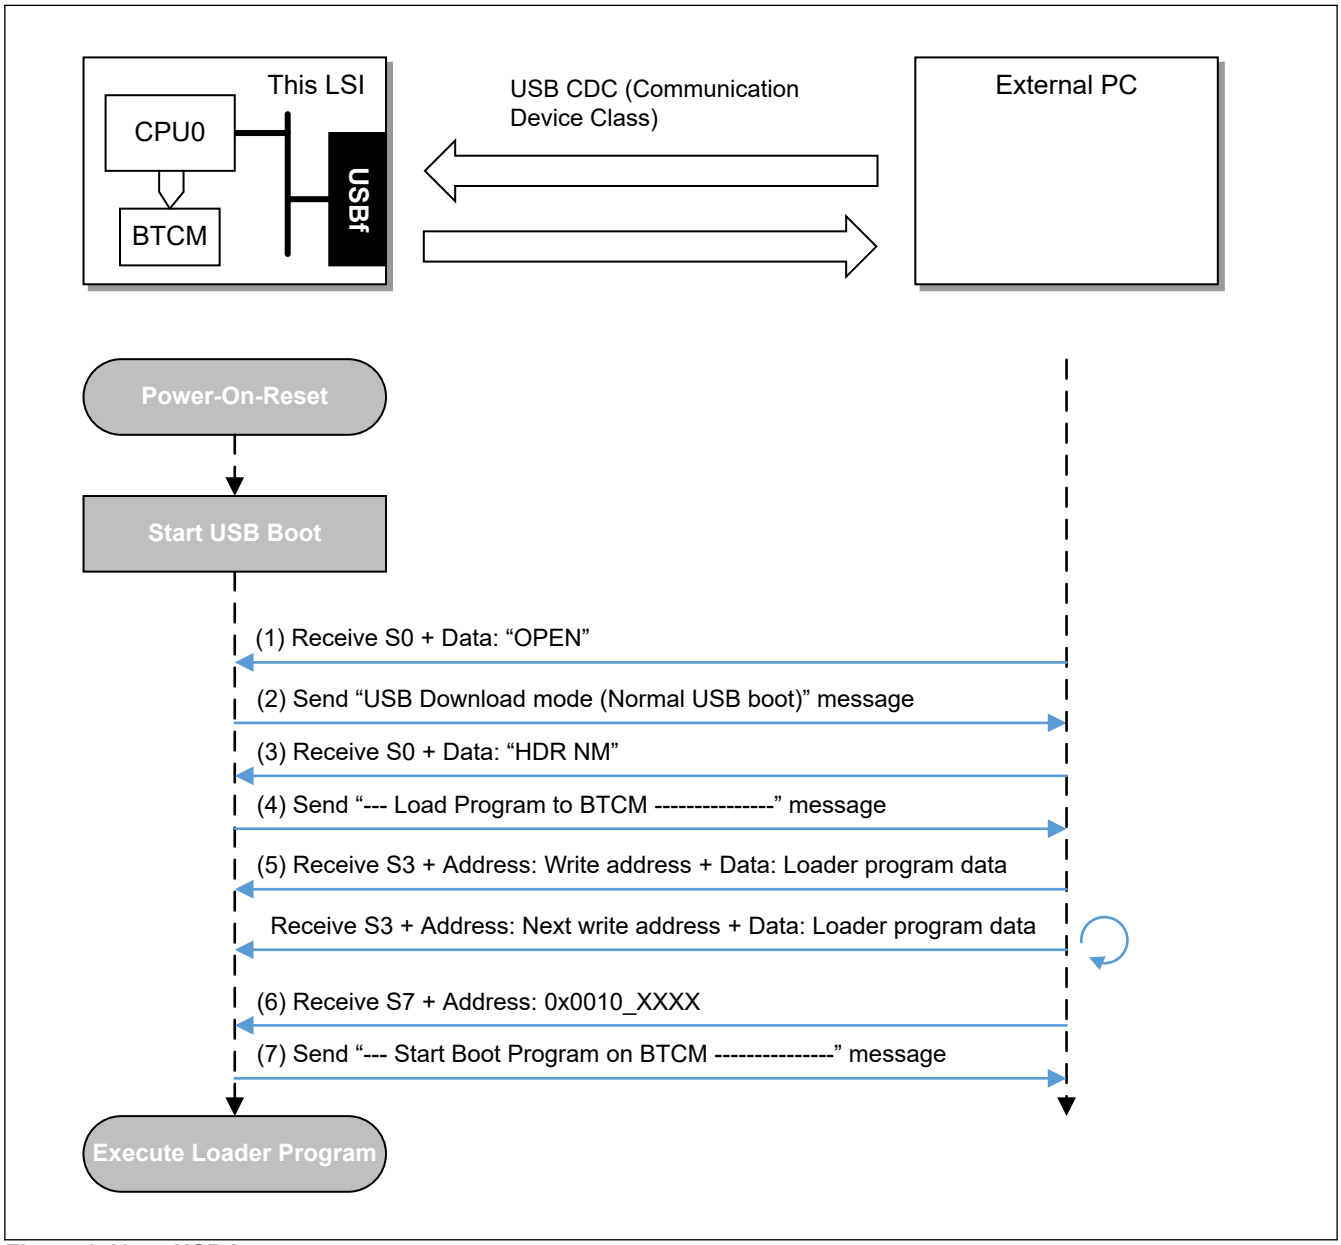

Figure 3.13 USB boot sequence

3.5.12 SCI/USB Boot Disable

The SCI/USB boot can be disabled by setting SCI/USB Boot Mode Disable area (SUDIS) in OTP.

If disable is selected, this LSI prohibits connection by SCI/USB boot mode permanently and boot fails.

3.5.13 Usage Note

3.5.13.1 Important Notice for MDVn Pin Setting

The LSI supports 1.8 V or 3.3 V operation voltage of I/O domain for BGA package. Operation voltage of I/O domain is selected as described in section 3.2. Types and Selection of Operating Modes.

MDVn setting and supply voltage for VCC1833_n must be matched. Otherwise it may cause malfunctions or permanent damage to the device. Table 3.16 shows a list of MDVn pins.

When 1.8 V operation voltage is selected for an I/O domain, 3.3 V should not be applied to the I/O domain because the I/O domain can operate at 1.8 V only. If 3.3 V is applied to the domain, the device may be permanently damaged. Table 3.3 shows 1.8 V or 3.3 V selectable I/O domains.

Table 3.16 List of MDVn pins

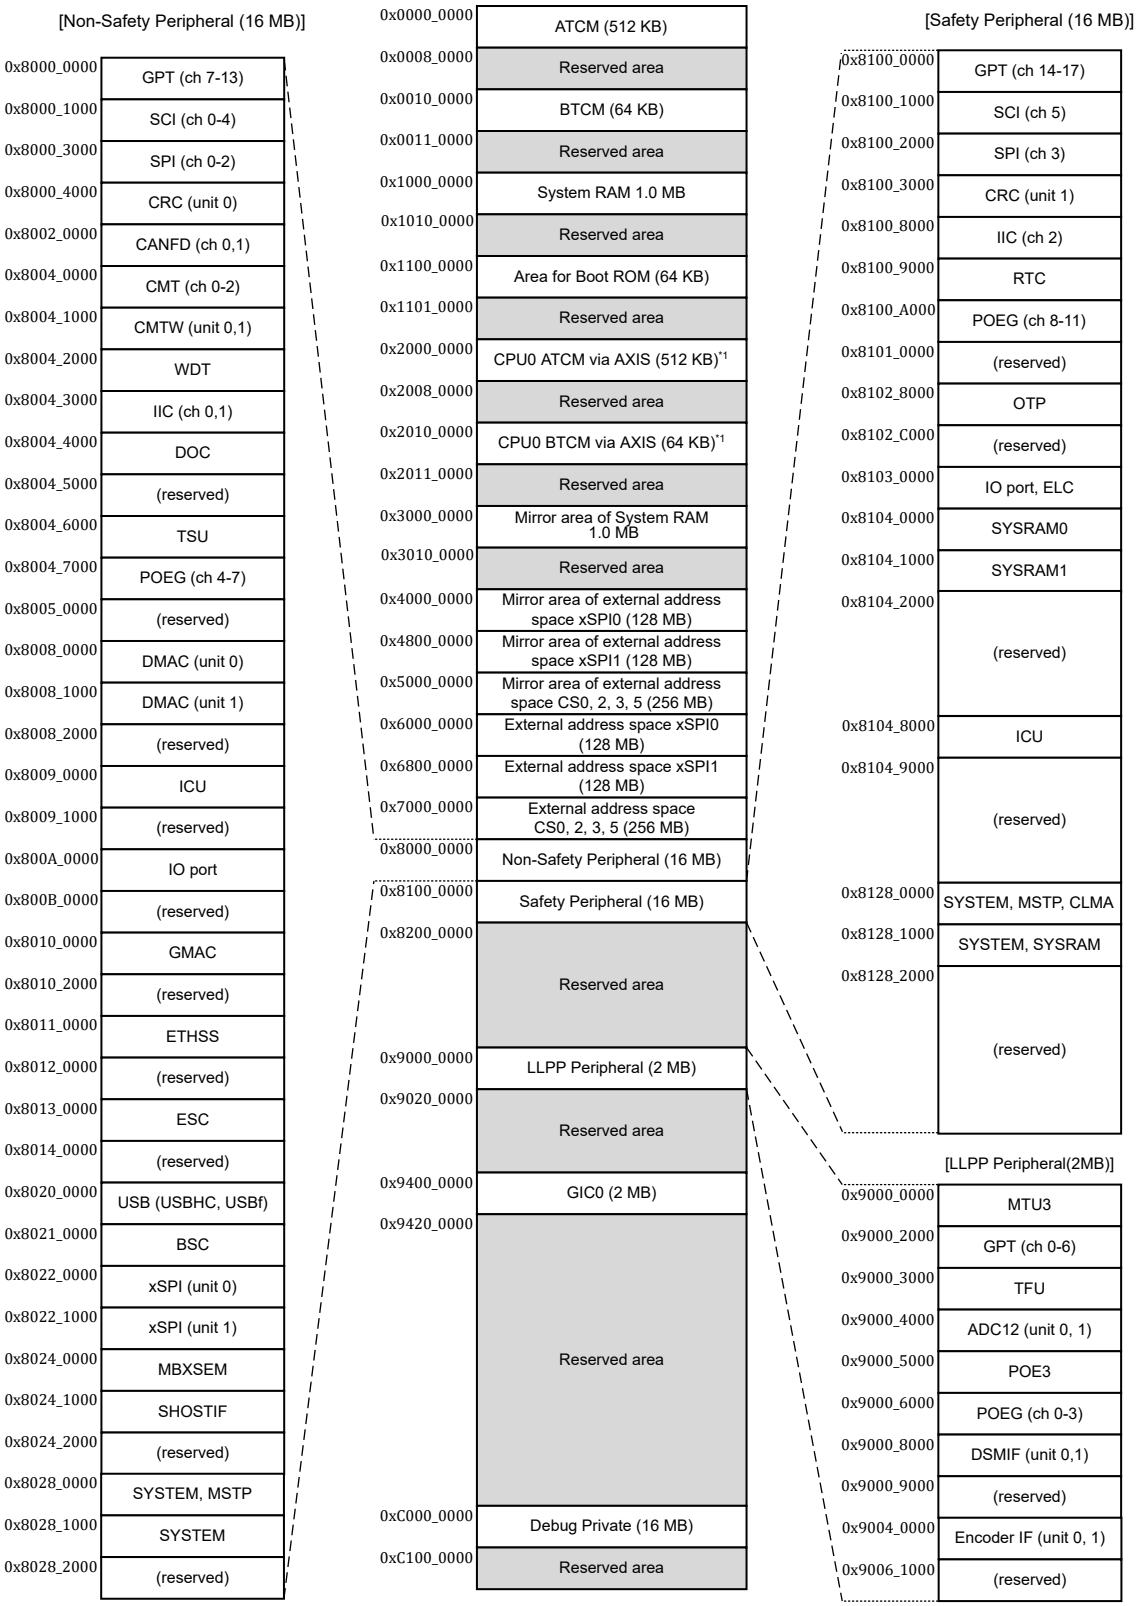
I/O voltage setting pins	Power supply	Pin number	Pin name
		196 FPGA	
MDV2	VCC1833_2	C8	P20_3 / GMAC_PTPOUT1 / MDV2 / ESC_LEDERR / CANTX1
MDV3	VCC1833_3	B3	P20_4 / GMAC_PTPOUT0 / MDV3 / ESC_LINKACT1

Note: Appropriate MDVn input level setting is required until operation mode setting is done. An operating mode is set according to the input level of the mode setting pins (MD[2:0], MDV[3:2], and MDD) when RES# or TRST# is set to high from the pin reset state (RES# and TRST# pins are both low). See section 3.2. Types and Selection of Operating Modes and section 5, Reset. For this reason, MDVn pins can be used as other functions. However, do not pull-up or pull-down MDVn to correct voltage level externally. Also, do not let MDVn pins be floated.

3.5.13.2 Bus Conflict on 16-Bit and 32-Bit Bus Boot Modes

If a reset such as #RES pin reset, system software reset, and error reset occur when the bus is shared with NOR Flash and SDRAM, the boot operation may not work due to bus conflict. In such cases, the following either measures should be taken.

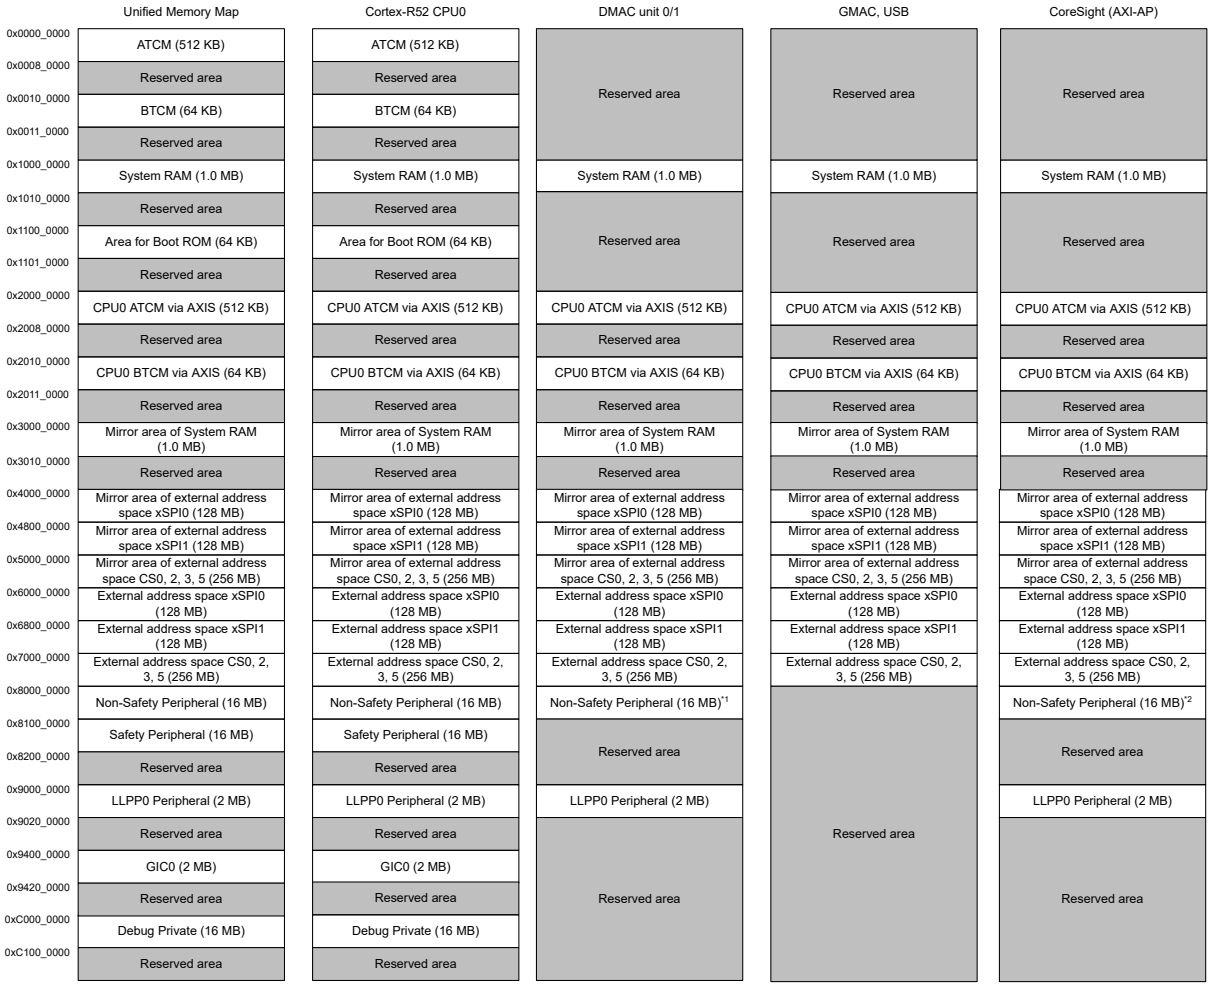
- The reset should be asserted after SDRAM state is changed to no data output like SDRAM power-down mode.
- A circuit is implemented to turn the SDRAM power on/off when a reset occurs.



3.5.13.3 Serial Flash Reset on xSPI Boot Modes (x1 Boot Serial Flash)

If a reset occurs when serial flash configuration is changed other than 1S-1S-1S, the boot operation may not work. In this case, external H/W reset for serial flash should be required.

4. Address Space



4.1 Address Space

The LSI has a 4-GB address space ranging from 0x0000_0000 to 0xFFFF_FFFF. That is, up to 4 GB of program and data areas can be accessed linearly. Figure 4.1, Figure 4.2, and Figure 4.3 show the memory maps of the bus masters. Accessible areas will differ depending on the operating mode and the states of control bits.

Note: Reserved area should not be accessed.
Note 1. Address to access the tightly coupled memory for CPU0 from bus master through AXIS interface.

Figure 4.1 Unified memory map

Note 1. DMAC, ICU, IO port, and SYSTEM registers are not accessible.
Note 2. IO Port registers are not accessible.

Figure 4.2 Memory map each bus master

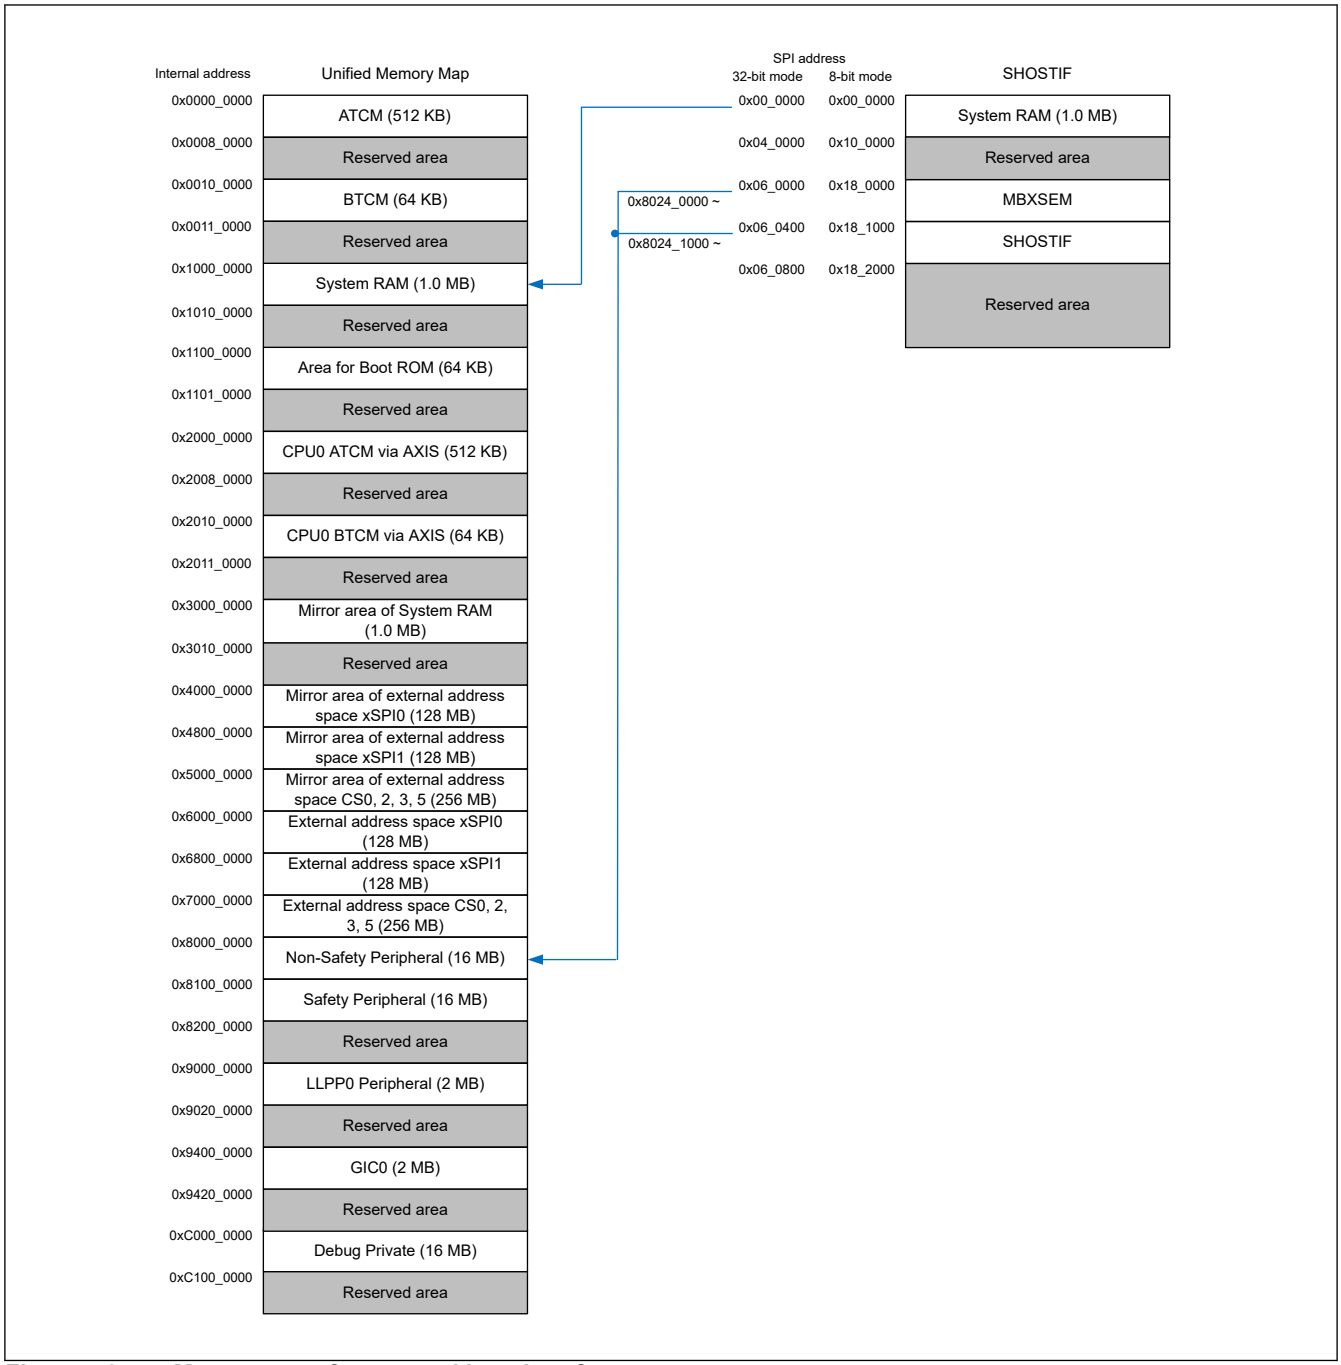


Figure 4.3 Memory map for external host interface

5. Reset

5.1 Overview

Available reset types are RES# pin reset, system software reset, CPU0 software reset, and error reset. Table 5.1 lists the reset names and sources.

Table 5.1 Reset names and sources

Reset name	Source
RES# pin reset	The low level is applied to the RES# pin
System software reset	SWRSYS register setting
CPU0 software reset	SWRCPU0 register setting
Error reset	Reset request from the ICU

The internal states and pins are initialized by reset.

Table 5.2 lists the reset targets to be initialized for each reset type. For details on reset control during debugging, see section 9.3.4. Reset Configuration and the Method of Connecting with the Emulator.

Table 5.2 Targets to be initialized for each reset type (✓: to be initialized, —: no change)

Reset target	Reset source			
	RES# pin reset	System software reset	CPU0 software reset	Error reset
RES# Pin Reset flag (RSTSR0.TRF)	—	✓	—	✓
System Software Reset Detect flag (RSTSR0.SWRSF)	✓	—	—	✓
CPU0 Software Reset Detect flag (RSTSR0.SWR0F)	✓	✓	—	✓
Error Reset Detect flag (RSTSR0.ERRF) Error Event Capture Status registers	✓	✓	—	—
Pin state	✓	✓	—	✓
Operating mode	✓*1	—*2	—	—*2
CPU0	✓	✓	✓	✓
WDT0 for CPU0	✓	✓	✓	✓
System SRAM, TCM, cache	✓	✓	—	✓
Peripheral modules, registers and internal states other than listed	✓	✓	—	✓
RSTOUT# pin output	✓(low)*3	✓(low)*3	—	✓(low)*3

Note 1. An operating mode is selected according to the input level of the mode setting pin (MD2, MD1, and MD0) when the pin reset state (RES# and TRST# pins are both low) is released. For details on the operating mode, see section 3.2. Types and Selection of Operating Modes.

Note 2. The operating mode is not initialized in response to this type of reset and the LSI is in the operating mode that was selected following the previous release from the reset state applied by the low level on the RES#. For details, see section 3, Operating Modes.

Note 3. For the low output period, see section 5.3.6. Reset Output Pin (RSTOUT#).

Table 5.3 lists the input and output pins related to the reset.

Table 5.3 Input and output pins related to reset

Pin name	I/O	Function
RES#	Input	Reset pin. Use this pin to reset the entire LSI except the debugging circuit and the TAP (Test Access Port). Since the power-on reset circuit is not incorporated, a reset circuit must be implemented outside this LSI. For an example of configuration of the external reset circuit, see section 9.3.4. Reset Configuration and the Method of Connecting with the Emulator.
TRST#	Input	Test reset pin. Use this pin to reset the TAP. If you design a board which enables an emulator, set the TRST# pin to low level during the same period as the RES# pin at the time of power-on. The TRST# pin should also be controllable independently. When unused, this pin must be set to low level or connected to the same signal as the RES# pin. For details, see section 9.3.4. Reset Configuration and the Method of Connecting with the Emulator.
RSTOUT#	Output	Reset output pin. This pin outputs low-level signal on occurrence of a reset. For details, see section 5.3.6. Reset Output Pin (RSTOUT#). This pin can be used for resetting the external device.

Note: For details on resetting the debugging circuit, see section 9, Debugging Interface.

5.2 Register Descriptions

The Reset Status Register 0 contains bits assigned to respective reset types to indicate reset generation sources. Registers RSTSR0, SWRSYS, SWRCPU0, MRCTLA, MRCTLE, MRCTLI, MRCTLJ, MRCTLK, and MRCTLL are protected by the register write protection function. To write these registers, clear the write protection bit [1] in the Protect Register (PRCRN for RSTSR0 and MRCTLE, RPCRS for SWRSYS and SWRCPU0). For details on the register write protection, see section 10, Register Write Protection Function.

5.2.1 RSTSR0 : Reset Status Register 0

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x200

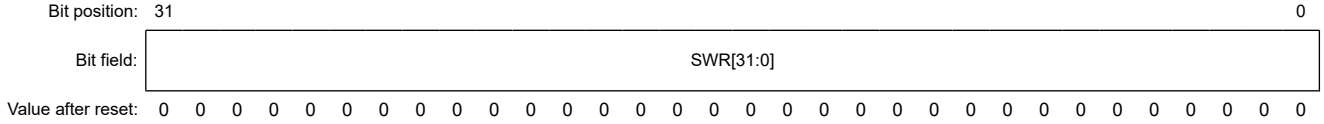
Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	SWR0F	SWRSF	ERRF	TRF	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	x*1	x*1	x*1	x*1	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
1	TRF	RES# Pin Reset Detect Flag This bit indicates the detection of RES# pin reset. 0: RES# pin reset not detected 1: RES# pin reset detected	R/W*2
2	ERRF	Error Reset Detect Flag This bit indicates the detection of error reset. 0: Error reset not detected 1: Error reset detected	R/W*2
3	SWRSF	System Software Reset Detect Flag This bit indicates the detection of system software reset. 0: System software reset not detected 1: System software reset detected	R/W*2
4	SWR0F	CPU0 Software Reset Detect Flag This bit indicates the detection of CPU0 software reset. 0: CPU0 software reset not detected 1: CPU0 software reset detected	R/W*2
31:5	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. The value after reset depends on the reset source. The following table lists the sources for the setting (1) and clearing (0) of each bit.

Bit	Setting conditions (0 to 1)	Clearing conditions (1 to 0)
TRF	When the low level is input to the RES# pin.	• When system software reset or error reset occurs • When 0x00000000 is written to RSTSR0 after RSTSR0 is read
ERRF	When an error predefined as a reset source by ICU setting occurs	• When the low level is input to the RES# pin or system software reset occurs • When 0x00000000 is written to RSTSR0 after RSTSR0 is read
SWRSF	When system software reset occurs	• When the low level is input to the RES# pin or error reset occurs • When 0x00000000 is written to RSTSR0 after RSTSR0 is read
SWR0F	When CPU0 software reset occurs	• When the low level is input to the RES# pin, system software reset or error reset occurs • When 0x00000000 is written to RSTSR0 after RSTSR0 is read



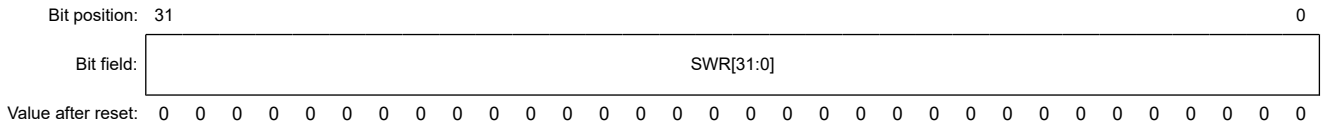
Note 2. Only 0 can be written to clear the flag.

The RSTSR0 register specifies reset generation sources.

5.2.2 SWRSYS : System Software Reset Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x210



Bit	Symbol	Function	R/W
31:0	SWR[31:0]	System Software Reset 1. When 0x4321A501 is written, a system software reset occurs. After about 200 µs (Typ.) from the reset occurrence, it automatically releases the reset, starts the system in the selected boot mode in the operating mode pins, and the program is restarted. 2. Other than the above written value, nothing is changed.	W

The SWRSYS register controls system software reset.

5.2.3 SWRCPU0 : CPU0 Software Reset Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x220

Bit	Symbol	Function	R/W
31:0	SWR[31:0]	CPU0 Software Reset 1. When 0x4321A501 is written, CPU0 software reset occurs. CPU0 and WDT0 for CPU0 are in reset state. Reset is not released automatically. The RES# pin reset required to release reset. 2. When 0x4321A502 is written, CPU0 software reset occurs. CPU0 and WDT0 for CPU0 are in reset state. After the below time passes from reset occurrence, reset is released automatically. ● SCKCR2.DIVSELSUB = 0: around 1.28 µs ● SCKCR2.DIVSELSUB = 1: around 1.70 µs Prohibit to write 0x00000000 to this register before above time passes. 3. Other than the above written value, nothing is changed. These bits are read as 0x00000001 during reset, and as 0x00000000 when reset is released. Be careful that after writing 0x4321A501 or 0x4321A502 to this register, transfer CPU0 to WFI state manually. After confirming CPU0 is in WFI state by hardware, CPU0 and WDT0 for CPU0 are reset. It is prohibited to write 0x4321A501 after writing 0x4321A502 and 0x4321A502 after writing 0x4321A501.	R/W

The SWRCPU0 register controls the CPU0 software reset.

5.2.4 MRCTLA : Module Reset Control Register A

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x240

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	MRCTLA05	MRCTLA04	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	MRCTLA04	xSPI Unit 0 Reset Control This bit controls the reset of the xSPI unit 0. 0: xSPI Unit 0 is released from reset 1: xSPI Unit 0 is in the reset state	R/W
5	MRCTLA05	xSPI Unit 1 Reset Control This bit controls the reset of xSPI unit 1. 0: xSPI Unit 1 is released from reset 1: xSPI Unit 1 is in the reset state	R/W
31:6	—	These bits are read as 0. The write value should be 0.	R/W

The MRCTLA register controls the reset of xSPI. This register is available in Non Safety region.

5.2.5 MRCTLE : Module Reset Control Register E

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x250

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	MRCTLE06	MRCTLE05	MRCTLE04	MRCTLE03	—	MRCTLE01	MRCTLE00
Value after reset:	0	0	0	0	0	0	0	0	0	1	1	1	1	0	1	1

Bit	Symbol	Function	R/W
0	MRCTLE00	GMAC (PCLKH clock domain) Reset Control This bit controls the reset of GMAC (PCLKH clock domain). 0: GMAC (PCLKH clock domain) is released from reset 1: GMAC (PCLKH clock domain) is in the reset state	R/W
1	MRCTLE01	GMAC (PCLKM clock domain) Reset Control This bit controls the reset of GMAC (PCLKM clock domain). 0: GMAC (PCLKM clock domain) is released from reset 1: GMAC (PCLKM clock domain) is in the reset state	R/W
2	—	This bit is read as 0. The write value should be 0.	R/W
3	MRCTLE03	ESC (Bus clock domain) Reset Control This bit controls the reset of ESC (Bus clock domain). 0: ESC (Bus clock domain) is released from reset 1: ESC (Bus clock domain) is in the reset state	R/W
4	MRCTLE04	ESC (IP clock domain) Reset Control This bit controls the reset of ESC (IP clock domain). 0: ESC (IP clock domain) is released from reset 1: ESC (IP clock domain) is in the reset state	R/W
5	MRCTLE05	Ethernet Subsystem Register Reset Control This bit controls the reset of Ethernet Subsystem register. 0: Ethernet Subsystem register is released from reset 1: Ethernet Subsystem register is in the reset state	R/W
6	MRCTLE06	MII Converter Reset Control This bit controls the reset of MII converter. 0: MII converter is released from reset 1: MII converter is in the reset state	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

The MRCTLE register controls the reset of peripheral modules related to Ethernet.

5.2.6 MRCTLI : Module Reset Control Register I

Base address: SYSC_S = 0x8128_0000

Offset address: 0x0260

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	MRCTLI03	MRCTLI02	MRCTLI01	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
1	MRCTLI01	SHOSTIF (Master bus clock domain) Reset Control 0: Reset released 1: Reset state	R/W
2	MRCTLI02	SHOSTIF (Slave bus clock domain) Reset Control 0: Reset released 1: Reset state	R/W
3	MRCTLI03	SHOSTIF (IP clock domain) Reset Control 0: Reset released 1: Reset state	R/W
31:4	—	These bits are read as 0. The write value should be 0.	R/W

The MRCTLI register controls reset of each IP. This register is available in Safety region.

5.2.7 MRCTLJ : Module Reset Control Register J

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x264

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	MRCTLJ03	MRCTLJ02	MRCTLJ01	MRCTLJ00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MRCTLJ00	AFMT0 Reset Control This bit controls the reset of AFMT0. 0: AFMT0 is released from reset 1: AFMT0 is in the reset state	R/W
1	MRCTLJ01	HDSL0 Reset Control This bit controls the reset of HDSL0. 0: HDSL0 is released from reset 1: HDSL0 is in the reset state	R/W

Bit	Symbol	Function	R/W
2	MRCTLJ02	BISS0 Reset Control This bit controls the reset of BISS0. 0: BISS0 is released from reset 1: BISS0 is in the reset state	R/W
3	MRCTLJ03	ENDAT0 Reset Control This bit controls the reset of ENDAT0. 0: ENDAT0 is released from reset 1: ENDAT0 is in the reset state	R/W
31:4	—	These bits are read as 0. The write value should be 0.	R/W

The MRCTLJ register controls the reset of Encoder Interface unit 0. This register is available in Non Safety region.

5.2.8 MRCTLK : Module Reset Control Register K

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x268

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	MRCTLK03	MRCTLK02	MRCTLK01	MRCTLK00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MRCTLK00	AFMT1 Reset Control This bit controls the reset of AFMT1. 0: AFMT1 is released from reset 1: AFMT1 is in the reset state	R/W
1	MRCTLK01	HDSL1 Reset Control This bit controls the reset of HDSL1. 0: HDSL1 is released from reset 1: HDSL1 is in the reset state	R/W
2	MRCTLK02	BISS1 Reset Control This bit controls the reset of BISS1. 0: BISS1 is released from reset 1: BISS1 is in the reset state	R/W
3	MRCTLK03	ENDAT1 Reset Control This bit controls the reset of ENDAT1. 0: ENDAT1 is released from reset 1: ENDAT1 is in the reset state	R/W
31:4	—	These bits are read as 0. The write value should be 0.	R/W

The MRCTLK register controls the reset of Encoder Interface unit 1. This register is available in Non Safety region.

5.3 Operation

5.3.1 RES# Pin Reset

This reset occurs when a signal arrives at the RES# pin from the externally connected reset circuit. When the signal becomes low at the RES# pin, all on-going processes are aborted and the LSI enters the reset state. To successfully reset the LSI, the RES# pin should be held at the low level for the specified time after power-on. For details on the reset configuration, see section 9.3.4. Reset Configuration and the Method of Connecting with the Emulator.

After the reset is released, CPU0 starts boot processing. When a RES# pin reset occurs, the RSTSR0.TRF flag is set to 1.

5.3.2 System Software Reset

System software reset occurs when 0x4321A501 is written to the SWRSYS register. When system software reset occurs, all on-going processes are aborted and the LSI enters the reset state. After the reset is released, CPU0 starts boot processing.

When system software reset occurs, the RSTSR0.SWRSF flag is set to 1.

5.3.3 CPU0 Software Reset

CPU0 software reset applies to CPU0 and WDT0 for CPU0. It occurs when 0x4321A501 or 0x4321A502 is written to the SWRCPU0 register and CPU0 is transferred to WFI state by WFI instruction. Do not write the SWRCPU0 register again until CPU0 is transferred to WFI state and SWRCPU0 register is changed to 0x00000001.

When 0x4321A501 is written, reset is not released automatically. To release the reset state of CPU0 software reset, the RES# pin reset is required.

When 0x4321A502 is written, reset is released automatically. Do not write 0x00000000 to the SWRCPU0 register.

5.3.4 Error Reset

This reset is generated in response to a reset request from ICU. ICU receives critical errors, such as oscillation stop detection, from individual modules in the LSI, and generates reset requests corresponding to respective errors. For details on the ICU operation, see section 11, Interrupt Controller (ICU).

When error reset occurs, all on-going processes are aborted and the LSI enters the reset state. After the reset is released, CPU0 starts boot processing. When the error reset occurs, the RSTSR0.ERRF flag is set to 1.

5.3.5 Determination of Reset Generation Source

Reading the RSTSR0 register determines which reset source was used for reset execution. Figure 5.1 shows an example of the flow to identify a reset generation source.

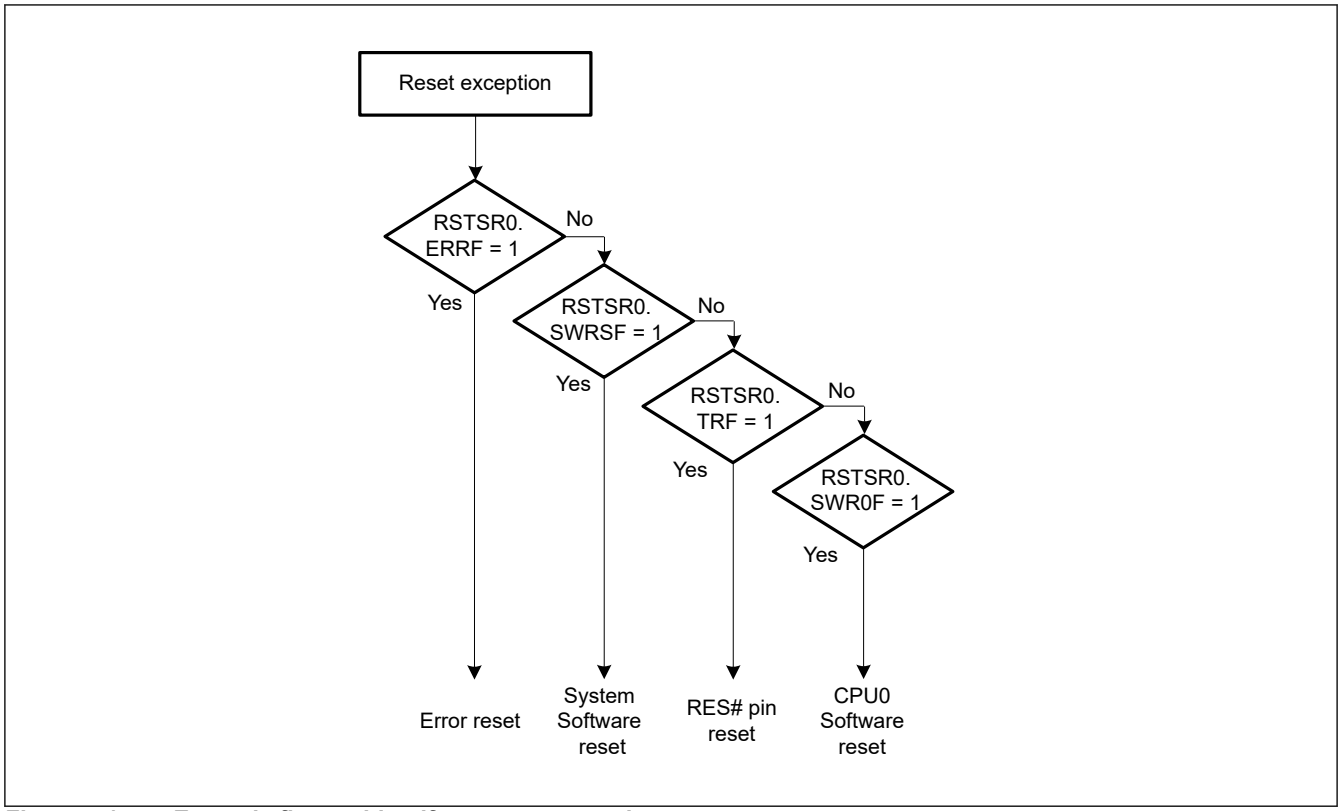


Figure 5.1 Example flow to identify a reset generation source

5.3.6 Reset Output Pin (RSTOUT#)

The reset output pin (RSTOUT#) outputs the low level on occurrence of a reset when the input level of the RES# pin is low. It also outputs the low level on occurrence of a system software reset or an error reset. If the RES# pin remains low for a specified time period and then changes to high, the reset output remains low for 200 µs (Typ.) and then changes to high. Similarly, the reset output remains low for 200 µs (Typ.) following a system software reset or an error reset, and then changes to high.

5.3.7 Noise Cancellation for Reset Input

Noise cancellation using analog delay is applied to the RES# and TRST# pins. This can eliminate noises within 100 ns (Min.).

5.4 Usage Note

5.4.1 Notes on Module Reset Control Register Operation

1. To secure processing after release from a module reset, dummy read the same register at least three times after writing to initiate release from the module reset, and only then proceed with the subsequent processing.
2. When module is reset once and released again, make sure that the target bit of module reset control register is set to 1 by reading the register before releasing from a module reset. Then release from a module reset.
3. When controlling the module resetting of modules that can initiate DMA transfer or that otherwise have operations related to those of other blocks, confirm that DMA transfer initiated by such modules and other points of interlinked operation has been completed before releasing modules from or placing modules in the module reset state. For set products in which such target modules are not used, design of the control of the module reset is on the assumption that the modules are initially stopped. Therefore, the absence of unexpected operations in states other than the above is not guaranteed. For example, operation after releasing modules from or placing modules in the module reset state while a module is running is not guaranteed.

5.4.2 Connection of Reset Output Pin (RSTOUT#)

The low level is output for a specified period of time on RSTOUT# after deassertion of the signal on the RES# pin. This means that RSTOUT# should not be directly connected as a reset signal for a flash memory to be used in booting the LSI. Otherwise, release of the LSI itself from the reset state may precede that for the flash memory.

However, using RSTOUT# as the reset signal for external device is still possible as long as the timing requirement imposed by the output on the RSTOUT# pin is satisfied.

RSTOUT# is shared function for port P17_5 but it is set by default after RES# pin reset, system software reset, and error reset. Even if function other than RSTOUT# is assigned, low level output from RSTOUT# is always effective when RES# pin reset, system software reset, or error reset occurs.

For details, see section 5.3.6. Reset Output Pin (RSTOUT#).

6. Clock Generation Circuit

6.1 Overview

The LSI incorporates a Clock Generation Circuit (CGC).

Table 6.1 and Table 6.2 show the specifications of the clock generation circuit. Figure 6.1 shows the block diagram and Table 6.3 shows the pin configuration of the clock generation circuit.

Table 6.1 Specifications of Clock Generation Circuit

Item	Description
Main clock oscillator	Resonator frequency: 25 MHz
	External clock input frequency: 25 MHz
	Connectable resonator or additional circuit: Ceramic resonator, crystal resonator Connection pin: EXTAL, XTAL
	External clock input instead of resonator Connection pin: EXTCLKIN
	Oscillation stop detection function: When the CLMA3 detects an abnormality in oscillation of the main clock, the system clock source is switched to LOCO and PLL output clocks are switched to LOCO or free-running clock of PLL, and MTU3 and GPT pins are placed in the high-impedance state.
PLL0 circuit (for main systems that include for example, a CPU, buses)	Input clock source: Main clock oscillator
	Input frequency: 25 MHz
	Frequency multiplication ratio: 96 multiplications
	Output clock frequency of the PLL0 circuit: 2400 MHz
	Oscillation abnormality detection function: When the CLMA0 detects an abnormality in oscillation of the PLL0, the PLL0 output clock is switched to the main clock, and MTU3 and GPT pins are placed in the high-impedance state.
PLL1 circuit (for clocks used in Ethernet)	Input clock source: Main clock oscillator
	Input frequency: 25 MHz
	Frequency multiplication ratio: 40 multiplications
	Output clock frequency of the PLL1 circuit: 1000 MHz
	Oscillation abnormality detection function: When the CLMA1 detects an abnormality in oscillation of the PLL1, the PLL1 output clock is switched to the main clock, and MTU3 and GPT pins are placed in the high-impedance state.
Low-speed on-chip oscillator (LOCO)	Oscillation frequency: 240 kHz
	Oscillation abnormality detection function: The CLMA2 can detect an abnormality in oscillation of the LOCO.
External clock input for JTAG (TCK)	Input frequency: 50 MHz (max.)

Table 6.2 Specifications of Clock Generation Circuit (internal clock) (1 of 3)

Parameter	Clock source	Supplied to	Frequency	Reset value
CPU0 clock (CPU0CLK)	Frequency-dividing clock for PLL0	CPU0 (Cortex-R52)	200 MHz or 150 MHz (ICLK × 1) 400 MHz or 300 MHz (ICLK × 2) 800 MHz or 600 MHz (ICLK × 4)	200 MHz
System clock (ICLK)	Frequency-dividing clock for PLL0	DMAC, ICU, CPU AXIM, BSC	200 MHz or 150 MHz	200 MHz

Table 6.2 Specifications of Clock Generation Circuit (internal clock) (2 of 3)

Parameter	Clock source	Supplied to	Frequency	Reset value
Peripheral module clock H (PCLKH)	Frequency-dividing clock for PLL0	Peripheral module (MTU3, GPT (LLPP, bus), TFU, DSMIF, POE3, POEG (LLPP), ADC12 (bus), xSPI (bus), GMAC, SHOSTIF), System SRAM	200 MHz or 150 MHz (ICLK × 1)	200 MHz
Peripheral module clock M (PCLKM)	Frequency-dividing clock for PLL0	Peripheral module (CRC, SCI (bus), SPI (bus), GPT (Non Safety, Safety), CANFD, GMAC, SHIP, OTP, Network Subsystem Reg, ESC (bus), USB (bus), GPIO, CLMA)	100 MHz or 75 MHz (ICLK/2)	100 MHz
Peripheral module clock L (PCLKL)	Frequency-dividing clock for PLL0	Peripheral module (POEG (Non Safety, Safety), IIC, DOC, CMT, CMTW, WDT, RTC (bus), TSU)	50 MHz or 37.5 MHz (ICLK/4)	50 MHz
Peripheral module clock for ADC12 (PCLKADC)	Frequency-dividing clock for PLL0	ADC12 (conversion)	25 MHz or 18.75 MHz (ICLK/8)	25 MHz
Peripheral module clock for GPT in LLPP (PCLKGPTL)	Frequency-dividing clock for PLL0	GPT (LLPP, operation)	400 MHz or 300 MHz (ICLK × 2)	400 MHz
Peripheral module clock for SCIn (PCLKSCIn) (n = 0 to 5)	Frequency-dividing clock for PLL0	SCIn (operation)	96 MHz or 75 MHz (Asynchronous mode) 100 MHz or 75 MHz (ICLK/2)	75 MHz (Asynchronous mode)
Peripheral module clock for SPIn (PCLKSPIn) (n = 0 to 3)	Frequency-dividing clock for PLL0	SPIn (operation)	96 MHz or 75 MHz (Asynchronous mode) 100 MHz or 75 MHz (ICLK/2)	75 MHz (Asynchronous mode)
Peripheral module clock for CANFD (PCLKCAN)	Frequency-dividing clock for PLL0	CANFD (serial)	40 MHz 80 MHz	40 MHz
Peripheral module clock for SHOSTIF (PCLKSHOST)	Frequency-dividing clock for PLL0	SHOSTIF (operation)	400 MHz	400 MHz
External bus clock (BSC_CLK, CKIO)	Frequency-dividing clock for PLL0	External bus	100.0 MHz or 75.0 MHz (ICLK/2) 66.7 MHz or 50.0 MHz (ICLK/3) 50.0 MHz or 37.5 MHz (ICLK/4) 40.0 MHz or 30.0 MHz (ICLK/5) 33.3 MHz or 25.0 MHz (ICLK/6) 28.6 MHz or 21.4 MHz (ICLK/7) 25.0 MHz or 18.75 MHz (ICLK/8)*1	50 MHz
Peripheral module clock for RTC (PCLKRTC)	Frequency-dividing clock for main clock	RTC (operation)	195.3 kHz	195.3 kHz
USB clock (USB_CLK48)	Frequency-dividing clock for PLL0	USB PHY	48 MHz	48 MHz
xSPIn serial clock (XSPI_CLKn) (n = 0, 1)	Frequency-dividing clock for PLL0	xSPIn (operation)	133.3, 100, 75, 50, 37.5, 25, 12.5 MHz*2	12.5 MHz
Ethernet clock B (ETCLKB)	Frequency-dividing clock for PLL1	GMAC, Converter	125 MHz	125 MHz
Ethernet clock C (ETCLKC)	Frequency-dividing clock for PLL1	ESC	100 MHz	100 MHz
Ethernet clock D (ETCLKD)	Frequency-dividing clock for PLL1	MII Converter	50 MHz	50 MHz

Table 6.2 Specifications of Clock Generation Circuit (internal clock) (3 of 3)

Parameter	Clock source	Supplied to	Frequency	Reset value
Ethernet clock E (ETCLKE)	Frequency-dividing clock for PLL1	ESC, MII Converter	25 MHz	25 MHz
CLMAn sampling clock (CLMAMCLKA) (n = 0, 1)	Main clock divided by 2	CLMA0, CLMA1	12.5 MHz	12.5 MHz
CLMA2 sampling clock (CLMAMCLKB)	Main clock divided by 256	CLMA2	97.7 kHz	97.7 kHz
CLMA3 sampling clock (CLMALCLKA)	LOCO output clock	CLMA3	240 kHz	240 kHz
CLMA0 monitor clock (CLMAPLCLK0)	PLL0 clock divided by 32	CLMA0	75 MHz	75 MHz
CLMA1 monitor clock (CLMAPLCLK1)	PLL1 clock divided by 16	CLMA1	62.5 MHz	62.5 MHz
CLMA2 monitor clock (CLMALCLK)	LOCO output clock	CLMA2	240 kHz	240 kHz
CLMA3 monitor clock (CLMAMCLK)	Main clock divided by 2	CLMA3	12.5 MHz	12.5 MHz
JTAG clock (JTAGTCK)	TCK	JTAG	Up to 50 MHz	—
Trace interface clock (TCLK)	Frequency-dividing clock for PLL0	CoreSight TPIU	100 MHz	100 MHz
Serial Host I/F clock (SHIFCLK)	HSPI_CLK	SHOSTIF	Up to 40 MHz	—
EnDat clock (PCLKENDAT)	Frequency-dividing clock for PLL0	ENDAT	100 MHz	100 MHz
BiSS-C clock (PCLKBISS)	Frequency-dividing clock for PLL0	BISS	20 MHz	20 MHz
HIPERFACE DSL clock (PCLKDSL)	Frequency-dividing clock for PLL0	HDSL	75 MHz	75 MHz
A-format clock (PCLKAFMT)	Frequency-dividing clock for PLL0	AFMT	80 MHz	80 MHz
ENCOUT clock (PCLKENCO)	Frequency-dividing clock for PLL0	ENCOUT	20 MHz	20 MHz
Ethernet PHY reference clock (ETHn_REFCLK) (n = 0 to 2)	Frequency-dividing clock for PLL1	— (External Ethernet PHY)	25 MHz	25 MHz
Ethernet PHY reference clock (RMIIn_REFCLK) (n = 0 to 2)	Frequency-dividing clock for PLL1	— (External Ethernet PHY)	50 MHz	50 MHz

Note 1. Max operating frequency depends on operating conditions (C, $T_j$min). For details, see section 52.5.3. Bus Timing.
Note 2. Max operating frequency depends on operating conditions (Voltage, SDR/DDR). For details, see section 52.5.5.12. xSPI Timing.

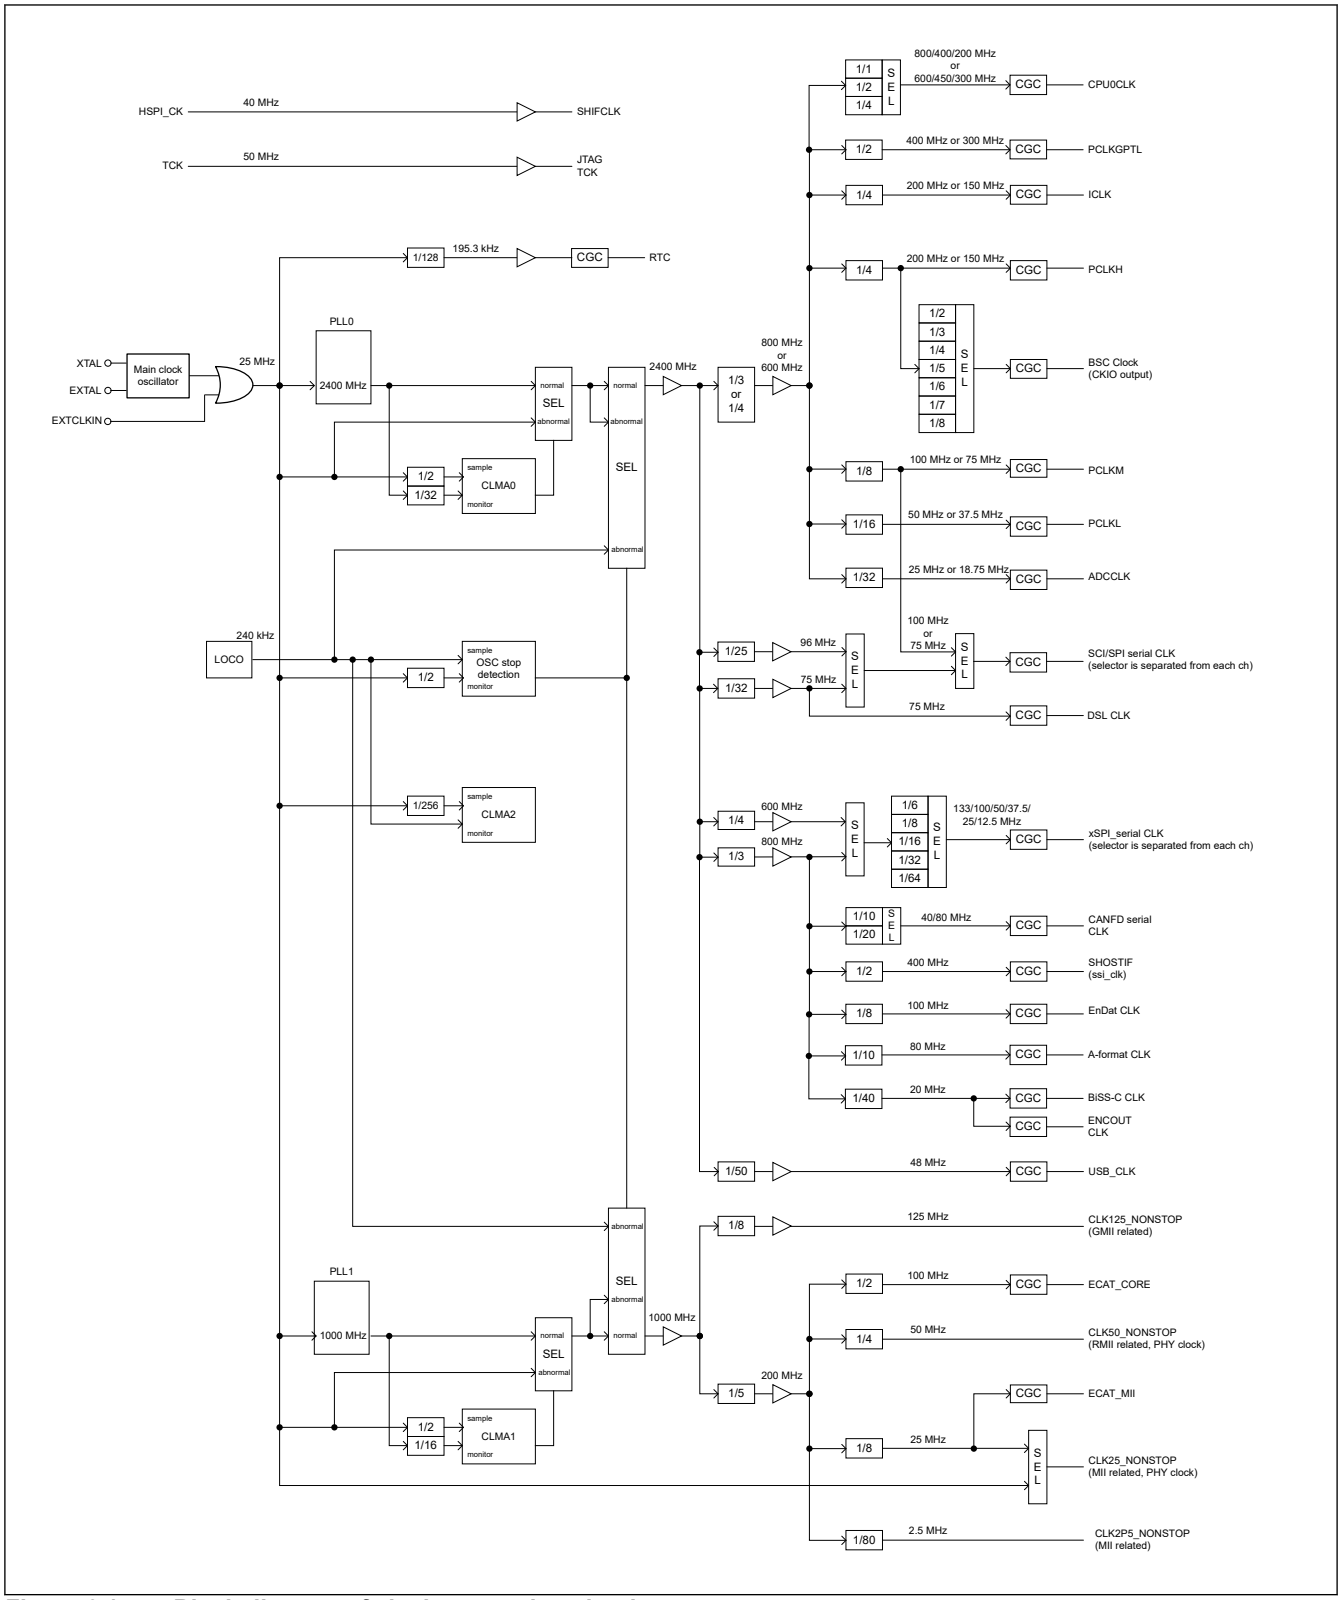

Figure 6.1 Block diagram of clock generation circuit

Table 6.3 Pin configuration of clock generation circuit (1 of 2)

Pin name	I/O	Description
XTAL	Output	These pins are used to connect a crystal resonator. When using an external clock signal, EXTAL pin must be driven low. XTAL pin must never be driven or loaded by anything other than crystal resonator. For details, see section 6.3.2. External Clock Input.
EXTAL	Input	

Table 6.3 Pin configuration of clock generation circuit (2 of 2)

Pin name	I/O	Description
EXTCLKIN	Input	This pin is used to input an external clock signal. When using a crystal resonator, this pin must be driven low.
TCK	Input	This pin is used to input the clock for the JTAG.
CKIO	Output	This pin is used to supply the external bus clock (CKIO) to external devices.
ETH0_REFCLK	Output	This pin is used to supply 25 MHz reference clock to the external Ethernet PHY.
ETH1_REFCLK	Output	This pin is used to supply 25 MHz reference clock to the external Ethernet PHY.
ETH2_REFCLK	Output	This pin is used to supply 25 MHz reference clock to the external Ethernet PHY.
RMII0_REFCLK	Output	This pin is used to supply 50 MHz reference clock to the external Ethernet PHY.
RMII1_REFCLK	Output	This pin is used to supply 50 MHz reference clock to the external Ethernet PHY.
RMII2_REFCLK	Output	This pin is used to supply 50 MHz reference clock to the external Ethernet PHY.

6.2 Register Descriptions

The registers related to the clock generation circuit can be write-protected. To write to the registers, specify bit 0 or 1 of the Protect Register (PRCRN and PRCRS) to cancel the write protection. For details, see section 10, Register Write Protection Function.

6.2.1 SCKCR : System Clock Control Register

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

<tr><td>31:1</td><td>—</td><td>These bits are read as 0.</td><td>R</td></tr>
</table>

The PLL0MON register is used to monitor the locking state of PLL0.

6.2.4 PLL1MON : PLL1 Monitor Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x40

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL1MON
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	*1

Bit	Symbol	Function	R/W
0	PLL1MON	PLL1 Lock State Monitor This bit monitors whether the PLL1 is locked or not. 0: PLL1 is not locked 1: PLL1 is locked	R
31:1	—	These bits are read as 0.	R

Note 1. Depends on package. QFP package: 0, BGA package: 1.

The PLL1MON register is used to monitor the locking state of PLL1.

6.2.5 PLL1EN : PLL1 Enable Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x50

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL1EN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	PLL1EN	PLL1 Enable 0: PLL1 is in standby state 1: PLL1 is in normal state	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

The PLL1EN register is used to set PLL1 to the standby mode. If PLL1 is not used, set this register to 0.

6.2.6 LOCOCR : Low-Speed On-Chip Oscillator Control Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x70

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LCSTP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	LCSTP	LOCO Stop Specify whether to run or stop the low-speed on-chip oscillator (LOCO). 0: Stop 1: Run	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: 1. When setting the LOCOCR to make the LOCO run again after it has been stopped, start using the LOCO clock after the LOCO oscillation stabilization time (t_{LOCOWT}) has elapsed.

2. Processing to stop oscillation after the bit has been set to stop the LOCO also requires a certain amount of time. Therefore, the following restrictions apply to making the LOCO run and stopping it:
   - When setting the bit to make the LOCO run again after it has been stopped, ensure that the period over which the LOCO has been stopped is at least the LOCO oscillation stabilization time (t_{LOCOWT}).
   - To set the bit to stop the LOCO, ensure that the LOCO oscillation is stable at the time.

3. LOCO may generate glitch when it is stopped after operation. Therefore, stop CLMA2 and CLMA3 which use LOCO clock, and transit to the module stop state by MSTPCRG register before LOCO is stopped.

The LOCOCR register is used to control operation of a low-speed on-chip oscillator (LOCO).

6.2.7 HIZCTRLEN : High-Impedance Control Enable Register

Base address: SYSC_S = 0x8128_0000

Offset address: 0x80

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	CLMA1MASK	CLMA0MASK	CLMA3MASK
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

Bit	Symbol	Function	R/W
0	CLMA3MASK	CLMA3 error mask to POE3 and POEG 0: CLMA3 error is not transferred to POE3 and POEG. 1: CLMA3 error is transferred to POE3 and POEG.	R/W
1	CLMA0MASK	CLMA0 error mask to POE3 and POEG 0: CLMA0 error is not transferred to POE3 and POEG. 1: CLMA0 error is transferred to POE3 and POEG.	R/W
2	CLMA1MASK	CLMA1 error mask to POE3 and POEG 0: CLMA1 error is not transferred to POE3 and POEG. 1: CLMA1 error is transferred to POE3 and POEG.	R/W

Bit	Symbol	Function	R/W
31:3	—	These bits are read as 0. The write value should be 0.	R/W

The HIZCTRLEN register is used to transfer CLMA error signals to POE3 and POEG.

6.3 Selecting Input to Main Clock Oscillator

The clock signal is supplied to the main clock oscillator by connecting a resonator or by the input of an external clock signal to EXTCLKIN. The clock input mode is set based on the status of the XTAL, EXTAL, and EXTCLKIN pins. For details about the settings, see Table 6.4.

Table 6.4 Clock input mode selection

Clock input mode	XTAL	EXTAL	EXTCLKIN
Resonator connection	Resonator connected	Resonator connected	VSS via a resistor
External clock input	Open	VSS via a resistor	Clock input

6.3.1 Connecting a Crystal Resonator

Figure 6.2 shows an example of connecting a crystal resonator. Make sure to connect EXTCLKIN to VSS via a resistor.

A damping resistor Rd should be added, if necessary. Because the resistor values vary depending on the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer.

When connecting a resonator to supply the clock, the frequency of the resonator should be in the frequency of the resonator for the main clock oscillator described in Table 6.5.

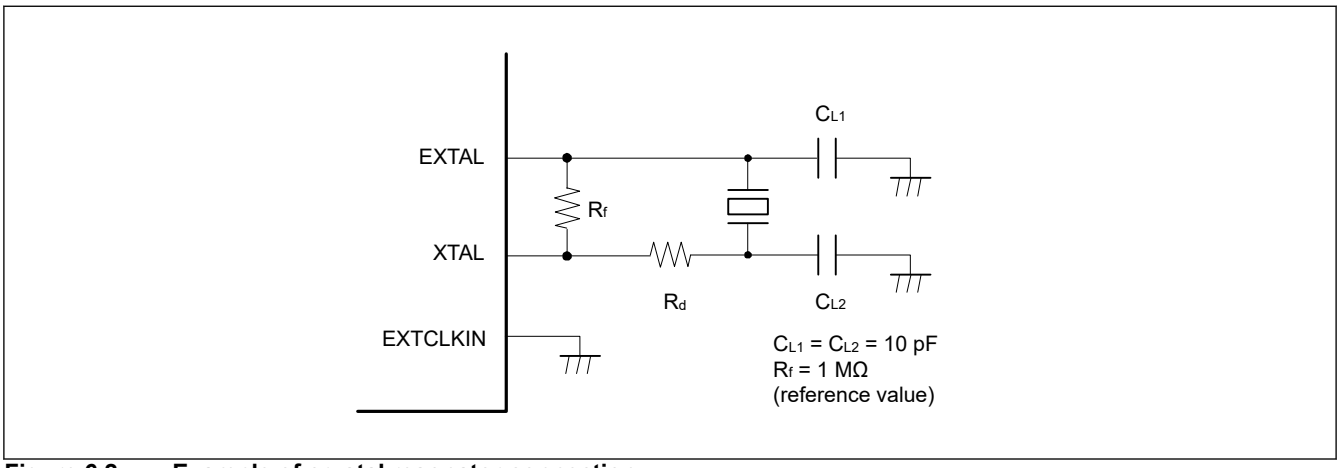

Figure 6.2 Example of crystal resonator connection

Table 6.5 Damping resistance (reference values)

Frequency (MHz)	25
Rd (Ω)	0

Figure 6.3 shows an equivalent circuit of the crystal resonator. Use a crystal resonator that has the characteristics shown in Table 6.6.

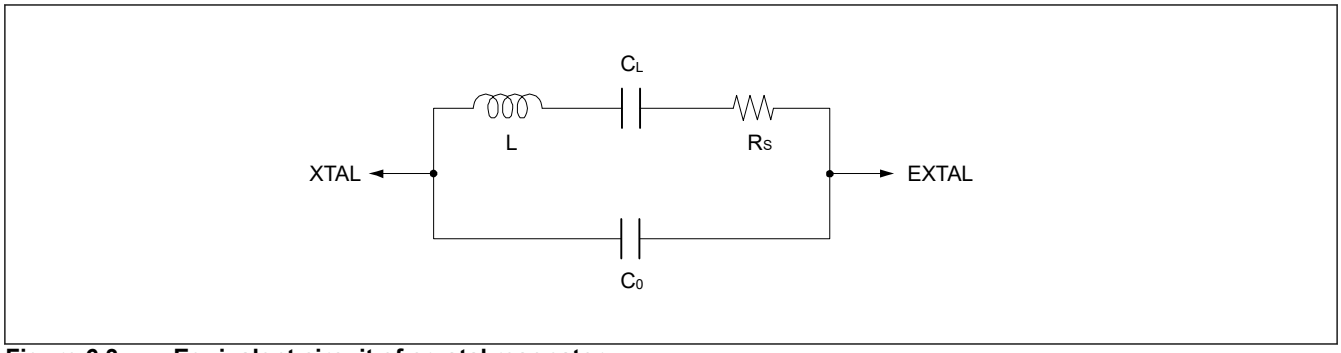

Figure 6.3 Equivalent circuit of crystal resonator

Table 6.6 Crystal resonator characteristics (reference values)

Frequency (MHz)	25
RS_{max} (Ω)	150 Ω

6.3.2 External Clock Input

Figure 6.4 shows an example connection of external clock input. Connect EXTAL to VSS via a resistor and leave XTAL open.

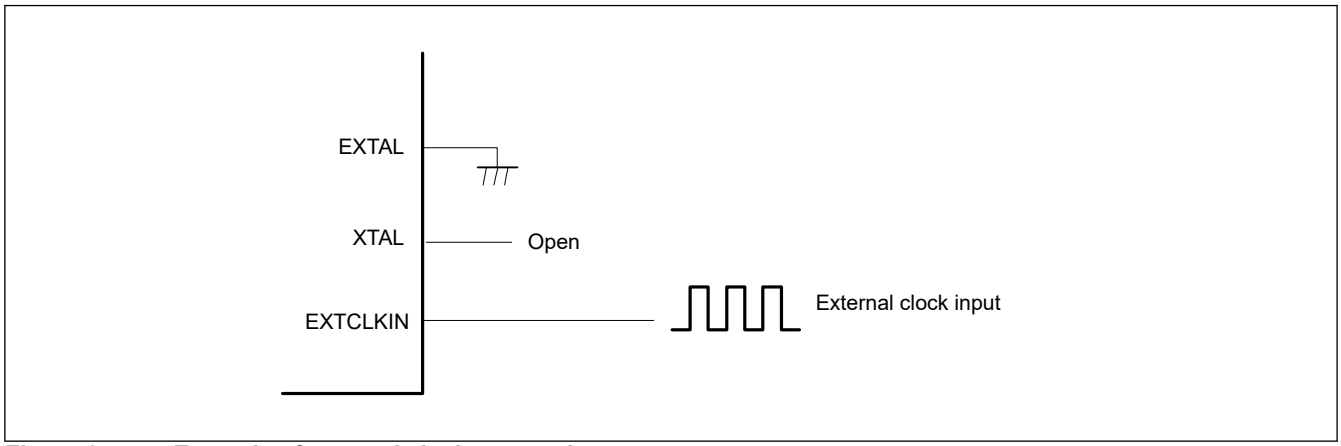

Figure 6.4 Example of external clock connection

6.4 PLL Circuit

The PLL circuit has a function to multiply the frequency from the oscillator. The LSI incorporates two PLL circuits (PLL0 and PLL1).

6.5 Low-Speed On-Chip Oscillator (LOCO)

The LSI incorporates low-speed on-chip oscillator (LOCO). It is used as sampling clock of CLMA and alternative clock of main clock and PLL clock when oscillation abnormality is detected.

After a reset is released, the LOCO is disabled. To enable this function, set the LOCO stop bit in the Low-Speed On-Chip Oscillator Control Register (LOCOCR.LCSTP) to 1.

6.6 Oscillation Abnormality Detection Function for the Main Clock

6.6.1 Main Clock Oscillation Abnormality Detection and Operation after Detection

The LSI incorporates a clock monitor circuit (CLMA3) that enables the detection of abnormal oscillation by the main clock. After a reset is released, the oscillation abnormality detection function is disabled. To enable this function, set the clock monitor enable bit in CLMA Control Register 0 (CLMA3.CTL0.CLME) to 1. For details, see section 7, Clock Monitor Circuit (CLMA).

An oscillation abnormality interrupt can be generated when an oscillation abnormality is detected. Low-speed on-chip oscillator (LOCO) clock or PLL free run clock is supplied as the system clock source instead of the main clock, PLL0 clock, and PLL1 clock. LOCO clock or PLL free run clock is selectable by the select alternative clock bit in the System Clock Control Register (SCKCR.CLMASEL). When PLL free run clock is selected, clock frequency is not guaranteed.

In addition, the MTU3 and GPT output can be forcedly driven to the high-impedance on the detection. For details, see:

- section 17, Multi-Function Timer Pulse Unit 3 (MTU3)
- section 18, Port Output Enable 3 (POE3)
- section 19, General PWM Timer (GPT)
- section 20, Port Output Enable for GPT (POEG)

Note: If CLMA3 detects abnormal oscillation, CLMA0/CLMA1 also generate abnormal oscillation deteced interrupt when both CLMA3 and CLMA0/CLMA1 are enabled.

6.6.2 Main Clock Oscillation Abnormality Detection Interrupt

When abnormal oscillation is detected, an abnormal oscillation detected interrupt is generated by the CLMA3 circuit, and it is transfered to the Port Output Enable 3 (POE3) block and Port Output Enable for GPT (POEG) if transmission is enabled in HIZCTRLEN register. On accepting the notification that the oscillation is to be stopped, the POE3 sets the OSTST high-impedance flag in the Input Level Control/Status Register 6 (ICSR6.OSTSTF) to 1 and the POEG also sets the Oscillation Stop Detection flags (POEGGn.OSTPF (n = A to D)) in the POEG Group n Setting Registers to 1.

The abnormal oscillation detected interrupt is connected to the Interrupt Controller Unit (ICU) as one of the error events of peripheral error interrupt so that error interrupt output and error reset are usable. When error interrupt output is used, the interrupt by all error events is disabled in the initial state after release from the reset state. To use oscillation stop detection interrupt (error event), release mask of the event in PRIERR_RSTMSK0 register when the ICU detects an error event. For details, see section 11, Interrupt Controller (ICU).

Note: If an abnormality in oscillation of the main clock occurs, oscillation of the PLL0 clock source also becomes abnormal, which may result in incorrect operation of the CPU. The POE3 and POEG set the high-impedance flag regardless of the state of the CPU, and the MTU3 and GPT outputs are driven to the high-impedance state.

6.7 PLL Oscillation Abnormality Detection Function

The PLL oscillation abnormality detection function detects an abnormality in oscillation of the PLL0 or PLL1 by using the Clock Monitor Circuits (CLMA0 and CLMA1) to monitor the frequency. It then supplies the main clock instead of the PLL0 or PLL1 clock. For details about the CLMA, see section 7, Clock Monitor Circuit (CLMA).

When abnormal oscillation is detected, an abnormal oscillation detected interrupt is generated by the CLMA0 or CLMA1 circuit, and it is transferred to POE3 and POEG if transmission is enabled in HIZCTRLEN register. On accepting the notification that the oscillation is to be stopped, the POE3 sets the OSTST high-impedance flag in the Input Level Control/Status Register 6 (ICSR6.OSTSTF) to 1 and the POEG also sets the Oscillation Stop Detection flags (POEGGn.OSTPF (n = A to D)) in the POEG Group n Setting Registers to 1.

The abnormal oscillation detected interrupt is connected to the Interrupt Controller Unit (ICU) as one of the error events of peripheral error interrupt so that error interrupt output and error reset are usable. When error interrupt output is used, the interrupt by all error events is disabled in the initial state after release from the reset state. To use oscillation stop detection interrupt (error event), release mask of the event in PRIERR_RSTMSK0 register when the ICU detects an error event. For details, see section 11, Interrupt Controller (ICU) .

6.8 Low-Speed On-Chip Oscillator Oscillation Abnormality Detection Function

The clock monitor circuit (CLMA2) can be used to detect an abnormality in oscillation of the low-speed on-chip oscillator. For details about the CLMA, see section 7, Clock Monitor Circuit (CLMA).

6.9 Internal Clock

Clock sources of internal clock signals are the main clock, LOCO clock, PLL0 clock, PLL1 clock, and the external clock for JTAG. Multiple internal clocks listed in Table 6.7 are produced from these sources.

Table 6.7 Overview of Clock Generation Circuit Specifications (Internal Clock) (1 of 2)

Clock name	Description
CPU0 clock (CPU0CLK)	The CPU0 clock (CPU0CLK) is used as the operating clock of the Cortex-R52 CPU0. The CPU0 operating frequency is specified by combination of the SCKCR2.FSELCPU0 and DIVSELSUB bits. Frequency of CPU0 is selectable from ×1, ×2, or ×4 of ICLK frequency.
System clock (ICLK)	The system clock (ICLK) is a clock supplied to, for example DMAC, interrupt controller, CPU bus interface, BSC. The ICLK is specified by the SCKCR2.DIVSELSUB bit.
Peripheral module clock H (PCLKH)	The peripheral module clock H (PCLKH) is used as the operating clock and/or bus clock for high-speed peripheral modules such as MTU3, GPT connected to LLPP bus, TFU, DSMIF, POE3, POEG (LLPP), ADC12 (bus), GMAC, xSPI (bus), SHOSTIF, and System SRAM. The PCLKH frequency is specified by the SCKCR2.DIVSELSUB bit. Frequency of PCLKH is the same as ICLK.
Peripheral module clock M (PCLKM)	The peripheral module clock M (PCLKM) is used as the operating clock and/or bus clock for middle-speed peripheral modules such as CRC, SCI (bus), SPI (bus), GPT connected to non-safety and safety regions, CANFD, GMAC (bus), SHIP, OTP, Network Reg, ESC (bus), USB (bus), GPIO, and CLMA. The PCLKM frequency is specified by the SCKCR2.DIVSELSUB bit. Frequency of PCLKM is the same as 1/2 of ICLK.
Peripheral module clock L (PCLKL)	The peripheral module clock L (PCLKL) is used as the operating clock and/or bus clock for low-speed peripheral modules such as POEG (Non Safety, Safety), IIC, DOC, CMT, CMTW, WDT, RTC (bus), and TSU. The PCLKL frequency is specified by the SCKCR2.DIVSELSUB bit. Frequency of PCLKL is the same as 1/4 of ICLK.
Peripheral module clock for ADC12 (PCLKADC)	The peripheral module clock for ADC12 (PCLKADC) is used as the operating clock for ADC12 unit 0 and 1. The PCLKADC frequency is specified by the SCKCR2.DIVSELSUB bit. Frequency of PCLKADC is the same as 1/8 of ICLK.
Peripheral module clock for GPT in LLPP (PCLKGPTL)	The peripheral module clock for GPT in LLPP (PCLKGPTL) is used as the operational clock for GPT in LLPP. The PCLKGPTL frequency is specified by the SCKCR2.DIVSELSUB bit. Frequency of PCLKGPTL is the same as ×2 of ICLK.
Peripheral module clock for SCIn (PCLKSCIn) (n = 0 to 5)	The peripheral module clock for SCIn (PCLKSCIn) is used as the operating clock for SCIn. The PCLKSCIn frequency is specified by combination of the SCKCR.SCInASYNCSEL (n = 0 to 4) or SCKCR2.SCInASYNCSEL (n = 5) bit and the SCIn.CCR3.BPEN bit. SCIn.CCR3.BPEN bit specifies which clock is used, synchronous clock (1) or asynchronous clock (0). When the bit is set to 1 (synchronous clock), the frequency of PCLKSCIn is the same as PCLKM. When the bit is set to 0 (asynchronous clock), the frequency of PCKLSCIn is the clock frequency selected by SCKCR.SCInASYNCSEL (n = 0 to 4) or SCKCR2.SCInASYNCSEL (n = 5) bit. It is selectable from 75 MHz or 96 MHz. Setting is independent for each channel.
Peripheral module clock for SPIn (PCLKSPIn) (n = 0 to 3)	The peripheral module clock for SPIn (PCLKSPIn) is used as the operating clock for SPIn. The PCLKSPIn frequency is specified by combination of the SCKCR.SPInASYNCSEL (n = 0 to 2) or SCKCR2.SPInASYNCSEL (n = 3) bit and the SPIn.SPCR.BPEN bit. SPIn.SPCR.BPEN bit specifies which clock is used, synchronous clock (1) or asynchronous clock (0). When the bit is set to 1 (synchronous clock), the frequency of PCLKSPIn is the same as PCLKM. When the bit is set to 0 (asynchronous clock), the frequency of PCKLSPIn is the clock frequency selected by SCKCR.SPInASYNCSEL (n = 0 to 2) or SCKCR2.SPInASYNCSEL (n = 3) bit. It is selectable from 75 MHz or 96 MHz. Setting is independent for each channel.
Peripheral module clock for CANFD (PCLKCAN)	The peripheral module clock for CANFD (PCLKCAN) is used as the serial clock for CANFD. The PCLKCAN frequency is specified by the SCKCR.FSELCANFD bit. It is selectable from 40 MHz or 80 MHz.
External bus clock (BSC_CLK, CKIO)	The external bus clock (CKIO) is used as an operating clock. The CKIO operating frequency is selectable from ICLK/2, ICLK/3, ICLK/4, ICLK/5, ICLK/6, ICLK/7, or ICLK/8 by combination of the SCKCR.CKIO and SCKCR2.DIVSELSUB bits.
Peripheral module clock for RTC (PCLKRTC)	The peripheral module clock for RTC (PCLKRTC) is used as the operational clock for RTC. The PCLKRTC frequency is fixed to 195.3 kHz, and cannot be user-specified.
USB clock (USB_CLK48)	The USB clock is used as the reference clock for USB PHY layer. The USB clock frequency is fixed to 48 MHz, and cannot be user-specified.
xSPIn serial clock (XSPI_CLKn) (n = 0, 1)	The xSPI serial clock for xSPIn (XSPI_CLKn) is used as the serial clock for xSPIn. Clock frequency is selectable by combination of the SCKCR.FSELXSPIn and DIVSELXSPIn bits.
Ethernet clock B (ETCLKB)	The Ethernet clock B (ETCLKB) is a clock for GMAC and MII converter. The ETCLKB frequency is fixed to 125 MHz, and cannot be user-specified.

Table 6.7 Overview of Clock Generation Circuit Specifications (Internal Clock) (2 of 2)

Clock name	Description
Ethernet clock C (ETCLKC)	The Ethernet clock C (ETCLKC) is a clock for ESC. The ETCLKC frequency is fixed to 100 MHz, and cannot be user-specified.
Ethernet clock D (ETCLKD)	The Ethernet clock D (ETCLKD) is a clock for MII Converter. The ETCLKC frequency is fixed to 50 MHz, and cannot be user-specified.
Ethernet clock E (ETCLKE)	The Ethernet clock E (ETCLKE) is a clock for ESC and MII converter. The ETCLKE frequency is fixed to 25 MHz, and cannot be user-specified.
CLMAn sampling clock (CLMAMCLKA) (n = 0, 1)	The CLMAn (n = 0, 1) sampling clocks (CLMAMCLKA) are for use with CLMA0 and CLMA1. The CLMAMCLKA frequency is fixed to 12.5 MHz, and cannot be user-specified.
CLMA2 sampling clock (CLMAMCLKB)	The CLMA2 sampling clock (CLMAMCLKB) is for use with CLMA2. The CLMAMCLKB frequency is fixed to 97.7 kHz, and cannot be user-specified.
CLMA3 sampling clock (CLMALCLKA)	The CLMA3 sampling clock (CLMALCLKA) is for use with CLMA3. The CLMALCLKA frequency is fixed to 240 kHz, and cannot be user-specified.
CLMA0 monitor clock (CLMAPLCLK0)	The CLMA0 monitor clock (CLMAPLCLK0) is the monitoring clock for use with CLMA0. The CLMAPLCLK0 frequency is fixed to 75 MHz, and cannot be user-specified.
CLMA1 monitor clock (CLMAPLCLK1)	The CLMA1 monitor clock (CLMAPLCLK1) is the monitoring clock for use with CLMA1. The CLMAPLCLK1 frequency is fixed to 62.5 MHz, and cannot be user-specified.
CLMA2 monitor clock (CLMALCLK)	The CLMA2 monitor clock (CLMAPLCLK) is the monitoring clock for use with CLMA2. The CLMALCLK frequency is fixed to 240 kHz, and cannot be user-specified.
CLMA3 monitor clock (CLMAMCLK)	The CLMA3 monitor clock (CLMAMCLK) is the monitoring clock for use with CLMA3. The CLMAMCLK frequency is fixed to 12.5 MHz, and cannot be user-specified.
JTAG clock (JTAGTCK)	The JTAG clock (JTAGTCK) is the operating clock for JTAG. JTAGTCK is generated by the external clock for JTAG (TCK).
Trace interface clock (TCLK)	The trace interface clock (TCLK) is used as the operating clock for the trace interface within CoreSight architecture. The TCLK frequency is fixed to 100 MHz, and cannot be user-specified. This clock frequency-divided by 2 is output from the LSI as the CPU trace clock for the on-chip debugger (TRACECLK).
Serial Host I/F clock (SHIFCLK)	The Serial Host I/F clock (SHIFCLK) is used as the interface clock for SHOSTIF. The SHIFCLK frequency is up to 40 MHz.
EnDat clock (PCLKENDAT)	The EnDat clock (PCLKENDAT) is used as the operating clock for EnDat. The PCLKENDAT is fixed to 100 MHz.
BiSS-C clock (PCLKBISS)	The BiSS-C clock (PCLKBISS) is used as the operating clock for BiSS-C. The PCLKBISS is fixed to 20 MHz.
HIPERFACE DSL clock (PCLKDSL)	The HIPERFACE DSL clock (PCLKDSL) is used as the operating clock for HIPERFACE. The PCLKDSL is fixed to 75 MHz.
A-format clock (PCLKAFMT)	The A-format clock (PCLKAFMT) is used as the operating clock for A-format. The PCLKAFMT is fixed to 80 MHz.
ENCOUT clock (PCLKENCO)	The ENCOUT clock (PCLKENCO) is used as the operating clock for ENCOUT. The PCLKENCO is fixed to 20 MHz.

6.10 Reference Clock to the External Ethernet PHY

The LSI provides reference clocks to the external Ethernet PHY.

Table 6.8 List of reference clock to the external Ethernet PHY

Clock name	Description
ETHn_REFCLK (n = 0 to 2)	25 MHz reference clock to the external Ethernet PHY. Clock source is selectable from main clock or frequency-dividing clock for PLL1 by the SCKCR.PHYSEL bit.
RMIIn_REFCLK (n = 0 to 2)	50 MHz reference clock to the external Ethernet PHY for RMII.

6.11 Usage Notes

6.11.1 Notes on Clock Generation Circuit

1. The operating frequency of xSPI interface, the external bus clock (CKIO), and CANFD serial clock that are supplied to the modules based on the SCKCR and SCKCR2 register settings varies before and after the frequency is changed. Do not change the clock frequency during access via the external interface. To start access via the external interface after the clock frequency is changed, confirm that the change to the frequency has been completed before you start access via the interface.
2. Do not change the clock frequency of the PCLKSPIn or PCLKSCIn while the SPIn (channels 0 to 3) or the SCIn (channels 0 to 5) is operating. To cancel the module-stop state after the clock frequency is changed, confirm that the change to the frequency is completed before you cancel the module-stop state.
3. In order to secure the processing after the clock frequency is changed, modify the pertinent clock control register to change the frequency, and then perform a dummy read of the register at least three times. Then perform the subsequent processing.
4. In order to secure processing after release from the module-stop state, dummy read the same register at least three times after writing to initiate release from the module-stop state, and only then proceed with the subsequent processing.
5. Do not change the base clock frequency for peripheral module by the DIVSELSUB bit in SCKSCR2 register during operation.
6. When controlling the module-stop state of the modules that initiate DMA transfer or that otherwise operate in relation with other blocks, confirm that DMAC transfer initiated by such modules and other points of interlinked operation are completed before releasing modules from or placing modules in the module-stop state. For set products in which such target modules are not used, design of the control of the module-stop state is on the assumption that the clocks are initially stopped. Therefore, the absence of unexpected operations in states other than the specified is not guaranteed. For example, operation after releasing modules from or placing modules in the module-stop state while a module is running is not guaranteed. For details on the operation and stopping of individual modules, see the section on processing by the corresponding block.
7. When CPU clock frequency is changed from 200 MHz to 800 MHz, change 400 MHz once and then change to 800 MHz.
   Example code:

```
volatile unsigned long dummy; // Declared volatile to prevent optimization being applied
R_SYSC_S->SCKCR2.FSELCPU0 = 01; // Step 1: Setting to frequency of CPU0 (400 MHz)
dummy = R_SYSC_S->SCKCR2.FSELCPU0; // Step 2: Dummy-read the SCKCR2 register.
dummy = R_SYSC_S->SCKCR2.FSELCPU0; // Step 3: Dummy-read the SCKCR2 register at least 3 times.
dummy = R_SYSC_S->SCKCR2.FSELCPU0;
R_SYSC_S->SCKCR2.FSELCPU0 = 00; // Step 4: Setting to frequency of CPU0 (800 MHz)
dummy = R_SYSC_S->SCKCR2.FSELCPU0; // Step 2: Dummy-read the SCKCR2 register.
dummy = R_SYSC_S->SCKCR2.FSELCPU0; // Step 3: Dummy-read the SCKCR2 register at least 3 times.
dummy = R_SYSC_S->SCKCR2.FSELCPU0;
```

6.11.2 Notes on Resonator

Since various resonator characteristics relate closely to the user's board design, adequate evaluation is required on the user side before use, referencing the resonator connection example shown in this section. The circuit constants for the resonator depend on the resonator to be used and the stray capacitance of the mounting circuit. Therefore, the circuit constants should be determined in full consultation with the resonator manufacturer. The voltage to be applied between the resonator pins must be within the absolute maximum rating.

6.11.3 Notes on Designing the Board

When using a crystal resonator, place the resonator and its load capacitors as close to the XTAL and EXTAL pins as possible. Other signal lines should be routed away from the oscillation circuit as shown in Figure 6.5. This prevents electromagnetic induction from interfering with correct oscillation.

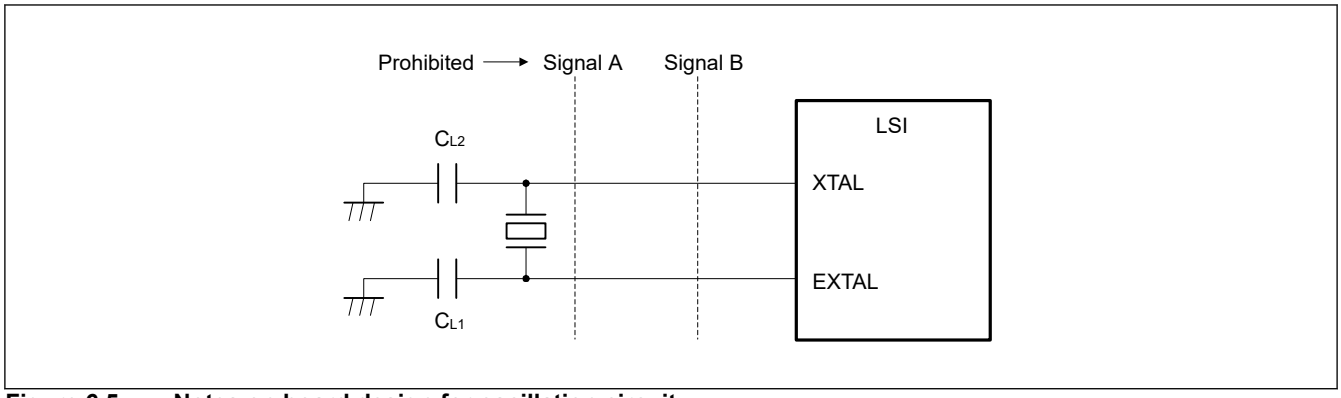

Figure 6.5 Notes on board design for oscillation circuit

7. Clock Monitor Circuit (CLMA)

7.1 Overview

A clock monitor circuit, CLMAm (m = 0 to 3), can detect a frequency error in PLL0 output, PLL1 output, low-speed on-chip oscillator (LOCO) output, or main clock. During 16 cycles of the sampling clock, it counts the rising edges of the monitoring clock (frequency-dividing clock from PLL0, PLL1, LOCO, or main clock), and then compares the counter value with the compare register.

When CLMAm detects an error, error events are generated and sent to the interrupt controller (ICU).

Table 7.1 lists the specifications of CLMAm and Figure 7.1 shows a block diagram.

Table 7.1 CLMAm (m = 0 to 3) specifications

Parameter	Description
Monitoring clock	The following monitoring clock frequency errors can be detected: ● PLL0 output clock divided by 32 (CLMAPLCLK0, which is to be supplied to CLMA0): 75 MHz ● PLL1 output clock divided by 16 (CLMAPLCLK1, which is to be supplied to CLMA1): 62.5 MHz ● Low-speed on-chip oscillator (LOCO) output clock (CLMALCLK, which is to be supplied to CLMA2): 240 kHz. ● Clock which equals to the main clock frequency divided by 2 (CLMAMCLK, which is to be supplied to CLMA3): 12.5 MHz
Sampling clock	The following clock frequency errors are monitored as the sampling clock: ● Clock which equals to the main clock frequency divided by 2 (CLMAMCLKA, which is to be supplied to CLMA0): 12.5 MHz ● Clock which equals to the main clock frequency divided by 2 (CLMAMCLKA, which is to be supplied to CLMA1): 12.5 MHz ● Clock which equals to the main clock frequency divided by 256 (CLMAMCLKB, which is to be supplied to CLMA2): 97.7 kHz. ● Clock which equals to LOCO frequency (CLMALCLKA, which is to be supplied to CLMA3): 240 kHz
Error event	When CLMAm detects a frequency error, error events are generated and sent to the interrupt controller (ICU). ● CLMA0 oscillator-stopped detection error ● CLMA1 oscillator-stopped detection error ● CLMA2 oscillator-stopped detection error ● CLMA3 oscillator-stopped detection error

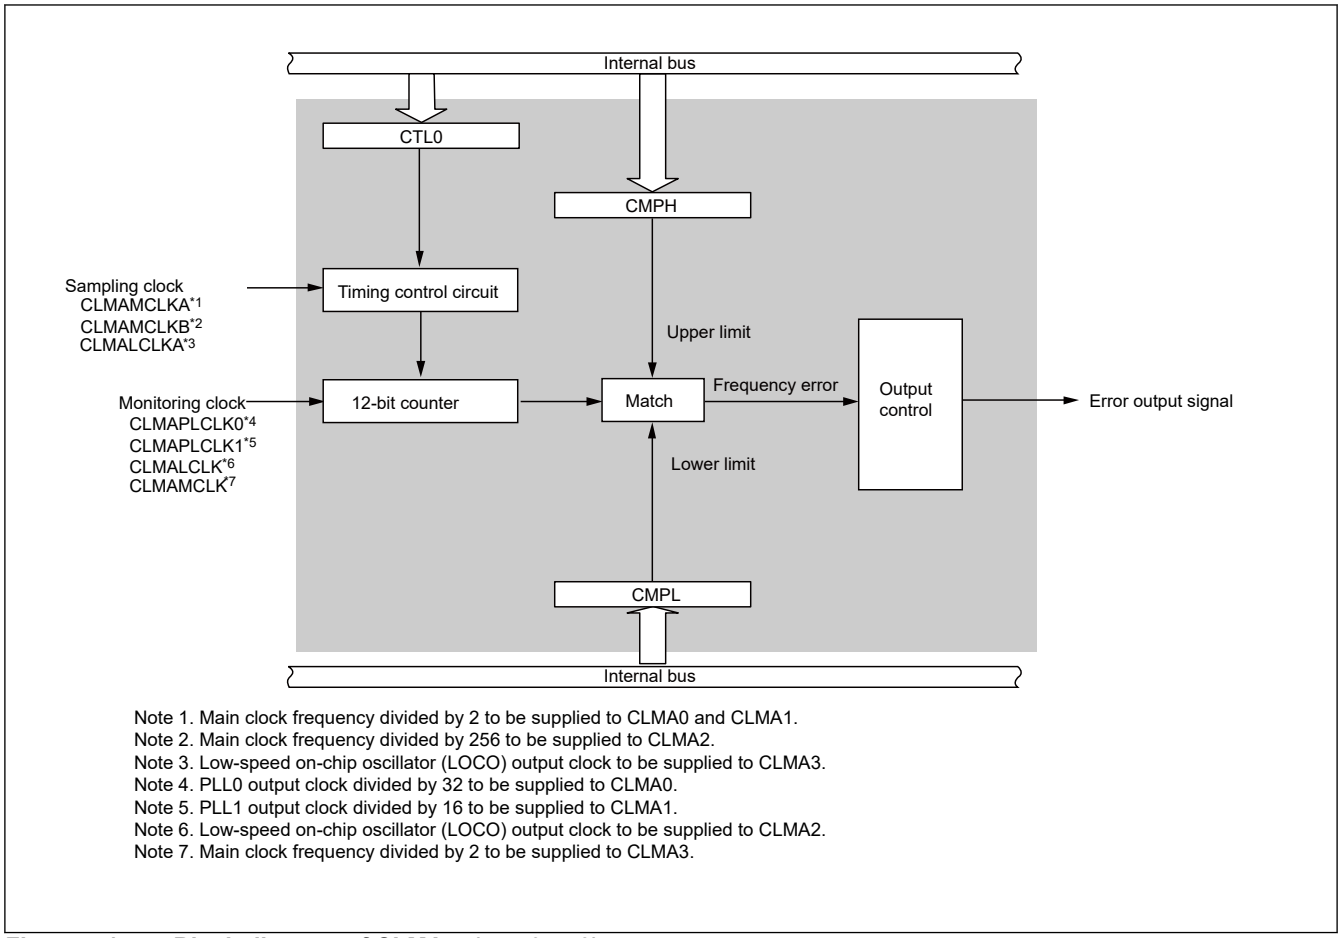

Figure 7.1 Block diagram of CLMAm (m = 0 to 3)

7.2 Register Descriptions

7.2.1 CTL0 : CLMA Control Register 0

Base address: CLMAm = 0x8128_0800 + 0x0020 × m (m = 0 to 3)

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	CLME
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CLME	Clock Monitor m Enable (m = 0 to 3) Enables or disables operation of clock monitor circuit CLMAm. 0: Disables CLMAm operation 1: Enables CLMAm operation*1	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Once the CLME bit is set to 1, it cannot be cleared by any operation other than reset (except CPU0 software reset).

The CTL0 registers control operation of clock monitor circuit CLMAm. Writing to these registers is protected by a specific command sequence. For details, see (1)Enabling operations.

7.2.2 CMPL : CLMA Compare Register L

Base address: CLMAm = 0x8128_0800 + 0x0020 × m (m = 0 to 3)

Offset address: 0x08

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	CMPL[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
11:0	CMPL[11:0]	Clock Monitor m Compare L (m = 0 to 3) Specify the lower-limit threshold for the frequency domain.*1 ● For details, see (2)Method of calculating threshold values, the CMPL and CMPH registers. Recommended value: $f_{CLMATMON}$ (min) / $f_{CLMATSMP}$ (max) × 16 - 1 $f_{CLMATMON}$: Monitoring clock frequency $f_{CLMATSMP}$: Sampling clock frequency ● Minimum value: 0x0001	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. To set the CMPL registers, the following conditions must be met:
1. 1 ≤ CMPL
2. CMPL + 3 ≤ CMPH

The CMPL registers set the lower limit for comparing frequency domains. Values can be written to these registers when CTL0.CLME = 0. When CTL0.CLME = 1, writing to these registers has no effect.

7.2.3 CMPH : CLMA Compare Register H

Base address: CLMAm = 0x8128_0800 + 0x0020 × m (m = 0 to 3)

Offset address: 0x0C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	CMPH[11:0]											
Value after reset:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
11:0	CMPH[11:0]	Clock Monitor m Compare H (m = 0 to 3) Specify the upper-limit threshold for the frequency domain.*1 ● For details, see (2)Method of calculating threshold values, the CMPL and CMPH registers. Recommended value: $f_{CLMATMON}$ (max) / $f_{CLMATSMP}$ (min) × 16 + 1 $f_{CLMATMON}$: Monitoring clock frequency $f_{CLMATSMP}$: Sampling clock frequency ● Minimum value: CMPL + 0x0003	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. To set the CMPH registers, the following conditions must be met:
- 1 ≤ CMPL
- CMPL + 3 ≤ CMPH

The CMPH registers set the upper limit for comparing frequency domains. Values can be written to these registers when CTL0.CLME = 0. When CTL0.CLME = 1, writing to these registers has no effect.

7.2.4 PCMD : CLMA Command Register

Base address: CLMAm = 0x8128_0800 + 0x0020 × m (m = 0 to 3)

Offset address: 0x10

Bit position:	7	6	5	4	3	2	1	0
Bit field:								
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
7:0	n/a	CLMAm Protect Key Code (m = 0 to 3) Write a specific command sequence.	W

The PCMD registers control writing to the protected registers.

For details, see (1)Enabling operations.

7.2.5 PROTSR : CLMA Protection Status Register

Base address: CLMAm = 0x8128_0800 + 0x0020 × m (m = 0 to 3)

Offset address: 0x14

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	PRERR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PRERR	CLMAm Error (m = 0 to 3) 0: No protection error occurred 1: A protection error occurred	R
7:1	—	These bits are read as 0.	R

The PROTSR registers indicate whether writing to the protected register is performed correctly. If writing is not performed correctly, a protection error occurs and the PROTSR.PRERR bit is set to 1.

For details, see (1)Enabling operations.

7.3 Operation

7.3.1 CLMAm Operation

(1) Enabling operations

Setting the CTL0.CLME bit to 1 starts monitoring the monitoring clock (PLL0 output divided by 32, PLL1 output divided by 16, LOCO output, and main clock divided by 2) by using clock monitor circuit CLMAm (m = 0 to 3) output. To write 1 in the CTL0.CLME bit, use the following command sequence:

1. Write 0xA5 to the PCMD register.
2. Writing to CTL0 is performed with the following sequence:
   (a) Write the target setting value (0x01).
   (b) Write the reversed value of the target (0xFE).
   (c) Write the target value (0x01) again.
3. Read CTL0.
   When the value of CTL0 shows 0x01, the operation of CLMAm is enabled. If it shows another value, check the value of PROTSR register.

When PROTSR = 0x01, the command sequence is not performed correctly. Execute the sequence again from step 1 to perform writing.

(2) Stopping operations

When a sampling clock stops due to register operation, the corresponding clock monitor circuit (CLMAm) is disabled automatically. After that, when the monitoring clock starts oscillating again and stabilizes, CLMAm resumes operation.

Table 7.2 Monitoring clock and sampling clock each CLMAm

Parameter		CLMA0	CLMA1	CLMA2	CLMA3
Detection target	Clock	PLL0 output clock	PLL1 output clock	LOCO	Main clock
	Frequency	2400 MHz	1000 MHz	240 kHz	25 MHz
Monitoring clock	Clock	PLL0 output clock divided by 32	PLL1 output clock divided by 16	LOCO	Main clock divided by 2
	Frequency	75.0 MHz	62.5 MHz	240 kHz	12.5 MHz
Sampling clock	Clock	Main clock divided by 2	Main clock divided by 2	Main clock divided by 256	LOCO
	Frequency	12.5 MHz	12.5 MHz	97.7 kHz	240 kHz

7.3.2 Detecting Error Clock Frequency

(1) Detection Method

1. During 16 cycles of the sampling clock (main clock frequency dividing clock and LOCO), CLMAm counts the rising edge of the monitoring clock (PLL0 output divided by 32, PLL1 output divided by 16, LOCO output, and main clock divided by 2), and compares the counter value with the set threshold (m = 0 to 3).
   - CMPL.CMPL[11:0] set the lower-limit threshold of the frequency domain.
   - CMPH.CMPH[11:0] set the upper-limit threshold of the frequency domain.
2. If the monitoring clock stops or shows a value lower than the expected frequency, the counter value shows a value lower than the setting of CMPL.CMPL[11:0].
3. If the monitoring clock shows a value higher than the expected frequency, the counter value shows a value higher than the setting of CMPH.CMPH[11:0].

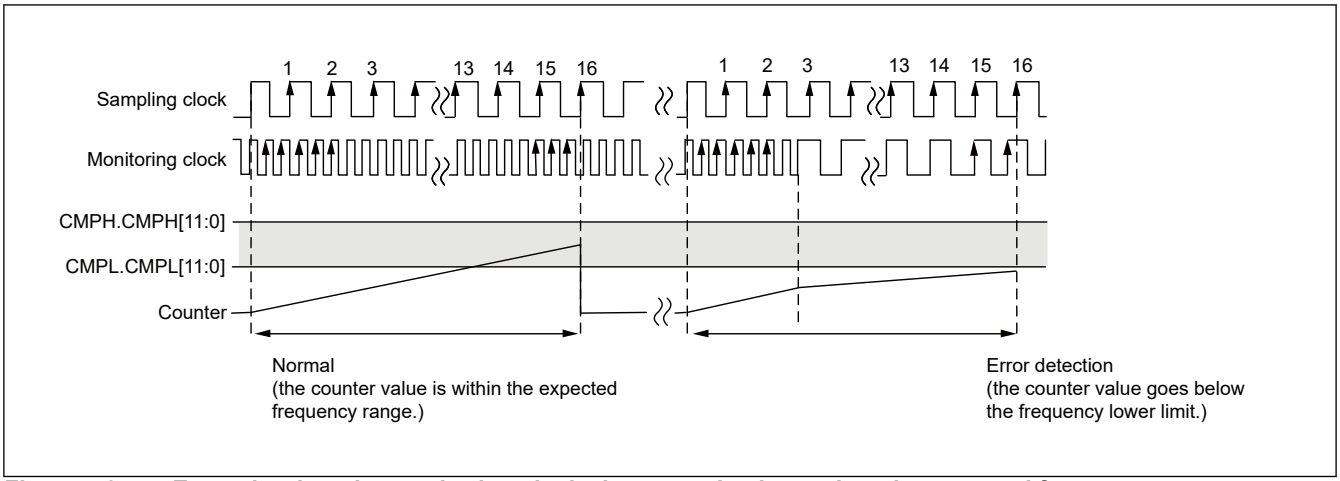

Figure 7.2 Example when the monitoring clock shows a value lower than the expected frequency

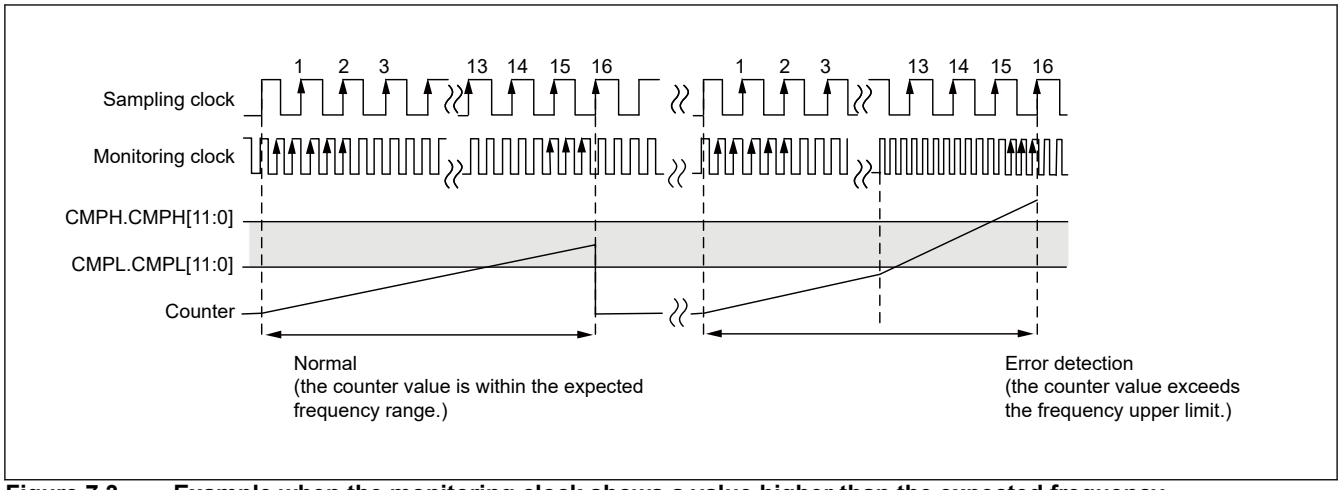

Figure 7.3 Example when the monitoring clock shows a value higher than the expected frequency

Note: No error is detected if the monitoring clock frequency changes within a sampling interval, and it eventually stays within a valid counter value. A monitoring clock error is detected after a sampling interval (16 cycles of the sampling clock).

(2) Method of calculating threshold values, the CMPL and CMPH registers

For compare registers CMPL and CMPH, set the minimum and maximum values of the number of cycles (the number of rising edges) for the monitoring clock which is assumed to be normal within 16 cycles of the sampling clock (main clock frequency dividing clock and LOCO).

$f_{CLMATSMP}$ indicates the sampling clock frequency, $f_{CLMATMON}$ indicates the monitoring clock frequency, and N indicates the number of cycles (rising edges) of the monitoring clock, which is expected within 16 cycles of the sampling clock.

$$N = \frac{f_{\mathrm{CLMATMON}}}{f_{\mathrm{CLMATSMP}}} \times 16$$

Consider the allowable frequency deviations for the monitoring clock and the sampling clock, use the following formula to calculate the threshold:

$$\text{Lower-limit threshold} = N_{\min} = \frac{f_{\mathrm{CLMATMON(min)}}}{f_{\mathrm{CLMATSMP(max)}}} \times 16 - 1$$

$$\text{Upper-limit threshold} = N_{\max} = \frac{f_{\mathrm{CLMATMON(max)}}}{f_{\mathrm{CLMATSMP(min)}}} \times 16 + 1$$

Note: Set the threshold within the following range:
CMPL ≥ 0x0001
CMPH ≥ CMPL + 0x0003

(3) Example: For CLMA0

For example, when the sampling clock equals to the main clock frequency divided by 2, $f_{CLMATSMP}$ = 12.5 MHz (±5%), or the monitoring clock equals to PLL0 output divided by 32, $f_{CLMATMON}$ = 75 MHz (±5%), the recommended threshold is calculated as follows:

$$N_{\min} = \frac{f_{\mathrm{CLMATMON(min)}}}{f_{\mathrm{CLMATSMP(max)}}} = \frac{71.25}{13.125} \times 16 - 1 = 85.86$$

$$\mathrm{CMPL} = 86 = 0\mathrm{x}0056$$

$$N_{\max} = \frac{f_{\mathrm{CLMATMON(max)}}}{f_{\mathrm{CLMATSMP(min)}}} = \frac{78.75}{11.875} \times 16 + 1 = 107.11$$

$$\mathrm{CMPH} = 107 = 0\mathrm{x}006\mathrm{B}$$

7.3.3 Detecting Error Clock Frequency

When the monitoring clock frequency (PLL0 output divided by 32, PLL1 output divided by 16, LOCO output, and main clock divided by 2) is higher than the upper-limit threshold or lower than the lower-limit threshold, any of the following signals is sent to the interrupt controller (ICU) as error event:

- CLMA0 oscillator-stopped detection error
- CLMA1 oscillator-stopped detection error
- CLMA2 oscillator-stopped detection error
- CLMA3 oscillator-stopped detection error

Error signal can be cleared by RES# pin reset, System software reset, or Error reset only.

7.4 Notes on Using CLMAm

- Do not use a clock for which CLMAm detected an error. If you use the clock, operation of the device is not guaranteed.
- No multiple clocks but only single monitoring clock error is assumed at the same time.
- Abnormality of the main clock oscillator may cause not only CLMA3 error but also other CLMA errors because it is also used as sampling clock. Abnormality of the LOCO may cause not only CMA2 but also other CLMA errors.
- In case of higher frequency than expectation, the product may not work correctly due to outside of the operation range.
- Glitch may be generated when switching to the alternative clock in case main oscillator clock frequency is lower than one-eight of the LOCO frequency.
- The clock is switched to the alternative clock when the clock abnormality is detected as below table.

CLMAm error				**Alternative clock**			
CLMA3 (MOSC) error	**CLMA2 (LOCO) error**	**CLMA0 (PLL0) error**	**CLMA1 (PLL1) error**	**MOSC clock**	**PLL0 output clock**	**PLL1 output clock**	**Description**
0	0	0	0	MOSC	PLL0	PLL1	Normal operation
1	0	X	X	LOCO	LOCO or PLL0	LOCO or PLL1	MOSC error*1 *2 *3
0	1	0	0	MOSC	PLL0	PLL1	LOCO error
1	1	X	X	LOCO	LOCO or PLL0	LOCO or PLL1	Either MOSC or LOCO error*1 *2 *3
0	0	1	0	MOSC	MOSC	PLL1	PLL0 error
0	0	0	1	MOSC	PLL0	MOSC	PLL1 error
Other than the above				Indefinite			Indefinite

Note: MOSC is main clock oscillator. It is assumed that all CLMAm are enabled.
Note 1. Set LOCOCR.LCSTP to 1 when the clock is switched to LOCO in case of detecting abnormality since LOCO is stopped at the reset value. Be careful that if the reset is asserted after switching to the LOCO, this LSI may not restart because LOCO is disabled at the reset value in case clock abnormality originates from the hard error.
Note 2. PLL output clocks are selected by SCKCR.CLMASEL.
Note 3. When PLL is selected as alternative clock, PLL output clock is free run and the clock frequency is not guaranteed.

8. Low-Power Consumption Function

8.1 Overview

This LSI has several functions for reducing power consumption, including the Cortex®-R52 standby function and the module-stop function that stops functions independently for each peripheral module. Power consumption using clock control such as CKIO output control is also possible.

Table 8.1 lists the specifications of low-power consumption functions. Table 8.2 describes how to stop each peripheral module and exit the stop state.

Table 8.1 Specifications of low-power consumption function

Parameter	Specifications
Low-power consumption mode	Standby mode (Cortex-R52)
Module-stop function	Functions can be stopped independently for each peripheral module
CKIO output control function	CKIO clock output or stop (held at the low level) can be selected

Table 8.2 Stopping peripheral modules and exiting module-stop state (1 of 2)

Module	How to stop operation and exit the stop state	Initial state*1
Cortex-R52	Standby mode condition: Execution of the Wait For Interrupt (WFI) instruction Condition for release from the Standby mode: interrupt	Operating
Internal bus	Always operating	Operating
Tightly coupled memory (ATCM or BTCM)	Operate only during access	Operate only during access
System SRAM (SYSRAM)	Operate only during access	Operate only during access
Interrupt controller unit (ICU)	Operation is always enabled	Operating
Bus state controller (BSC)	Set the control register to enter or exit the module-stop state	Stop*2
Direct memory access controller (DMAC)	Operation is always enabled	Operating
General-purpose I/O ports	Operation is always enabled	Operating
Event link controller (ELC)	Operation is always enabled	Operating
Multi-function timer pulse unit 3 (MTU3)	Set the control register to enter or exit the module-stop state	Stop
General PWM timer (GPT)	Set the control register to enter or exit the module-stop state	Stop
Compare match timer (CMT)	Set the control register to enter or exit the module-stop state	Stop
Compare match timer W (CMTW)	Set the control register to enter or exit the module-stop state	Stop
Watchdog timer (WDT)	Operation is always enabled	Operating
Port output enable 3 (POE3)	Operation is always enabled	Operating
Port output enable for GPT (POEG)	Operation is always enabled	Operating
Real time clock (RTC)	Set the control register to enter or exit the module-stop state	Stop
Ethernet MAC (GMAC)	Set the control register to stop the module or exit the module-stop state	Stop
EtherCAT slave controller (ESC)	Set the control register to stop the module or exit the module-stop state	Stop
USB 2.0 HS host/function module	Set the control register to stop the module or exit the module-stop state	Stop*2
Serial communication interface (SCI)	Set the control register to enter or exit the module-stop state	Stop*2

Table 8.2 Stopping peripheral modules and exiting module-stop state (2 of 2)

Module	How to stop operation and exit the stop state	Initial state*1
I2C bus interface (IIC)	Set the control register to enter or exit the module-stop state	Stop
CANFD interface (CANFD)	Set the control register to enter or exit the module-stop state	Stop
Serial peripheral interface (SPI)	Set the control register to enter or exit the module-stop state	Stop
Expanded serial peripheral interface (xSPI)	Set the control register to enter or exit the module-stop state	Stop*2
ΔΣ interface (DSMIF)	Set the control register to enter or exit the module-stop state	Stop
Trigonometric function unit (TFU)	Set the control register to enter or exit the module-stop state	Stop
12-bit A/D converter (ADC12)	Set the control register to enter or exit the module-stop state	Stop
Temperature sensor unit (TSU)	Set the control register to enter or exit the module-stop state	Stop
CRC operation unit (CRC)	Set the control register to enter or exit the module-stop state	Stop
Clock monitor circuit (CLMA)	Set the control register to enter or exit the module-stop state	Stop
Data operation circuit (DOC)	Set the control register to enter or exit the module-stop state	Stop
Serial host interface (SHOSTIF)	Set the control register to enter or exit the module-stop state	Stop*2
EnDat 2.2 (ENDAT)	Set the control register to enter or exit the module-stop state	Stop
BiSS-C (BISS)	Set the control register to enter or exit the module-stop state	Stop
HIPERFACE DSL (HDSL)	Set the control register to enter or exit the module-stop state	Stop
A-format (AFMT)	Set the control register to enter or exit the module-stop state	Stop
ENCOUT	Set the control register to enter or exit the module-stop state	Stop
Debugging interface	Set the control register to stop the module or exit the module-stop state	Operating

Note 1. Each module is returned to the initial state by means of the RES# pin reset, error reset, or system software reset.
Note 2. The state of the module is Operating if its boot mode is selected.

8.2 Register Descriptions

The registers are applicable to the register write protection function. To write these registers, clear write protection for the target register by setting bit [1] of the Protect Register (PRCRN and PRCRS). For details, see section 10, Register Write Protection Function.

8.2.1 MSTPCRA : Module Stop Control Register A

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x0300

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	MSTPCRA12	MSTPCRA11	MSTPCRA10	MSTPCRA09	MSTPCRA08	—	—	MSTPCRA05	MSTPCRA04	—	—	—	MSTPCRA00
Value after reset:	0	0	0	1	1	1	1	1*1	0	0	1*1	1*1	0	0	0	1*1

Bit	Symbol	Function	R/W
0	MSTPCRA00	BSC Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
4	MSTPCRA04	xSPI Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
5	MSTPCRA05	xSPI Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
8	MSTPCRA08	SCI Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
9	MSTPCRA09	SCI Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
10	MSTPCRA10	SCI Unit 2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
11	MSTPCRA11	SCI Unit 3 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
12	MSTPCRA12	SCI Unit 4 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
31:13	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. The initial value changes depending on the operation mode setting.

The MSTPCRA register controls the module-stop state. This register is available in Non Safety region.

8.2.2 MSTPCRB : Module Stop Control Register B

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x0304

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	MSTPCRB06	MSTPCRB05	MSTPCRB04	—	—	MSTPCRB01	MSTPCRB00

1	MSTPCRB01	IIC Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	MSTPCRB04	SPI Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W

Bit	Symbol	Function	R/W
5	MSTPCRB05	SPI Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
6	MSTPCRB06	SPI Unit 2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

The MSTPCRB register controls the module-stop state. This register is available in Non Safety region.

8.2.3 MSTPCRC : Module Stop Control Register C

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x308

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	MSTPCRC07	MSTPCRC06	MSTPCRC05	—	—	MSTPCRC02	MSTPCRC01	MSTPCRC00
Value after reset:	0	0	0	0	0	0	0	0	1	1	1	0	0	1	1	1

Bit	Symbol	Function	R/W
0	MSTPCRC00	MTU3 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
1	MSTPCRC01	GPT Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
2	MSTPCRC02	GPT Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
4:3	—	These bits are read as 0. The write value should be 0.	R/W
5	MSTPCRC05	TFU Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
6	MSTPCRC06	ADC12 Unit 0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
7	MSTPCRC07	ADC12 Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

The MSTPCRC register controls the module-stop state. This register is available in Non Safety region.

8.2.4 MSTPCRD : Module Stop Control Register D

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x30C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31:1	—	These bits are read as 0. The write value should be 0.	R/W

The MSTPCRF register controls the module-stop state. This register is available in Safety region.

8.2.7 MSTPCRG : Module Stop Control Register G

Base address: SYSC_S = 0x8128_0000

Offset address: 0x318

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	MSTPCRG11	MSTPCRG10	MSTPCRG09	MSTPCRG08	—	—	MSTPCRG05	MSTPCRG04	MSTPCRG03	MSTPCRG02	MSTPCRG01	MSTPCRG00
Value after reset:	0	0	0	0	1	1	1	1	0	0	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	MSTPCRG00	SCI Unit 5 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
1	MSTPCRG01	IIC Unit 2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
2	MSTPCRG02	SPI Unit 3 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
3	MSTPCRG03	GPT Unit 2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
4	MSTPCRG04	CRC Unit 1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
5	MSTPCRG05	RTC Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
8	MSTPCRG08	CLMA3 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
9	MSTPCRG09	CLMA0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
10	MSTPCRG10	CLMA1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
11	MSTPCRG11	CLMA2 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
31:12	—	These bits are read as 0. The write value should be 0.	R/W

The MSTPCRG register controls the module-stop state. This register is available in Safety region.

8.2.8 MSTPCRI : Module Stop Control Register I

Base address: SYSC_S = 0x8128_0000

Offset address: 0x320

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MSTPCRI01	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1*1	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
1	MSTPCRI01	SHOSTIF Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made.	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. The initial value changes depending on the operation mode setting.

The MSTPCRI register controls the module stop state of each IP. This register is available in Safety region.

8.2.9 MSTPCRJ : Module Stop Control Register J

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x324

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	MSTPCRJ03	MSTPCRJ02	MSTPCRJ01	MSTPCRJ00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1

Bit	Symbol	Function	R/W
0	MSTPCRJ00	AFMT0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
1	MSTPCRJ01	HDSL0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
2	MSTPCRJ02	BISS0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
3	MSTPCRJ03	ENDAT0 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
31:4	—	These bits are read as 0. The write value should be 0.	R/W

The MSTPCRJ register controls the module stop state of Encoder Interface unit 0. This register is available in Safety region.

8.2.10 MSTPCRK : Module Stop Control Register K

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x328

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	MSTPCRK03	MSTPCRK02	MSTPCRK01	MSTPCRK00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1

Bit	Symbol	Function	R/W
0	MSTPCRK00	AFMT1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
1	MSTPCRK01	HDSL1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
2	MSTPCRK02	BISS1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
3	MSTPCRK03	ENDAT1 Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
31:4	—	These bits are read as 0. The write value should be 0.	R/W

The MSTPCRK register controls the module stop state of Encoder Interface unit 1. This register is available in Safety region.

8.2.11 MSTPCRL : Module Stop Control Register L

Base address: SYSC_NS = 0x8028_0000

Offset address: 0x32C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MSTPCRL00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	MSTPCRL00	ENCOUT Module Stop 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

The MSTPCRL register controls the module stop state of ENCOUT. This register is available in Safety region.

8.3 Operation

8.3.1 Module-Stop Function

The module-stop function can stop operation of each module of on-chip peripheral functions. When the MSTPCRmi bit (m = A to G and L, i = 31 to 00) in the MSTPCRA to MSTPCRG and MSTPCRL registers is set to 1, the specified module stops operating and enters the module-stop state. Clearing the MSTPCRmi bit (m = A to G and L, i = 31 to 00) to 0 leads to release from the module-stop state. Follow the procedure given below when releasing any of the peripheral modules listed in Table 8.3 from the module-stop state. This procedure is not required for peripheral modules not listed in Table 8.3. However, release from the module-stop state should be in accord with the procedure for initialization described in the section for the given peripheral module.

(1) Procedure

1. Clear the corresponding bit in the relevant Module Stop Control Register (MSTPCRm, m = A to G and L) then immediately dummy-read the MSTPCRm register once.
2. Dummy-read any register of the peripheral module which is being released from the module-stop state at least 5 times except RTC. For RTC, wait for 20 µs from release of module stop until clock is supplied. After that, all registers of that peripheral module can be accessible.

Note: The MPU having set the access control attribute for the peripheral I/O register region to 'Device nGnRnE' or 'Device nGnRE' is a prerequisite for the procedure.

(2) Example code

```
volatile unsigned long dummy;           // Declared volatile to prevent optimization being applied

R_SYSC_NS->MSTPCRD_b.MSTPCRD06 = 0;     // Setting to release CMTW unit 1 from the module-stop state
dummy = R_SYSC_NS->MSTPCRD;             // Step 1: Dummy-read the MSTPCRm register.

dummy = R_CMTW1->CMWCOR;                // Step 2: Dummy-read any register of CMTW unit 1 at least 5 times.
dummy = R_CMTW1->CMWCOR;
dummy = R_CMTW1->CMWCOR;
dummy = R_CMTW1->CMWCOR;
dummy = R_CMTW1->CMWCOR;
R_CMTW1->CMWIOR = 0x0001U;              // The first setting for CMTW unit 1 (value is an example)
```

For details about the initial state after a release from the reset state, see Table 8.2.

Note: Directly after a module is set to the module-stop state, writing to the control register of that module might still be possible.

Table 8.3 Peripheral functions requiring the above procedure for release from the module-stop state (1 of 3)

Peripheral functions	Corresponding Module-Stop Control Register
BSC	MSTPCRA register, MSTPCRA00 bit
xSPI Unit 0	MSTPCRA register, MSTPCRA04 bit
xSPI Unit 1	MSTPCRA register, MSTPCRA05 bit
SCI Unit 0	MSTPCRA register, MSTPCRA08 bit

Table 8.3 Peripheral functions requiring the above procedure for release from the module-stop state (3 of 3)

Peripheral functions	Corresponding Module-Stop Control Register
ENDAT1	MSTPCRK register, MSTPCRK03 bit
ENCOUT	MSTPCRL register, MSTPCRL00 bit

8.3.2 Cortex-R52 Standby Mode

8.3.2.1 Transition to Cortex-R52 Standby Mode

The Cortex-R52 enters Standby mode by execution of a WFI instruction. In Standby mode, the Cortex-R52 stops operating, thus reducing power consumption. For details, see the technical reference manual provided by Arm.

8.3.2.2 Release from Cortex-R52 Standby Mode

Release from the Cortex-R52 Standby mode is initiated by any interrupt, the RES# pin reset, an error reset, system software reset, or CPU software reset.

(1) Release triggered by an interrupt signal

Generation of an interrupt in a CPU triggers release from Standby mode or Sleep mode of the CPU and the interrupt exception handling starts. Release is triggered by a non-maskable interrupt or a maskable interrupt of which interrupt request is permitted by using the Interrupt Enable register.

(2) Release by a reset

After the RES# pin reset, error reset, system software reset, or CPU software reset is cleared, the Cortex-R52 CPU0 starts the reset exception handling. For details about resets, see section 5, Reset.

8.4 Usage Notes

8.4.1 I/O Port State

To reduce I/O power consumption, pin processing based on I/O control is required. For details, see section 16, I/O Ports.

8.4.2 On-Chip Peripheral Module Interrupts in Module-Stop State

Peripheral modules cannot interrupt in a module-stop state. Therefore, if the module-stop state is set during interrupt processing of the module or during DMA transfer by the DMAC, a CPU interrupt source or a DMAC startup source cannot be cleared. For this reason, disable the relevant interrupts before setting the module-stop state.

8.4.3 USB Low Power Consumption

For details about how to clear the USB module-stop state and how to enter the USB in low-power consumption mode, see section 29, USB 2.0 Host Module (USBHC) and section 30, USB 2.0 HS Function Module (USBf).

8.4.4 Low Power Consumption for Ethernet-Related Functions

Ethernet-related functions are stopped and reset in the initial state. To use the functions, specify the MSTPCRE.MSTPCRE00 to MSTPCRE03 bits for release from the module-stop state. After the dummy read, specify the MRCTLE.MRCTLE00 to MRCTLE06 bits for release from reset state.

Note: After release from the module-stop state, the module-stop state cannot be set again. Operation is not guaranteed after release from the module-stop state is initiated the second time. After the modules are returned to the initial state (stop state) by a reset, they can be released from the module-stop state again.

8.4.5 Low Power Consumption for HIPERFACE DSL and EnDat 2.2

Encoder interface functions, EnDat 2.2, BiSS-C, HIPERFACE DSL, and A-Format, are stopped and reset in the initial state. To use the functions, specify the MSTPCRJ.MSTPCRJ00 to MSTPCRJ03 bits and MSTPCRK.MSTPCRK00 to MSTPCRJ03 bits for release from the module-stop state. After the dummy read, specify the MRCTLJ.MRCTLJ00 to MRCTLJ03 bits and MRCTLK.MRCTLK00 to MRCTLK03 bits for release from reset state.

Note: After release from the module-stop state, the reset state has to be set when the module-stop state is set. Operation is not guaranteed after release from the module-stop state is initiated the second time without reset state. After the modules are returned to the initial state (stop state) by a reset, they can be released from the module-stop state again.

8.4.6 Write Protection Function

The Module Stop Control registers (MSTPCRA to MSTPCRG and MSTPCRI to MSTPCRL) can be write-protected. To write to the MSTPCRA to MSTPCRG and MSTPCRI to MSTPCRL registers, specify bit 1 of the Protect Register (PRCRN for MSTPCRA to MSTPCRE, and PRCRS for MSTPCRF, MSTPCRG, MSTPCRI, MSTRCRJ, MSTRCRK, and MSTRCRL) to unlock the write protection. For details, see section 10, Register Write Protection Function.

9. Debugging Interface

The LSI has an internal debugging interface that adopts an architecture in which Cortex-R52 are integrated by CoreSight. This LSI supports debugging functions, such as downloading, running, and breaking a program, and trace function, which outputs execution history of programs.

9.1 Overview

The LSI supports JTAG and SWD interfaces for debugging and trace port as interface for trace.

The LSI has TAP controllers for boundary scan and for CoreSight debugging, which can be selected by the input level of the BSCANP pin. To use the debugging function, set the input level of the BSCANP pin to low. For details on boundary scan, see section 37, Boundary Scan.

Table 9.1 lists the specifications of CoreSight and Figure 9.1 shows a block diagram of CoreSight. For details on CoreSight, see the *Arm Technical Reference Manual*.

Table 9.1 CoreSight specifications

Parameter	Description
Debugging function	• JTAG interface • SWD (Serial Wire Debug) interface
Trace function	• Trace port interface – 8 bit × 100 Mbps (50 MHz DDR) trace data pin output – Embedded Trace FIFO (ETF) 16 KB

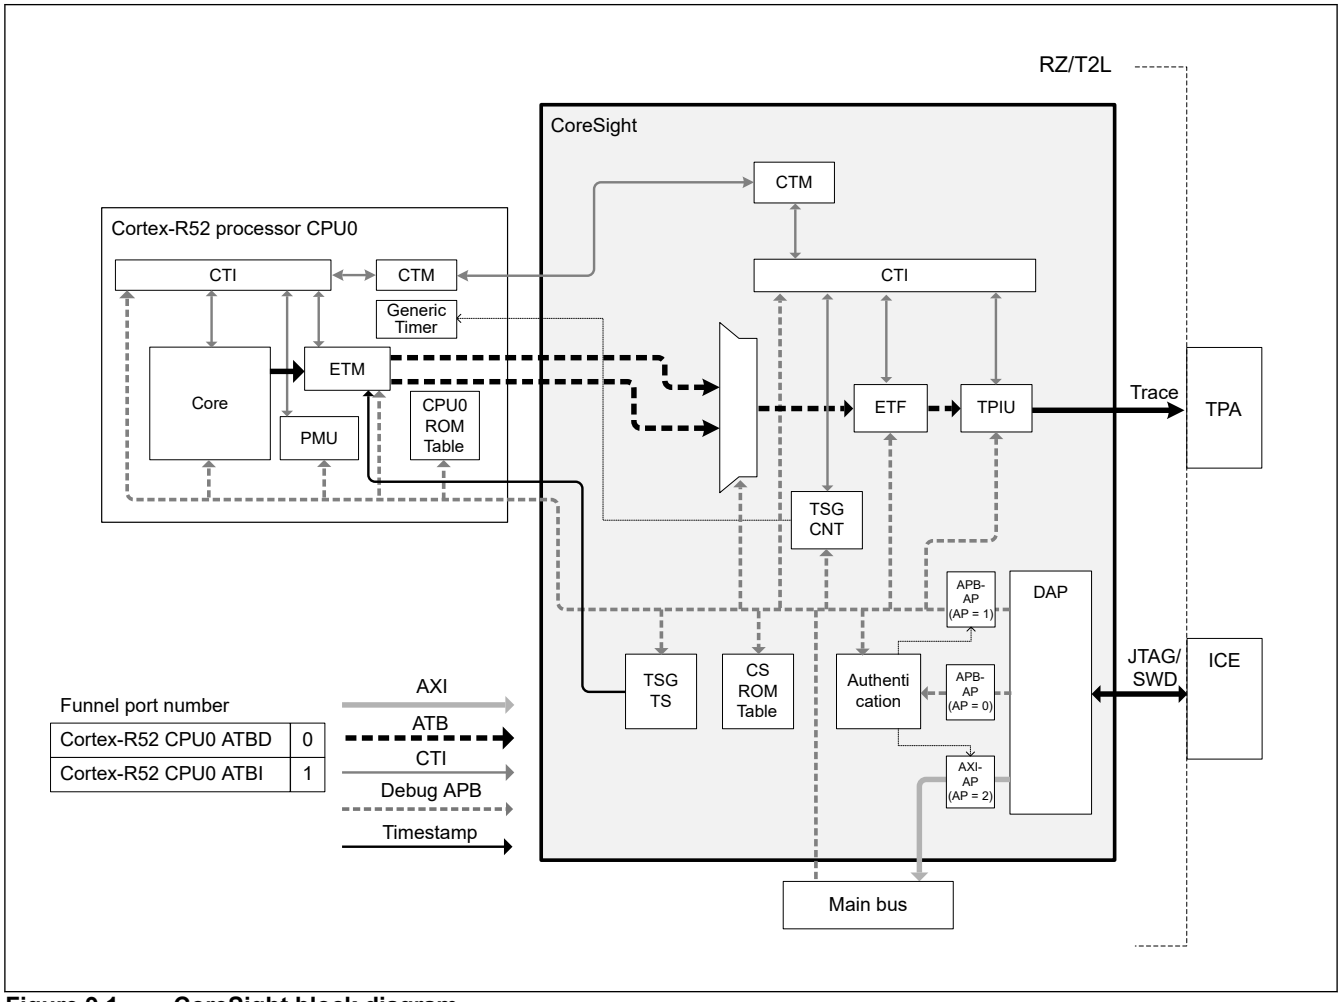

Figure 9.1 CoreSight block diagram

Table 9.2 lists the input and output for the CTI trigger of CoreSight.

Table 9.2 CTI trigger input and output (CoreSight)

CTI input	Description	CTI output	Description
0	ETF ACQCOMP	0	ETF FLUSHIN
1	ETF FULL	1	ETF TRIGIN
2	—	2	TPIU FLUSHIN
3	—	3	TPIU TRIGIN
4	—	4	TSGCNT HALTREQ
5	—	5	TSGCNT RESTARTREQ
6	—	6	—
7	—	7	—

Table 9.3 lists the input and output of the CTI trigger for Cortex-R52 CPU0.

Table 9.3 CTI trigger input and output (Cortex-R52 CPU0)

CTI input	Description	CTI output	Description
0	Cross halt trigger event	0	Requests the processor to enter debug state
1	PMU interrupt	1	Requests the processor to exit debug state
2	—	2	CTI interrupt
3	—	3	—
4	ETM trace unit external output 0	4	ETM trace unit external input 0
5	ETM trace unit external output 1	5	ETM trace unit external input 1
6	ETM trace unit external output 2	6	ETM trace unit external input 2
7	ETM trace unit external output 3	7	ETM trace unit external input 3

Table 9.4 lists the address map of CoreSight (Debug-APB).

Table 9.4 CoreSight address map (Debug-APB)

Cortex-R52 CPU0 view	Debugger view (AP = 1)	Module
0xC000_0000 to 0xC000_0FFF	0x8000_0000 to 0x8000_0FFF	CoreSight/ROM Table
0xC001_0000 to 0xC001_0FFF	0x8001_0000 to 0x8001_0FFF	CoreSight/TMC-ETF
0xC002_0000 to 0xC002_0FFF	0x8002_0000 to 0x8002_0FFF	CoreSight/CTI
0xC003_0000 to 0xC003_0FFF	0x8003_0000 to 0x8003_0FFF	CoreSight/Funnel
0xC004_0000 to 0xC004_0FFF	0x8004_0000 to 0x8004_0FFF	CoreSight/TPIU
0xC005_0000 to 0xC005_0FFF	0x8005_0000 to 0x8005_0FFF	CoreSight/TSG-TS
0xC006_0000 to 0xC006_0FFF	0x8006_0000 to 0x8006_0FFF	CoreSight/TSG-CNT
0xC040_0000 to 0xC040_0FFF	0x8040_0000 to 0x8040_0FFF	Cortex-R52 CPU0 ROM Table
0xC041_0000 to 0xC041_0FFF	0x8041_0000 to 0x8041_0FFF	Cortex-R52 CPU0 Debug
0xC042_0000 to 0xC042_0FFF	0x8042_0000 to 0x8042_0FFF	Cortex-R52 CPU0 CTI
0xC043_0000 to 0xC043_0FFF	0x8043_0000 to 0x8043_0FFF	Cortex-R52 CPU0 PMU
0xC044_0000 to 0xC044_0FFF	0x8044_0000 to 0x8044_0FFF	Cortex-R52 CPU0 ETM

Note: No listed areas between 0xC000_0000 and 0xC0FF_FFFF for Cortex-R52 CPU0 view and between 0x8000_0000 and 0x80FF_FFFF for debugger view are reserved. Do not access those areas.

Table 9.5 lists the input/output pins of the debugging interface.

Table 9.5 Configuration of pins for the debugging interface

Name	Pin name	I/O	Functions
Test clock	TCK	Input	Data is serially supplied from the Test Data Input (TDI) pin to this module, synchronized with this clock, and output from the Test Data Output (TDO) pin. In SWD mode, this pin functions as the SWCLK pin. This pin can also be used as a general-purpose port. The initial function is TCK.
Test mode select	TMS	Input/ Output	Changing the level of this signal, by synchronizing with TCK, determines the status of the TAP (Test Access Port) control circuit. The protocol conforms to the JTAG standard (IEEE Std.1149.1). In SWD mode, this pin functions as the SWDIO pin. This pin can also be used as a general-purpose port. The initial function is TMS.
Test reset	TRST#	Input	This pin accepts input asynchronously with TCK. When the level of this pin is low, TAP (Test Access Port) is reset. When the levels of the TRST# pin and RES# pin are both low, TAP and the debugging circuit are reset.
Test data input	TDI	Input	Changing the level of this pin, by synchronizing with TCK, sends data to this module. This pin can also be used as a general-purpose port. The initial function is TDI.
Test data output	TDO	Output	Reading the level of this pin, by synchronizing with TCK, reads data from this module. This pin can also be used as a general-purpose port. The initial function is TDO.
Trace clock output	TRACECLK	Output	This pin is an output pin of the clock used for synchronizing trace data.
Trace enable output	TRACECTL	Output	This pin is an output pin of the enable signal for trace control.
Trace data output	TRACEDATA7 to TRACEDATA0	Output	These pins are output pins of trace data.
Boundary scan setting	BSCANP	Input	Input the high level when boundary scan test is performed. Input low when debugging is performed by CoreSight. For details on boundary scan, see section 37, Boundary Scan.

Note: When you design a board on which an emulator can be used, set the TRST# pin to low while the RES# pin is asserted at power up, and configure the board so that control is available by the TRST# pin only. When this pin is not used, fix it to low, or connect it so that the same signal as that on the RES# pin is to be input. For details, see section 9.3.4. Reset Configuration and the Method of Connecting with the Emulator.

9.2 Register Descriptions

9.2.1 OIRn : OCD Authentication ID Code Register n (n = 0 to 3)

Address: 0x0008_0000 + 0x04 × n (the address is the debugger view (AP = 0))

Bit position:	31																												0
Bit field:	IDn[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	IDn[31:0]	128-bit Authentication ID n = 0: Authentication ID[31:0] n = 1: Authentication ID[63:32] n = 2: Authentication ID[95:64] n = 3: Authentication ID[127:96]	W*1

Note 1. Once all four registers are written, further write is blocked.

The OIRn registers are used to write 128-bit authentication ID from the external debugger to access debug system.

9.2.2 OSR : OCD Status Register

Address: 0x0008_0010 (the address is the debugger view (AP = 0))

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	WFLG	RESULT[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	RESULT[1:0]	Authentication result 0 0: No authentication 0 1: Passed Authentication level 1. Both EL2 and EL1/EL0 accesses are permitted. 1 0: Passed Authentication level 2. Only EL1/EL0 access is permitted. 1 1: Failed or access permanently prohibited	R
2	WFLG	All OIRn registers written flag 0: Not written 1: Written	R
31:3	—	These bits are read as 0.	R

The OSR register indicates authentication result.

9.3 Operation

9.3.1 JTAG Interface

The JTAG interface uses five signals (TCK, TMS, TDO, TDI, and TRST#) to communicate with the host machine (PC) through the emulator. Figure 9.2 shows an example connection, which includes the RES# pin connection.

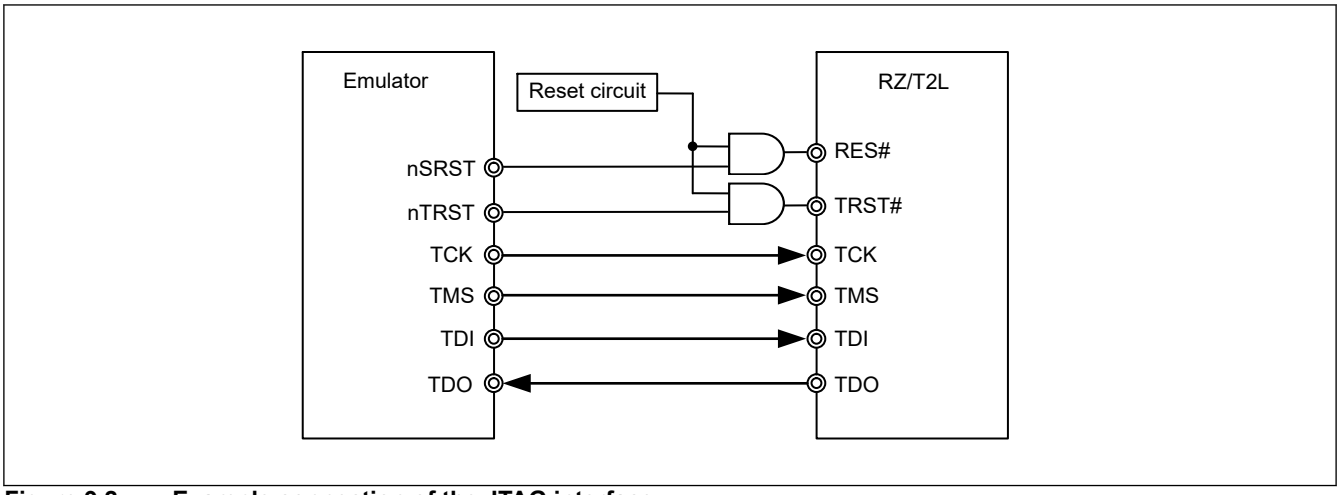

Figure 9.2 Example connection of the JTAG interface

When the JTAG interface is not used, the TCK, TMS, TDI, and TDO pins can be used as general-purpose ports. When you use these pins as general-purpose ports, perform pin settings by referring to section 16, I/O Ports.

9.3.2 SWD Interface

The SWD (Serial Wire Debug) interface uses two signals (SWCLK (TCK) and SWDIO (TMS)) to communicate with the host machine (PC) through the emulator. Figure 9.3 shows an example connection, which includes the RES# pin connection.

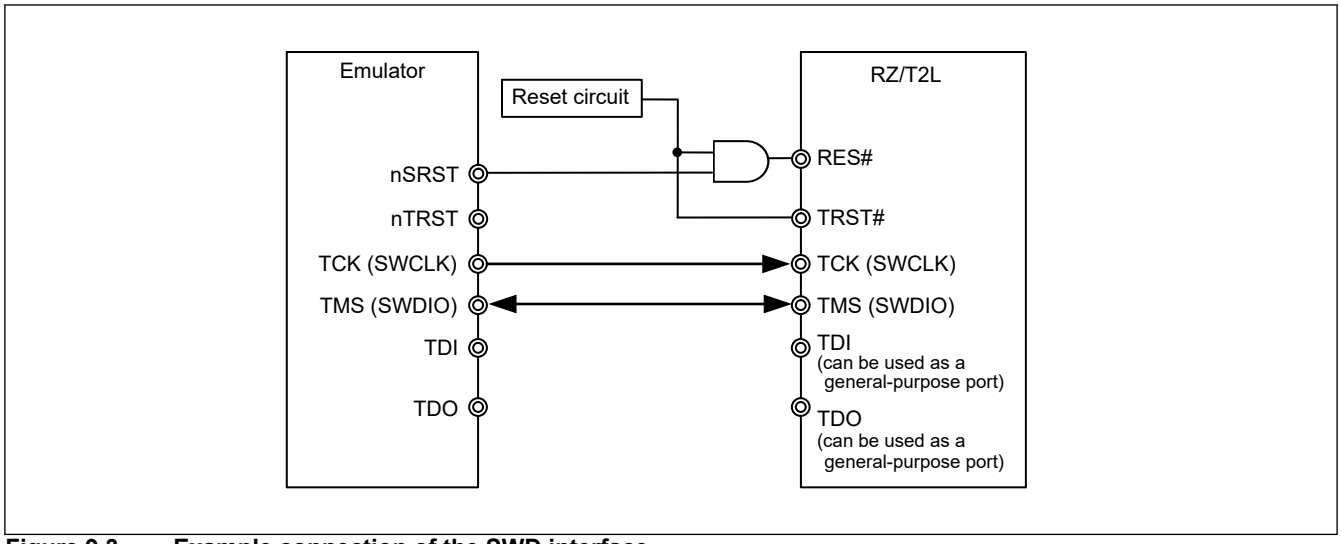

Figure 9.3 Example connection of the SWD interface

When the SWD interface is used for debugging, the TDI and TDO pins can be used as general-purpose ports. When using these pins as general-purpose ports, perform pin settings by referring to section 16, I/O Ports.

Note: In the initial status of the LSI, the debugging interface is in JTAG mode. If you use the TDI and TDO pins as general-purpose ports and the emulator connection for debugging, switch the mode to SWD (Serial Wire Debug) mode using the control from the debugger, and then start debugging.

9.3.3 Trace Port Interface

The trace port interface uses ten signals (TRACECLK, TRACECTL, and TRACEDATA7 to TRACEDATA0) to output trace information. Information about branch instructions of the executed program (obtained by the ETM (Embedded Trace Macrocell) trace) is output from the trace port interface. After the debugger complements the information, you can know the branch source and destination at the time a branch occurred. For details on trace information, see the manual of each emulator vendor.

Only DDR clocking mode is supported for the synchronization relationship between the TRACECLK pin and TRACEDATA pin.

The maximum number of available TRACEDATA pins is 8. If the number of TRACEDATA pins is smaller than 8, the pins with smaller numbers are used (from TRACEDATA0). Set whether to connect the TRACECTL pin to TPA (Trace Port Analyzer), according to the specifications of the trace data transfer format of the TPA.

As the output frequency of the TRACECLK pin, 50 MHz (obtained by dividing the trace I/F clock (TCLK) by 2) can be set. For details, see section 6, Clock Generation Circuit.

In the initial status, different functions are assigned to the TRACECLK, TRACEDATA0 to TRACEDATA7, and TRACECTL pins. Perform pin settings by referring to section 16, I/O Ports.

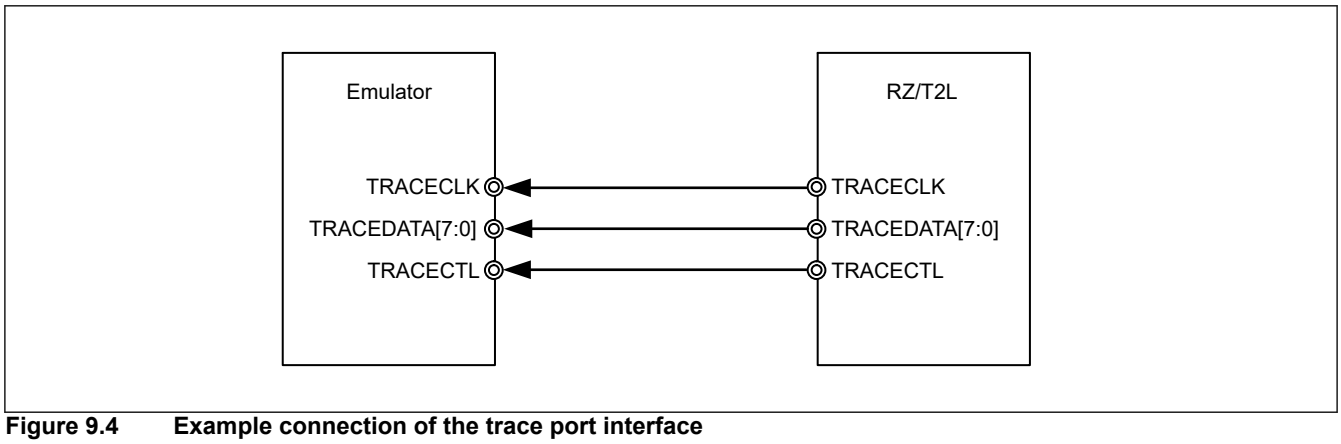

Figure 9.4 Example connection of the trace port interface

9.3.4 Reset Configuration and the Method of Connecting with the Emulator

When designing a board on which the emulator can be used, set the TRST# pin to low while the RES# pin is asserted at power up. Also, configure the board so that control is available by the TRST# pin only.

When debugging is performed, if the initial level of the RES# and TRST# pins are both low, the CPU and debugging section become the reset status. Then, setting the TRST# pin to high while the RES# pin is kept to low enables the TAP access to set SWJ-DP registers. After RES# pin is set to high, it is possible to access OCD registers (OIRn and OSR) in AP = 0. Debugging setting is possible after on-chip boot code runs if JTAG authentication passes, or no authentication is needed.

When the emulator is not connected, fix the TRST# pin to low, or let the signal be the same as that on the RES# pin input to the TRST# pin.

Note: When debugging is performed by CoreSight, input low to the BSCANP pin to disable the boundary scan function.

9.3.4.1 Example Connection of the Emulator That Cannot Drive the nTRST Output to High

Figure 9.5 shows an example of connection circuit when an emulator that cannot drive the nTRST output to high is used. The TRST# pin is pulled up and is asserted to low by the emulator.

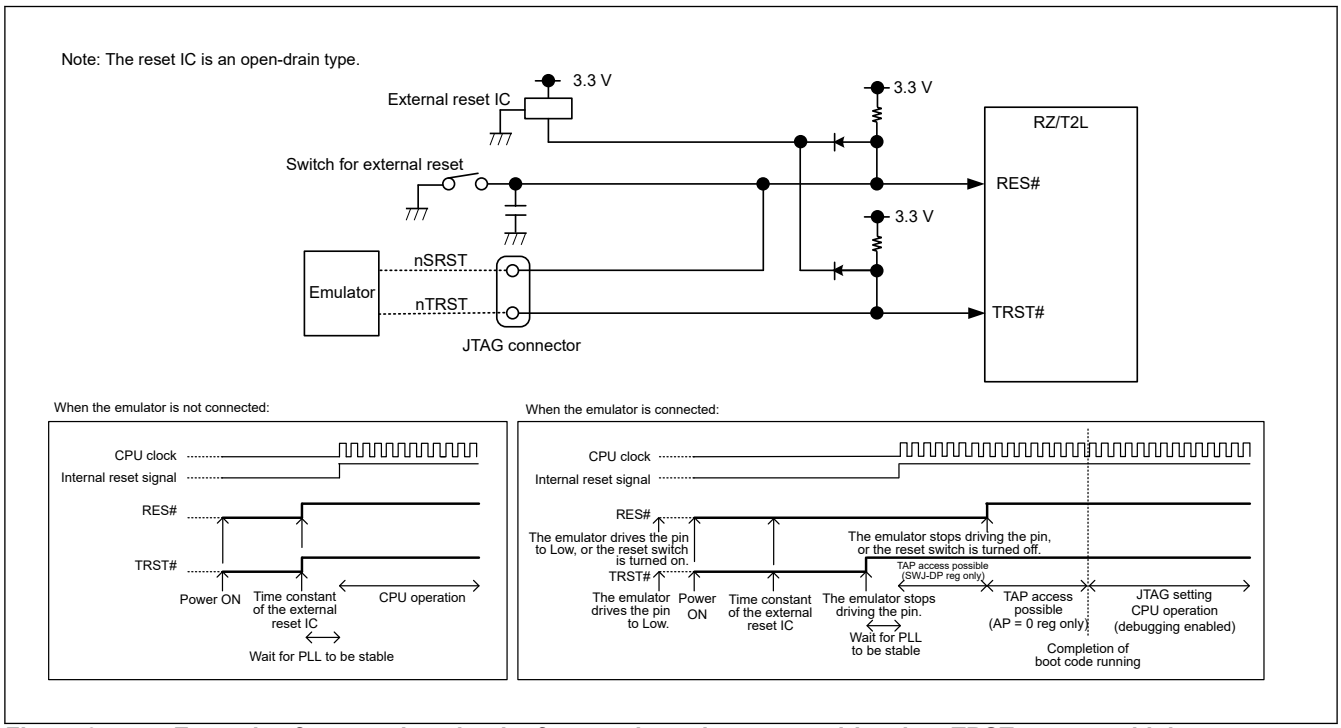

Figure 9.5 Example of connection circuit of an emulator that cannot drive the nTRST output to high

9.3.4.2 Example Connection of the Emulator That Can Drive the nTRST Output to High

Figure 9.6 shows an example of connection circuit when an emulator that can drive the nTRST output to high is used. The TRST# pin (high or low) is controlled by the emulator.

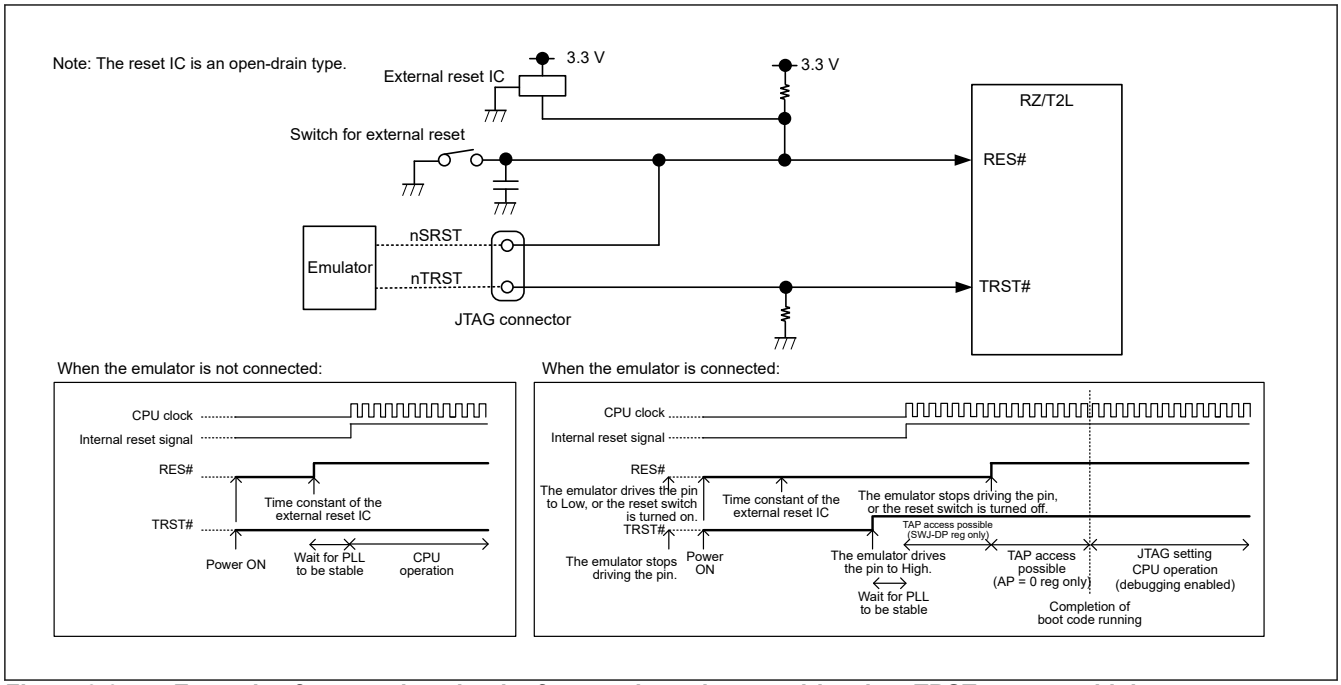

Figure 9.6 Example of connection circuit of an emulator that can drive the nTRST output to high

9.3.5 JTAG Pin Treatment When No Emulator Is Connected

If no emulator is connected, pin treatment is required according to Table 9.6.

Table 9.6 JTAG pin treatment when no emulator is connected

Pin name	Treatment
TCK	Pull down the pin (except when the port is used as a general-purpose port)
TMS	Pull up the pin (except when the port is used as a general-purpose port)
TDI	Pull up the pin (except when the port is used as a general-purpose port)
TDO	Open the pin (except when the port is used as a general-purpose port)
TRST#	Pull down the pin, or let the signal be the same as that on the RES# pin input

9.3.6 Noise Reduction of the TRST# Pin

Analog delay noise reduction is performed for the TRST# pin. This measure against noise can remove noise that is within 100 ns at maximum.

9.3.7 Available Trace Functions

Table 9.7 lists the trace functions that are available through the respective debugging ports (trace port interface and SWD or JTAG).

Table 9.7 Available trace functions

CPU core	Debugging port	Trace functions
Cortex-R52	Trace port interface	Full instruction and data tracing through the ETM of the Cortex-R52. ETF is programmed to be in Circular Buffer mode or Hardware FIFO mode.
	SWD/JTAG	The same information as for the trace port interface can be acquired through the ETF which is programmed to be in Software FIFO mode.

9.3.8 Debug Authentication

Debug authentication mechanism checks access permission for debugging and LSI resources. To obtain full debug functionality, a pass result of the authentication mechanism is required if authentication is required.

Authentication level is selectable from four states by setting AUTHMODEJ area of OTP (One Time Programmable memory):

- No authentication
- Authentication level 1 (both EL2 and EL1/EL0 access permission)
- Authentication level 2 (only EL1/EL0 access permission)
- Permanent prohibition

If authentication level 1 or 2 is selected, 128-bit authentication ID must be written to OCD Authentication ID Code Register n (OIRn) (n = 0 to 3) from debugger to compare with the ID which is already stored in OTP. Once all OIRn registers are written, authentication automatically starts and the authentication result is available in OCD Status Register (OSR). If authentication failed, then no debug connection is permitted. Reset (RES# pin reset, system software reset, or error reset) is required to retry debug authentication. If "No Authentication" is selected, RESULT[1:0] bits in OSR register indicate 01b which means both EL2 and EL1/EL0 accesses are permitted.

9.3.9 Debug Authentication Procedure

Figure 9.7 shows the debug authentication procedure.

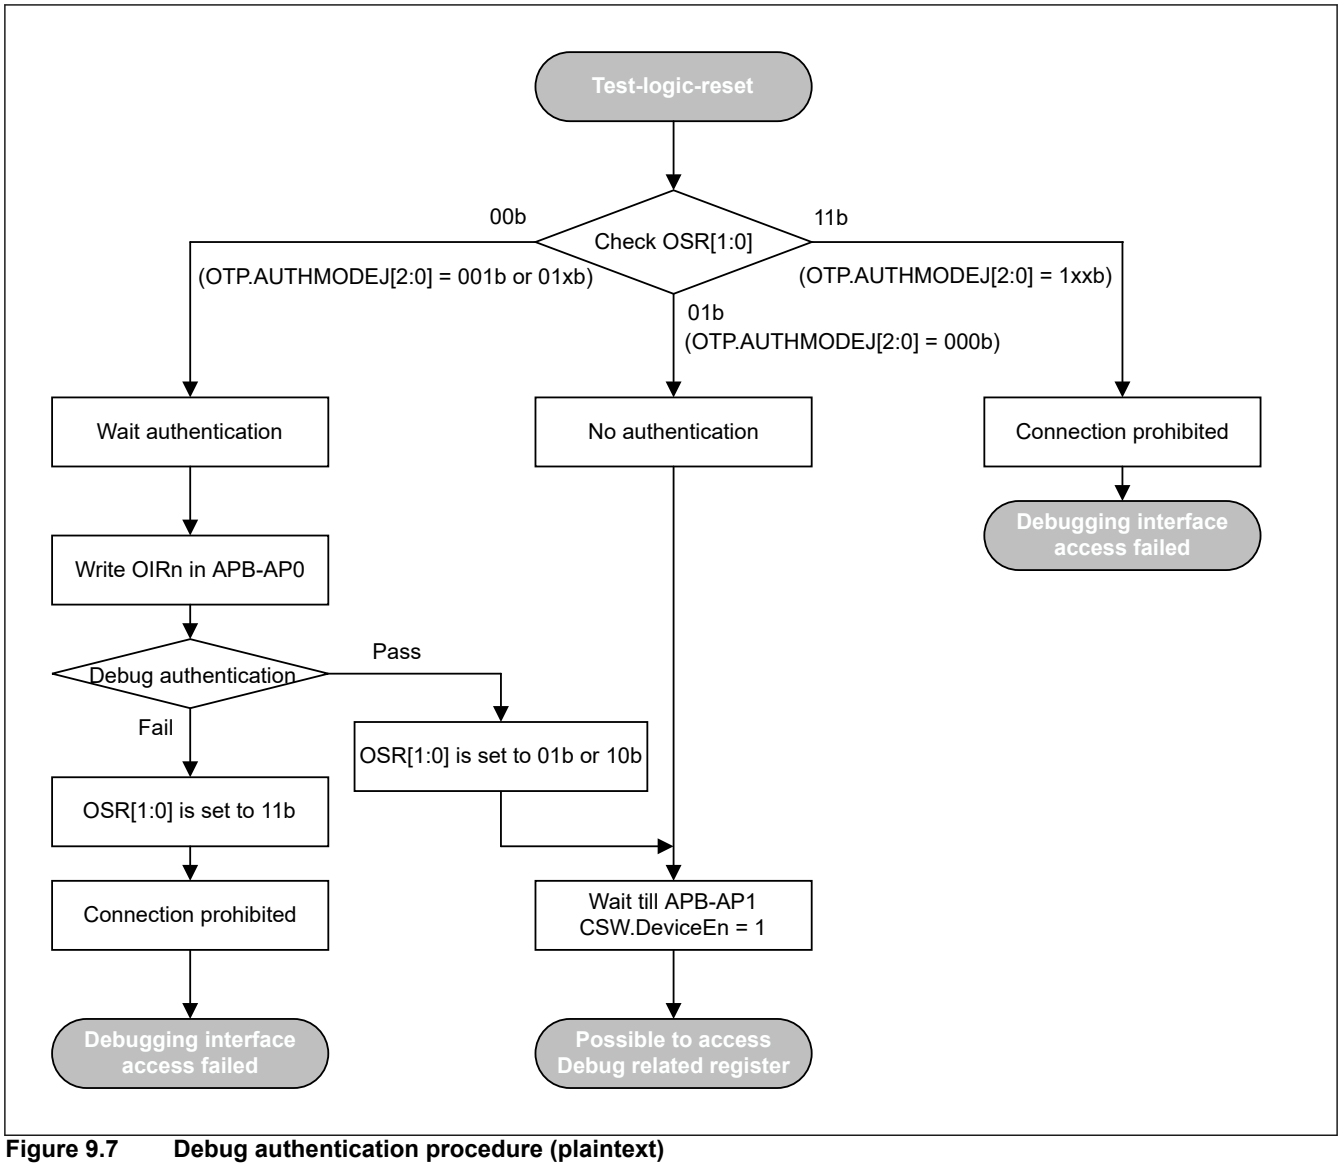

Figure 9.7 Debug authentication procedure (plaintext)

9.4 Usage Notes

9.4.1 Access to the Main Bus

Access to the main bus by the DAP is through either the Cortex-R52 CPU0 or AXI-AP. When access is to be through the AXI-AP, the setting of M-MPU for AXI-AP must be changed to access internal resources.

9.4.2 Authentication Level

Authentication level 2 is available only when debugger can access by EL1/EL0. In case using debugger which can access by EL2 only, do not use authentication level 2.

9.4.3 Debug Reset

The reset request from debugger is prohibited during boot operation.

10. Register Write Protection Function

10.1 Overview

The register write protection function protects important registers from being overwritten in case a program runs out of control. The registers to be protected are set with the protect register (PRCRN and PRCRS).

Table 10.1 and Table 10.2 show the relationship between the PRCRN/PRCRS register bits and the registers to be protected.

Table 10.1 Relationship between PRCRN register bits and registers to be protected

PRCRN register	Registers to be protected
PRC0 bit	• Registers related to the clock generation circuit: SCKCR
PRC1 bit	• Registers related to the low-power consumption functions: MSTPCRA, MSTPCRB, MSTPCRC, MSTPCRD, MSTPCRE, MSTPCRJ, MSTPCRK, MSTPCRL • Reset-related registers: RSTSR0, MRCTLA, MRCTLE, MRCTLJ, MRCTLK
PRC2 bit	• GPIO-related registers: PMC00 to PMC24, PFC00 to PFC24, DRCTL00 to DRCTL24, ELC_PGR1, ELC_PGR2, ELC_PGC1, ELC_PGC2, ELC_PDBF1, ELC_PDBF2, ELC_PEL0 to ELC_PEL3, ELC_DPTC, ELC_ELSR2
PRC3 bit	• Encoder interface subsystem registers: ENCODER_CFG, ENDAT_CFG

Table 10.2 Relationship between PRCRS register bits and registers to be protected

PRCRS register	Registers to be protected
PRC0 bit	• Registers related to the clock generation circuit: SCKCR2, LOCOCR
PRC1 bit	• Registers related to the clock generation circuit: PLL1EN • Registers related to the low-power consumption functions: MSTPCRF, MSTPCRG • Reset related registers: SWRSYS, SWRCPU0, MRCTLI
PRC2 bit	• GPIO-related registers: PMC00 to PMC24, PFC00 to PFC24, DRCTL00 to DRCTL24, RSELP00 to RSELP24, ELC_PGR1, ELC_PGR2, ELC_PGC1, ELC_PGC2, ELC_PDBF1, ELC_PDBF2, ELC_PEL0 to ELC_PEL3, ELC_DPTC, ELC_ELSR2
PRC3 bit	• System control registers: STADD0 to STADD7, ENDADD0 to ENDADD7, ERRINF, ERRINF_R, ERRINF_W, SYSRAM_CTRL0 to SYSRAM_CTRL1

10.2 Register Descriptions

10.2.1 PRCRN : Non_Safety Area Protect Register

Base address: RWP_NS = 0x8028_1A10

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PRKEY[7:0]								—	—	—	—	PRC3	PRC2	PRC1	PRC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PRC0	Protect 0 Enables writing to the registers related to the clock generation circuit. 0: Write disabled 1: Write enabled	R/W
1	PRC1	Protect 1 Enables writing to the registers related to low power consumption and reset. 0: Write disabled 1: Write enabled	R/W
2	PRC2	Protect 2 Enables writing to the registers related to GPIO settings. 0: Write disabled 1: Write enabled	R/W
3	PRC3	Protect 3 Enables writing to the registers related to Encoder interface subsystem configuration. 0: Write disabled 1: Write enabled	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
15:8	PRKEY[7:0]	PRC Key Code These bits control permission and prohibition of writing to the PRCRN register. To modify the PRCRN register, write 0xA5 to the PRKEY[7:0] bits. Any other value is ignored if written to the PRCRN register.*1	W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Write a value to the PRKEY[7:0] bits at the same time as other bits. When setting PRC0 to 1 and, PRC1 and PRC2 to 0, for example, write 0x0000A501 to the PRCRN register.

PRCi bit (Protect i) (i = 0 to 3)

Setting the PRCi bit to 1 or 0 enables or disables writing to the corresponding registers to be protected, respectively.

The PRCRN register controls writes to the protected registers for non-safety area. The non-safety area is as follows:

- 0x800A_0000 to 0x800A_0FFF: address area for GPIO-related registers
- 0x8028_0000 to 0x8028_1FFF: address area for clock generation, low power consumption, reset, and Encoder interface subsystem configuration registers

10.2.2 PRCRS : Safety Area Protect Register

Base address: RWP_S = 0x8128_1A00

Offset address: 0x00

Bit position:	31																15								8				3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PRKEY[7:0]								—	—	—	—	PRC3	PRC2	PRC1	PRC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PRC0	Protect 0 Enables writes to the registers related to the clock generation circuit. 0: Write disabled 1: Write enabled	R/W
1	PRC1	Protect 1 Enables writes to the registers related to low power consumption and reset. 0: Write disabled 1: Write enabled	R/W
2	PRC2	Protect 2 Enables writes to the registers related to GPIO settings. 0: Write disabled 1: Write enabled	R/W

Bit	Symbol	Function	R/W
3	PRC3	Protect 3 Enables writes to the system control registers. 0: Write disabled 1: Write enabled	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
15:8	PRKEY[7:0]	PRC Key Code These bits control permission and prohibition of writing to the PRCRS register. To modify the PRCRS register, write 0xA5 to the PRKEY[7:0] bits. Any other value is ignored if written to the PRCRS register.*1	W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Write a value to the PRKEY[7:0] bits at the same time as other bits. When setting PRC0 to 1 and PRC1, PRC2, and PRC3 to 0, for example, write 0x0000A501 to the PRCRS register.

PRCi bit (Protect i) (i = 0 to 3)

Setting the PRCi bit to 1 or 0 enables or disables writing to the corresponding registers to be protected, respectively.

The PRCRS register controls writes to the protected registers for safety area. The safety area is as follows:

- 0x8103_0000 to 0x8103_0FFF: address area for GPIO-related registers
- 0x8128_0000 to 0x8128_1FFF: address area for system control, clock generation, low power consumption, and reset registers

11. Interrupt Controller (ICU)

11.1 Overview

The interrupt controller accepts interrupt request from peripheral module, external pins include the external DMA request pins. An interrupt accepted by the interrupt controller is set either as an interrupt to the CPU (Cortex-R52 CPU0) or as an activating trigger signal for the DMAC and ELC.

Table 11.1 lists the specifications of the ICU, and Figure 11.1 shows a block diagram of the interrupt controller.

Table 11.1 ICU specifications

Item		Description
Interrupts	Interrupt contact destinations	• Cortex-R52 CPU0 • Two DMAC units • ELC
	Peripheral function interrupts	Interrupts from peripheral modules Interrupt detection: Edge detection/level detection
	External pin interrupts	Interrupts from pins IRQ0 to IRQ15 Number of sources: 16 IRQ0 to IRQ13: for NONSAFETY IRQ14 to IRQ15: for SAFETY Interrupt detection: Low level/falling edge/rising edge/rising and falling edges. One of these detection methods can be set for each source. Digital noise filter function: Supported
	Software interrupts	Software interrupts Number of sources: 8 INTCPU0 to INTCPU5: for NONSAFETY INTCPU6 to INTCPU7: for SAFETY
	Error events	• Error events from CPU and peripherals are captured and merged to two interrupts with mask. Initial state is all masked. (no interrupt generated) • Hardware reset can be generated by error events.
	DMAC control	Interrupts can be assigned as DMA activation sources.
	External DMA request	External DMA request pins (DREQ) can output DACK, TEND when DMA transfer to external bus. Number of sources: 1 Digital noise filter function: Supported
Non maskable interrupts	NMI pin interrupts	Interrupts from the NMI pin Interrupt detection: Falling edge/rising edge Digital noise filter function: Supported The NMI pin can be allocated as SEI (system error interrupt).
Restoration from the sleep status		Restoration due to non-maskable interrupt and all unmasked interrupt sources

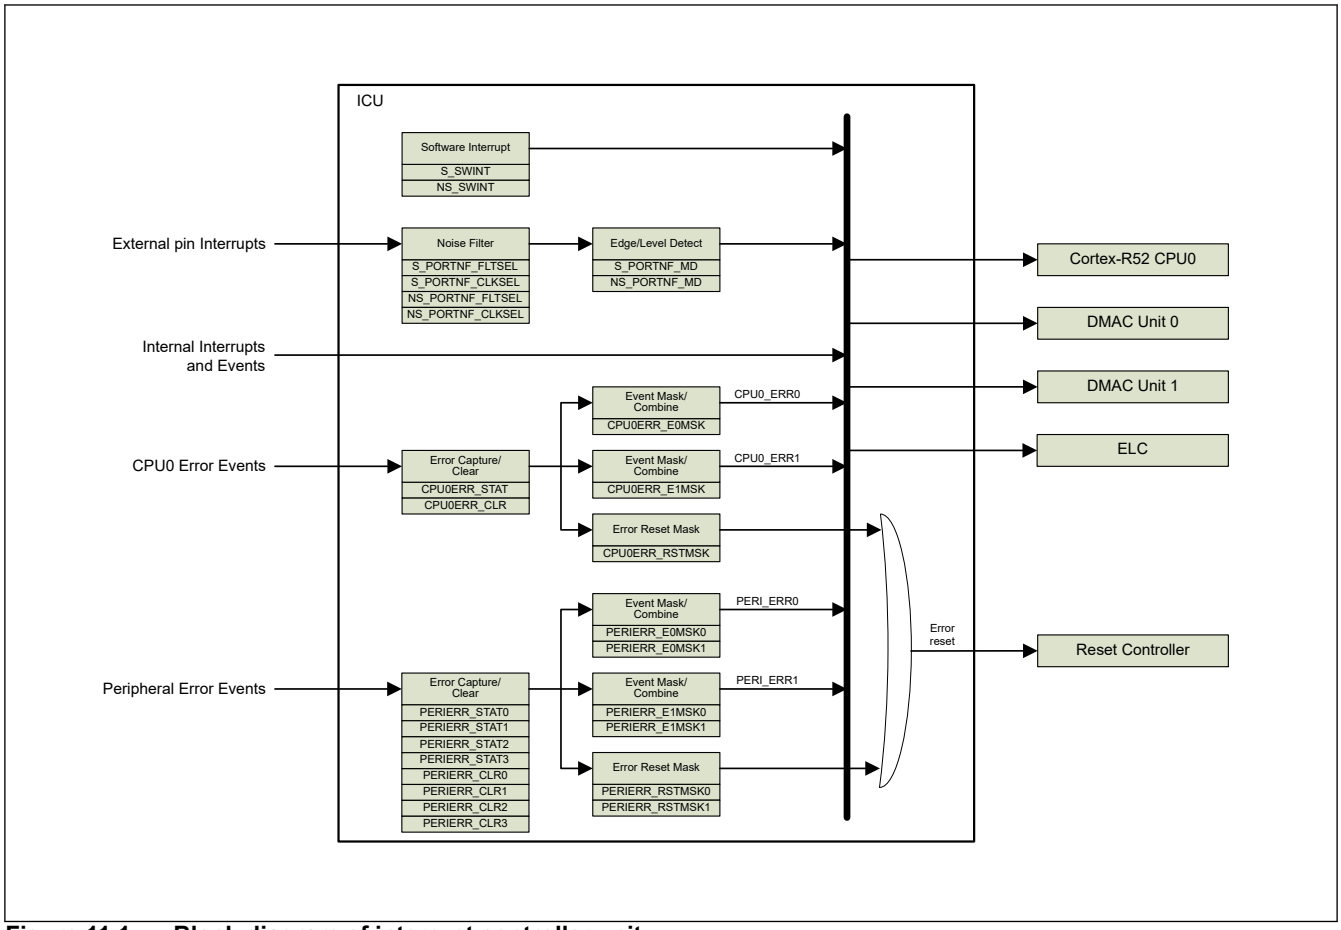

Figure 11.1 Block diagram of interrupt controller unit

11.2 Register Descriptions

This section describes details of the register functions.

11.2.1 Interrupt Control Unit Register 0 (Safety Region)

11.2.1.1 S_SWINT : Software Interrupt Register for Safety Register

Base address: ICU = 0x8104_8000

Offset address: 0x000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IC7	IC6
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IC6	Software Interrupt register Occur software interrupt INTCPU6 when this value is set to 1. This bit is read as 0.	W

Bit	Symbol	Function	R/W
1	IC7	Software Interrupt register Occur software interrupt INTCPU7 when this value is set to 1. This bit is read as 0.	W
31:2	—	The write value should be 0.	W

11.2.1.2 S_PORTNF_FLTSEL : Interrupt Noise Filter Enable Register for Safety Register

Base address: ICU = 0x8104_8000

Offset address: 0x004

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	FLTNMI	FLT15	FLT14
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FLT14	Noise filter enable for IRQ14 0: Disable 1: Enable	R/W
1	FLT15	Noise filter enable for IRQ15 0: Disable 1: Enable	R/W
2	FLTNMI	Noise filter enable for NMI 0: Disable 1: Enable	R/W
31:3	—	These bits are read as 0. The write value should be 0.	R/W

11.2.1.3 S_PORTNF_CLKSEL : Interrupt Noise Filter Setting Register for Safety Register

Base address: ICU = 0x8104_8000

Offset address: 0x008

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

29:28	MDDRQ[1:0]	Select detection mode for DREQ of DMAC 0 0: Low level 0 1: Falling edge 1 0: Rising edge 1 1: Falling and rising edges	R/W
31:30	—	These bits are read as 0. The write value should be 0.	R/W

11.3 Operations

11.3.1 Event Handling

Events and interrupts from internal modules and external pins include the external DMA request pins are connected to the CPU (Cortex-R52 CPU0) and/or the DMAC and ELC as an activating trigger signal. Table 11.2 shows event table of this device. The checked event in the CPU0 GIC Request (SPI)*1, DMAC Activation Request, and ELC Source columns indicates that there is a connection to the modules. Event number is common to SPI number of the GIC, DMACn_RSSELi register (n = 0, 1 and i = 0 to 5), and ELC_SSELn register (n = 0 to 18).

Note 1. GIC request number shows Shared Peripheral interrupts (SPIs) number of the interrupt interface for the Cortex-R52 processor. Generic Interrupt Controller (GIC) handles these interrupts.

Regarding to GIC, please refer to the Arm® Cortex®-R52 Processor Technical Reference Manual.

11.3.2 Event Table

Table 11.2 shows event table of this device.

Note 1. NMI is connected to GIC Physical system error interrupt (SEI) and Virtual system error interrupt (VSEI) of CPU0.

11.3.3 Error Events

The ICU handles error events from modules. CPU0ERR_STAT, PERIERR_STAT0, PERIERR_STAT1, PERIERR_STAT2, PERIERR_STAT3 registers show each error status. The ICU captures error events and generates combined interrupt signal CPU0_ERR0, PERI_ERR0 and CPU0_ERR1, PERI_ERR1.

Error events can be disabled by CPU0ERR_E0MSK, PERIERR_E0MSK0, PERIERR_E0MSK1, PERIERR_E0MSK2, PERIERR_E0MSK3 registers and CPU0ERR_E1MSK, PERIERR_E1MSK0, PERIERR_E1MSK1, PERIERR_E1MSK2, PERIERR_E1MSK3 registers.

Additionally, error events can cause the error reset. Error events that cause error reset are maskable in CPU0ERR_RSTMSK, PERIERR_RSTMSK0, PERIERR_RSTMSK1, PERIERR_RSTMSK2, and PERIERR_RSTMSK3.

All error events are masked as initial values. *ERR_STAT register is not subject to initialization by Error reset. Since it is not initialized, Error will occur again if the Error reset mask is released. If it returns to normal operation after Error reset, it is necessary to confirm error status and clear error flag after restarting.

Table 11.3 shows the relation among error control registers and combined interrupts. Table 11.4 shows error events.

Table 11.3 Relation among error control registers and combined interrupts

Module	Error Event Status register	Error Event Status Clear register	Error Event Mask register	Combined interrupt
Cortex-R52 CPU0	CPU0ERR_STAT	CPU0ERR_CLR	CPU0ERR_E0MSK	CPU0_ERR0
			CPU0ERR_E1MSK	CPU0_ERR1
			CPU0ERR_RSTMSK	Error reset
Peripheral modules	PERIERR_STAT0, PERIERR_STAT1, PERIERR_STAT2, PERIERR_STAT3	PERIERR_CLR0, PERIERR_CLR1, PERIERR_CLR2, PERIERR_CLR3	PERIERR_E0MSK0	PERI_ERR0
			PERIERR_E0MSK1	
			PERIERR_E0MSK2	
			PERIERR_E0MSK3	
			PERIERR_E1MSK0	PERI_ERR1
			PERIERR_E1MSK1	
			PERIERR_E1MSK2	
			PERIERR_E1MSK3	
			PERIERR_RSTMSK0	Error reset
			PERIERR_RSTMSK1	
			PERIERR_RSTMSK2	
			PERIERR_RSTMSK3

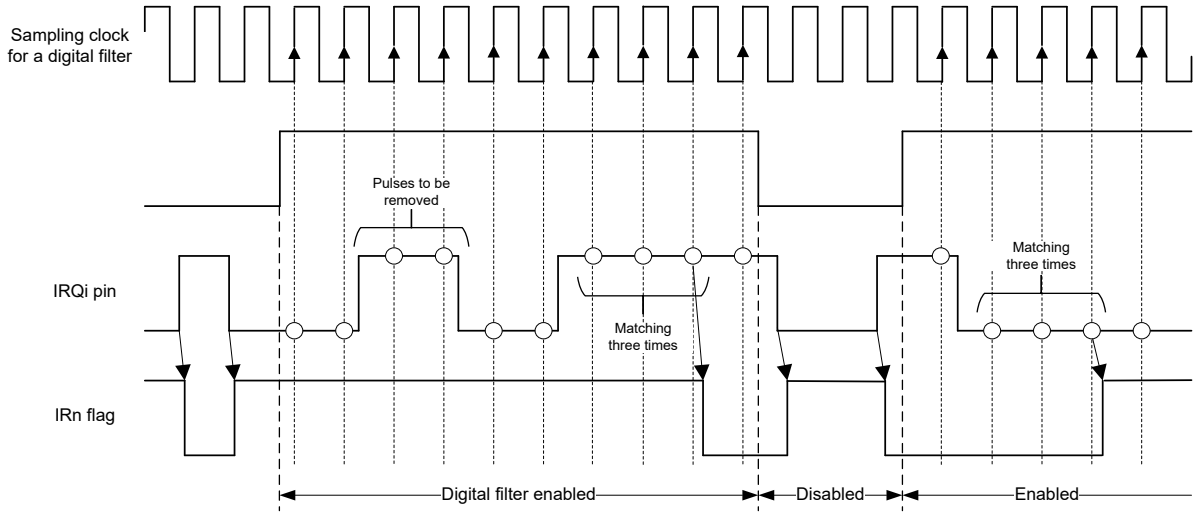
11.3.4 Noise Filter

Noise filter can be used for external interrupt signals. Noise filter has the following functions:

- Noise filter function with sampling cycles of 64 divisions, 32 divisions, 8 divisions, and 1 division for PCLKM
- Inversion/rising/falling/both edge detection method selection function



Noise filters are desirable for all signals as initial value. Set S_PORTNF_FLTSEL, NS_PORTNF_FLTSEL when using noise filter.

The digital noise filter function is provided for the external interrupt request IRQi pins (i = 0 to 15), NMI pin interrupts.

The digital noise filter samples input signals at the filter sampling clock (PCLKM) and pulsed with levels that only match once or twice are removed.

To use the digital noise filter for the IRQi pins (IRQ0 to IRQ15), set the sampling clock cycle (PCLKM, PCLKM/8, PLCKM/32, PCLKM/64) with the S(NS)_PORTNF_CLKSEL.CLSELx[1:0] bits, and set the S(NS)_PORTNF_FLTSEL.FLTx bits to 1.

Figure 11.2 shows an example of digital noise filter operation.

Operation example for S(NS)_PORTNF_MD.MDx[1:0] = 00b (operation in the Low level)

Figure 11.2 Digital noise filter operation example

12. Internal Buses

12.1 Overview

The LSI contains internal main bus, low latency peripheral port bus, and multiple peripheral buses. Master MPUs are implemented for bus masters except the Cortex-R52 so that access to the bus slaves can be controlled by the Cortex-R52. Additionally, physical paths to the bus slaves are separated among some peripherals. It allows CPU access to avoid access conflict from bus masters except the Cortex-R52 physically. Table 12.1 lists the specifications of internal buses and Figure 12.1 shows the internal bus configuration.

Table 12.1 Internal buses specifications

Internal bus type		Description
Internal main bus	• Bus masters Cortex-R52 (CPU0), DMAC (unit 0, unit 1), GMAC, USBHC, USBf, CoreSight, SHOSTIF	• Operates in synchronization with ICLK • Bus protocol: AMBA AXI • Priority order decision: Round-robin
Low latency peripheral port (LLPP) bus	• Bus masters Cortex-R52 (CPU0), internal main bus (DMAC (unit 0, unit 1), CoreSight (AXI-AP))	• Operates in synchronization with ICLK • Bus protocol: AMBA AXI • Priority order decision: Fixed priority (Cortex-R52 > internal main bus)
Peripheral bus 0	MTU3, GPT (ch0 to ch6), TFU, DSMIF, POE3, POEG (unit 0), ADC12 (unit 0, unit1), Encoder Subsytem (ENDAT, BISS, HDSL, AFMT) (unit 0, unit 1), ENCOUT	• LLPP peripheral (LLPP) • Operates in synchronization with PCLKH
Peripheral bus 1	GPT (ch7 to ch13), SCI (ch0 to ch4), SPI (ch0 to ch2), CRC (unit 0), CANFD	• Non-Safety peripheral (NONSAFETY) • Operates in synchronization with PCLKM
Peripheral bus 2	CMT, CMTW, WDT, IIC (ch0, ch1), DOC, TSU, POEG (unit 1)	• Non-Safety peripheral (NONSAFETY) • Operates in synchronization with PCLKL
Peripheral bus 3	GPT (ch14 to ch17), SCI (ch5), SPI (ch3), CRC (unit 1)	• Safety peripheral (SAFETY) • Operates in synchronization with PCLKM
Peripheral bus 4	IIC (ch2), RTC, POEG (unit 2)	• Safety peripheral (SAFETY) • Operates in synchronization with PCLKL
Peripheral bus 5	DMAC	• Non-Safety peripheral (NONSAFETY) • Operates in synchronization with PCLKH
Peripheral bus 6	GMAC, ESC, Ethernet Subsystem registers, USBHC, USBf	• Non-Safety peripheral (NONSAFETY) • Operates in synchronization with PCLKM
Cortex-R52 CPU0 AXIS	Cortex-R52 CPU0 ATCM, BTCM	• Operates in synchronization with ICLK
BSC	• External memory space • Related registers	• Operates in synchronization with PCLKM
xSPI	• External memory space • Related registers	• Operates in synchronization with PCLKH
System SRAM	• System SRAM memory space • Related registers	• Operates in synchronization with PCLKH
System Control	ICU, ELC, clock controller, reset controller, master MPU	• Operates in synchronization with PCLKM
HOSTIF Control	MBXSEM, SHOSTIF registers	• Operates in synchronization with PCLKH
IO port		• Operates in synchronization with PCLKM
OTP		• Operates in synchronization with PCLKM
Security		• Operates in synchronization with PCLKM
CoreSight		• Operates in synchronization with PCLKH

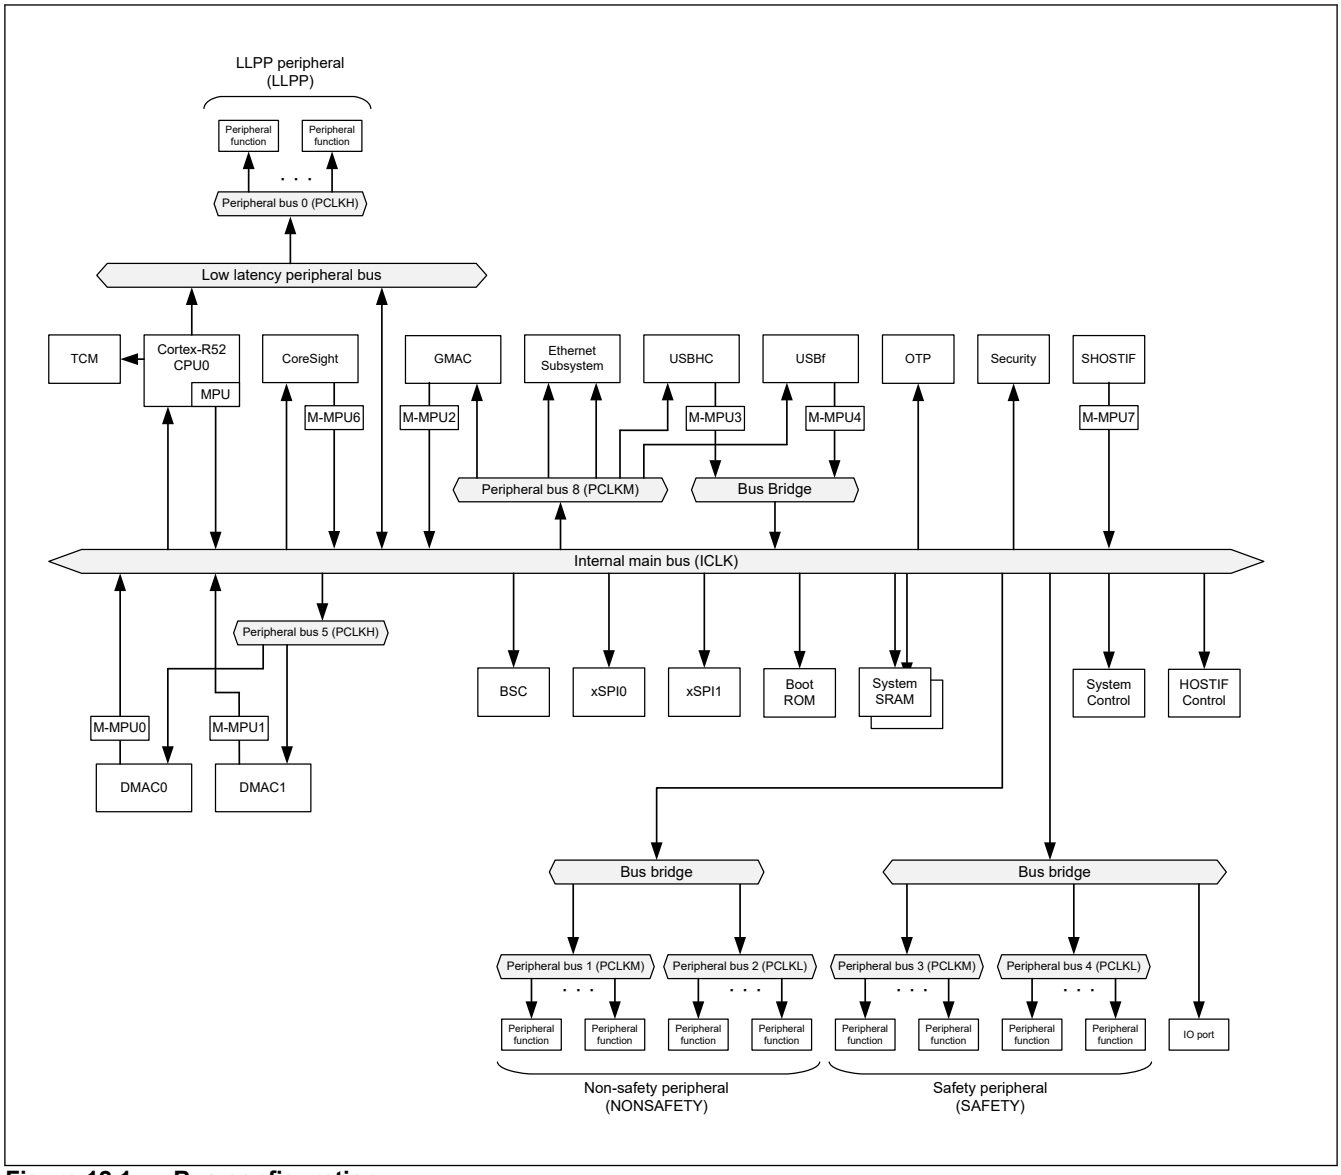


Figure 12.1 Bus configuration

12.2 Register Descriptions

12.2.1 STADDm : Master MPU Safety Region Start Address Register m (m = 0 to 7)

Base address: MPUi = 0x8128_1100 + 0x0100 × i (i = 0 to 4 and 6)
MPU7 = 0x8128_1C00

Offset address: 0x00 + 0x10 × m

Bit position:	31																					10								1	0
Bit field:	STADDR[21:0]																					—	—	—	—	—	—	—	—	WRPR	RDPR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1

Bit	Symbol	Function	R/W
0	RDPR	Enable read protection for region m of master MPU 0: Disable read protection. Read access to the safety region is permitted. 1: Enable read protection. Read access to the safety region is protected and error is generated.	R/W

Bit	Symbol	Function	R/W
1	WRPR	Enable write protection for region m of master MPU 0: Disable write protection. Write access to the safety region is permitted. 1: Enable write protection. Write access to the safety region is protected and error is generated.	R/W
9:2	—	These bits are read as 0. The write value should be 0.	R/W
31:10	STADDR[21:0]	Start address for MPU region Set upper 22 bits of the 32-bit start address of the safety region to be protected access. Lower 10 bits of the 32-bit start address is set 0x000 automatically. For AXI type MPU (i = 0 to 2, and 6), STADDR[1:0] must be set 00b.	R/W

Note 1. Initial value depends on the number of m. The value is 1 for m = 0 and 0 for the others.

The STADDm register is a 32-bit register that controls the start address of the safety region. Access from the master module to the safety region which is specified is protected by the master MPU. Up to 7 regions (m = 0 to 7) can be defined for each master MPU. Boundary and granularity of the start address to be set is 1 KB for AHB type MPU (i = 3, 4, and 7) and 4 KB for AXI type MPU (i = 0 to 2, and 6).

12.2.2 ENDADDm : Master MPU Safety Region End Address Register m (m = 0 to 7)

Base address: MPUi = 0x8128_1100 + 0x0100 × i (i = 0 to 4 and 6)
MPU7 = 0x8128_1C00

Offset address: 0x04 + 0x10 × m

Bit position:	31																			10										0
Bit field:	ENDADDR[21:0]																			—	—	—	—	—	—	—	—	—	—	
Value after reset:	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
9:0	—	These bits are read as 0. The write value should be 0.	R/W
31:10	ENDADDR[21:0]	End address for MPU region Set upper 22 bits of the 32-bit end address of the safety region to be protected access. Lower 10 bits of the 32-bit end address is set 0x3FF automatically. For AXI type MPU (i = 0 to 2, and 6), ENDADDR[1:0] must be set 11b.	R/W

Note 1. Initial value depends on the number of m. The value is 1 for m = 0 and 0 for the others.

The ENDADDm register is a 32-bit register that controls the end address of the safety region. Access from the master module to the safety region which is specified is protected by the master MPU. Up to 7 regions (m = 0 to 7) can be defined for each master MPU. Boundary and granularity of the end address to be set is 1 KB for AHB type MPU (i = 3, 4, and 7) and 4 KB for AXI type MPU (i = 0 to 2, and 6).

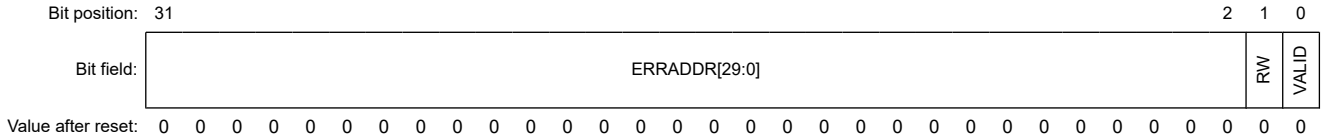
12.2.3 ERRINF : Master MPU Error Information Register for AHB type

Base address: MPUj = 0x8128_1100 + 0x0100 × j (j = 3, 4)
MPU7 = 0x8128_1C00

Offset address: 0x80

Bit position:	31																												2	1	0
Bit field:	ERRADDR[29:0]																												RW	VALID	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	VALID	Validity of Access Error Information Cleared to 0 when 0 is written. 0: Error information is invalid 1: Error information is valid	R/W



Bit	Symbol	Function	R/W
1	RW	Access error type 0: Read access 1: Write access	R
31:2	ERRADDR[29:0]	Access Error Address Indicates upper 30 bits of the 32-bit address. Lower 2 bits are masked.	R

The ERRINF is a 32-bit register to store the safety region access error information by master module. AHB type MPUj (j = 3, 4, and 7) provides one error information for both read and write.

12.2.4 ERRINF_x : Master MPU Error Information Register for AXI type (x = R, W)

Base address: MPUi = 0x8128_1100 + 0x0100 × i (i = 0 to 2, and 6)

Offset address: 0x80 (ERRINF_R)
0x84 (ERRINF_W)

Bit	Symbol	Function	R/W
0	VALID	Validity of access error information Cleared to 0 when 0 is written. 0: Error information is invalid 1: Error information is valid	R/W
1	RW	Access error type 0: Read access 1: Write access	R
31:2	ERRADDR[29:0]	Access error address Indicates upper 30 bits of the 32-bit address. Lower 2 bits are masked.	R

The ERRINF_x register is a 32-bit register to store the safety region access error information by master module. AXI type MPUi (i = 0 to 2, and 6) provides error information for each read and write channel separately. ERRINF_R is for read channel and ERRINF_W is for write channel.

12.3 Operation

12.3.1 Bus Connection

The internal main bus and low-latency peripheral bus of this LSI both have a multiple-layer structure. If bus masters request to access different bus slaves respectively, multiple accesses are processed in parallel. If bus masters request to access the same bus slave, priority order decision is performed and accesses are processed sequentially according to the priority order. Arbitration scheme for internal main bus is round-robin and for low-latency peripheral bus is fixed priority. Access to slaves on low-latency peripheral bus from the Cortex-R52 CPU0 is prioritized compared to the access from the bus masters through internal main bus.

Table 12.2 lists the connection between the bus masters and the bus slaves.

Table 12.2 Connection between bus masters and bus slaves (A: Accessible, —: Inaccessible) (1 of 2)

Bus slave	Bus master							
	Cortex-R52 CPU0	SHOSTIF	DMAC unit 0	DMAC unit 1	GMAC	USBHC	USBf	CoreSight
Peripheral bus 0 (LLPP)	A	—	A*1	A*1	—	—	—	A*1
Peripheral bus 1 (NONSAFETY)	A	—	A	A	—	—	—	A

Table 12.2 Connection between bus masters and bus slaves (A: Accessible, —: Inaccessible) (2 of 2)

Bus slave	Bus master							
	Cortex-R52 CPU0	SHOSTIF	DMAC unit 0	DMAC unit 1	GMAC	USBHC	USBf	CoreSight
Peripheral bus 2 (NONSAFETY)	A	—	A	A	—	—	—	A
Peripheral bus 3 (SAFETY)	A	—	—	—	—	—	—	—
Peripheral bus 4 (SAFETY)	A	—	—	—	—	—	—	—
Peripheral bus 5 (DMAC)	A	—	—	—	—	—	—	A
Peripheral bus 6 (Ethernet Subsystem, USBHC, USBf)	A	—	A*5	A*5	—	—	—	A
Cortex-R52 CPU0 AXIS (ATCM, BTCM)	A	—	A	A	A	A	A	A
BSC	A	—	A*4	A*4	A*4	A*4	A*4	A
xSPI	A	—	A*2	A*2	A*2	A*2	A*2	A
System SRAM	A	A*3	A*3	A*3	A*3	A*3	A*3	A*3
System Control	A	—	—	—	—	—	—	A
HOSTIF Control	A	A	—	—	—	—	—	—

OTP	A	—	—	—	—	—	—	—
Security	A	—	A	A	—	—	—	—
CoreSight	A	—	—	—	—	—	—	—

Note 1. Access through internal main bus is available. Priority order for these bus masters is round-robin.
Note 2. External memory space only. Control registers related to xSPI are not accessible.
Note 3. Memory space only. Control registers related to system SRAM are not accessible.
Note 4. External memory space only. Control registers related to BSC are not accessible.
Note 5. Process data RAM on ESC only.

12.3.2 Master MPU

Master MPU (MPUi, (i = 0 to 4 and 6 to 7)) is used to prevent master modules except the Cortex-R52 from accessing the safety region that is specified by STADDm and ENDADDm registers. When the master MPU detects the access to the safety region, access is terminated with an error response from the bus. Up to 7 regions can be protected for each master module. Boundary of the safety region is set with 1 KB granularity for AHB type MPU and 4 KB for AXI type MPU.

Master MPU stores error address and access attribution (read or write) to the Master MPU Error Information registers (ERRINF, ERRINF_R, ERRINF_W) when access error is detected. Interrupt is also generated to inform the CPU of the error occurrence.

Master MPU registers (STADDm, ENDADDm, ERRINF, and ERRINF_x) can be controlled by Cortex-R52 CPU0.

Table 12.3 lists the correspondence between MPUi and the master module. AXI type master MPU monitors access address and stores error address to the registers for read and write channels separately. On the other hand, AHB type master MPU monitors access address and stores error address to the same register for commonly read and write operation.

Table 12.3 Correspondence between master module and error information registers (1 of 2)

Master module	Type	Error information registers	
		Base address symbol	Register symbol
DMAC Unit 0	AXI	MPU0	ERRINF_R, ERRINF_W
DMAC Unit 1	AXI	MPU1	ERRINF_R, ERRINF_W
GMAC	AXI	MPU2	ERRINF_R, ERRINF_W
USB Host	AHB	MPU3	ERRINF
USB Function	AHB	MPU4	ERRINF

Table 12.3 Correspondence between master module and error information registers (2 of 2)

Master module	Type	Error information registers	
		Base address symbol	Register symbol
CoreSight (AXI-AP)	AXI	MPU6	ERRINF_R, ERRINF_W
SHOSTIF	AHB	MPU7	ERRINF

Safety region that is specified can be overlapped. If different attributions (read protection, write protection, or read/write protection) are set to the same area, combined protection is applied. Figure 12.2 shows an example of the safety region and attribution by the master MPU.

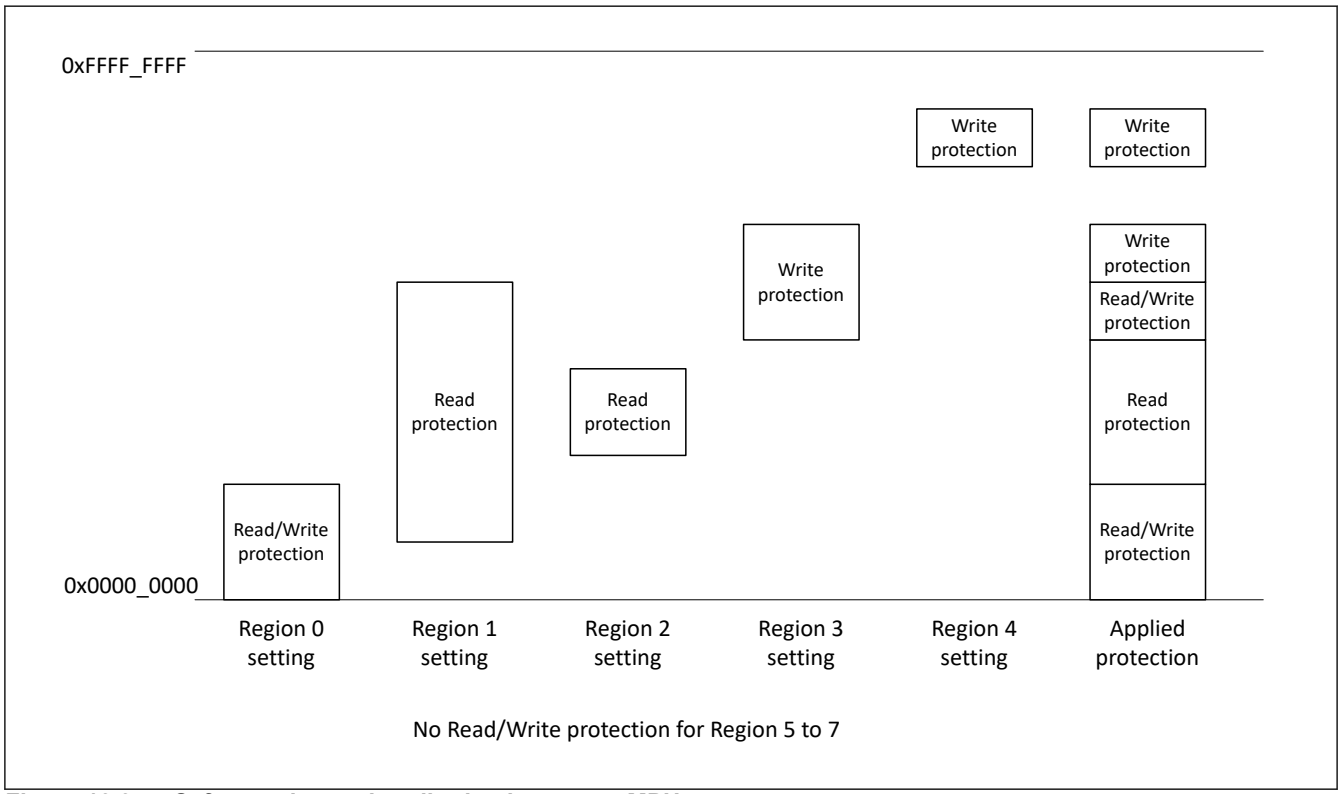

Figure 12.2 Safety region and attribution by master MPU

12.3.3 Interrupt

When a bus error or an MPU error occurs by reading or writing to the safety region, interrupt can be output. Table 12.4 lists the internal bus and master MPU interrupt sources. These interrupts are combined with peripheral error interrupts (PERI_ERR0 and PERI_ERR1) as error events with other error interrupts.

Table 12.4 Internal bus and master MPU interrupt sources (1 of 2)

Name	Interrupt sources	CPU0 GIC request	DMAC activation
BUS_ERRINT	Internal bus error	Possible*1	Not possible
MPU_DMACR0	Master MPU read channel for DMAC0 error	Possible*1	Not possible
MPU_DMACW0	Master MPU write channel for DMAC0 error	Possible*1	Not possible
MPU_DMACR1	Master MPU read channel for DMAC1 error	Possible*1	Not possible
MPU_DMACW1	Master MPU write channel for DMAC1 error	Possible*1	Not possible
MPU_GMACR	Master MPU read channel for GMAC error	Possible*1	Not possible
MPU_GMACW	Master MPU write channel for GMAC error	Possible*1	Not possible
MPU_USBH	Master MPU for USB host error	Possible*1	Not possible

Table 12.4 Internal bus and master MPU interrupt sources (2 of 2)

Name	Interrupt sources	CPU0 GIC request	DMAC activation
MPU_USBF	Master MPU for USB function error	Possible*1	Not possible
MPU_DBGR	Master MPU read channel for CoreSight error	Possible*1	Not possible
MPU_DBGW	Master MPU write channel for CoreSight error	Possible*1	Not possible
MPU_SHOSTIF	Master MPU for SHOSTIF error	Possible*1	Not possible

Note 1. These are not directly connected to CPU GIC but through peripheral error interrupts (PERI_ERR0 and PERI_ERR1).

12.4 Usage Notes

12.4.1 Release of Register Write Protection

The Master MPU registers are write protected. To release write protection, follow the steps below.

1. Write 0x0000A508 to PRCRS register (release write protection using PRCS3 bit).
2. Write value to the STADDm, ENDADDm, ERRINF, and ERRINF_x registers.
3. Write 0x0000A500 to PRCRS register (set write protection with PRCS3 bit).

12.4.2 Initial Setting of Master MPU

The initial setting of region 0 specifies all the area of memory map with read/write protection for every master MPU. This means the master modules cannot access any of the bus slaves. The Master MPU register must be changed from Cortex-R52 CPU0 before operating master modules.

12.4.3 New MPU Error Detection While Preserving Valid Error Information

When master MPU detects new error access while preserving valid error information (VALID bit = 1 in Master MPU error information registers), the error information is not updated to the new one unless the VALID bit is cleared to 0 by writing 0. Nevertheless, access to the safety region is protected. Interrupt is also not regenerated while the VALID bit is 1.

12.4.4 TCM Access via AXIS Interface of Cortex-R52

Bus masters can access to TCMs of Cortex-R52 CPU0 via AXIS interface in Cortex-R52 CPU0. AXIS has some limitations for data size and address alignment. Table 12.5 shows the limitation of TCM access via AXIS interface each bus master and Table 12.6 shows register setting to access TCM under limitation.

Table 12.5 Limitation of TCM access via AXIS interface (1 of 2)

Bus master	Description
CPU0 via AXIM	Instruction fetch is not possible. Data access Read ● Possible if region attribution is set to Device and LD instruction (8, 16, or 32 bits) is used to access. Write ● Possible if region attribution is set to Device and ST instruction (8, 16, or 32 bits) is used to access.
DMAC0	Descriptor access is not possible. Data access Read ● Possible if transfer size is 8, 16, 32, 64, 128, or 512 bits. Write ● Possible if transfer size is 8, 16, 32, 64, or 128 bits. ● Possible if transfer size is 512 bits and access address is 64-byte aligned. 256-bits transfer is not possible.
DMAC1	Descriptor access is not possible. Data access Read and Write ● Possible if transfer size is 8, 16, 32, 64, or 128 bits. 256-bit transfer is not possible.

Table 12.5 Limitation of TCM access via AXIS interface (2 of 2)

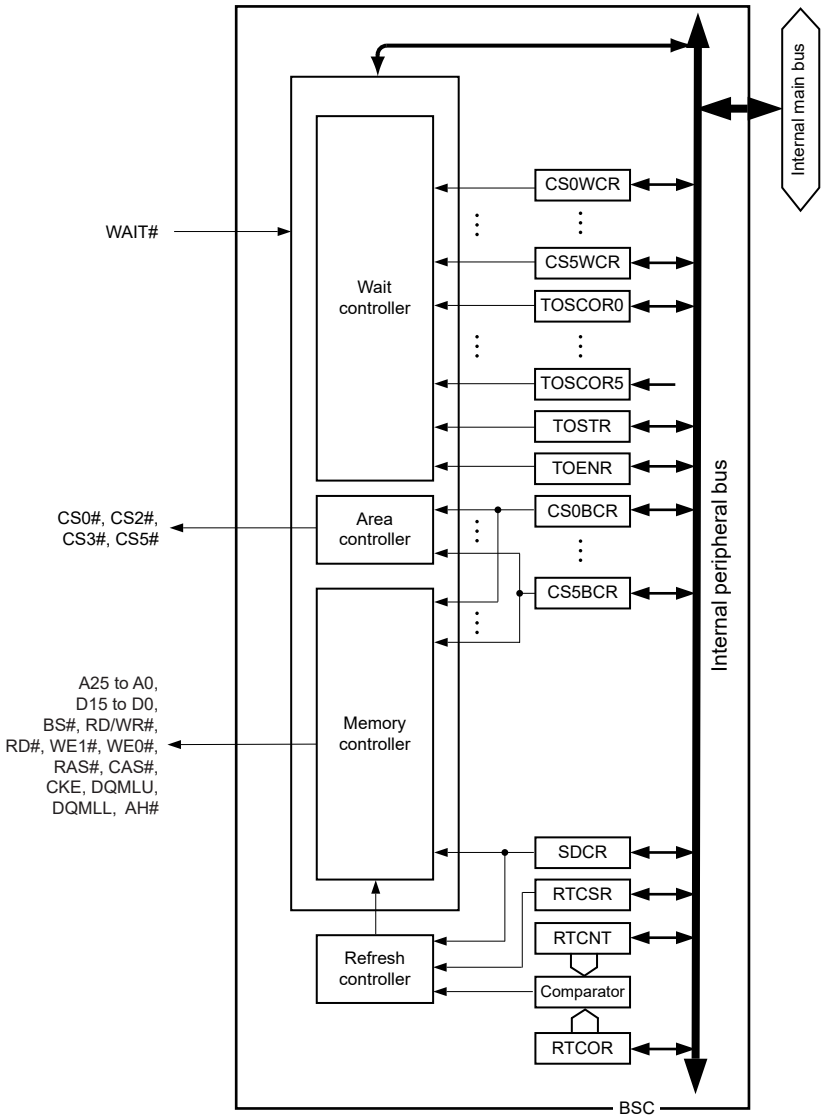
Bus master	Description
GMAC	Read and Write ● Possible if transfer is 32-bit ×1 beat and access address is 4-byte aligned. ● Possible if transfer is 32-bit ×4 beat and access address is 16-byte aligned. Other combination transfer is not possible.
USBHC USBf	Descriptor access is not possible. Data access Read and Write ● Possible if transfer size is 128 bits and access addresses is 16-byte aligned. Other combination transfer is not possible.
CoreSight (AXI-AP)	No limitation in the supported access.

Table 12.6 Register setting to access TCM from each bus master

Bus master	Register	Bit setting
DMAC0	CHCFG_n	DDS = 0x0 (8-bit), 0x1 (16-bit), 0x2 (32-bit), 0x3 (64-bit), 0x4 (128-bit), or 0x6 (512-bit) SDS = 0x0 (8-bit), 0x1 (16-bit), 0x2 (32-bit), 0x3 (64-bit), 0x4 (128-bit), or 0x6 (512-bit)
	CHEXT_n	DCA = 0x2 if CHCFG_n.DDS = 0x4 or 0x6 and destination is TCM SCA = 0x2 if CHCFG_n.SDS = 0x4 or 0x6 and source is TCM
DMAC1	CHCFG_n	DDS = 0x0 (8-bit), 0x1 (16-bit), 0x2 (32-bit), 0x3 (64-bit), or 0x4 (128-bit) SDS = 0x0 (8-bit), 0x1 (16-bit), 0x2 (32-bit), 0x3 (64-bit), or 0x4 (128-bit)
	CHEXT_n	DCA = 0x2 if CHCFG_n.DDS = 0x4 and destination is TCM SCA = 0x2 if CHCFG_n.SDS = 0x4 and source is TCM
GMAC	Bus_Mode	AAL = 0x1 USP = 0 RPBL = any FB = 0x1 PBL = 0x4
	AXI_Bus_Mode	BLEN16 = 0 BLEN8 = 0 BLEN4 = 0x1
USBHC	AHB_BUS_CTR	PROT_TYPE = 1xxxb ALIGN_ADDRESS = 11b
USBf	CHCFG_n	DDS = 0x4 (128-bit) SDS = 0x4 (128-bit)
	CHEXT_n	DPR = 1xxxb SPR = 1xxxb

13. Bus State Controller

13.1 Overview



The bus state controller outputs control signals for various types of memory and external devices that are connected to the external address space. The functions of this module enable this LSI to connect directly with SRAM, SDRAM, other memory storage devices, and external devices.

Table 13.1 Bus state controller specifications

Item	Description
External address space	• A maximum of 64 MB for each of areas CS0, CS2, CS3, and CS5 • Can specify the following for each CS space: SRAM interface, SRAM interface with byte selection, burst ROM (clocked synchronous or asynchronous), MPX-I/O, and SDRAM memory. – Data bus width (8 or 16 bits) Insertion of wait cycles for each read access and write access. • Can set independent idle cycles for the following five cases: Read-write (in same space/different spaces), read-read (in same space/different spaces), and the first cycle is a write access.
Various interfaces	• SRAM interface Supports the interface that can directly connect to the SRAM.
	• Burst ROM interface (clocked asynchronous) High-speed access to the ROM that has the page mode function.
	• MPX-I/O interface Can directly connect to a peripheral LSI that needs an address/data multiplexing.
	• SDRAM interface – Can set the SDRAM in up to two areas[*1] Multiplex output for row address/column address. Efficient access by single read/single write. – High-speed access in bank-active mode Supports an auto-refresh and self-refresh. Supports a power-down mode. – Issues MRS and EMRS commands.
	• SRAM interface with byte selection Can connect directly to an SRAM with byte selection.
	• Burst ROM interface (clocked synchronous) Can connect directly to a burst ROM of the clocked synchronous type.
Refresh function	• Supports the auto-refresh and self-refresh functions • Specifies the refresh interval using the refresh counter and clock selection • Can execute concentrated refresh by specifying the refresh counts (1, 2, 4, 6, or 8) Usage as interval timer for refresh counter. • Generates an interrupt request at compare match
External WAIT# pin	• Detection of long wait state for access by the signal on the external WAIT# pin • A timeout detection condition is specifiable per CS space • Once timeout is detected, the external WAIT function is disabled and an external wait timeout detection interrupt is issued

Note 1. When connecting one SDRAM, set up the CS3 space for SDRAM or CS2 space and CS3 space for the SDRAM. CS2 space only is not supported.

Figure 13.1 is a block diagram of the bus state controller.

Note: CSnWCR: CSn Space Wait Control Register (n = 0, 2, 3, 5)
CSnBCR: CSn Space Bus Control Register (n = 0, 2, 3, 5)
SDCR: SDRAM Control Register
RTCSR: Refresh Timer Control/Status Register
RTCNT: Refresh Timer Counter
RTCOR: Refresh Time Constant Register
TOSCORn: Timeout Cycle Constant Register (n = 0, 2, 3, 5)
TOSTR: Timeout Status Register
TOENR: Timeout Enable Register

Figure 13.1 Block diagram of bus state controller

Table 13.2 lists the input/output pins of the bus state controller.

Table 13.2 Input/output pins of the bus state controller (1 of 2)

Name	I/O	Function
A25 to A0	Output	Address output pins
D15 to D0	I/O	Data input/output pins
BS#	Output	Status signal output pin that indicates the start of the bus cycle

Table 13.2 Input/output pins of the bus state controller (2 of 2)

Name	I/O	Function
CS0#, CS2#, CS3#, CS5#	Output	Chip select signal output pins
RD/WR#	Output	Strobe signal output pin that indicates a read or write access Connect this pin to WE# pins when SDRAM or SRAM with byte selection is connected.
RD#	Output	Strobe signal output pin that indicates a read signal (read data output enable signal)
AH#	Output	Functions as the address hold signal output pin when the MPX-I/O interface is used.
WE1#/DQMLU	Output	Write strobe signal output pin for D15 to D8 Connect this pin to the byte select pin when SRAM with byte selection is connected. Functions as the data mask enable signal output pin for D15 to D8 when SDRAM is connected.
WE0#/DQMLL	Output	Write strobe signal output pin for D7 to D0 Connect this pin to the byte select pin when SRAM with byte selection is connected. Functions as the data mask enable signal output pin for D7 to D0 when SDRAM is connected.
RAS#	Output	Row address strobe signal output pin for SDRAM. Connect this pin to RAS# pin of the SDRAM.
CAS#	Output	Column address strobe signal output pin for SDRAM. Connect this pin to CAS# pin of the SDRAM.
CKE	Output	Clock enable signal output pin for SDRAM. Connect this pin to CKE pin of the SDRAM.
WAIT#	Input	External wait control signal input pin used to insert a wait state into a bus cycle

13.2 Area Overview

13.2.1 Address Map

The kind of memory to be connected to the external address space and the data bus width are specified in each of CS0, CS2, CS3, and CS5 spaces. The address map for the external address space is listed below.

Table 13.3 Address map

Internal address	Space	Memory to be connected
0x5000_0000 to 0x53FF_FFFF	CS0 mirror	SRAM interface, SRAM with byte selection, burst ROM (asynchronous or synchronous)
0x5400_0000 to 0x57FF_FFFF	CS2 mirror	SRAM interface, SRAM with byte selection, SDRAM*1
0x5800_0000 to 0x5BFF_FFFF	CS3 mirror	SRAM interface, SRAM with byte selection, SDRAM*1
0x5C00_0000 to 0x5FFF_FFFF	CS5 mirror	SRAM interface, SRAM with byte selection, MPX-I/O
0x7000_0000 to 0x73FF_FFFF	CS0	SRAM interface, SRAM with byte selection, burst ROM (asynchronous or synchronous)
0x7400_0000 to 0x77FF_FFFF	CS2	SRAM interface, SRAM with byte selection, SDRAM
0x7800_0000 to 0x7BFF_FFFF	CS3	SRAM interface, SRAM with byte selection, SDRAM*1
0x7C00_0000 to 0x7FFF_FFFF	CS5	SRAM interface, SRAM with byte selection, MPX-I/O

Note 1. When connecting one SDRAM, set up the CS3 space for SDRAM or CS2 space and CS3 space for the SDRAM. CS2 space only is not supported.

13.2.2 Data Bus Width and Related Pin Setting for Each Area Depending on Boot Mode

The initial state of data bus width and settings of the pins related to this module depends on boot mode. For boot mode, see section 3, Operating Modes.

In 16-bit bus boot, the bus width of area 0 is automatically set to 16 bits, because this LSI is started up by the program stored in the ROM connected to area 0. For areas 2, 3, and 5, the bus width and the memory to be connected can be changed by the program. Immediately after a power-on reset in these modes, some of the address and data-bus signals and the CS0# and RD# signals are automatically selected by default as the functions of the corresponding pins, since these signals are required to read ROM data from area 0. With the exception of these pins, the general purpose pin function is selected by

default, and other required pin functions must be specified by software. Read access to area 0 is only permitted before the pin settings are completed.

In other boot modes, the state of areas 0, 2, 3, and 5 can be changed from the initial state by software, because the LSI does not use the ROM connected to area 0. Pin functions related to this module need to be set by software. Do not access external address spaces before the pin settings are completed.

Table 13.4 shows the initial state for individual boot modes and areas.

The sample access waveforms shown in this section include the pins such as BS#, RD/WR#, and WEn#. They are the waveforms when individual pin functions are enabled by the multi-function pin controller. For example, when 8-bit bus width is used in 16-bit bus boot mode, setting for pin A0 is needed.

For details on pin function settings, see section 16, I/O Ports.

Table 13.4 Initial states for individual boot modes and areas

Boot mode	Parameter	Area 0	Areas 2, 3, and 5
16-bit bus boot	Data bus width	Fixed to 16 bits. Not changeable.	16 bits. Can be changed by program.
	Settings of pins related to this module	Pins A20 to A1, D15 to D0, CS0#, and RD# are set automatically. Other pins need to be set by program.	
Others	Data bus width	16 bits. Can be changed by program.	
	Settings of pins related to this module	The initial value is the general I/O function. For external bus access, all the necessary pins need to be set by program.	

Note:
- In 16-bit bus boot, if an external memory that uses higher-order address lines than A21 is connected, the circuit board must include pull-down resistors for those address lines.
- The data-bus width may be limited by the type of memory in use. For details, see section 13.3.1. CSnBCR : CSn Space Bus Control Register (n = 0, 2, 3, 5).

13.3 Register Descriptions

13.3.1 CSnBCR : CSn Space Bus Control Register (n = 0, 2, 3, 5)

Base address: BSC = 0x8021_0000

Offset address: 0x004 + 0x4 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	IWW[2:0]			IWRWD[2:0]			IWRWS[2:0]			IWRRD[2:0]			IWRRS[2:0]		
Value after reset:	0	0	1	1	0	1	1	0	1	1	0	1	1	0	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	TYPE[2:0]			—	BSZ[1:0]		—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
10:9	BSZ[1:0]	Data Bus Width Specification Specify the data bus width of CS spaces. ● If area 5 is specified as MPX-I/O, setting these bits to 11b selects 8-bit or 16-bit bus width according to the address settings of the SZSEL bit in CS5WCR. Setting these bits to 01b or 10b selects the fixed bus width of 8-bit or 16-bit, respectively. ● In 16-bit bus boot mode, 10b is automatically written to the BSZ[1:0] bits of the CS0BCR register. ● If area 2 or area 3 is specified as SDRAM space, the bus width should be fixed to 16 bits. ● If area 0 is specified as clocked synchronous burst ROM space,the bus width should be fixed to 16 bits. 0 0: Setting prohibited 0 1: 8-bit size 1 0: 16-bit size 1 1: For MPX-I/O, selects bus width by address.	R/W
11	—	This bit is read as 1. The write value should be 1.	R/W
14:12	TYPE[2:0]	Memory Connected to a Space Specify the type of memory connected to a CS space. For details for memory type in each area, see Table 13.3. ● When connecting the burst ROM to the CS0 space in 16-bit bus boot, change the CS0WCR register to the settings according to the burst ROM, and then set TYPE[2:0] to the burst ROM setting. In other boot modes, memory access should be performed after setting CS0BCR and CS0WCR. ● Selecting SDRAM requires setting of I/O Buffer m Function Switching Register (DRCTLm) at the same time. For details, see section 16.3.6. DRCTLm : I/O Buffer m Function Switching Register (m = 00 to 24). 0 0 0: Normal space 0 0 1: Burst ROM (clock asynchronous) 0 1 0: MPX-I/O 0 1 1: SRAM with byte selection 1 0 0: SDRAM 1 0 1: Setting prohibited 1 1 0: Setting prohibited 1 1 1: Burst ROM (clock synchronous)	R/W
15	—	This bit is read as 0. The write value should be 0.	R/W
18:16	IWRRS[2:0]	Idle State Insertion between Read-Read Cycles in the Same CS Space Specify the number of idle cycles to be inserted after the access to an external memory that is connected to the CS space. The target cycle is a read-read cycle of which continuous access cycles are for the same CS space. 0 0 0: No idle cycle inserted 0 0 1: 1 idle cycle inserted 0 1 0: 2 idle cycles inserted 0 1 1: 4 idle cycles inserted 1 0 0: 6 idle cycles inserted 1 0 1: 8 idle cycles inserted 1 1 0: 10 idle cycles inserted 1 1 1: 12 idle cycles inserted	R/W
21:19	IWRRD[2:0]	Idle State Insertion between Read-Read Cycles in Different CS Spaces Specify the number of idle cycles to be inserted after the access to an external memory that is connected to the CS space. The target cycle is a read-read cycle of which continuous access cycles switch between different CS spaces. 0 0 0: No idle cycle inserted 0 0 1: 1 idle cycle inserted 0 1 0: 2 idle cycles inserted 0 1 1: 4 idle cycles inserted 1 0 0: 6 idle cycles inserted 1 0 1: 8 idle cycles inserted 1 1 0: 10 idle cycles inserted 1 1 1: 12 idle cycles inserted	R/W

Bit	Symbol	Function	R/W
24:22	IWRWS[2:0]	Idle State Insertion between Read-Write Cycles in the Same CS Space Specify the number of idle cycles to be inserted after the access to an external memory that is connected to the CS space. The target cycle is a read-write cycle of which continuous access cycles are for the same CS space. 0 0 0: No idle cycle inserted 0 0 1: 1 idle cycle inserted 0 1 0: 2 idle cycles inserted 0 1 1: 4 idle cycles inserted 1 0 0: 6 idle cycles inserted 1 0 1: 8 idle cycles inserted 1 1 0: 10 idle cycles inserted 1 1 1: 12 idle cycles inserted	R/W
27:25	IWRWD[2:0]	Idle State Insertion between Read-Write Cycles in Different CS Spaces Specify the number of idle cycles to be inserted after the access to an external memory that is connected to the CS space. The target access cycle is a read-write one in which continuous access cycles switch between different CS spaces. 0 0 0: No idle cycle inserted 0 0 1: 1 idle cycle inserted 0 1 0: 2 idle cycles inserted 0 1 1: 4 idle cycles inserted 1 0 0: 6 idle cycles inserted 1 0 1: 8 idle cycles inserted 1 1 0: 10 idle cycles inserted 1 1 1: 12 idle cycles inserted	R/W
30:28	IWW[2:0]	Idle Cycles between Write-Read Cycles and Write-Write Cycles These bits specify the number of idle cycles to be inserted after the access to an external memory that is connected to the CS space. The target access cycles are the write-read cycle and write-write cycle. 0 0 0: No idle cycle inserted 0 0 1: 1 idle cycle inserted 0 1 0: 2 idle cycles inserted 0 1 1: 4 idle cycles inserted 1 0 0: 6 idle cycles inserted 1 0 1: 8 idle cycles inserted 1 1 0: 10 idle cycles inserted 1 1 1: 12 idle cycles inserted	R/W
31	—	This bit is read as 0. The write value should be 0.	R/W

The CSnBCR register specifies the memory connected to each CS space, the number of idle cycles between bus cycles, and the bus width.

Do not access external memory for the corresponding area until CSnBCR initial setting and pin setting that are required for accessing the external memory are completed.

Idle cycles may be inserted even when they are not specified. For details, see section 13.4.10. Wait between Access Cycles.

13.3.2 CSn Space Wait Control Register (CSnWCR) (n = 0, 2, 3, 5)

The CSnWCR register specifies various wait cycles for external memory access. The bit configuration of this register varies as shown below according to the memory type (TYPE2 to TYPE0) specified by the CSn space bus control register (CSnBCR). Specify CSnWCR before accessing the target area. Specify CSnBCR first, then specify CSnWCR.

13.3.2.1 CS0WCR_0 : CS0 Space Wait Control Register for Normal Space, SRAM with Byte Selection

Base address: BSC = 0x8021_0000

Offset address: 0x028

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	BAS	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	SW[1:0]		WR[3:0]				WM	—	—	—	—	HW[1:0]	
Value after reset:	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	HW[1:0]	Delay States from RD#, WEn# Negation to Address, CS0# Negation Specify the number of delay states from RD# and WEn# inactive to address and CS0# inactive. 0 0: 0.5 cycles 0 1: 1.5 cycles 1 0: 2.5 cycles 1 1: 3.5 cycles	R/W
5:2	—	These bits are read as 0. The write value should be 0.	R/W
6	WM	External Wait Mask Specification Specifies whether the external wait input is valid. The specification by this bit is valid even when the number of access wait cycle is 0. 0: External wait input is valid 1: External wait input is ignored	R/W
10:7	WR[3:0]	Number of Access Waits Specify the number of wait insertions that are necessary for read/write access. 0x0: No wait insertion 0x1: 1 cycle 0x2: 2 cycles 0x3: 3 cycles 0x4: 4 cycles 0x5: 5 cycles 0x6: 6 cycles 0x7: 8 cycles 0x8: 10 cycles 0x9: 12 cycles 0xA: 14 cycles 0xB: 18 cycles 0xC: 24 cycles Others: Setting prohibited	R/W
12:11	SW[1:0]	Number of Delay Cycles from Address, CSn# Assertion to RD#, WEn# Assertion Specify the number of delay cycle states from address and CS0# active to RD# and WEn# active. 0 0: 0.5 cycles 0 1: 1.5 cycles 1 0: 2.5 cycles 1 1: 3.5 cycles	R/W
15:13	—	These bits are read as 0. The write value should be 0.	R/W
17:16	—*1	Set these bits to 0 when the interfaces for SRAM or for SRAM with byte selection are used.	R/W
19:18	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
20	BAS*2	SRAM with Byte Selection Byte Access Select Specifies the WE# and RD/WR# signal timing when the SRAM interface with byte selection is used. 0: Activates the WEn# signal at the read/write timing and activates the RD/WR# signal during the write access cycle. 1: Activates the WEn# signal during the read/write access cycle and activates the RD/WR# signal at the write timing.	R/W
21	—*1	Set this bit to 0 when the interfaces for SRAM or for SRAM with byte selection are used.	R/W
31:22	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. In 16-bit bus boot mode, to connect the burst ROM to the CS0 space and switch to burst ROM interface after activation, set the TYPE[2:0] bits in CS0BCR after setting the burst number by the bits 20 and 21 and the burst wait cycle number by the bits 16 and 17. (For details on individual bits, see section 13.3.2.4. CS0WCR_1 : CS0 Space Wait Control Register for Burst ROM with Clocked Asynchronous and section 13.3.2.7. CS0WCR_2 : CS0 Space Wait Control Register for Burst ROM with Clocked Synchronous.) Do not write 1 to the reserved bits other than above bits.

Note 2. When BAS = 0, the write access timing of the SRAM interface with byte selection is the same as that of the SRAM interface. In write operation, data is written to the memory when the byte select pins (WEn# (n = 0, 1)) are active. In read operation, the active timing of the WEn# (n = 0, 1) pins are different from that of the SRAM interface and the byte selection signal is output from the WEn# (n = 0, 1) pins. When BAS = 1, the active timing of the WEn# (n = 0, 1) and RD/WR# pins varies. In write operation, data is written to the memory when the write enable pin (RD/WR#) is active. Set HW[1:0] for the write data hold time to the RD/WR# inactive timing to ensure the hold time. For details of access timing, see section 13.4.8. SRAM Interface with Byte Selection.

13.3.2.2 CSnWCR_0 : CSn Space Wait Control Register for Normal Space, SRAM with Byte Selection (n = 2, 3)

Base address: BSC = 0x8021_0000

Offset address: 0x030 + 0x4 × (n - 2)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	BAS	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	WR[3:0]				WM	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
6	WM	External Wait Mask Specification Specifies whether the external wait input is valid. The specification by this bit is valid even when the number of access waits is 0. 0: External wait input is valid 1: External wait input is ignored	R/W

Bit	Symbol	Function	R/W
10:7	WR[3:0]	Number of Access Waits Specify the number of waits that are necessary for read/write access. 0x0: No wait insertion 0x1: 1 cycle 0x2: 2 cycles 0x3: 3 cycles 0x4: 4 cycles 0x5: 5 cycles 0x6: 6 cycles 0x7: 8 cycles 0x8: 10 cycles 0x9: 12 cycles 0xA: 14 cycles 0xB: 18 cycles 0xC: 24 cycles Others: Setting prohibited	R/W
19:11	—	These bits are read as 0. The write value should be 0.	R/W
20	BAS	SRAM with Byte Selection Byte Access Select Specifies the WEn# and RD/WR# signal timing when the SRAM interface with byte selection is used. 0: Activates the WEn# signal at the read/write timing and activates the RD/WR# signal during the write access cycle. 1: Activates the WEn# signal during the read/write access cycle and activates the RD/WR# signal at the write timing.	R/W
31:21	—	These bits are read as 0. The write value should be 0.	R/W

13.3.2.3 CS5WCR : CS5 Space Wait Control Register for Normal Space, SRAM with Byte Selection, and MPX-I/O

Base address: BSC = 0x8021_0000

Offset address: 0x03C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	SZSEL	MPXW SBAS	—	WW[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	SW[1:0]		WR[3:0]				WM	—	—	—	—	HW[1:0]	
Value after reset:	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	HW[1:0]	Delay Cycles from RD#, WEn# to Address, CS5# Specify the number of delay states from RD# and WEn# inactive to address and CS5# inactive when area 5 is specified as the SRAM interface or the SRAM interface with byte selection. When area 5 is specified as the MPX-I/O interface, these bits specify the number of delay states from RD# and WEn# inactive to CS5# inactive. 0 0: 0.5 states 0 1: 1.5 states 1 0: 2.5 states 1 1: 3.5 states	R/W
5:2	—	These bits are read as 0. The write value should be 0.	R/W
6	WM	External Wait Mask Specification Specifies whether the external wait input is valid. The specification by this bit is valid even when the number of access wait is 0. 0: External wait input is valid 1: External wait input is ignored	R/W

10:7	W[3:0]	Number of Access Waits Specify the number of waits to be inserted in the first access cycle. 0x0: No wait insertion 0x1: 1 wait 0x2: 2 waits 0x3: 3 waits 0x4: 4 waits 0x5: 5 waits 0x6: 6 waits 0x7: 8 waits 0x8: 10 waits 0x9: 12 waits 0xA: 14 waits 0xB: 18 waits 0xC: 24 waits Others: Setting prohibited	R/W
15:11	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
17:16	BW[1:0]	Number of Burst Wait Cycles Specify the number of waits to be inserted between the second or subsequent access cycles in burst access. 0 0: No wait insertion 0 1: 1 wait 1 0: 2 waits 1 1: 3 waits	R/W
31:18	—	These bits are read as 0. The write value should be 0.	R/W

13.3.3 SDCR : SDRAM Control Register

Base address: BSC = 0x8021_0000

Offset address: 0x04C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	A2ROW[1:0]		—	A2COL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	DEEP	—	RFSH	RMODE	PDOWN	BACTV	—	—	—	A3ROW[1:0]		—	A3COL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	A3COL[1:0]	Number of Bits of Column Address for Area 3 Specify the number of bits of the column address for area 3. 0 0: 8 bits 0 1: 9 bits 1 0: 10 bits 1 1: Setting prohibited	R/W
2	—	This bit is read as 0. The write value should be 0.	R/W
4:3	A3ROW[1:0]	Number of Bits of Row Address for Area 3 Specify the number of bits of the row address for area 3. 0 0: 11 bits 0 1: 12 bits 1 0: 13 bits 1 1: Setting prohibited	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
8	BACTV	Bank Active Mode Specifies whether to access in auto-precharge mode (using READA and WRITA commands) or in bank active mode (using READ and WRIT commands). Bank active mode can be set only for area 3. When both areas 2 and 3 are set to SDRAM, specify the auto-precharge mode. 0: Auto-precharge mode (using READA and WRITA commands) 1: Bank active mode (using READ and WRIT commands)	R/W
9	PDOWN	Power-Down Mode Specifies whether the SDRAM will enter the power-down mode after the access to the SDRAM. With this bit being set to 1, after the SDRAM is accessed, the CKE signal is driven low and the SDRAM enters the power-down mode. 0: The SDRAM does not enter the power-down mode after being accessed. 1: The SDRAM enters the power-down mode after being accessed.	R/W

Bit	Symbol	Function	R/W
10	RMODE	Refresh Mode Specifies whether to perform auto-refresh or self-refresh when the RFSH bit is 1. When the RFSH bit is 1 and this bit is 1, self-refresh starts immediately. When the RFSH bit is 1 and this bit is 0, auto-refresh starts according to the contents that are set in registers RTCSR, RTCNT, and RTCOR. 0: Auto-refresh is performed 1: Self-refresh is performed	R/W
11	RFSH	Refresh Control Specifies the refresh control for the SDRAM. 0: No refresh 1: Refresh	R/W
12	—	This bit is read as 0. The write value should be 0.	R/W
13	DEEP	Deep Power-Down Mode This bit is valid for low-power SDRAM. If the RFSH or RMODE bit is set to 1 while this bit is set to 1, the deep power-down entry command is issued and the low-power SDRAM enters the deep power-down mode. 0: Self-refresh mode 1: Deep power-down mode	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W
17:16	A2COL[1:0]	Number of Bits of Column Address for Area 2 Specify the number of bits of column address for area 2. 0 0: 8 bits 0 1: 9 bits 1 0: 10 bits 1 1: Setting prohibited	R/W
18	—	This bit is read as 0. The write value should be 0.	R/W
20:19	A2ROW[1:0]	Number of Bits of Row Address for Area 2 Specify the number of bits of row address of the SDRAM connected to area 2. 0 0: 11 bits 0 1: 12 bits 1 0: 13 bits 1 1: Setting prohibited	R/W
31:21	—	These bits are read as 0. The write value should be 0.	R/W

The SDCR register specifies the method to refresh and access SDRAM, and the types of SDRAMs to be connected.

13.3.4 RTCSR : Refresh Timer Control/Status Register

Base address: BSC = 0x8021_0000

Offset address: 0x050

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	CWP[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	CMF	CMIE	CKS[2:0]			RRC[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	RRC[2:0]	Refresh Count Specify the number of continuous refresh cycles, when the refresh request occurs after the coincidence of the values of the refresh timer counter (RTCNT) and the refresh time constant register (RTCOR). These bits can make the period of occurrence of refresh long. 0 0 0: 1 time 0 0 1: 2 times 0 1 0: 4 times 0 1 1: 6 times 1 0 0: 8 times Others: Setting prohibited	R/W
5:3	CKS[2:0]	Clock Select Select the clock input to count-up the refresh timer counter (RTCNT). 0 0 0: Stop the counting-up 0 0 1: CKIO/4 0 1 0: CKIO/16 0 1 1: CKIO/64 1 0 0: CKIO/256 1 0 1: CKIO/1024 1 1 0: CKIO/2048 1 1 1: CKIO/4096	R/W
6	CMIE	Compare Match Interrupt Enable Enables or disables CMF interrupt requests when the CMF bit in RTCSR is set to 1. 0: Disables CMF interrupt requests. 1: Enables CMF interrupt requests.	R/W
7	CMF	Compare Match Flag Indicates that a compare match occurs between the refresh timer counter (RTCNT) and refresh time constant register (RTCOR). This bit is set or cleared in the following conditions. 0: Clearing condition: When 0 is written in CMF after reading out RTCSR during CMF = 1. 1: Setting condition: When the condition RTCNT = RTCOR is satisfied.	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W
31:16	CWP[15:0]	Cancel Write Protection To modify the bits [7:0], write the value 0xA55A to the CWP[15:0] bits simultaneously, as a 32-bit unit.	W

The RTCSR register specifies various items about refresh for SDRAM.

The phase of the clock for incrementing the count in the refresh timer counter (RTCNT) is adjusted only by a power-on reset. Note that there is an error in the time until the compare match flag is set for the first time after the timer is started with the CKS[2:0] bits being set to a value other than 000b.

To modify the bits [7:0], write the value 0xA55A to the CWP[15:0] bits simultaneously, as a 32-bit unit.

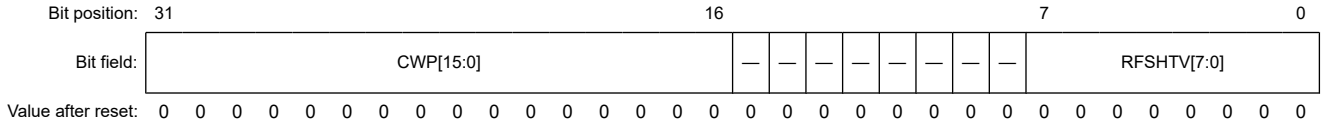
13.3.5 RTCNT : Refresh Timer Counter

Base address: BSC = 0x8021_0000

Offset address: 0x054

Bit position:	31															16							7							0
Bit field:	CWP[15:0]															—	—	—	—	—	—	—	—	RFSHTC[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	RFSHTC[7:0]	Refresh Timer Counter	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W
31:16	CWP[15:0]	Cancel Write Protection To modify the RFSHTC[7:0] bits, write the value 0xA55A to the CWP[15:0] bits simultaneously.	W



The RTCNT register has the refresh timer counter of 8-bit width that increments using the clock selected by the RTCSR.CKS[2:0] bits. When the RFSHTC[7:0] bits match the RTCOR.RFSHTV[7:0] bits, the RTCSR.CMF bit is set to 1 and RTCNT is automatically set to 0.

To modify the RFSHTC[7:0] bits, write the value 0xA55A to the CWP[15:0] bits simultaneously, as a 32-bit unit.

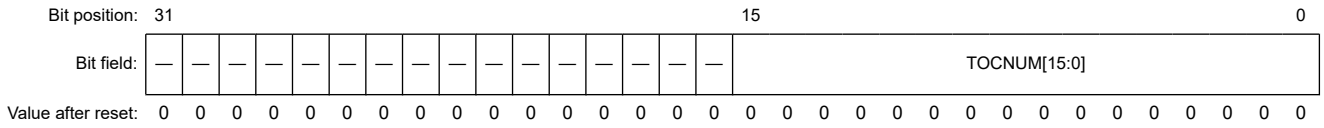
13.3.6 RTCOR : Refresh Time Constant Register

Base address: BSC = 0x8021_0000

Offset address: 0x058

Bit	Symbol	Function	R/W
7:0	RFSHTV[7:0]	Refresh time value	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W
31:16	CWP[15:0]	Cancel Write Protection To modify the RFSHTV[7:0] bits, write the value 0xA55A to the CWP[15:0] bits simultaneously.	W

The RTCOR register sets the count value for issuing a memory refresh request. When the RFSHTC[7:0] bits match the RTCNT.RFSHTV[7:0] bits, the CMF bit in RTCSR is set to 1 and RTCNT is automatically set to 0.



When the RFSH bit in SDCR is 1, a memory refresh request is issued by this matching signal. This request is maintained until the refresh operation is performed. If the request is not processed when the next matching occurs, the previous request is ignored. When the CMIE bit in RTCSR is set to 1, an interrupt request (BSC_CMI) is issued by this matching signal. The request continues to be output until the CMF bit in RTCSR is cleared. Clearing the CMF bit only affects the interrupt request and does not clear the refresh request. Therefore, a combination of refresh request and interval timer interrupt can be specified so that the number of refresh requests is counted using the timer interrupts while refresh is performed periodically.

To modify the RFSHTV[7:0] bits, write the value 0xA55A to the CWP[15:0] bits simultaneously, as a 32-bit unit.

13.3.7 TOSCORn : Timeout Cycle Constant Register n (n = 0, 2, 3, 5)

Base address: BSC = 0x8021_0000

Offset address: 0x060 + 0x4 × n

Bit	Symbol	Function	R/W
15:0	TOCNUM[15:0]	Timeout Cycle Number When the number of external wait cycles matches the setting value of these bits, the external wait timeout detection interrupt occurs and the wait state is forcibly interrupted to end the cycle of access. 0x0000 65536 (number of external wait cycles) : 0x0001 1 : ⋮ 0xFFFF 65535 :	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

The TOSCORn register sets the timeout to forcibly interrupt the wait state and end the access cycle of the CSn space. This register is enabled when the WM bit of the CSn Space Wait Control Register (CSnWCR) is 0 and the corresponding bit of the Timeout Enable Register (TOENR) is 1. When the number of wait cycles due to the signal on the external wait input pin matches the setting of TOSCORn, the wait state is forcibly interrupted (external wait input is disabled) to end the cycle of access, the Timeout Status flag for the corresponding space in the Timeout Status Register (TOSTR) is set, and an external wait timeout detection interrupt request from the external WAIT# pin is generated. The external wait timeout detection interrupt request is retained until the corresponding bit in the TOENR register is set to 0, or 0 is written to the Timeout Status flag for the corresponding space. Note that timeout detection is enabled even while the Timeout Status flag for the corresponding space in the TOSTR register is 1, and the wait state is forcibly interrupted (external wait input is disabled) to end the cycle of access in response to a further timeout.

13.3.8 TOSTR : Timeout Status Register

Base address: BSC = 0x8021_0000

Offset address: 0x080

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	CS5T OSTF	—	CS3T OSTF	CS2T OSTF	—	CS0T OSTF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CS0TOSTF	CS0 Space Timeout Status Flag Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS0 space has matched the setting of the CS0 space timeout cycle constant register (TOSCOR0). This bit is set or cleared in the following conditions. 0: Clearing condition When 0 is written in CS0TOSTF. 1: Setting condition When the WM bit in the CS0 space wait control register (CS0WCR) is 0 and the CS0TOEN bit in the timeout enable register (TOENR) is 1, the number of cycles of waiting due to the input on the external wait pin during access to the CS0 space has matched the setting of the TOSCOR0 register.	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W
2	CS2TOSTF	CS2 Space Timeout Status Flag Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS2 space has matched the setting of the CS2 space timeout cycle constant register (TOSCOR2). For the condition to set or clear this bit, see the description of CS0TOSTF.	R/W
3	CS3TOSTF	CS3 Space Timeout Status Flag Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS3 space has matched the setting of the CS3 space timeout cycle constant register (TOSCOR3). For the condition to set or clear this bit, see the description of CS0TOSTF.	R/W
4	—	This bit is read as 0. The write value should be 0.	R/W
5	CS5TOSTF	CS5 Space Timeout Status Flag Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS5 space has matched the setting of the CS5 space timeout cycle constant register (TOSCOR5). For the condition to set or clear this bit, see the description of CS0TOSTF.	R/W
31:6	—	These bits are read as 0. The write value should be 0.	R/W

The TOSTR register is used for status of the external wait input. When the WM bit in the CSn space wait control register (CSnWCR) is 0 and the corresponding bit in the timeout enable register (TOENR) is 1 and the number of waits in response

to the signal on the external wait input matches the setting of TOSCORn, the timeout status flag for the corresponding space is set and an external wait timeout detection interrupt request is generated. The only writable value for the timeout status flags is 0, which clears the flag. Writing 1 to a flag is ignored.

13.3.9 TOENR : Timeout Enable Register

Base address: BSC = 0x8021_0000

Offset address: 0x084

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	CS5TOEN	—	CS3TOEN	CS2TOEN	—	CS0TOEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CS0TOEN	CS0 Space Timeout Detection Enable Specifies enabling or disabling the detection of timeout for waiting in the CS0 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W
2	CS2TOEN	CS2 Space Timeout Detection Enable Specifies enabling or disabling the detection of timeout for waiting in the CS2 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.	R/W
3	CS3TOEN	CS3 Space Timeout Detection Enable Specifies enabling or disabling the detection of timeout for waiting in the CS3 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.	R/W
4	—	This bit is read as 0. The write value should be 0.	R/W
5	CS5TOEN	CS5 Space Timeout Detection Enable Specifies enabling or disabling the detection of timeout for waiting in the CS5 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.	R/W
31:6	—	These bits are read as 0. The write value should be 0.	R/W

The TOENR register is used to enable or disable timeout detection function for each space.

13.4 Operation

13.4.1 Access Size and Data Alignment

This LSI supports little endian, in which the least significant byte (LSB) is that in the direction of the 0th address. Data bus width can be selected from 8 bits and 16 bits for the normal memory and SRAM with byte selection. Data bus width is fixed to 16 bits for SDRAM. For MPX-I/O, the data bus width is fixed to either 8 or 16 bits, or made selectable as 8 bits or 16 bits by one of the address lines.

Data bus width varies depending on boot mode. For details, see section 13.2.2. Data Bus Width and Related Pin Setting for Each Area Depending on Boot Mode.

Data alignment is performed in accordance with the data bus width selected for the device. This also means that four read operations are required to read 32-bit data from a byte-width device. In this LSI, data alignment and conversion of data length is performed automatically between the respective interfaces.

Table 13.5 and Table 13.6 show the relationship between device data width and access unit.

Table 13.5 16-bit external device access and data alignment in little endian

Operation		Data bus		Strobe signals	
		D15 to D8	D7 to D0	WE1#, DQMLU	WE0#, DQMLL
8-bit access at address 0		—	Data 7 to 0	—	Active
8-bit access at address 1		Data 7 to 0	—	Active	—
8-bit access at address 2		—	Data 7 to 0	—	Active
8-bit access at address 3		Data 7 to 0	—	Active	—
16-bit access at address 0		Data 15 to 8	Data 7 to 0	Active	Active
16-bit access at address 2		Data 15 to 8	Data 7 to 0	Active	Active
32-bit access at address 0	1st access at address 0	Data 15 to 8	Data 7 to 0	Active	Active
	2nd access at address 2	Data 31 to 24	Data 23 to 16	Active	Active

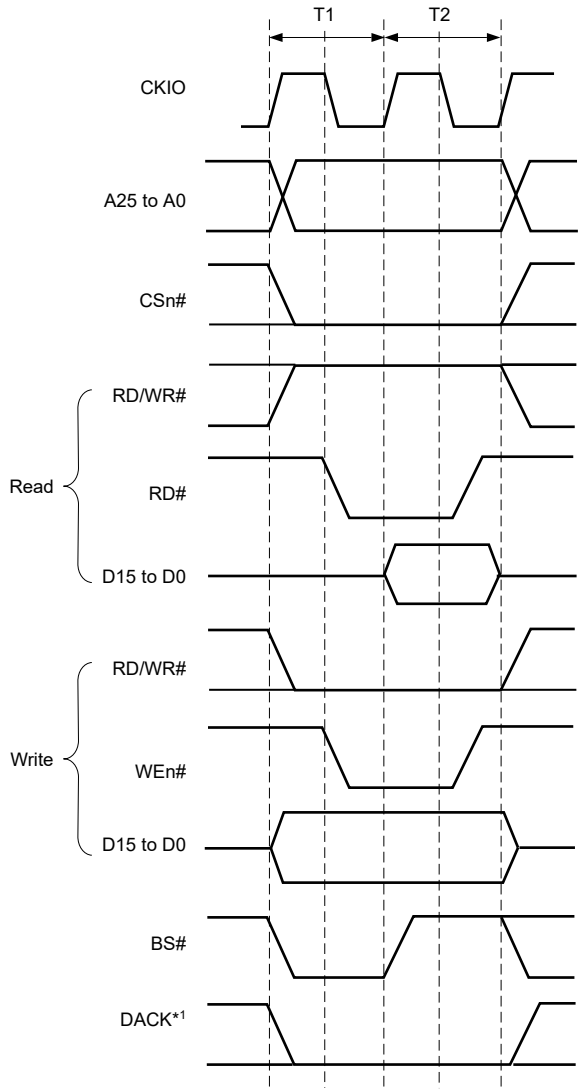


Table 13.6 8-bit external device access and data alignment in little endian

Operation		Data bus		Strobe signals	
		D15 to D8	D7 to D0	WE1#, DQMLU	WE0#, DQMLL
8-bit access at address 0		—	Data 7 to 0	—	Active
8-bit access at address 1		—	Data 7 to 0	—	Active
8-bit access at address 2		—	Data 7 to 0	—	Active
8-bit access at address 3		—	Data 7 to 0	—	Active
16-bit access at address 0	1st access at address 0	—	Data 7 to 0	—	Active
	2nd access at address 1	—	Data 15 to 8	—	Active
16-bit access at address 2	1st access at address 0	—	Data 7 to 0	—	Active
	2nd access at address 1	—	Data 15 to 8	—	Active
32-bit access at address 0	1st access at address 0	—	Data 7 to 0	—	Active
	2nd access at address 1	—	Data 15 to 8	—	Active
	3rd access at address 2	—	Data 23 to 16	—	Active
	4th access at address 3	—	Data 31 to 24	—	Active

13.4.2 SRAM Interface

(1) Basic Timing

For access to an SRAM interface, this LSI uses strobe signal output in consideration of the fact that mainly static RAM will be directly connected. When using SRAM with a byte-selection pin, see section 13.4.8. SRAM Interface with Byte Selection. Figure 13.2 shows the basic timings of SRAM interface access. A no-wait normal access is completed in two cycles. The BS# signal is activated for one state to indicate the start of a bus cycle.

Note 1. The waveform for DACKn is when active-low is specified.

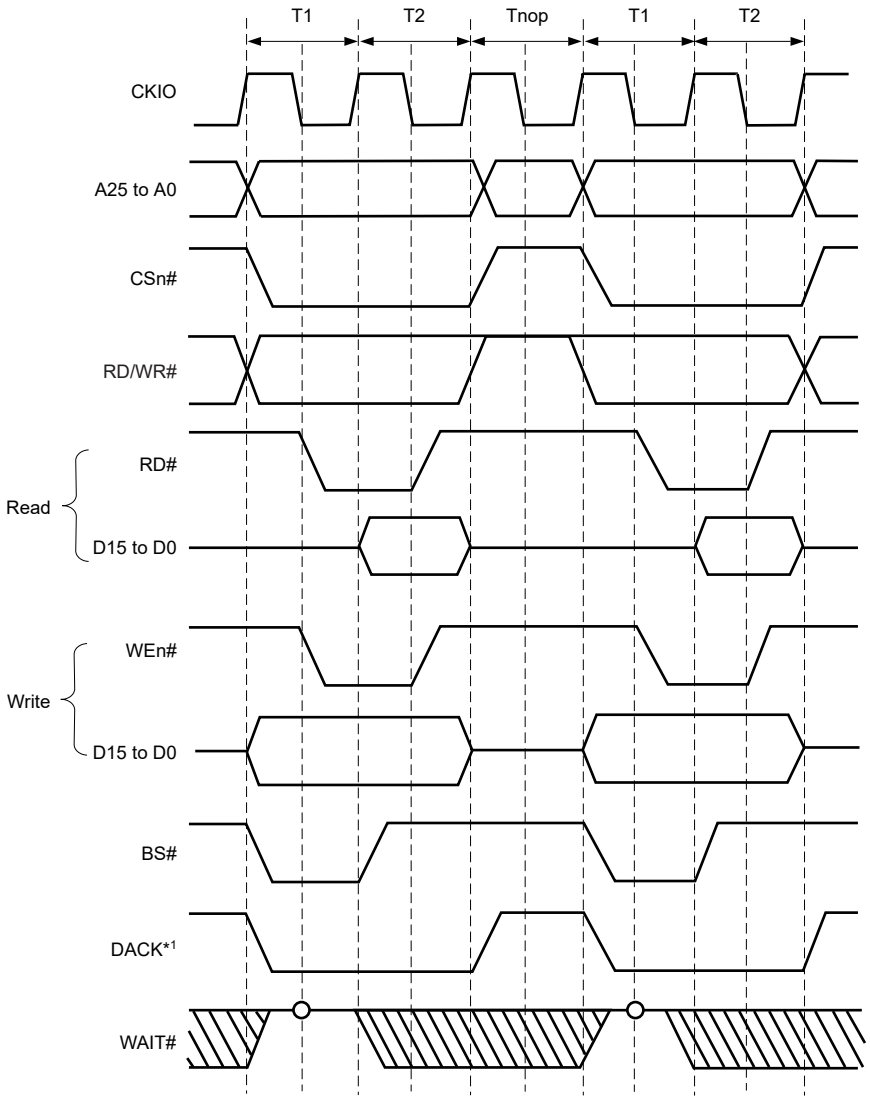

Figure 13.2 SRAM interface basic access timing (access wait 0)

There is no access size specification when reading. The correct access start address is output in the least significant bit of the address, but since there is no access size specification, 16 bits are always read in case of a 16-bit device. When writing, only the WEn# signal for the byte to be written is activated.

It is necessary to output the data that has been read using RD# when a buffer is established in the data bus. The RD/WR# signal is in a read state (high output) when no access has been carried out. Therefore, care must be taken when controlling the external data buffer with this signal, to avoid output collision.

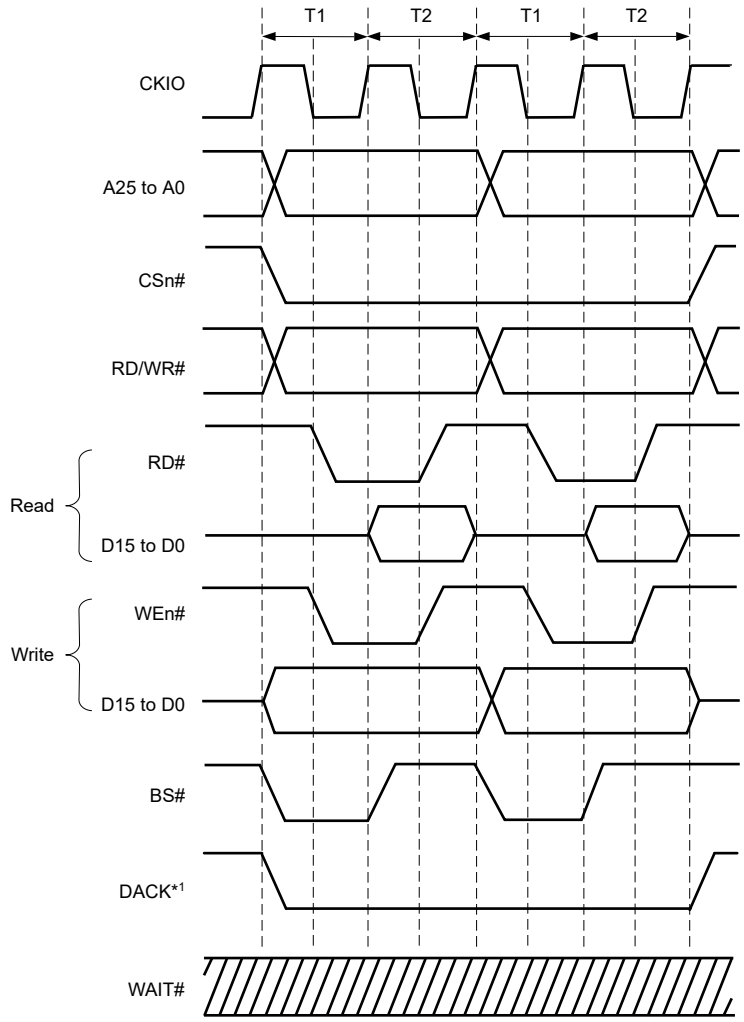

Figure 13.3 and Figure 13.4 show the basic timings in continuous access to the SRAM interface. If the WM bit in CSnWCR is cleared to 0, a Tnop cycle is inserted after the CSn space access to sample the external wait (Figure 13.3).

If the WM bit in CSnWCR is set to 1, external waits are ignored and no Tnop cycle is inserted (Figure 13.4).

Note 1. The waveform for DACKn is when active-low is specified.

Figure 13.3 Continuous access to the SRAM interface (1) (bus width = 16 bits, 32-bit access, CSnWCR.WM bit = 0 (access wait = 0, cycle wait = 0))

Note 1. The waveform for DACKn is when active-low is specified.

Figure 13.4 Continuous access to the SRAM interface (2) (bus width = 16 bits, 32-bit access, CSnWCR.WM bit = 1 (access wait = 0, cycle wait = 0))

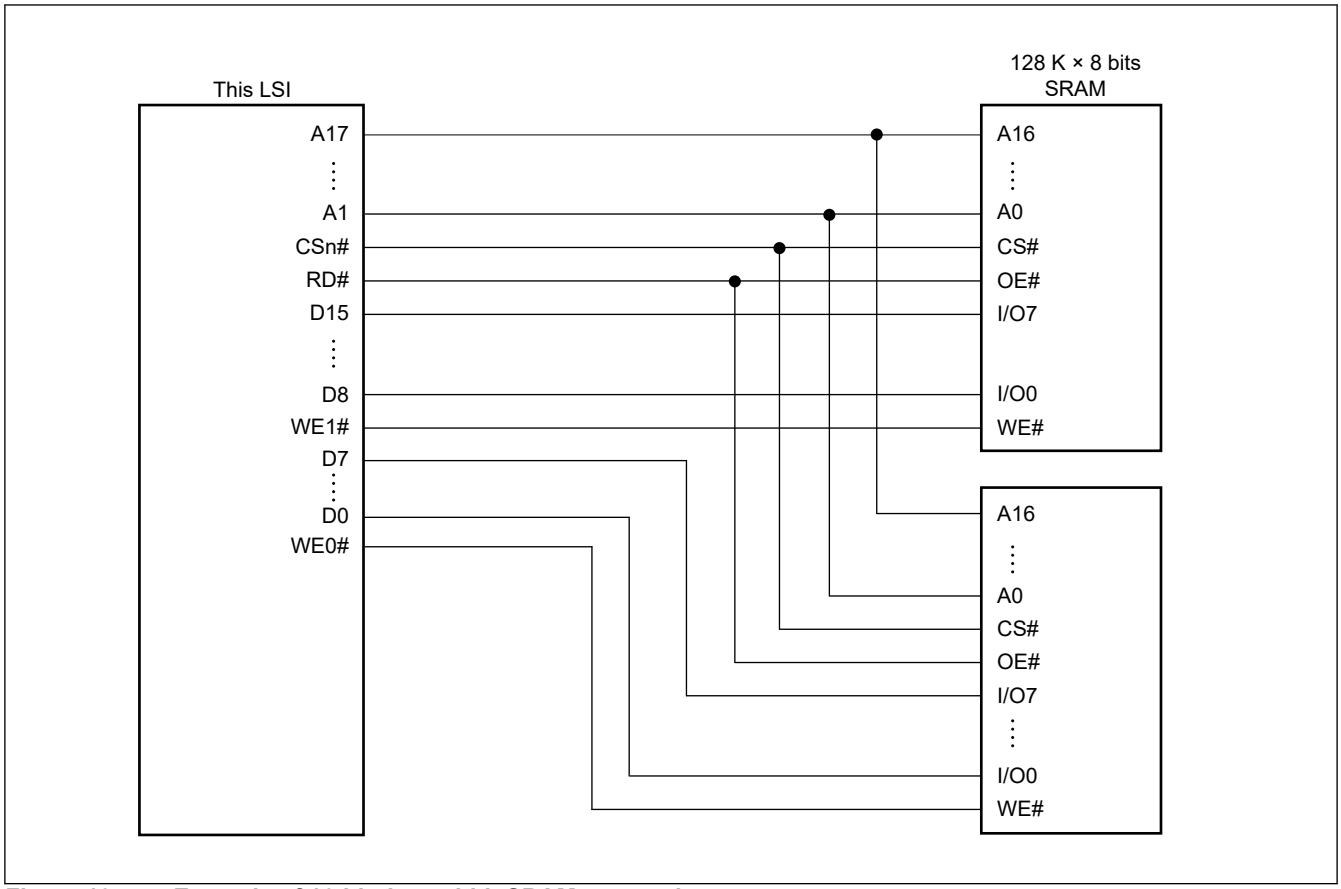

Figure 13.5 Example of 16-bit data-width SRAM connection

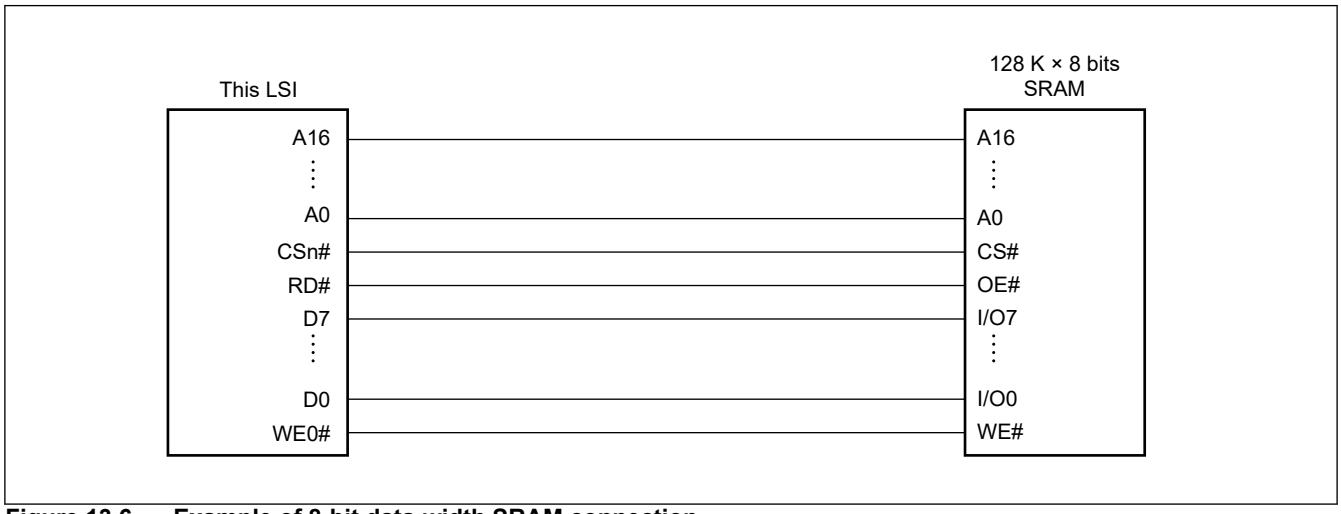

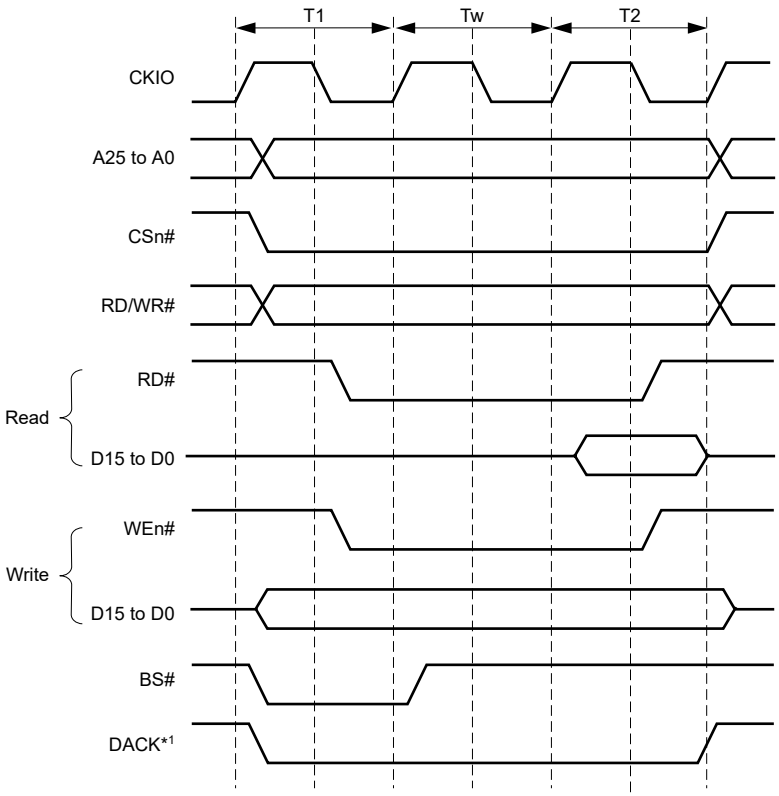

Figure 13.6 Example of 8-bit data-width SRAM connection

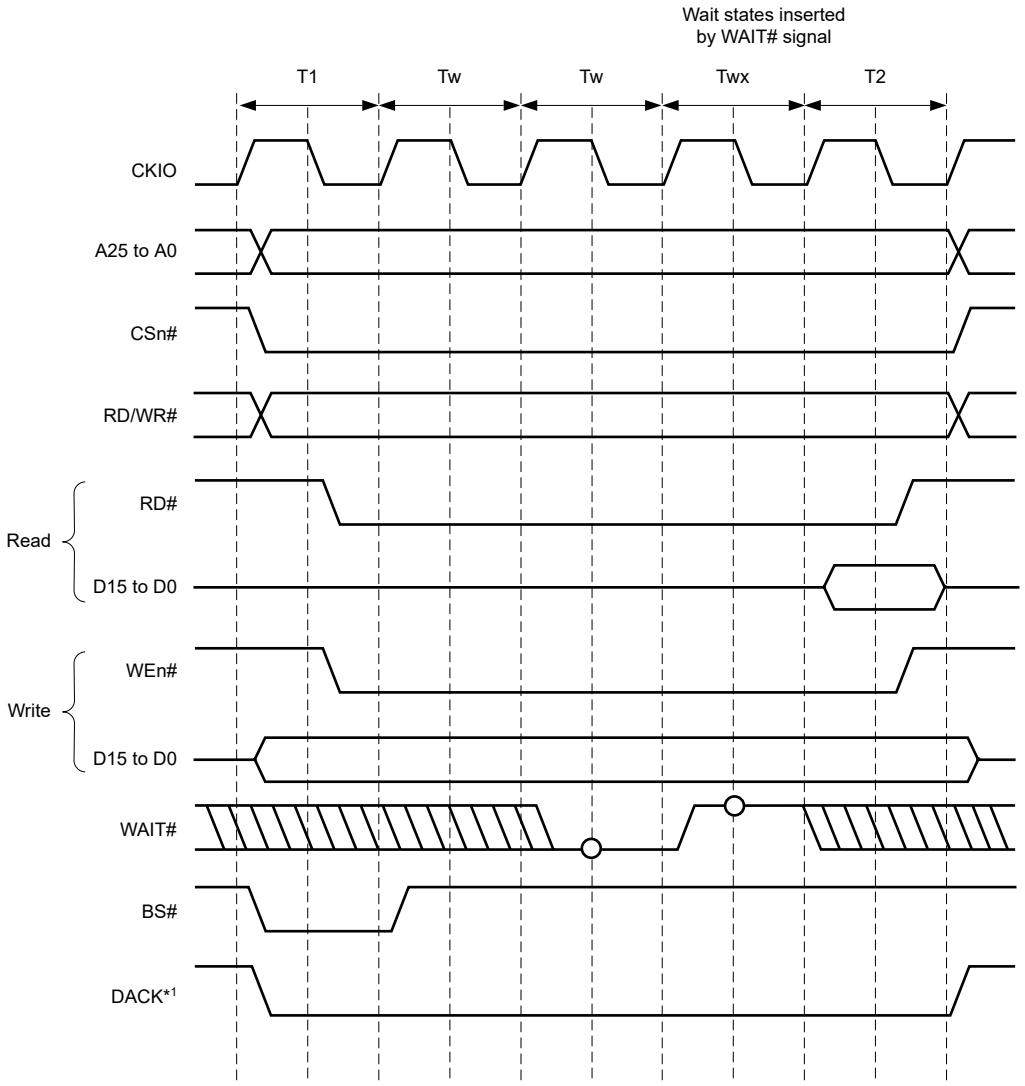
13.4.3 Access Wait Control

Wait insertion on an SRAM interface access can be controlled by the settings of bits WR3 to WR0 in CSnWCR. It is possible for area 5 to insert waits independently in read access and in write access. Areas 0, 2, and 3 have common access wait for read cycle and write cycle. The specified number of Tw states are inserted as waits in an SRAM interface access shown in Figure 13.7.

Example: Insertion of 1 cycle of waiting by a software wait
(WR[3:0] = 0001b, WW[2:0] = 000b)

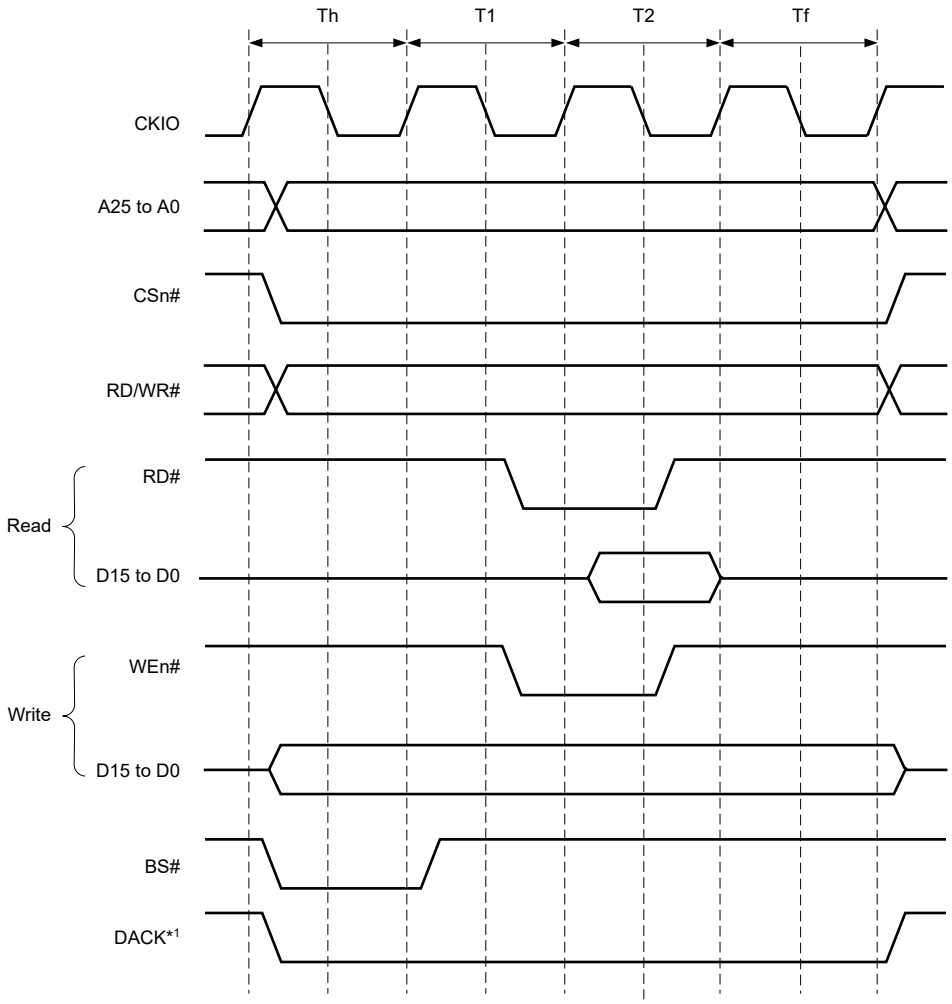


Note 1. The waveform for DACKn is when active-low is specified.

Figure 13.7 Wait timing for SRAM interface access (software wait only)

When the WM bit in the CSnWCR register is cleared to 0, the signal on the external WAIT# pin is also sampled. WAIT# pin sampling is shown in Figure 13.8. Two waits are specified as software waits. The WAIT# signal is sampled on the falling edge of the CKIO signal at the transition from the T1 or Tw cycle to the T2 cycle.

Example: Insertion of 2 cycles of waiting by a software wait and 1 cycle of waiting by the WAIT# signal (WR[3:0] = 0010b, WW[2:0] = 000b, WM = 0)



Note 1. The waveform for DACKn is when active-low is specified.

Figure 13.8 Wait cycle timing for SRAM interface access (wait cycle insertion using WAIT# signal)

13.4.4 CSn# Assert Period Expansion

The number of states from CSn# active to RD#, WEn# active can be specified by setting bits SW1 and SW0 in CSnWCR. The number of states from the inactive state of the RD# and WEn# signals to the inactive state of the CSn# signal can be specified by setting bits HW1 and HW0. Therefore, a flexible interface to an external device can be obtained. Figure 13.9 shows an example. A Th state and a Tf state are added before and after an ordinary cycle, respectively. In these states, the RD# and WEn# signals are not activated, while other signals are activated. The data output is prolonged to the Tf cycle, and this prolongation is useful for devices with slow writing operations.

Example: SW[1:0] = 01b (delay of 1.5 cycles) and HW[1:0] = 01b (delay of 1.5 cycles)

Note 1. The waveform for DACKn is when active-low is specified.

Figure 13.9 Active period expansion for the CSn signal

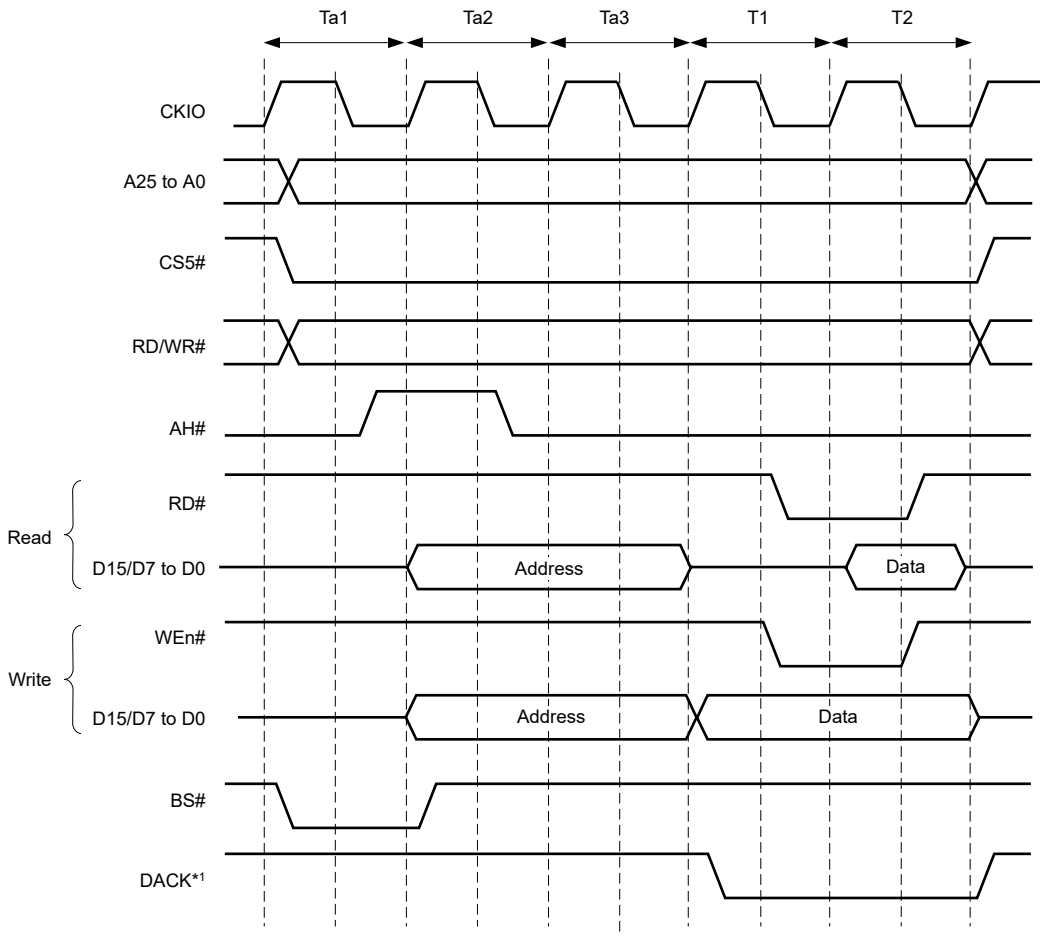
13.4.5 MPX-I/O Interface

Access timing for the MPX space is shown below. In the MPX space, CS5#, AH#, RD#, and WEn# signals control the accessing. The basic access for the MPX space consists of 2 cycles of address output followed by an access to an SRAM interface. The bus width for the address output cycle or the data input/output cycle is fixed to 8 bits or 16 bits.

Alternatively, it can be 8 bits or 16 bits depending on the address to be accessed.

Output of the addresses D15 to D0 or D7 to D0 is performed from state Ta2 to state Ta3. Because state Ta1 has a high-impedance state, collisions of addresses and data can be avoided without inserting idle cycles, even in continuous access cycles. Address output is increased to 3 cycles by setting the MPXW bit in the CS5WCR register to 1.

The RD/WR# signal is output at the same time as the CS5# signal; it is high in the read cycle and low in the write cycle.

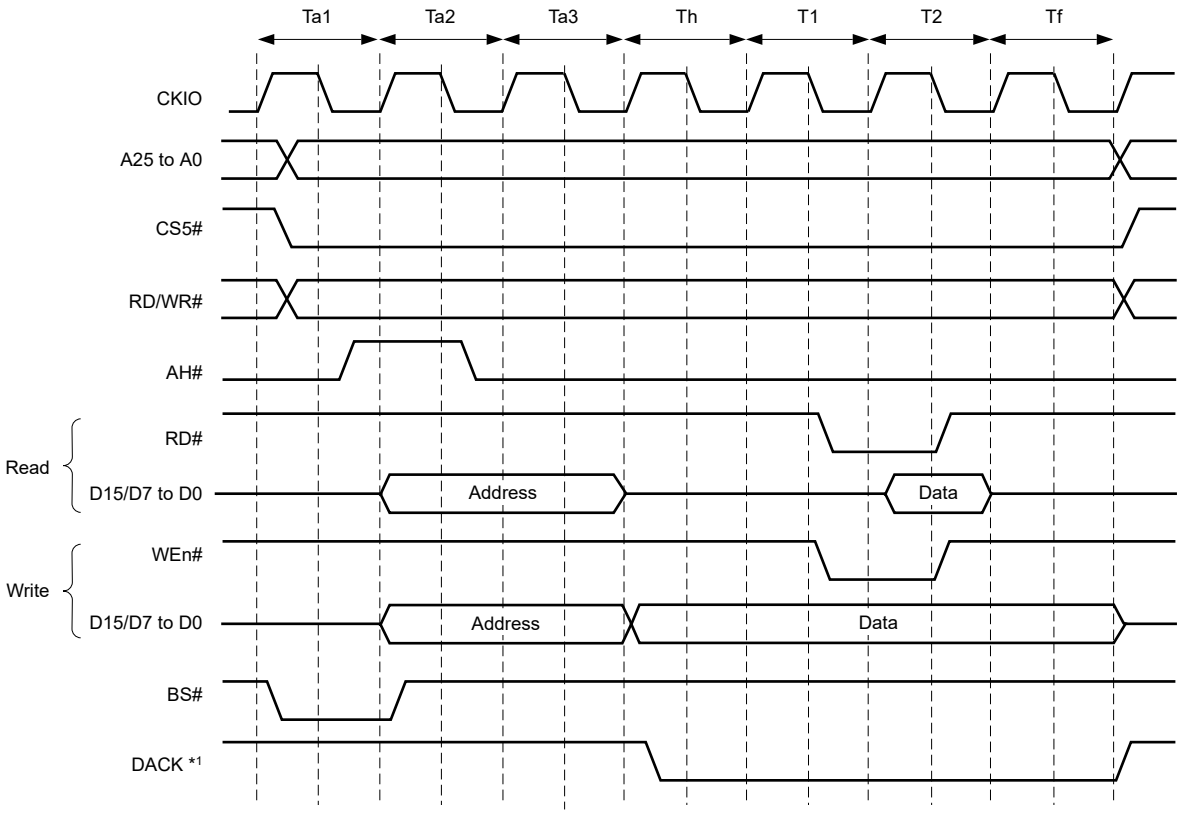


The data cycle is the same as that in an SRAM interface access.

Delay cycles specified in the SW[1:0] bits of the CS5WCR register are inserted between the Ta3 state and the T1 state.

Delay cycles specified in the HW[1:0] bits are added after the T2 state.

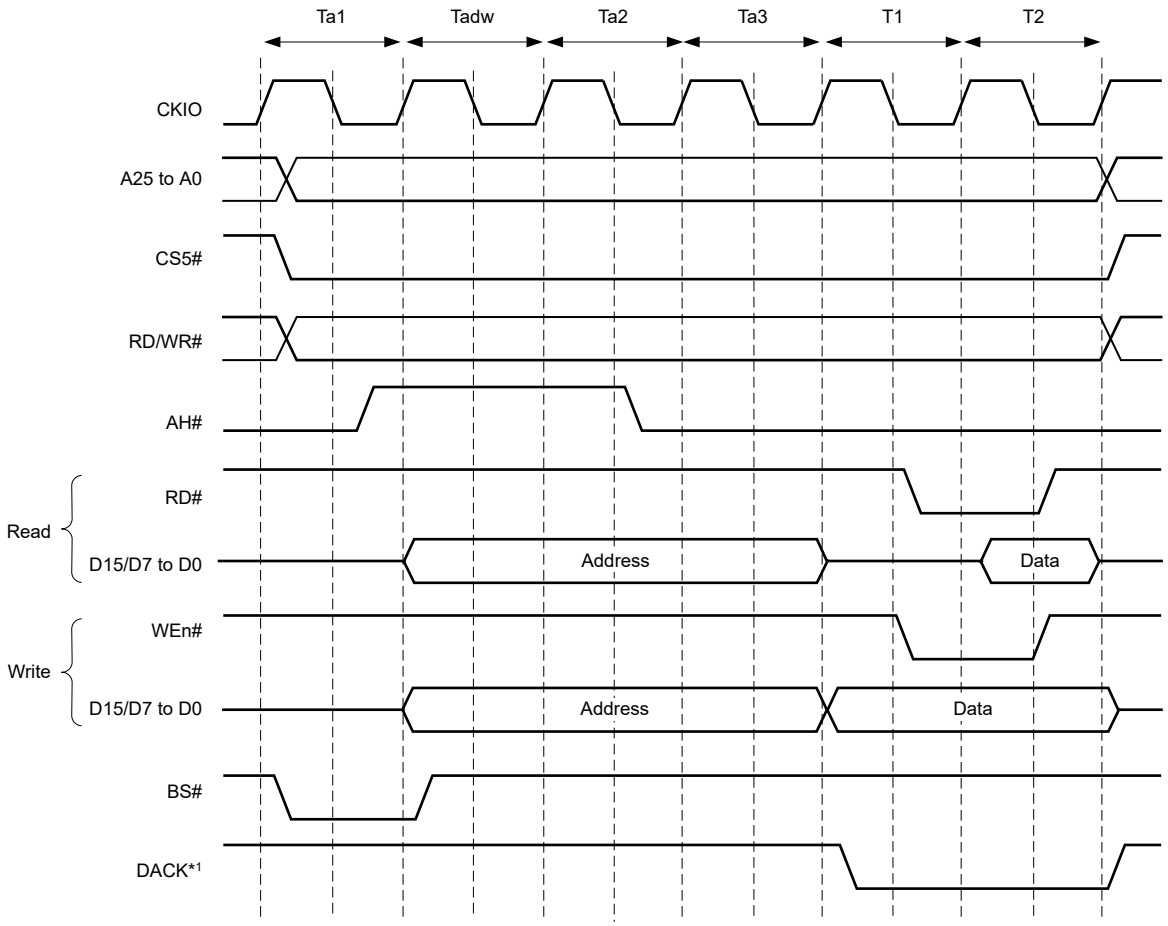
Timing charts are shown in Figure 13.10 to Figure 13.13.



Example: MPXW = 0 (no insertion of wait cycles)

Note 1. The waveform for DACKn is when active-low is specified.

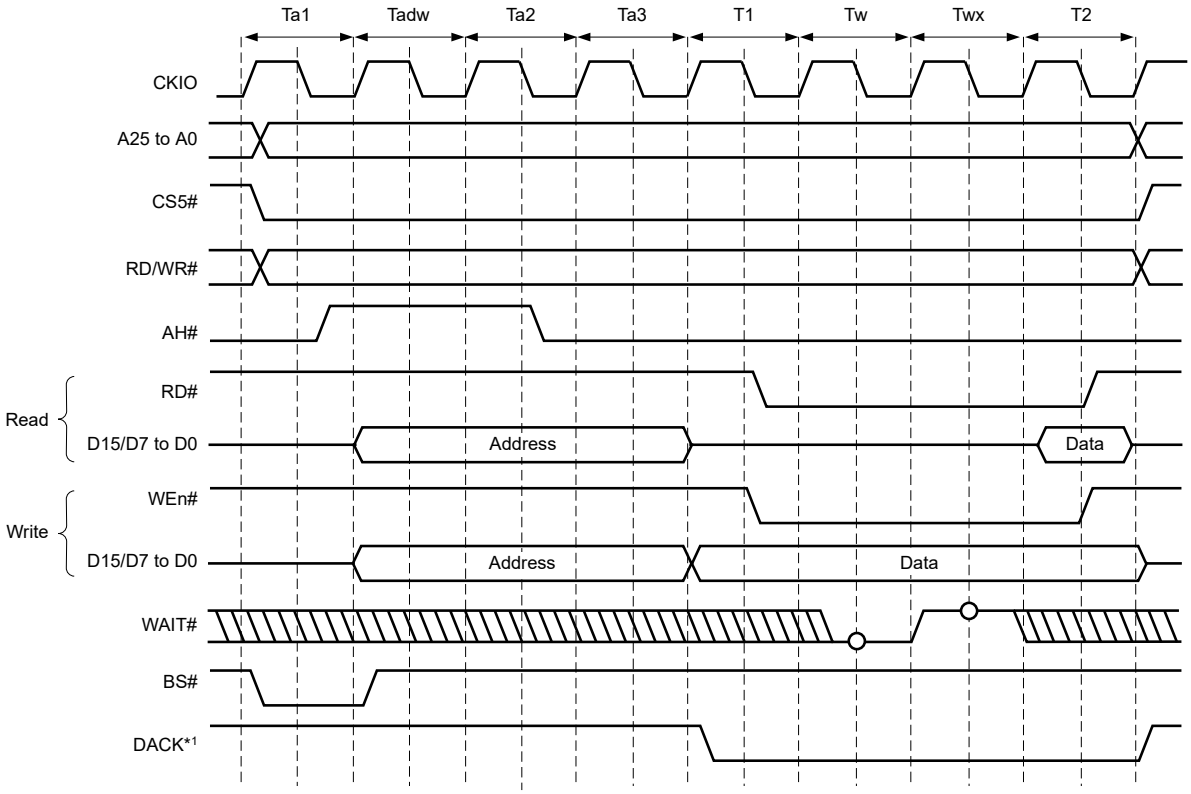
Figure 13.10 Access timing for MPX space (1) (address cycle no wait, data cycle no wait)



Example: MPXW = 0 (no insertion of wait cycles), SW[1:0] = 01b (delay of 1.5 cycles), HW[1:0] = 01b (delay of 1.5 cycles)

Note 1. The waveform for DACKn is when active-low is specified.

Figure 13.11 Access timing for MPX space (2) (address cycle no wait, 1.5 aassertion delay states, data cycle no wait, 1.5 delay states)



Example: MPXW = 1 (1 cycle of waiting)

Note 1. The waveform for DACKn is when active-low is specified.

Figure 13.12 Access timing for MPX space (3) (address cycle wait 1, data cycle no wait)

Example: MPXW = 1 (1 cycle of waiting), WR[3:0] = 0001b, WW[2:0] = 000b, WM = 0

Note 1. The waveform for DACKn is when active-low is specified.

Figure 13.13 Access timing for MPX space (4) (address cycle access wait 1, data cycle wait 1, external wait 1)

13.4.6 SDRAM Interface

(1) SDRAM Direct Connection

The SDRAM that can be connected to this LSI is a product that has 11/12/13 bits of row address, 8/9/10 bits of column address, 4 or less banks, and uses the A10 pin for setting precharge mode in read and write command cycles.

The control signals for direct connection of SDRAM are RAS#, CAS#, RD/WR#, DQMLU, DQMLL, CKE, CS2#, and CS3#. All the signals other than CS2# and CS3# are common to all areas, and signals other than CKE are valid only when CS2# or CS3# is asserted. SDRAM can be connected to up to 2 spaces. The data bus width of the area that is connected to SDRAM is 16 bits .

Commands for SDRAM can be specified by RAS#, CAS#, RD/WR#, and specific address signals. These commands supports:

- NOP
- Auto-refresh (REF)
- Self-refresh (SELF)
- All banks pre-charge (PALL)
- Specified bank pre-charge (PRE)
- Bank active (ACTV)
- Read (READ)
- Read with pre-charge (READA)

- Write (WRIT)
- Write with pre-charge (WRITA)
- Set mode register (MRS, EMRS)

The byte to be accessed is specified by DQMLU and DQMLL. Reading or writing is performed for a byte whose corresponding DQMxx is low. For details on the relationship between DQMxx (xx = LU, LL) and the byte to be accessed, see section 13.4.1. Access Size and Data Alignment.

Figure 13.14 shows example of the connection of the SDRAM with this LSI.

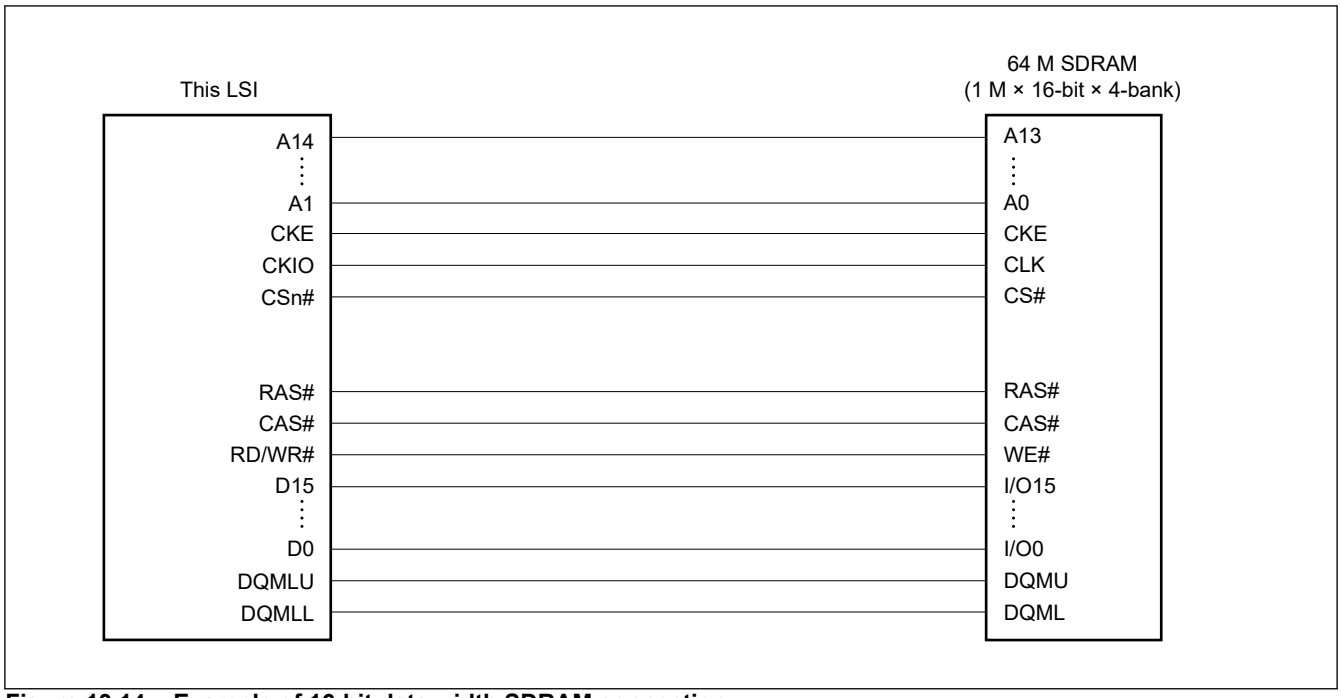


Figure 13.14 Example of 16-bit data width SDRAM connection

(2) Address Multiplexing

An address multiplexing is specified so that SDRAM can be connected without external multiplexing circuitry according to the setting of bits BSZ[1:0] in CSnBCR and bits A2ROW[1:0], A2COL[1:0], A3ROW[1:0], and A3COL[1:0] in SDCR. Table 13.7 to Table 13.12 show the relationship between the settings of bits BSZ[1:0], A2ROW[1:0], A2COL[1:0], A3ROW[1:0], and A3COL[1:0] and the bits output at the address pins. Do not specify those bits in the manner other than this table, otherwise the operation of this LSI is not guaranteed. A25 to A18 are not multiplexed and the original values of address are always output at these pins.

When the data bus width is 16 bits (BSZ1 and BSZ0 = 10b), A0 of SDRAM specifies a 16-bit address. Therefore, connect this A0 pin of SDRAM to the A1 pin of this LSI; the A1 pin of SDRAM to the A2 pin of the LSI, and so on.

(3) Burst Read

A burst read occurs in the following cases with this LSI.

- Access size in reading is larger than data bus width.
- 16-, 32-, or 64-byte transfer

This LSI always accesses the SDRAM with burst length 1. For example, read access of burst length 1 is performed consecutively 8 times to read 16-byte continuous data from the SDRAM that is connected to a 16-bit data bus. This access is called the burst read with the burst number 8. Table 13.13 shows the relationship between the access size and the number of bursts.

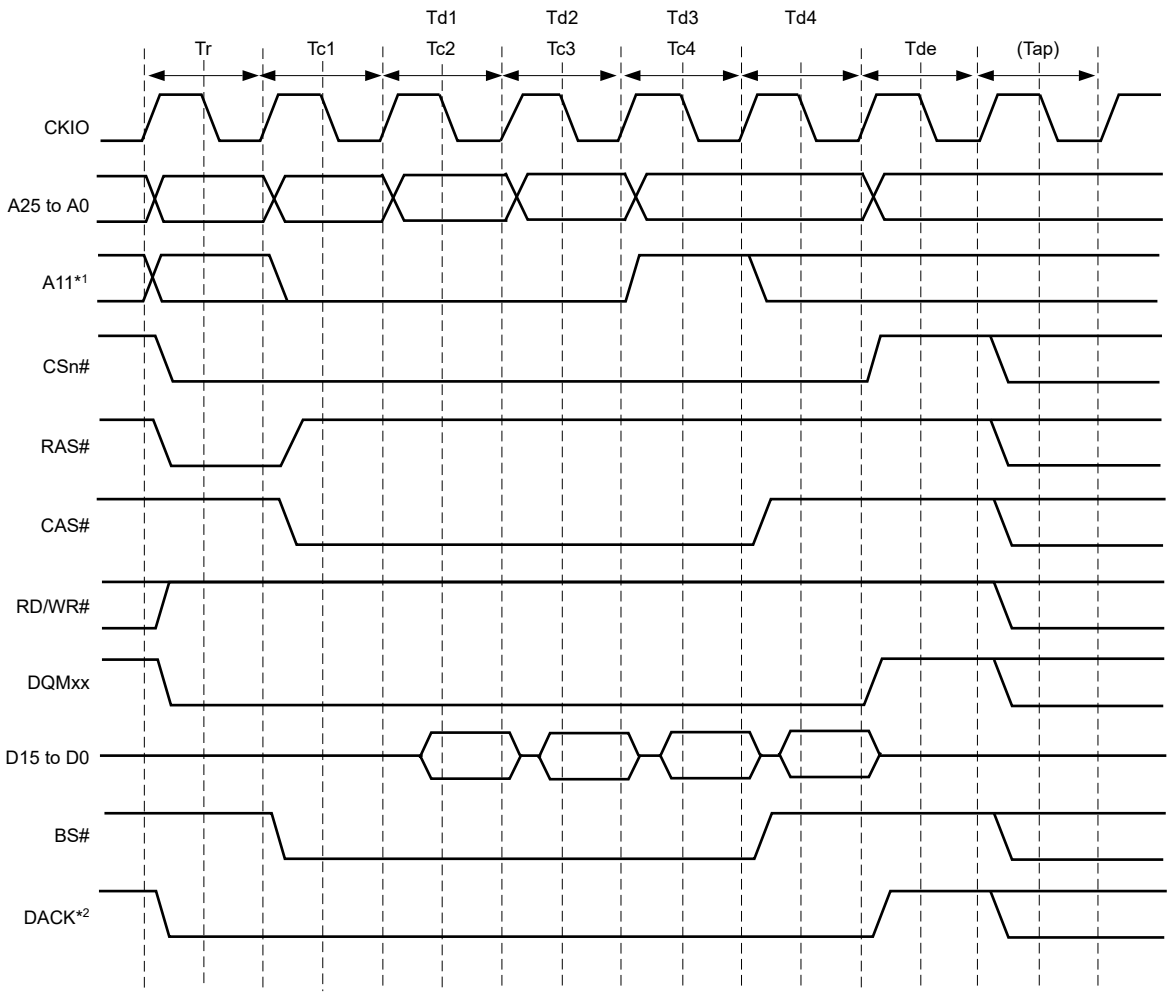

Table 13.13 Relationship between access size and number of bursts

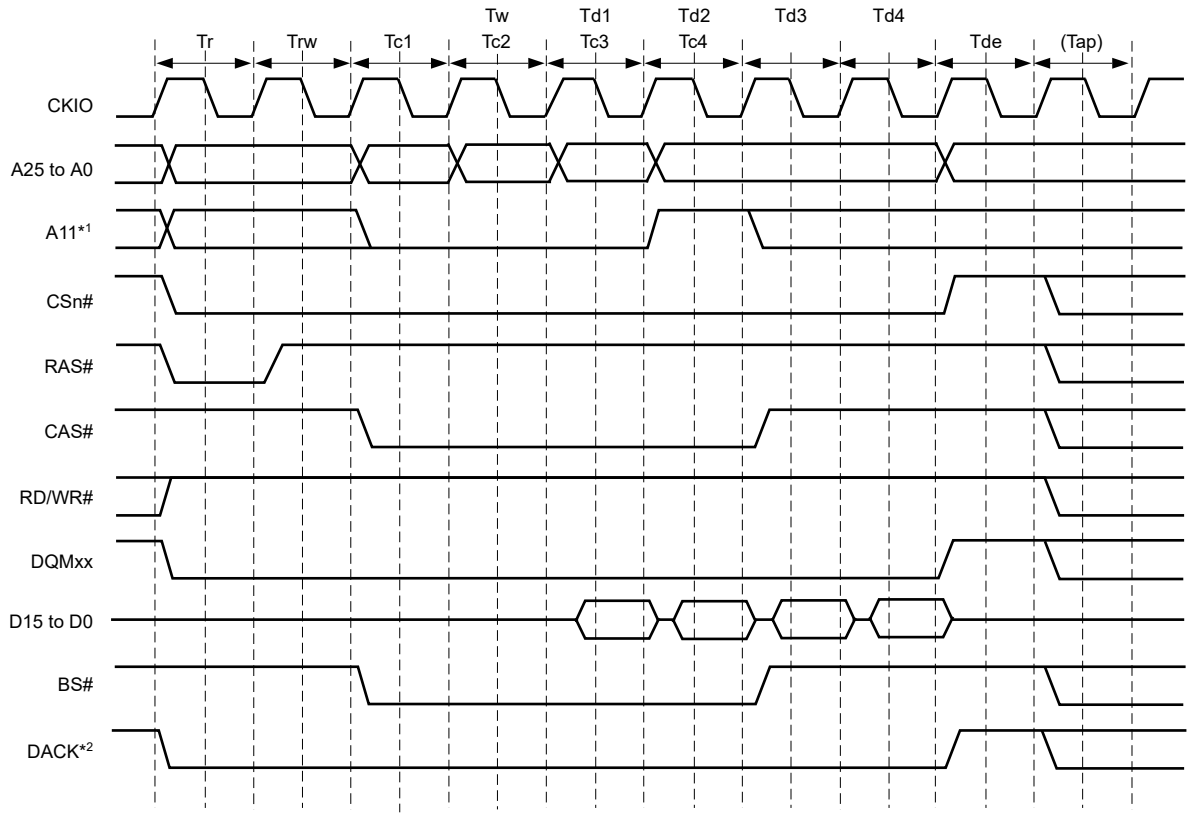
Bus width	Access size	Number of bursts
16 bits	8 bits	1
	16 bits	1
	32 bits	2
	16 bytes	8
	32 bytes	16
	64 bytes	32

Figure 13.15 and Figure 13.16 show timing charts in burst read. In burst read, an ACTV command is output in the Tr cycle, the READ command is issued in the Tc1, Tc2, and Tc3 cycles, the READA command is issued in the Tc4 cycle, and the read data is received at the rising edge of the external clock (CKIO) in the Td1 to Td4 cycles. The Tap cycle is used to wait for the completion of an auto-precharge induced by the READA command in the SDRAM. In the Tap cycle, a new command will not be issued to the same bank. However, access to another CS space or another bank in the same SDRAM space is enabled. The number of Tap cycles is specified by the WTRP[1:0] bits in CS3WCR.

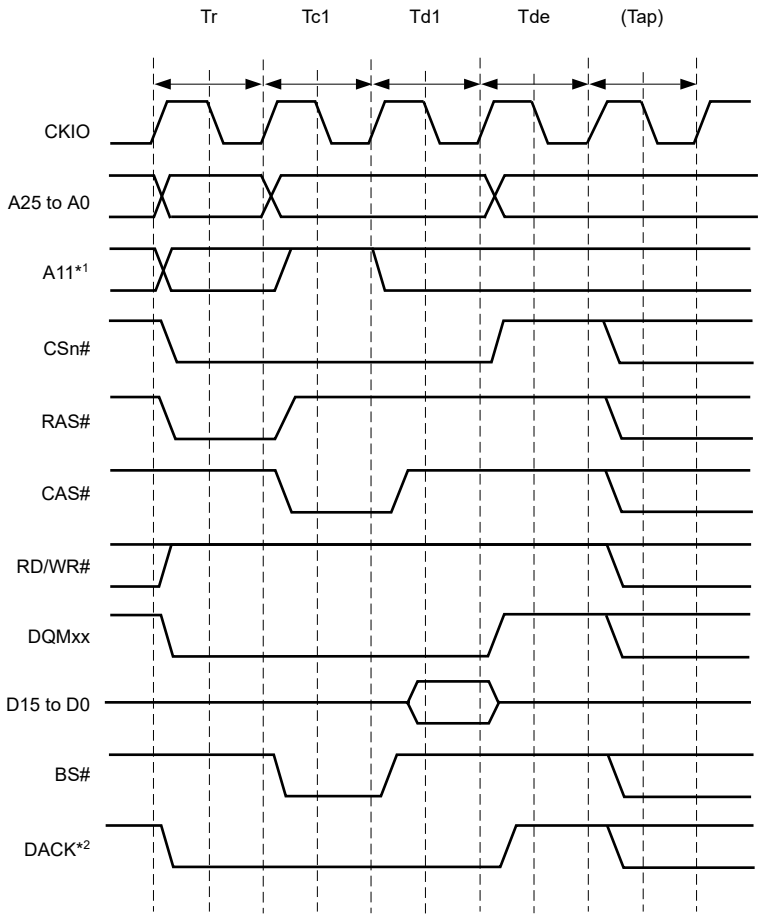


In this LSI, wait cycles can be inserted by specifying each bit in CS3WCR to connect the SDRAM in variable frequencies. Figure 13.16 shows an example in which wait cycles are inserted. The number of states from the Tr state where the ACTV command is output to the Tc1 state where the READ command is output can be specified using the WTRCD[1:0] bits in the CS3WCR register. If the WTRCD[1:0] bits specify one wait or more, a Trw state where the NOP command is issued is inserted between the Tr state and Tc1 state. The number of states from the Tc1 state where the READ command is output to the Td1 state where the read data is latched can be specified for the CS2 and CS3 spaces independently, using the A2CL1 and A2CL0 bits in the CS2WCR register or the A3CL[1:0] bits in the CS3WCR register. The number of states from Tc1 to Td1 corresponds to the SDRAM CAS latency. The CAS latency for the SDRAM is normally defined as up to three. However, the CAS latency in this LSI can be specified as 1 to 4. This CAS latency can be achieved by connecting a latch circuit between this LSI and the SDRAM.

A Tde state is an idle state required to transfer the read data into this LSI and occurs once for every burst read or every single read.

Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active-low is specified.

Figure 13.15 Burst read basic timing (CAS latency 1, auto-precharge)



Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active-low is specified.

Figure 13.16 Burst read wait specification timing (CAS latency 2, WTRCD[1:0] = 1 state, auto-precharge)

(4) Single Read

A read access ends in one cycle when the data bus width is larger than or equal to the access size. A read access that ends in one cycle is called single read.

Figure 13.17 shows the single read basic timing.

Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active-low is specified.

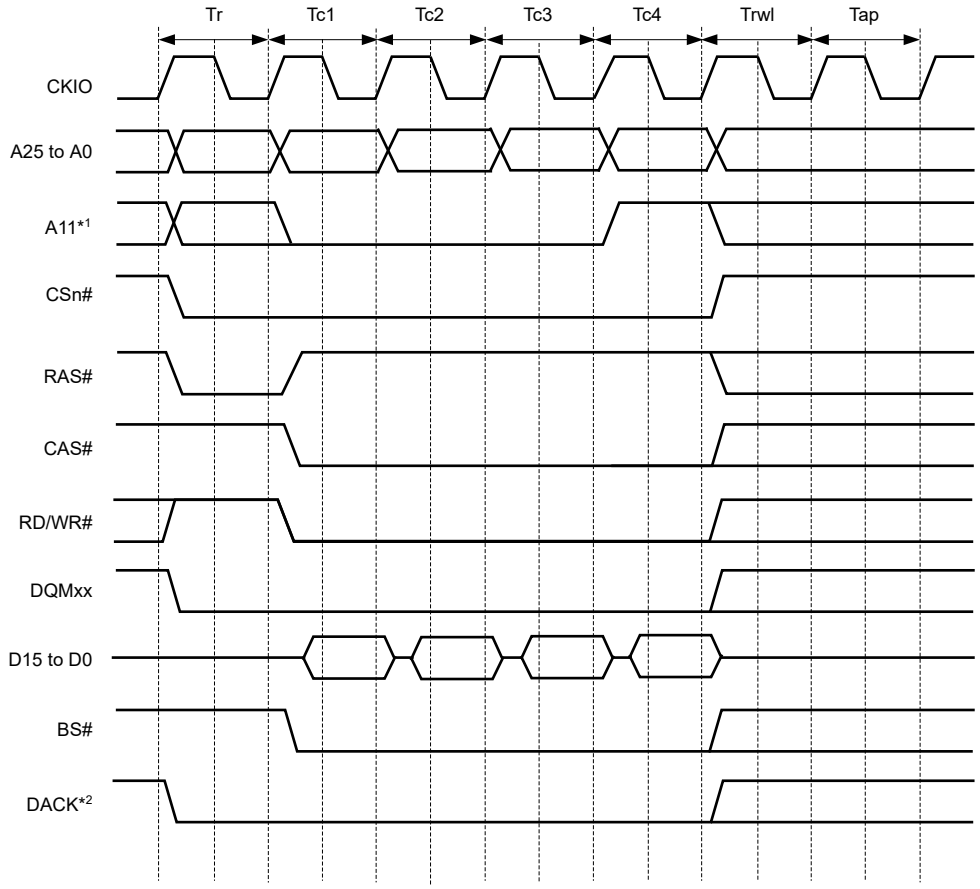


Figure 13.17 Basic timing for single read (CAS latency 1, auto-precharge)

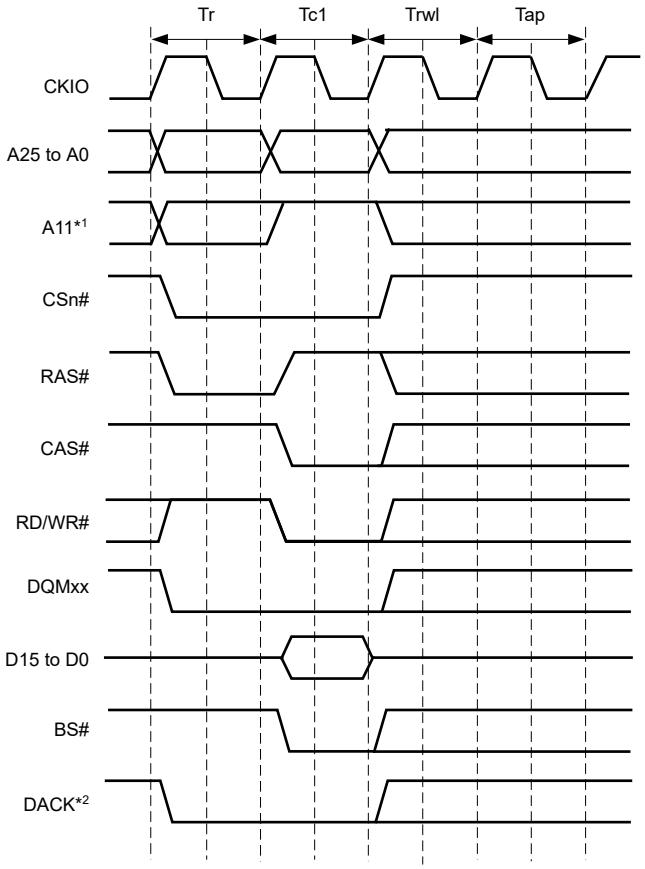
(5) Burst Write

A burst write occurs in the following cases in this LSI.

- Access size in writing is larger than data bus width.
- 16-, 32-, or 64-byte transfer

This LSI always accesses SDRAM with burst length 1. For example, write access of burst length 1 is performed continuously 8 times to write 16-byte continuous data to the SDRAM that is connected to a 16-bit data bus. This access is called burst write with the burst number 8. The relationship between the access size and the number of bursts is shown in Table 13.13. Figure 13.18 shows a timing chart for burst writes. In burst write, an ACTV command is output in the Tr state, the WRIT command is issued in the Tc1, Tc2, and Tc3 states, and the WRITA command is issued to execute an auto-precharge in the Tc4 state. In the write cycle, the write data is output simultaneously with the write command. After the write command with the auto-precharge is output, the Trw1 state that waits for the auto-precharge initiation is followed by the Tap state that waits for completion of the auto-precharge induced by the WRITA command in the SDRAM. Between the Trwl and the Tap states, a new command will not be issued to the same bank. However, access to another CS space or another bank in the same SDRAM space is enabled. The number of Trw1 states is specified by the TRWL[1:0] bits in the CS3WCR register. The number of Tap states is specified by the WTRP[1:0] bits in the CS3WCR register.



Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active-low is specified.

Figure 13.18 Basic timing for burst write (auto-precharge)

(6) Single Write

A write access ends in one cycle when the data bus width is larger than or equal to the access size. A write access that ends in one cycle is called single write. Figure 13.19 shows the basic timing of single-write operation.

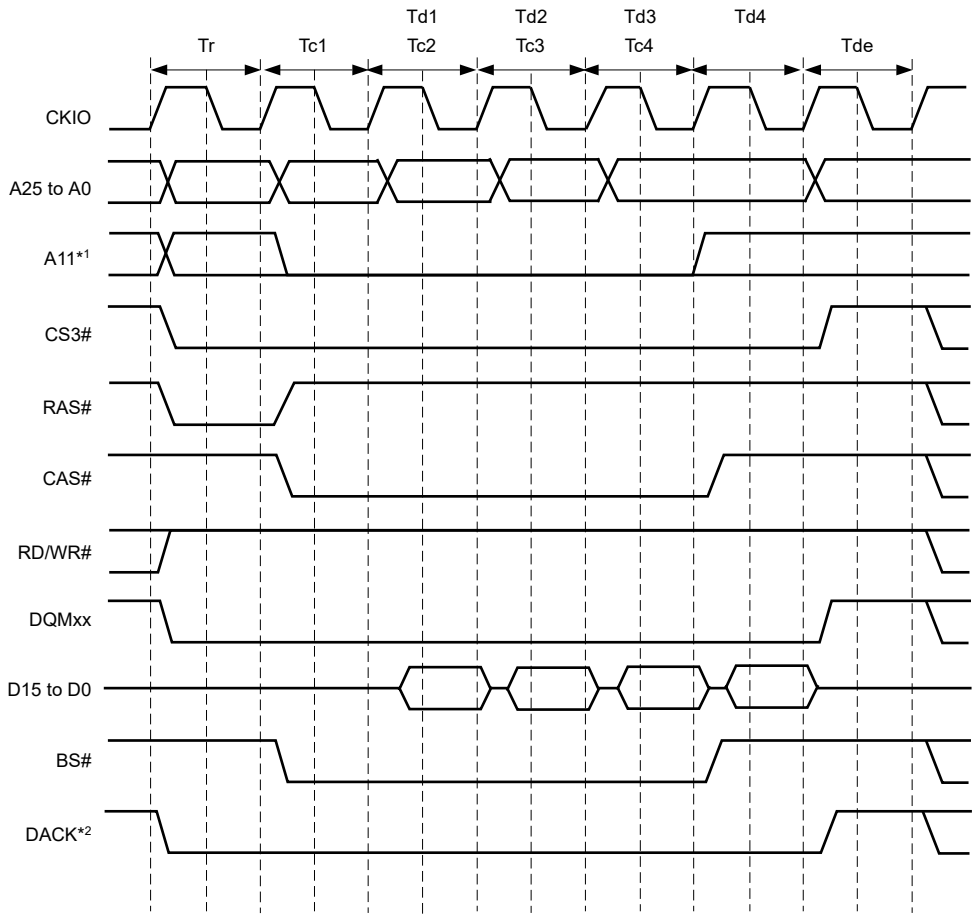
Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active-low is specified.

Figure 13.19 Single write basic timing (auto-precharge)

(7) Bank Active

The SDRAM bank function can be used to support high-speed access to the same row address. When the BACTV bit in SDCR is 1, access is performed using commands without auto-precharge (READ or WRIT). This function is called bank-active function. This function is valid only for area 3. When area 3 is set to bank-active mode, area 2 should be set to normal space or SRAM with byte selection. When areas 2 and 3 are both set to SDRAM, auto precharge mode must be set.

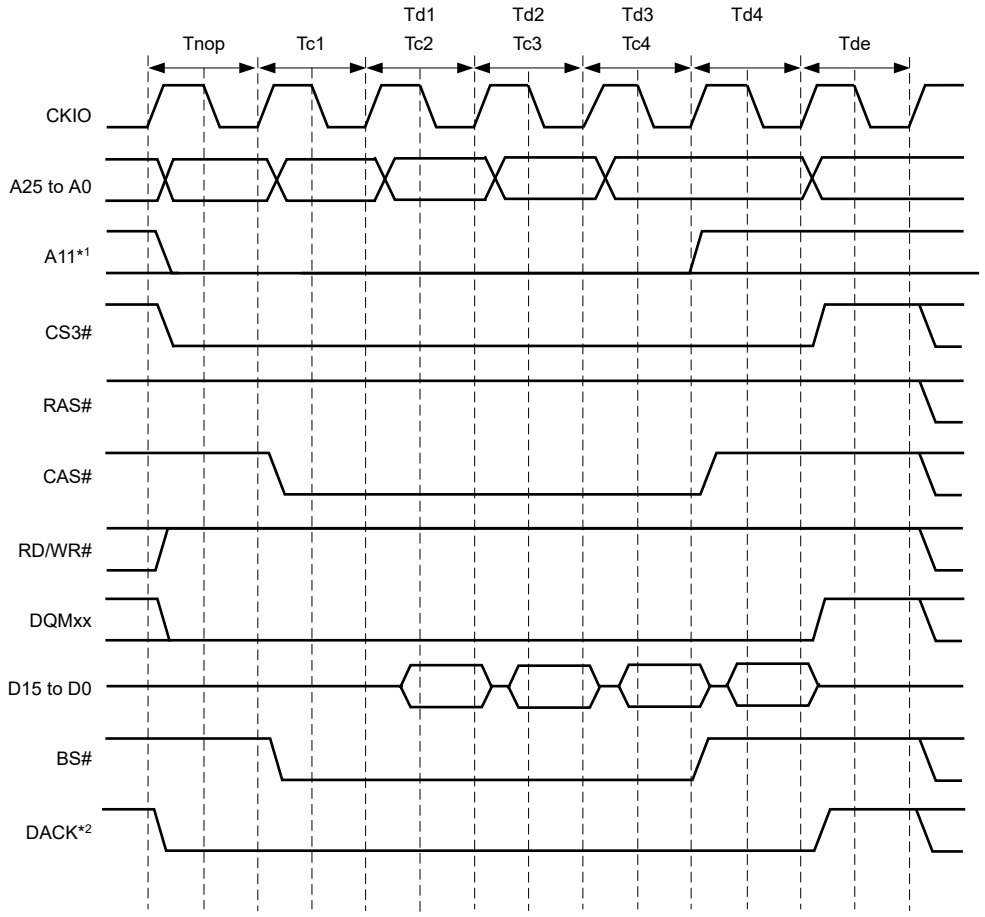
When the bank-active function is used, precharging is not performed when the access ends. When accessing the same row address in the same bank, it is possible to issue the READ or WRIT command immediately, without issuing an ACTV command. As SDRAM is internally divided into several banks, it is possible to activate one row address in each bank. If the next access is to a different row address, a PRE command is first issued to precharge the relevant bank, then when precharging is completed, the access is performed by issuing an ACTV command followed by a READ or WRIT command. If this is followed by an access to a different row address, the access time will be longer because of the precharging performed after the access request is received. The number of states between issuance of the PRE command and the ACTV command is determined by the WTRP[1:0] bits in CS3WCR.



In a write, when an auto-precharge is performed, a command cannot be issued to the same bank for a period of Trwl + Tap states after issuance of the WRITA command. When bank active mode is used, READ or WRIT commands can be issued successively if the row address is the same. The number of cycles can thus be reduced by Trwl + Tap states for each write.

There is a limit on tRAS, the time for placing each bank in the active state. If there is no guarantee that there will not be a cache hit and another row address will be accessed within the period in which this value is maintained by program execution, it is necessary to set auto-refresh and set the refresh cycle to no more than the maximum value of tRAS. A burst read cycle without auto-precharge is shown in Figure 13.20, a burst read cycle for the same row address in Figure 13.21, and a burst read cycle for different row addresses in Figure 13.22. Similarly, a single write cycle without auto-precharge is

shown in Figure 13.23, a single write cycle for the same row address in Figure 13.24, and a single write cycle for different row addresses in Figure 13.25.



In Figure 13.21, a Tnop state in which no operation is performed is inserted before the Tc state that issues the READ command. The Tnop state is inserted to maintain latency 2 for the DQMxx signal that specifies the read byte in the data read from the SDRAM. If the CAS latency is specified as two or more, the Tnop state is not inserted because latency 2 can be maintained even if the DQMxx signal is activated after the Tc state.

When bank active mode is set, if only access cycles to the respective banks in the area 3 space are considered, as long as access cycles to the same row address continue, the operation starts with the cycle in Figure 13.20 or Figure 13.23, followed by repetition of the cycle in Figure 13.21 or Figure 13.24. An access to a different area during this time has no effect. If there is an access to a different row address in the bank active state, the bus cycle in Figure 13.22 or Figure 13.25 is executed instead of that in Figure 13.21 or Figure 13.24. In bank active mode, too, all banks become inactive after a refresh cycle.

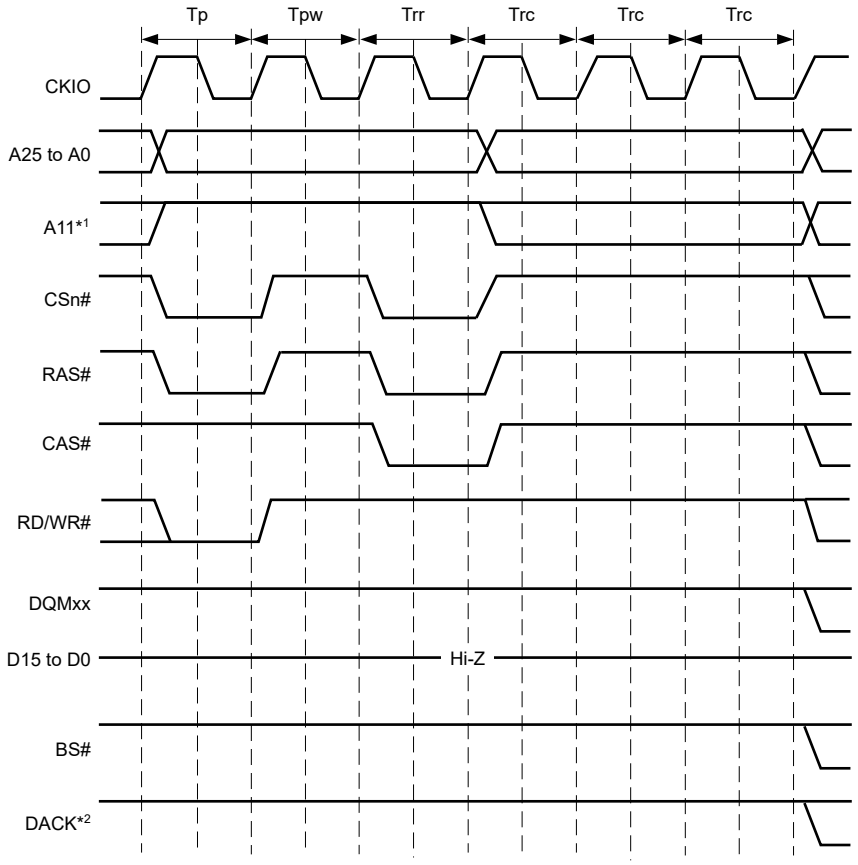
Figure 13.25 Single write timing (bank active, different row addresses in the same bank)



(8) Refreshing

This module has a function for controlling SDRAM refreshing. Auto-refreshing can be performed by clearing the RMODE bit to 0 and setting the RFSH bit to 1 in SDCR. A continuous refreshing can be performed by setting the RRC2 to RRC0 bits in the RTCSR register. If SDRAM is not accessed for a long period, self-refresh mode, in which the power consumption for data retention is low, can be activated by setting both the RMODE bit and the RFSH bit to 1.

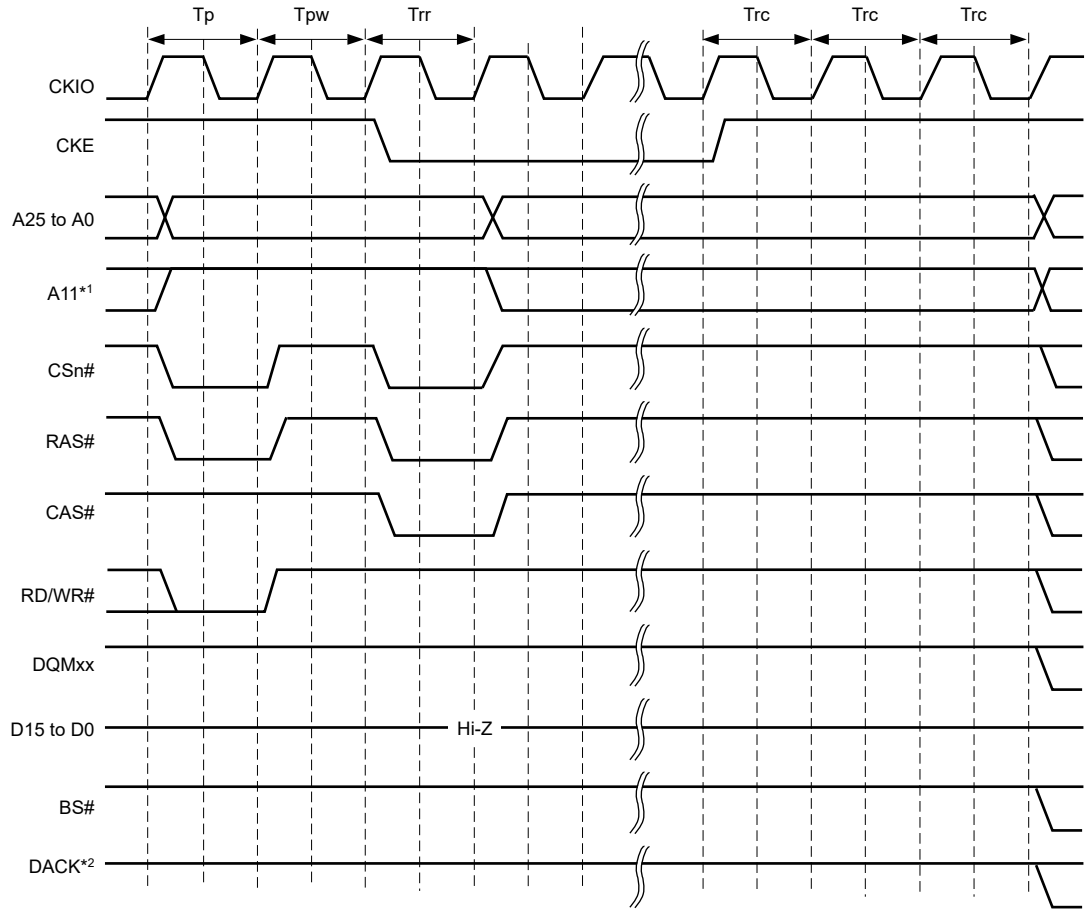
(a) Auto-refreshing

Refreshing is performed at intervals determined by the input clock selected by bits CKS2 to CKS0 in RTCSR, and the value set by in RTCOR. The value of bits CKS2 to CKS0 in RTCOR should be set so as to satisfy the refresh interval stipulation for the SDRAM used. First make the settings for RTCOR, RTCNT, and the RMODE and RFSH bits in SDCR, and then make the CKS2 to CKS0 and RRC2 to RRC0 settings. When the clock is selected by bits CKS2 to CKS0, RTCNT starts counting up from the value at that time. The RTCNT value is constantly compared with the RTCOR value, and if the two values are the same, a refresh request is generated and an auto-refresh is performed for the number of times specified by the RRC2 to RRC0. At the same time, RTCNT is cleared to zero and the count-up is restarted.

Figure 13.26 shows the auto-refresh cycle timing. After starting the auto refreshing, PALL command is issued in the Tp state to make all the banks to pre-charged state from active state when some bank is being pre-charged. Then REF command is issued in the Trr state after inserting idle states of which number is specified by the WTRP[1:0] bits in CS3WCR. A new command is not issued for the duration of the number of states specified by the WTRC[1:0] bits in CS3WCR after the Trr state. The WTRC[1:0] bits must be set so as to satisfy the SDRAM refreshing cycle time stipulation (tRC). An idle state is inserted between the Tp state and Trr state when the setting value of the WTRP[1:0] bits in CS3WCR is longer than or equal to 1 state.

Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active-low is specified.

Figure 13.26 Auto-refresh timing



(b) Self-refreshing

Self-refresh mode is a kind of standby mode, in which the refresh timing and refresh addresses are generated within the SDRAM. This LSI enters self-refreshing by setting both the RMODE bit and the RFSH bit in SDCR to 1. After starting the self-refreshing, PALL command is issued in Tp state after the completion of the pre-charging bank. A SELF command is then issued after inserting idle states of which number is specified by the WTRP[1:0] bits in CS3WSR. SDRAM cannot be accessed while in the self-refresh state. Clearing the RMODE bit to 0 clears the self-refresh mode. After self-refresh mode has been cleared, command issuance is disabled for the number of states specified by the WTRC[1:0] bits in CS3WCR.

Self-refresh timing is shown in Figure 13.27. Settings must be made so that self-refresh clearing and data retention are performed correctly, and auto-refreshing is performed at the correct intervals. When self-refreshing is activated from the state in which auto-refreshing is set, auto-refreshing is restarted if the RFSH bit is set to 1 and the RMODE bit is cleared to 0 when self-refresh mode is cleared. If the transition from clearing of self-refresh mode to the start of auto-refreshing takes time, this time should be taken into consideration when setting the initial value of RTCNT. Making the RTCNT value 1 less than the RTCOR value will enable refreshing to be started immediately.

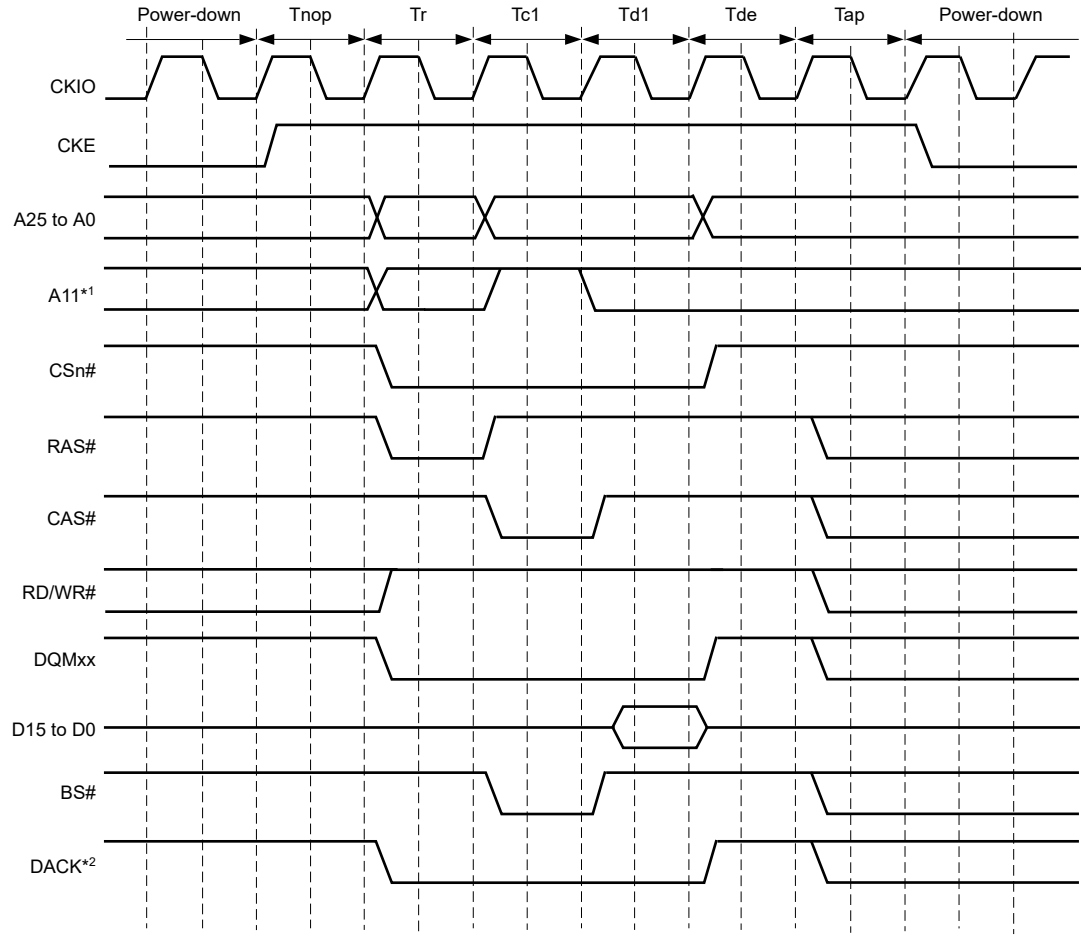
After self-refreshing has been set, the self-refresh state continues even if the chip standby state is entered using this LSI standby function, and is maintained even after recovery from standby mode due to an interrupt.

In case of a power-on reset, the bus state controller's registers are initialized, and therefore the self-refresh state is cleared.

Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active-low is specified.

Figure 13.27 Self-refresh timing

(9) Relationship between Refresh Requests and Bus Cycles



If a refresh request occurs during bus cycle execution, the refresh cycle must wait for the bus cycle to be completed.

If a new refresh request occurs while waiting for the previous refresh request, the previous refresh request is deleted. To refresh correctly, a bus cycle longer than the refresh interval must be prevented from occurring.

(10) Power-Down Mode

If the PDOWN bit in SDCR is set to 1 and the CKE signal is set to the low level after the access to the SDRAM, the SDRAM can enter the power-down mode. This power-down mode can effectively lower the power consumption in the non-access cycle. However, please note that if an access occurs in power-down mode, a state of overhead occurs because a state is needed to activate the CKE in order to cancel the power-down mode.

Figure 13.28 shows the access timing in power-down mode.

Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active-low is specified.

Figure 13.28 Power-down mode access timing

(11) Power-On Sequence

In order to use SDRAM, mode setting must first be made for SDRAM after the pose interval specified for the SDRAM to be used after powering on. The pose interval should be obtained by a power-on reset generating circuit or software.

To perform SDRAM initialization correctly, the registers of this module must first be set, followed by a write to the SDRAM mode register. In SDRAM mode register setting, the address signal value at that time is latched by a combination of the CSn#, RAS#, CAS#, and RD/WR# signals. If the value to be set is X, the bus state controller provides for value X to be written to the SDRAM mode register by performing a 16-bit write to address 0x8021_1000 + X for area 2 SDRAM and to address 0x8021_2000 + X for area 3 SDRAM. In this operation, the data is ignored, but the mode write is performed as a byte-size access. To set burst read/single write or burst read/burst write (CAS latency 2 to 3, wrap type = sequential, and burst length 1) supported by this LSI, arbitrary data is written in 16 bits to the access addresses shown in Table 13.14. In this time, 0 is output at the external address pins of A12 or later.

Table 13.14 Access address in SDRAM mode register write

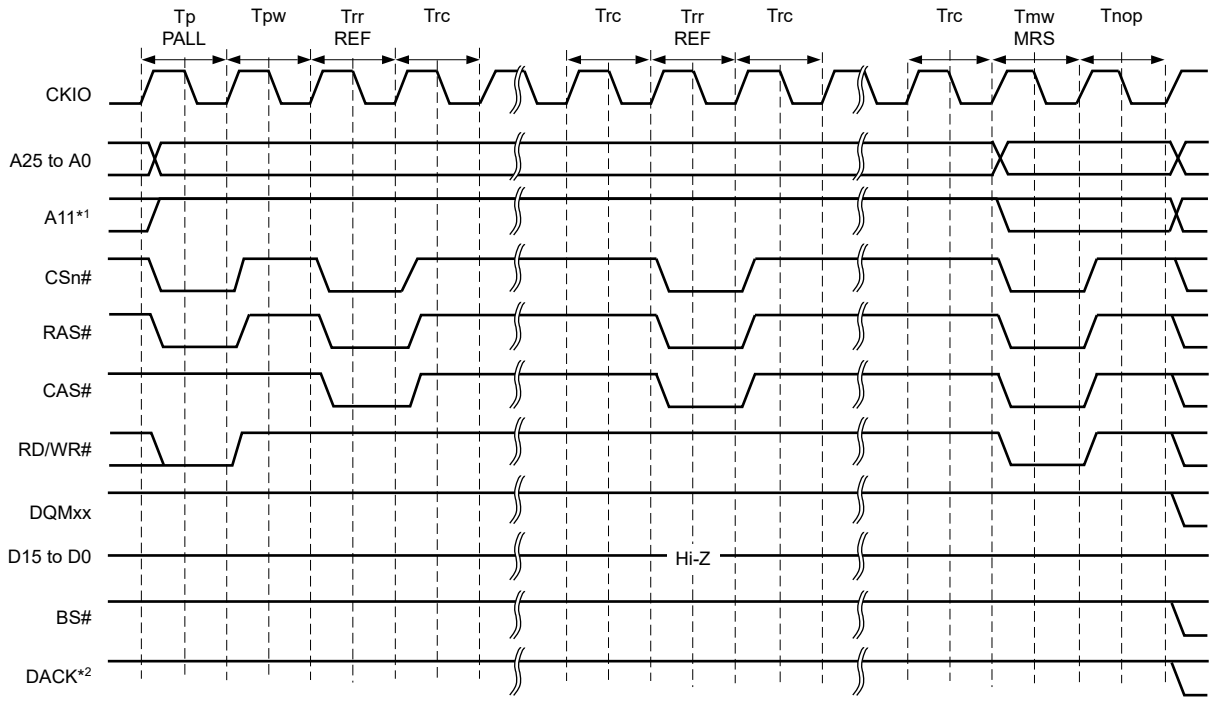
Setting for Area 2
Burst read/single write (burst length 1):

Data bus width	CAS latency	Access address	External address pin
16 bits	2	0x8021_1440	0x0000440
	3	0x8021_1460	0x0000460

Burst read/burst write (burst length 1):

Data bus width	CAS latency	Access address	External address pin
16 bits	2	0x8021_1040	0x0000040
	3	0x8021_1060	0x0000060

Setting for Area 3
Burst read/single write (burst length 1):



Data bus width	CAS latency	Access address	External address pin
16 bits	2	0x8021_2440	0x0000440
	3	0x8021_2460	0x0000460

Burst read/burst write (burst length 1):

Data bus width	CAS latency	Access address	External address pin
16 bits	2	0x8021_2040	0x0000040
	3	0x8021_2060	0x0000060

Mode register setting timing is shown in Figure 13.29. A PALL command (all bank pre-charge command) is firstly issued. A REF command (auto refresh command) is then issued 8 times. An MRS command (mode register set command) is finally issued. Idle states, of which number is specified by the WTRP[1:0] bits in CS3WCR, are inserted between the PALL and the first REF. Idle states, of which number is specified by the WTRC[1:0] bits in CS3WCR, are inserted between REF and REF, and between the 8th REF and MRS. One or more idle states are inserted between the MRS and a command to be issued next.

It is necessary to keep idle time of certain cycles for SDRAM before issuing PALL command after power-on. Refer to the manual of the SDRAM for the idle time to be needed. When the pulse width of the reset signal is longer than the idle time, mode register setting can be started immediately after the reset, but care should be taken when the pulse width of the reset signal is shorter than the idle time.

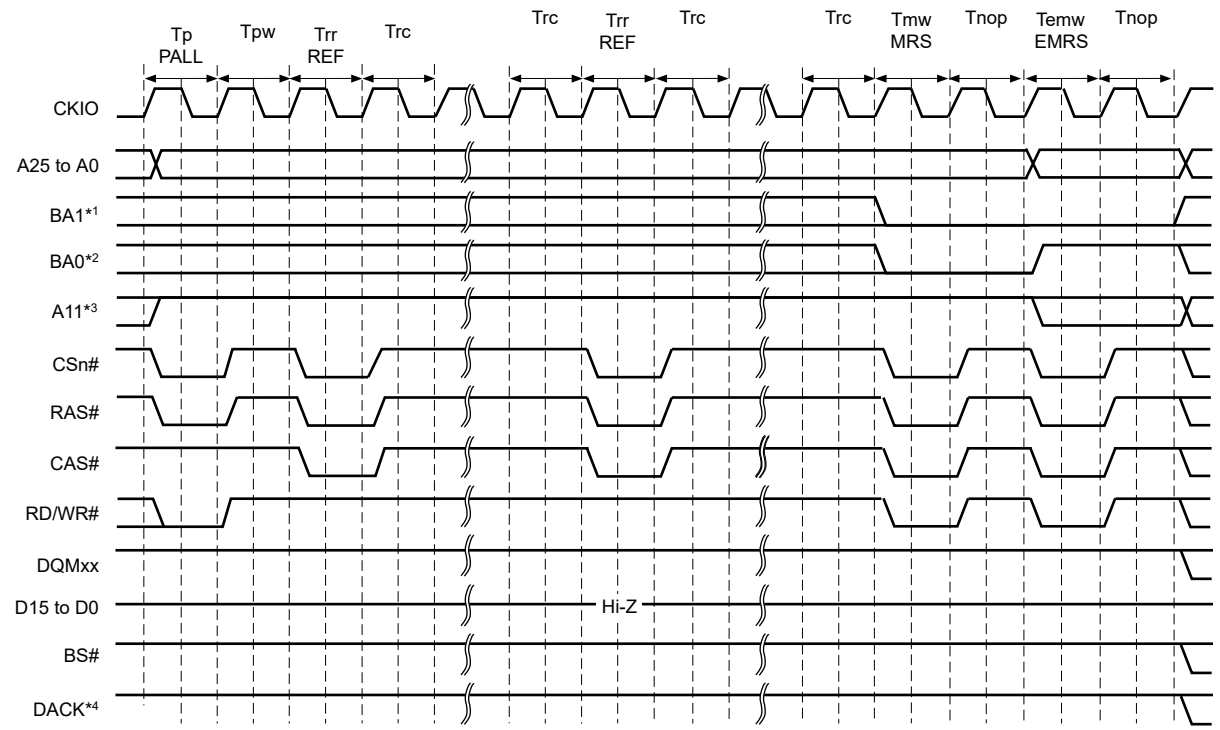
Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active-low is specified.

Figure 13.29 SDRAM mode set timing (based on JEDEC)

(12) Low-Power SDRAM

The low-power SDRAM can be accessed using the same protocol as the normal SDRAM.

The differences between the low-power SDRAM and normal SDRAM are that partial refresh takes place that puts only a part of the SDRAM in the self-refresh state during the self-refresh function, and that power consumption is low during refresh under user conditions such as the operating temperature. The partial refresh is effective in systems in which the data in a work area other than the specific area can be lost without severe repercussions. For details, please see the Data Sheet for the low-power SDRAM to be used.



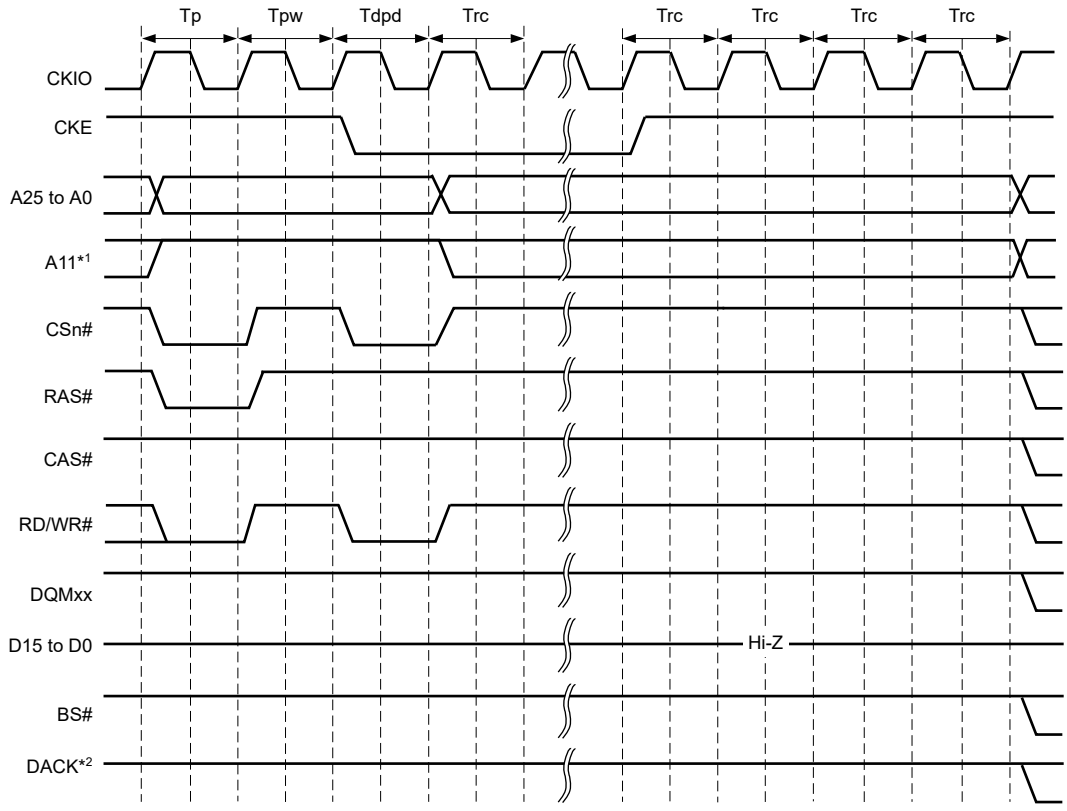
The low-power SDRAM supports the extended mode register in addition to the mode registers as the normal SDRAM.

This LSI supports issuing of the extended mode register set command (EMRS).

The EMRS command is issued according to the conditions specified in table below. For example, if data 0x0YYY_YYYY is written to address 0x8021_2XX0 in 32 bits, the commands are issued to the CS3 space in the following sequence: PALL -> REF × 8 -> MRS -> EMRS. In this case, the MRS and EMRS issue addresses are 0x0000XX0 and 0xYYYYYYY, respectively. If data 0x1YYY_YYYY is written to address 0x8021_2XX0 in 32 bits, the commands are issued to the CS3 space in the following sequence: PALL -> MRS -> EMRS.

Table 13.15 Output addresses when EMRS command is issued

Command to be issued	Access address	Access data	Write access size	MRS command issue address	EMRS command issue address
CS2 MRS	0x8021_1XX0	0x****_****	16 bits	0x0000XX0	0x-------
CS3 MRS	0x8021_2XX0	0x****_****	16 bits	0x0000XX0	0x-------
CS2 MRS + EMRS (with refresh)	0x8021_1XX0	0x0YYY_YYYY	32 bits	0x0000XX0	0xYYYYYYY
CS3 MRS + EMRS (with refresh)	0x8021_2XX0	0x0YYY_YYYY	32 bits	0x0000XX0	0xYYYYYYY
CS2 MRS + EMRS (without refresh)	0x8021_1XX0	0x1YYY_YYYY	32 bits	0x0000XX0	0xYYYYYYY
CS3 MRS + EMRS (without refresh)	0x8021_2XX0	0x1YYY_YYYY	32 bits	0x0000XX0	0xYYYYYYY



Note 1. Address pin to be connected to pin BA1 of SDRAM.
Note 2. Address pin to be connected to pin BA0 of SDRAM.
Note 3. Address pin to be connected to pin A10 of SDRAM.
Note 4. The waveform for DACKn is when active-low is specified.

Figure 13.30 EMRS command issue timing

- Deep power-down mode
  The low-power SDRAM supports the deep power-down mode as a low-power consumption mode. In the partial self-refresh function, self-refresh is performed on a specific area. In the deep power-down mode, self-refresh will not be performed on any memory area. This mode is effective in systems where all of the system memory areas are used as work areas.

If the RMODE bit in the SDCR is set to 1 while the DEEP and RFSH bits in the SDCR register are set to 1, the lowpower SDRAM enters the deep power-down mode. If the RMODE bit is cleared to 0, the CKE signal is pulled high to cancel the deep power-down mode. Before executing an access after returning from the deep power-down mode, the power-up sequence must be re-executed.

Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active-low is specified

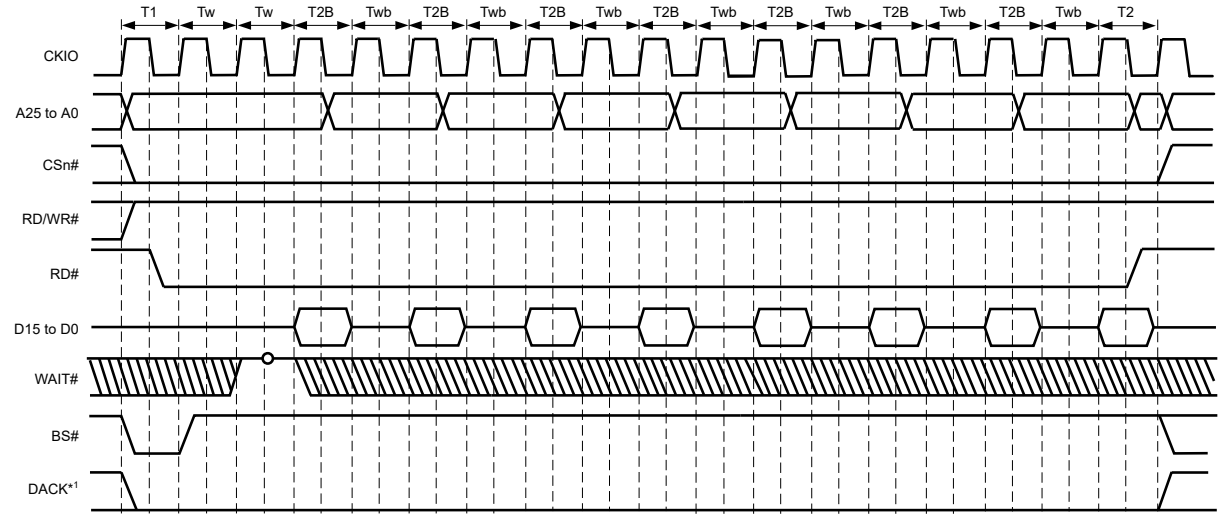
Figure 13.31 Deep power-down mode transition timing

13.4.7 Burst ROM (Clocked Asynchronous) Interface

The burst ROM (clocked asynchronous) interface is used to access a memory with a high-speed read function using a method of address switching called the burst mode or page mode. In a burst ROM (clocked asynchronous) interface, basically, the same access as the SRAM interface is performed, but the 2nd and subsequent access cycles are performed only by changing the address, without inactivating the RD# signal at the end of the 1st cycle. In the 2nd and subsequent access cycles, addresses are changed at the falling edge of the CKIO signal.

For the 1st access cycle, the number of waits specified by the W3 to W0 bits in the CS0WCR_1 register is inserted. For the 2nd and subsequent access cycles, the number of wait cycles specified by the BW1 and BW0 bits in the CS0WCR_1 register is inserted.

In the access to the burst ROM (clocked asynchronous), the BS# signal is activated only to the first access cycle. An external wait input is valid only to the first access cycle.



In the single access or write access that does not perform the burst operation in the burst ROM (clocked asynchronous) interface, access timing is the same as an SRAM interface.

Table 13.16 lists a relationship between bus width, access size, and the number of bursts. Figure 13.32 shows a timing chart.

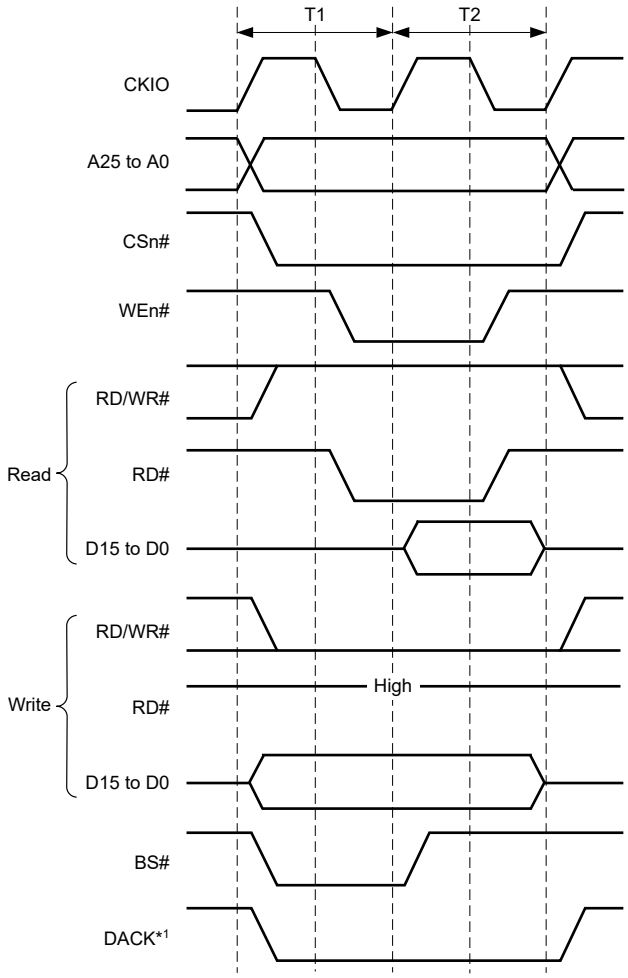
Table 13.16 Relationship between bus width, access size, and number of bursts

Bus width	Access size	CSnWCR.BST[1:0] bits	Number of bursts	Access count
8 bits	8 bits	Not affected	1	1
	16 bits	Not affected	2	1
	32 bits	Not affected	4	1
	16 bytes	00	16	1
		01	4	4
	32 bytes	00	16	2
		01	4	8
	64 bytes	00	16	4
		01	4	16
16 bits	8 bits	Not affected	1	1
	16 bits	Not affected	1	1
	32 bits	Not affected	2	1
	16 bytes	00	8	1
		01	2	4
		10*1	4	2
			2, 4, 2	3
	32 bytes	00	8	2
		01	2	8
		10*1	4	4
			2, 4, 2	6
	64 bytes	00	8	4
		01	2	16
		10*1	4	8
			2, 4, 2	12

Note 1. When the bus width is 16 bits, the access size is 16 bits or more, and the BST[1:0] bits in CS0WCR_1 are 10b, the number of bursts and access count depends on the access start address. At address 0x***0 or 0x***8, 4-4 burst access is performed (burst numbers: 4, 4 for a total of 2 rounds of access). At address 0x***4 or 0x***C, 2-4-2 burst access is performed (burst numbers: 2, 4, 2 for a total of 3 rounds of access).

Note 1. The waveform for DACKn is when active-low is specified.

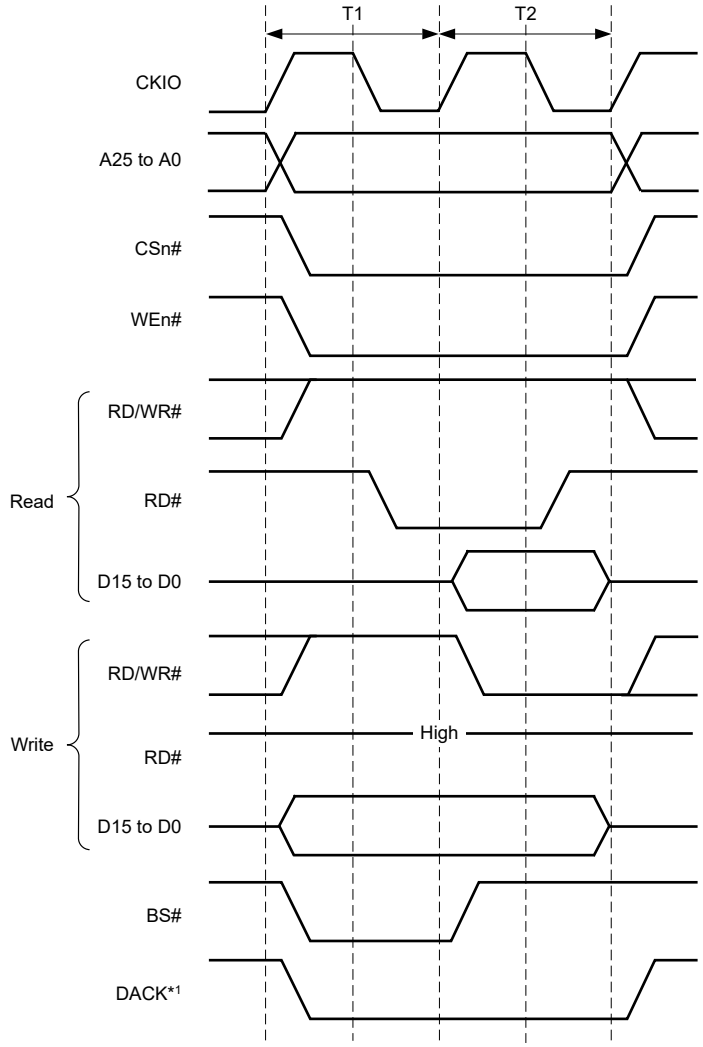
Figure 13.32 Burst ROM access timing (clocked asynchronous) (bus width = 16 bits, 16-byte transfer (number of burst 8), wait cycles inserted in first access = 2, wait cycles inserted in second and subsequent access cycles = 1)



13.4.8 SRAM Interface with Byte Selection

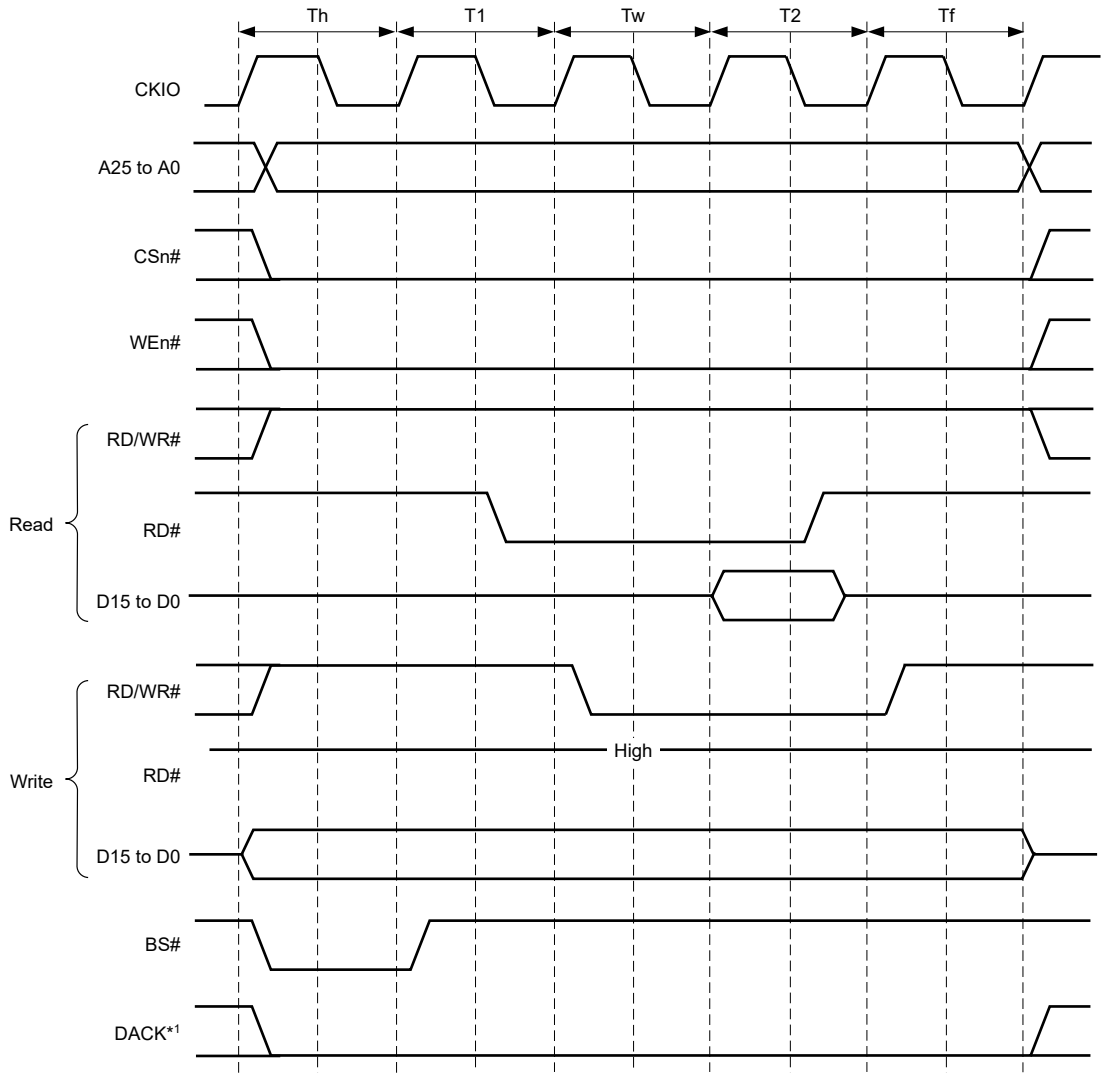
The SRAM interface with byte selection is a memory interface that outputs the byte selection signal (WEn#) in both read and write bus cycles. This interface has 16-bit data pins and accesses SRAMs having upper and lower byte selection pins, such as UB# and LB#.

When the BAS bit in CSnWCR is cleared to 0 (value after reset), the write access timing of the SRAM interface with byte selection is the same as that for the SRAM interface. While in read access of a byte-selection SRAM interface, the byte-selection signal is output from the WEn# pin, which is different from that for the SRAM interface. The basic access timing is shown in Figure 13.33. In write access, data is written to the memory according to the timing of the byte-selection pin (WEn#). For details, please see the Data Sheet for the corresponding memory.



If the BAS bit in CSnWCR is set to 1, the WEn# pin and RD/WR# pin timings change. Figure 13.34 shows the basic access timing. In write access, data is written to the memory according to the timing of the write enable pin (RD/WR#).

The data hold of write data at the timing of RD/WR# inactive must be acquired by setting the HW1 and HW0 bits in the CSnWCR register. Figure 13.35 shows the access timing when a software wait is specified.



Note 1. The waveform for DACKn is when active-low is specified.

Figure 13.33 Basic access timing for SRAM with byte selection (BAS = 0)

Note 1. The waveform for DACKn is when active-low is specified.

Figure 13.34 Basic access timing for SRAM with byte selection (BAS = 1)

Note 1. The waveform for DACKn is when active-low is specified.

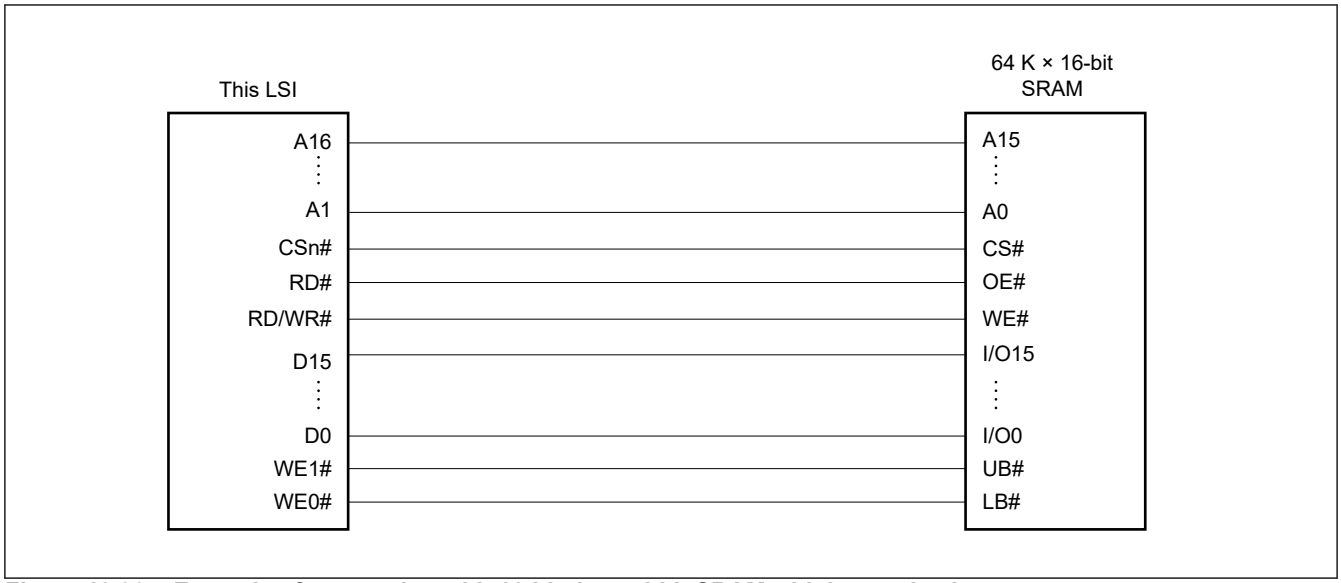

Figure 13.36 Example of connection with 16-bit data-width SRAM with byte selection

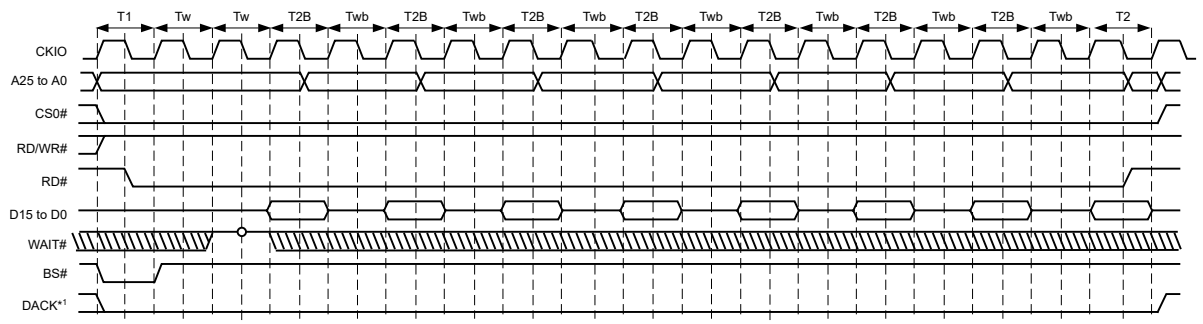
13.4.9 Burst ROM (Clocked Synchronous) Interface



The burst ROM (clocked synchronous) interface is supported to access a ROM with a synchronous burst function at high speed. The burst ROM interface accesses the burst ROM in the same way as an SRAM interface. This interface is valid only for area 0.

In the first access cycle, wait cycles are inserted. In this case, the number of wait cycles to be inserted is specified by the W3 to W0 bits in CS0WCR. In the second and subsequent cycles, the number of wait cycles to be inserted is specified by the BW1 and BW0 bits in CS0WCR.

While the burst ROM (clocked synchronous) is accessed, the BS# signal is activated only for the first access cycle and an external wait input is also valid for the first access cycle.

When the bus width is 16 bits, the burst length must be specified as 8. The burst ROM interface does not support the 8-bit bus width for the burst ROM.

The burst ROM interface performs burst operations for all read access. For example, in a 32-bit access over a 16-bit bus, valid 16-bit data is read two times and invalid 16-bit data is read six times. These invalid data read cycles increase the memory access time and degrade the program execution speed and DMA transfer speed. To prevent this problem, it is recommended using a read in a 16-byte or more access size. The burst ROM interface performs write access in the same way as SRAM interface access.

Note 1. The waveform for DACKn is when active-low is specified.

Figure 13.37 Burst ROM access timing (clocked synchronous) (burst length = 8, wait cycles inserted in first access = 2, wait cycles inserted in second and subsequent access cycles = 1)

13.4.10 Wait between Access Cycles

As the operating frequency of LSIs becomes higher, the off-operation of the output data buffer for devices with slow access speed often collides with the data output for the next cycle. As a result of these collisions, the reliability of the device might be lowered or malfunctions might occur. Data collisions can be avoided by inserting idle (wait) cycles between continuous access cycles.

The number of idle states between access cycles can be set by the WM bit in CSnWCR, bits IWW2 to IWW0, IWRWD2 to IWRWD0, IWRWS2 to IWRWS0, IWRRD2 to IWRRD0, and IWRRS2 to IWRRS 0 in CSnBCR. The conditions for setting the idle cycles between access cycles are shown below.

1. Continuous access cycles are write-read or write-write
2. Continuous access cycles are read-write for different spaces
3. Continuous access cycles are read-write for the same space
4. Continuous access cycles are read-read for different spaces
5. Continuous access cycles are read-read for the same space

For the specification of the number of idle cycles between access cycles described above, see the description of each register.

Besides the idle states between access cycles specified by the registers, idle cycles must be inserted to interface with the internal bus or to obtain the minimum pulse width for a multiplexed pin (WEn#). The following gives detailed information about the idle cycles and describes how to estimate the number of idle cycles.

The number of idle cycles on the external bus from the inactive state of the CSn# signal to the active state of CSn# is described below.

There are seven conditions that determine the number of idle cycles on the external bus as shown in Table 13.17. The effects of these conditions are shown in Figure 13.38.

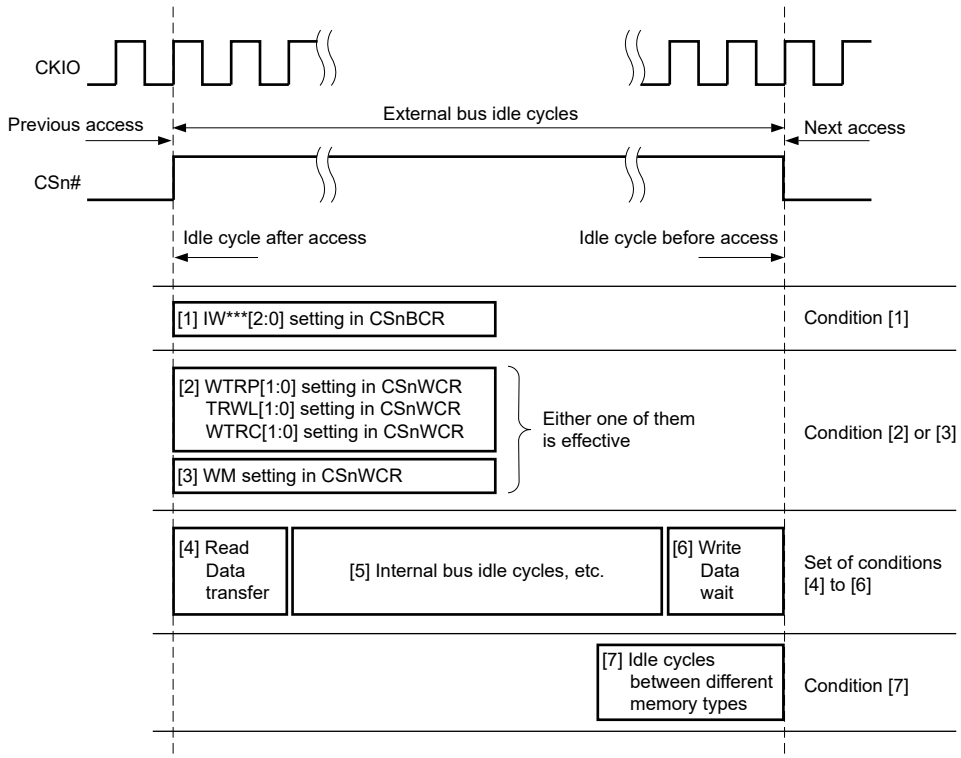


Table 13.17 Conditions for determining number of idle cycles (1 of 2)

No.	Condition	Description	Range	Note
[1]	IW***[2:0] in CSnBCR	These bits specify the number of idle cycles for access. The number of idle cycles can be specified independently for each combination of the previous and next cycles. For example, in the case where reading CS2 space followed by reading other CS space, the bits IWRRD[2:0] in CS2BCR should be set to 100b to specify six or more idle cycles. This condition is effective only for access states other than single address transfer and generates idle states after the access is completed.	0 to 12	Do not set 0 for the number of idle cycles between memory types which are not allowed to be accessed successively.
[2]	SDRAM-related bits in CSnWCR	These bits specify precharge completion and startup wait states and idle states between commands for SDRAM access. This condition is effective only for SDRAM access and generates idle states after the access is completed.	0 to 3	Specify these bits in accordance with the specification of the target SDRAM.
[3]	WM in CSnWCR	This bit enables or disables external WAIT# pin input for the memory types other than SDRAM. When this bit is cleared to 0 (external WAIT# enabled), one idle state is inserted to check the external WAIT# pin input after the access is completed. When this bit is set to 1 (disabled), no idle state is generated.	0 or 1	—
[4]	Read data transfer cycle	One idle state is inserted after a read access is completed. This idle state is not generated for the first or middle cycles in divided access cycles. This is neither generated when the HW[1:0] bits in CSnWCR are not 00b.	0 or 1	One idle state is always inserted during a read cycle with SDRAM.

Table 13.17 Conditions for determining number of idle cycles (2 of 2)

No.	Condition	Description	Range	Note
[5]	Internal bus idle cycles, etc.	External bus access requests from the CPU or the direct memory access controller (DMA) and their results are passed through the internal bus. The external bus enters idle state during internal bus idle cycles or while a bus other than the external bus is being accessed. This condition is not effective for divided access cycles, which are generated by the bus state controller when the access size is larger than the external data bus width.	0 or larger	The number of internal bus idle cycles may not become 0 depending on the CPU: internal bus: CKIO.
[6]	Write data wait cycles	During write access, a write cycle is executed on the external bus only after the write data becomes ready. This write data wait period generates idle cycles before the write cycle. Note that when the previous cycle is a write cycle and the internal bus idle cycles are shorter than the previous write cycle, write data can be prepared in parallel with the previous write cycle and therefore, no idle cycle is generated (write buffer effect).	0 or 1	For write → write or write → read access cycles, successive access cycles without idle cycles may be available due to the write buffer effect described in the left column. If successive access cycles without idle cycles are not allowed, specify the minimum number of idle cycles between access cycles through the CSnBCR register.
[7]	Idle cycles between different memory types	To ensure the minimum pulse width on the multi-use pins, idle cycles may be inserted before access after memories are switched. For some memory types, idle cycles are inserted even when memory types are not switched.	0 to 2	The number of idle cycles depends on the target memory types. See Table 13.18.

In the above conditions, a total of four conditions, that is, condition [1], condition [2] or [3] (either one is effective), a set of conditions [4] to [6] (these are generated successively, and therefore the sum of them should be taken as one set of idle cycles), and condition [7] are generated at the same time. The maximum number of idle cycles among these four conditions becomes the number of idle cycles on the external bus. To ensure the minimum idle cycles, be sure to make register settings for condition [1].

Note: A total of four conditions (condition [1], condition [2] or [3], a set of conditions [4] to [6], and condition [7]) generate idle cycle at the same time. Accordingly, the maximum number of cycles among these four conditions become the number of idle cycles.

Figure 13.38 Idle cycle conditions

Table 13.18 Number of idle cycles inserted between access cycles to different memory types

Previous cycle	Next Cycle						
	SRAM	Burst ROM (asynchronous)	MPX-I/O	Byte SRAM (BAS = 0)	Byte SRAM (BAS = 1)	SDRAM	Burst ROM (synchronous)
SRAM	0	0	1	0	0/1*1	0/1*1	0
Burst ROM (asynchronous)	0	0	1	0	0/1*1	0/1*1	0
MPX-I/O	1	1	0	1	1	1	1
Byte SRAM (BAS = 0)	0	0	1	0	0/1*1	0/1*1	0
Byte SRAM (BAS = 1)	0/1*1	0/1*1	1/2*1	0/1*1	0	0	0/1*1
SDRAM	1	1	2	1	0	0	1
Burst ROM (synchronous)	0	0	1	0	1	1	0

Note 1. The number of idle cycles depends on the setting of the CSnWCR.HW[1:0] bits in the previous cycle. When HW[1:0] ≠ 00b, the number of idle cycles is the value on the left; when HM[1:0] = 00b, the number of idle cycles is the value on the right. If the CSnWCR.HW[1:0] bits were for a CSn space that does not exist in the previous cycle, the number of idle cycles is the value on the right.

13.4.11 Others

(1) Reset

This module can be initialized completely only at reset of the entire chip (pin reset, software reset, and error reset).

When reset of the entire chip occurs, all signals are inactivated and data output buffers are turned off regardless of the bus cycle state after the internal reset is synchronized with the internal clock. All control registers are initialized. In the module stop state, control registers of the bus state controller are not initialized.

(2) Caution on Write Buffer

Since the bus state controller incorporates a one-stage write buffer, it can execute an access via the internal bus before the previous external bus cycle is completed in a write cycle. If the on-chip module is read or written after the external low-speed memory is written, the on-chip module can be accessed before the completion of the external low-speed memory write cycle.

In read cycles, the CPU is placed in the wait state until read operation has been completed. To continue the process after the data write to the device has been completed, perform a dummy read to the same address to check for completion of the write before the next process to be executed.

The write buffer of the bus state controller functions in the same way for an access by a bus master other than the CPU such as the direct memory access controller (DMA). Accordingly, to perform DMA transfers, the next read cycle is initiated before the previous write cycle is completed. Note, however, that if both the DMA source and destination addresses exist in external memory space, the next read cycle will not be initiated until the previous write cycle is completed.

Changing the registers in this module while the write buffer is operating may disrupt correct write access. Therefore, do not change the registers in this module immediately after a write access. If this change becomes necessary, do it after executing a dummy read of the write data.

14. DMA Controller (DMAC)

14.1 Overview

The LSI contains Direct Memory Access Controller (DMAC) consisting of two units, DMAC0 and DMAC1.

DMAC transfers data without using the CPU. When a transfer is requested, DMAC transfers data stored at the transfer source address to the transfer destination address.

Table 14.1 lists the specifications of DMAC.

Table 14.1 DMAC specifications

Parameter		Description	
		DMAC0	DMAC1
Number of channels		16 channels	16 channels
Address space		4 GB	
DMAC activation source		• External request (DREQ) • External interrupts (IRQ0 to IRQ13) • On-chip peripheral module requests/software requests*1	
Channel priority		• Priority among channels: Fixed priority levels within the group of channels 0 to 7 and within the group of channels 8 to 15, respectively, or round-robin scheduling for all channels. • Priority between channel groups: Round-robin scheduling between the group of channels 0 to 7 and the group of channels 8 to 15.	
Transfer data unit		8, 16, 32, 64, 128, 256, and 512 bits	8, 16, 32, 64, 128, and 256 bits
Maximum transfer size		2^{32} - 1 bytes	
Transfer mode	Single transfer	Performs DMA transfer for each DMA transfer request.	
	Block transfer	Performs DMA transfer of the specified transfer size for a DMAC activation request.	
DMA mode	Register mode	• DMA transfer setting value: Control register value within the DMA controller • DMA transfer from the source to the destination specified by a register.	
	Link mode	• DMA transfer setting value: Descriptors in the internal RAM or an external memory • Various DMA transfers specified by descriptors can be performed (responsiveness: register mode > link mode).	
Interval function		The DMA transfer interval can be specified (bus occupation ratio can be adjusted).	
Suspending function		Current DMA transfer can be paused.	
Buffer flush function		When DMAC is stopped forcibly, data in the buffer can be flushed.	
Interrupt request		Each channel has the following interrupt requests: • Transfer completion: Indicates completion of transfer of the specified size; each channel has this source. • Transfer error: Indicates a bus error; total of two sources, one for unit 0 and the other for unit 1.	

Note 1. A software request is output as a source of an on-chip peripheral module request from the interrupt controller. For how to set a software request, see section 11, Interrupt Controller (ICU).

Table 14.2 lists the input/output pins of the DMAC.

Table 14.2 Pin configuration of DMAC

Pin name	I/O	Description
DREQ	Input	DMA transfer request input from an external device to DMAC
DACK	Output	Output of DMAC transfer request acceptance from DMAC to an external device
TEND	Output	Output of transfer completion from DMAC to an external device

Note: For details on active levels of DACK and TEND, see section 14.2.11. CMNCR : Common Control Register.

14.2 Register Descriptions

14.2.1 NmSA_n : Nextm Source Address Register n (m = 0, 1) (n = 0 to 15)

Base address: DMACi = 0x8008_0000 + 0x1000 × i (i = 0, 1)

Offset address: 0x000 + 0x40 × n (m = 0) (n = 0 to 7)
0x400 + 0x40 × (n - 8) (m = 0) (n = 8 to 15)
0x00C + 0x40 × n (m = 1) (n = 0 to 7)
0x40C + 0x40 × (n - 8) (m = 1) (n = 8 to 15)

Bit position:	31																												0
Bit field:																													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Source Address Sets the start address of the DMA transfer source.	R/W

Note: During link mode transfer, descriptor read data is set to the N0SA_n register automatically.

The N0SA_n and N1SA_n registers set the DMA transfer source address of DMA channel n (n = 0 to 15). The N0SA_n register is for Next0 Register Set, and the N1SA_n register is for Next1 Register Set.

14.2.2 NmDA_n : Nextm Destination Address Register n (m = 0, 1) (n = 0 to 15)

Base address: DMACi = 0x8008_0000 + 0x1000 × i (i = 0, 1)

Offset address: 0x004 + 0x40 × n (m = 0) (n = 0 to 7)
0x404 + 0x40 × (n - 8) (m = 0) (n = 8 to 15)
0x010 + 0x40 × n (m = 1) (n = 0 to 7)
0x410 + 0x40 × (n - 8) (m = 1) (n = 8 to 15)

Bit position:	31																												0
Bit field:																													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Destination Address Sets the start address of the DMA transfer destination.	R/W

Note: During link mode transfer, descriptor read data is set to the N0DA_n register automatically.

The N0DA_n and N1DA_n registers set the DMA transfer destination address of DMA channel n (n = 0 to 15). The N0DA_n register is for Next0 Register Set, and the N1DA_n register is for the Next1 Register Set.

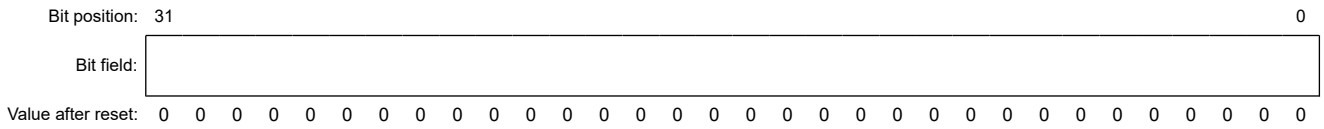
14.2.3 NmTB_n : Nextm Transaction Byte Register n (m = 0, 1) (n = 0 to 15)

Base address: DMACi = 0x8008_0000 + 0x1000 × i (i = 0, 1)

Offset address: 0x008 + 0x40 × n (m = 0) (n = 0 to 7)
0x408 + 0x40 × (n - 8) (m = 0) (n = 8 to 15)
0x014 + 0x40 × n (m = 1) (n = 0 to 7)
0x414 + 0x40 × (n - 8) (m = 1) (n = 8 to 15)

Bit position:	31																												0
Bit field:																													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Transaction Byte Sets the total number of transfer bytes. Do not start DMA transfer when 0 is set.	R/W



Note: During link mode transfer, descriptor read data is set to the N0TB_n register automatically.

The N0TB_n and N1TB_n registers set the total number of transfer bytes of DMA channel n (n = 0 to 15). The N0TB_n register is for Next0 Register Set, and the N1TB_n register is for Next1 Register Set.

14.2.4 CRSA_n : Current Source Address Register n (n = 0 to 15)

Base address: DMACi = 0x8008_0000 + 0x1000 × i (i = 0, 1)

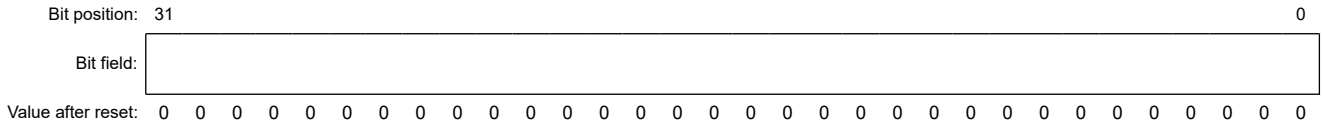
Offset address: 0x018 + 0x40 × n (n = 0 to 7)
0x418 + 0x40 × (n - 8) (n = 8 to 15)

Bit	Symbol	Function	R/W
31:0	n/a	Current Source Address Displays the read address of the next DMA transfer.	R

The CRSA_n register is a register that displays the DMA transfer source address of DMA channel n (n = 0 to 15). During DMA transfer, the value is incremented automatically (fixed when CHCFG_n.SAD = 1).

The value after a reset is loaded from the following registers:

- In register mode:
  Loads the transfer source address from the Next0/1 register.
- In link mode:
  Loads the transfer source address from the descriptor read data (the hardware inputs the descriptor read data to the N0SA_n register automatically, and loads it to the CRSA_n register when transfer starts).



The value is incremented when reading data from the transfer source completes.

Read this register after DMA stops (when CHSTAT_n.EN = 0). Handle the value during DMA operation as a reference value.

14.2.5 CRDA_n : Current Destination Address Register n (n = 0 to 15)

Base address: DMACi = 0x8008_0000 + 0x1000 × i (i = 0, 1)

Offset address: 0x01C + 0x40 × n (n = 0 to 7)
0x41C + 0x40 × (n - 8) (n = 8 to 15)

Bit	Symbol	Function	R/W
31:0	n/a	Current Destination Address Displays the write address of the next DMA transfer.	R

The CRDA_n register displays the DMA transfer destination address of DMA channel n (n = 0 to 15).

During DMA transfer, the value is incremented automatically (fixed when CHCFG_n.DAD = 1).

The value after a reset is loaded from the following registers:

- In register mode:

Loads the transfer destination address from the Next0/1 register.

- In link mode:
  Loads the transfer destination address from the descriptor read data (the hardware inputs the descriptor read data to the N0DA_n register automatically, and loads it to the CRDA_n register when transfer starts).

The value is incremented when writing data to the transfer destination completes.

Read this register after DMA stops (when CHSTAT_n.EN = 0). Handle the value during DMA operation as a reference value.

14.2.6 CRTB_n : Current Transaction Byte Register n (n = 0 to 15)

Base address: DMACi = 0x8008_0000 + 0x1000 × i (i = 0, 1)

Offset address: 0x020 + 0x40 × n (n = 0 to 7)
0x420 + 0x40 × (n - 8) (n = 8 to 15)

Bit position:	31																												0
Bit field:																													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Current Transaction Byte Displays the remaining number of transfer bytes that is currently performed.	R

The CRTB_n register displays the total number of transfer bytes of DMA channel n (n = 0 to 15). The value is cleared to 0 when transfer completes.

During DMA transfer, the value is decremented automatically.

The value after a reset is loaded from the following registers:

- In register mode:
  Loads the number of transfer bytes from the Next0/1 register.
- In link mode:
  Loads the number of transfer bytes from descriptor read data (the hardware inputs the descriptor read data to the N0TB_n register automatically and loads it to the CRTB_n register when transfer starts).

The value is decremented when writing data to the transfer destination completes.

Read this register after DMA stops (when CHSTAT_n.EN = 0). Handle the value during DMA operation as a reference value.

14.2.7 CHSTAT_n : Channel Status Register n (n = 0 to 15)

Base address: DMACi = 0x8008_0000 + 0x1000 × i (i = 0, 1)

Offset address: 0x024 + 0x40 × n (n = 0 to 7)
0x424 + 0x40 × (n - 8) (n = 8 to 15)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	INTM
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	MODE	DER	DW	DL	SR	TC	END	ER	SUS	TACT	RQST	EN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EN	DMA Activation Enable Displays the operation status of DMA channel n. [Setting condition] ● Writing 1 to the SETEN bit in the CHCTRL_n register [Clearing conditions] When any of the following conditions is met: ● Writing 1 to the CLREN bit in the CHCTRL_n register ● Writing 1 to the SWRST bit in the CHCTRL_n register ● When a bus error is reported during transfer ● When all DMA transfers complete in register mode (transfers complete when the REN bit in the CHCFG_n register = 0) ● In link mode, when DMA transfer (write back when WBD = 0) of the last descriptor (LE = 1) completes ● When reading the descriptor in link mode stopped (when LV = 0) 0: Operation disabled 1: Operation enabled	R
1	RQST	DMA Transfer Request This bit indicates that the transfer request is accepted. [Setting condition] ● The transfer request is accepted. [Clearing conditions] When any of the following conditions is met: ● Writing 1 to the SWRST bit in the CHCTRL_n register ● Writing 1 to the STG bit in the CHCTRL_n register ● Writing 1 to the CLRRQ bit in the CHCTRL_n register ● In single transfer (the TM bit in the CHCFG_n register = 0) mode, the transfer specified in the REQD bit in the CHCFG_n register is performed ● When all DMA transfers complete in register mode (transfer completes when the REN bit in the CHCFG_n register = 0) ● In link mode, DMA transfer of the last descriptor (LE = 1) completes ● In link mode, reading the descriptor is disabled (when LV = 0) ● In link mode, the DEM bit in the CHCFG_n register = 0, and DMA transfer completes ● When a bus error is reported to the master interface 0: DMA transfer request not accepted 1: DMA transfer request accepted	R
2	TACT	DMAC Operating Status This bit indicates that DMAC is running. This bit is used to ensure the channel stops completely. For details, see section 14.3.9. DMA Transfer Status. [Setting condition] ● Writing 1 to the SETEN bit in the CHCTRL_n register (reading the descriptor starts, or the DMA request is being serviced). [Clearing condition] ● When the internal state is idling (the EN bit in the CHSTAT_n register is cleared to 0, and all DMA transfer completes). 0: DMA in Channel_n stops 1: DMA in Channel_n is running	R
3	SUS	Suspend This bit indicates that the channel is suspended. For details, see section 14.3.10. Suspending a Transfer. [Setting condition] ● Writing 1 to the SETSUS bit in the CHCTRL_n register during DMA transfer of Channel_n, and the internal state is changed to the suspended state [Clearing conditions] When any of the following conditions is met: ● Writing 1 to the CLRSUS bit in the CHCTRL_n register ● Writing 1 to the CLREN bit in the CHCTRL_n register ● Condition for clearing the EN bit in the CHSTAT_n register 0: Channel_n not suspended 1: Channel_n suspended	R

Bit	Symbol	Function	R/W
4	ER	DMA Error This bit indicates that a DMA error interrupt is generated as a result of the bus error during DMA transfer. [Setting condition] ● A bus error is reported to the bus cycle [Clearing condition] ● Writing 1 to the SWRST bit in the CHCTRL_n register 0: No bus error occurred 1: A bus error occurred	R
5	END	DMA Transfer Completion Interrupt This bit indicates that DMA transfer completes, and a DMA interrupt is generated. [Setting conditions] When any of the following conditions is met: ● When the TC bit setting condition is met while DEM bit in the CHCFG_n register = 0 ● When the descriptor is read in link mode, LV of header = 0, and DIM in the header register = 0 [Clearing conditions] When any of the following conditions is met: ● Writing 1 to the CLREND bit in the CHCTRL_n register ● Writing 1 to the SWRST bit in the CHCTRL_n register 0: DMA transfer not completed 1: DMA transfer completed	R
6	TC	DMA Transfer Completion (total number of data bytes for transaction) This bit indicates that DMA transfer is completed. [Setting conditions] When any of the following conditions is met: ● When a transfer for the total number of data bytes for transaction set in the CRTB_n register is completed in register mode ● When the header bit WBD = 1 in link mode, and a transfer for the total number of data bytes for transaction set in the CRTB_n register is completed ● When the header bit WBD = 0 in link mode, and write-back to the descriptor is completed [Clearing conditions] When any of the following conditions is met: ● Writing 1 to the CLRTC bit in the CHCTRL_n register ● Writing 1 to the SWRST bit in the CHCTRL_n register 0: DMA transfer not completed 1: DMA transfer completed	R
7	SR	Next Register Select In register mode, this bit indicates the selected register set. [Setting condition] ● Setting 1 to the RSEL bit in the CHCFG_n register [Clearing condition] ● Clearing the RSEL bit in the CHCFG_n register to 0 0: Next0 register set 1: Next1 register set	R
8	DL	Descriptor Load This bit indicates that the descriptor is being read. In addition, if a bus error is reported while the descriptor is being read, 1 is retained. [Setting condition] ● Reading the descriptor in link mode is started [Clearing conditions] When any of the following conditions is met: ● Reading the descriptor in link mode completes with the OK response ● Writing 1 to the SWRST bit in the CHCTRL_n register (if 1 is retained for the bus error, it can be cleared to 0 only by the SWRST bit) 0: The descriptor is not being read 1: When ER = 0 The descriptor is being read in link mode When ER = 1 A bus error occurred while the descriptor is being read in link mode	R

Bit	Symbol	Function	R/W
9	DW	Descriptor Write Back This bit indicates that the descriptor is being written back. In addition, if a bus error is reported while the descriptor is written back, 1 is retained. [Setting condition] ● Writing back of header in link mode is started [Clearing conditions] ● Writing back of header in link mode completes with the OK response ● Writing 1 to the SWRST bit in the CHCTRL_n register (if 1 is retained due to the bus error, it can be cleared to 0 only by the SWRST bit) 0: Header is not written back in link mode 1: The ER bit in the CHSTAT_n register = 0 Header is written back in link mode The ER bit in the CHSTAT_n register = 1 A bus error occurred when header is written back in link mode	R
10	DER	Descriptor Error This bit indicates that the read descriptor is invalid (LV = 0) (does not depend on the value of the DIM bit in the header register). [Setting condition] ● In link mode, the LV of the read descriptor is 0 [Clearing conditions] When the following condition is met: ● Writing 1 to the SWRST bit in the CHCTRL_n register 0: No descriptor error occurred 1: Descriptor error occurred	R
11	MODE	DMA Mode This bit indicates DMA mode and displays the setting value of the DMS bit in the CHCFG_n register. 0: Register mode 1: Link mode	R
15:12	—	These bits are read as 0.	R
16	INTM	DMA Transfer Completion Interrupt Request Mask This bit displays the temporary mask status of DMA interrupt output. [Setting condition] ● Writing 1 to the SETINTM bit in the CHCTRL_n register [Clearing conditions] When any of the following conditions is met: ● Writing 1 to the CLRINTM bit in the CHCTRL_n register ● Writing 1 to the SWRST bit in the CHCTRL_n register 0: The temporary mask status is cleared 1: Temporary mask status	R
31:17	—	These bits are read as 0.	R

Note:
- Handle the transfer as invalid when CHSTAT_n.ER is set to 1.
- To suspend DMA transfer, mask or clear the transfer request, or clear CHSTAT_n.EN. See section 14.3.11. Aborting a Transfer for the procedure).
- To request a transfer by software, make sure that the previously requested DMA transfer operation completes (by checking the current register), set the STG bit in the Channel Control Register n (CHCTRL_n), then activate DMA.
- When DMA transfer for the same channel is requested by both hardware and software, the DMA transfer request cannot be identified for which. Therefore, set the DMA transfer request on your system to either hardware or software.

The CHSTAT_n register displays the status of DMA channel n (n = 0 to 15).

14.2.8 CHEXT_n : Channel Extension Register n (n = 0 to 15)

Base address: DMACi = 0x8008_0000 + 0x1000 × i (i = 0, 1)

Offset address: 0x034 + 0x40 × n (n = 0 to 7)
0x434 + 0x40 × (n - 8) (n = 8 to 15)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DCA[3:0]				—	DPR[2:0]			SCA[3:0]				—	SPR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	SPR[2:0]	Source PROT These bits set the value to be output to the PROT[2:0] pins during DMA read transfer.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
7:4	SCA[3:0]	Source CACHE These bits set the value to be output to the CACHE[3:0] pins during DMA read transfer.	R/W
10:8	DPR[2:0]	Destination PROT These bits set the value to be output to the PROT[2:0] pins during DMA write transfer.	R/W
11	—	This bit is read as 0. The write value should be 0.	R/W
15:12	DCA[3:0]	Destination CACHE These bits set the value to be output to the CACHE[3:0] pins during DMA write transfer.	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

The CHEXT_n register is an extension register for DMA channel n.

14.2.9 DMAC0_RSSELi : DMAC Unit 0 Resource Select Register i (i = 0 to 5)

Base address: DMA = 0x8009_0060

Offset address: 0x0C + 0x04 × i

Bit position:	31			28								20	18									10	8								0
Bit field:	—	—	—	REQ_SELC[8:0]								—	REQ_SELB[8:0]									—	REQ_SELA[8:0]								
Value after reset:	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
8:0	REQ_SELA[8:0]	DMA Resource Select for Channel n Select the trigger source of the DMA channel. 0x1FF: No resource assignment 0x000: ⋮ 0x1FE: DMA trigger source is assigned (event number)	R/W
9	—	This bit is read as 1. The write value should be 1.	R/W
18:10	REQ_SELB[8:0]	DMA Resource Select for Channel n + 1 Select the trigger source of the DMA channel. When i = 5, the REQ_SELB[8:0] bits are invalid. 0x1FF: No resource assignment 0x000: ⋮ 0x1FE: DMA trigger source is assigned (event number)	R/W

Bit	Symbol	Function	R/W
19	—	This bit is read as 1. The write value should be 1.	R/W
28:20	REQ_SELC[8:0]	DMA Resource Select for Channel n + 2 Select the trigger source of the DMA channel. When i = 5, the REQ_SELC[8:0] bits are invalid. 0x1FF: No resource assignment 0x000: ⋮ 0x1FE: DMA trigger source is assigned (event number)	R/W
29	—	This bit is read as 1. The write value should be 1.	R/W
31:30	—	These bits are read as 0. The write value should be 0.	R/W

Note:
- Relationship between register number and channel number is n = i × 3.
- The [30:10] bits in the DMAC0_RSSEL5 register are read as 0. The write value should be 0.

The DMAC0_RSSELi register selects the activation trigger source for DMAC unit 0. For details on numbers that are selected by this source selection, see the event numbers listed in Table 14.19.

In addition, do not set the same source for multiple DMAC0_RSSELi and DMAC1_RSSELi registers. If the same source is set, the operation of this LSI cannot be guaranteed.

14.2.10 DMAC1_RSSELi : DMAC Unit 1 Resource Select Register i (i = 0 to 5)

Base address: DMA = 0x8009_0060

Offset address: 0x24 + 0x04 × i

Bit position:	31			28									20	18									10	8								0
Bit field:	—	—	—	REQ_SELC[8:0]									—	REQ_SELB[8:0]									—	REQ_SELA[8:0]								
Value after reset:	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
8:0	REQ_SELA[8:0]	DMA Resource Select for Channel n Select the trigger source of the DMA channel. 0x1FF: No resource assignment 0x000: ⋮ 0x1FE: DMA trigger source is assigned (event number)	R/W
9	—	This bit is read as 1. The write value should be 1.	R/W
18:10	REQ_SELB[8:0]	DMA Resource Select for Channel n + 1 Select the trigger source of the DMA channel. When i = 5, the REQ_SELB[8:0] bits are invalid. 0x1FF: No resource assignment 0x000: ⋮ 0x1FE: DMA trigger source is assigned (event number)	R/W
19	—	This bit is read as 1. The write value should be 1.	R/W
28:20	REQ_SELC[8:0]	DMA Resource Select for Channel n + 2 Select the trigger source of the DMA channel. When i = 5, the REQ_SELC[8:0] bits are invalid. 0x1FF: No resource assignment 0x000: ⋮ 0x1FE: DMA trigger source is assigned (event number)	R/W
29	—	This bit is read as 1. The write value should be 1.	R/W
31:30	—	These bits are read as 0. The write value should be 0.	R/W

Note:
- Relationship between register number and channel number is n = i × 3.
- The [30:10] bits in the DMAC1_RSSEL5 register are read as 0. The write value should be 0.

The DMAC1_RSSELi register selects the activation trigger source for DMAC unit 1. For details on numbers that are selected by this source selection, see the event numbers listed in Table 14.19.

In addition, do not set the same source for multiple DMAC0_RSSELi and DMAC1_RSSELi registers. If the same source is set, the operation of this LSI cannot be guaranteed.

14.2.11 CMNCR : Common Control Register

Base address: BSC = 0x8021_0000

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	TL	—	—	—	AL	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	DPRTY[1:0]		—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	1	0	0	0	0	0	0	0	1	1	0	0	0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
4:3	—	These bits are read as 1. The write value should be 1.	R/W
8:5	—	These bits are read as 0. The write value should be 0.	R/W
10:9	DPRTY[1:0]	DMA Burst Transfer Priority 0 x: Accept a refresh request during DMA burst transfer 1 0: Do not accept a refresh request during DMA burst transfer 1 1: Setting prohibited	R/W
11	—	This bit is read as 0. The write value should be 0.	R/W
12	—	This bit is read as 1. The write value should be 1.	R/W
23:13	—	These bits are read as 0. The write value should be 0.	R/W
24	AL	Acknowledge Level Specify the active level of the DACK signal 0: Active-low output from DACK 1: Active-high output from DACK	R/W
27:25	—	These bits are read as 0. The write value should be 0.	R/W
28	TL	Transfer End Level Specify the active level of the TEND signal 0: Active-low output from TEND 1: Active-high output from TEND	R/W
31:29	—	These bits are read as 0. The write value should be 0.	R/W

The CMNCR register is a 32-bit register that controls the common items from each area.

14.2.12 CHCTRL_n : Channel Control Register n (n = 0 to 15)

Base address: DMACi = 0x8008_0000 + 0x1000 × i (i = 0, 1)

Offset address: 0x028 + 0x40 × n (n = 0 to 7)
0x428 + 0x40 × (n - 8) (n = 8 to 15)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLRINTM	SETINTM
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	CLRSUS	SETSUS	—	CLRTC	CLREND	CLRRQ	SWRST	STG	CLREN	SETEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SETEN	DMA Activation Enable Enable DMA transfer of DMA channel n. When this bit is set with the SWRST bit, clearing by the SWRST bit takes precedence, and a transfer does not start. This bit is always read as 0. To reset the DMA register, stop the ongoing DMA transfer by setting the CLREN bit and then set the SETEN bit. 0: Operation is not affected 1: DMA transfer is enabled (the EN bit in the CHSTAT_n register is set)	R/W
1	CLREN	DMA Activation Enable Clear Clear the EN bit in the CHSTAT_n register (for details, see section 14.3.11. Aborting a Transfer). This bit is always read as 0. 0: Operation is not affected 1: DMA transfer is disabled (the EN bit in the CHSTAT_n register is cleared)	R/W
2	STG	Software Trigger Set a transfer request by software. When this bit is set at the same time as the SWRST bit is being set, clearing by the SWRST bit takes precedence. This bit is always read as 0. 0: Operation is not affected 1: A transfer request is set by software (the RQST bit in the CHSTAT_n register is set)	R/W
3	SWRST	Software Reset Clear each bit in the CHSTAT_n register (for details on the bit to be cleared, see the descriptions of the applicable bit). Set this bit to 0 when the EN bit and the TACT bit are cleared to 0. This bit is always read as 0. 0: Operation is not affected 1: Clear each bit in the CHSTAT_n register	R/W
4	CLRRQ	DMA Transfer Request Clear Clear the RQST bit in the CHSTAT_n register to 0. This bit is always read as 0. 0: Operation is not affected 1: Clear the RQST bit in the CHSTAT_n register	R/W
5	CLREND	END Clear Clear the END bit in the CHSTAT_n register to 0. This bit is always read as 0. 0: Operation is not affected 1: Clear the END bit	R/W
6	CLRTC	TC Clear Clear the TC bit in the CHSTAT_n register to 0. This bit is always read as 0. 0: Operation is not affected 1: Clear the TC bit in the CHSTAT_n register	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W
8	SETSUS	Suspend Request If 1 is set to this bit when the EN bit in the CHSTAT_n register is 1, the current DMA transfer is suspended. This bit is always read as 0. 0: Operation is not affected 1: Suspends the current DMA transfer	R/W

Bit	Symbol	Function	R/W
9	CLRSUS	Suspend Clear If 1 is set to this bit when the SUS bit in the CHSTAT_n register is 1, the temporary suspend status is cleared. This bit is always read as 0. 0: Operation is not affected 1: Clear the temporary suspend status of the current DMA transfer	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
16	SETINTM	DMA Transfer Completion Interrupt Request Mask Mask DMA transfer completion interrupt output temporarily. Additionally, the INTM bit in the CHSTATn register is set to 1. This bit is always read as 0. 0: Operation is not affected 1: Mask a DMA transfer completion interrupt temporarily	R/W
17	CLRINTM	DMA Transfer Completion Interrupt Request Mask Clear Clear the mask status of DMA transfer completion interrupt output. Additionally, the INTM bit in the CHSTATn register is cleared to 0. If the mask state is cleared when the LVINT bit in the DCTRL register = 1 and the END bit in the CHSTAT_n register = 1, DMA transfer completion interrupt is deactivated. It is not activated when LVINT = 0. This bit is always read as 0. 0: Operation is not affected 1: Clear the mask state set with the SETINTM bit	R/W
31:18	—	These bits are read as 0. The write value should be 0.	R/W

The CHCTRL_n register controls DMA transfer of DMA channel n (n = 0 to 15).

14.2.13 CHCFG_n : Channel Configuration Register n (n = 0 to 15)

Base address: DMACi = 0x8008_0000 + 0x1000 × i (i = 0, 1)

Offset address: 0x02C + 0x40 × n (n = 0 to 7)
0x42C + 0x40 × (n - 8) (n = 8 to 15)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DMS	REN	RSW	RSEL	SBE	—	TCM	DEM	—	TM	DAD	SAD	DDS[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SDS[3:0]				—	AM[2:0]			—	LVL	HIEN	LOEN	REQD	SEL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	SEL[2:0]	Pin Select Set channels of DMAC. Set the following values so that the channels of CHCFG_n (n = 0 to 15) and the channel set by SEL become the same. For example, set 001b to the SEL bits in CHCFG_1. 0 0 0: Channel 0/8 0 0 1: Channel 1/9 0 1 0: Channel 2/10 0 1 1: Channel 3/11 1 0 0: Channel 4/12 1 0 1: Channel 5/13 1 1 0: Channel 6/14 1 1 1: Channel 7/15	R/W

Bit	Symbol	Function	R/W
3	REQD	DMA Activation Request Source Select Specifies the DMA transfer request input source (internal modules or external devices that require DACK). The timing when DACK becomes active is determined by the setting of this bit. 0: Requested by a transfer source module. DACK output is activated when it is read (a value after a reset). 1: Requested by a transfer destination module. DACK output is activated when it is written.	R/W
4	LOEN	L Detection Enable Specifies the detection method of the DMA request signal. When LVL = 0 LOEN = 1: If DMA transfer request input detects a falling edge, it is regarded as requested. LOEN = 0: If the DMA transfer request input falls, the request is not recognized (a value after a reset). When LVL = 1 LOEN = 1: If DMA transfer request input detects a low level, it is regarded as requested. LOEN = 0: If the DMA transfer request input is a low level, the request is not recognized (a value after reset).	R/W
5	HIEN	H Detection Enable Specifies the detection method of the DMA request signal. When LVL = 0 HIEN = 1: If DMA transfer request input detects a rising edge, it is regarded as requested. HIEN = 0: If the DMA transfer request input rises, the request is not recognized (a value after reset). When LVL = 1 HIEN = 1: If DMA transfer request input detects a high level, it is regarded as requested. HIEN = 0: If the DMA transfer request input is a high level, the request is not recognized (a value after reset).	R/W
6	LVL	Level Detection Enable Specifies the detection method of the DMA request signal. 0: Detects the edge (a value after reset) 1: Detects the level	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W
10:8	AM[2:0]	ACK Mode These bits specify the DACK output mode. For the conditions of outputting the DACK and TEND signals, see section 14.3.5. DMA Acknowledge Output/DMA Transaction Completion Output Function. 0 0 0: Setting is prohibited (a value after reset). At the initial setup, set a value other than 000b. 0 0 1: Level mode (active until DMA transfer request input becomes inactive) 0 1 x: Bus cycle mode (active between DMA transfer cycles (active if internal resources are the target)) 1 x x: Mask DACK output	R/W
11	—	This bit is read as 0. The write value should be 0.	R/W
15:12	SDS[3:0]	Source Data Size Set the size of data in the transfer source to be transferred at a time. 0x0: 8 bits (a value after reset) 0x1: 16 bits 0x2: 32 bits 0x3: 64 bits 0x4: 128 bits*1 0x5: 256 bits*2 0x6: 512 bits (can be set only for DMAC0)*1 Others: Setting prohibited	R/W

Bit	Symbol	Function	R/W
19:16	DDS[3:0]	Destination Data Size Set the size of data in the transfer destination to be transferred at a time. 0x0: 8 bits (a value after reset) 0x1: 16 bits 0x2: 32 bits 0x3: 64 bits 0x4: 128 bits*1 0x5: 256 bits*2 0x6: 512 bits (can be set only for DMAC0)*1 Others: Setting prohibited	R/W
20	SAD	Source Address Count Direction Set the count direction of the transfer source address of DMA channel n. When the transfer source address is beat-unaligned, specify SAD = 0 (increment). When the transfer source address is aligned with a boundary of the size specified by the SDS[3:0] bits, SAD can be set to 0 or 1. 0: Increment (a value after reset) 1: Fixed	R/W
21	DAD	Destination Address Count Direction Set the count direction of the transfer destination address of DMA channel n. When the transfer destination address is beat-unaligned, specify DAD = 0 (increment). When the transfer destination address is aligned with a boundary of the size specified by the DDS[3:0] bits, DAD can be set to 0 or 1. 0: Increment (a value after reset) 1: Fixed	R/W
22	TM	Transfer Mode Set DMA transfer mode. 0: Single transfer mode (a value after reset) 1: Block transfer mode	R/W
23	—	This bit is read as 0. The write value should be 0.	R/W
24	DEM	DMA Transfer Completion Interrupt Mask Mask DMA transfer completion interrupt detection. If this bit is set to 1 when DMA transfer completion interrupt is output, DMA transfer completion interrupt is not activated. At this time, the DEM bit is automatically cleared to 0. [Clearing condition] ● When DEM = 1 and DMA transfer completes 0: Does not mask (a value after reset) 1: Mask	R/W
25	TCM	TEND Mask Mask the TEND output. If this bit is 1 at the TEND output timing, TEND is not asserted. At this time, the TCM bit is automatically cleared to 0. Use this bit to control DMA transfers by software. [Clearing condition] ● When TCM = 1 and DMA transfer completes 0: Does not mask (a value after reset) 1: Mask	R/W
26	—	This bit is read as 0. The write value should be 0.	R/W
27	SBE	Buffer Flush Enable If the EN bit in the CHSTAT_n register is cleared to 0 during DMA transfer, select whether to stop flushing (writing) data that is already read and stored in the buffer. Only when REQD = 0, flush mode can be used. 0: Stop transfer without flushing data in the buffer (a value after reset) 1: Stop transfer after flushing data in the buffer	R/W
28	RSEL	Next Register Select Select the Next register set to be executed next. This bit is valid in register mode only. When RSW = 1, the value is reversed automatically (0 is reversed to 1, 1 is reversed to 0) after DMA transfer completes. [Transition condition] ● When RSW = 1 and DMA transfer completes 0: Execute Next0 Register Set (a value after reset) 1: Execute Next1 Register Set	R/W

Bit	Symbol	Function	R/W
29	RSW	RSEL Reverse When DMA transfer completes, the RSEL bit is automatically reversed (0 is reversed to 1, 1 is reversed to 0). This bit is valid in register mode only. 0: Does not reverse the RSEL bit when DMA transfer completes (a value after reset) 1: Reverse the RSEL bit when DMA transfer completes	R/W
30	REN	Register Set Enable When DMA transfer completes, performs DMA transfer of the Next register set selected by the RSEL bit accordingly. This bit is valid in register mode only. [Setting condition] ● Writing 1 to this bit [Clearing conditions] When any of the following conditions is met: ● Writing 0 to this bit ● When REN = 1 and DMA transfer completes 0: Does not perform DMA transfer accordingly 1: Performs DMA transfer accordingly	R/W
31	DMS	DMA Mode Select Set DMA mode. 0: Register mode (a value after reset). 1: Link mode	R/W

Note 1. The SCA[3:0] bits in the CHEXT_n register should be set to 0x2 if source is TCM. The DCA[3:0] bits in the CHEXT_n register should be set to 0x2 if destination is TCM.
Note 2. This setting is prohibited when DMAC accesses TCM.

The CHCFG_n register controls DMA transfer of DMA channel n (n = 0 to 15).

Specify the detection method depending on the DMA transfer source to be used. For details on the DMA request signals, see section 14.3.4.1. Specifying Detection Operation of DMA Transfer Requests for Each Source.

14.2.14 CHITVL_n : Channel Interval Register n (n = 0 to 15)

Base address: DMACi = 0x8008_0000 + 0x1000 × i (i = 0, 1)

Offset address: 0x030 + 0x40 × n (n = 0 to 7)
0x430 + 0x40 × (n - 8) (n = 8 to 15)

Bit position:	31															15															0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ITVL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	ITVL[15:0]	Interval These bits set the DMA transfer internal.	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

The CHITVL_n register sets the DMA transfer interval of DMA channel n (n = 0 to 15).

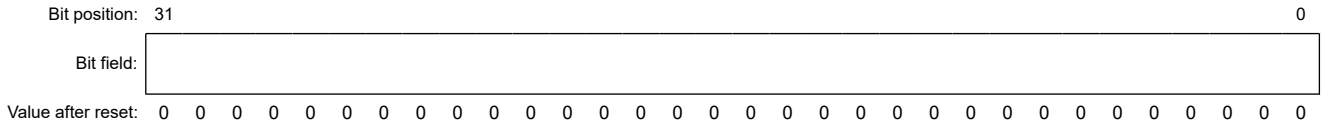
For details, see section 14.3.7. Interval Count Function.

14.2.15 NXLA_n : Next Link Address Register n (n = 0 to 15)

Base address: DMACi = 0x8008_0000 + 0x1000 × i (i = 0, 1)

Offset address: 0x038 + 0x40 × n (n = 0 to 7)
0x438 + 0x40 × (n - 8) (n = 8 to 15)

Bit position:	31																													0
Bit field:																														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0



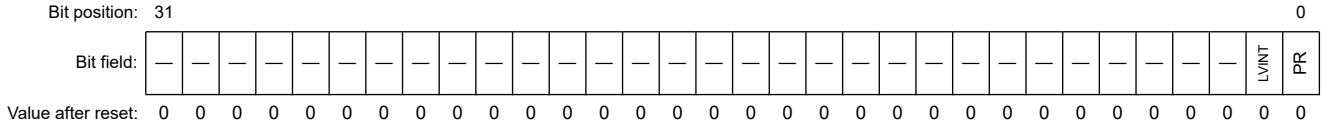
Bit	Symbol	Function	R/W
31:0	n/a	Next Link Address Sets the address of the link destination. Because the 2 lower-order bits are fixed to 0, only word-aligned addresses can be set.	R/W

The NXLA_n register sets the link address of DMA channel n (n = 0 to 15).

14.2.16 CRLA_n : Current Link Address Register n (n = 0 to 15)

Base address: DMACi = 0x8008_0000 + 0x1000 × i (i = 0, 1)

Offset address: 0x03C + 0x40 × n (n = 0 to 7)
0x43C + 0x40 × (n - 8) (n = 8 to 15)



Bit	Symbol	Function	R/W
31:0	n/a	Current Link Address Displays the address of the descriptor that is being executed.	R

The CRLA_n register sets the link address of DMA channel n (n = 0 to 15).

14.2.17 DCTRL_x : DMA Control Register x (x = A, B)

Base address: DMACi = 0x8008_0000 + 0x1000 × i (i = 0, 1)

Offset address: 0x300 (DCTRL_A)
0x700 (DCTRL_B)

Bit	Symbol	Function	R/W
0	PR	Priority Control Select Sets the transfer priority control mode (see section 14.3.3. DMA Channel Priority Control. 0: Fixed priority mode 1: Round-robin mode	R/W
1	LVINT	DMA Interrupt Output Select Sets the interrupt output mode. This bit must be set to 1 when the DMA interrupt is enabled. 0: Pulse output 1: Level output	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

The DCTRL_x register sets the arbitration between channels in all channels (DCTRL_A = channels 0 to 7, DCTRL_B = channels 8 to 15).

14.2.18 DSTAT_EN_x : DMA Status EN Register x (x = A, B)

Base address: DMACi = 0x8008_0000 + 0x1000 × i (i = 0, 1)

Offset address: 0x310 (DSTAT_EN_A)
0x710 (DSTAT_EN_B)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	EN0715	EN0614	EN0513	EN0412	EN0311	EN0210	EN0109	EN0008
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EN0008	Channel 0/8 EN Displays the status for the EN bit of DMA channel 0/8.	R
1	EN0109	Channel 1/9 EN Displays the status for the EN bit of DMA channel 1/9.	R
2	EN0210	Channel 2/10 EN Displays the status for the EN bit of DMA channel 2/10.	R
3	EN0311	Channel 3/11 EN Displays the status for the EN bit of DMA channel 3/11.	R
4	EN0412	Channel 4/12 EN Displays the status for the EN bit of DMA channel 4/12.	R
5	EN0513	Channel 5/13 EN Displays the status for the EN bit of DMA channel 5/13.	R
6	EN0614	Channel 6/14 EN Displays the status for the EN bit of DMA channel 6/14.	R
7	EN0715	Channel 7/15 EN Displays the status for the EN bit of DMA channel 7/15.	R
31:8	—	These bits are read as 0.	R

The DSTAT_EN_x register displays the status for the EN bit of all channels (DSTAT_EN_A = channels 0 to 7, DSTAT_EN_B = channels 8 to 15).

Writing data to this register does not change the value of each bit.

14.2.19 DSTAT_ER_x : DMA Status ER Register x (x = A, B)

Base address: DMACi = 0x8008_0000 + 0x1000 × i (i = 0, 1)

Offset address: 0x314 (DSTAT_ER_A)
0x714 (DSTAT_ER_B)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	ER0715	ER0614	ER0513	ER0412	ER0311	ER0210	ER0109	ER0008
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ER0008	Channel 0/8 ER Displays the status for the ER bit of DMA channel 0/8.	R
1	ER0109	Channel 1/9 ER Displays the status for the ER bit of DMA channel 1/9.	R
2	ER0210	Channel 2/10 ER Displays the status for the ER bit of DMA channel 2/10.	R
3	ER0311	Channel 3/11 ER Displays the status for the ER bit of DMA channel 3/11.	R
4	ER0412	Channel 4/12 ER Displays the status for the ER bit of DMA channel 4/12.	R
5	ER0513	Channel 5/13 ER Displays the status for the ER bit of DMA channel 5/13.	R
6	ER0614	Channel 6/14 ER Displays the status for the ER bit of DMA channel 6/14.	R
7	ER0715	Channel 7/15 ER Displays the status for the ER bit of DMA channel 7/15.	R
31:8	—	These bits are read as 0.	R

The DSTAT_ER_x register displays the status for the ER bit of all channels (DSTAT_ER_A = channels 0 to 7, DSTAT_ER_B = channels 8 to 15).

Writing data to this register does not change the value of each bit.

14.2.20 DSTAT_END_x : DMA Status END Register x (x = A, B)

Base address: DMACi = 0x8008_0000 + 0x1000 × i (i = 0, 1)

Offset address: 0x318 (DSTAT_END_A)
0x718 (DSTAT_END_B)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	END0 715	END0 614	END0 513	END0 412	END0 311	END0 210	END0 109	END0 008
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	END0008	Channel 0/8 END Displays the status for the END bit of DMA channel 0/8.	R
1	END0109	Channel 1/9 END Displays the status for the END bit of DMA channel 1/9.	R
2	END0210	Channel 2/10 END Displays the status for the END bit of DMA channel 2/10.	R
3	END0311	Channel 3/11 END Displays the status for the END bit of DMA channel 3/11.	R
4	END0412	Channel 4/12 END Displays the status for the END bit of DMA channel 4/12.	R
5	END0513	Channel 5/13 END Displays the status for the END bit of DMA channel 5/13.	R
6	END0614	Channel 6/14 END Displays the status for the END bit of DMA channel 6/14.	R

Bit	Symbol	Function	R/W
7	END0715	Channel 7/15 END Displays the status for the END bit of DMA channel 7/15.	R
31:8	—	These bits are read as 0.	R

The DSTAT_END_x register displays the status for the END bit of all channels (DSTAT_END_A = channels 0 to 7, DSTAT_END_B = channels 8 to 15).

Writing data to this register does not change the value of each bit.

14.2.21 DSTAT_SUS_x : DMA Status SUS Register x (x = A, B)

Base address: DMACi = 0x8008_0000 + 0x1000 × i (i = 0, 1)

Offset address: 0x320 (DSTAT_SUS_A)
0x720 (DSTAT_SUS_B)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	SUS07 15	SUS06 14	SUS05 13	SUS04 12	SUS03 11	SUS02 10	SUS01 09	SUS00 08
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SUS0008	Channel 0/8 SUS Displays the status for the SUS bit of DMA channel 0/8.	R
1	SUS0109	Channel 1/9 SUS Displays the status for the SUS bit of DMA channel 1/9.	R
2	SUS0210	Channel 2/10 SUS Displays the status for the SUS bit of DMA channel 2/10.	R
3	SUS0311	Channel 3/11 SUS Displays the status for the SUS bit of DMA channel 3/11.	R
4	SUS0412	Channel 4/12 SUS Displays the status for the SUS bit of DMA channel 4/12.	R
5	SUS0513	Channel 5/13 SUS Displays the status for the SUS bit of DMA channel 5/13.	R
6	SUS0614	Channel 6/14 SUS Displays the status for the SUS bit of DMA channel 6/14.	R
7	SUS0715	Channel 7/15 SUS Displays the status for the SUS bit of DMA channel 7/15.	R
31:8	—	These bits are read as 0.	R

The DSTAT_SUS_x register displays the status for the SUS bit of all channels (DSTAT_SUS_A = channels 0 to 7, DSTAT_SUS_B = channels 8 to 15).

Writing data to this register does not change the value of each bit.

14.3 Operation

14.3.1 DMA Mode

With the DMS bit in the CHCFG_n register, DMA mode can be switched between register mode and link mode.

Table 14.3 DMA mode setting

DMS (CHCFG_n)	Description	Applications
0	Register mode	With the values set for the next register set, performs a DMA transfer.
1	Link mode	Accesses the descriptor area, and performs a DMA transfer with the value set for the descriptor. Repeats descriptor read and DMA transfer unless you set the descriptor or use the control register to stop them.

14.3.1.1 Register Mode

In register mode, you can perform a DMA transfer with the value set in the internal register. You can set two sets (Next0 Register Set and Next1 Register Set) of the transfer source addresses, transfer destination addresses, and numbers of transfer bytes. You can select the next register set to perform a transfer, or transfer two next register sets successively.

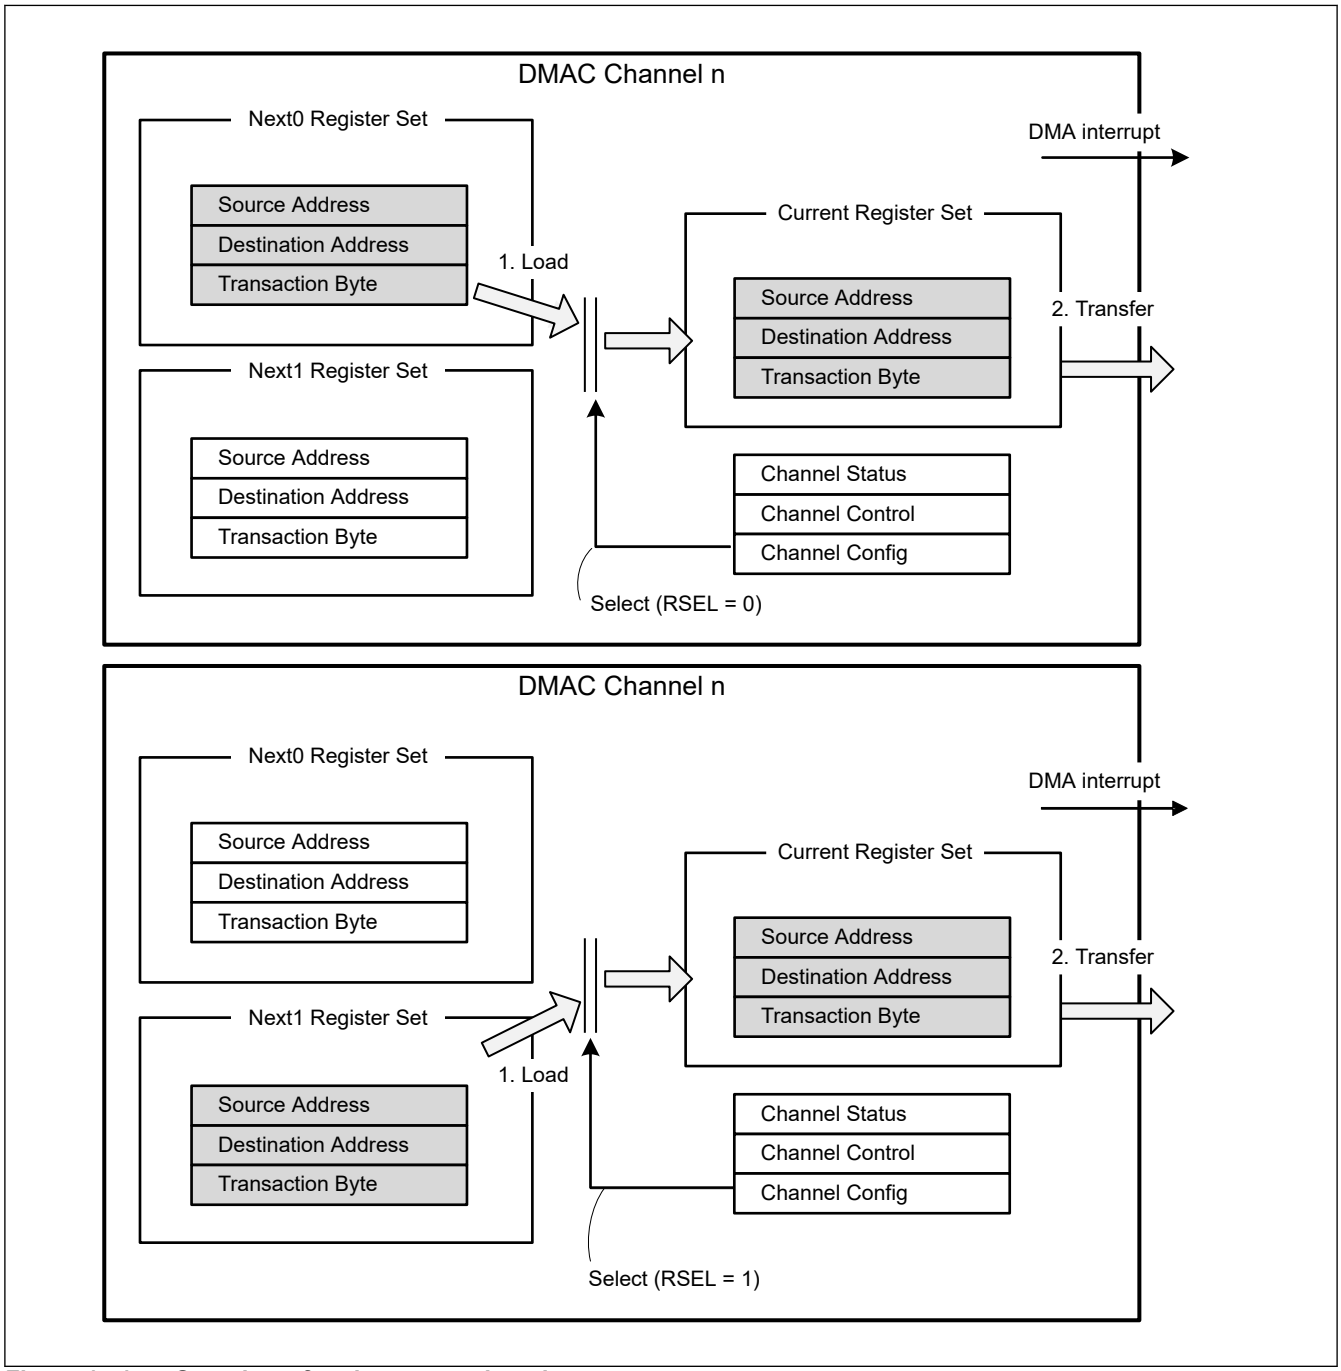


Figure 14.1 Overview of register normal mode

Figure 14.1 shows operations when Next0 Register Set is executed above and when Next1 Register Set is executed below.

(1) Operation Flow in Register Mode

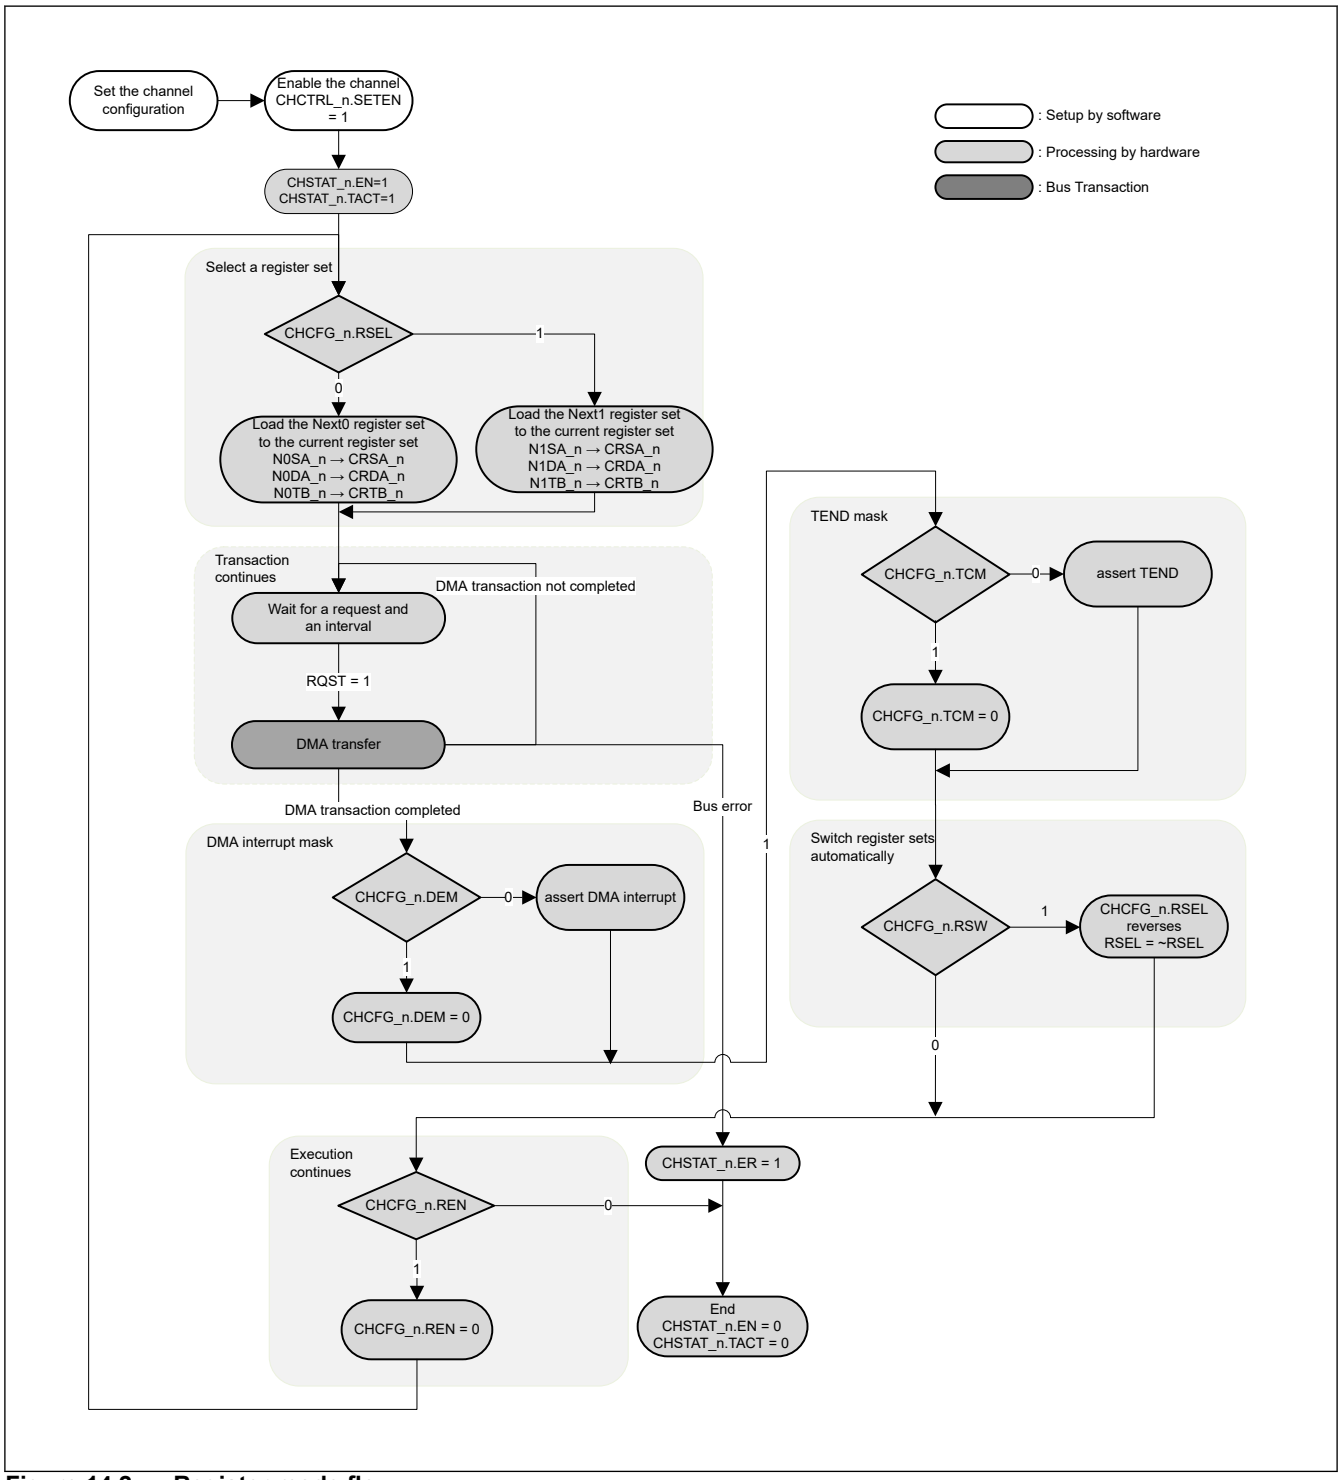

Figure 14.2 Register mode flow

(2) Register Mode Flow Description

1. Channel setting
   Set Next0 or Next1 Register Set (the transfer destination address, the transfer source address, and the total number of transfer bytes).
   In addition, use setting registers CHCTRL_n or CHCFG_n for each channel to set the detection method of the DMA transfer request, the output mode of the DACK/TEND signal, and the amount of data for a transfer.

2. Selecting the register set
   When 1 is written to the SETEN bit in the CHCTRL_n register, the EN bit and the TACT bit in the CHSTAT_n register are set to 1, and the setting value of the next register set selected by the RSEL bit in the CHCFG_n register is loaded to the current register set.
3. DMA transfer
   According to the set value, a DMA transfer is performed. For details on the transfer, see from section 14.3.2. Transfer Mode to section 14.3.11. Aborting a Transfer.
4. DMA transfer completion mask
   According to the value set for the DEM bit in the CHCFG_n register, the DMA transfer completion interrupt is masked. When DEM = 1, the DMA transfer completion interrupt is masked. Immediately after the DMA transfer completion interrupt conditions are satisfied, the DEM bit is cleared to 0 automatically.
5. TEND mask
   According to the values set for the TCM bit in the CHCFG_n register, the TEND is masked. When TCM = 1, TEND is masked. Immediately, the DMA transfer completes and the TCM bit is cleared to 0 automatically.
6. Switching register sets automatically
   According to the value set for the RSW bit in the CHCFG_n register, the register set is switched to the other next register set.
7. Successive execution
   According to the value set for the REN bit in the CHCFG_n register, DMA transfers are performed successively. When REN = 0, the EN bit and the TACT bit in the CHSTAT_n register are cleared to 0, and DMAC stops operation. When REN = 1, the DMA transfer continues. Immediately after the conditions for performing DMA transfer again are satisfied with the REN bit, the REN bit is cleared to 0 automatically.

(3) Setting the Register Mode

Select the register set to execute.

Table 14.4 Register mode settings

DMS (CHCFG_n)	RSEL (CHCFG_n)	Description
0	0	Executes Next0 Register Set
	1	Executes Next1 Register Set

DMA transfer completion interrupts can be masked.

Table 14.5 DMA transfer completion interrupt mask settings

DEM (CHCFG_n)	Description
0	When a DMA transfer completes, the DMA transfer completion interrupt is generated
1	Even if a DMA transfer completes, no DMA transfer completion interrupt is generated. When a DMA transfer completes, the DEM bit is cleared to 0 automatically.

TEND output can be masked.

Table 14.6 TEND output mask settings

TCM (CHCFG_n)	Description
0	When a DMA transfer completes, the TEND is asserted
1	Even if a DMA transfer completes, no TEND is asserted. When a DMA transfer completes, the TCM bit is cleared to 0 automatically.

After a DMA transfer, another DMA transfer can be performed successively.

Table 14.7 Settings for automatic execution of register sets

REN (CHCFG_n)	Operation	Remarks
0	When a DMA transfer of the register set for the RSEL bit completes, the EN bit is cleared to 0, and the DMA operation ends	Set this value if you want to perform a DMA transfer once
1	After a DMA transfer completes, a DMA transfer is performed for the register set that was selected to be performed successively. When the successive transfer is performed, the REN bit is cleared to 0.	Set this register if you want to perform register sets successively

When a DMA transfer completes, the register set can be switched to the next register set.

Table 14.8 Settings for switching register sets automatically

RSW (CHCFG_n)	Operation	Remarks
0	When a DMA transfer completes, register sets are not switched	Set this value when you want to use one register set only
1	When a DMA transfer completes, the RSEL bit is reversed automatically, and the other register set is selected	Set this value if you want to switch register sets

(4) Register Mode Setting Examples

Using the Next0 register set only.

Table 14.9 Register mode setting example 1

DMS (CHCFG_n)	RSEL (CHCFG_n)	DEM (CHCFG_n)	TCM (CHCFG_n)	RSW (CHCFG_n)	REN (CHCFG_n)
0 (Register mode)	0 (Next0)	0 (Do not mask)	0 (Do not mask)	0 (Do not switch)	0 (Continuous execution not in progress)

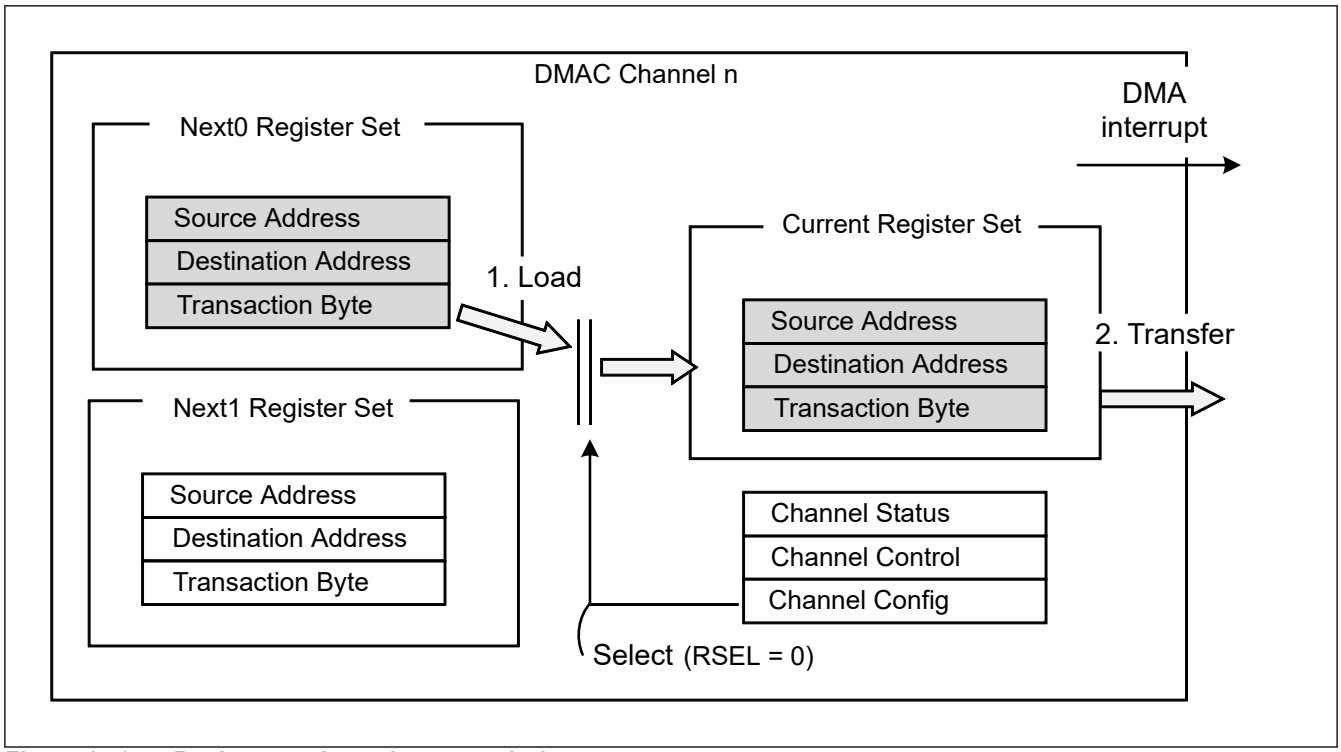

Figure 14.3 Register mode setting example 1

1. Writing 1 to the SETEN bit in the CHCTRL_n register sets 1 to the EN bit in the CHSTAT_n register, and loads Next0 Register Set to the current register set.
2. According to the values set for the current register set and the channel register set, a DMA transfer is performed.

3. Because the DEM bit in the CHCFG_n register is 0, a DMA transfer completion interrupt is generated when a DMA transfer completes.
4. Because the TCM bit in the CHCFG_n register is 0, the TEND is asserted when DMA transfer completes.
5. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0, and the operation ends.

Using two register sets successively.

Table 14.10 Register mode setting example 2

DMS (CHCFG_n)	RSEL (CHCFG_n)	DEM (CHCFG_n)	TCM (CHCFG_n)	RSW (CHCFG_n)	REN (CHCFG_n)
0 (Register mode)	0 (Next0)	1 (Mask)	0 (Do not mask)	1 (Switch)	1 (Continuous execution not in progress)

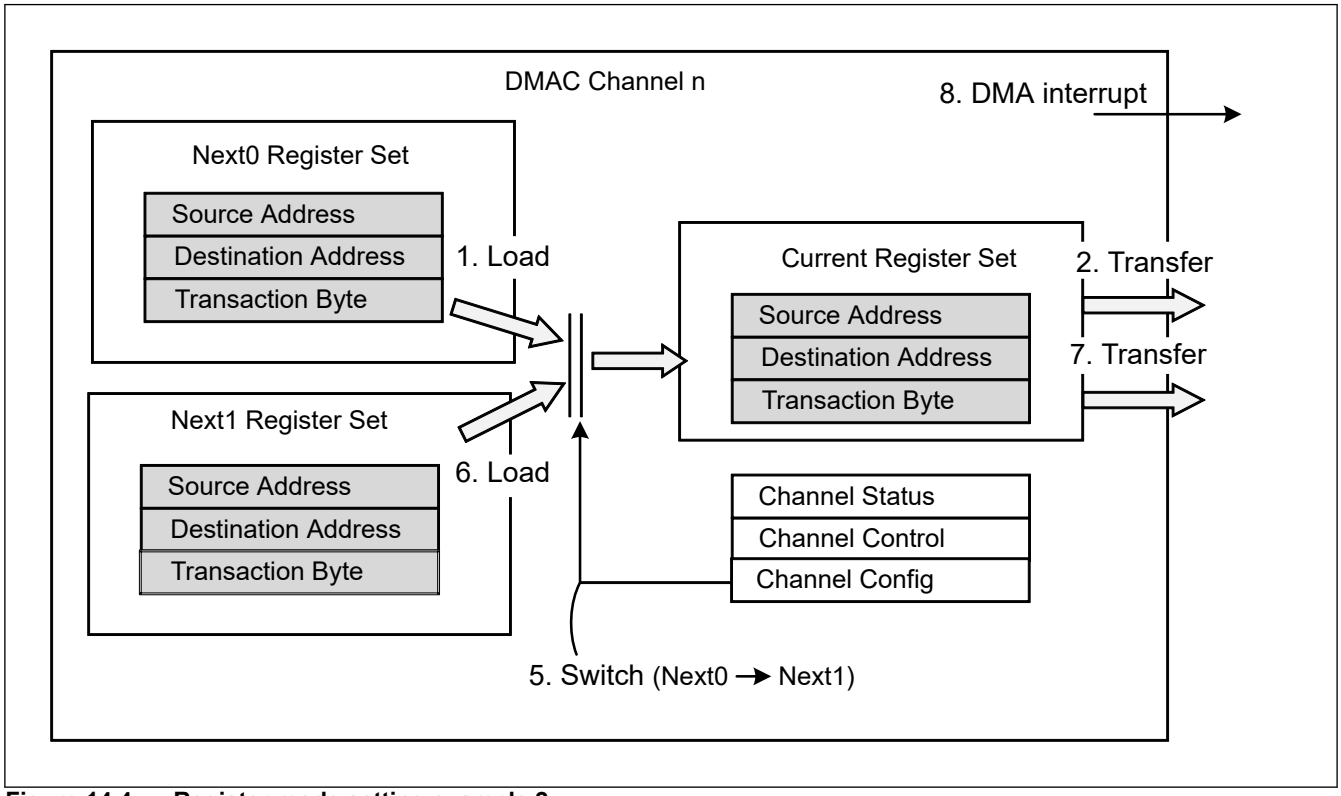

Figure 14.4 Register mode setting example 2

1. Writing 1 to the SETEN bit in the CHCTRL_n register sets 1 to the EN bit in the CHSTAT_n register, and loads Next0 Register Set to the current register set.
2. According to the values set for the current register set and the channel register set, a DMA transfer is performed.
3. Because the DEM bit in the CHCFG_n register is 1, when the DMA transfer completes, no DMA transfer completion interrupt is generated. In addition, the DEM bit is cleared to 0 automatically.
4. Because the REN bit in the CHCFG_n register is 1, DMA transfers are performed successively. In addition, the REN bit is cleared to 0.
5. Because the RSW bit in the CHCFG_n register is 1, the register set to be executed next is switched (RSEL = 0 → 1).
6. Loads Next1 Register Set to Current Register Set.
7. According to the values for Current Register Set and Channel Register Set, DMA transfers are performed.
8. Because the DEM bit in the CHCFG_n register is 0, a DMA transfer completion interrupt is generated when a DMA transfer completes.
9. Because the TCM bit in the CHCFG_n register is 0, the TEND is asserted when DMA transfer completes.

10. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0 automatically.

14.3.1.2 Link Mode

In link mode, a DMA transfer is performed by reading a descriptor in the memory area outside the DMAC as the setting value. Within DMAC, each channel has the next link address (NXLA_n) register and the current link address (CRLA_n) register. Each of them is used to set the address of the descriptor to be executed next and to display the descriptor address of the current DMA transfer respectively.

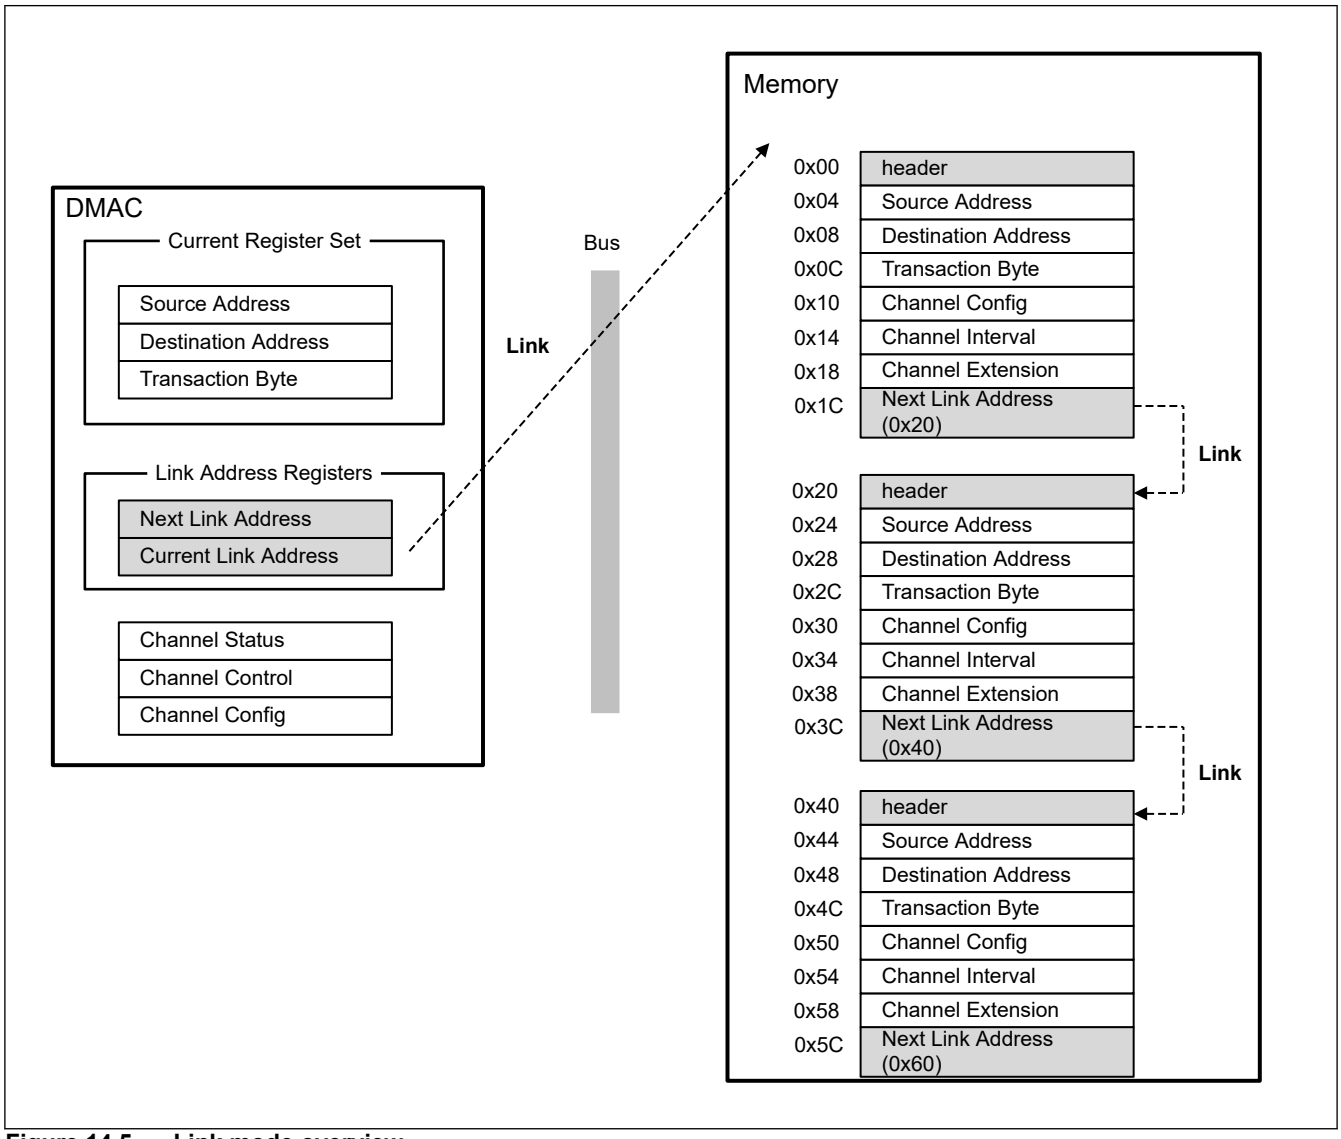

Figure 14.5 Link mode overview

(1) Operation Flows in Link Mode

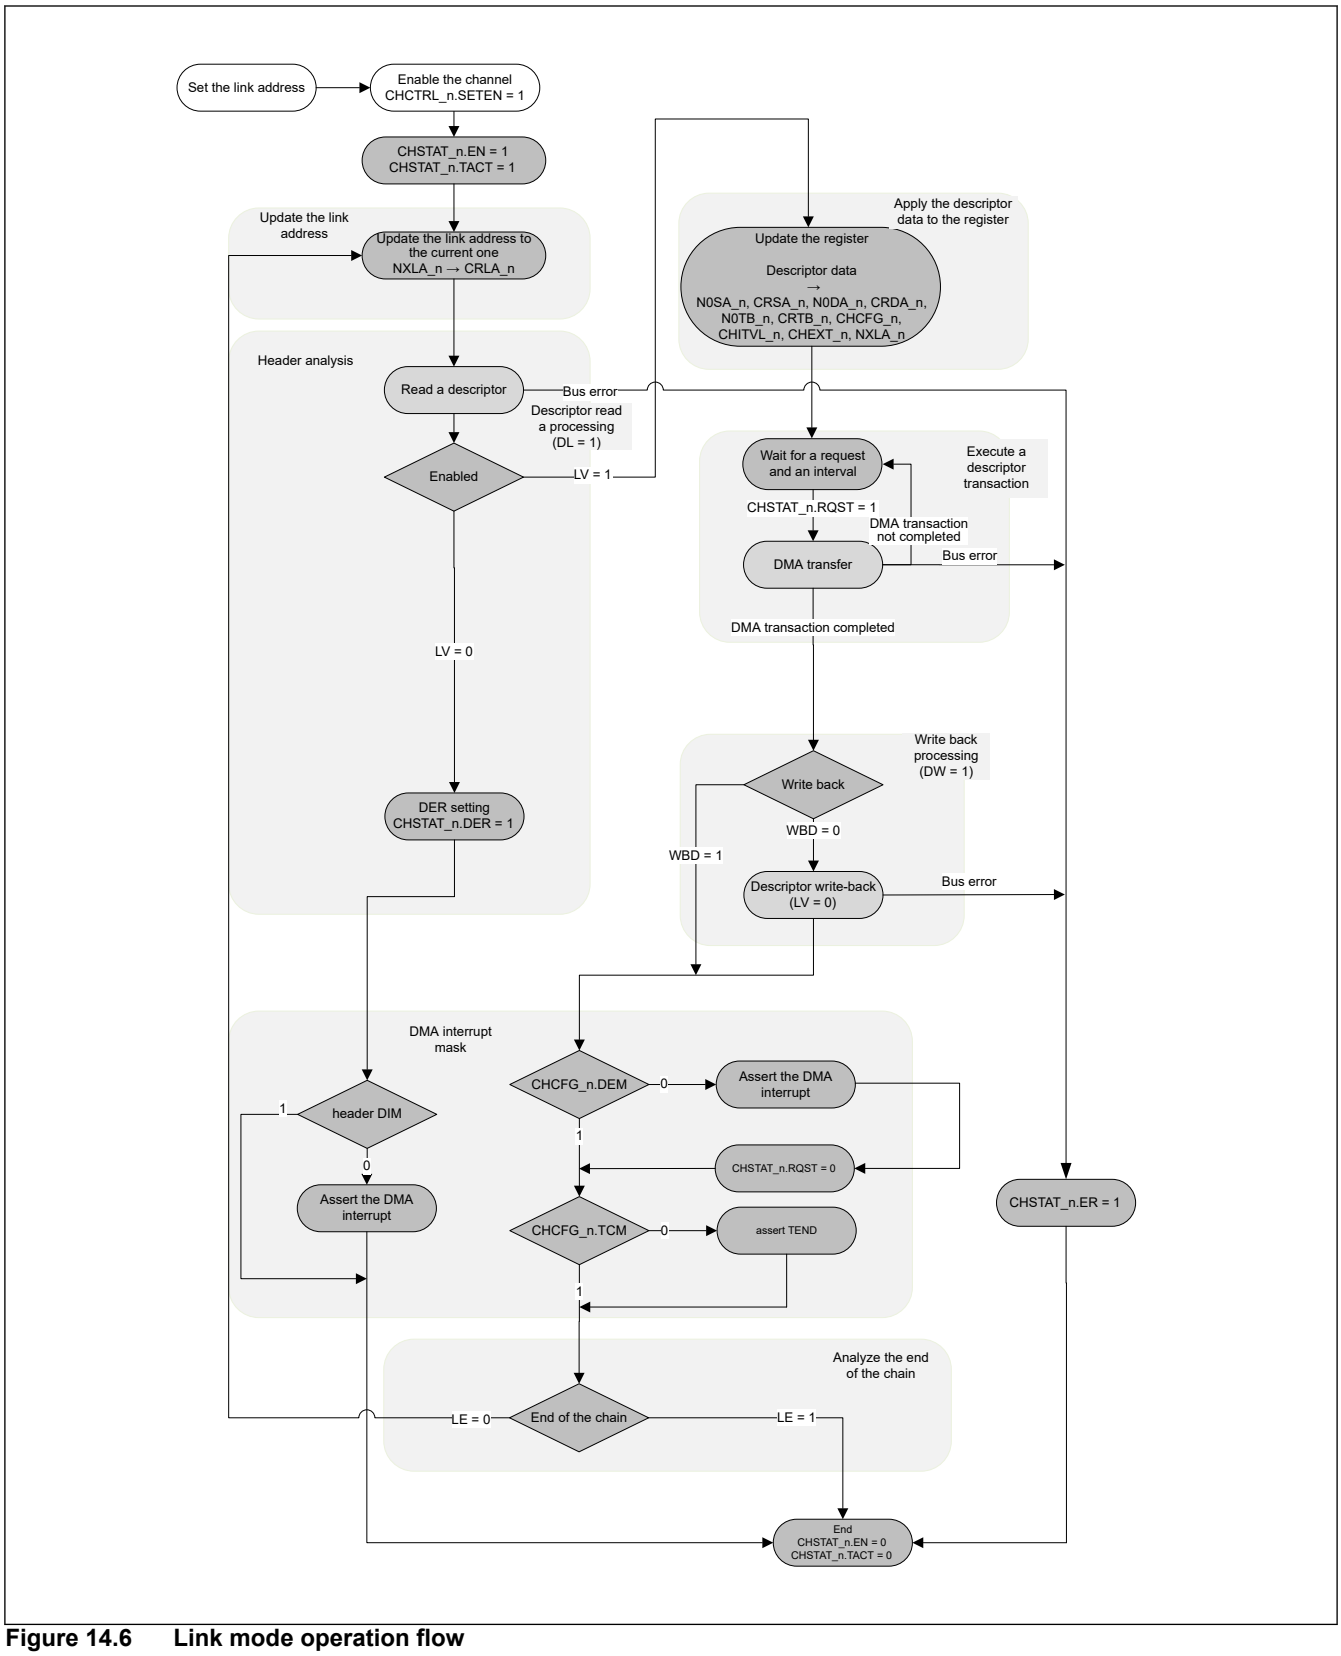

Figure 14.6 Link mode operation flow

(2) Description of Link Mode Operation Flow

1. Channel setting
   Set the start address of the link destination in the NXLA_n register.

2. Updating the link address
   Writing 1 to the SETEN bit in the CHCTRL_n register sets 1 to the EN bit and the TACT bit in the CHSTAT_n register, and loads the link address set for the NXLA_n register to the CRLA_n register.
3. Descriptor read and header judgment
   DMAC starts reading a descriptor and checks the header contents. When LV = 0, the descriptor is discarded and the DER bit in the CHSTAT_n register = 1 indicates the end state (the EN bit in the CHSTAT_n register = 0). At that time, if the DIM bit in the header register is 0, a DMA transfer completion interrupt is generated.
4. Descriptor settings
   When LV = 1, the read descriptor data is loaded to the current register set and the channel register set. In addition, the next link destination is loaded to the NXLA_n register.
5. DMA transfer
   According to the set value, a DMA transfer is performed. For details on the transfer, see from section 14.3.2. Transfer Mode to section 14.3.11. Aborting a Transfer.
6. Writing back of header
   When WBD of header = 0, DMAC writes LV = 0 back to the header area.
7. DMA interrupt mask
   When the DEM bit in the CHCFG_n register is 0, a DMA transfer completion interrupt is generated. When DMA transfer is performed using multi descriptors, DMA request should be issued again and RQST is set to 1 to continue the DMA transfer because RQST is set to 0 when DEM = 0.
8. TEND mask
   When the TCM bit in the CHCGF_n register is 0, the TEND is generated.
9. Link end judgment
   When LE of header = 1, the EN bit and the TACT bit in the CHSTAT_n register are cleared to 0, and DMAC stops operation. When LE = 0, the current register set is updated, and the next descriptor read is started.

(3) Register Settings

When using link mode, set the DMS bit in the CHCFG_n register to 1.

Table 14.11 Link mode settings

DMS (CHCFG_n)	Description
1	Operates in link mode. This bit cannot be changed by using a descriptor.

As registers that indicate the link destination, the next link address (NXLA_n) register and the current link address (CRLA_n) register are available.

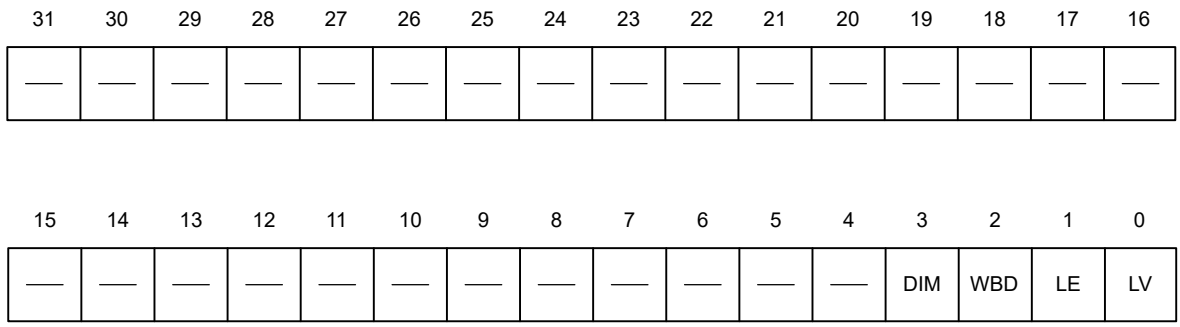
To start link mode, set the link destination in the NXLA_n register.

The NXLA_n register is updated to the next link after a descriptor is read. In addition, the CRLA_n register indicates the link address of the currently executed descriptor.

Table 14.12 Link address register set

Register	Description
NXLA_n	Sets and displays the next link destination. Before starting link mode, set the address of the link destination for this register.
CRLA_n	Displays the currently executed link destination. This register is read-only.

(4) Descriptor Settings



A descriptor should be deployed in the link address as shown in Table 14.13. DMAC interprets data obtained through descriptor read in order.

Table 14.13 Descriptor placement

Address (Link Address + N)*1							
+0x1C	**+0x18**	**+0x14**	**+0x10**	**+0x0C**	**+0x08**	**+0x04**	**+0x00**
Next link address	Extension	Interval	Config*2	Transaction byte	Destination address	Source address	Header

Note 1. Link address should be aligned to 32-bit boundary.
Note 2. Register mode setting is prohibited.

As shown in Figure 14.7, header indicates descriptor states. This area is read by DMAC before starting a DMA transfer in link mode. In addition, after the DMA transfer, the transfer status is written back by DMAC.

When reading header, DMA performs a write back for this 4 bytes area after DMA transfer and when the descriptor information is completed. Write back data is a header read data except LV, and LV = 0.

Figure 14.7 Header area

Table 14.14 Header area

Bit position	Bit name	Description
0	LV	Link Valid Indicates that this descriptor is enabled. When WBD = 0, DMAC writes 0 after the DMA transfer written in the descriptor. Set 1 when setting header. 0: The descriptor is disabled 1: The descriptor is enabled
1	LE	Link End Indicates that the link ends during DMA transfer of this descriptor. To indicate the end of the link, set this bit to 1. 0: The link continues 1: The link ends
2	WBD	Write Back Disable Masks write back execution of the LV bit. When this bit is 1, DMAC does not perform write-back operation. 0: The LV bit is written back to 0 1: The LV bit is not written back
3	DIM	Descriptor Interrupt Mask When LV = 0 at loading of header, specifies whether DMA transfer completion interrupt mask or not. 0: DMA transfer completion interrupt is asserted 1: DMA transfer completion interrupt is masked
31:4	—	A reserved area. Set 0.

Data in descriptors except header has the same specifications as an on-chip register. However, the DMS bit in the CHCFG_n register cannot be changed by a descriptor. For details on the on-chip register specifications, see section 14.2. Register Descriptions.

For descriptor setting examples, see section 14.5.4. Setting Example 4 (Link Mode).

Figure 14.8 provides an overview of the descriptor area and the DMA transfer area to which DMAC accesses.

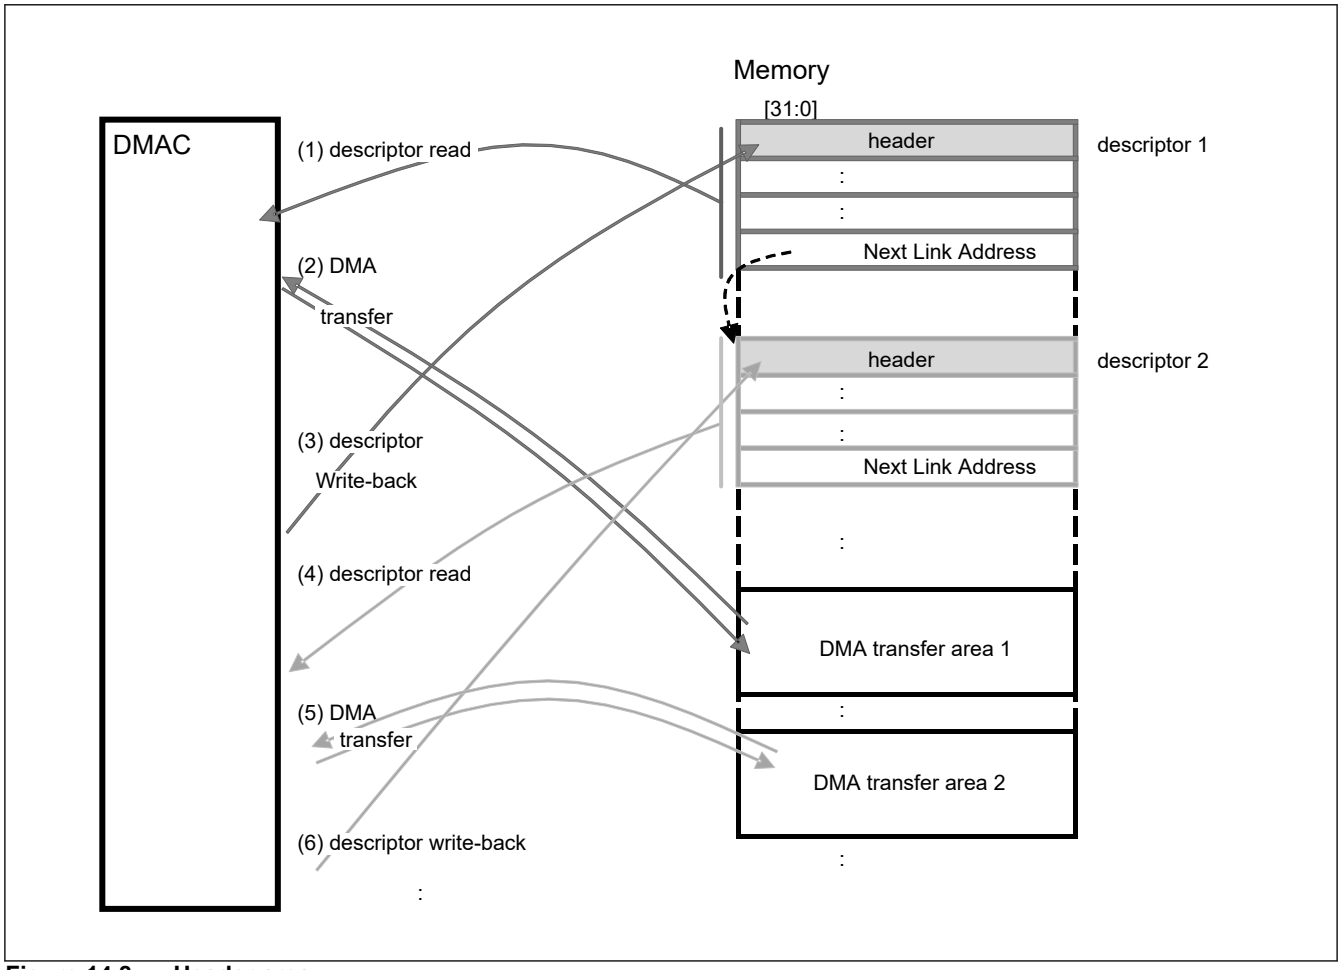


Figure 14.8 Header area

1. Descriptor read
   Loads the value set for the on-chip NXLA_n register to the CRLA_n register, and then reads the descriptor from the memory space (descriptor 1) indicated by the CRLA_n register.
2. DMA transfer
   When the LV bit in header is 1, performs a DMA transfer according to the descriptor information.
3. Descriptor write-back
   After the DMA transfer for the set number of bytes, if the WBD bit in header is 0, the LV bit writes 0 and other fields writes the value read in step 1 as data back to header [31:1] of descriptor 1 in bytes.
4. Descriptor read
   If the LE bit in header of the descriptor which was read previously (step 1) is 0, reads the next descriptor from the address (descriptor 2) indicated by the next link address in the descriptor.
5. DMA transfer
   When the LV bit in header is 1, performs a DMA transfer according to the descriptor information.
6. Descriptor write-back
   After the DMA transfer for the set number of bytes, if the WBD bit in header is 0, the LV bit writes 0 and other fields writes the value read in step 4 as data back to header [31:1] of descriptor 2 in bytes.

Hereafter, repeats steps (4) through (6).

When LE of header is 1 and WBD = 0, DMA transfer proceeds in accord with the descriptor settings, and 0 is written back to the LV bit of the header, after which operation ends.

When LE of header is 1 and WBD = 1, performs a DMA transfer with the setting, and ends the operation (no write-back is performed).

When LV of header is 0 the operation stops (no DMA transfer is performed).

(5) Link Configuration Examples

In link mode, descriptors can be configured as shown in Figure 14.9.

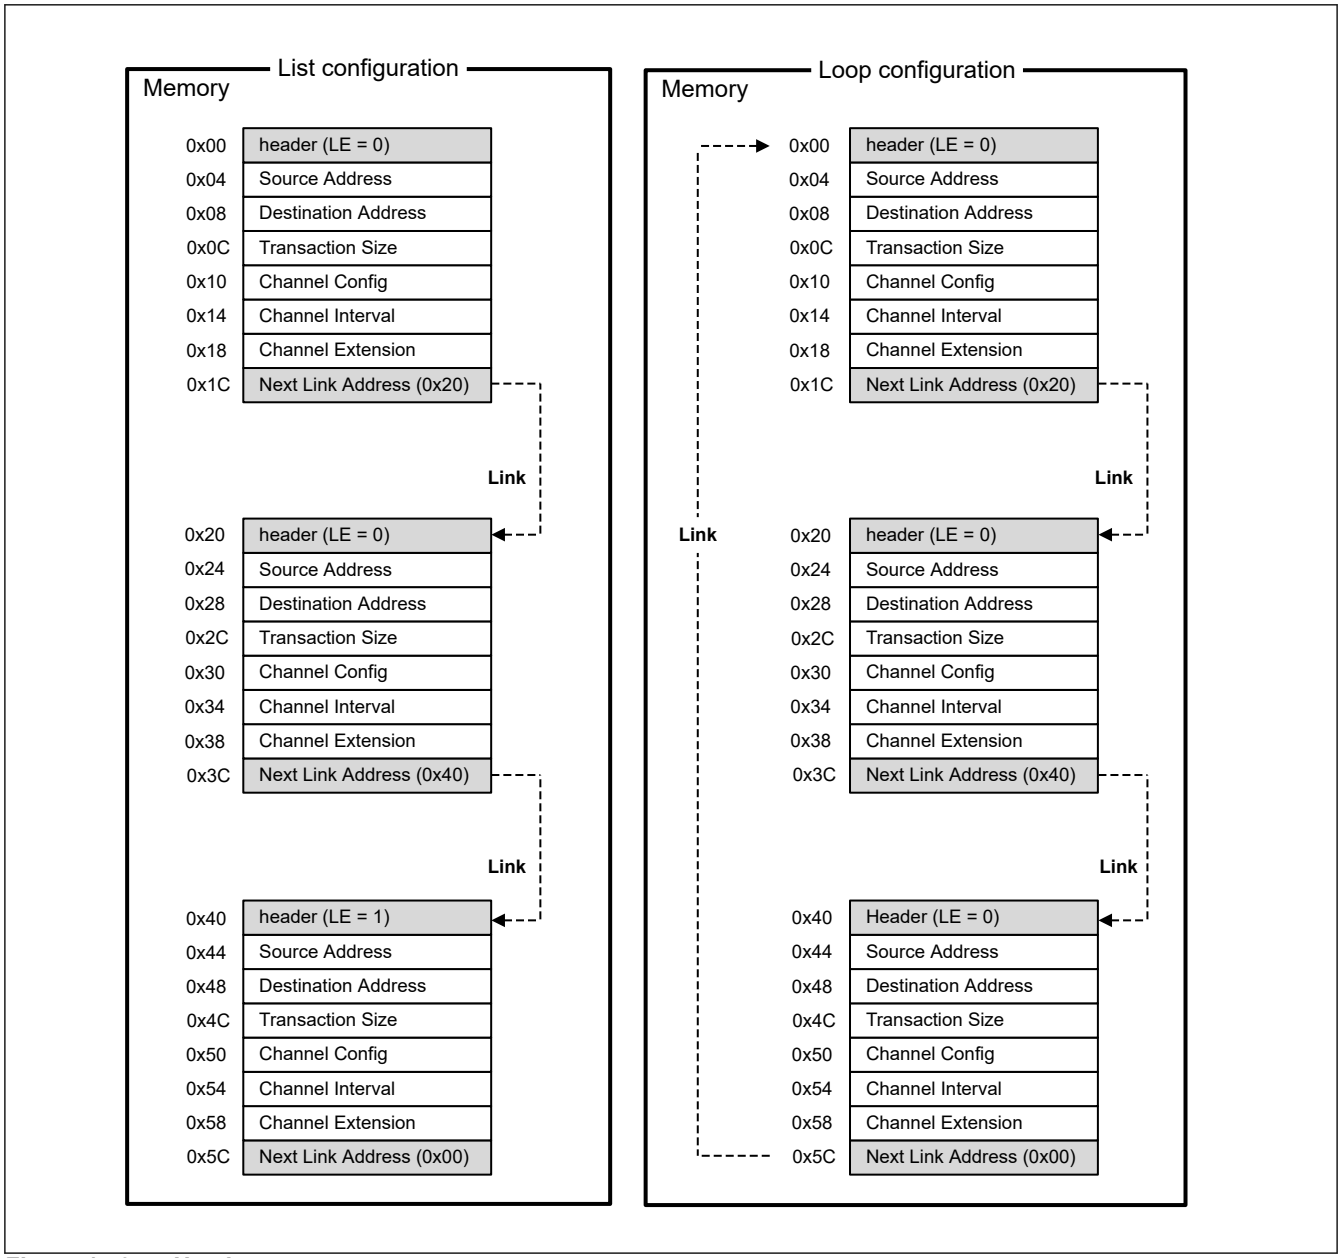

Figure 14.9 Header area

Setting 1 to the LE bit in header of the last descriptor ends the link.

Setting the link destination of the last descriptor to the address of the previous descriptor configures the descriptors in a loop. To end the loop, change the LE bit of header to 1 before DMAC reads a descriptor, or follow the procedure to pause a transfer.

14.3.2 Transfer Mode

Single transfer mode and block transfer mode are supported. When selecting mode, use the TM bit in the CHCFG_n register for each channel.

Table 14.15 Basic transfer settings

Transfer mode	TM (CHCFG_n)	Description
Single transfer	0	For one DMA request, performs a DMA transfer
Block transfer	1	For one DMA request, performs transfers until a DMA transfer completes

14.3.2.1 Single Transfer Mode

When a DMA transfer request is accepted, a DMA transfer is performed on the side (transfer source or transfer destination) indicated by the REQD bit in the CHCFG_n register to activate DACK. Each time a transfer request is accepted, transfer proceeds. This operation is repeated until it reaches the transfer size loaded from the N0TB_n or N1TB_n register to the CRTB_n register. Arbitration between channels is performed for each DMA transfer.

The DACK output timing differs depending on the setting for the REQD bit in the CHCFG_n register or settings for the transfer size (DDS[2:0] and SDS[2:0] in the CHCFG_n register) bit settings. For details, see section 14.3.8. Differences in Operation According to the Transfer Data Size.

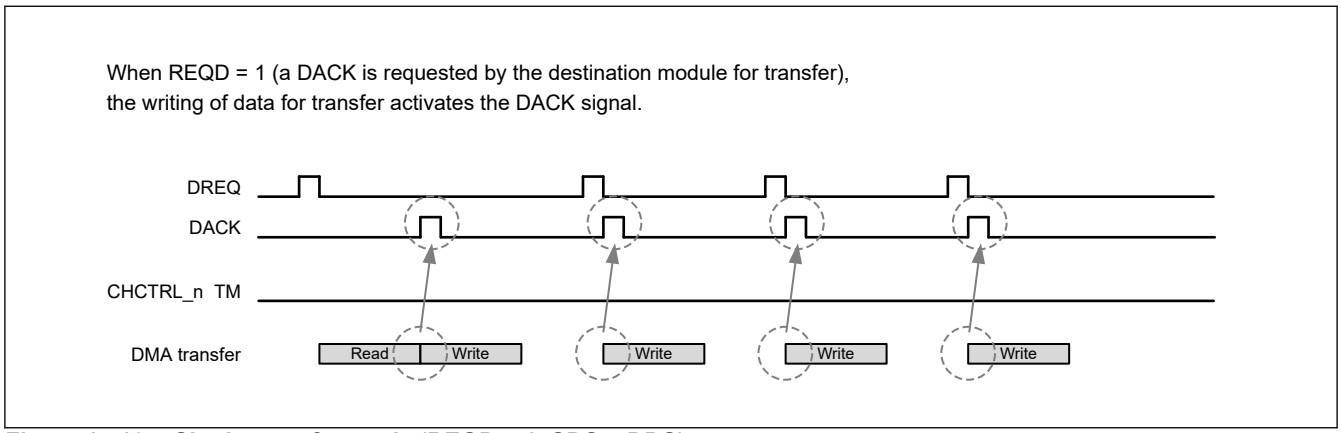

Figure 14.10 Single transfer mode (REQD = 1, SDS > DDS)

14.3.2.2 Block Transfer Mode

Once a DMA transfer request is accepted, the transfer continues until transfer of the number of bytes loaded from the N0TB_n or N1TB_n register to the DMA transfer byte register (CRTB_n register) is completed (After DMA transfer completion, arbitration between channels is performed for each DMA transfer).

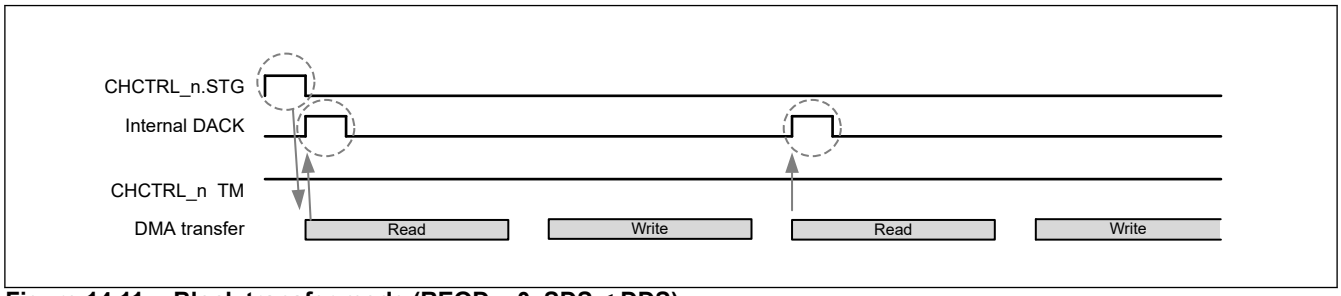

Figure 14.11 Block transfer mode (REQD = 0, SDS < DDS)

14.3.3 DMA Channel Priority Control

As an arbitration method between channels, fixed priority mode and round-robin mode are supported. To select the mode, use the PR bit in the DCTRL register. When the PR bit is 0, fixed priority mode is selected. When the PR bit is set to 1, round-robin mode is selected.

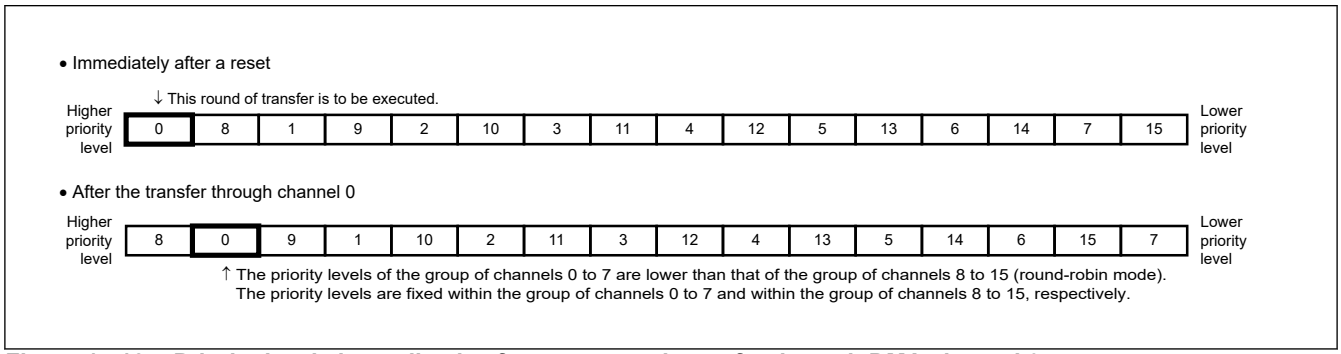
Table 14.16 Priority control settings

Transfer mode	PR (DCTRL)	Description	Applications
Fixed Priority	0	Channels 0 to 7, channels 8 to 15 are fixed priority mode. CH0 (CH8) > CH1 (CH9) > CH2 (CH10) > CH3 (CH11) > CH4 (CH12) > CH5 (CH13) > CH6 (CH14) > CH7 (CH15)	Select this mode if channels have priority
Round-Robin	1	Controls requests in round-robin mode	Select this mode if you want to execute requests equally

14.3.3.1 Fixed Priority Mode

In fixed priority mode, the priority levels are fixed within the group of channels 0 to 7 and within the group of channels 8 to 15. In addition, the priority levels between the group of channels 0 to 7 and the group of channels 8 to 15 are in round-robin mode.

The priority levels immediately after a reset and transfer through DMA channel 0 are shown in Figure 14.12.



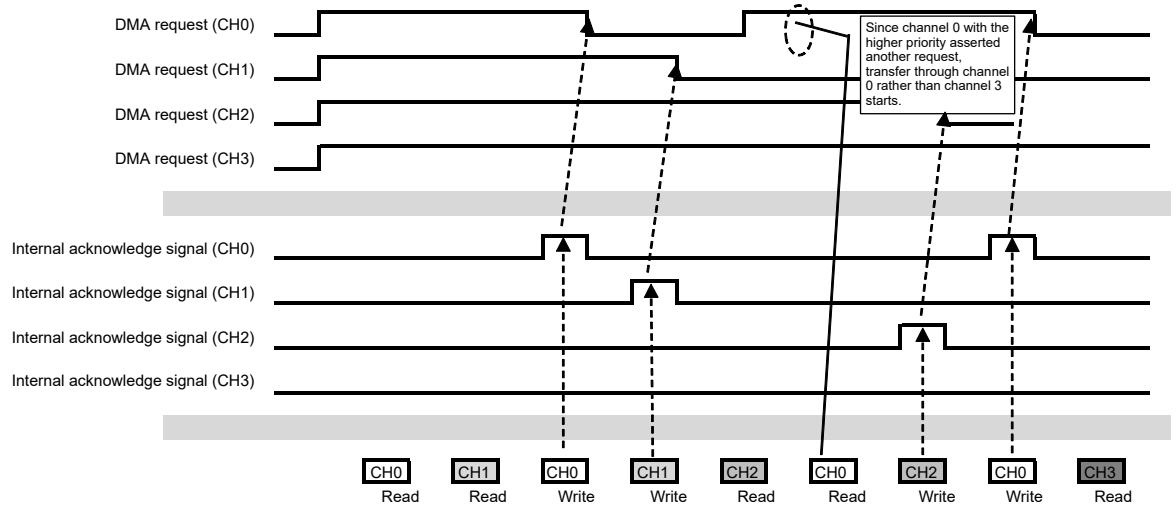


Figure 14.12 Priority levels immediately after a reset and transfer through DMA channel 0

If DMA transfer requests are generated on multiple channels simultaneously, a DMA transfer request with a smaller channel number takes precedence.

Figure 14.13 provides an example of when a DMA transfer is performed in fixed priority mode if another DMA transfer with higher priority is requested.

Example: DMA requests are issued through four channels at the same time.

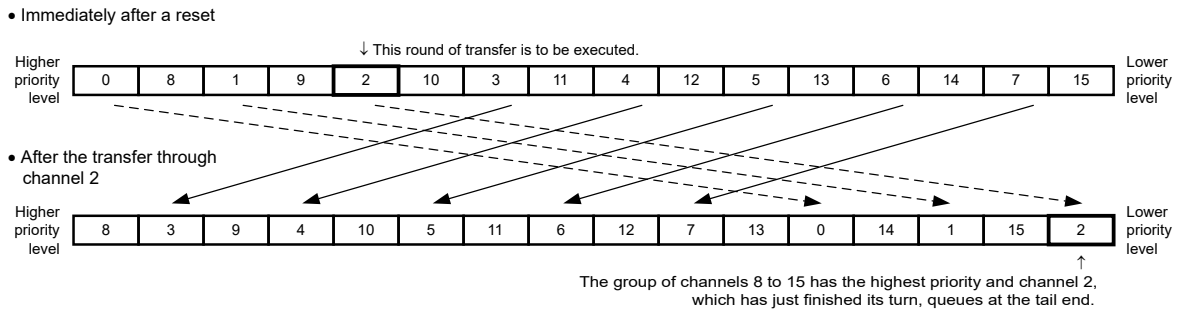
Note: Channel 0 is handled with the highest priority, but the transfer with the next highest priority is performed because bus arbitration is performed after data has been read from the transfer source of channel 0. Read operation of another channel may interrupt the operation between reading data from and writing data to the same channel.

Figure 14.13 Fixed priority mode (number of channels = 4 and REQD = 1)

14.3.3.2 Round-Robin Mode

In round-robin mode, priority is changed every time a transfer of a channel is accepted so that the lowest priority is given to the channel in which the last transfer is performed.

The priority levels immediately after a reset and transfer through DMA channel 2 are shown in Figure 14.14.



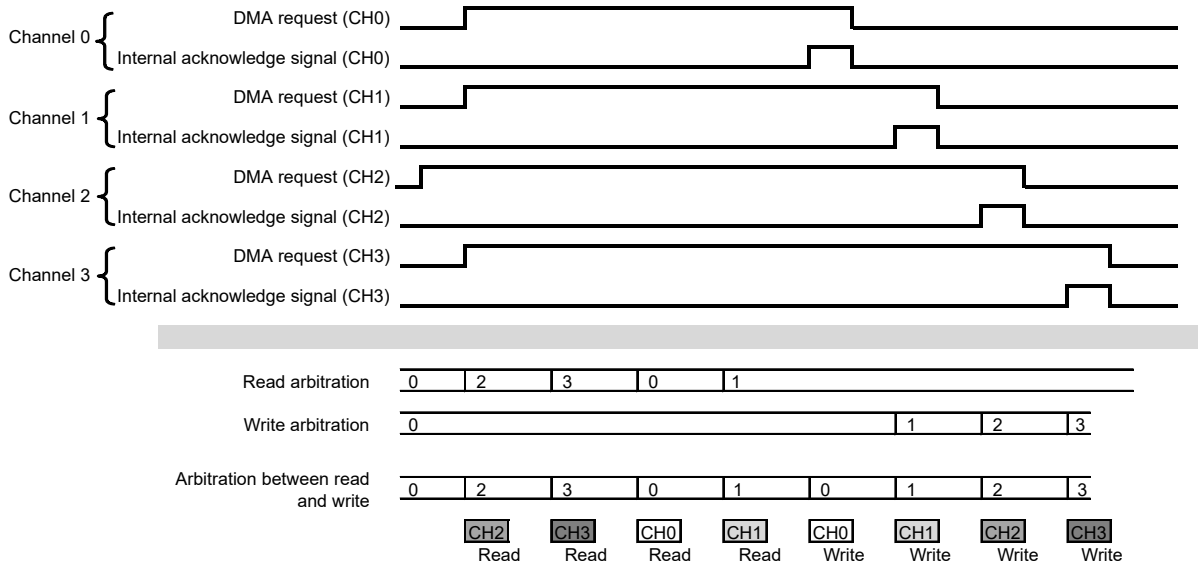


Figure 14.14 Priority levels immediately after a reset and transfer through DMA channel 2

Figure 14.15 provides an example of a DMA transfer in round-robin mode.

Note: Within DMAC, arbitration between read channels and arbitration between write channels are performed. As a result of those arbitrations, further arbitration is performed, and a bus access is issued.

Figure 14.15 Round-robin mode (number of channels = 4 and REQD = 1)

14.3.4 DMA Transfer Request

DMA activation requests have four types including software requests, external requests, on-chip peripheral module requests, and external interrupts.

Select the transfer request source for an external request, on-chip peripheral module request, external interrupt, and software request with the DMACm_RSSELn register (m = 0 or 1, n = 0 to 5).

For details on the DMACm_RSSELn register (m = 0 or 1, n = 0 to 5), see section 14.2.9. DMAC0_RSSELi : DMAC Unit 0 Resource Select Register i (i = 0 to 5) and section 14.2.10. DMAC1_RSSELi : DMAC Unit 1 Resource Select Register i (i = 0 to 5).

14.3.4.1 Specifying Detection Operation of DMA Transfer Requests for Each Source

Detection methods for DMA transfer requests of external requests, on-chip peripheral module requests, external interrupts, and software requests might be specified according to sources.

For each DMA transfer source, set the LVL, LEN, and HEN bits in the CHCFG_n register according to Table 14.17, Table 14.18, and Table 14.19.

For details on edge detection operation, see Figure 14.16 and Figure 14.17. For information about level detection operation, see Figure 14.18 and Figure Figure 14.19.

Table 14.17 Detection operation specification for each source of DMA transfer requests

DMA transfer request source	Detection operation specification of DMA transfer requests	DMA acknowledge signal specification
External request	Detects the rising edge. Detects the falling edge. Detects the high level. Detects the low level.	Depends on specifications of the DMA transfer request source
On-chip peripheral module request	Depends on specifications of the DMA transfer request source. See Table 14.19.	Bus cycle mode
External interrupt	Detects the rising edge. Detects the high level.	Bus cycle mode
Software request	Detects the rising edge	Bus cycle mode

Table 14.18 Method of detecting DMA transfer request signals

Mode	LVL (CHCFG_n)	HIEN (CHCFG_n)	LOEN (CHCFG_n)	Description
Edge detection	0	0	0	Disables detection
			1	Detects the falling edge
		1	0	Detects the rising edge
			1	Detects the falling and rising edges
Level detection	1	0	0	Disables detection
			1	Detects the low level
		1	0	Detects the high level
			1	DMA transfer starts regardless of the request signal level when the SETEN bit in the CHCTRL_n is 1. In this setting, DMA acknowledge must be set to other than level mode. If level mode is set, dead lock will occur.

Table 14.19 DMA transfer request detection operation setting table (1 of 9)

Note 1. Set the LVL, HIEN, and LOEN bits of the external interrupts (IRQ0 to IRQ13) as follows:

For the setting of the NS_PORTNF_MD register, see section 11.2.2.4. NS_PORTNF_MD : Interrupt Edge Detection Setting Register.

LVL: Set according to the edge/level setting of the NS_PORTNF_MD register.

HIEN: Set to 1 regardless of the detection level of the NS_PORTNF_MD register.

LOEN: Set to 0 regardless of the detection level of the NS_PORTNF_MD register.

Note 2. If the DACK/TEND signal is not used, specify any setting.

Note 3. When an interrupt occurred at the same time as DMA transfer request, DMA transfer completion interrupt does not occur. DMA transfer completion should be confirmed by END bit in CHSTAT_n register.

Remarks: CHCFG_n register setting values

TM bit
- 0: Single transfer
- 1: Block transfer

AM[2:0] bits
- 001b: DACK level output
- 010b: DACK bus cycle output
- 100b: Masks DACK output

LVL bit
- 0: Detects the edge of a DMA request
- 1: Detects the level of a DMA request

REQD bit
- 0: DACK output during read operation
- 1: DACK output during write operation

Note: Instead of an interrupt source from peripheral modules, transfer completion sources of DMAC channels selected by the DMAC source select register are connected to the vector number selected by the DMAC Source Select Register.

14.3.4.2 Edge Detection

Setting the LVL bit in the CHCFG_n register to 0 detects the edge.

Setting the HIEN bit in the CHCFG_n register to 1 detects the rising edge, and setting the LOEN bit in the CHCFG_n register to 1 detects the falling edge.

For DMA requests by the DREQ signal, request the next DMA transfer after the DACK signal is activated.

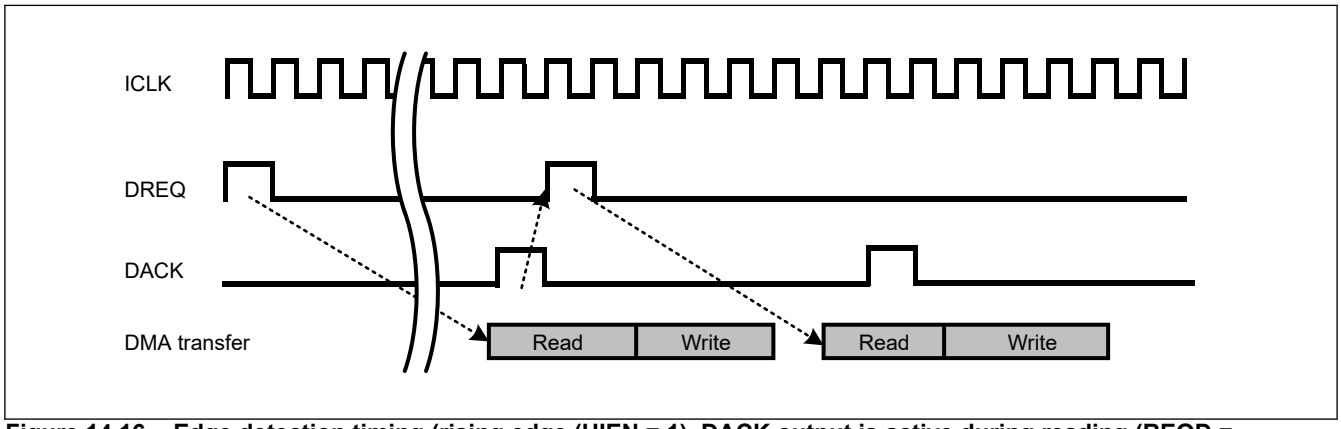

Figure 14.16 Edge detection timing (rising edge (HIEN = 1), DACK output is active during reading (REQD = 0))

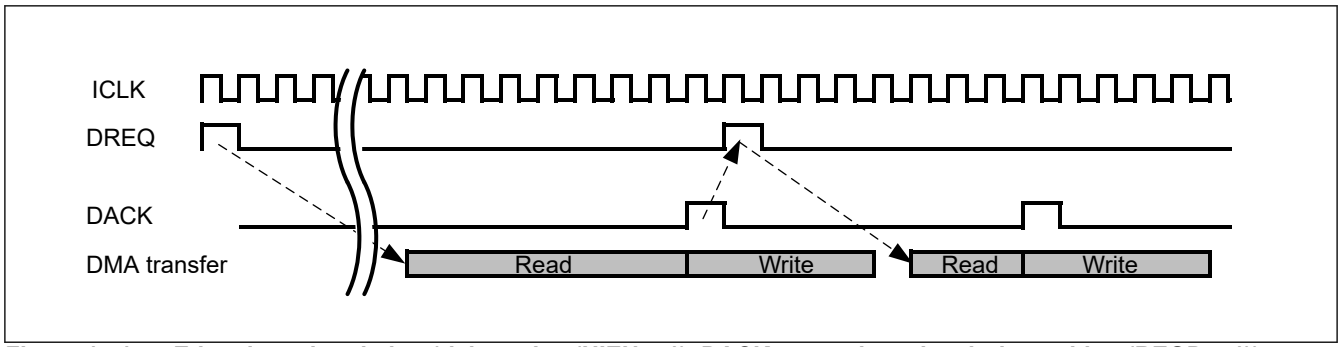

Figure 14.17 Edge detection timing (rising edge (HIEN = 1), DACK output is active during writing (REQD = 1))

14.3.4.3 Level Detection

Setting the LVL bit in the CHCFG_n register to 1 detects the level.

If a DMA transfer request is active (according to HIEN or LOEN settings) for two consecutive clocks (CLK) or more, it is recognized as a DMA request.

If the DACK signal output is set to level mode, the DACK signal output remains at the active level until the DMA transfer request is deactivated.

If you want to request the next DMA transfer, request it after the DACK signal is deactivated.

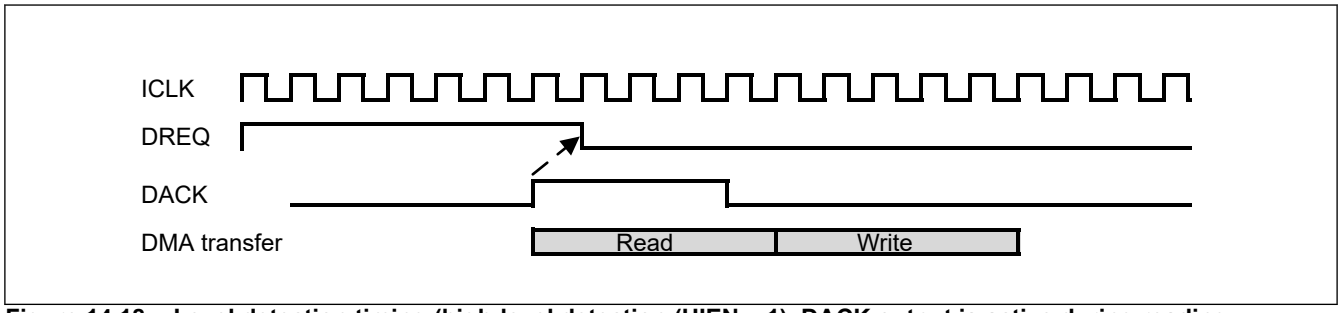

Figure 14.18 Level detection timing (high-level detection (HIEN = 1), DACK output is active during reading (REQD = 0))

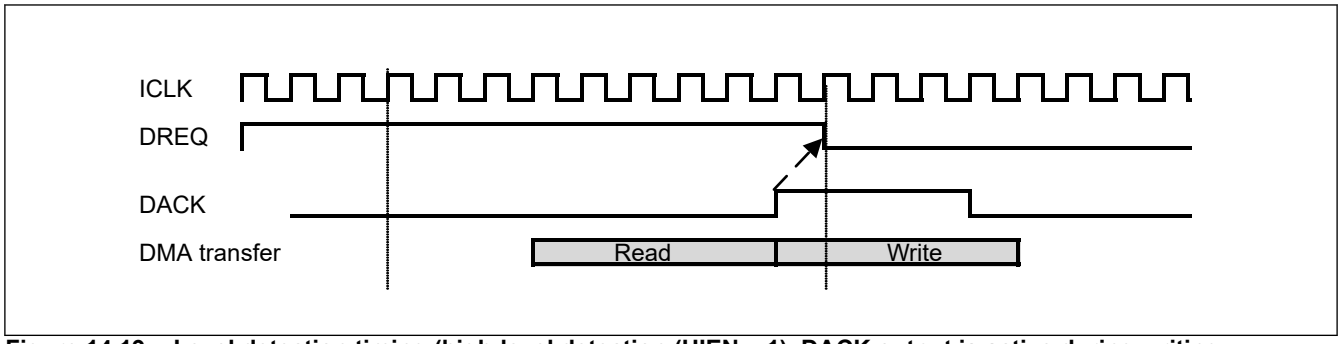

Figure 14.19 Level detection timing (high-level detection (HIEN = 1), DACK output is active during writing (REQD = 1))

14.3.5 DMA Acknowledge Output/DMA Transaction Completion Output Function

The DMA acknowledge signal (DACK) is output as a reception response signal for a DMA transfer request.

The DMA transfer completion signal (TEND) is output when the DACK signal for the last DMA transfer is output.

If the DREQ signal is used for a DMA transfer request, use DACK as the DMA acknowledge signal, and use TEND as the DMA transaction completion output signal.

Set the output mode of the DACK signals with the AM[2:0] bits in the Channel Configuration register (CHCFG_n). Level output and bus cycle output are supported.

The outputs of the DACK and TEND signals on the DACK and TEND pins are active only when the conditions given below are met. To use the DACK and TEND pins, specify appropriate settings for the Port Function Control register (PFC) and the Port Mode Control register (PMC) to use those pins as peripheral functions. For details on pin settings, see section 16, I/O Ports.

The conditions:

- The DREQ pin is set as the source for the DMA transfer request
- The source and destination of the DMA transfer are set as follows:
  - DMA is set to be transferred from an external address space (CSn) to any destination while the CHCFG_n.REQD bit is set to 0 (requested from the source of transfer)
  - DMA is set to be transferred to an external address space (CSn) from any source while the CHCFG_n.REQD bit is set to 1 (requested from the destination of transfer)

The outputs on the pins are not active for the cases other than above. However, the internal signals become active according to the setting of the AM[2:0] bits.

Transfer requested from	Source for DMA transfer	Transferred from	Transferred to	CHCFG_n		External pins used for outputting an active signal	
				AM[2:0]	REQD	DACK Signal	TEND Signal
Request from outside	DREQ	External bus	Anywhere	001/010	0	DACK	TEND
		Anywhere	External bus		1	DACK	TEND
		Internal	Anywhere		0	—	—
		Anywhere	Internal bus		1	—	—
Other than above	Other than above	Anywhere	Anywhere	Any value	Any value	—	—

Note: —: The outputs on the pin are always inactive. Inactive signal level is obtained by inverting the active level set by the bits which specify the acknowledge levels and transfer-end levels.
External bus refers to the CS0 to CS5 spaces and internal bus refers to the address spaces other than the external bus.

14.3.5.1 DMA Acknowledge Signal Output

For the DMA acknowledge signal and DMA transaction completion signal, output mode might be specified according to the source.

For each DMA transfer request source, specify the correct operation with the AM[2:0] bits of the Channel Configuration register (CHCFGn) according to Table 14.17, Table 14.19, and Table 14.20.

For details on level output operation, see Figure 14.20 and Figure 14.21.

For details on bus cycle output operation, see Figure 14.22 and Figure 14.23.

Table 14.20 DACK/TEND pin output settings

Mode	AM[2] (CHCFG_n)	AM[1:0] (CHCFG_n)	REQD (CHCFG_n)	Applications
Level	0	01b	0 (activated during read operation)	In level mode, enable DACK. The DACK output remains active until the DMA transfer request is deactivated. The TEND signal is activated only when the last DMA transfer is performed.
			1 (activated during write operation)	
Bus cycle	0	10b or 11b	0 (activated during read operation)	The DACK signal remains active during a bus cycle. Use this mode if you want to activate the DACK signal until a bus cycle ends.
			1 (activated during write operation)	
Mask	1	Any value	Any value	Set DACK output to inactive (fixed). Use this mode if you do not want to notify the connection destination of DACK output.

14.3.5.2 Level Output

By setting the AM field in the CHCFG_n register to 001b, the mode is switched to level output. DACK output remains active until the DMA transfer request is deactivated.

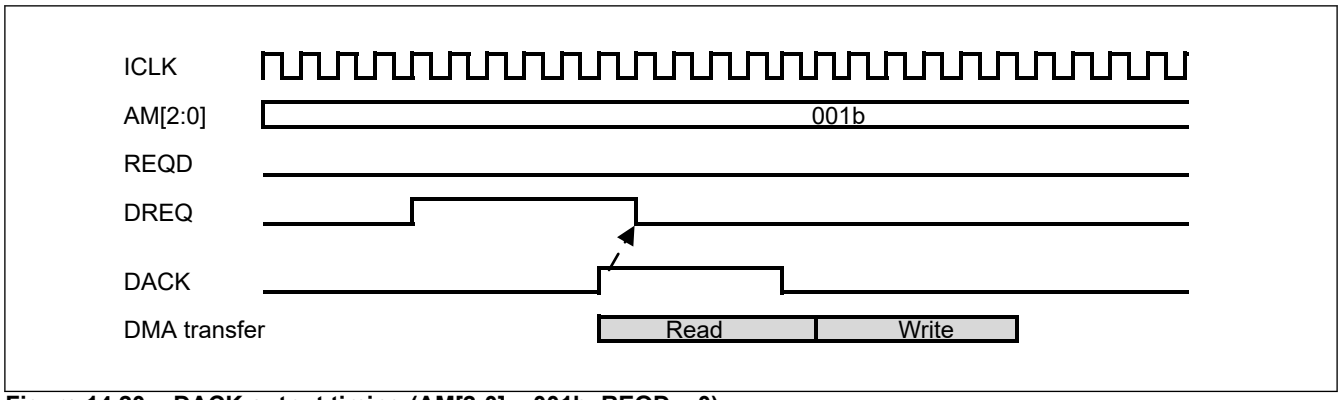

Figure 14.20 DACK output timing (AM[2:0] = 001b, REQD = 0)

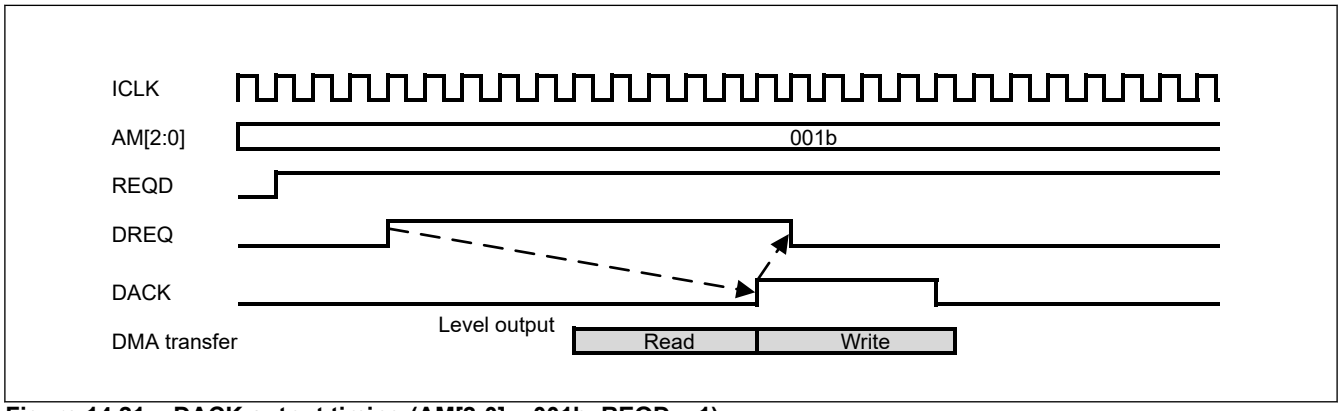

Figure 14.21 DACK output timing (AM[2:0] = 001b, REQD = 1)

14.3.5.3 Bus Cycle Output

By setting the AM field in the CHCFG_n register to 010b, the mode switches to bus cycle output. During a bus cycle, the DACK output remains active.

While the DACK signal is active, the DREQ signal is masked in the CPU. Therefore, even if the DREQ signal is set to level detection, it is not necessary to deactivate the signal on the output side.

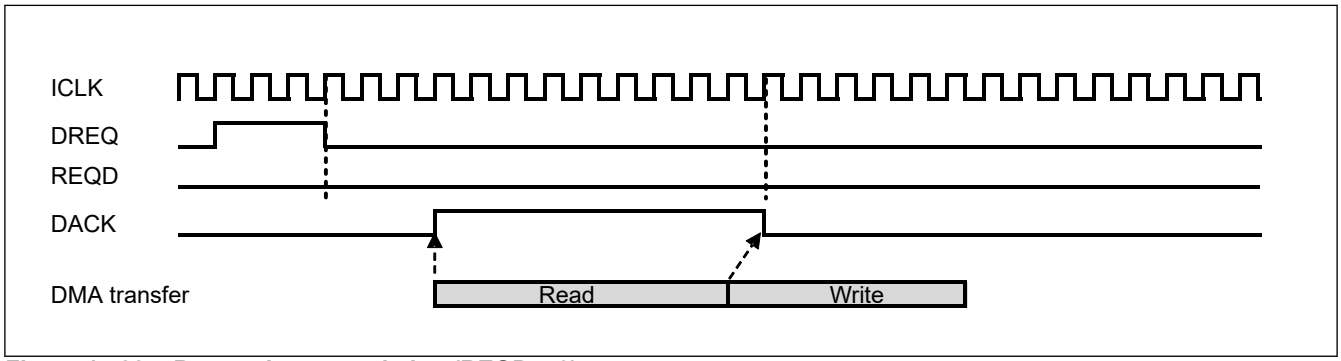

Figure 14.22 Bus cycle output timing (REQD = 0)

- When the REQD bit in the CHCFG_n register = 0 (activated during read operation), the DACK output remains active for the period from when a read request is output on the bus until a cycle elapses after reading the last data.
- If DMA transfer request input is detected by level, DMA transfer request input is deactivated until the next cycle begins after a bus cycle ends.

The following signals trigger the rising and falling of the DACK output:

Rising: Starts a transfer.

Falling: Ends a transfer.

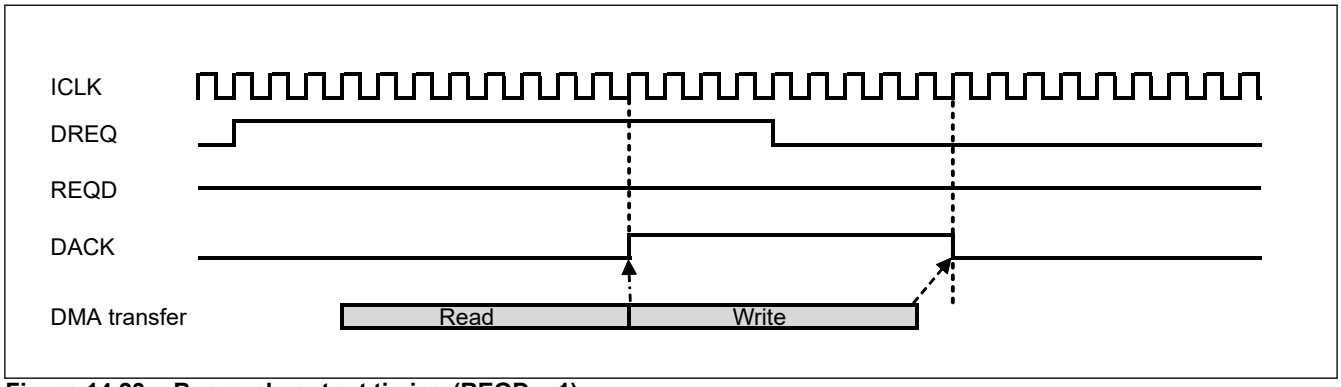

Figure 14.23 Bus cycle output timing (REQD = 1)

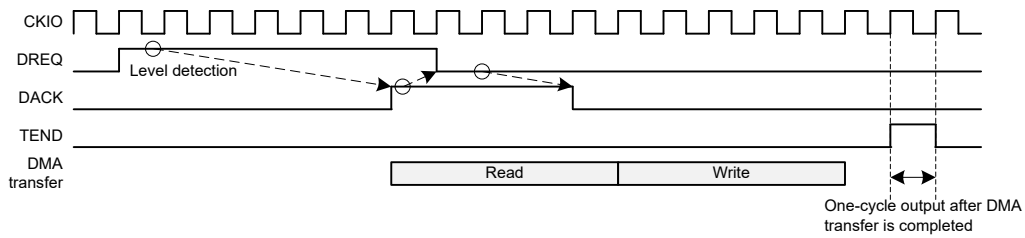
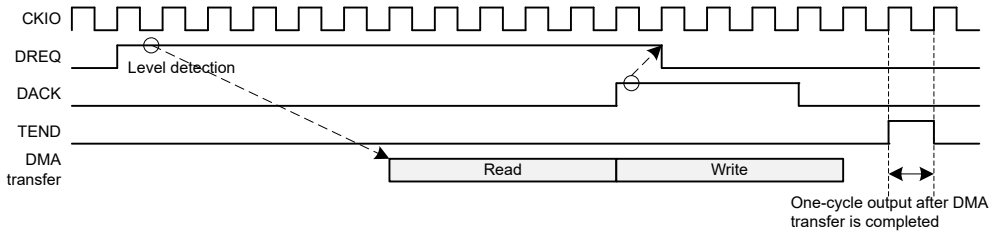
- When the REQD bit in the CHCFG_n register = 1 (activated during write operation), the DACK signal remains active for the period from when a write request is output until a clock (ICLK) elapses after responding to the last data.
- If DMA transfer request input is detected by level, DMA transfer request input is deactivated until the next cycle begins after a bus cycle ends.



The following signals trigger the rising and falling of the DACK output:

Rising: Starts a transfer.

Falling: Ends a transfer.

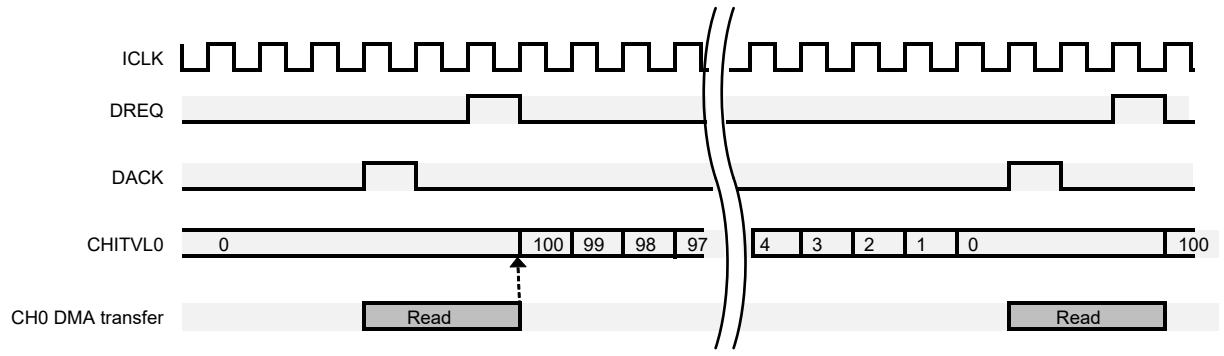


14.3.6 DMA Transaction Completion Signal Output

Figure 14.24 and Figure 14.25 show external DMA interface operation examples. One cycle of the TEND signal is output after the DMA transfer is completed.

Note:
- DMA transfer request: High level detection, request from transfer source (CHCFG_n.REQD = 0)
- DMA acknowledge output: Level mode (CHCFG_n.AM[2:0] = 001b)
- When source and destination are specified to external bus, the TEND signal might be output before write cycle completion.

Figure 14.24 External DMA interface operation example (REQD = 0: read)



Note:
- DMA transfer request: High level detection, request from transfer source (CHCFG_n.REQD = 1)
- DMA acknowledge output: Level mode (CHCFG_n.AM[2:0] = 001b)

Figure 14.25 External DMA interface operation example (REQD = 1: write)

14.3.7 Interval Count Function

By the setting for the ITVL field in the CHITVL_n register, the execution interval of DMA transfers can be adjusted. This function is used to avoid occupation of a bus by DMAC. Until the count value becomes 0, no DMA transfer for the next DMA request is performed.

Figure 14.26 provides an operation example.

Note: In this example, when REQD = 0 (a transfer request issued by the source module) and SDS < DDS (data size at the destination is greater than that at the source), a preset number of intervals (100) are inserted between several rounds of read access after a transfer request.

Figure 14.26 Interval count (REQD = 0, SDS < DDS)

An interval is inserted after a transfer specified by the REQD bit in the CHCFG_n register. Figure 14.27 shows the relationship between the setting values for the REQD, SDS, and DDS bits in the CHCFG_n register and the cycles to which intervals are applied.

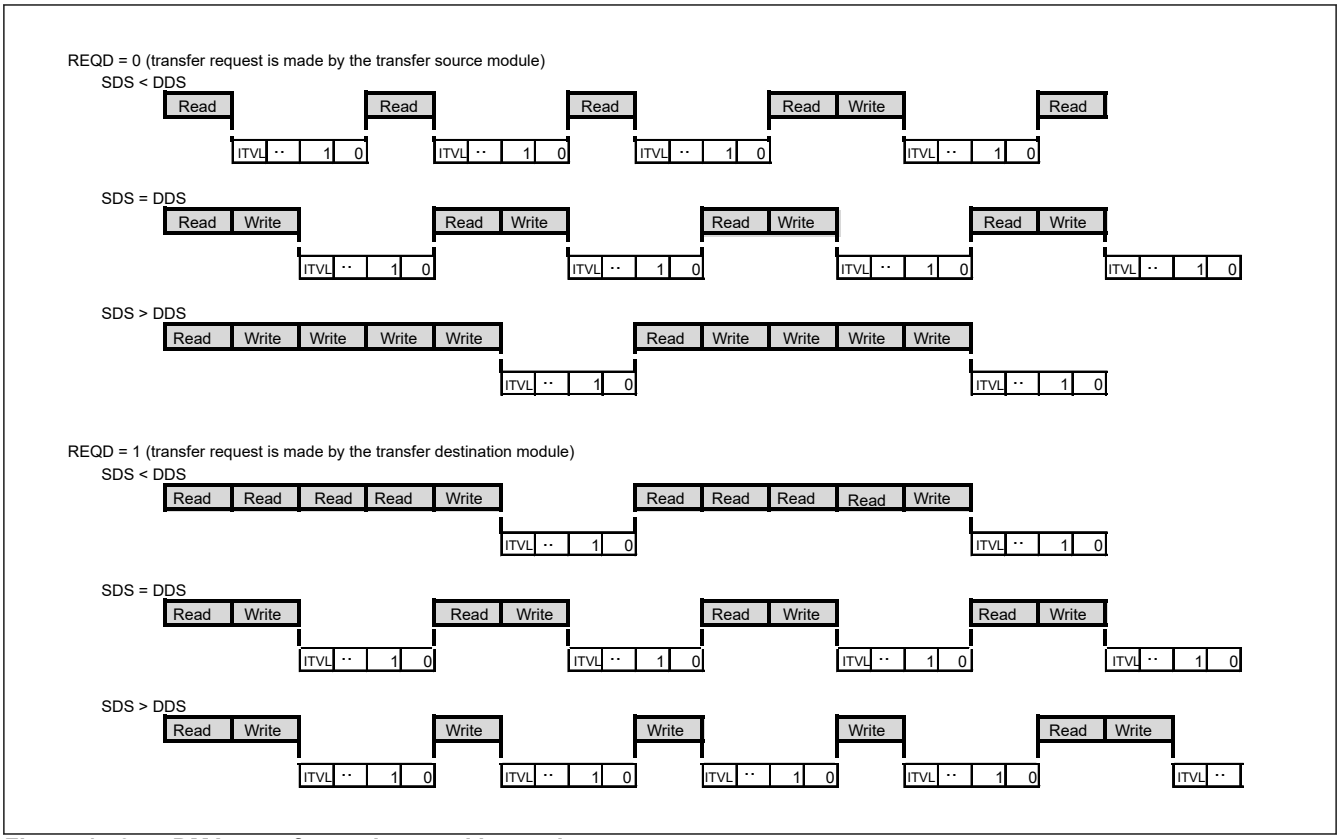


Figure 14.27 DMA transfer settings and interval counts

14.3.8 Differences in Operation According to the Transfer Data Size

14.3.8.1 When the Transfer Data Size on the Transfer Source is Small

When the transfer data size at the destination is large, reading from the source proceeds several times, and this is followed by writing to the destination.

Figure 14.28 shows the timing diagram when the transfer source is 8 bits, and the transfer destination is 32 bits (SDS = 0 and DDS = 2 in the CHCFG_n register) for rising edge detection.

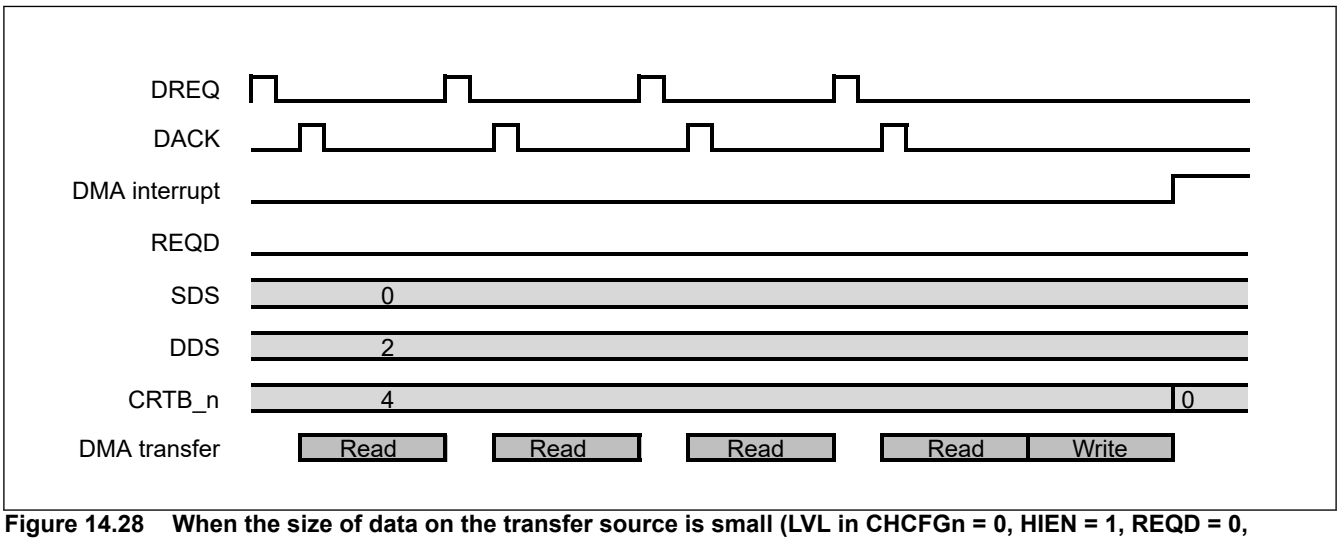

Figure 14.28 When the size of data on the transfer source is small (LVL in CHCFGn = 0, HIEN = 1, REQD = 0, SDS < DDS)

14.3.8.2 When the Transfer Data Size on the Transfer Destination is Small

When the transfer data size on the transfer source is large, after a single read operation, write operation to the transfer destination is performed a few times. Figure 14.29 shows the timing diagram when the transfer source is 64 bits, and the transfer destination is 16 bits (SDS = 3 and DDS = 1 in the CHCFG_n register) for rising edge detection.

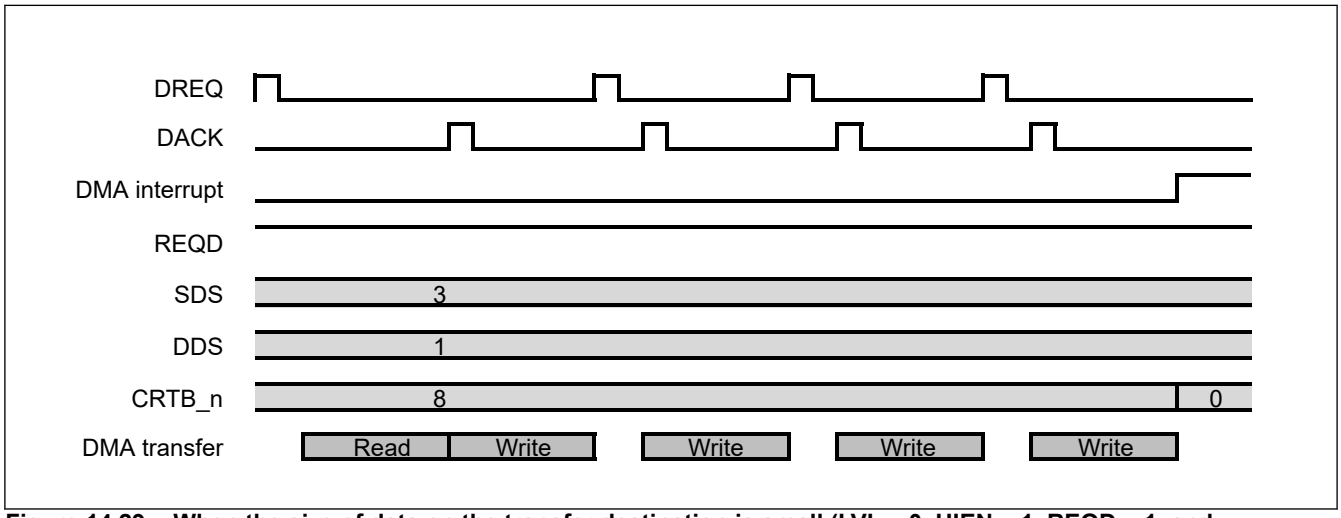

Figure 14.29 When the size of data on the transfer destination is small (LVL = 0, HIEN = 1, REQD = 1, and SDS > DDS in CHCFG_n)

14.3.8.3 When the Size of Transfer Data on the Transfer Source and on the Transfer Destination is the Same

Every time a DMA transfer request is detected, read operation is performed on the transfer source, and write operation is performed on the transfer destination.

Figure 14.30 shows the timing diagram when the transfer source and the transfer destination are 8 bits (SDS = 0 and DDS = 0 in the CHCFG_n register) for rising edge detection.

Figure 14.30 When the sizes of data on the transfer source and the transfer destination are the same (LVL = 0, HIEN = 1, REQD = 0, and SDS = DDS in CHCFG_n)

14.3.9 DMA Transfer Status

The CHSTAT_n register indicates the DMA transfer status of each channel.

The TACT bit in the CHSTAT_n register indicates that DMA operation is being performed on channel n. Writing 1 to the SETEN bit in the CHCTRL_n register sets 1. The TACT bit remains 1 while accessing a descriptor, or waiting for a DMA request.

The TACT bit is cleared when the EN bit in the CHSTAT_n register is cleared (for details on clear conditions, see section 14.2.7. CHSTAT_n : Channel Status Register n (n = 0 to 15)), and DMA transfers for the set number of times are finished.

The TACT bit is not cleared even when a DMA transfer finishes, but the EN bit is not cleared (when the REN bit in the CHCFG_n register = 1 in register mode or the next descriptor access is performed in link mode).

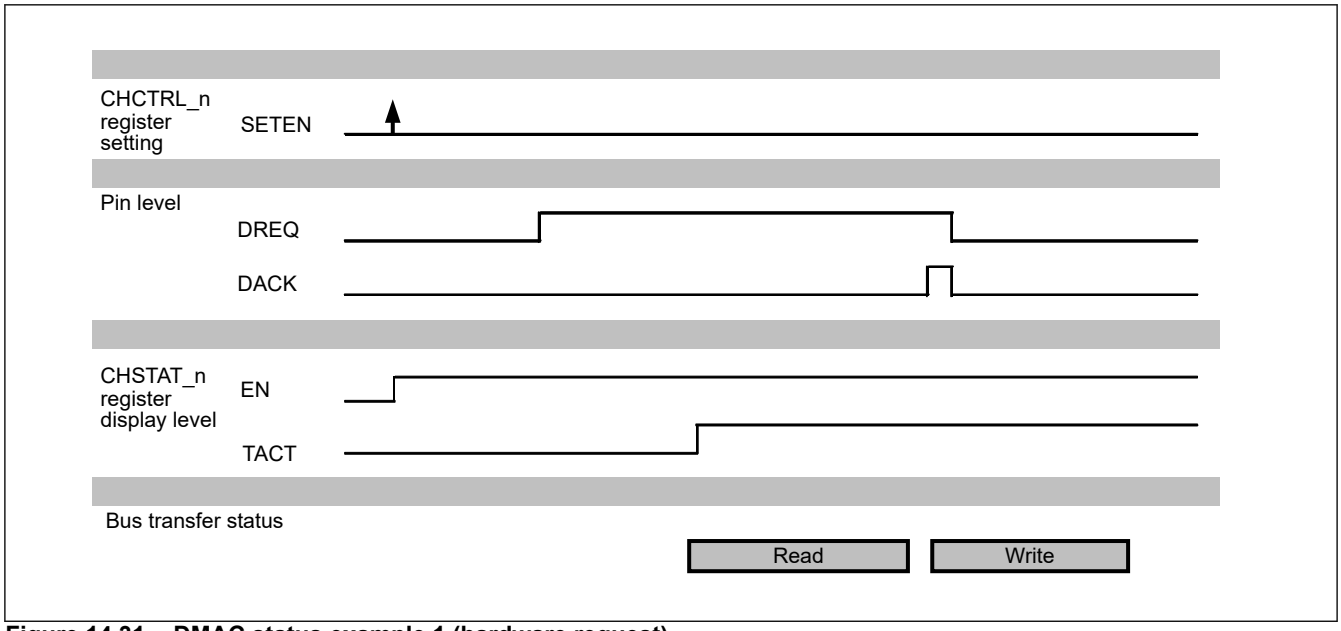

Figure 14.31 DMAC status example 1 (hardware request)

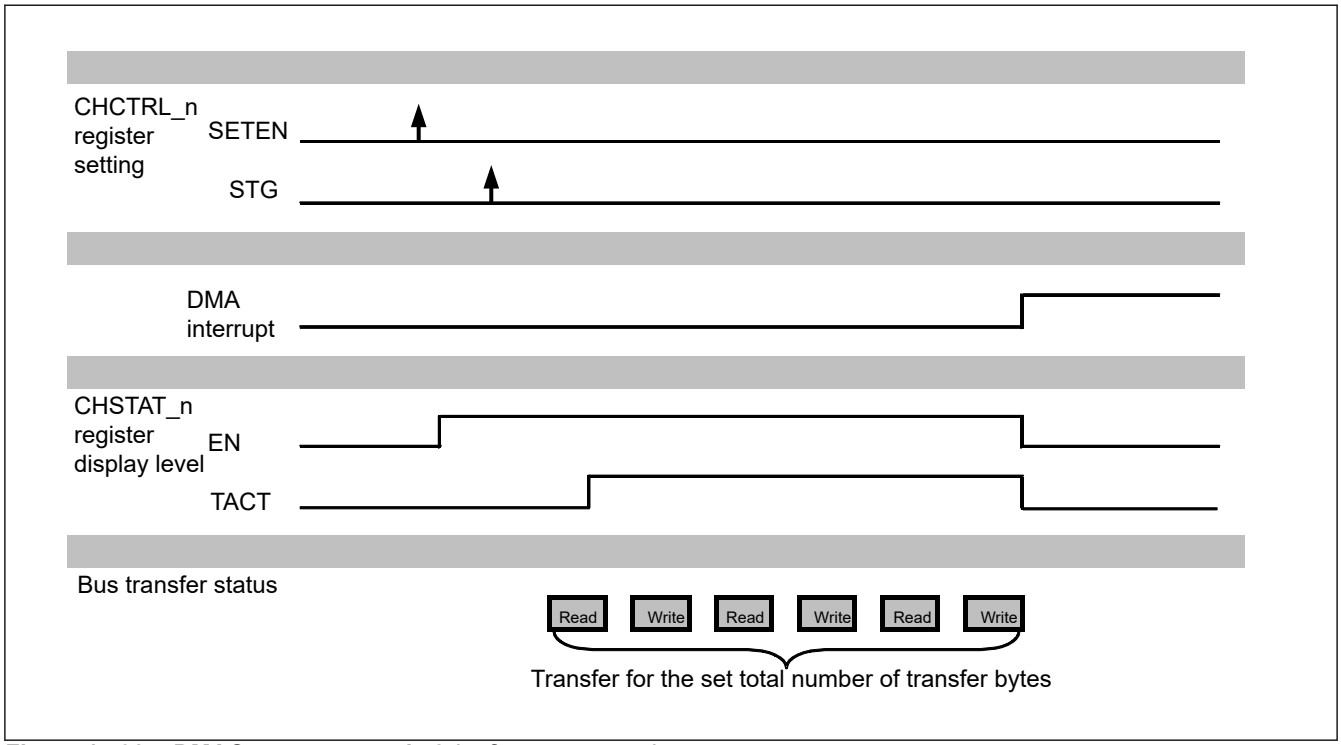

Figure 14.32 DMAC status example 2 (software request)

14.3.10 Suspending a Transfer

You can suspend a DMA transfer at the SETSUS bit in the CHCTRL_n register. At that time, if there is an already running bus cycle, waits for the cycle to end, then suspends the transfer. Writing 1 to the CLRSUS bit in the CHCTRL_n register resumes from the suspended state.

To check if the transfer is suspended, set the SETSUS bit in the CHCTRL_n register, and then make sure that the SUS bit in the CHSTAT_n register or the SUS bit in the DSTAT_SUS register on the applicable channel is set to 1.

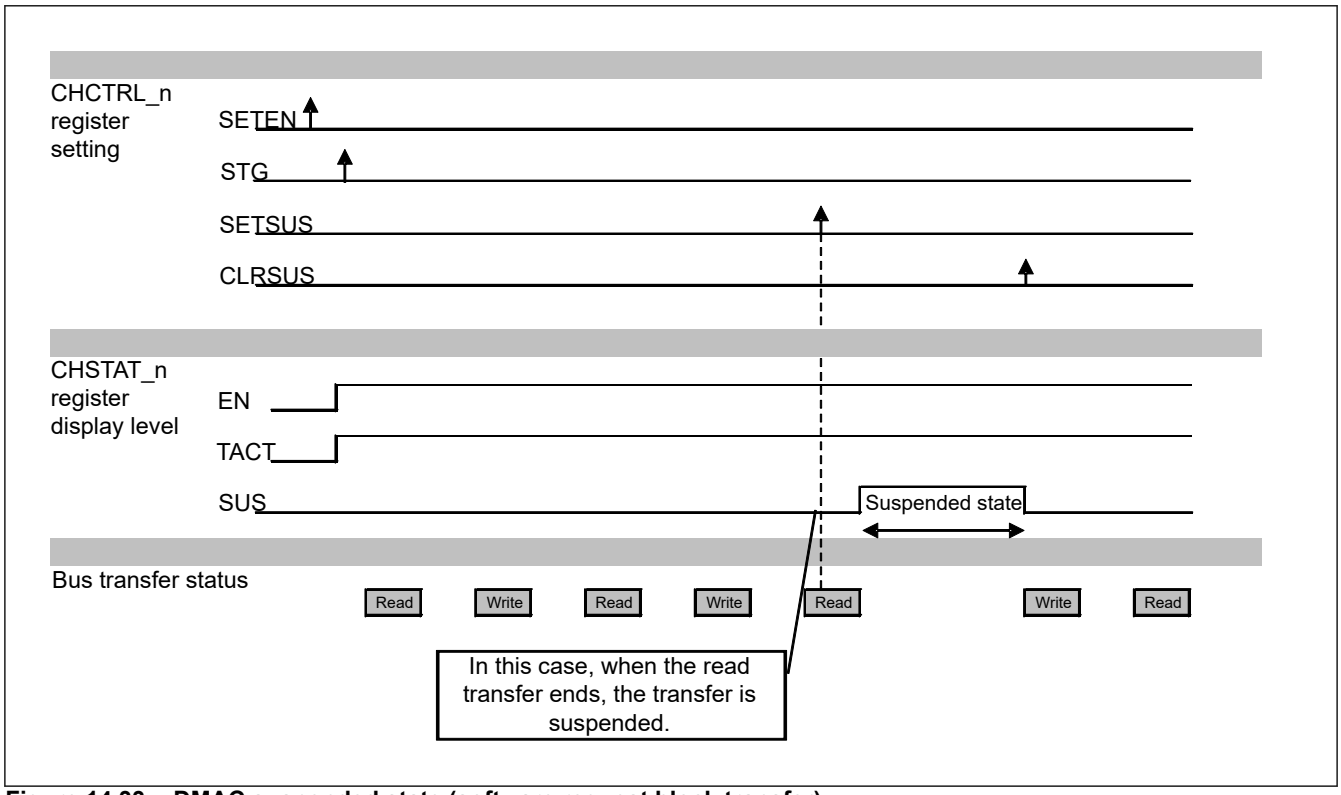

Figure 14.33 DMAC suspended state (software request block transfer)

14.3.11 Aborting a Transfer

During a DMA transfer, if you write 1 to the CLREN bit in the CHCTRL_n register, you can abort the DMA transfer of the channel. As processing after aborting the transfer, you can use the SBE bit in the CHCFG_n register to determine whether to flush data remaining in a buffer when a transfer is suspended. By default, SBE = 0 (do not flush data) is selected.

When this mode (flush data) is activated, if a transfer that is being performed when the CLREN bit in the CHCTRL_n register = 1 is aborted, data remaining in the buffer of DMAC is flushed, and the operation stops.

14.3.11.1 Aborting a Transfer (No Buffer Flush: SBE = 0)

During a DMA transfer, if you write 1 to the CLREN bit in the CHCTRL_n register, you can abort and then stop the DMA transfer. The timing to stop the transfer depends on the value set for the REQD bit. After the transfer stops, write 1 to the SWRST bit in the CHCTRL_n register, and clear the contents within the DMAC before setting the next transfer.

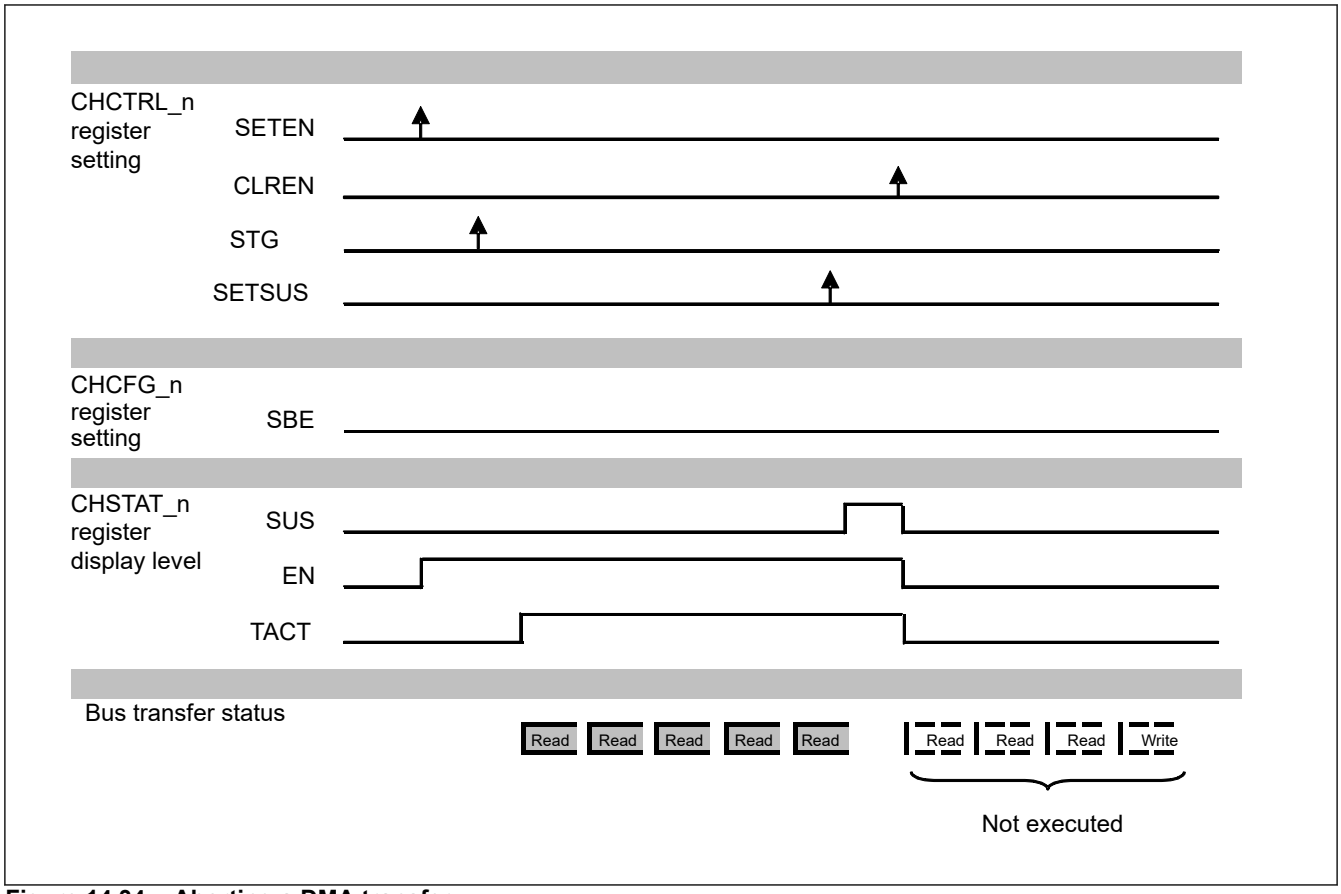

Figure 14.34 Aborting a DMA transfer

- When the TACT bit in the CHSTAT_n register is cleared, you can confirm that the channel stops completely.
- If a DMA transfer is aborted, no DMA transfer completion interrupt is generated.
- When the REQD bit in the CHCFG_n register = 0, the transfer stops when the next read operation completes. If there is data that can be written in the buffer, the transfer stops after the data is written.
- When the REQD bit in the CHCFG_n register = 1, the transfer stops when the next write operation completes.

14.3.11.2 Aborting a Transfer (Buffer Flush: SBE = 1)

During a DMA transfer, if you write 1 to the CLREN bit in the CHCTRL_n register, you can abort the DMA transfer.

When the REQD bit in the CHCFG_n register = 0, already read data is flushed (written), and then the DMA transfer stops. When REQD = 1, flush mode cannot be used.

After the transfer stops, set the SWRST bit in the CHCTRL_n register, and clear the contents within the DMAC before setting the next transfer.

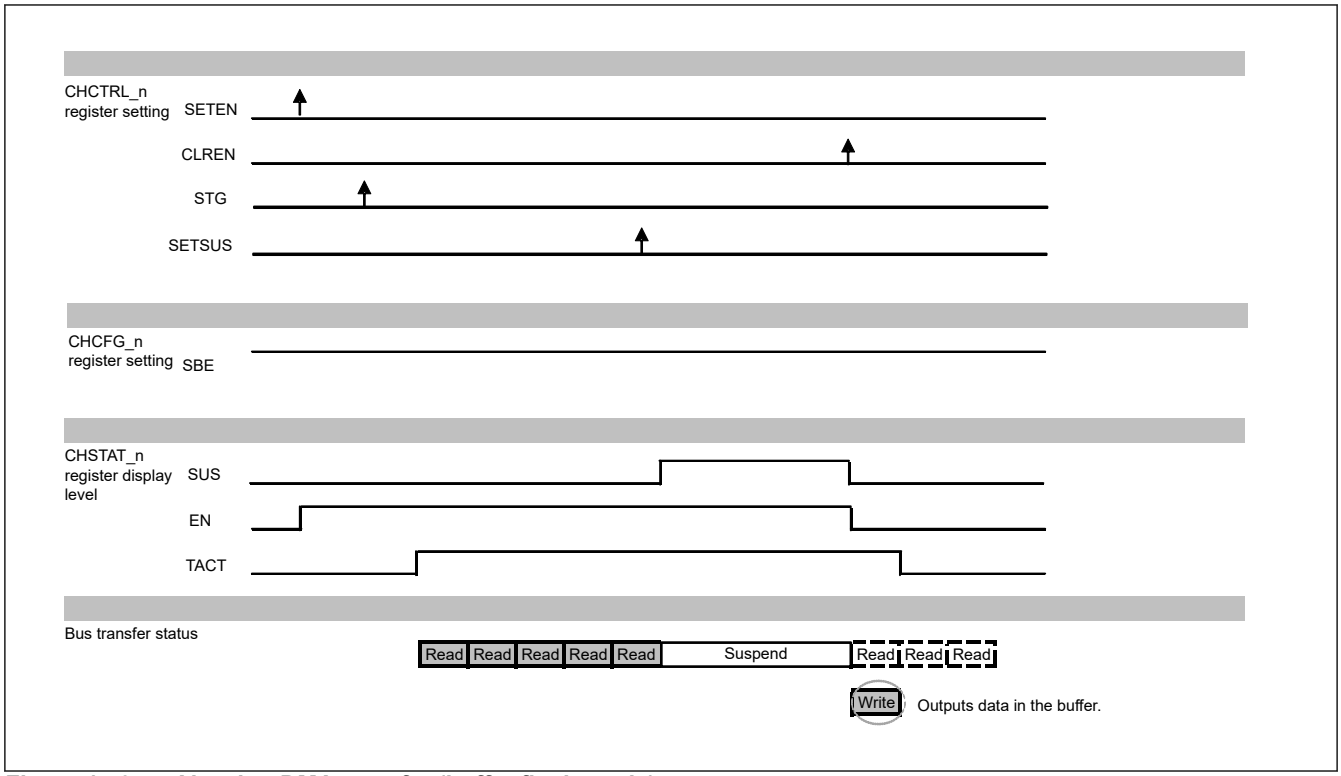

Figure 14.35 Aborting DMA transfer (buffer flush mode)

- Figure 14.35 shows an example when 1 is written to the CLREN bit in the CHCTRL_n register during the fifth read transfer in flush mode (the SBE bit in the CHCFG_n register = 1), and the transfer is aborted. It shows how read data is written, and the DMA transfer stops.
- When the TACT bit in the CHSTAT_n register is cleared to 0, you can confirm that the channel completely stops.

14.3.11.3 Checking if the Channel Stops

When 1 is written to the CLREN bit in the CHCTRL_n register, and the EN bit in the CHSTAT_n register is cleared to 0, if a transfer is already performed on a bus, DMAC cannot stop immediately. To check if DMA completely stops, make sure that the EN bit is cleared to 0, and the TACT bit in the CHSTAT_n register is cleared to 0.

14.3.11.4 Procedure for Aborting a Transfer

The following steps show the procedure for stopping a transfer:

1. Write 1 to the SETSUS bit in the CHCTRL_n register.
2. Perform polling until the SUS bit in the CHCTRL_n register is set to 1. If the EN bit = 0, go to step 6 because DMAC transfer is suspended.
3. Write 1 to the CLREN bit in the CHCTRL_n register.
4. When the SBE bit in the CHCFG_n register = 0, the transfer stops according to value for the REQD bit in the CHCFG_n register. At that time, if SBE = 1, flush mode is used.
5. By reading the CHSTAT_n register, make sure the TACT bit is cleared to 0. When TACT = 0, DMA stops completely. When TACT = 1, perform polling until the TACT bit is cleared to 0.
6. After a transfer is aborted, to perform the next DMA transfer, you must set the SWRST (software reset) bit in the CHCTRL_n register immediately before the next transfer starts.

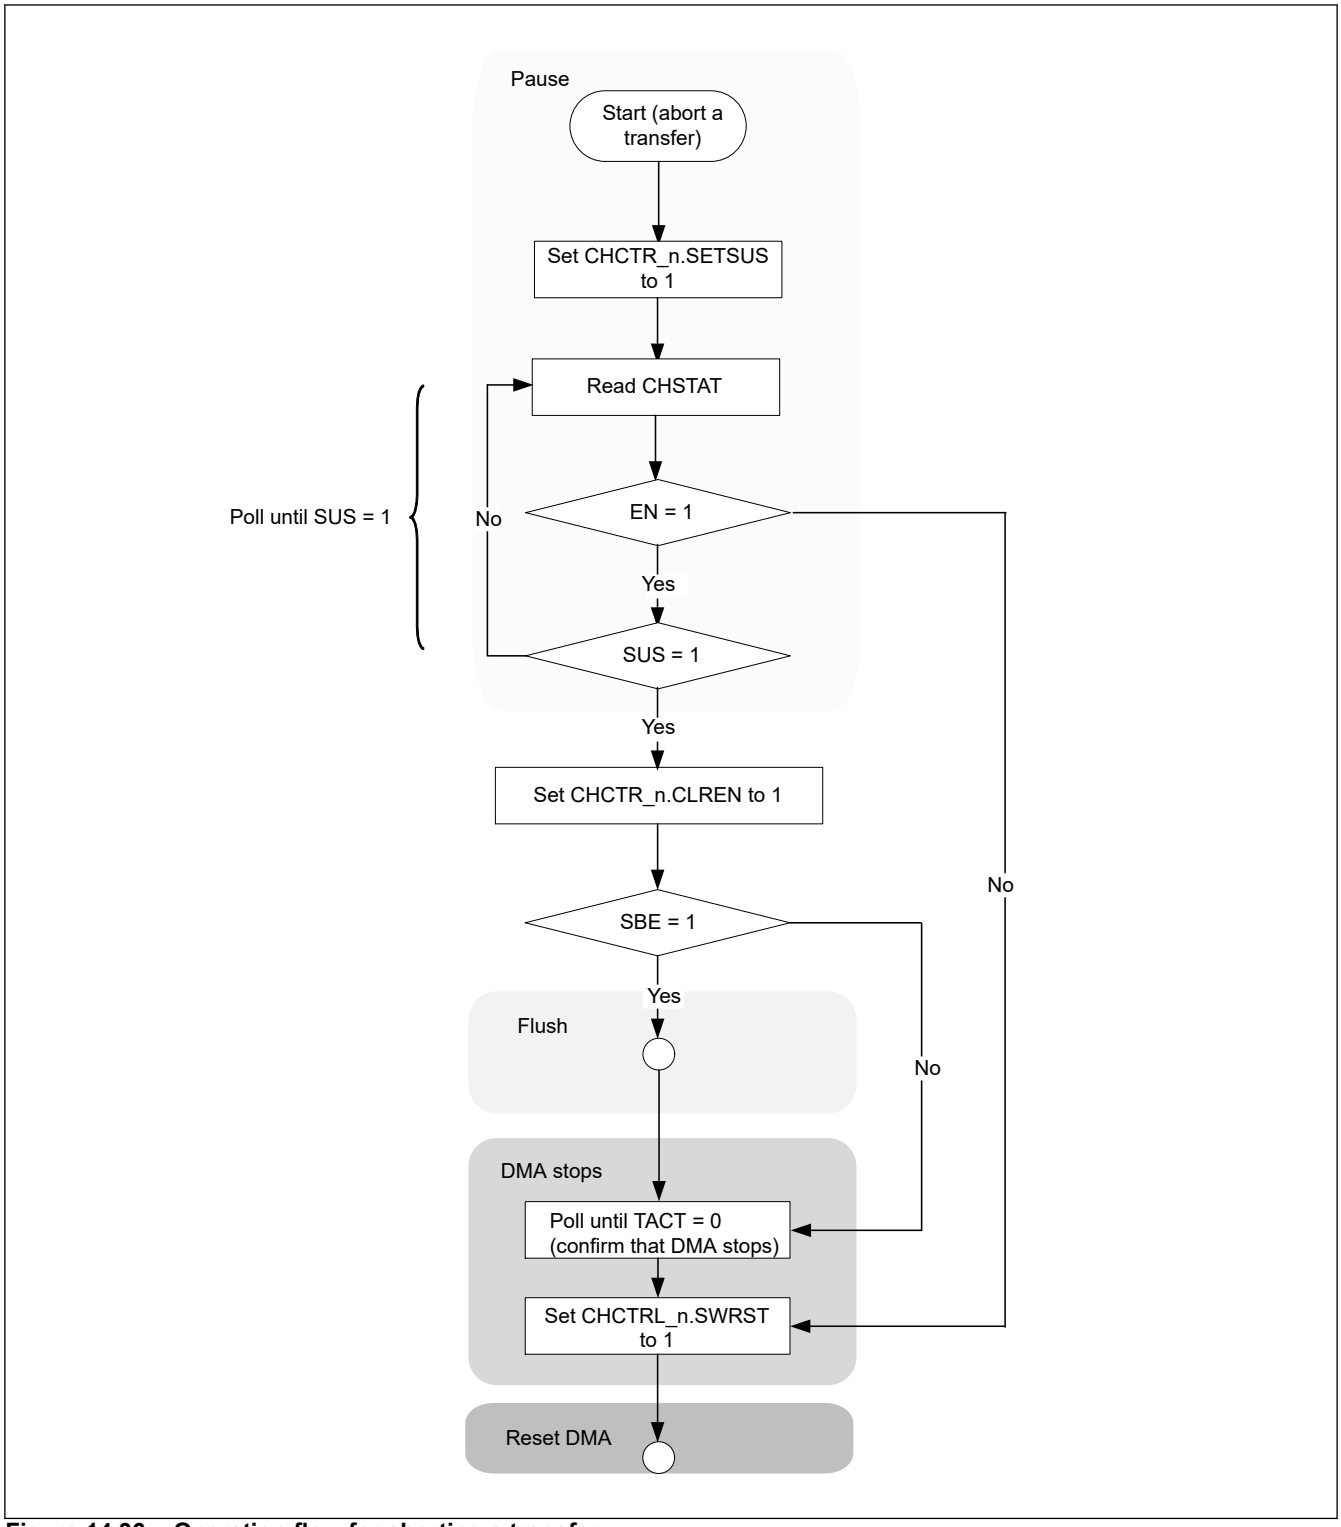

Figure 14.36 Operation flow for aborting a transfer

14.4 Interrupts

14.4.1 Interrupt Sources

DMAC has two types of interrupt sources, DMA transfer completion interrupts and DMA error interrupts for each channel. Table 14.21 shows the relationship among interrupt sources, enable bits, and status flags.

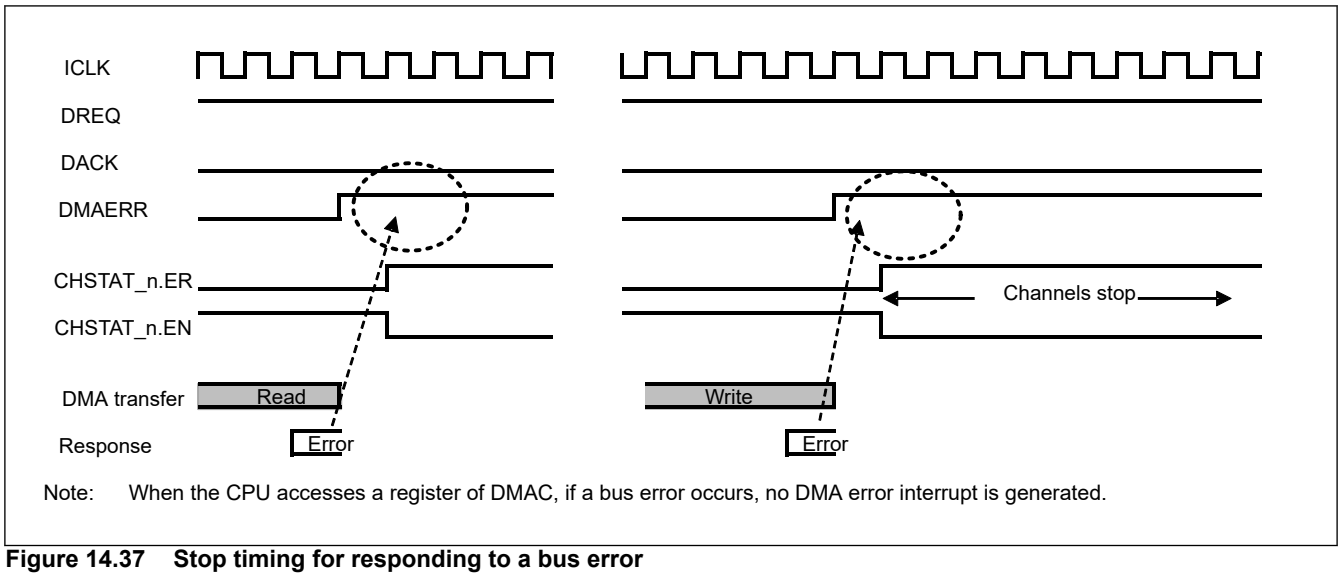
Table 14.21 Interrupt sources of DMAC

Interrupt source		Interrupt Enable bit	Interrupt Status flag	Output condition
DMA transfer completion interrupt	DMA transfer completion	CHCFG_n.DEM	CHSTAT_n.END	When a transfer for the total number of transfer bytes loaded to the CRTB_n register completes (after a write back if write back is performed in link mode)
	Descriptor invalid	DIM in header register		In link mode, when the header of the LV of the read descriptor = 0
DMA error interrupt		— (mask disabled)	CHSTAT_n.ER	When a bus error occurs during a DMA transfer and descriptor access

14.4.2 DMA Transfer Completion Interrupts

A DMA transfer completion interrupt is an interrupt request signal indicating that the DMA transfer completes. Each bit of the DMA transfer completion interrupt corresponds to each channel.

When the transfer of the total number of bytes loaded to the CRTB_n register is completed, the END bit in the CHSTAT_n register is set to 1. At that time, if the DEM bit in the CHCFG_n register = 0, a DMA transfer completion interrupt is generated (n = 0 to 15). To perform write back in link mode, an interrupt is generated after the write back.



In addition, when link mode and header of the read descriptor is LV = 0, the DER bit in the CHSTAT_n register is set to 1. At that time, if the DIM bit in the header register = 0, a DMA transfer completion interrupt is generated.

14.4.3 DMA Error Interrupt

If a bus error occurs during a DMA transfer or descriptor access, this module determines that an error occurred, and stops the transfer. When a bus error occurs, the EN bit in the CHSTAT_n register for channel n where a transfer is performed is cleared to 0, and the ER bit is set to 1 (n = 0 to 15). In addition, a DMA error interrupt is generated. DMA error interrupts cannot be masked.

Data for a series of error transfers cannot be guaranteed. You must perform the transfer from the beginning by using the following procedure:

1. Set the SWRST bit in the CHCTRL_n register to 1.
2. Set each register again.

Note: When the CPU accesses a register of DMAC, if a bus error occurs, no DMA error interrupt is generated.

Figure 14.37 Stop timing for responding to a bus error

14.5 DMA Setting Examples

This section provides examples of DMA transfers. Table 14.22 lists the transfer conditions for the setting examples described in this section.

Table 14.22 List of transfer conditions for the DMA transfer setting examples

Setting example	DMA mode	Transfer mode	Transfer request
Setting example 1	Register mode	Single transfer mode	Hardware
Setting example 2	Register mode	Block transfer mode	Software
Setting example 3	Register mode (continuous execution)	Block transfer mode	Software
Setting example 4	Link mode	Block transfer mode	Software

14.5.1 Setting Example 1 (Register Hardware Request)

This section provides setting examples of DMA transfers that use hardware requests in register mode.

Table 14.23 DMA transfer setting example 1

Parameter		Description
Channel to use		DMAC0 channel 3
Priority control		Fixed priority
DMA mode		Register mode
Transfer mode		Single transfer mode
Register set to use		Next0 register set
Transfer source	Start address	0x6000_0000
	Address direction	Increment
	Data size	32 bits
Transfer destination	Start address	0x1000_0000
	Address direction	Increment
	Data size	32 bits
Number of DMA transfer bytes		64 bytes
DMA transfer request		Detects the rising edge by hardware (DREQ)
Selection of the side which makes a DMA transfer request		Requested from the transfer-side module
DACK/TEND signal		Outputs by level during read operation
DMA transfer completion interrupt mask		None

Setting Example 1

N0SA = 0x6000_0000 (transfer source address)

N0DA = 0x1000_0000 (transfer destination address)

N0TB = 0x0000_0040 (number of transfer bytes)

CHCFG = 0x0002_2123 (configuration)

CHITVL = 0x0000_0000 (interval)

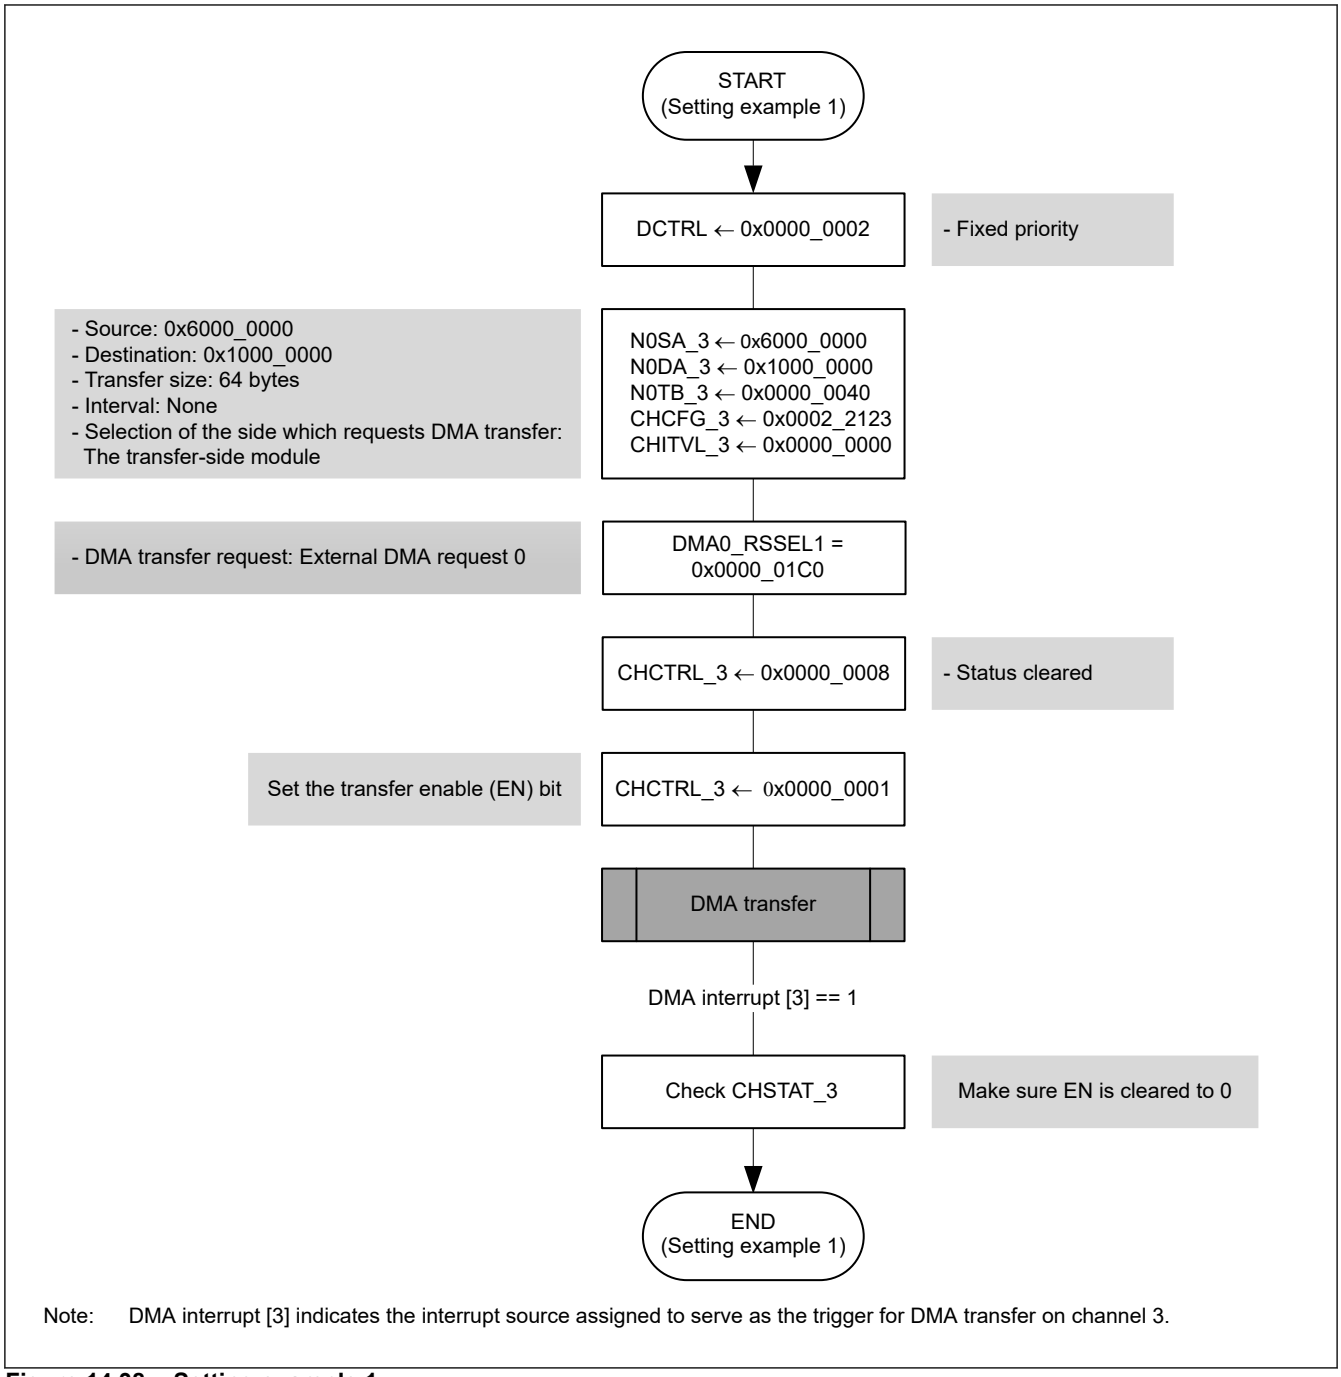


Figure 14.38 Setting example 1

14.5.2 Setting Example 2 (Register Mode Software Request)

This section provides a setting example of DMA transfers that use software requests in register mode.

Table 14.24 DMA transfer setting example 2 (1 of 2)

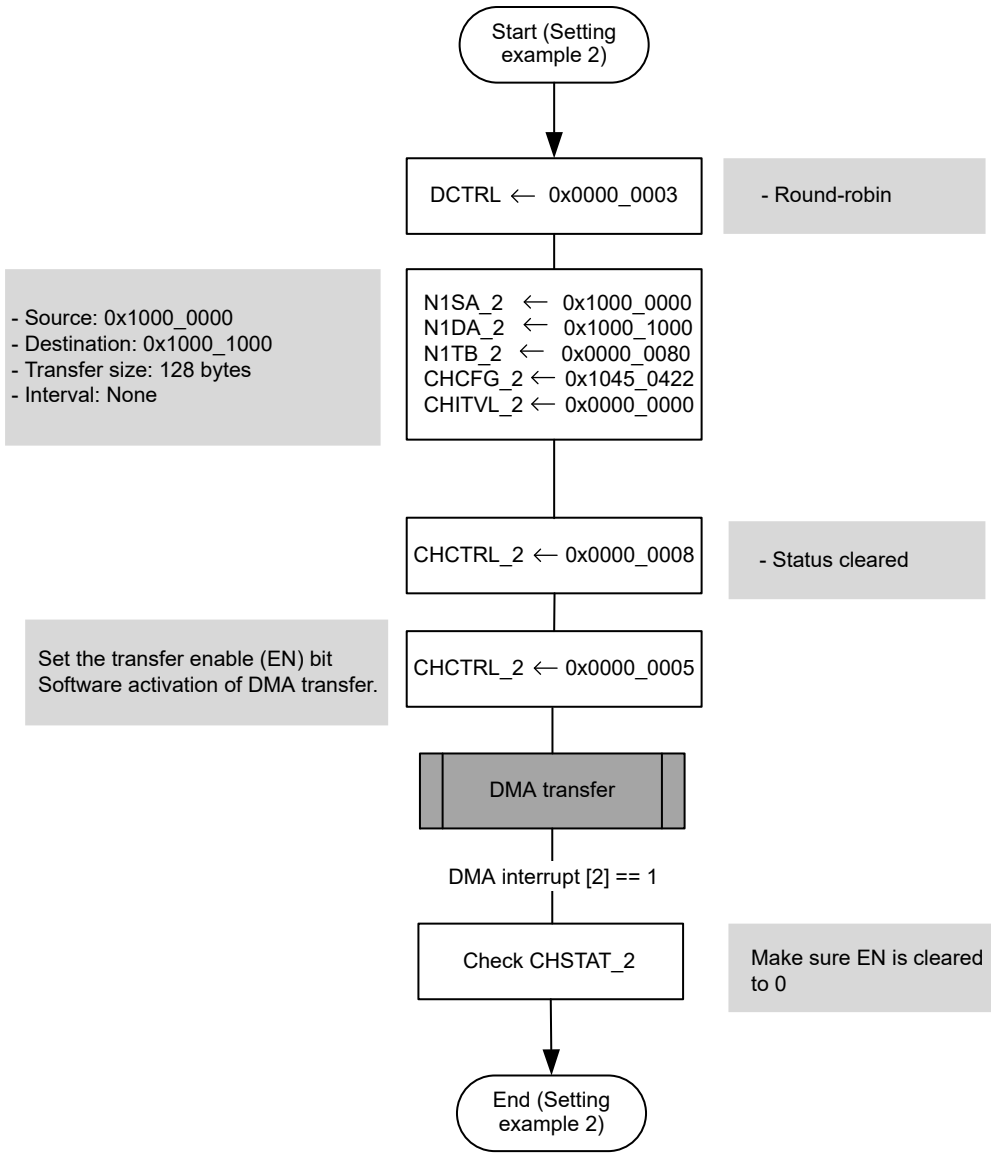
Parameter	Description
Channel to use	DMAC0 channel 2
Priority control	Round-robin
DMA mode	Register mode
Transfer mode	Block transfer mode
Register set to use	Next1 register set

Table 14.24 DMA transfer setting example 2 (2 of 2)

Parameter		Description
Transfer source	Start address	0x1000_0000
	Address direction	Increment
	Data size	8 bits
Transfer destination	Start address	0x1000_1000
	Address direction	Increment
	Data size	256 bits
Number of DMA transfer bytes		128 bytes
DMA transfer request		Software request
DACK/TEND signal		Mask
DMA transfer completion interrupt mask		None

Setting Example 2

DCTRL = 0x0000_0003 (DMA setting)



N1SA = 0x1000_0000 (transfer source address)

N1DA = 0x1000_1000 (transfer destination address)

N1TB = 0x0000_0080 (number of transfer bytes)

CHCFG = 0x1045_0422 (configuration)

CHITVL = 0x0000_0000 (interval)

Note: DMA interrupt [2] indicates the interrupt source assigned to serve as the trigger for DMA transfer on channel 2.

Figure 14.39 Setting example 2

14.5.3 Setting Example 3 (Register Mode Continuous Execution)

This section provides a setting example of DMA transfers that use Next0/1 Register Sets in series in register mode.

Table 14.25 DMA transfer setting example 3 (1 of 2)

Parameter	Description
Channel to use	DMAC0 channel 1
Priority control	Round-robin
DMA mode	Register mode
Transfer mode	Block transfer mode
Register set to use	Next0 register set → Next1 register set in series

Table 14.25 DMA transfer setting example 3 (2 of 2)

Parameter		Description
Transfer source (Next0)	Start address	0x1000_4000
	Address direction	Fixed
	Data size	32 bits
	Number of DMA transfer bytes	512 bytes
Transfer destination (Next0)	Start address	0x1000_5000
	Address direction	Fixed
	Data size	512 bits
	Number of DMA transfer bytes	512 bytes
Transfer source (Next1)	Start address	0x1000_6000
	Address direction	Fixed
	Data size	32 bits
	Number of DMA transfer bytes	2048 bytes
Transfer destination (Next1)	Start address	0x1000_7000
	Address direction	Fixed
	Data size	512 bits
	Number of DMA transfer bytes	2048 bytes
DMA transfer request		Software request
DACK/TEND signal		Mask
DMA transfer completion interrupt mask		Masks when Next0 completes

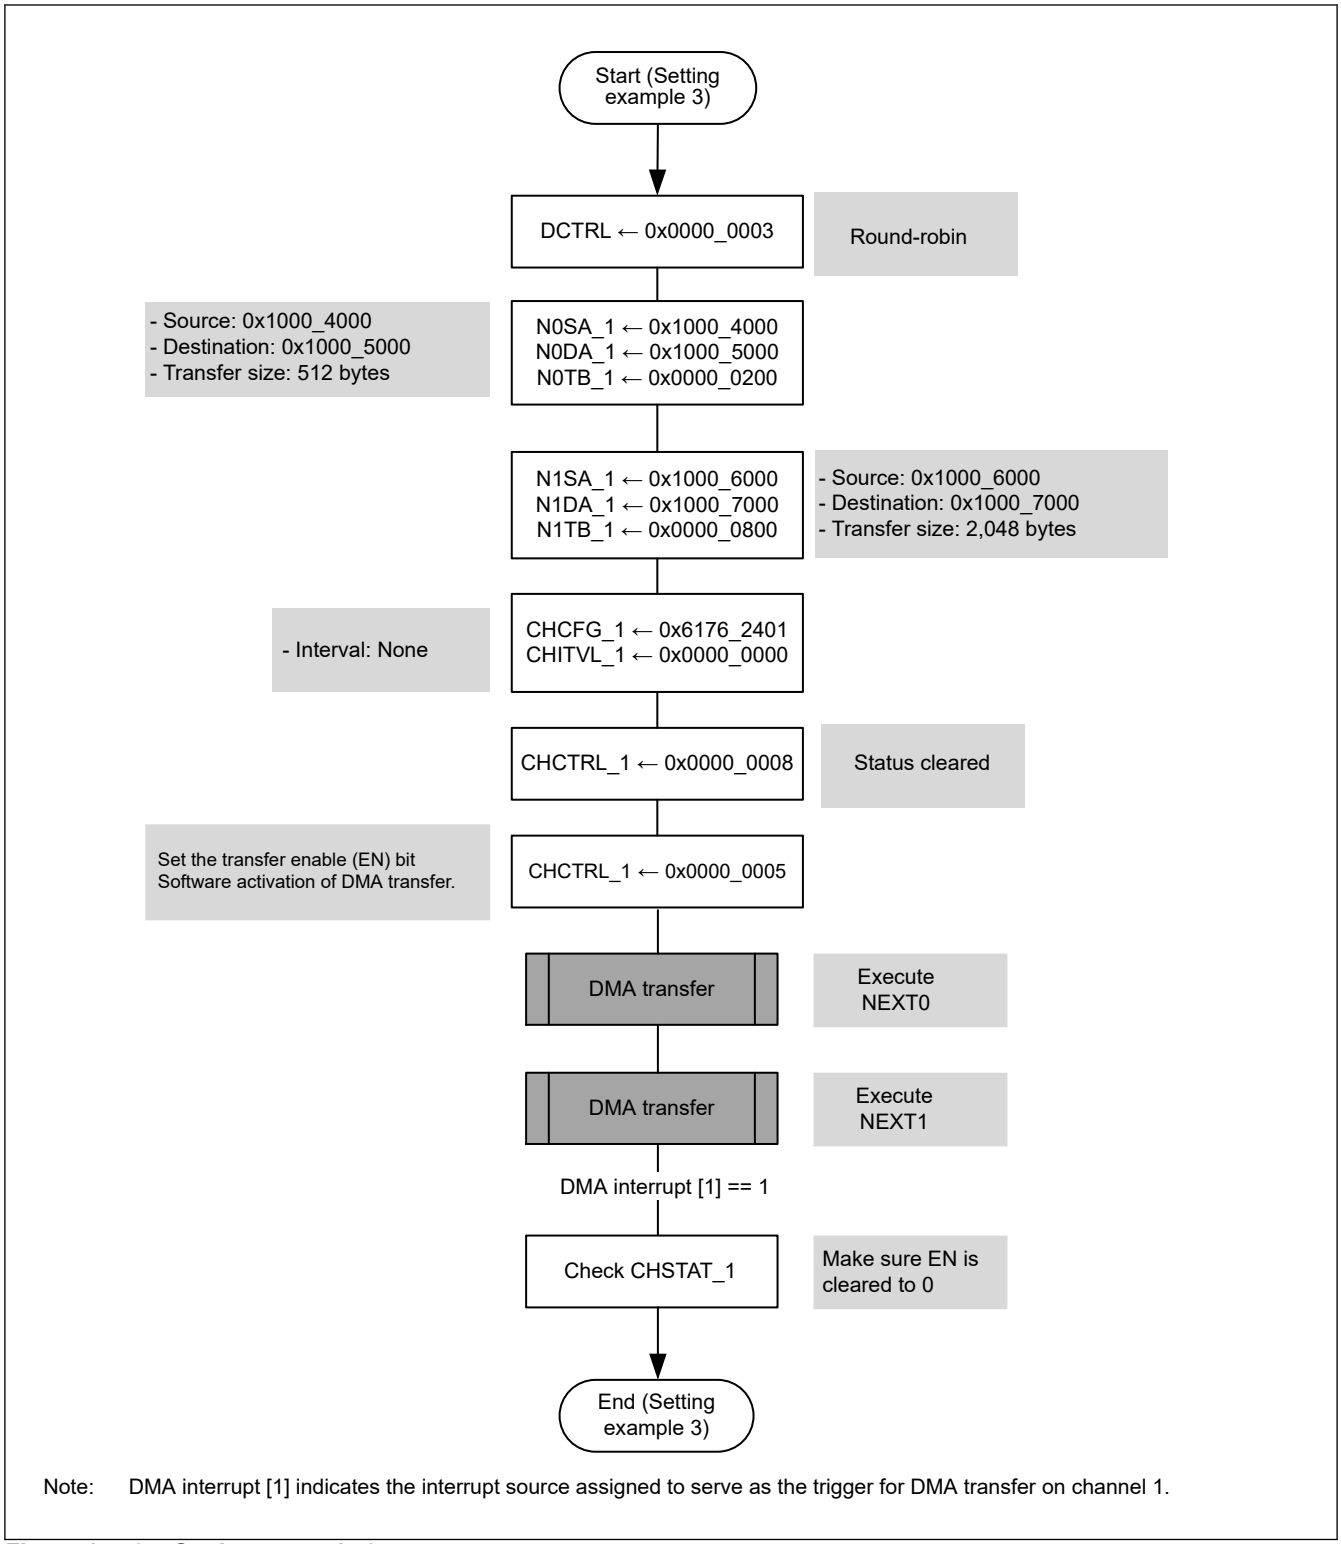
Setting Example 3

DCTRL = 0x0000_0003 (DMA setting)

N0SA = 0x1000_4000 (transfer source address)

N0DA = 0x1000_5000 (transfer destination address)

N0TB = 0x0000_0200 (number of transfer bytes)



N1SA = 0x1000_6000 (transfer source address)

N1DA = 0x1000_7000 (transfer destination address)

N1TB = 0x0000_0800 (number of transfer bytes)

CHCFG = 0x6176_2401 (configuration)

CHITVL = 0x0000_0000 (interval)

Note: DMA interrupt [1] indicates the interrupt source assigned to serve as the trigger for DMA transfer on channel 1.

Figure 14.40 Setting example 3

14.5.4 Setting Example 4 (Link Mode)

This section provides a setting example when a DMA transfer is performed in link mode.

Table 14.26 DMA transfer setting example 4 (1 of 2)

Parameter	Description
Channel to use	DMAC0 channel 0

Table 14.26 DMA transfer setting example 4 (2 of 2)

Parameter	Description
Priority control	Round-robin
DMA mode	Link mode
Transfer mode	Block transfer mode
Descriptor start address	0x1080_0000

Table 14.27 DMA transfer setting example 4 (descriptor 1)

Parameter		Description
Descriptor start address		0x1080_0000
Next descriptor start address		0x1080_1000
Transfer mode		Block transfer mode
Transfer source	Start address	0x1000_0000
	Address direction	Increment
	Data size	32 bits
Transfer destination	Start address	0x1000_1000
	Address direction	Increment
	Data size	32 bits
Number of DMA transfer bytes		2048 bytes
DMA transfer request		Software request
DACK/TEND signal		Mask
DMA transfer completion interrupt output mask		Masks when a DMA transfer on descriptor 1 completes
Descriptor header	DMA interrupt when LV =1	Issued (DIM = 0)
	LV write back	Done (WBD = 0)
	Next link address	Available (LE = 0)
	Descriptor valid	Valid (LV = 1)

Table 14.28 DMA transfer setting example 4 (descriptor 2) (1 of 2)

Parameter		Description
Descriptor start address		0x1080_1000
Next descriptor start address		0x1080_2000
Transfer mode		Block transfer mode
Transfer source	Start address	0x1000_2000
	Address direction	Increment
	Data size	256 bits
Transfer destination	Start address	0x1000_3000
	Address direction	Increment
	Data size	256 bits
Number of DMA transfer bytes		1024 bytes
DMA transfer request		Software request
DACK/TEND signal		Mask
DMA transfer completion interrupt output mask		Masks when a DMA transfer on descriptor 2 completes

Table 14.28 DMA transfer setting example 4 (descriptor 2) (2 of 2)

Parameter		Description
Descriptor header	DMA interrupt when LV =1	Issued (DIM = 0)
	LV write back	Done (WBD = 0)
	Next link address	Available (LE = 0)
	Descriptor valid	Valid (LV = 1)

Table 14.29 DMA transfer setting example 4 (descriptor 3)

Parameter		Description
Descriptor start address		0x1080_2000
Next descriptor start address		—
Transfer mode		Block transfer mode
Transfer source	Start address	0x1000_4000
	Address direction	Increment
	Data size	512 bits
Transfer destination	Start address	0x1000_6000
	Address direction	Increment
	Data size	512 bits
Number of DMA transfer bytes		4096 bytes
DMA transfer request		Software request

CFG (Configuration)	0x8142_2220	0x8145_5220	0x8046_6220
ITVL (Interval)	0x0000_0000	0x0000_0000	0x0000_0000
EXT (Extension)	0x0000_0000	0x0000_0000	0x0000_0000
NXLA (Next Link Address)	0x1080_1000	0x1080_2000	0x0000_0000

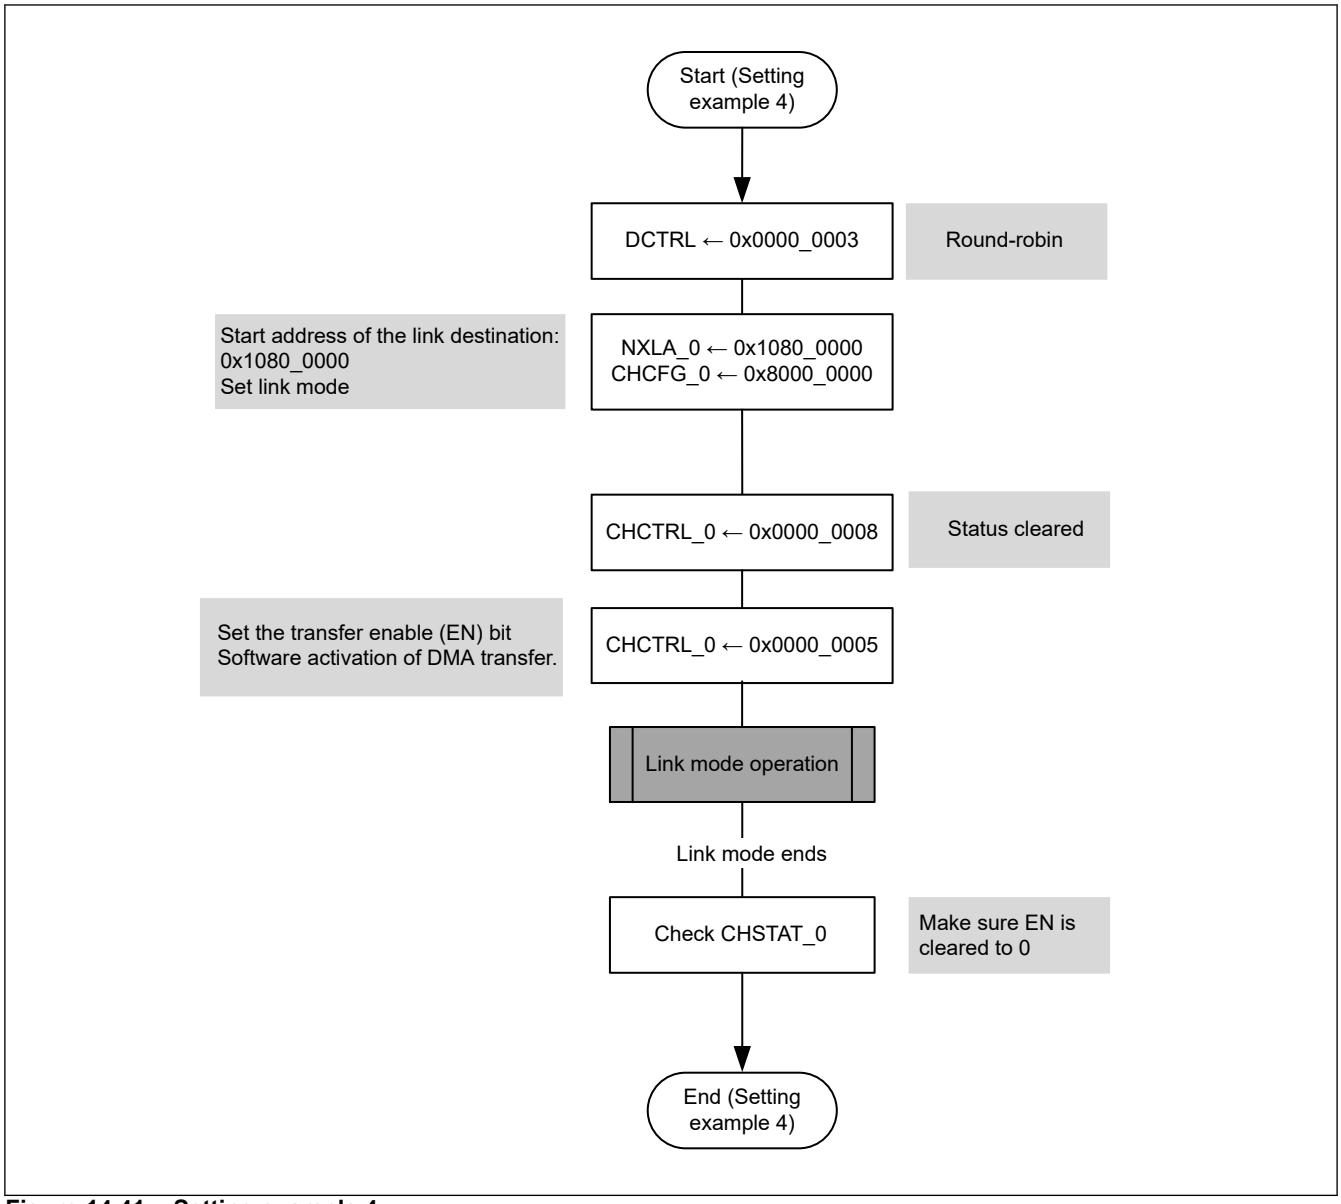

Figure 14.41 Setting example 4

14.5.5 Next Register Continuous Execution Settings

Figure 14.42 shows the flow when using two Next register sets to continue DMA transfers in register mode.

While performing a DMA transfer of a Next register, set the other Next register, and perform the DMA transfers in series.

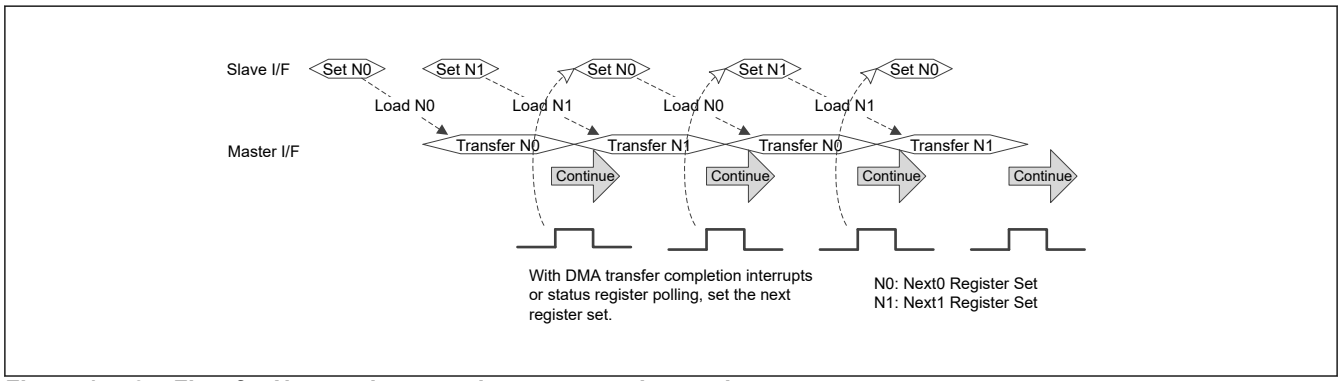

Figure 14.42 Flow for Next register continuous execution setting

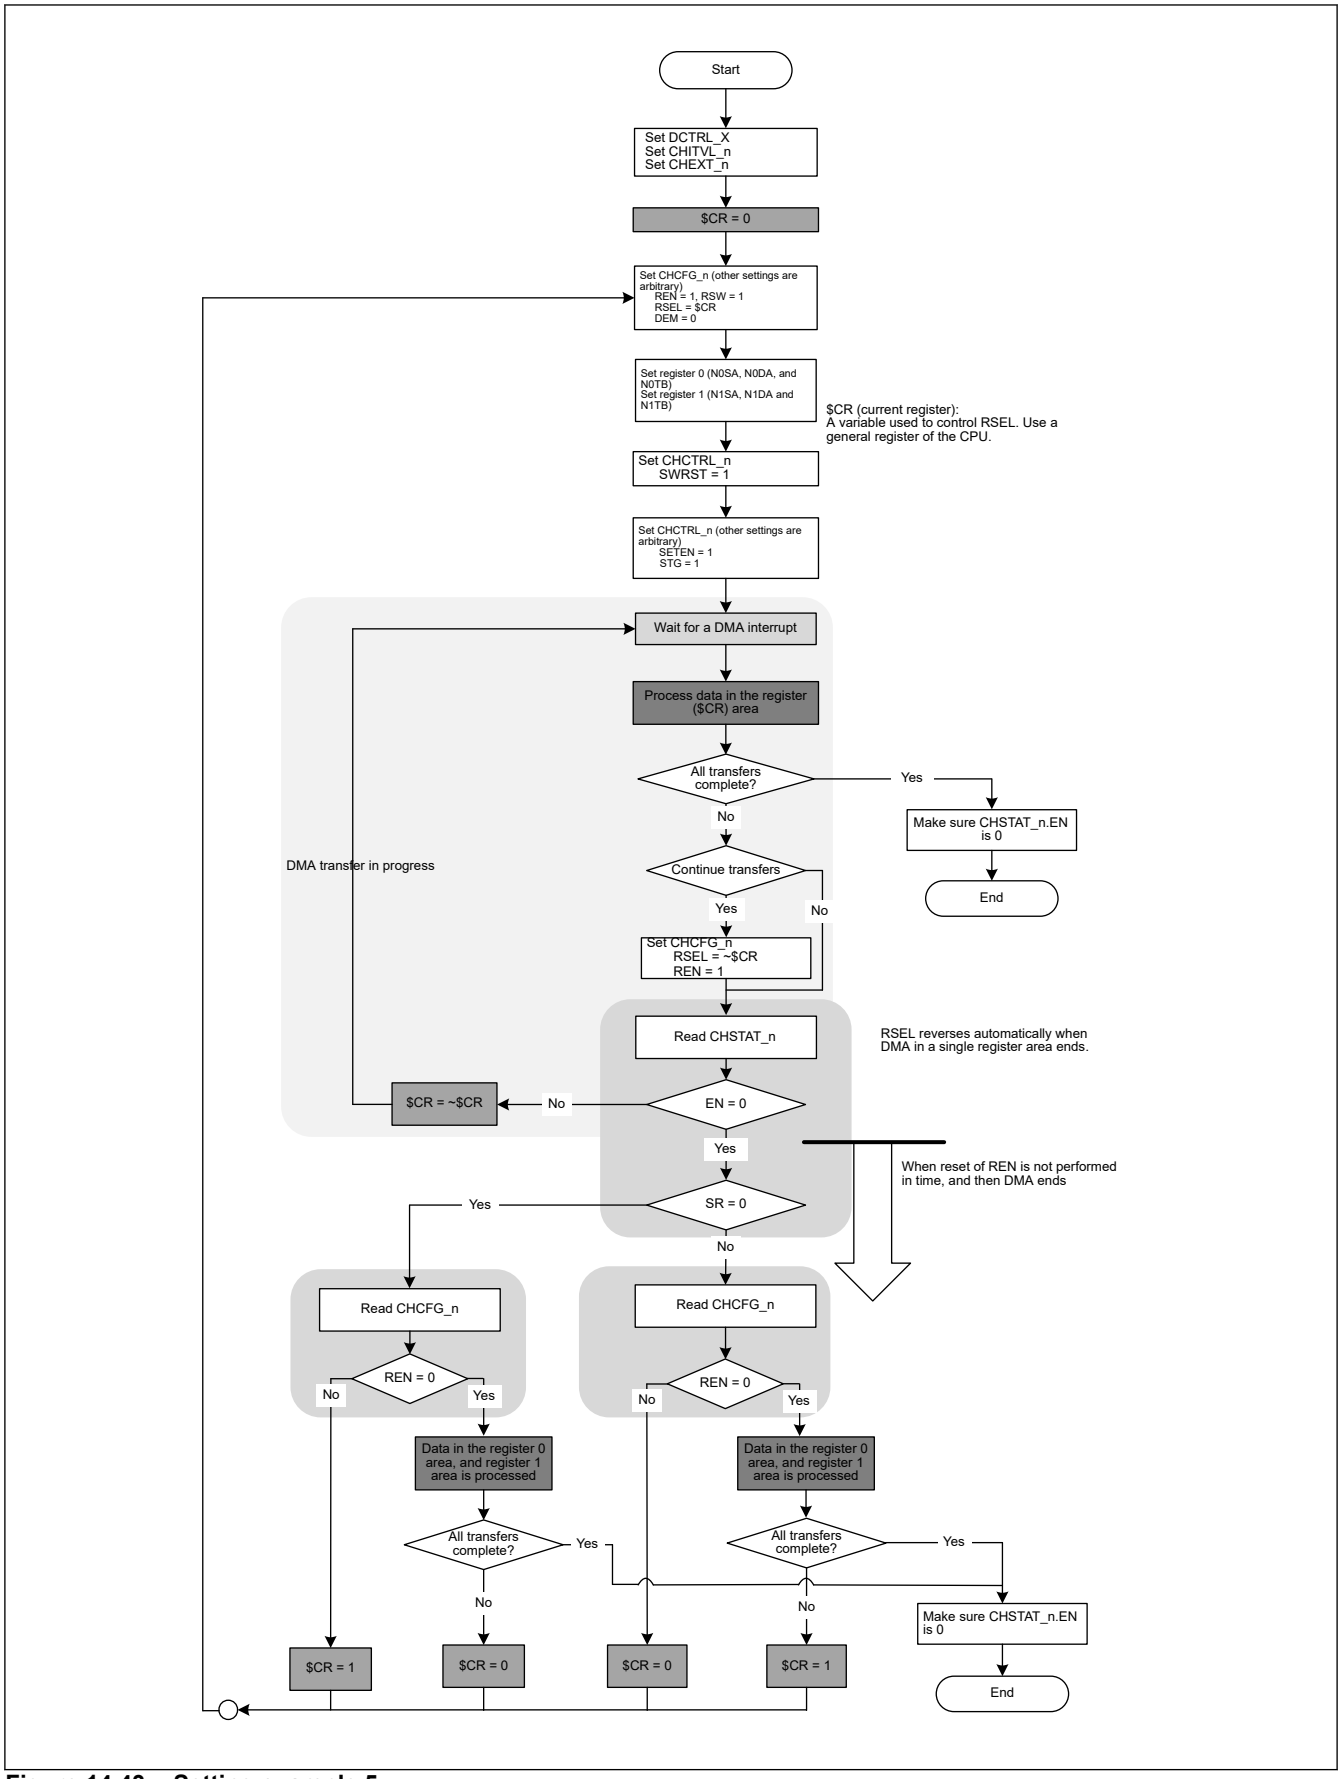

Figure 14.43 Setting example 5

(1) Supplementary information

Save the register sets 0 (N0SA_n, N0DA_n, and N0TB_n registers) and 1 (N1SA_n, N1DA_n, and N1TB_n registers) in a general register (call this register value $CR for convenience).

Every time a DMA transfer of a register set completes (a DMA transfer completion interrupt is generated), the REN bit in the CHCFG_n register is cleared to 0 automatically. To perform transfers in series, write 1 to the REN bit in the CHCFG_n register.

In this mode, two Next registers are executed in series. However, if the REN bit is not set before a DMA transfer completes (before the next DMA transfer completion interrupt is generated), the continuous execution stops. In this case, by reading the SR and EN bits in the CHSTAT_n register, and the REN bit in the CHCFG_n register, you can check how far the transfer has performed. To resume the transfer, perform the procedure described in Figure 14.43.

14.6 Usage Notes

This section provides notes on the DMA Controller module.

- When a transfer of which source and destination are the same, or partially shared area is performed, consistency of data cannot be guaranteed. Therefore, do not perform a transfer of which source and destination address areas overlap.
- For hardware activation, if REQD = 1 (the transfer destination issues a hardware request), SBE = 1 (flush mode) then the forced ejection function cannot be used. The transfer is deactivated by hardware.

14.6.1 When the DACK Signal is Divided and Output

When 4 bytes or more of data is transferred to an 8-bit or 16-bit external device, or 2 bytes or more of data is transferred to an 8-bit external device, a DMA transfer unit is divided into multiple bus cycles. The TEND signal outputs after the last DMA access completion.

When a DMA transfer is divided into multiple bus cycles and the CS signal is deactivated between bus cycles, DACK output is divided in the same way as the CS signal.

Figure 14.44 provides an example of DACK/TEND.

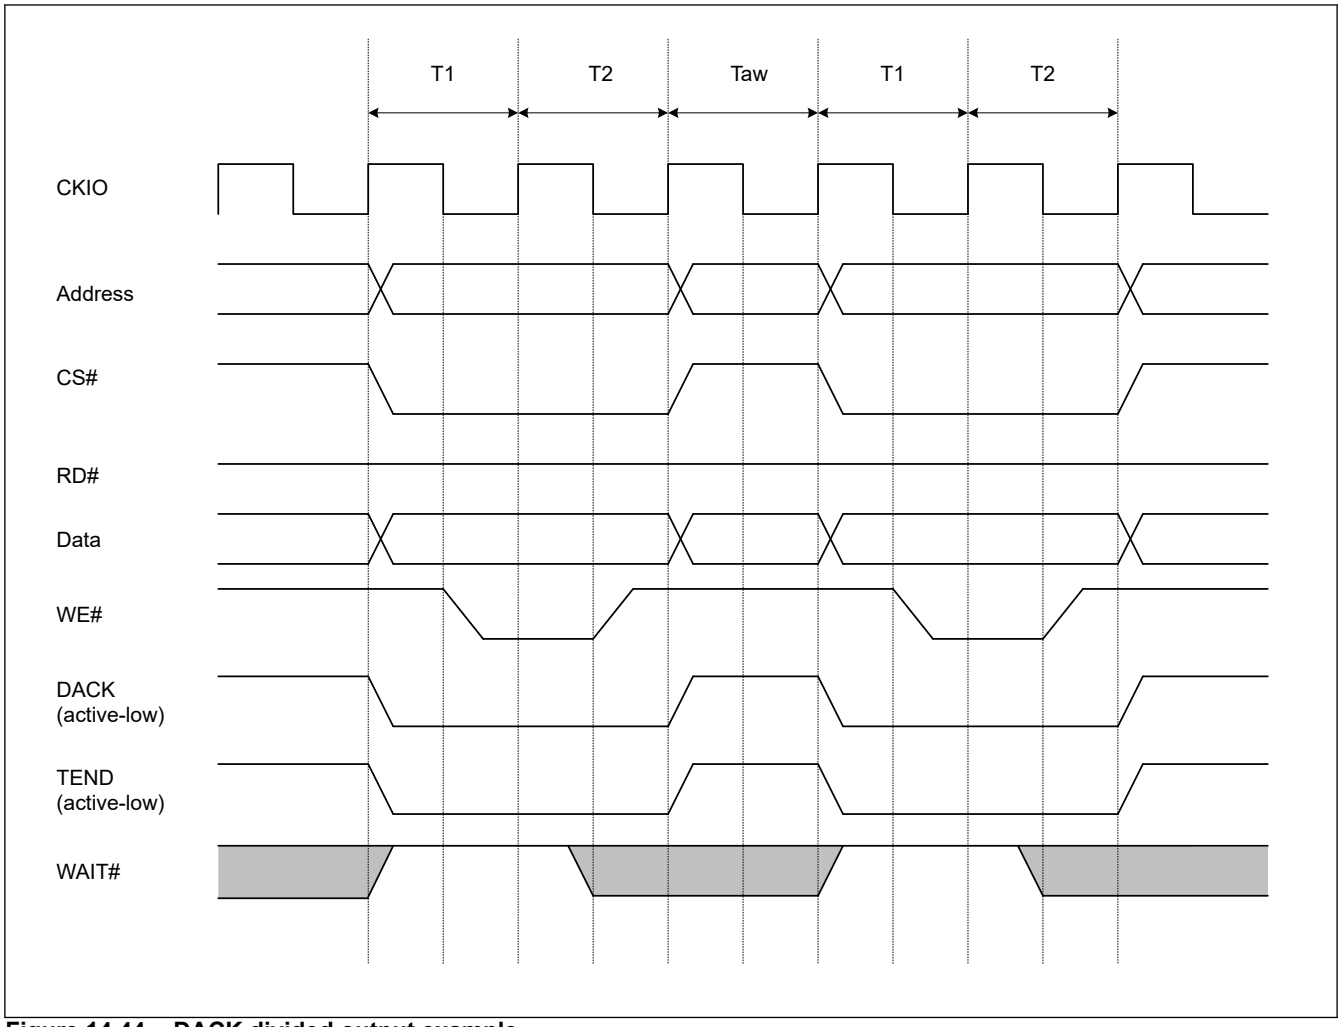

Figure 14.44 DACK divided output example

15. Event Link Controller (ELC)

15.1 Overview

The event link controller (ELC) connects (links) events generated by various peripheral modules to other modules. Event link allows direct cooperation among modules without CPU intervention.

Table 15.1 lists the specifications of the ELC and Figure 15.1 shows a block diagram.

Table 15.1 ELC specifications

Parameter	Specifications
Event link function	• 214 types of event signals can be directly connected to modules. • The operation of timer modules can be selected when an event is input to the timer module. • Event link operation is possible for Port 16 and Port 18. Single port*1: An event link can be set for a single bit specified in a port. Port group*1: An event link can be set for a group of single bits specified within eight I/O ports.

Note 1. The single port and port group specified as the input generate an event according to the change in the connected signal value.

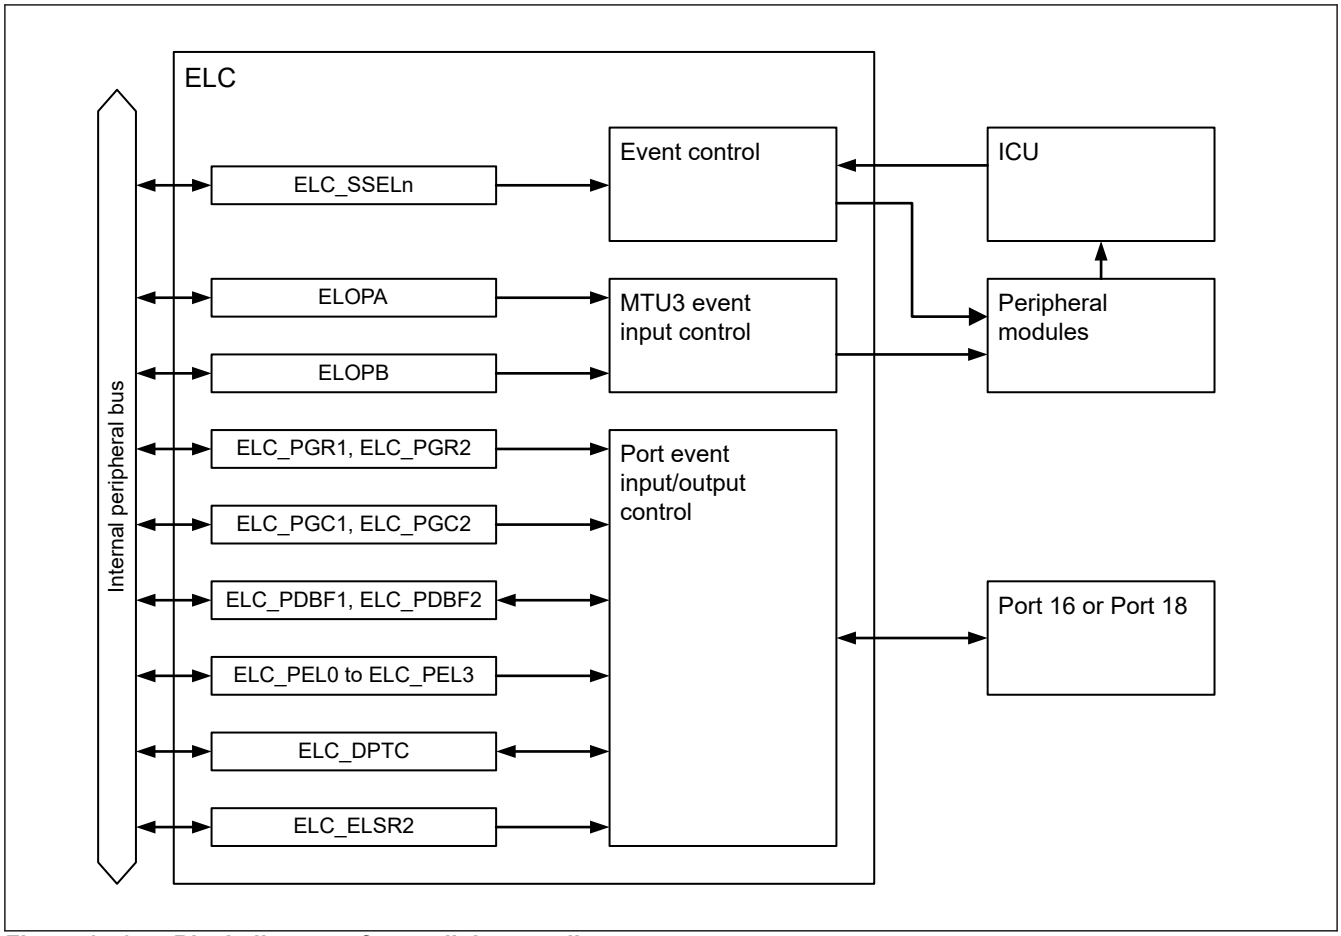

Figure 15.1 Block diagram of event link controller

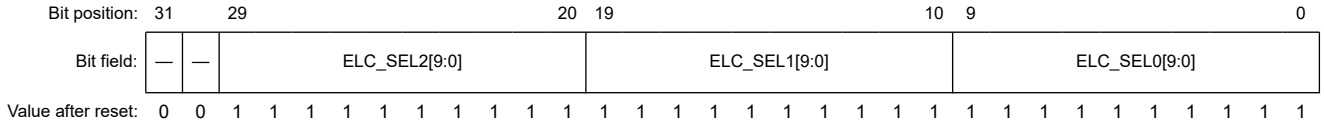

15.2 Register Descriptions

This section describes details of the register functions.

15.2.1 ELC_SSELn : ELC Event Source Select Register n (n = 0 to 18)

Base address: ELC = 0x8009_0010

Offset address: 0x00 + 0x04 × n

Bit	Symbol	Function	R/W
9:0	ELC_SEL0[9:0]	Set the number for ELC event source to be linked to the ELC destination. Event source is selectable from Table 15.2. If ELC function is not used, set 0x3FF (Disable ELC function). Setting of the number not listed in Table 15.2 is prohibited. See Table 15.3 for correspondence between register/bit assignment and ELC destination.	R/W
19:10	ELC_SEL1[9:0]		R/W
29:20	ELC_SEL2[9:0]		R/W
31:30	—	These bits are read as 0. The write value should be 0.	R/W

The ELC_SSELn register specifies an event source to be linked to for each destination peripheral module. Table 15.2 lists the correspondence between the event source number set in the ELC_SSELn register and the event source description. Table 15.3 lists the correspondence between the ELC_SSELn register/bits and the destination peripheral modules.

Table 15.2 ELC Event Source (1 of 6)

Event Source No.	Peripheral module	Event source description
0x000	ICU	Software interrupt 0
0x001		Software interrupt 1
0x002		Software interrupt 2
0x003		Software interrupt 3

15.2.2 ELOPA : Event Link Option Setting Register A

Base address: ELO = 0x8028_1200

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	MTU3MD[1:0]		—	—	—	—	MTU0MD[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
1:0	MTU0MD[1:0]	MTU0 Operation Select 0 0: Counting is started. 0 1: Counting is restarted. 1 0: Input capture (The MTU0.TCNT value is captured into MTU0.TGRA.) 1 1: Event is disabled.	R/W
5:2	—	These bits are read as 1. The write value should be 1.	R/W
7:6	MTU3MD[1:0]	MTU3 Operation Select 0 0: Counting is started. 0 1: Counting is restarted. 1 0: Input capture (The MTU3.TCNT value is captured into MTU3.TGRA.) 1 1: Event is disabled.	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

The ELOPA register determines the operation of MTU0 and MTU3 when an event is input. The event setting should be disabled when the ELC function is not used.

15.2.3 ELOPB : Event Link Option Setting Register B

Base address: ELO = 0x8028_1200

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MTU4MD[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
1:0	MTU4MD[1:0]	MTU4 Operation Select 0 0: Counting is started. 0 1: Counting is restarted. 1 0: Input capture (The MTU4.TCNT value is captured into MTU4.TGRA.) 1 1: Event is disabled.	R/W
7:2	—	These bits are read as 1. The write value should be 1.	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

The ELOPB register determines the operation of MTU4 when an event is input. The event setting should be disabled when the ELC function is not used.

15.2.4 ELC_PGRn : ELC Port Group Setting Register n (n = 1, 2)

Base address: PORT_NSR = 0x800A_0000
PORT_SR = 0x8103_0000

Offset address: 0xE00 + 0x01 × (n − 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PG7	PG6	PG5	PG4	PG3	PG2	PG1	PG0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	PG7 to PG0	Port Group Setting 0: The port bit is not specified as a member of the same group. 1: The port bit is specified as a member of the same group.	R/W

The ELC_PGRn register specifies a group for I/O port bits. This register specifies each port bit in the same eight I/O ports as the member of a group. One to eight port bits can be specified as the members of the same group as required.

Table 15.4 Registers related to port groups and corresponding port numbers

Port Number	Port Group Setting Register (ELC_PGRn)	Port Group Control Register (ELC_PGCn)	Port Buffer Register (ELC_PDBFn)
Port 16	ELC_PGR1 register	ELC_PGC1 register	ELC_PDBF1 register
Port 18	ELC_PGR2 register	ELC_PGC2 register	ELC_PDBF2 register

15.2.5 ELC_PGCn : ELC Port Group Control Register n (n = 1, 2)

Base address: PORT_NSR = 0x800A_0000
PORT_SR = 0x8103_0000

Offset address: 0xE02 + 0x01 × (n − 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	PGCO[2:0]			—	PGCOVE	PGCI[1:0]	
Value after reset:	1	0	0	0	1	0	0	0

Bit	Symbol	Function	R/W
1:0	PGCI[1:0]	Event Output Edge Select 0 0: Event is generated on detection of the rising edge of the external input signal. 0 1: Event is generated on detection of the falling edge of the external input signal. 1 x: Event is generated on detection of both the rising and falling edges of the external input signal.	R/W
2	PGCOVE	PDBF Overwrite 0: Overwriting ELC_PDBFn register is disabled. 1: Overwriting ELC_PDBFn register is enabled.	R/W
3	—	This bit is read as 1. The write value should be 1.	R/W
6:4	PGCO[2:0]	Port Group Operation Select 0 0 0: 0 is output when the event is input. 0 0 1: 1 is output when the event is input. 0 1 0: The toggled (inverted) value is output when the event is input. The target Port m Mode register should be set to 11b: Output (Output data is input to input buffer) 0 1 1: The buffer value is output when the event is input. 1 x x: Setting prohibited	R/W
7	—	This bit is read as 1. The write value should be 1.	R/W

For the output port group, the ELC_PGCn register specifies the form of outputting the signal externally via the port when the event signal is input. For the input port group, this register enables/disables overwriting of the ELC_PDBFn register and specifies the conditions of event generation (edge of the externally input signal).

15.2.6 ELC_PDBFn : ELC Port Buffer Register n (n = 1, 2)

Base address: PORT_NSR = 0x800A_0000
PORT_SR = 0x8103_0000

Offset address: 0xE04 + 0x04 × (n − 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PB7	PB6	PB5	PB4	PB3	PB2	PB1	PB0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	PB7 to PB0	Port Buffer n ● In case Port is output Data is transferred from ELC_PDBFn register to Pm register when an event is input. ● In case Port is input External input data is transferred to ELC_PDBFn register when an event is input. Write access to the bit specified as a member of the input port group is invalid.	R/W

The ELC_PDBFn register is an 8-bit readable/writable register used in combination with the ELC_PGRn register.

15.2.7 ELC_PELn : ELC Port Setting Register n (n = 0 to 3)

Base address: PORT_NSR = 0x800A_0000
PORT_SR = 0x8103_0000

Offset address: 0xE0C+ 0x01 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	PSM[1:0]		PSP[1:0]		PSB[2:0]		
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	PSB[2:0]	Bit Number Specification A bit number in eight I/O ports is specified.	R/W
4:3	PSP[1:0]	Port Number Specification 0 0: Setting prohibited 0 1: Port 16 (corresponding to ELC_PGR1) 1 0: Port 18 (corresponding to ELC_PGR2) 1 1: Setting prohibited	R/W
6:5	PSM[1:0]	Event Link Specification For the output port, data to be output from the port is specified. For the input port, the edge on which the event is to be output is specified. 0 0: For the output port, 0 is output when the event is input. For the input port, the event is output on detection of the rising edge. 0 1: For the output port, 1 is output when the event is input. For the input port, the event is output on detection of the falling edge. 1 x: For the output port, the toggled (inverted) value is output when the event is input. For the input port, the event is output on detection of both the rising and falling edges. The target Port m Mode register should be set to 11b: Output (Output data is input to input buffer)	R/W
7	—	This bit is read as 1. The write value should be 1.	R/W

The ELC_PELn register specifies the single port to which an event is to be linked, the port operation on the event signal input, and the conditions of event generation. In this LSI, a total of 4 bits in Port 16 or Port 18 can be specified as single ports.

15.2.8 ELC_DPTC : ELC Edge Detection Control Register

Base address: PORT_NSR = 0x800A_0000
PORT_SR = 0x8103_0000

Offset address: 0xE10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	PTC3	PTC2	PTC1	PTC0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	PTC3 to PTC0	Single Input Port n Edge Detection 0: Disable edge detection for Single Input Port n 1: Enable edge detection for Single Input Port n	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

The ELC_DPTC register specifies input edge detection function for single input port linked to the event.

15.2.9 ELC_ELSR2 : ELC Port Event Control Register

Base address: PORT_NSR = 0x800A_0000
PORT_SR = 0x8103_0000

Offset address: 0xE11

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PES3	PES2	PES1	PES0	PEG2	PEG1	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0. The write value should be 0.	R/W
3:2	PEG2 to PEG1	ELC Port Buffer Register (ELC_PDBFn) write access control. When set to 1, writing to the ELC_PDBFn register via Internal peripheral bus is disabled, preventing overwriting. 0: When not use event link function of input port group n 1: When use event link function of input port group n	R/W
7:4	PES3 to PES0	Single Port n Event Link Function Enable 0: Disable Single Port event link function 1: Enable Single Port event link function	R/W

The ELC_ELSR2 register specifies input port function linked to ELC. When enabled in this register, corresponding ELC_SSELn should be enabled.

15.3 Operation

15.3.1 Event Linkage

ELC connects events generated by various source peripheral modules to other destination modules. It allows direct interlinked operation among source and destination modules without using software.

When source events are specified in the ELC_SSELn registers, the corresponding destination peripheral modules can be operated at generation of the specified events. A single destination peripheral module can link only with a single event source. Set the ELC_SSELn register after completing the initialization of the destination peripheral module to operate by an event. Table 15.5 lists the operations of destination peripheral modules when an event signal is input. When ELC is not used in the destination peripheral module, set 0x3FF to the corresponding ELC_SSELn register.

Table 15.5 ELC destination and operation (1 of 3)

No	ELC destination	Operation
0	MTU0	The following operations can be selected by setting the ELOPA and ELOPB registers: ● Starts counting when an event signal is input ● Restarts counting when an event signal is input ● Performs input-capture operation when an event signal is input
1	MTU3	
2	MTU4	
3	LLPP GPT event A	The following operations can be selected by setting GPT registers in LLPP: ● Starts counting when an event signal is input ● Stops counting when an event signal is input ● Clears counter when an event signal is input ● Increments counter when an event signal is input ● Decrements counter when an event signal is input ● Performs input-capture operation when an event signal is input
4	LLPP GPT event B	
5	LLPP GPT event C	
6	LLPP GPT event D	
7	LLPP GPT event E	
8	LLPP GPT event F	
9	LLPP GPT event G	
10	LLPP GPT event H	

Table 15.5 ELC destination and operation (2 of 3)

No	ELC destination	Operation
11	NONSAFTY GPT event A	The following operations can be selected by setting GPT registers in NONSAFETY: ● Starts counting when an event signal is input ● Stops counting when an event signal is input ● Clears counter when an event signal is input ● Increments counter when an event signal is input ● Decrements counter when an event signal is input ● Performs input-capture operation when an event signal is input
12	NONSAFTY GPT event B	
13	NONSAFTY GPT event C	
14	NONSAFTY GPT event D	
15	NONSAFTY GPT event E	
16	NONSAFTY GPT event F	
17	NONSAFTY GPT event G	
18	NONSAFTY GPT event H

44	ESC LATCH1	
45	GMAC PTP timer capture 0	Capture current value of PTP timer
46	GMAC PTP timer capture 1	
47	Output port group 1 (Port 16)	● Change the Pm value to the value specified in the ELC_PGCn register ● Transfer ELC_PDBFn value to the Pm register
48	Output port group 2 (Port 18)	
49	Input port group 1 (Port 16)	Transfers the signal value of the external pin to the ELC_PDBFn register
50	Input port group 2 (Port 18)	

Table 15.5 ELC destination and operation (3 of 3)

No	ELC destination	Operation
51	Single port 0	• In case single port is output Changes the Pm value to the value specified in the ELC_PELn register • In case single port is input Generates an event when edge detection on the single input port
52	Single port 1	
53	Single port 2	
54	Single port 3	
55	ENCOUT trigger	ENCOUT trigger

15.3.2 Operation of MTU When Event is Input

The operations are performed depending on the ELOPA and ELOPB registers when an event is input.

15.3.2.1 Count Start Operation

When an event is input, the timer starts counting, which sets the count start bit*1 in each timer control register to 1. An event that is input while the count start bit is 1 is invalid.

Note 1. Refer to the register descriptions on starting the timer in the relevant Peripheral Timer Module section.

15.3.2.2 Count Restart Operation

When an event is input, the timer counter is initialized. Since the count start bit*1 in each timer control register is retained, counting is restarted when an event signal is input while the count start bit is 1.

Note 1. Refer to the register descriptions on starting the timer in the relevant Peripheral Timer Module section.

15.3.2.3 Input Capture Operation

When an event is input, the timer performs input-capture operation.

15.3.3 Operation of GPT When Event is Input

Eight event signals of each GPT in LLPP and NONSAFETY are connected to every channel of each GPT in LLPP and NONSAFETY as GPT event sources A to H. To set GPT operation when inputting an event signal, enable any of the event sources A to H by a corresponding bit in registers listed in Table 15.6.

Table 15.6 Operations when event is input and corresponding source select registers

Operations on event	Register symbol	Register name
Count start	GTSSR	General PWM Timer Start Source Select Register
Count stop	GTPSR	General PWM Timer Stop Source Select Register
Counter clear	GTCSR	General PWM Timer Clear Source Select Register
Up-count	GTUPSR	General PWM Timer Count-Up Source Select Register
Down-count	GTDNSR	General PWM Timer Count-Down Source Select Register
Input capture A	GTICASR	General PWM Timer Input Capture Source Select Register A
Input capture B	GTICBSR	General PWM Timer Input Capture Source Select Register B

15.3.4 Operation of A/D Converter When Event is Input

The A/D converter starts A/D conversion when the ADCSR.ADST bit*1 is set to 1.

Note 1. For details, see section 39, 12-Bit A/D converter (ADC12).

15.3.5 I/O Port Operation on Event Input and Event Generation

The I/O port operation to be performed on event input to the port and the operation causing the port to generate an event can be set.

15.3.5.1 Single Ports and Port Groups

There are two event link modes:

- Event link to single ports
- Event link to port groups

In the former mode, events can be connected to eight I/O ports. In the latter mode, events can be connected to port groups consisting of any two or more bits in the same eight I/O ports.

A single port can be set by specifying any bit in the I/O port*1 to which an event can be connected using the ELC_PELn register. A port group can be set by specifying any one or more bits in the I/O port*1 to which an event can be connected using the ELC_PGRn register. One input port group and one output port group can be set in the same I/O port.

If the I/O port bit is specified as both a single port and a member of a port group, both functions are enabled when the relevant port is input, whereas only the port group function is enabled when the relevant port is output.

Set the PMm register to select the direction of the I/O ports.

Note 1. Port 16 and port 18

15.3.5.2 Single Input Port Operation on Event Generation

A single input port which is specified by the PMm register generates an event when the signal value of the external pin connected to the relevant port changes. The event generation condition is specified using the ELC_PELn register. An example of event linking operation by a single input port is shown as [1] in Figure 15.2.

15.3.5.3 Single Output Ports Operation on Event Input

When an event is input to a single output port which is specified by the PMm register, the signal of the external pin connected to the relevant port changes according to the settings of the ELC_PELn register. This changes the signal value of the external pin connected to the relevant port. An example of event linking operation by a single output port is shown as [2] in Figure 15.2.

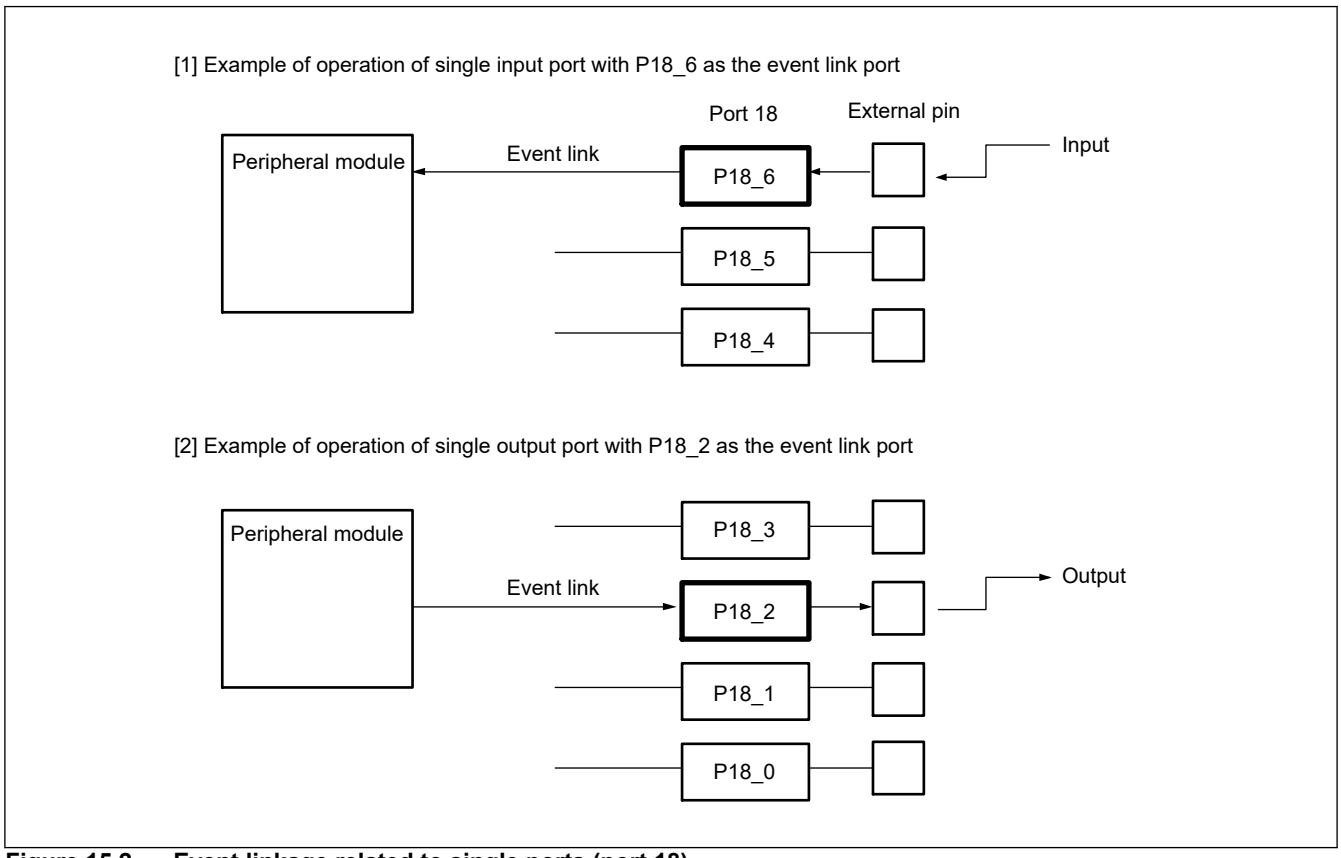

Figure 15.2 Event linkage related to single ports (port 18)

15.3.5.4 Input Port Group Operation on Event Generation

An input port group which is specified by the PMm register generates an event when the signal value of any one of the external pins connected to the relevant port group changes. The event generation condition is specified using the PGCIn bit of the ELC_PGCn register.

15.3.5.5 Input Port Group Operation on Event Input

When an event is input to an input port group, the signal value of the external pin on event input is transferred to the ELC_PDBFn register. In this case, only the values of the bits specified as members of the input port group are transferred. If another event is input to the input port group in this state, operations are performed depending on the ELC_PGCn.PGCOVE bit setting as described below. An example of operation is shown in Figure 15.3.

- ELC_PGCn.PGCOVE = 0 (overwriting is disabled)
  If the value that was transferred to the ELC_PDBFn register on the previous event input has already been read by the CPU, the signal value of the external pin is transferred to the ELC_PDBFn register. If not read, the signal value of the external pin is not transferred and the input event is invalid.
- ELC_PGCn.PGCOVE = 1 (overwriting is enabled)
  When another event is input to an input port group, the signal value of the external pin is transferred to the ELC_PDBFn register.

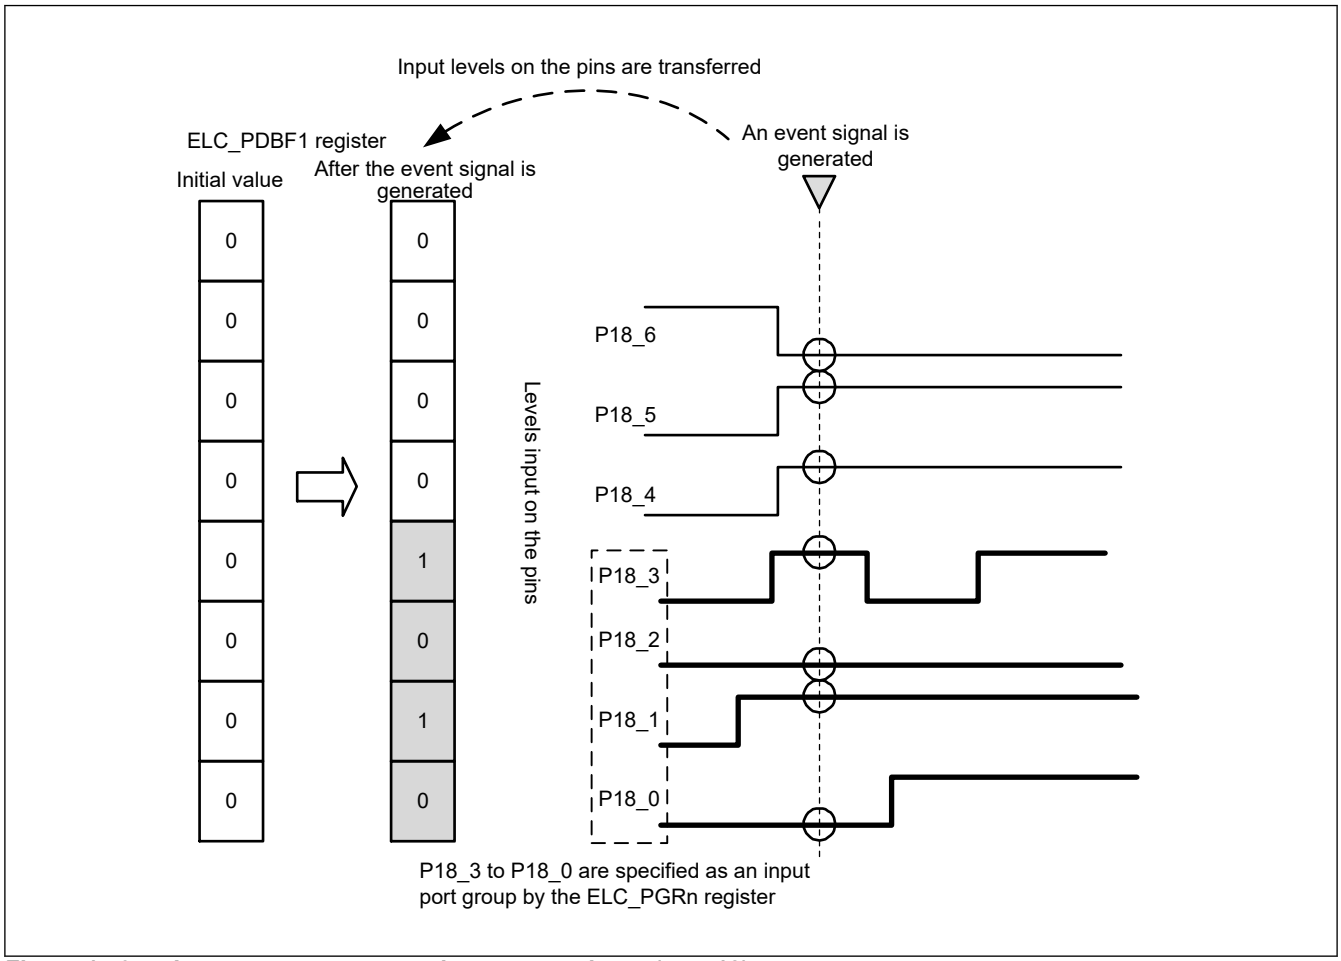

Figure 15.3 Input port group operation on event input (port 18)

15.3.5.6 Output Port Group Operation on Event Input

If an event is input to an output port group while the ELC_PGCn.PGCOn bit is 000b, 001b, or 010b, the Pm register value is changed to the value which was specified in the ELC_PGCn register.

If an event is input to an output port group while the ELC_PGCn.PGCOn bit is 011b, the ELC_PDBFn value is transferred to the Pm register of the port which was specified in the ELC_PGRn register. Example of operation of the output port group on an event input (when ELC_PGCn.PGCOn = 011b) is shown in Figure 15.4.

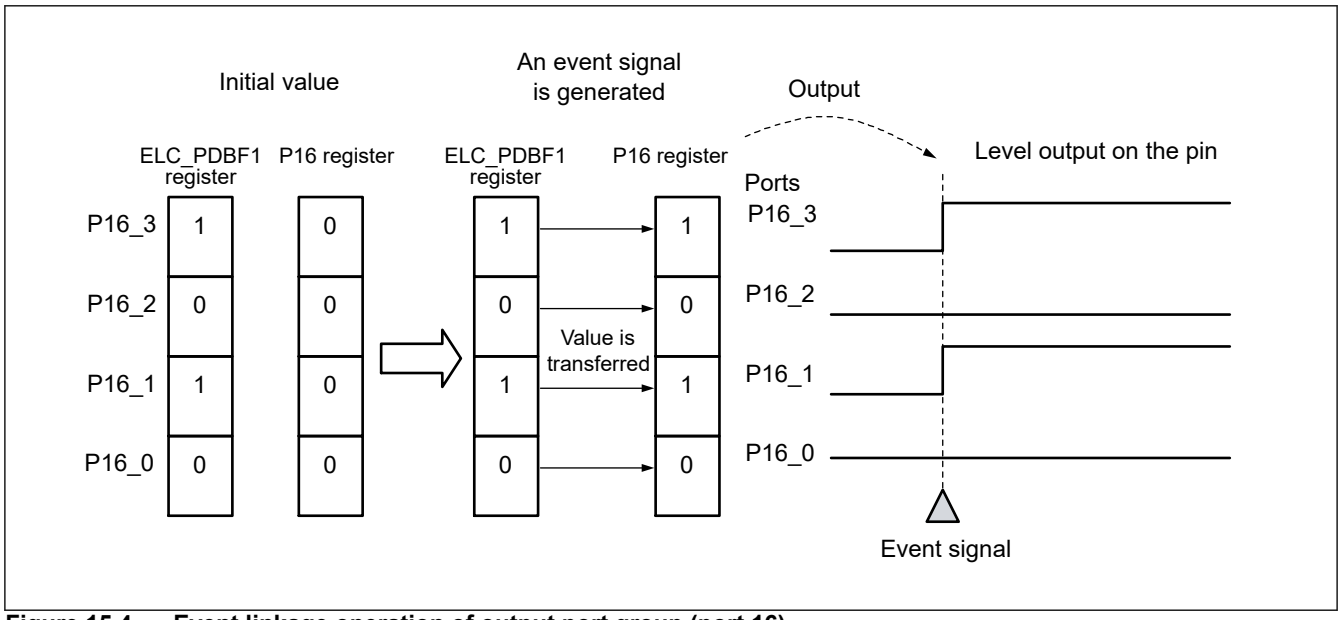

Figure 15.4 Event linkage operation of output port group (port 16)

15.3.5.7 Restrictions on Writing to Pm and ELC_PDBFn Registers by a CPU

For event linkage through the I/O ports, following restrictions apply when a CPU writes the Pm and ELC_PDBFn registers.

- If port bits are specified as members of the input port group, write access to the relevant bits in the ELC_PDBFn register is invalid.
- If port bits are specified as members of the output port group, write access to the relevant bits in the Pm register is invalid.
- If a port bit is specified as a single output port and the event linkage is set (by the ELC_SSELn register) for the port, write access to the relevant bit in the Pm register is invalid.

15.3.6 Example of Procedure for Linking Events

The following procedure describes the steps for linking events.

1. Set the operation of the module to which an event is to be linked.
2. If events are linked to ports, set the registers associated with the ports as follows:
   - I/O port setting
     Pm: Set the initial values of the output ports.
     PMm: Set the I/O direction of the ports.
   - ELC setting
     ELC_PGRn: If ports are used as a port group, set the ports (in bit units) to be grouped.
     ELC_PGCn: Set the operation of the port group.
     ELC_PELn: If ports are used as single ports, set the ports, the operation of the ports when an event is input, and the condition when an event is generated.
     ELC_DPTC: If pots are used as single input port edge detection, set the ports.
     ELC_ELSR2: If ports are used as input port groups, set the PEGn bits. If ports are used as single ports, set the PESn bits.
3. For the ELC_SSELn register associated with the module to which an event signal is to be linked, set the number of the event signal.
4. If events are to be linked to timer modules, set the ELOPA and ELOPB registers corresponding to the timers as required.

5. Set the operation of the module from which an event is output, and activate the module. This allows the event output from the module to start the module to which an event is linked as preset.
6. To stop event linkage of independent modules, set 0x3FF to ELC_SELx bits in the ELC_SSEL register corresponding to the modules.

Note: Setting the ELC_PDBFn register
- Output port groups
  Set the ELC_PGCn register before setting the ELC_PDBFn register. The value of the ELC_PGCn register can be modified if this precedes an event trigger which causes the value of the Pm register to change.
- Input port groups
  Setting the ELC_PDBFn is not required. However, since the value after a reset is 0x00, if the ELC_PDBFn register is used to confirm changes from H to L due to an event input, set the ELC_PDBFn bit for the pin for which you want to confirm this to be 1.

15.4 Usage Notes

15.4.1 Setting Clocks

To link events, it is necessary for the ELC and the related modules to be enabled. The modules cannot operate if the related modules are in the module-stop state or if the low power consumption mode causes the modules to stop (all-module stop mode).

16. I/O Ports

16.1 Overview

The I/O port pins operate as general I/O port pins, I/O pins for peripheral modules, or interrupt input pins. All pins are set to non-use immediately after a reset (Hi-Z input protection) excluding P02_4 to P02_7 and P17_5 which are shared with JTAG pins and reset output pin. The pin functions are switched by register settings. The I/O ports and peripheral modules for each pin are specified in the associated registers.

The configuration of the I/O ports differs depending on the package.

Table 16.1 shows the specifications of I/O ports.

Table 16.1 Specification of I/O ports

Port	Package	
	196-pin FBGA	Number of pins
Port 00	P00_0 to P00_3, P00_6	5
Port 01	P01_0 to P01_7	8
Port 02	P02_0 to P02_7	8
Port 03	—	0
Port 04	P04_1	1

16.3 Register Descriptions

16.3.1 Pm : Port m Register (m = 00 to 24)

Base address: PORT_NSR = 0x800A_0000
PORT_SR = 0x8103_0000

Offset address: 0x000 + 0x001 × m

Bit position:	7	6	5	4	3	2	1	0
Bit field:	POUT_7	POUT_6	POUT_5	POUT_4	POUT_3	POUT_2	POUT_1	POUT_0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W[*1]
7:0	POUT_0 to POUT_7	Pm_n Output Data Store (n: bit position) 0: Low output 1: High output	R/W

Note: Available pins depend on port group. For details, see Table 16.1. P07_4 is not available because of input only.
Note 1. If access address is not region selected by RSELPm register, the bit is read only.

The Pm register holds the data to be output from the pins used for general I/O.

16.3.2 PMm : Port m Mode Register (m = 00 to 24)

Base address: PORT_NSR = 0x800A_0000
PORT_SR = 0x8103_0000

Offset address: 0x200 + 0x002 × m

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PM7[1:0]		PM6[1:0]		PM5[1:0]		PM4[1:0]		PM3[1:0]		PM2[1:0]		PM1[1:0]		PM0[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W*1
1:0	PM0[1:0]	Pm_0 I/O Select 0 0: Hi-Z 0 1: Input 1 0: Output (Output data is not input to input buffer) 1 1: Output (Output data is input to input buffer)	R/W
3:2	PM1[1:0]	Pm_1 I/O Select This function is the same as PM0[1:0].	R/W
5:4	PM2[1:0]	Pm_2 I/O Select This function is the same as PM0[1:0].	R/W
7:6	PM3[1:0]	Pm_3 I/O Select This function is the same as PM0[1:0].	R/W
9:8	PM4[1:0]	Pm_4 I/O Select This function is the same as PM0[1:0].	R/W
11:10	PM5[1:0]	Pm_5 I/O Select This function is the same as PM0[1:0].	R/W
13:12	PM6[1:0]	Pm_6 I/O Select This function is the same as PM0[1:0].	R/W
15:14	PM7[1:0]	Pm_7 I/O Select This function is the same as PM0[1:0].	R/W

Note: Available pins depend on port group. For details, see Table 16.1. P07_4 supports only Input (01b).
Note: For the port shared with the following signals, initial value is 01b; input.
MDD (P17_0), MDV3 (P20_4), MDV2 (P20_3), MDW (P02_1), MD2 (P05_7), MD1 (P06_2), MD0 (P06_3)
Note 1. If access address is not region selected by RSELPm register, the bit is read only.

The PMm register is used to select I/O function for the pins used for general I/O.

16.3.3 PMCm : Port m Mode Control Register (m = 00 to 24)

Base address: PORT_NSR = 0x800A_0000
PORT_SR = 0x8103_0000

Offset address: 0x400 + 0x001 × m

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PMC7	PMC6	PMC5	PMC4	PMC3	PMC2	PMC1	PMC0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W*1
7:0	PMC0 to PMC7	Pm_n Pin Mode Control (n: bit position) 0: Uses the pin as a general I/O pin. 1: Uses the pin as an I/O port for peripheral functions.	R/W

Note: Available pins depend on port group. For details, see Table 16.1.
Note: For the port shared with the following signals, initial value is 1: peripheral function.
RSTOUT# (P17_5), TDO (P02_4), TDI (P02_5), TMS (P02_6), TCK (P02_7)

Note 1. If access address is not region selected by RSELPm register, the bit is read only.

The PMCm register is used to select the function of the pins of the port.

16.3.4 PFCm : Port m Function Control Register (m = 00 to 24)

Base address: PORT_NSR = 0x800A_0000
PORT_SR = 0x8103_0000

Offset address: 0x600 + 0x004 × m

Bit position:	31 28	27 24	23 20	19 16	15 12	11 8	7 4	3 0
Bit field:	PFC7[3:0]	PFC6[3:0]	PFC5[3:0]	PFC4[3:0]	PFC3[3:0]	PFC2[3:0]	PFC1[3:0]	PFC0[3:0]
Value after reset:	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0

Bit	Symbol	Function	R/W*1
3:0	PFC0[3:0]	Pm_0 Pin function Select Select one function from maximum 16 shared functions. For details of pin multiplex mapping, see section 16.4. Multiplexed Pin Configurations.	R/W
7:4	PFC1[3:0]	Pm_1 Pin function Select This function is the same as PFC0[3:0].	R/W
11:8	PFC2[3:0]	Pm_2 Pin function Select This function is the same as PFC0[3:0].	R/W
15:12	PFC3[3:0]	Pm_3 Pin function Select This function is the same as PFC0[3:0].	R/W
19:16	PFC4[3:0]	Pm_4 Pin function Select This function is the same as PFC0[3:0].	R/W
23:20	PFC5[3:0]	Pm_5 Pin function Select This function is the same as PFC0[3:0].	R/W
27:24	PFC6[3:0]	Pm_6 Pin function Select This function is the same as PFC0[3:0].	R/W
31:28	PFC7[3:0]	Pm_7 Pin function Select This function is the same as PFC0[3:0].	R/W

Note: Available pins depend on port group. For details, see Table 16.1.
Note: For the port shared with the following signal, initial value is 1.
TDI (P02_5)
Note 1. If access address is not region selected by RSELPm register, the bit is read only.

The PFCm register is used to select peripheral function for the pins.

16.3.5 PINm : Port m Input Register (m = 00 to 24)

Base address: PORT_NSR = 0x800A_0000
PORT_SR = 0x8103_0000

Offset address: 0x800 + 0x001 × m

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PIN7	PIN6	PIN5	PIN4	PIN3	PIN2	PIN1	PIN0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	PIN0 to PIN7	Pm_n Pin Input (n: bit position) 0: Low input 1: High input	R

Note: Available pins depend on port group. For details, see Table 16.1.

The PINm register reflects the states of the individual input port pins.

16.3.6 DRCTLm : I/O Buffer m Function Switching Register (m = 00 to 24)

Base address: PORT_NSR = 0x800A_0000
PORT_SR = 0x8103_0000

Offset address: 0xA00 + 0x008 × m

Bit position:	63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
Bit field:	—	—	SR7	SMT7	PUD7[1:0]		DRV7[1:0]		—	—	SR6	SMT6	PUD6[1:0]		DRV6[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Bit field:	—	—	SR5	SMT5	PUD5[1:0]		DRV5[1:0]		—	—	SR4	SMT4	PUD4[1:0]		DRV4[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	SR3	SMT3	PUD3[1:0]		DRV3[1:0]		—	—	SR2	SMT2	PUD2[1:0]		DRV2[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	SR1	SMT1	PUD1[1:0]		DRV1[1:0]		—	—	SR0	SMT0	PUD0[1:0]		DRV0[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W*1
1:0	DRV0[1:0]	Pm_0 Driving Ability Control 0 0: Low 0 1: Middle 1 0: High 1 1: Ultra High	R/W
3:2	PUD0[1:0]	Pm_0 Pull-Up/Down Control 0 0: No pull-up/down 0 1: Pull-up 1 0: Pull-down 1 1: Setting prohibited	R/W
4	SMT0	Pm_0 Schmitt Trigger Control 0: Disable Schmitt Trigger input 1: Enable Schmitt Trigger input	R/W
5	SR0	Pm_0 Slew Rate Control 0: Slow 1: Fast	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
9:8	DRV1[1:0]	Pm_1 Driving Ability Control This function is the same as DRV0[1:0].	R/W
11:10	PUD1[1:0]	Pm_1 Pull-Up/Down Control This function is the same as PUD0[1:0].	R/W
12	SMT1	Pm_1 Schmitt Trigger Control This function is the same as SMT0.	R/W
13	SR1	Pm_1 Slew Rate Control This function is the same as SR0.	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W
17:16	DRV2[1:0]	Pm_2 Driving Ability Control This function is same as DRV0[1:0].	R/W
19:18	PUD2[1:0]	Pm_2 Pull-Up/Down Control This function is same as PUD0[1:0].	R/W

Bit	Symbol	Function	R/W*1
20	SMT2	Pm_2 Schmitt Trigger Control This function is the same as SMT0.	R/W
21	SR2	Pm_2 Slew Rate Control This function is the same as SR0.	R/W
23:22	—	These bits are read as 0. The write value should be 0.	R/W
25:24	DRV3[1:0]	Pm_3 Driving Ability Control This function is same as DRV0[1:0].	R/W
27:26	PUD3[1:0]	Pm_3 Pull-Up/Down Control This function is same as PUD0[1:0].	R/W
28	SMT3	Pm_3 Schmitt Trigger Control This function is the same as SMT0.	R/W
29	SR3	Pm_3 Slew Rate Control This function is the same as SR0.	R/W
31:30	—	These bits are read as 0. The write value should be 0.	R/W
33:32	DRV4[1:0]	Pm_4 Driving Ability Control This function is same as DRV0[1:0].	R/W
35:34	PUD4[1:0]	Pm_4 Pull-Up/Down Control This function is same as PUD0[1:0].	R/W
36	SMT4	Pm_4 Schmitt Trigger Control This function is the same as SMT0.	R/W
37	SR4	Pm_4 Slew Rate Control This function is the same as SR0.	R/W
39:38	—	These bits are read as 0. The write value should be 0.	R/W
41:40	DRV5[1:0]	Pm_5 Driving Ability Control This function is same as DRV0[1:0].	R/W
43:42	PUD5[1:0]	Pm_5 Pull-Up/Down Control This function is same as PUD0[1:0].	R/W
44	SMT5	Pm_5 Schmitt Trigger Control This function is the same as SMT0.	R/W
45	SR5	Pm_5 Slew Rate Control This function is the same as SR0.	R/W
47:46	—	These bits are read as 0. The write value should be 0.	R/W
49:48	DRV6[1:0]	Pm_6 Driving Ability Control This function is same as DRV0[1:0].	R/W
51:50	PUD6[1:0]	Pm_6 Pull-Up/Down Control This function is same as PUD0[1:0].	R/W
52	SMT6	Pm_6 Schmitt Trigger Control This function is the same as SMT0.	R/W
53	SR6	Pm_6 Slew Rate Control This function is the same as SR0.	R/W
55:54	—	These bits are read as 0. The write value should be 0.	R/W
57:56	DRV7[1:0]	Pm_7 Driving Ability Control This function is same as DRV0[1:0].	R/W
59:58	PUD7[1:0]	Pm_7 Pull-Up/Down Control This function is same as PUD0[1:0].	R/W
60	SMT7	Pm_7 Schmitt Trigger Control This function is the same as SMT0.	R/W
61	SR7	Pm_7 Slew Rate Control This function is the same as SR0.	R/W
63:62	—	These bits are read as 0. The write value should be 0.	R/W

Note: Available pins depend on port group. For details, see Table 16.1. P07_4 supports only Schmitt Trigger Control. Other ports have all features.

Note: For the port shared with the following signals, initial value of SRx and DRVx is different.
TDO (P02_4) : SR4 = 1, DRV4[1:0] = 10b
TMS (P02_6) : SR6 = 1, DRV6[1:0] = 10b
Note 1. If access address is not region selected by RSELPm register, the bit is read only.

The DRCTLm register is used to control function of I/O buffers. This register is valid even if the pin is used as either general I/O pin or an I/O port for peripheral functions in PMCm register.

16.3.7 RSELPm : Port m Region Select Register (m = 00 to 24)

Base address: PTADR = 0x8103_0C00

Offset address: 0x000 + 0x001 × m

Bit position:	7	6	5	4	3	2	1	0
Bit field:	RS7	RS6	RS5	RS4	RS3	RS2	RS1	RS0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	RS0 to RS7	Pm_n pin I/O port registers Region Select (n = bit position) 0: Safety region (Address is 0x8103_0xxx) 1: Non safety region (Address is 0x800A_0xxx)	R/W

Note: Available pins depend on port group. For details, see Table 16.1.

The RSELPm register is used to specify which is the attribution of the I/O port, Safety or Non safety. I/O ports registers except this register are defined two address, Safety region and Non safety region. When Safety region is selected in this register, access to Non safety region in I/O ports registers is limited to read-only though access to Safety region is allowed R/W. On the other hand, when Non safety region is selected in this register, access to Safety region in I/O ports registers is limited to read-only though access to Non safety region is allowed R/W. (Except PINm register due to read-only originally.)

16.4 Multiplexed Pin Configurations

Select the function number with PFCn bit of Port m Function Control Register (PFCm: m = 00 to 24).

One of three types of IO buffers, Type A, B, or C is used each port. Depending on the IO type, recommended DRCTLm register setting may be different each peripheral function. For details, see Table 52.14.

Each port belongs to one voltage domain. Voltage domain VCC1833_n (n = 2, 3) are selectable from 1.8 V or 3.3 V according to the selected peripheral function. When using Ethernet with RGMII or 1.8 V xSPI, supply 1.8 V to the corresponding voltage domain (VCC1833_n). In other cases, supply 3.3 V to the corresponding voltage domain (VCC1833_n). Note that 1.8 V operation is not supported for other peripheral function than Ethernet with RGMII and xSPI.

16.4.1 Port 00 Function Assignment

Table 16.3 Port 00 function assignment (1 of 2)

Function number (PFCn)	Port	P00_0	P00_1	P00_2	P00_3	P00_6

16.5 Handling of Unused Pins

Details on the handling of unused pins are given in Table 16.24.

Table 16.24 Handling of unused pins (1 of 2)

Pin name	Handling
AN000 to AN007, AN100 to AN115	Keep these pins open.
VREFH0	Connect this pin to VCC18_ADC0.
VREFH1	Connect this pin to VCC18_ADC1.
XTAL	Keep this pin open when external clock signal is used.
EXTAL	Connect this pin to VSS via a resistor (pulling down) when external clock signal is used.

Table 16.24 Handling of unused pins (2 of 2)

Pin name	Handling
EXTCLKIN	Connect this pin to VSS via a resistor (pulling down) when a crystal resonator is connected.
TRST#	Connect these pins to VSS via a resistor (pulling down), or input the same signal as that on the RES# pin.
TCK (P02_7)	Connect this pin to VSS via a resistor (pulling down).
TMS (P02_6)	Connect this pin to VCC33 via a resistor (pulling up).
TDI (P02_5)	Connect this pin to VCC33 via a resistor (pulling up).
TDO (P02_4)	Keep this pin open
RSTOUT# (P17_5)	Keep this pin open
MDX	— (Always connect this pin to VSS via a resister (pull down).)
BSCANP	— (Use this as a boundary scan enable pin.)
USB_DP, USB_DM	Connect these pins to GND via a resistor of 10 kΩ or keep these pins open with setting the DIRPD bit in the USBCTR register to 1.
USB_RREF	Keep this pin open.
Other Pins*1	Keep these pins open, connect them to VCC33 via a resistor (pulling up), or connect them to VSS via a resistor (pulling down).

Note 1. When handling them as unused pins, set the corresponding bits of Port m Mode Register (PMm: m = 00 to 24) to "Non-use (Hi-Z input protection)" which is the value after reset release. For P07_4 pin, set to "input" and connect it to VCC33 via a resister (pulling up), or connect it to VSS via a resister (pulling down).

16.6 Usage Notes

16.6.1 Release of Register Write Protection

PMCm, PFCm, DRCTLm, and RSELPm registers are write protected. To release write protection, follow the steps below.

In case of access to 0x8103_0xxx and RSELPm = 0 or in case of access to RSELPm,

1. Write 0x0000A504 to PRCRS register (Release write protection by PRC2 bit)
2. Write value to PMCm, PFCm, DRCTLm, or RSELPm registers
3. Write 0x0000A500 to PRCRS register (Set write protection by PRC2 bit)

In case of access to 0x800A_0xxx and RSELPm = 1,

1. Write 0x0000A504 to PRCRN register (Release write protection by PRC2 bit)
2. Write value to PMCm, PFCm, or DRCTLm registers
3. Write 0x0000A500 to PRCRN register (Set write protection by PRC2 bit)

16.6.2 Examples of Port Setting

The registers to be controlled are shown in Table 16.25.

Table 16.25 Port register configuration (1 of 2)

Register name		Bit name	Description
GPIO control register	Pm	POUT_n	Port register
	PMm	PMn	Port mode register
	PINm	PINn	Port input register
Multiplexed function select register	PMCm	PMCn	Port mode control register
	PFCm	PFCn	Port function control register

Table 16.25 Port register configuration (2 of 2)

Register name		Bit name	Description
I/O Buffer function switching register	DRCTLm	DRVn	Port driving ability control
		PUDn	Port Pull-Up/Down control
		SMTn	Port Schmitt trigger control
		SRn	Port slew rate control

Note: m: 00 to 24, n: 0 to 7

Table 16.26 is overview of the mode register settings for the pin function.

Table 16.26 Pin function configuration overview

Mode	PMCm.PMCn	PMm.PMn	Pm.POUT_n	PINm.PINn	I/O
General I/O input	0	01	x	Input value	I
General I/O output	0	1x	Output value	(Input value)	O
I/O port for peripheral functions*1	1	x	—	—	I/O

Note: m: 00 to 24, n: 0 to 7
Note 1. When PMCm.PMCn = 1, select pin function by PFCm.PFCn.

Figure 16.2 is an example flow of setting the Port Pm_n.

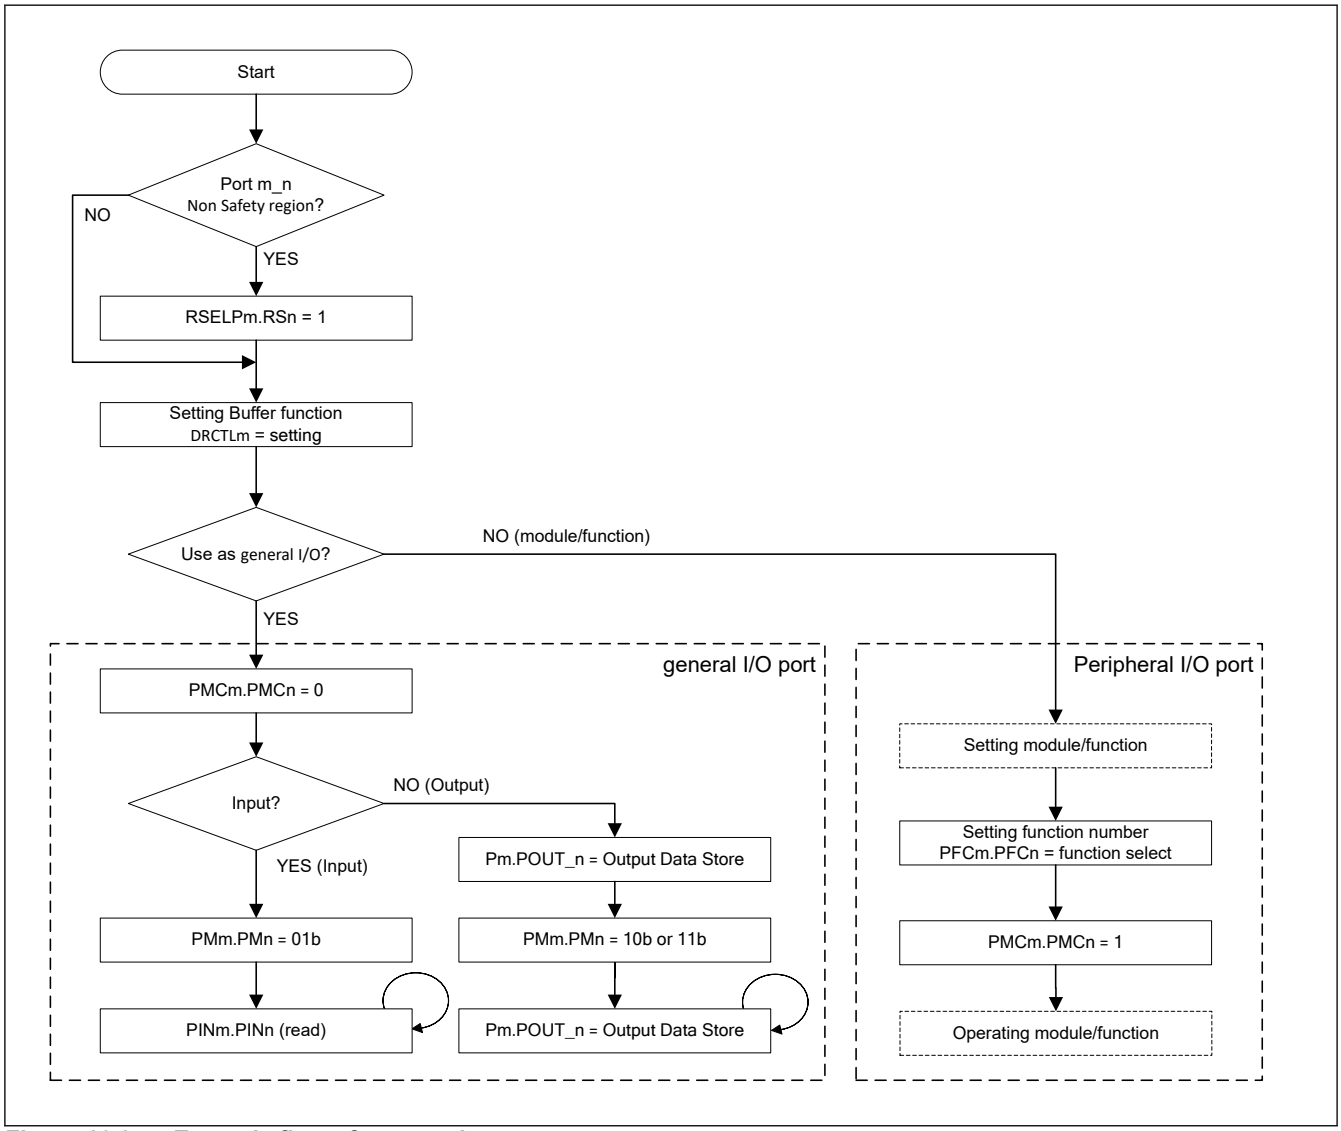

Figure 16.2 Example flow of port setting

16.6.3 Notes on Port Register Setting

1. If the multiplexed function is switched, a spike pulse may be generated in the signal of the on-chip peripheral function multiplexed with port due to the pin state immediately before the switching or other reasons. Take general measures shown below against spike pulses by software.
   - Switch the multiplexed function while the on-chip function is not working.
   - Clear the interrupt request flags, and then release the mask for pins multiplexed with interrupt signals.
   - Determine the output value, and then change the mode.
2. Only the allowed functions should be specified for the PFCm register. If a value that is not allowed for the register is specified, correct operation is not guaranteed.
3. Do not assign a single function to multiple pins through the PFCm registers.

16.6.4 Pin Assignment of each Boot Mode

Functional pin is shared with multiple ports for flexibility of pin assignment. However, pins to be used at booting are uniquely determined each boot mode and each package. These pin assignments are automatically set, and they can't be changed. PMCm and PFCm registers related to function pins at selected boot mode are changed from the initial values and stay after boot processing. If BSC_FLG at BSC boot mode or xSPI_FLG at xSPI boot mode is set to 0x2236_0679 in the boot parameter, these registers are changed back to the initial value after boot processing.

17. Multi-Function Timer Pulse Unit 3 (MTU3)

17.1 Overview

This LSI has an on-chip multi-function timer pulse unit 3 (MTU3), consisting of eight 16-bit timer channels and one 32-bit timer channel.

Table 17.1 shows the specifications of the MTU and Table 17.2 lists the functions of the MTU. Figure 17.1 and Figure 17.2 show block diagrams of the MTU.

Table 17.1 MTU specifications

Item	Description
Pulse input/output	28 lines maximum
Pulse input	3 lines
Count clock	11 clocks for each channel (14 clocks for MTU0, 12 clocks for MTU1 and MTU2, 10 clocks for MTU5)
Operating frequency	PCLKH (150 or 200 MHz)
Available operations	[MTU0 to MTU4, MTU6, MTU7, MTU8] ● Waveform output on compare match ● Input capture function (noise filter setting available) ● Counter-clearing operation ● Simultaneous writing to multiple timer counters (TCNT) (excluding MTU8) ● Simultaneous clearing on compare match or input capture (excluding MTU8) ● Simultaneous input and output to registers in synchronization with counter operations (excluding MTU8) ● Up to 12-phase PWM output in combination with synchronous operation (excluding MTU8)
	[MTU0, MTU3, MTU4, MTU6, MTU7, MTU8] ● Buffer operation specifiable
	[MTU1, MTU2] ● Phase counting mode can be specified independently ● 32-bit phase counting mode can be specified for interlocked operation of MTU1 and MTU2 (when TMDR3.LWA = 1) ● Cascade connection operation available
	[MTU3, MTU4, MTU6, MTU7] ● Through interlocked operation of MTU3/4 and MTU6/7, the positive and negative signals in six phases (12 phases in total) can be output in complementary PWM and reset-synchronized PWM operation. ● In complementary PWM mode, transfer of values from buffer registers to temporary registers on crests and troughs of the timer-counter values or writing to the buffer registers (MTU4.TGRD and MTU7.TGRD) ● Double-buffering selectable in complementary PWM mode
	[MTU3, MTU4] ● Through interlocking with MTU0, a mode for driving AC synchronous motors (brushless DC motors) by using complementary PWM output and reset PWM output is settable and allows the selection of two types of waveform output (chopping or level)
	[MTU5] ● Capable of operation as a dead-time compensation counter
	[MTU0/MTU5, MTU1, MTU2, MTU8] ● 32-bit phase counting mode specifiable by combining MTU1 and MTU2 and through interlocked operation with MTU0/MTU5 and MTU8
Interrupt skipping function	● In complementary PWM mode, interrupts on crests and troughs of counter values and triggers to start conversion by the A/D converter can be skipped
Interrupt sources	43 sources
Buffer operation	Automatic transfer of register data (transfer from the buffer register to the timer register)
Trigger generation	A/D converter start triggers can be generated
	A/D converter start request delaying function enables A/D converter to be started with any desired timing and to be synchronized with PWM output
Low power consumption function	Module stop mode can be set

Channel	Name	Interrupt sources	CPU0 GIC request	DMAC activation
MTU5	TGIU5	MTU5.TGRU input capture/compare match	Possible	Possible
	TGIV5	MTU5.TGRV input capture/compare match	Possible	Possible
	TGIW5	MTU5.TGRW input capture/compare match	Possible	Possible
MTU6	TGIA6	MTU6.TGRA input capture/compare match	Possible	Possible
	TGIB6	MTU6.TGRB input capture/compare match	Possible	Possible
	TGIC6	MTU6.TGRC input capture/compare match	Possible	Possible
	TGID6	MTU6.TGRD input capture/compare match	Possible	Possible
	TCIV6	MTU6.TCNT overflow	Possible	Not possible
MTU7	TGIA7	MTU7.TGRA input capture/compare match	Possible	Possible
	TGIB7	MTU7.TGRB input capture/compare match	Possible	Possible
	TGIC7	MTU7.TGRC input capture/compare match	Possible	Possible
	TGID7	MTU7.TGRD input capture/compare match	Possible	Possible
	TCIV7	MTU7.TCNT overflow/underflow*1	Possible	Possible
MTU8	TGIA8	MTU8.TGRA input capture/compare match	Possible	Possible
	TGIB8	MTU8.TGRB input capture/compare match	Possible	Possible
	TGIC8	MTU8.TGRC input capture/compare match	Possible	Possible
	TGID8	MTU8.TGRD input capture/compare match	Possible	Possible
	TCIV8	MTU8.TCNT overflow	Possible	Not possible

Note 1. Only in complementary PWM mode.

17.2 Register Descriptions

17.2.1 TCR : Timer Control Register

Base address: MTU0 = 0x9000_1300, MTU1 = 0x9000_1380, MTU2 = 0x9000_1400, MTU3 = 0x9000_1100
MTU4 = 0x9000_1200, MTU6 = 0x9000_1900, MTU7 = 0x9000_1A00, MTU8 = 0x9000_1600

Offset address: 0x000 (MTU0, MTU1, MTU2, MTU8), 0x100 (MTU3, MTU6), 0x001 (MTU4, MTU7)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CCLR[2:0]			CKEG[1:0]		TPSC[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TPSC[2:0]	Time Prescaler Select See section 17.2.3. TCR2 — Timer Control Registers.	R/W
4:3	CKEG[1:0]	Clock Edge Select 0 0: Count at rising edge 0 1: Count at falling edge 1 x: Count at both edges	R/W
7:5	CCLR[2:0]	Counter Clear Source Select See Table 17.5 and Table 17.6.	R/W

The TCR register controls the TCNT operation for each channel in combination with the TCR2 register. TCR values should be specified only while TCNT operation is stopped.

TPSC[2:0] bits (Time Prescaler Select)

These bits select the TCNT counter clock. The count clock source can be selected independently for each channel. For details, see section 17.2.3. TCR2 — Timer Control Registers.

CKEG[1:0] bits (Clock Edge Select)

The CKEG[1:0] bits select the input clock edge, including the MTIOC1A pin. When the input clock is counted at both edges, the input clock period is halved (e.g. PCLKH/4 at both edges = PCLKH/2 at rising edge). If phase counting mode is used on MTU1 and MTU2, the setting of these bits is ignored and the phase counting mode setting has priority. Internal clock edge selection is valid when the input clock is PCLKH/2 or slower. When PCLKH/1 or the overflow/underflow in another channel is selected for the input clock, a value can be written to these bits but counter operation compiles with the initial value.

CCLR[2:0] bits (Counter Clear Source Select)

These bits select the TCNT counter clearing source. See Table 17.5 and Table 17.6 for details.

Table 17.5 CCLR[2:0] (MTU0, MTU3, MTU4, MTU6, MTU7, MTU8)

Channel	Bit 7 CCLR[2]	Bit 6 CCLR[1]	Bit 5 CCLR[0]	Description
MTU0 MTU3 MTU4 MTU6 MTU7 MTU8	0	0	0	TCNT clearing disabled
	0	0	1	TCNT cleared by TGRA compare match/input capture
	0	1	0	TCNT cleared by TGRB compare match/input capture
	0	1	1	TCNT cleared by counter clearing in another channel performing synchronous clearing/synchronous operation*1
	1	0	0	TCNT clearing disabled
	1	0	1	TCNT cleared by TGRC compare match/input capture*2
	1	1	0	TCNT cleared by TGRD compare match/input capture*2
	1	1	1	TCNT cleared by counter clearing in another channel performing synchronous clearing/synchronous operation*1

Note 1. Synchronous operation is selected by setting the TSYRA.SYNC or TSYRB.SYNC bit to 1 except for MTU8.
Note 2. When TGRC or TGRD is used as a buffer register, TCNT is not cleared because the buffer register setting has priority and compare match/input capture does not occur.

Table 17.6 CCLR[2:0] (MTU1 and MTU2)

Channel	Bit 7 Reserved*2	Bit 6 CCLR[1]	Bit 5 CCLR[0]	Description
MTU1 MTU2	0	0	0	TCNT clearing disabled
	0	0	1	TCNT cleared by TGRA compare match/input capture
	0	1	0	TCNT cleared by TGRB compare match/input capture
	0	1	1	TCNT cleared by counter clearing in another channel performing synchronous clearing/synchronous operation*1

Note 1. Synchronous operation is selected by setting the TSYRA.SYNC and TSYRB.SYNC bits to 1.
Note 2. Bit 7 is reserved in MTU1 and MTU2. It is read as 0. The write value is ignored.

17.2.2 TCRx : Timer Control Register x (x = U, V, W)

Base address: MTU5 = 0x9000_1C00

Offset address: 0x084 (TCRU)
0x094 (TCRV)
0x0A4 (TCRW)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	TPSC[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	TPSC[1:0]	Time Prescaler Select See Table 17.12.	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

TPSC[1:0] bits (Time Prescaler Select)

The TPSC[1:0] bits select the TCNT counter clock. For details, see Table 17.12.

17.2.3 TCR2 — Timer Control Registers

17.2.3.1 MTU0.TCR2 : Timer Control Register 2

Base address: MTU0 = 0x9000_1300

Offset address: 0x28

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TPSC2[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TPSC2[2:0]	Time Prescaler Select See Table 17.7.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

The TCR2 register controls the TCNT operation for each channel in combination with the TCR register. TCR2 values should be specified only while TCNT operation is stopped.

TPSC2[2:0] bits (Time Prescaler Select)

The TPSC2[2:0] bits select the TCNT count clock source. The count clock source can be selected independently for each channel. For details, see Table 17.7.

Table 17.7 TCR2.TPSC2[2:0], TCR.TPSC[2:0] (MTU0)

Channel	TCR2 register			TCR register			Description
	Bit 2	Bit 1	Bit 0	Bit 2	Bit 1	Bit 0	
	TPSC2[2]	TPSC2[1]	TPSC2[0]	TPSC[2]	TPSC[1]	TPSC[0]	
MTU0	0	0	0	0	0	0	Internal clock: counts on PCLKH/1
	0	0	0	0	0	1	Internal clock: counts on PCLKH/4
	0	0	0	0	1	0	Internal clock: counts on PCLKH/16
	0	0	0	0	1	1	Internal clock: counts on PCLKH/64
	0	0	0	1	0	0	External clock: counts on MTCLKA pin input
	0	0	0	1	0	1	External clock: counts on MTCLKB pin input
	0	0	0	1	1	0	External clock: counts on MTCLKC pin input
	0	0	0	1	1	1	External clock: counts on MTCLKD pin input
	0	0	1	x	x	x	Internal clock: counts on PCLKH/2
	0	1	0	x	x	x	Internal clock: counts on PCLKH/8
	0	1	1	x	x	x	Internal clock: counts on PCLKH/32
	1	0	0	x	x	x	Internal clock: counts on PCLKH/256
	1	0	1	x	x	x	Internal clock: counts on PCLKH/1024
	1	1	0	x	x	x	Setting prohibited
	1	1	1	x	x	x	External clock: counts on MTIOC1A pin input

17.2.3.2 MTU1.TCR2 : Timer Control Register 2

Base address: MTU1 = 0x9000_1380

Offset address: 0x14

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	PCB[1:0]		TPSC2[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TPSC2[2:0]	Time Prescaler Select See Table 17.8.	R/W
4:3	PCB[1:0]	Functional Expansion Control for Phase Counting Modes 2, 3, and 5 Controls expansion of functionality to modes 2, 3, and 5 of phase-counting mode	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

The TCR2 register controls the TCNT operation for each channel in combination with the TCR register. TCR2 values should be specified only while TCNT operation is stopped.

TPSC2[2:0] bits (Time Prescaler Select)

The TPSC2[2:0] bits select the TCNT count clock source. The count clock source can be selected independently for each channel. For details, see Table 17.8.

PCB[1:0] bits (Functional Expansion Control for Phase Counting Modes 2, 3, and 5)

The PCB[1:0] bits control extended functions for phase counting modes 2, 3, and 5 in MTU1 and MTU2. For details, see section 17.3.6. Phase Counting Mode.

Table 17.8 TCR2.TPSC2[2:0], TCR.TPSC[2:0] (MTU1)

Channel	TCR2 register			TCR register			Description
	Bit 2	Bit 1	Bit 0	Bit 2	Bit 1	Bit 0	
	TPSC2[2]	TPSC2[1]	TPSC2[0]	TPSC[2]	TPSC[1]	TPSC[0]	
MTU1	0	0	0	0	0	0	Internal clock: counts on PCLKH/1
	0	0	0	0	0	1	Internal clock: counts on PCLKH/4
	0	0	0	0	1	0	Internal clock: counts on PCLKH/16
	0	0	0	0	1	1	Internal clock: counts on PCLKH/64
	0	0	0	1	0	0	External clock: counts on MTCLKA pin input
	0	0	0	1	0	1	External clock: counts on MTCLKB pin input
	0	0	0	1	1	0	Internal clock: counts on PCLKH/256
	0	0	0	1	1	1	Overflow/underflow of MTU2.TCNT
	0	0	1	x	x	x	Internal clock: counts on PCLKH/2
	0	1	0	x	x	x	Internal clock: counts on PCLKH/8
	0	1	1	x	x	x	Internal clock: counts on PCLKH/32
	1	0	0	x	x	x	Internal clock: counts on PCLKH/1024
	1	0	1	x	x	x	Setting prohibited
	1	1	0	x	x	x	Setting prohibited
	1	1	1	x	x	x	Setting prohibited

Note: This setting has no effect when MTU1 is in phase counting mode.

17.2.3.3 MTU2.TCR2 : Timer Control Register 2

Base address: MTU2 = 0x9000_1400

Offset address: 0x0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	PCB[1:0]		TPSC2[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TPSC2[2:0]	Time Prescaler Select See Table 17.9.	R/W
4:3	PCB[1:0]	Functional Expansion Control for Phase Counting Modes 2, 3, and 5 Controls expansion of functionality to modes 2, 3, and 5 of phase-counting mode.	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

The TCR2 register controls the TCNT operation for each channel in combination with the TCR register. TCR2 values should be specified only while TCNT operation is stopped.

TPSC2[2:0] bits (Time Prescaler Select)

The TPSC2[2:0] bits select the TCNT count clock source. The count clock source can be selected independently for each channel. See Table 17.9 for details.

PCB[1:0] bits (Functional Expansion Control for Phase Counting Modes 2, 3, and 5)

The PCB[1:0] bits control extended functions for phase counting modes 2, 3, and 5 in MTU1 and MTU2. See section 17.3.6. Phase Counting Mode for details.

Table 17.9 TCR2.TPSC2[2:0], TCR.TPSC[2:0] (MTU2)

Channel	TCR2 register			TCR register			Description
	Bit 2	Bit 1	Bit 0	Bit 2	Bit 1	Bit 0	
	TPSC2[2]	TPSC2[1]	TPSC2[0]	TPSC[2]	TPSC[1]	TPSC[0]	
MTU2	0	0	0	0	0	0	Internal clock: counts on PCLKH/1
	0	0	0	0	0	1	Internal clock: counts on PCLKH/4
	0	0	0	0	1	0	Internal clock: counts on PCLKH/16
	0	0	0	0	1	1	Internal clock: counts on PCLKH/64
	0	0	0	1	0	0	External clock: counts on MTCLKA pin input
	0	0	0	1	0	1	External clock: counts on MTCLKB pin input
	0	0	0	1	1	0	External clock: counts on MTCLKC pin input
	0	0	0	1	1	1	Internal clock: counts on PCLKH/1024
	0	0	1	x	x	x	Internal clock: counts on PCLKH/2
	0	1	0	x	x	x	Internal clock: counts on PCLKH/8
	0	1	1	x	x	x	Internal clock: counts on PCLKH/32
	1	0	0	x	x	x	Internal clock: counts on PCLKH/256
	1	0	1	x	x	x	Setting prohibited
	1	1	0	x	x	x	Setting prohibited
	1	1	1	x	x	x	Setting prohibited

Note: This setting has no effect when the MTU2 is in phase counting mode.

17.2.3.4 MTUm.TCR2 : Timer Control Register 2 (m = 3, 4, 6, 7)

Base address: MTU3 = 0x9000_1100, MTU4 = 0x9000_1200, MTU6 = 0x9000_1900, MTU7 = 0x9000_1A00

Offset address: 0x4D (MTU4, MTU7)
0x14C (MTU3, MTU6)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TPSC2[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TPSC2[2:0]	Time Prescaler Select See Table 17.10.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

The TCR2 register controls the TCNT operation for each channel in combination with the TCR register. TCR2 values should be specified only while TCNT operation is stopped.

TPSC2[2:0] bits (Time Prescaler Select)

The TPSC2[2:0] bits select the TCNT count clock source. The count clock source can be selected independently for each channel. See Table 17.10 for details.

Table 17.10 TCR2.TPSC2[2:0], TCR.TPSC[2:0] (MTU3, MTU4, MTU6, MTU7)

Channel	TCR2 register			TCR register			Description
	Bit 2	Bit 1	Bit 0	Bit 2	Bit 1	Bit 0	
	TPSC2[2]	TPSC2[1]	TPSC2[0]	TPSC[2]	TPSC[1]	TPSC[0]	
MTU3 MTU4 MTU6 MTU7	0	0	0	0	0	0	Internal clock: counts on PCLKH/1
	0	0	0	0	0	1	Internal clock: counts on PCLKH/4
	0	0	0	0	1	0	Internal clock: counts on PCLKH/16
	0	0	0	0	1	1	Internal clock: counts on PCLKH/64
	0	0	0	1	0	0	Internal clock: counts on PCLKH/256
	0	0	0	1	0	1	Internal clock: counts on PCLKH/1024
	0	0	0	1	1	0	External clock: counts on MTCLKA pin input
	0	0	0	1	1	1	External clock: counts on MTCLKB pin input
	0	0	1	x	x	x	Internal clock: counts on PCLKH/2
	0	1	0	x	x	x	Internal clock: counts on PCLKH/8
	0	1	1	x	x	x	Internal clock: counts on PCLKH/32
	1	0	0	x	x	x	Setting prohibited
	1	0	1	x	x	x	Setting prohibited
	1	1	0	x	x	x	Setting prohibited
	1	1	1	x	x	x	Setting prohibited

17.2.3.5 MTU8.TCR2 : Timer Control Register 2

Base address: MTU8 = 0x9000_1600

Offset address: 0x06

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TPSC2[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TPSC2[2:0]	Time Prescaler Select See Table 17.10.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

The TCR2 register controls the TCNT operation for each channel in combination with the TCR register. TCR2 values should be specified only while TCNT operation is stopped.

TPSC2[2:0] bits (Time Prescaler Select)

The TPSC2[2:0] bits select the TCNT count clock source. The count clock source can be selected independently for each channel. See Table 17.10 for details.

Table 17.11 TCR2.TPSC2[2:0], TCR.TPSC[2:0] (MTU8)

Channel	TCR2 register			TCR register			Description
	Bit 2	Bit 1	Bit 0	Bit 2	Bit 1	Bit 0	
	TPSC2[2]	TPSC2[1]	TPSC2[0]	TPSC[2]	TPSC[1]	TPSC[0]	
MTU8	0	0	0	0	0	0	Internal clock: counts on PCLKH/1
	0	0	0	0	0	1	Internal clock: counts on PCLKH/4
	0	0	0	0	1	0	Internal clock: counts on PCLKH/16
	0	0	0	0	1	1	Internal clock: counts on PCLKH/64
	0	0	0	1	0	0	Internal clock: counts on PCLKH/256
	0	0	0	1	0	1	Internal clock: counts on PCLKH/1024
	0	0	0	1	1	0	External clock: counts on MTCLKA pin input
	0	0	0	1	1	1	External clock: counts on MTCLKB pin input
	0	0	1	x	x	x	Internal clock: counts on PCLKH/2
	0	1	0	x	x	x	Internal clock: counts on PCLKH/8
	0	1	1	x	x	x	Internal clock: counts on PCLKH/32
	1	0	0	x	x	x	Setting prohibited
	1	0	1	x	x	x	Setting prohibited
	1	1	0	x	x	x	Setting prohibited
	1	1	1	x	x	x	Setting prohibited

17.2.3.6 MTU5.TCR2x : Timer Control Register 2x (x = U, V, W)

Base address: MTU5 = 0x9000_1C00

Offset address: 0x85 (TCR2U)
0x95 (TCR2V)
0xA5 (TCR2W)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	CKEG[1:0]		TPSC2[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TPSC2[2:0]	Time Prescaler Select See Table 17.12.	R/W
4:3	CKEG[1:0]	Clock Edge Select 0 0: Counts at the rising edge 0 1: Counts at the falling edge 1 x: Counts at both edges	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

TPSC2[2:0] bits (Time Prescaler Select)

The TPSC2[2:0] bits select the TCNT count clock source. See Table 17.12 for details.

CKEG[1:0] bits (Clock Edge Select)

The CKEG[1:0] bits select the edge of the count clock signal input from the MTIOC1A pin.

Table 17.12 TPSC[1:0], CKEG[1:0], TPSC2[2:0] (MTU5)

Channel	TCR2 register					TCR register		Description
	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Bit 1	Bit 0	
	CKEG[1]	CKEG[0]	TPSC2[2]	TPSC2[1]	TPSC2[0]	TPSC[1]	TPSC[0]	
MTU5	x	x	0	0	0	0	0	Internal clock: counts on PCLKH/1
	x	x	0	0	0	0	1	Internal clock: counts on PCLKH/4
	x	x	0	0	0	1	0	Internal clock: counts on PCLKH/16
	x	x	0	0	0	1	1	Internal clock: counts on PCLKH/64
	x	x	0	0	1	x	x	Internal clock: counts on PCLKH/2
	x	x	0	1	0	x	x	Internal clock: counts on PCLKH/8
	x	x	0	1	1	x	x	Internal clock: counts on PCLKH/32
	x	x	1	0	0	x	x	Internal clock: counts on PCLKH/256
	x	x	1	0	1	x	x	Internal clock: counts on PCLKH/1024
	x	x	1	1	0	x	x	Setting prohibited
	0	0	1	1	1	x	x	Counts at the rising edge on MTIOC1A pin input
	0	1	1	1	1	x	x	Counts at the falling edge on MTIOC1A pin input
	1	x	1	1	1	x	x	Counts at the both edges on MTIOC1A pin input

Note: Bits 7 to 2 in the TCR register are reserved for MTU5. These bits are read as 0. The write value should be 0.

17.2.4 TMDR1 : Timer Mode Register 1

Base address: MTU0 = 0x9000_1300

Offset address: 0x001

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	BFE	BFB	BFA	MD[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Base address: MTU1 = 0x9000_1380, MTU2 = 0x9000_1400

Offset address: 0x001

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	MD[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Base address: MTU3 = 0x9000_1100, MTU4 = 0x9000_1200, MTU6 = 0x9000_1900, MTU7 = 0x9000_1A00
MTU8 = 0x9000_1600

Offset address: 0x102 (MTU3, MTU6), 0x003 (MTU4, MTU7), 0x001 (MTU8)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	BFB	BFA	MD[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	MD[3:0]	Mode Select These bits specify the timer operating mode. See Table 17.13 for details.	R/W

Bit	Symbol	Function	R/W
4	BFA	Buffer Operation A 0: TGRA and TGRC operate normally 1: TGRA and TGRC used together for buffer operation	R/W
5	BFB	Buffer Operation B 0: TGRB and TGRD operate normally 1: TGRB and TGRD used together for buffer operation	R/W
6	BFE	Buffer Operation E 0: MTU0.TGRE and MTU0.TGRF operate normally 1: MTU0.TGRE and MTU0.TGRF used together for buffer operation	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

The TMDR1 register specifies the operating mode of each channel. The MTU has a total of eight TMDR1 registers, one each for MTU0 to MTU4, MTU6, MTU7, and MTU8. TMDR1 register values should be specified only while TCNT operation is stopped.

MD[3:0] bits (Mode Select)

Table 17.13 Operating mode setting by MD[3:0] bits (MTU0 to MTU4 and MTU6 to MTU8)

MD[3]	MD[2]	MD[1]	MD[0]	Description	MTU0	MTU1	MTU2	MTU3	MTU4	MTU6	MTU7	MTU8
0	0	0	0	Normal mode	✓	✓	✓	✓	✓	✓	✓	✓
0	0	0	1	Setting prohibited								
0	0	1	0	PWM mode 1	✓	✓	✓	✓	✓	✓	✓	
0	0	1	1	PWM mode 2	✓	✓	✓					
0	1	0	0	Phase counting mode 1		✓	✓

0	1	1	0	Phase counting mode 3		✓	✓					
0	1	1	1	Phase counting mode 4		✓	✓					
1	0	0	0	Reset-synchronized PWM mode*1				✓		✓		
1	0	0	1	Phase counting mode 5		✓	✓					
1	0	1	0	Setting prohibited								
1	0	1	1	Setting prohibited								
1	1	0	0	Setting prohibited								
1	1	0	1	Complementary PWM mode 1 (transfer at crest)*1				✓		✓		
1	1	1	0	Complementary PWM mode 2 (transfer at trough)*1				✓		✓		
1	1	1	1	Complementary PWM mode 3 (transfer at crest and trough)*1				✓		✓		

Note: Only set the corresponding operating mode listed above for each channel.
Note 1. Reset-synchronized PWM mode and complementary PWM mode can only be set for MTU3 and MTU6. When MTU3 or MTU6 is set to reset-synchronized PWM mode or complementary PWM mode, the MTU4 or MTU7 settings become ineffective and automatically conform to the MTU3 or MTU6 setting, respectively. MTU4 and MTU7 should be set to the initial values (normal mode).

BFA bit (Buffer Operation A)

The BFA bit specifies whether to operate TGRA in the normal way or to use TGRA and TGRC together for buffer operation. When TGRC is used as a buffer register, TGRC input capture/output compare does not take place in a mode other than complementary PWM mode, but TGRC compare match takes place in complementary PWM mode. If MTU4 compare match takes place in the Tb interval of complementary PWM mode, clear the TGIEC bit in the timer interrupt enable register (MTU4.TIER) to 0.

In reset synchronized PWM mode, buffer operation in MTU3 and MTU4 (MTU6 and MTU7) depends on the settings in the BFA bit of MTU3.TMDR1. The BFA bit of MTU4.TMDR1 should be set to 0. In complementary PWM mode, buffer

operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the BFA bit setting in MTU3.TMDR1 (MTU6.TMDR1). Set the BFA bit in MTU4.TMDR1 (MTU7.TMDR1) to 0.

In MTU1 and MTU2, which have no TGRC, this bit is reserved. It is read as 0. The write value should be 0. For details about the Tb interval of complementary PWM mode, see Figure 17.50.

BFB bit (Buffer Operation B)

The BFB bit specifies whether to operate TGRB in the normal way or to use TGRB and TGRD together for buffer operation. When TGRD is used as a buffer register, TGRD input capture/output compare does not usually take place, but TGRD compare match takes place in complementary PWM mode. If MTU4 compare match takes place in the Tb interval of complementary PWM mode, clear the TGIED bit in the timer interrupt enable register (MTU4.TIER) to 0.

In reset synchronized PWM mode, buffer operation in MTU3 and MTU4 (MTU6 and MTU7) depends on the settings in the BFB bit of MTU3.TMDR1. The BFB bit of MTU4.TMDR1 should be set to 0. In complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the BFB bit setting in MTU3.TMDR1 (MTU6.TMDR1). Set the BFB bit in MTU4.TMDR1 (MTU7.TMDR1) to 0.

In MTU1 and MTU2, which have no TGRD, this bit is reserved. It is read as 0. The write value should be 0. For details about the Tb interval of complementary PWM mode, see Figure 17.50.

BFE bit (Buffer Operation E)

The BFE bit specifies whether to operate MTU0.TGRE and MTU0.TGRF in the normal way or to use them together for buffer operation. TGRF compare match takes place even when TGRF is used as a buffer register.

In MTU1 to MTU4, MTU6, MTU7, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

17.2.5 TMDR2x : Timer Mode Register 2x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x270 (TMDR2A)
0xA70 (TMDR2B)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DRS
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DRS	Double Buffer Select 0: Double buffer function is disabled 1: Double buffer function is enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

TMDR2A and TMDR2B specify the double buffer function in complementary PWM mode 3 (transfer at the crest and trough of the counter value). The MTU has two TMDR2 registers, and one each for MTU3 (TMDR2A) and MTU6 (TMDR2B). TMDR2A and TMDR2B values should be specified only while TCNT operation is stopped.

DRS bit (Double Buffer Select)

This bit enables or disables the double buffer function in complementary PWM mode.

17.2.6 TMDR3 : Timer Mode Register 3

Base address: MTU1 = 0x9000_1380

Offset address: 0x011

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	PHCK SEL	LWA
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
0	LWA	MTU1/MTU2 Combination Longword Access Control 0: 16-bit access is enabled. 1: 32-bit access is enabled.	R/W
1	PHCKSEL	External Input Phase Clock Select Selects the external clock pin for phase counting mode. 0: MTCLKA and MTCLKB are selected for the external phase clock. 1: MTCLKC and MTCLKD are selected for the external phase clock.	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

The TMDR3 register controls access in longword units to the combination of MTU1 and MTU2, and there is only one register, which is in MTU1. Such access can proceed when the LWA bit is set in the ways listed in Table 17.14.

LWA bit (MTU1/MTU2 Combination Longword Access Control)

This bit selects a 32-bit access in combination of MTU1 and MTU2. Set this bit only in 32-bit phase counting mode.

When LWA is set to 0, the MTU1.TCNTLW, MTU1.TGRALW, and MTU1.TGRBLW registers cannot be accessed. These bits are read as 0x00000000.

When LWA is set to 1, the MTU1.TCNT, MTU2.TCNT, MTU1.TGRA, MTU2.TGRA, MTU1.TGRB, and MTU2.TGRB registers cannot be accessed. These bits are read as 0x0000.

The settings of the control registers (TCR, TCR2, TIOR, and TMDR1) in MTU1 take priority because MTU1 and MTU2 operates together while LWA = 1.

In this case, the settings of the control registers in MTU2 are ignored. Furthermore, MTU2 input capture and compare match are disabled, which in turn disables any linked operation with the ELC.

The cascaded connection of MTU1 and MTU2 with the LWA bit set to 1 can only be used in phase counting mode, but not in normal mode, PWM mode 1, or PWM mode 2. Select phase counting mode when LWA = 1.

Initialize the counters and general registers in MTU1 and MTU2 prior to rewriting to the LWA bit.

PHCKSEL bit (External Input Phase Clock Select)

When the MTU1 and MTU2 registers are combined for 32-bit phase counting mode or MTU2 phase counting mode, this bit selects the external input clock pin on which A- or B-phase signal is to be input. See Table 17.61 for details.

Table 17.14 Setting and combination of the TMDR3 register

Register	TMDR3.LWA = 0		TMDR3.LWA = 1	
	Symbol	Access mode	Symbol	Access mode
Counter in MTU1*1	MTU1.TCNT	Word	MTU1.TCNTLW	Longword
Counter in MTU2	MTU2.TCNT	Word		
General register A in MTU1	MTU1.TGRA	Word	MTU1.TGRALW	Longword
General register A in MTU2	MTU2.TGRA	Word		
General register B in MTU1	MTU1.TGRB	Word	MTU1.TGRBLW	Longword
General register B in MTU2	MTU2.TGRB	Word		

Note 1. When the LWA bit is set to 1, setting the count clock for MTU1 as MTU2.TCNT overflow/underflow is not required.

17.2.7 TIOR — Timer I/O Control Registers

17.2.7.1 MTUm.TIOR : Timer I/O Control Register (m = 1, 2)

Base address: MTU1 = 0x9000_1380
MTU2 = 0x9000_1400

Offset address: 0x002

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOB[3:0]				IOA[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOA[3:0]	I/O Control A*1 For MTU1, see Table 17.15. For MTU2, see Table 17.17.	R/W
7:4	IOB[3:0]	I/O Control B*1 For MTU1, see Table 17.16. For MTU2, see Table 17.18.	R/W

Note 1. When the value of IOn[3:0] (n = A, B) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIOR register controls the TGR register. The TIOR register should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIOR is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIOR is affected by the TMDR1 setting.

Table 17.15 IOA[3:0] bits enumerated value and function for MTU1

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA[3]	IOA[2]	IOA[1]	IOA[0]	TGRA register function	MTIOC1A pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Input capture at generation of MTU0.TGRA compare match/ input capture.

Table 17.16 IOB[3:0] bits enumerated value and function for MTU1

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB[3]	IOB[2]	IOB[1]	IOB[0]	TGRB register function	MTIOC1B pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	0	0		Input capture at occurrence of compare match or input capture in the MTU0.TGRC register
1	1	1	x		Input capture at occurrence of compare match or input capture in the MTU8.TGRC register

Table 17.17 IOA[3:0] bits enumerated value and function for MTU2

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA[3]	IOA[2]	IOA[1]	IOA[0]	TGRA register function	MTIOC2A pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Table 17.18 IOB[3:0] bits enumerated value and function for MTU2 (1 of 2)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB[3]	IOB[2]	IOB[1]	IOB[0]	TGRB register function	MTIOC2B pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.

Table 17.18 IOB[3:0] bits enumerated value and function for MTU2 (2 of 2)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB[3]	IOB[2]	IOB[1]	IOB[0]	TGRB register function	MTIOC2B pin function
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

17.2.7.2 MTU0.TIORH : Timer I/O Control Register H

Base address: MTU0 = 0x9000_1300

Offset address: 0x002

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOB[3:0]				IOA[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOA[3:0]	I/O Control A*1 See Table 17.19.	R/W
7:4	IOB[3:0]	I/O Control B*1 See Table 17.20.	R/W

Note 1. When the value of IOn[3:0] (n = A, B) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORH register controls the TGR register. The TIORH register should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORH is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORH is affected by the TMDR1 setting.

Table 17.19 IOA[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA[3]	IOA[2]	IOA[1]	IOA[0]	TGRA register function	MTIOC0A pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	0	0		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by MTU1.TCNT (LWA = 0) or MTU1.TCNTLW (LWA = 1).*1
1	1	1	x		Input capture on generation of compare match with MTU8.TGRC

Note 1. When PCLKH/1 is selected as the count clock for MTU1, MTU0 input capture is not generated. Do not select PCLKH/1 as the count clock for MTU1.

Table 17.20 IOB[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB[3]	IOB[2]	IOB[1]	IOB[0]	TGRB register function	MTIOC0B pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by MTU1.TCNT (LWA = 0) or MTU1.TCNTLW (LWA = 1).*1

Note 1. When PCLKH/1 is selected as the count clock for MTU1, MTU0 input capture is not generated. Do not select PCLKH/1 as the count clock for MTU1.

17.2.7.3 MTU3.TIORH : Timer I/O Control Register H

Base address: MTU3 = 0x9000_1100

Offset address: 0x104

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOB[3:0]				IOA[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOA[3:0]	I/O Control A*1 See Table 17.21.	R/W
7:4	IOB[3:0]	I/O Control B*1 See Table 17.22.	R/W

Note 1. When the value of IOn[3:0] (n = A, B) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORH register controls the TGR register. The TIORH register should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORH is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORH is affected by the TMDR1 setting.

Table 17.21 IOA[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA[3]	IOA[2]	IOA[1]	IOA[0]	TGRA register function	MTIOC3A pin function

Table 17.26 IOB[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB[3]	IOB[2]	IOB[1]	IOB[0]	TGRB register function	MTIOC6B pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

17.2.7.6 MTU7.TIORH : Timer I/O Control Register H

Base address: MTU7 = 0x9000_1A00

Offset address: 0x006

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOB[3:0]				IOA[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOA[3:0]	I/O Control A*1 See Table 17.27.	R/W
7:4	IOB[3:0]	I/O Control B*1 See Table 17.28.	R/W

Note 1. When the value of IOn[3:0] (n = A, B) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORH register controls the TGR register. The TIORH register should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORH is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORH is affected by the TMDR1 setting.

Table 17.27 IOA[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA[3]	IOA[2]	IOA[1]	IOA[0]	TGRA register function	MTIOC7A pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Table 17.28 IOB[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB[3]	IOB[2]	IOB[1]	IOB[0]	TGRB register function	MTIOC7B pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

17.2.7.7 MTU8.TIORH : Timer I/O Control Register H

Base address: MTU8 = 0x9000_1600

Offset address: 0x002

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOB[3:0]				IOA[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOA[3:0]	I/O Control A*1 See Table 17.29.	R/W
7:4	IOB[3:0]	I/O Control B*1 See Table 17.30.	R/W

Note 1. When the value of IOn[3:0] (n = A, B) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORH register controls the TGR register. The TIORH register should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORH is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORH is affected by the TMDR1 setting.

Table 17.29 IOA[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA[3]	IOA[2]	IOA[1]	IOA[0]	TGRA register function	MTIOC8A pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Table 17.30 IOB[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB[3]	IOB[2]	IOB[1]	IOB[0]	TGRB register function	MTIOC8B pin function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by MTU1.TCNT (LWA = 0) or MTU1.TCNTLW (LWA = 1).

17.2.7.8 MTU0.TIORL : Timer I/O Control Register L

Base address: MTU0 = 0x9000_1300

Offset address: 0x003

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOD[3:0]				IOC[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOC[3:0]	I/O Control A*1 See Table 17.31.	R/W
7:4	IOD[3:0]	I/O Control B*1 See Table 17.32.	R/W

Note 1. When the value of IOn[3:0] (n = C, D) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORL register controls the TGR register and should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORL is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORL is affected by the TMDR1 setting.

Table 17.31 IOC[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC[3]	IOC[2]	IOC[1]	IOC[0]	TGRC register function	MTIOC0C pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register*1	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by MTU1.TCNT (LWA = 0) or MTU1.TCNTLW (LWA = 1).*2

Note 1. When the MTU0.TMDR1.BFA bit is set to 1 and MTU0.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.
Note 2. When PCLKH/1 is selected as the count clock for MTU1, MTU0 input capture is not generated. Do not select PCLKH/1 as the count clock for MTU1.

Table 17.32 IOD[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD[3]	IOD[2]	IOD[1]	IOD[0]	TGRD register function	MTIOC0D pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register*1	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by MTU1.TCNT (LWA = 0) or MTU1.TCNTLW (LWA = 1).*2

Note 1. When the MTU0.TMDR1.BFB bit is set to 1 and MTU0.TGRD register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.
Note 2. When PCLKH/1 is selected as the count clock for MTU1, MTU0 input capture is not generated. Do not select PCLKH/1 as the count clock for MTU1.

17.2.7.9 MTU3.TIORL : Timer I/O Control Register L

Base address: MTU3 = 0x9000_1100

Offset address: 0x105

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOD[3:0]				IOC[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOC[3:0]	I/O Control A*1 See Table 17.33.	R/W
7:4	IOD[3:0]	I/O Control B*1 See Table 17.34.	R/W

Note 1. When the value of IOn[3:0] (n = C, D) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORL register controls the TGR register and should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORL is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORL is affected by the TMDR1 setting.

Table 17.33 IOC[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC[3]	IOC[2]	IOC[1]	IOC[0]	TGRC register function	MTIOC3C pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU3.TMDR1.BFA bit is set to 1 and MTU3.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 17.34 IOD[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD[3]	IOD[2]	IOD[1]	IOD[0]	TGRD register function	MTIOC3D pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU3.TMDR1.BFB bit is set to 1 and MTU3.TGRD register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

17.2.7.10 MTU4.TIORL : Timer I/O Control Register L

Base address: MTU4 = 0x9000_1200

Offset address: 0x007

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOD[3:0]				IOC[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOC[3:0]	I/O Control A*1 See Table 17.35.	R/W
7:4	IOD[3:0]	I/O Control B*1 See Table 17.36.	R/W

Note 1. When the value of IOn[3:0] (n = C, D) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORL register controls the TGR register and should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORL is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORL is affected by the TMDR1 setting.

Table 17.35 IOC[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC[3]	IOC[2]	IOC[1]	IOC[0]	TGRC register function	MTIOC4C pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU4.TMDR1.BFB bit is set to 1 and MTU4.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 17.36 IOD[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD[3]	IOD[2]	IOD[1]	IOD[0]	TGRD register function	MTIOC4D pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU4.TMDR1.BFB bit is set to 1 and MTU4.TGRD register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

17.2.7.11 MTU6.TIORL : Timer I/O Control Register L

Base address: MTU6 = 0x9000_1900

Offset address: 0x105

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOD[3:0]				IOC[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOC[3:0]	I/O Control A*1 See Table 17.37.	R/W

Bit	Symbol	Function	R/W
7:4	IOD[3:0]	I/O Control B*1 See Table 17.38.	R/W

Note 1. When the value of IOn[3:0] (n = C, D) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORL register controls the TGR register and should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORL is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORL is affected by the TMDR1 setting.

Table 17.37 IOC[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC[3]	IOC[2]	IOC[1]	IOC[0]	TGRC register function	MTIOC6C pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU6.TMDR1.BFA bit is set to 1 and MTU6.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 17.38 IOD[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD[3]	IOD[2]	IOD[1]	IOD[0]	TGRD register function	MTIOC6D pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU6.TMDR1.BFB bit is set to 1 and MTU6.TGRD register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

17.2.7.12 MTU7.TIORL : Timer I/O Control Register L

Base address: MTU7 = 0x9000_1A00

Offset address: 0x007

Bit position:	7	6	5	4	3	2	1	0
Bit field:	IOD[3:0]				IOC[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	IOC[3:0]	I/O Control A*1 See Table 17.39.	R/W
7:4	IOD[3:0]	I/O Control B*1 See Table 17.40.	R/W

Note 1. When the value of IOn[3:0] (n = C, D) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORL register controls the TGR register and should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORL is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

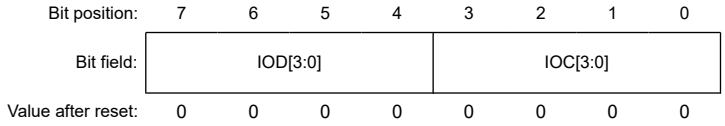
Note: TIORL is affected by the TMDR1 setting.

Table 17.39 IOC[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC[3]	IOC[2]	IOC[1]	IOC[0]	TGRC register function	MTIOC7C pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU7.TMDR1.BFA bit is set to 1 and MTU7.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 17.40 IOD[3:0] bits enumerated value and function



Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD[3]	IOD[2]	IOD[1]	IOD[0]	TGRD register function	MTIOC7D pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU7.TMDR1.BFB bit is set to 1 and MTU7.TGRD register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

17.2.7.13 MTU8.TIORL : Timer I/O Control Register L

Base address: MTU8 = 0x9000_1600

Offset address: 0x003

Bit	Symbol	Function	R/W
3:0	IOC[3:0]	I/O Control A*1 See Table 17.41.	R/W
7:4	IOD[3:0]	I/O Control B*1 See Table 17.42.	R/W

Note 1. When the value of IOn[3:0] (n = C, D) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

The TIORL register controls the TGR register and should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORL is valid when the counter is stopped (the CSTn bit in TSTRA and the CSTn bit in TSTRB are set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORL is affected by the TMDR1 setting.

Table 17.41 IOC[3:0] bits enumerated value and function

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC[3]	IOC[2]	IOC[1]	IOC[0]	TGRC register function	MTIOC8C pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU8.TMDR1.BFA bit is set to 1 and MTU8.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 17.42 IOD[3:0] bits enumerated value and function

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD[3]	IOD[2]	IOD[1]	IOD[0]	TGRD register function	MTIOC8D pin function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Note 1. When the MTU8.TMDR1.BFB bit is set to 1 and MTU8.TGRD register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

17.2.7.14 MTU5.TIORx : Timer I/O Control Register x (x = U, V, W)

Base address: MTU5 = 0x9000_1C00

Offset address: 0x086 (TIORU)
0x096 (TIORV)
0x0A6 (TIORW)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	IOC[4:0]				
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
4:0	IOC[4:0]	I/O Control C For details, see Table 17.43.	R/W

Bit	Symbol	Function	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

The TIORx register controls the TGR register and should be set when the TMDR1 register setting is normal mode, PWM mode, or phase counting mode. The initial output specified by TIORx is valid when the counter is stopped (the CST5 bit in TSTR is set to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.

Note: TIORx is affected by the TMDR1 setting.

Table 17.43 IOC[4:0] bits enumerated value and function for MTU5

Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC[4]	IOC[3]	IOC[2]	IOC[1]	IOC[0]	TGRU, TGRV, TGRW register function	MTIC5U, MTIC5V, MTIC5W pin function
0	0	0	0	0	Output compare register	No function
0	0	0	0	1		Setting prohibited
0	0	0	1	x		Setting prohibited
0	0	1	x	x		Setting prohibited
0	1	x	x	x		Setting prohibited
1	0	0	0	0	Input capture register	Setting prohibited
1	0	0	0	1		Input capture at rising edge.
1	0	0	1	0		Input capture at falling edge.
1	0	0	1	1		Input capture at both edges.
1	0	1	x	x		Input capture on generation of compare match with MTU8.TGRC
1	1	0	0	0		Setting prohibited
1	1	0	0	1		Measurement of low pulse width of external input signal. Capture at trough in complementary PWM mode.
1	1	0	1	0		Measurement of low pulse width of external input signal. Capture at crest of complementary PWM mode.
1	1	0	1	1		Measurement of low pulse width of external input signal. Capture at crest and trough of complementary PWM mode.
1	1	1	0	0		Setting prohibited
1	1	1	0	1		Measurement of high pulse width of external input signal. Capture at trough in complementary PWM mode.
1	1	1	1	0		Measurement of high pulse width of external input signal. Capture at crest of complementary PWM mode.
1	1	1	1	1		Measurement of high pulse width of external input signal. Capture at crest and trough of complementary PWM mode.

17.2.8 TCNTCMPCLR : Timer Compare Match Clear Register

Base address: MTU5 = 0x9000_1C00

Offset address: 0x0B6

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	CMPCLR5U	CMPCLR5V	CMPCLR5W
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CMPCLR5W	TCNT Compare Clear 5W 0: Disables MTU5.TCNTW to be cleared to 0x0000 at MTU5.TCNTW and MTU5.TGRW compare match or input capture 1: Enables MTU5.TCNTW to be cleared to 0x0000 at MTU5.TCNTW and MTU5.TGRW compare match or input capture	R/W
1	CMPCLR5V	TCNT Compare Clear 5V 0: Disables MTU5.TCNTV to be cleared to 0x0000 at MTU5.TCNTV and MTU5.TGRV compare match or input capture 1: Enables MTU5.TCNTV to be cleared to 0x0000 at MTU5.TCNTV and MTU5.TGRV compare match or input capture	R/W
2	CMPCLR5U	TCNT Compare Clear 5U 0: Disables MTU5.TCNTU to be cleared to 0x0000 at MTU5.TCNTU and MTU5.TGRU compare match or input capture 1: Enables MTU5.TCNTU to be cleared to 0x0000 at MTU5.TCNTU and MTU5.TGRU compare match or input capture	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

TCNTCMPCLR specifies requests to clear MTU5.TCNTU, MTU5.TCNTV, and MTU5.TCNTW. The MTU has one TCNTCMPCLR (on MTU5).

17.2.9 TIER — Timer Interrupt Enable Registers

17.2.9.1 MTUm.TIER : Timer Interrupt Enable Register (m = 0 to 4, 6 to 8)

Base address: MTU1 = 0x9000_1380, MTU2 = 0x9000_1400

Offset address: 0x004 (MTU1, MTU2)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TTGE	—	TCIEU	TCIEV	—	—	TGIEB	TGIEA
Value after reset:	0	0	0	0	0	0	0	0

Base address: MTU0 = 0x9000_1300, MTU3 = 0x9000_1100, MTU6 = 0x9000_1900

Offset address: 0x004 (MTU0), 0x108 (MTU3, MTU6)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TTGE	—	—	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Value after reset:	0	0	0	0	0	0	0	0

Base address: MTU4 = 0x9000_1200, MTU7 = 0x9000_1A00

Offset address: 0x009 (MTU4, MTU7)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TTGE	TTGE2	—	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Value after reset:	0	0	0	0	0	0	0	0

Base address: MTU8 = 0x9000_1600

Offset address: 0x004 (MTU8)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TGIEA	TGR Interrupt Enable A 0: Interrupt requests (TGIA) disabled 1: Interrupt requests (TGIA) enabled	R/W
1	TGIEB	TGR Interrupt Enable B 0: Interrupt requests (TGIB) disabled 1: Interrupt requests (TGIB) enabled	R/W
2	TGIEC	TGR Interrupt Enable C 0: Interrupt requests (TGIC) disabled 1: Interrupt requests (TGIC) enabled	R/W
3	TGIED	TGR Interrupt Enable D 0: Interrupt requests (TGID) disabled 1: Interrupt requests (TGID) enabled	R/W
4	TCIEV	Overflow Interrupt Enable 0: Interrupt requests (TCIV) disabled 1: Interrupt requests (TCIV) enabled	R/W
5	TCIEU	Underflow Interrupt Enable 0: Interrupt requests (TCIU) disabled 1: Interrupt requests (TCIU) enabled	R/W
6	TTGE2	A/D Converter Start Request Enable 2 0: A/D converter start request generation by MTUn.TCNT underflow (trough) disabled 1: A/D converter start request generation by MTUn.TCNT underflow (trough) enabled	R/W
7	TTGE	A/D Converter Start Request Enable 0: A/D converter start request generation disabled 1: A/D converter start request generation enabled	R/W

Note: n = 4 or 7

The TIER register enables or disables interrupt requests from each channel. The MTU has a total of ten TIER registers, two for MTU0 and one each for MTU1 to MTU8.

TGIEA and TGIEB bits (TGR Interrupt Enable A and TGR Interrupt Enable B)

Each bit enables or disables interrupt requests (TGIn) (n = A, B).

TGIEC and TGIED bits (TGR Interrupt Enable C and TGR Interrupt Enable D)

Each bit enables or disables interrupt requests (TGIn) (n = C, D).

In MTU1 and MTU2, these bits are reserved. They are read as 0. The write value should be 0.

TCIEV bit (Overflow Interrupt Enable)

This bit enables or disables interrupt requests (TCIV).

TCIEU bit (Underflow Interrupt Enable)

This bit enables or disables interrupt requests (TCIU).

In MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

TTGE2 bit (A/D Converter Start Request Enable 2)

This bit enables or disables generation of A/D converter start requests by MTUn.TCNT underflow (trough) in complementary PWM mode (n = 4 or 7).

In MTU0 to MTU3, MTU6, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

TTGE bit (A/D Converter Start Request Enable)

This bit enables or disables generation of A/D converter start requests by TGRA input capture/compare match.

MTU8 is a reserved bit. It is read as 0. The write value should be 0.

17.2.9.2 MTU0.TIER2 : Timer Interrupt Enable Register 2

Base address: MTU0 = 0x9000_1300

Offset address: 0x024

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TTGE2	—	—	—	—	—	TGIEF	TGIEE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TGIEE	TGR Interrupt Enable E 0: Interrupt requests (TGIE) disabled 1: Interrupt requests (TGIE) enabled	R/W
1	TGIEF	TGR Interrupt Enable F 0: Interrupt requests (TGIF) disabled 1: Interrupt requests (TGIF) enabled	R/W
6:2	—	The read values are undefined. The write value should be 0.	R/W
7	TTGE2	A/D Converter Start Request Enable 2 0: A/D converter start request generation by compare match between MTU0.TCNT and MTU0.TGRE disabled 1: A/D converter start request generation by compare match between MTU0.TCNT and MTU0.TGRE enabled	R/W

TGIEE bit (TGR Interrupt Enable E)

The TGIEE bit enables or disables interrupt requests by compare match between MTU0.TCNT and MTU0.TGRE.

TGIEF bit (TGR Interrupt Enable F)

The TGIEF bit enables or disables interrupt requests by compare match between MTU0.TCNT and MTU0.TGRF.

TTGE2 bit (A/D Converter Start Request Enable 2)

The TTGE2 bit enables or disables A/D converter start requests by compare match between MTU0.TCNT and MTU0.TGRE.

17.2.9.3 MTU5.TIER : Timer Interrupt Enable Register

Base address: MTU5 = 0x9000_1C00

Offset address: 0x0B2

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TGIE5U	TGIE5V	TGIE5W
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	TGIE5W	TGR Interrupt Enable 5W 0: Interrupt requests TGIW5 disabled 1: Interrupt requests TGIW5 enabled	R/W
1	TGIE5V	TGR Interrupt Enable 5V 0: Interrupt requests TGIV5 disabled 1: Interrupt requests TGIV5 enabled	R/W
2	TGIE5U	TGR Interrupt Enable 5U 0: Interrupt requests TGIU5 disabled 1: Interrupt requests TGIU5 enabled	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

TGIE5x bits (TGR Interrupt Enable 5x)

Each bit enables or disables interrupt requests (TGIx5) (x = U, V, W).

17.2.10 TSR : Timer Status Register

Base address: MTU1 = 0x9000_1380, MTU2 = 0x9000_1400
MTU3 = 0x9000_1100, MTU4 = 0x9000_1200, MTU6 = 0x9000_1900, MTU7 = 0x9000_1A00

Offset address: 0x005 (MTU1, MTU2), 0x02D (MTU4, MTU7), 0x12C (MTU3, MTU6)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TCFD	—	TCFU	TCFV	TGFD	TGFC	TGFB	TGFA
Value after reset:	1	1	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TGFA	Input Capture/Output Compare Flag A 0: TGRA input capture or compare match has not occurred 1: TGRA input capture or compare match has occurred	R/W*1
1	TGFB	Input Capture/Output Compare Flag B 0: TGRB input capture or compare match has not occurred 1: TGRB input capture or compare match has occurred	R/W*1
2	TGFC	Input Capture/Output Compare Flag C 0: TGRC input capture or compare match has not occurred 1: TGRC input capture or compare match has occurred	R/W*1
3	TGFD	Input Capture/Output Compare Flag D 0: TGRD input capture or compare match has not occurred 1: TGRD input capture or compare match has occurred	R/W*1
4	TCFV	Overflow flag 0: TCNT overflow has not occurred 1: TCNT overflow has occurred	R/W*1
5	TCFU	Underflow flag 0: TCNT underflow has not occurred when MTU1 and MTU2 are in phase counting mode 1: TCNT underflow has occurred when MTU1 and MTU2 are in phase counting mode	R/W*1
6	—	This bit is read as 1. The write value should be 1.	R/W
7	TCFD	Count Direction Flag 0: TCNT counts down 1: TCNT counts up	R

Note 1. Only writing 0 to this bit after reading 1 from this bit in order to clear the flag is possible. After 1 is read from this bit, if the next flag is set before 0 is written to this bit, writing 0 to this bit does not clear the flag. In this case, read 1 again from this bit, and then write 0 to this bit.

TSR indicates the states of each of the channels. The MTU has a total of six TSR registers, one each for MTU1 to MTU4, MTU6, and MTU7.

TGFA flag (Input Capture/Output Compare Flag A)

The TGFA flag indicates generation of TGRA input capture or compare match. Only writing 0 to this bit in order to clear the flag is possible.

[Clearing condition]

- When TGFA = 1, the TGFA flag is read, and then 0 is written to the TGFA flag.

[Setting conditions]

- TCNT = TGRA when the TGRA register functions as an output compare register.
- The value of TCNT is transferred to TGRA due to the input capture signal when the TGRA register functions as an input capture register.

TGFB flag (Input Capture/Output Compare Flag B)

The TGFB flag indicates generation of TGRB input capture or compare match. Only writing 0 to this bit in order to clear the flag is possible.

[Clearing condition]

- When TGFB = 1, the TGFB flag is read, and then 0 is written to the TGFB flag.

[Setting conditions]

- TCNT = TGRB when the TGRB register functions as an output compare register.
- The value of TCNT is transferred to the TGRB register due to the input capture signal when the TGRB register functions as an input capture register.

TGFC flag (Input Capture/Output Compare Flag C)

The TGFC flag indicates generation of TGRC input capture or compare match for MTU3, MTU4, MTU6, or MTU7. Only writing 0 to this bit in order to clear the flag is possible.

[Clearing condition]

- When TGFC = 1, the TGFC flag is read, and then 0 is written to the TGFC flag.

[Setting conditions]

- TCNT = TGRC when the TGRC register functions as an output compare register.
- The value of TCNT is transferred to the TGRC register due to the input capture signal when the TGRC register functions as an input capture register.

This bit is reserved for MTU1 and MTU2. This bit is read as 0. The write value should be 0.

TGFD flag (Input Capture/Output Compare Flag D)

The TGFD flag indicates generation of TGRD input capture or compare match for MTU3, MTU4, MTU6, or MTU7. Only writing 0 to this bit in order to clear the flag is possible.

[Clearing condition]

- When TGFD = 1, the TGFD flag is read, and then 0 is written to the TGFD flag.

[Setting conditions]

- TCNT = TGRD when the TGRD register functions as the output compare register.
- The value of TCNT is transferred to the TGRD register due to the input capture signal when the TGRD register functions as an input capture register.

This bit is reserved for MTU1 and MTU2. This bit is read as 0. The write value should be 0.

TCFV flag (Overflow flag)

The TCFV flag indicates generation of TCNT overflow. Only writing 0 to this bit in order to clear the flag is possible.

[Clearing condition]

- When TCFV = 1, the TCFV flag is read, and then 0 is written to the TCFV flag.

[Setting conditions]

- The value of TCNT overflows (changed from 0xFFFF to 0x0000).

For MTU4 or MTU7, the TCFV flag is also set to 1 when the value of TCNT of MTU4 or MTU7 underflows (changed from 0x0001 to 0x0000) in complementary PWM mode.

TCFU flag (Underflow flag)

The TCFU flag indicates generation of TCNT underflow when MTU1 and MTU2 are in phase counting mode. Only writing 0 to this bit in order to clear the flag is possible.

[Clearing condition]

- When TCFU = 1, TCFU is read, and then 0 is written to TCFU.

[Setting conditions]

- The value of TCNT underflows (changed from 0x0000 to 0xFFFF).

This bit is reserved for MTU3, MTU4, MTU6, and MTU7. This bit is read as 0. The write value should be 0.

TCFD flag (Count Direction Flag)

The TCFD flag indicates the direction in which TCNT is counting in MTU1 to MTU4, MTU6, and MTU7.

17.2.11 TBTM : Timer Buffer Operation Transfer Mode Register

Base address: MTU0 = 0x9000_1300

Offset address: 0x026

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TTSE	TTSB	TTSA
Value after reset:	0	0	0	0	0	0	0	0

Base address: MTU3 = 0x9000_1100, MTU4 = 0x9000_1200, MTU6 = 0x9000_1900, MTU7 = 0x9000_1A00

Offset address: 0x138 (MTU3, MTU6), 0x039 (MTU4, MTU7)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	TTSB	TTSA
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TTSA	Timing Select A 0: When compare match A occurs in each channel, data is transferred from TGRC to TGRA 1: When TCNT is cleared in each channel, data is transferred from TGRC to TGRA	R/W
1	TTSB	Timing Select B 0: When compare match B occurs in each channel, data is transferred from TGRD to TGRB 1: When TCNT is cleared in each channel, data is transferred from TGRD to TGRB	R/W
2	TTSE	Timing Select E 0: When compare match E occurs in MTU0, data is transferred from MTU0.TGRF to MTU0.TGRE 1: When MTU0.TCNT is cleared in MTU0, data is transferred from MTU0.TGRF to MTU0.TGRE	R/W
7:37:2	—	These bits are read as 0. The write value should be 0.	R/W

TBTM specifies the timing for transferring data from the buffer register to the timer general register in PWM mode. The MTU has a total of five TBTM registers, one each for MTU0, MTU3, MTU4, MTU6, and MTU7.

TTSA bit (Timing Select A)

This bit specifies the timing for transferring data from TGRC to TGRA in each channel when they are used together for buffer operation. When a channel is not set to PWM mode, do not set the TTSA bit in the channel to 1.

TTSB bit (Timing Select B)

This bit specifies the timing for transferring data from TGRD to TGRB in each channel when they are used together for buffer operation. When a channel is not set to PWM mode, do not set the TTSB bit in the channel to 1.

TTSE bit (Timing Select E)

This bit specifies the timing for transferring data from MTU0.TGRF to MTU0.TGRE when they are used together for buffer operation.

In MTU3, MTU4, MTU6, and MTU7, this bit is reserved. It is read as 0 and the write value should be 0. When a channel is not set to PWM mode, do not set the TTSE bit in the channel to 1.

17.2.12 TICCR : Timer Input Capture Control Register

Base address: MTU1 = 0x9000_1380

Offset address: 0x010

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	I2BE	I2AE	I1BE	I1AE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	I1AE	Input Capture Enable 0: Does not include the MTIOC1A pin in the MTU2.TGRA input capture conditions 1: Includes the MTIOC1A pin in the MTU2.TGRA input capture conditions	R/W
1	I1BE	Input Capture Enable 0: Does not include the MTIOC1B pin in the MTU2.TGRB input capture conditions 1: Includes the MTIOC1B pin in the MTU2.TGRB input capture conditions	R/W
2	I2AE	Input Capture Enable 0: Does not include the MTIOC2A pin in the MTU1.TGRA input capture conditions 1: Includes the MTIOC2A pin in the MTU1.TGRA input capture conditions	R/W
3	I2BE	Input Capture Enable 0: Does not include the MTIOC2B pin in the MTU1.TGRB input capture conditions 1: Includes the MTIOC2B pin in the MTU1.TGRB input capture conditions	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

TICCR specifies input capture conditions when MTU1.TCNT and MTU2.TCNT are cascaded. The MTU has one TICCR for MTU1.

17.2.13 TSYCR : Timer Synchronous Clear Register

Base address: MTU6 = 0x9000_1900

Offset address: 0x150

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CE0A	CE0B	CE0C	CE0D	CE1A	CE1B	CE2A	CE2B
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CE2B	Clear Enable 2B 0: Disables counter clearing by the MTU2.TGIB2 interrupt generation timing. 1: Enables counter clearing by the MTU2.TGIB2 interrupt generation timing.	R/W
1	CE2A	Clear Enable 2A 0: Disables counter clearing by the MTU2.TGIA2 interrupt generation timing.*1 1: Enables counter clearing by the MTU2.TGIA2 interrupt generation timing.*1	R/W
2	CE1B	Clear Enable 1B 0: Disables counter clearing by the MTU1.TGIB1 interrupt generation timing.*1 1: Enables counter clearing by the MTU1.TGIB1 interrupt generation timing.*1	R/W

Bit	Symbol	Function	R/W
3	CE1A	Clear Enable 1A 0: Disables counter clearing by the MTU1.TGIA1 interrupt generation timing.*1 1: Enables counter clearing by the MTU1.TGIA1 interrupt generation timing.*1	R/W
4	CE0D	Clear Enable 0D 0: Disables counter clearing by the MTU0.TGID0 interrupt generation timing.*1 1: Enables counter clearing by the MTU0.TGID0 interrupt generation timing.*1	R/W
5	CE0C	Clear Enable 0C 0: Disables counter clearing by the MTU0.TGIC0 interrupt generation timing.*1 1: Enables counter clearing by the MTU0.TGIC0 interrupt generation timing.*1	R/W
6	CE0B	Clear Enable 0B 0: Disables counter clearing by the MTU0.TGIB0 interrupt generation timing.*1 1: Enables counter clearing by the MTU0.TGIB0 interrupt generation timing.*1	R/W
7	CE0A	Clear Enable 0A 0: Disables counter clearing by the MTU0.TGIA0 interrupt generation timing.*1 1: Enables counter clearing by the MTU0.TGIA0 interrupt generation timing.*1	R/W

Note 1. This does not depend on the MTUn.TIERn.TGIEm bit setting. (n = 0, 1, 2; m = A, B, C, D)

TSYCR specifies synchronous clear conditions for MTU6.TCNT and MTU7.TCNT. The MTU has one TSYCR for MTU6.

17.2.14 TCNT — Timer Counters

17.2.14.1 MTUn.TCNT : Timer Counter (n = 0 to 4, 6, 7)

Base address: MTU0 = 0x9000_1300, MTU1 = 0x9000_1380, MTU2 = 0x9000_1400, MTU3 = 0x9000_1100
MTU4 = 0x9000_1200, MTU6 = 0x9000_1900, MTU7 = 0x9000_1A00

Offset address: 0x006 (MTU0, MTU1, MTU2), 0x110 (MTU3, MTU6), 0x012 (MTU4, MTU7)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15	n/a	Timer Counter	R/W

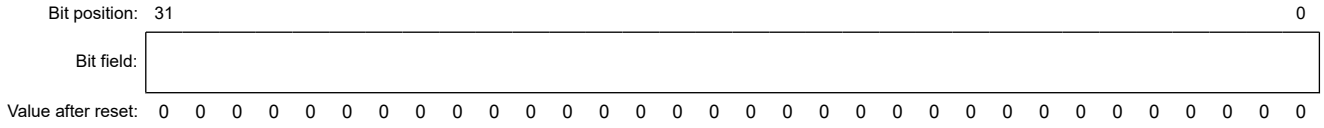
Note: The TCNT counters should be accessed in 16-bit units.

17.2.14.2 MTU5.TCNTx : Timer Counter x (x = U, V, W)

Base address: MTU5 = 0x9000_1C00

Offset address: 0x080 (TCNTU)
0x090 (TCNTV)
0x0A0 (TCNTW)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0



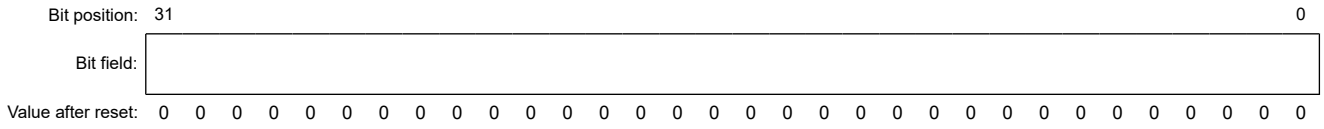
Bit	Symbol	Function	R/W
15	n/a	Timer Counter	R/W

Note: The TCNT counters should be accessed in 16-bit units.

17.2.14.3 MTU8.TCNT : Timer Counter

Base address: MTU8 = 0x9000_1600

Offset address: 0x008



Bit	Symbol	Function	R/W
31:0	n/a	Timer Counter	R/W

Note: The TCNT counters should be accessed in 32-bit units.

17.2.15 TCNTLW : Timer Longword Counter

Base address: MTU1 = 0x9000_1380

Offset address: 0x020

Bit	Symbol	Function	R/W
31:0	n/a	The TCNTLW counter is a 32-bit readable/writable counter. Only one counter of this type is provided, and is formed by combining MTU1.TCNT and MTU2.TCNT. Such operation is only effective when TMDR3.LWA = 1. The TCNTLW counter is initialized to 0x00000000 by a reset. See section 17.2.6. TMDR3 : Timer Mode Register 3 for details. This register can only be used in 32-bit phase counting mode.	R/W

17.2.16 TGR — Timer General Registers

17.2.16.1 MTU0.TGRx : Timer General Register x (x = A, B, C, D, E, F)

Base address: MTU0 = 0x9000_1300

Offset address: 0x008 (TGRA), 0x00A (TGRB), 0x00C (TGRC), 0x00E (TGRD), 0x020 (TGRE), 0x022 (TGRF)

Bit	Symbol	Function	R/W
15:0	n/a	The TGRA, TGRB, TGRC, and TGRD registers function as either output compare or input capture registers. The TGRC and TGRD registers can also be designated for operation as buffer registers. TGR buffer register combinations are TGRA and TGRC, and TGRB and TGRD. TGRE and TGRF function as compare registers. When the MTU0.TCNT count matches the TGRE value, an A/D converter start request can be issued. The TGRF register can also be designated for operation as a buffer register. TGR buffer register combination is TGRE and TGRF.	R/W

Note: TGR should be accessed in 16-bit units.

17.2.16.2 MTU1/2.TGRx : Timer General Register x (x = A, B)

Base address: MTU1 = 0x9000_1380, MTU2 = 0x9000_1400

Offset address: 0x008 (TGRA), 0x00A (TGRB)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	The TGRA and TGRB registers function as either output compare or input capture registers. The TGRA and TGRB registers are read as 0x0000 when TMDR3.LWA = 1. For details, see section 17.2.6. TMDR3 : Timer Mode Register 3.	R/W

Note: TGR should be accessed in 16-bit units.

17.2.16.3 MTU3/6.TGRx : Timer General Register x (x = A, B, C, D, E)

Base address: MTU3 = 0x9000_1100, MTU6 = 0x9000_1900

Offset address: 0x118 (TGRA), 0x11A (TGRB), 0x124 (TGRC), 0x126 (TGRD), 0x172 (TGRE)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	The TGRA, TGRB, TGRC, and TGRD registers function as either output compare or input capture registers. The TGRC and TGRD registers for MTU3 and MTU6 can also be designated for operation as buffer registers. TGR buffer register combinations are TGRA and TGRC, and TGRB and TGRD.	R/W

Note: TGR should be accessed in 16-bit units.

17.2.16.4 MTU4/7.TGRx : Timer General Register x (x = A, B, C, D, E, F)

Base address: MTU4 = 0x9000_1200, MTU7 = 0x9000_1A00

Offset address: 0x01C (TGRA), 0x01E (TGRB), 0x028 (TGRC), 0x02A (TGRD), 0x074 (TGRE), 0x076 (TGRF)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	The TGRA, TGRB, TGRC, and TGRD registers function as either output compare or input capture registers. The TGRC and TGRD registers for MTU4 and MTU7 can also be designated for operation as buffer registers. TGR buffer register combinations are TGRA and TGRC, and TGRB and TGRD.	R/W

Note: TGR should be accessed in 16-bit units.

17.2.16.5 MTU8.TGRx : Timer General Register x (x = A, B, C, D)

Base address: MTU8 = 0x9000_1600

Offset address: 0x00C (TGRA), 0x010 (TGRB), 0x014 (TGRC), 0x018 (TGRD)

Bit position:	31																												0
Bit field:																													
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	The TGRA, TGRB, TGRC, and TGRD registers function as either output compare or input capture registers. The TGRC and TGRD registers can also be designated for operation as buffer registers. TGR buffer register combinations are TGRA and TGRC, and TGRB and TGRD.	R/W

Note: TGR should be accessed in 32-bit units.

17.2.16.6 MTU5.TGRx : Timer General Register x (x = U, V, W)

Base address: MTU5 = 0x9000_1C00

Offset address: 0x082 (TGRU), 0x092 (TGRV), 0x0A2 (TGRW)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	MTU5.TGRU, MTU5.TGRV, and MTU5.TGRW function as compare match, input capture, or external pulse width measurement registers.	R/W

Note: TGR should be accessed in 16-bit units.

17.2.17 TGRxLW : Timer Longword General Register x (x = A, B)

Base address: MTU1 = 0x9000_1380

Offset address: 0x024 (TGRALW)
0x028 (TGRBLW)

Bit position:	31																												0
Bit field:																													
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	The TGRnLW register is a 32-bit readable/writable register. Two general registers of this type are provided, and are formed by combining MTU1.TGRn and MTU2.TGRn. Such operation is only effective when TMDR3.LWA = 1. See section 17.2.6. TMDR3 : Timer Mode Register 3 for details. The TGRnLW register functions as an output compare or input capture register when TMDR3.LWA = 1. This register can only be used in 32-bit phase counting mode.	R/W

17.2.18 TSTR — Timer Start Registers

17.2.18.1 TSTRA : Timer Start Register A

Base address: MTU = 0x9000_1000

Offset address: 0x280

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CST4	CST3	—	—	CST8	CST2	CST1	CST0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CST0	Counter Start 0 0: MTU0.TCNT counting is stopped 1: MTU0.TCNT performs count operation	R/W
1	CST1	Counter Start 1 0: MTU1.TCNT counting is stopped 1: MTU1.TCNT performs count operation	R/W
2	CST2	Counter Start 2 0: MTU2.TCNT counting is stopped 1: MTU2.TCNT performs count operation	R/W
3	CST8	Counter Start 8 0: MTU8.TCNT counting is stopped 1: MTU8.TCNT performs count operation	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	CST3	Counter Start 3 0: MTU3.TCNT counting is stopped 1: MTU3.TCNT performs count operation	R/W
7	CST4	Counter Start 4 0: MTU4.TCNT counting is stopped 1: MTU4.TCNT performs count operation	R/W

Note: When 1 is written to a bit in TCSYSTR, the corresponding bit in TSTRA is also set to 1 automatically.

CSTn bits (Counter Start n (n = 0 to 4, 8))

Each bit starts or stops TCNT in the corresponding channel.

If 0 is written to the CSTn bit during operation with the MTIOC pin designated for output, the counter stops. At this time the MTIOC pin outputs the initial output level set in the TOCR1A or TOCR2A register in complementary PWM mode or reset-synchronized PWM mode, but the output compare signal level from the MTIOC pin is retained in the other modes. If TIOR is written to while the CSTn bit is 0, the pin output level will be changed to the specified initial output value.

17.2.18.2 TSTRB : Timer Start Register B

Base address: MTU = 0x9000_1000

Offset address: 0xA80

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CST7	CST6	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
6	CST6	Counter Start 6 0: MTU6.TCNT counting is stopped 1: MTU6.TCNT performs count operation	R/W
7	CST7	Counter Start 7 0: MTU7.TCNT counting is stopped 1: MTU7.TCNT performs count operation	R/W

Note: When 1 is written to a bit in TCSYSTR, the corresponding bit in TSTRB is also set to 1 automatically.

CSTn bits (Counter Start n (n = 6, 7))

Each bit starts or stops TCNT in the corresponding channel.

If 0 is written to the CSTn bit during operation with the MTIOC pin designated for output, the counter stops. At this time the MTIOC pin outputs the initial output level set in the TOCR1B or TOCR2B register in complementary PWM mode or reset-synchronized PWM mode, but the output compare signal level from the MTIOC pin is retained in the other modes. If TIOR is written to while the CSTn bit is 0, the pin output level will be changed to the specified initial output value.

17.2.18.3 MTU5.TSTR : Timer Start Register

Base address: MTU5 = 0x9000_1C00

Offset address: 0x0B4

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	CSTU5	CSTV5	CSTW5
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CSTW5	Counter Start W5 0: MTU5.TCNTW counting is stopped 1: MTU5.TCNTW performs count operation	R/W
1	CSTV5	Counter Start V5 0: MTU5.TCNTV counting is stopped 1: MTU5.TCNTV performs count operation	R/W
2	CSTU5	Counter Start U5 0: MTU5.TCNTU counting is stopped 1: MTU5.TCNTU performs count operation	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

17.2.19 TSYRA : Timer Synchronous Register A

Base address: MTU = 0x9000_1000

Offset address: 0x281

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SYNC4	SYNC3	—	—	—	SYNC2	SYNC1	SYNC0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SYNC0	Timer Synchronous Operation 0 0: MTU0.TCNT operates independently (TCNT presetting/clearing is not related to other channels). 1: MTU0.TCNT performs synchronous operation (TCNT synchronous presetting/ synchronous clearing is enabled).	R/W

Bit	Symbol	Function	R/W
1	SYNC1	Timer Synchronous Operation 1 0: MTU1.TCNT operates independently (TCNT presetting/clearing is not related to other channels). 1: MTU1.TCNT performs synchronous operation (TCNT synchronous presetting/ synchronous clearing is enabled).	R/W
2	SYNC2	Timer Synchronous Operation 2 0: MTU2.TCNT operates independently (TCNT presetting/clearing is not related to other channels). 1: MTU2.TCNT performs synchronous operation (TCNT synchronous presetting/ synchronous clearing is enabled).	R/W
5:3	—	These bits are read as 0. The write value should be 0.	R/W
6	SYNC3	Timer Synchronous Operation 3 0: MTU3.TCNT operates independently (TCNT presetting/clearing is not related to other channels). 1: MTU3.TCNT performs synchronous operation (TCNT synchronous presetting/ synchronous clearing is enabled).	R/W
7	SYNC4	Timer Synchronous Operation 4 0: MTU4.TCNT operates independently (TCNT presetting/clearing is not related to other channels). 1: MTU4.TCNT performs synchronous operation (TCNT synchronous presetting/ synchronous clearing is enabled).	R/W

TSYRA selects independent operation or synchronous operation of TCNT in MTU0 to MTU4. A channel performs synchronous operation when the corresponding bit in TSYRA is set to 1.

SYNCn bits (Timer Synchronous Operation n)

Each bit selects whether operation is independent of or synchronized with other channels.

When synchronous operation is selected, the TCNT synchronous presetting of multiple channels and synchronous clearing by counter clearing on another channel are possible. To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of the TCR.CCLR[2:0] bits.

17.2.20 TSYRB : Timer Synchronous Register B

Base address: MTU = 0x9000_1000

Offset address: 0xA81

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SYNC 7	SYNC 6	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
6	SYNC6	Timer Synchronous Operation 6 0: MTU6.TCNT operates independently (TCNT presetting/clearing is not related to other channels). 1: MTU6.TCNT performs synchronous operation (TCNT synchronous presetting/ synchronous clearing is enabled).	R/W
7	SYNC7	Timer Synchronous Operation 7 0: MTU7.TCNT operates independently (TCNT presetting/clearing is not related to other channels). 1: MTU7.TCNT performs synchronous operation (TCNT synchronous presetting/ synchronous clearing is enabled).	R/W

TSYRB selects independent operation or synchronous operation of TCNT in MTU6 and MTU7. A channel performs synchronous operation when the corresponding bit in TSYRB is set to 1.

SYNCn bits (Timer Synchronous Operation n)

Each bit selects whether operation is independent of or synchronized with other channels.

When synchronous operation is selected, the TCNT synchronous presetting of multiple channels and synchronous clearing by counter clearing on another channel are possible. To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of the TCR.CCLR[2:0] bits.

17.2.21 TCSYSTR : Timer Counter Synchronous Start Register

Base address: MTU = 0x9000_1000

Offset address: 0x282

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SCH0	SCH1	SCH2	SCH3	SCH4	—	SCH6	SCH7
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SCH7	Synchronous Start 7 0: Does not specify synchronous start for MTU7.TCNT 1: Specifies synchronous start for MTU7.TCNT	R/W*1
1	SCH6	Synchronous Start 6 0: Does not specify synchronous start for MTU6.TCNT 1: Specifies synchronous start for MTU6.TCNT	R/W*1
2	—	This bit is read as 0. The write value should be 0.	R/W
3	SCH4	Synchronous Start 4 0: Does not specify synchronous start for MTU4.TCNT 1: Specifies synchronous start for MTU4.TCNT	R/W*1
4	SCH3	Synchronous Start 3 0: Does not specify synchronous start for MTU3.TCNT 1: Specifies synchronous start for MTU3.TCNT	R/W*1
5	SCH2	Synchronous Start 2 0: Does not specify synchronous start for MTU2.TCNT 1: Specifies synchronous start for MTU2.TCNT	R/W*1
6	SCH1	Synchronous Start 1 0: Does not specify synchronous start for MTU1.TCNT 1: Specifies synchronous start for MTU1.TCNT	R/W*1
7	SCH0	Synchronous Start 0 0: Does not specify synchronous start for MTU0.TCNT 1: Specifies synchronous start for MTU0.TCNT	R/W*1

Note 1. Only 1 can be written to this bit, and doing so sets the register. TCSYSTR is automatically cleared to 0 after 1 is written to.

TCSYSTR specifies synchronous start of the counters.

SCH7 bit (Synchronous Start 7)

This bit controls synchronous start of MTU7.TCNT.

[Clearing condition]

- When 1 is set to the TSTRB.CST7 bit while SCH7 = 1

SCH6 bit (Synchronous Start 6)

This bit controls synchronous start of MTU6.TCNT.

[Clearing condition]

- When 1 is set to the TSTRB.CST6 bit while SCH6 = 1

SCH4 bit (Synchronous Start 4)

This bit controls synchronous start of MTU4.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST4 bit while SCH4 = 1

SCH3 bit (Synchronous Start 3)

This bit controls synchronous start of MTU3.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST3 bit while SCH3 = 1

SCH2 bit (Synchronous Start 2)

This bit controls synchronous start of MTU2.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST2 bit while SCH2 = 1

SCH1 bit (Synchronous Start 1)

This bit controls synchronous start of MTU1.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST1 bit while SCH1 = 1

SCH0 bit (Synchronous Start 0)

This bit controls synchronous start of MTU0.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST0 bit while SCH0 = 1

17.2.22 TRWERx : Timer Read/Write Enable Register x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x284 (TRWERA)
0xA84 (TRWERB)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	RWE
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	RWE	Read/Write Enable 0: Read/write access to the registers is disabled 1: Read/write access to the registers is enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

TRWERA enables or disables access to the registers and counters that have write-protection capability against accidental modification in MTU3 and MTU4.

TRWERB enables or disables access to the registers and counters that have write-protection capability against accidental modification in MTU6 and MTU7.

RWE bit (Read/Write Enable)

This bit enables or disables access to the registers that have write-protection capability against accidental modification.

[Clearing condition]

- When 0 is written to the RWE bit after reading RWE = 1

Note:
- **Registers and Counters having Write-Protection Capability against Accidental Modification (TRWERA)**
  24 registers: MTUn.TCR, MTUn.TCR2, MTUn.TMDR1, MTUn.TIORH, MTUn.TIORL, MTUn.TIER, MTUn.TGRA, MTUn.TGRB, MTU.TOERA, MTU.TOCR1A, MTU.TOCR2A, MTU.TGCRA, MTU.TCDRA, MTU.TDDRA, and MTUn.TCNT (n = 3, 4)
- **Registers and Counters having Write-Protection Capability against Accidental Modification (TRWERB)**
  23 registers: MTUn.TCR, MTUn.TCR2, MTUn.TMDR1, MTUn.TIORH, MTUn.TIORL, MTUn.TIER, MTUn.TGRA, MTUn.TGRB, MTUn.MTU.TOERB, MTU.TOCR1B, MTU.TOCR2B, MTU.TCDRB, MTU.TDDRB, and MTUn.TCNT (n = 6, 7)

17.2.23 TOERA : Timer Output Master Enable Register A

Base address: MTU = 0x9000_1000

Offset address: 0x20A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	OE4D	OE4C	OE3D	OE4B	OE4A	OE3B
Value after reset:	1	1	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OE3B	Master Enable MTIOC3B 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
1	OE4A	Master Enable MTIOC4A 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
2	OE4B	Master Enable MTIOC4B 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
3	OE3D	Master Enable MTIOC3D 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
4	OE4C	Master Enable MTIOC4C 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
5	OE4D	Master Enable MTIOC4D 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
7:6	—	These bits are read as 1. The write value should be 1.	R/W

Note 1. The non-active level depends on the setting of the timer output control register 1 or 2 (TOCR 1/2). See section 17.2.25. TOCR1x : Timer Output Control Register 1x (x = A, B) and section 17.2.26. TOCR2x : Timer Output Control Register 2x (x = A, B) for details. When MTU output is in a mode other than complementary PWM mode or reset-synchronized PWM mode, set the relevant bit to 1. If the setting is 0, the non-active level will be output due to this setting of the timer output control register.

TOERA enables or disables output settings for output pins MTIOC4D, MTIOC4C, MTIOC3D, MTIOC4B, MTIOC4A, and MTIOC3B.

These pins do not output correctly if the bits in the TOERA register have not been set. In MTU3 and MTU4, set TOERA prior to setting TIOR.

Set MTU.TOERA after setting the CST3 and CST4 bits in MTU.TSTRA to 0 (see Figure 17.44 and Figure 17.48).

17.2.24 TOERB : Timer Output Master Enable Register B

Base address: MTU = 0x9000_1000

Offset address: 0xA0A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	OE7D	OE7C	OE6D	OE7B	OE7A	OE6B
Value after reset:	1	1	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OE6B	Master Enable MTIOC6B 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
1	OE7A	Master Enable MTIOC7A 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
2	OE7B	Master Enable MTIOC7B 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
3	OE6D	Master Enable MTIOC6D 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
4	OE7C	Master Enable MTIOC7C 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
5	OE7D	Master Enable MTIOC7D 0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
7:6	—	These bits are read as 1. The write value should be 1.	R/W

Note 1. The non-active level depends on the setting of the timer output control register 1 or 2 (TOCR 1/2). See section 17.2.25. TOCR1x : Timer Output Control Register 1x (x = A, B) and section 17.2.26. TOCR2x : Timer Output Control Register 2x (x = A, B) for details. When MTU output is in a mode other than complementary PWM mode or reset-synchronized PWM mode, set the relevant bit to 1. If the setting is 0, the non-active level will be output due to this setting of the timer output control register.

TOERB enables or disables output settings for output pins MTIOC7D, MTIOC7C, MTIOC6D, MTIOC7B, MTIOC7A, and MTIOC6B.

These pins do not output correctly if the bits in the TOERB register have not been set. In MTU6 and MTU7, set TOERB prior to setting TIOR.

Set MTU.TOERB after setting the CST6 and CST7 bits in MTU.TSTRB to 0 (see Figure 17.44 and Figure 17.48).

17.2.25 TOCR1x : Timer Output Control Register 1x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x20E (TOCR1A)
0xA0E (TOCR1B)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	PSYE	—	—	TOCL	TOCS	OLSN	OLSP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OLSP	Output Level Select P*1 *3 See Table 17.44.	R/W

Bit	Symbol	Function	R/W
1	OLSN	Output Level Select N*1 *3 See Table 17.45.	R/W
2	TOCS	TOC Select 0: TOCR1j setting is selected (j = A, B). 1: TOCR2j setting is selected (j = A, B).	R/W
3	TOCL	TOC Register Write Protection*2 *4 0: Write access to the TOCS, OLSN, and OLSP bits is enabled. 1: Write access to the TOCS, OLSN, and OLSP bits is disabled.	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	PSYE	PWM Synchronous Output Enable 0: Toggle output is disabled. 1: Toggle output is enabled.	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note 1. Setting the TOCR1j.TOCS bit to 0 makes this bit setting valid.
Note 2. Setting the TOCR1j.TOCL bit to 1 prevents accidental modification when the CPU goes out of control.
Note 3. If dead-time is not generated, the negative-phase output is the exact inverse of the positive-phase output. In this case, only the OLSP bit is valid.
Note 4. This bit can be set to 1 only once after a reset. After 1 is written, 0 cannot be written to the bit.

TOCR1A and TOCR1B enable or disable PWM-synchronized toggle output in complementary PWM mode and reset synchronized PWM mode, and control inversion of PWM output level.

OLSP bit (Output Level Select P)

This bit selects the positive-phase output level in reset-synchronized PWM mode and complementary PWM mode. The initial output is selected while the counter is stopped.

OLSN bit (Output Level Select N)

This bit selects the negative-phase output level in reset-synchronized PWM mode and complementary PWM mode. The initial output is selected while the counter is stopped.

TOCS bit (TOC Select)

This bit selects either the TOCR1j or TOCR2j (j = A, B) setting to be used for the output level in complementary PWM mode and reset-synchronized PWM mode.

TOCL bit (TOC Register Write Protection)

This bit enables or disables write access to the TOCS, OLSN, and OLSP bits in TOCR1j (j = A, B).

PSYE bit (PWM Synchronous Output Enable)

This bit enables or disables toggle output synchronized with the PWM period.

Table 17.44 Output level select function

Bit 0	Function			
			Compare match output	
OLSP	Initial output	Active level	Up-counting	Down-counting
0	High level	Low level	Low level	High level
1	Low level	High level	High level	Low level

Table 17.45 Output level select function

Bit 1	Function			
			Compare match output	
OLSN	Initial output	Active level	Up-counting	Down-counting
0	High level	Low level	High level	Low level
1	Low level	High level	Low level	High level

Note: The initial output value of negative-phase waveform changes to an active level after the dead time has passed since counting starts.

Figure 17.3 shows an example of output in complementary PWM mode (one phase) when OLSN = 1 and OLSP = 1.

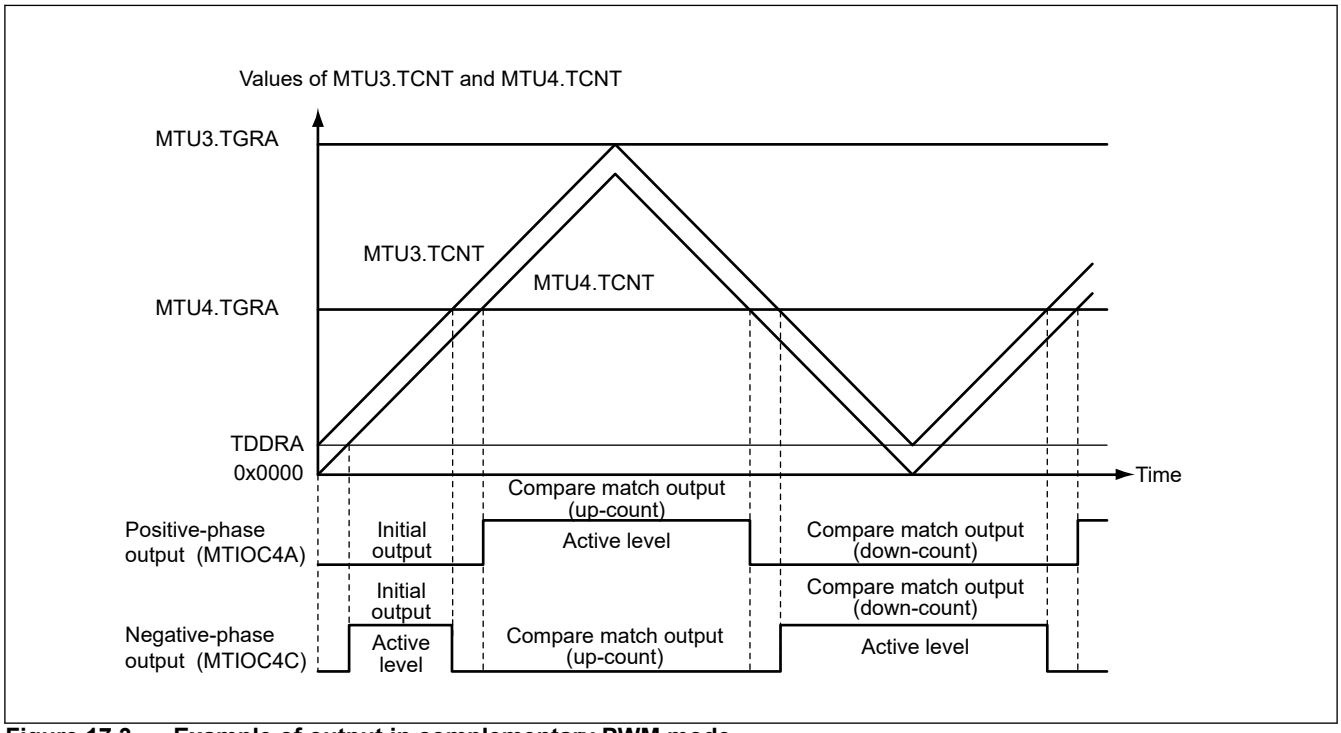


Figure 17.3 Example of output in complementary PWM mode

17.2.26 TOCR2x : Timer Output Control Register 2x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x20F (TOCR2A)
0xA0F (TOCR2B)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	BF[1:0]		OLS3N	OLS3P	OLS2N	OLS2P	OLS1N	OLS1P
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OLS1P	Output Level Select 1P*1 *2 This bit selects the output level on MTIOC3B or MTIOC6B in reset-synchronized PWM mode and complementary PWM mode. See Table 17.46.	R/W
1	OLS1N	Output Level Select 1N*1 *2 This bit selects the output level on MTIOC3D or MTIOC6D in reset-synchronized PWM mode and complementary PWM mode. See Table 17.47.	R/W
2	OLS2P	Output Level Select 2P*1 *2 This bit selects the output level on MTIOC4A or MTIOC7A in reset-synchronized PWM mode and complementary PWM mode. See Table 17.48.	R/W
3	OLS2N	Output Level Select 2N*1 *2 This bit selects the output level on MTIOC4C or MTIOC7C in reset-synchronized PWM mode and complementary PWM mode. See Table 17.49.	R/W

Bit	Symbol	Function	R/W
4	OLS3P	Output Level Select 3P*1 *2 This bit selects the output level on MTIOC4B or MTIOC7B in reset-synchronized PWM mode and complementary PWM mode. See Table 17.50.	R/W
5	OLS3N	Output Level Select 3N*1 *2 This bit selects the output level on MTIOC4D or MTIOC7D in reset-synchronized PWM mode and complementary PWM mode. See Table 17.51.	R/W
7:6	BF[1:0]	TOLBR Buffer Transfer Timing Select These bits select the timing for transferring data from TOLBRj to TOCR2j. See Table 17.52 for details.	R/W

Note 1. Setting the TOCR1j.TOCS bit to 1 makes this bit setting valid (j = A, B).
Note 2. If dead-time is not generated, the negative-phase output is the exact inverse of the positive-phase output. In this case, only the OLSiP bits are valid (i = 1 to 3).

TOCR2A and TOCR2B control inversion of PWM output level in complementary PWM mode and reset-synchronized PWM mode.

The initial output is selected while the counter is stopped.

Table 17.46 MTIOCmB output level select function

Bit 0	Function

1	Low level	High level	Low level	High level

Note: m = 4, 7
Note: The initial output value of negative-phase waveform changes to an active level after the dead time has passed since counting starts.

Table 17.52 Setting of TOCR2j.BF[1:0] bits

Bit 7	Bit 6	Description	
BF[1]	BF[0]	Complementary PWM mode	Reset-synchronized PWM mode
0	0	Does not transfer data from the buffer register (TOLBRj) to TOCR2j.	Does not transfer data from the buffer register (TOLBRj) to TOCR2j.
0	1	Transfers data from the buffer register (TOLBRj) to TOCR2j at the crest of the MTUn.TCNT count.	Transfers data from the buffer register (TOLBRj) to TOCR2j when MTUm.TCNT or MTUn.TCNT is cleared.
1	0	Transfers data from the buffer register (TOLBRj) to TOCR2j at the trough of the MTUn.TCNT count.	Setting prohibited
1	1	Transfers data from the buffer register (TOLBRj) to TOCR2j at the crest and trough of the MTUn.TCNT count.	Setting prohibited

Note: n = 4, 7; m = 3, 6; j = A, B

17.2.27 TOLBRx : Timer Output Level Buffer Register x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x236 (TOLBRA)
0xA36 (TOLBRB)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	OLS3N	OLS3P	OLS2N	OLS2P	OLS1N	OLS1P
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OLS1P	Output Level Select 1P Specify the buffer value to be transferred to the OLS1P bit in TOCR2A and TOCR2B.	R/W
1	OLS1N	Output Level Select 1N Specify the buffer value to be transferred to the OLS1N bit in TOCR2A and TOCR2B.	R/W
2	OLS2P	Output Level Select 2P Specify the buffer value to be transferred to the OLS2P bit in TOCR2A and TOCR2B.	R/W

Bit	Symbol	Function	R/W
3	OLS2N	Output Level Select 2N Specify the buffer value to be transferred to the OLS2N bit in TOCR2A and TOCR2B.	R/W
4	OLS3P	Output Level Select 3P Specify the buffer value to be transferred to the OLS3P bit in TOCR2A and TOCR2B.	R/W
5	OLS3N	Output Level Select 3N Specify the buffer value to be transferred to the OLS3N bit in TOCR2A and TOCR2B.	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

TOLBRA and TOLBRB are buffer registers for TOCR2A and TOCR2B and specify the PWM output level in complementary PWM mode and reset-synchronized PWM mode.

Figure 17.4 shows an example of the PWM output level setting procedure in buffer operation.

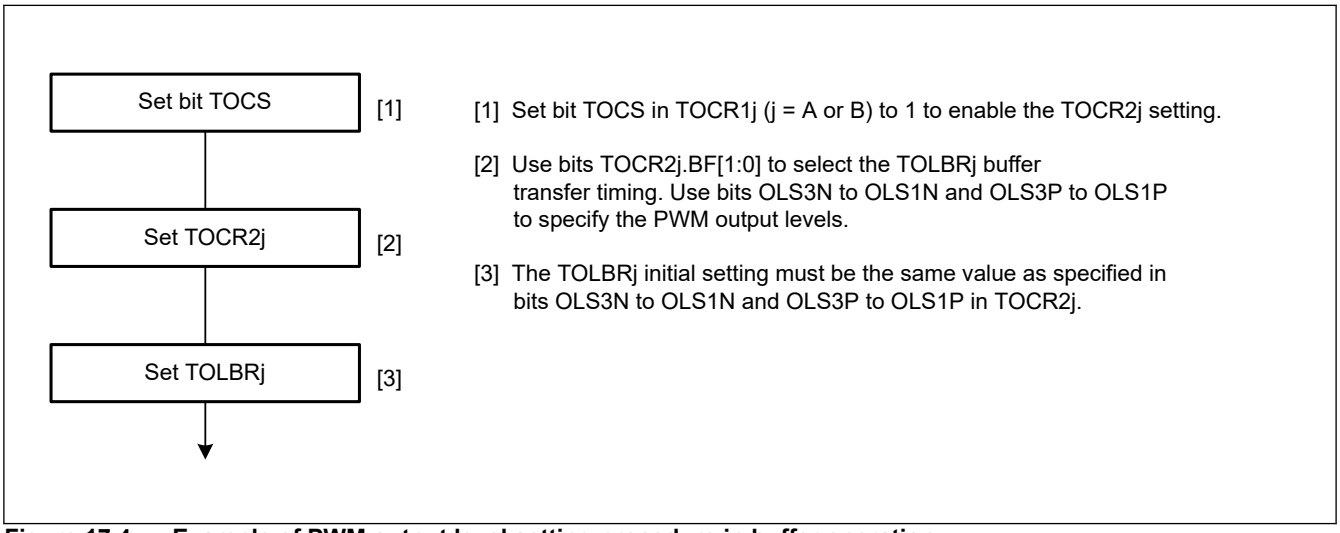

Figure 17.4 Example of PWM output level setting procedure in buffer operation

17.2.28 TGCRA : Timer Gate Control Register A

Base address: MTU = 0x9000_1000

Offset address: 0x20D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	BDC	N	P	FB	WF	VF	UF
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	UF	Output Phase Switch These bits turn on or off the positive-phase/negative-phase output. The setting of these bits is valid only when FB = 1. In this case, the setting of bit 0 to bit 2 is used instead of the external input. See Table 17.53.	R/W
1	VF	Output Phase Switch See Table 17.53.	R/W
2	WF	Output Phase Switch See Table 17.53.	R/W
3	FB	External Feedback Signal Enable 0: Output is switched by external input (input sources are TGRA, TGRB, and TGRC input capture signals in MTU0) 1: Output is switched by software (UF, VF, and WF settings)	R/W

Bit	Symbol	Function	R/W
4	P	Positive-Phase Output (P) Control 0: Level output 1: Reset-synchronized PWM or complementary PWM output	R/W
5	N	Negative-Phase Output (N) Control 0: Level output 1: Reset-synchronized PWM or complementary PWM output	R/W
6	BDC	Brushless DC Motor 0: Ordinary output 1: Functions of this register are made effective	R/W
7	—	This bit is read as 1. The write value should be 1.	R/W

TGCRA controls the output waveform necessary for brushless DC motor control in reset-synchronized PWM mode and complementary PWM mode. TGCRA register settings are ineffective for anything other than complementary PWM mode and reset-synchronized PWM mode.

UF, VF, and WF bits (Output Phase Switch)

The setting of these bits is valid only when FB = 1. In this case, the setting of bit 0 to bit 2 is used instead of the external input. For details, see Table 17.53.

Table 17.53 Output level select function

Bit 2	Bit 1	Bit 0	Function					
			MTIOC3B	MTIOC4A	MTIOC4B	MTIOC3D	MTIOC4C	MTIOC4D
WF	VF	UF	U phase	V phase	W phase	U phase	V phase	W phase
0	0	0	OFF	OFF	OFF	OFF	OFF	OFF
0	0	1	ON	OFF	OFF	OFF	OFF	ON
0	1	0	OFF	ON	OFF	ON	OFF	OFF
0	1	1	OFF	ON	OFF	OFF	OFF	ON
1	0	0	OFF	OFF	ON	OFF	ON	OFF
1	0	1	ON	OFF	OFF	OFF	ON	OFF
1	1	0	OFF	OFF	ON	ON	OFF	OFF
1	1	1	OFF	OFF	OFF	OFF	OFF	OFF

FB bit (External Feedback Signal Enable)

This bit selects whether the positive-/negative-phase output is switched automatically with the TGRA, TGRB, and TGRC input capture signals in MTU0 or by writing 0 or 1 to bits 2 to 0 in TGCRA. When the TGCRA.FB bit is 0, output of MTU3 and MTU4 can be switched with the TGRA, TGRB, and TGRC input capture signals in MTU0.

P bit (Positive-Phase Output (P) Control)

This bit selects the level output or the reset-synchronized PWM/complementary PWM output for the positive-phase output pins (MTIOC3B, MTIOC4A, and MTIOC4B pins).

N bit (Negative-Phase Output (N) Control)

This bit selects the level output or the reset-synchronized PWM/complementary PWM output for the negative-phase output pins (MTIOC3D, MTIOC4C, and MTIOC4D pins).

BDC bit (Brushless DC Motor)

This bit selects whether to make the functions of TGCRA effective or ineffective.

17.2.29 TCNTSx : Timer Subcounter x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x220 (TCNTSA)
0xA20 (TCNTSB)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	n/a	TCNTSA and TCNTSB are 16-bit read-only counters used only in complementary PWM mode.	R

Note: TCNTSA and TCNTSB should be accessed in 16-bit units.

17.2.30 TCDRx : Timer Cycle Data Register x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x214 (TCDRA)
0xA14 (TCDRB)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	TCDRA and TCDRB are 16-bit readable/writable registers used only in complementary PWM mode. Set half the PWM carrier period as the TCDRA and TCDRB values. The TCDRA and TCDRB registers are constantly compared with the TCNTSA and TCNTSB counters in complementary PWM mode, respectively. When a match occurs, the TCNTSA and TCNTSB counters switch the count direction (down-count to up-count).	R/W

Note: TCDRA and TCDRB should be accessed in 16-bit units.

17.2.31 TCBRx : Timer Cycle Buffer Register x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x222 (TCBRA)
0xA22 (TCBRB)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	TCBRA and TCBRB are 16-bit readable/writable registers, used only in complementary PWM mode, that function as buffer registers for TCDRA and TCDRB. The TCBRA and TCBRB values are transferred to TCDRA and TCDRB with the transfer timing set in TMDR1.	R/W

Note: TCBRA and TCBRB should be accessed in 16-bit units.

17.2.32 TDDRx : Timer Dead Time Data Register x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x216 (TDDRA)
0xA16 (TDDRB)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	TDDRA and TDDRB are 16-bit readable/writable registers, used only in complementary PWM mode, that specify the MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) counter offset value. In complementary PWM mode, when the MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) counters are cleared and then restarted, the TDDRA (TDDRB) value is loaded into the MTU3.TCNT (MTU6.TCNT) counter and the count operation starts.	R/W

Note: TDDRA and TDDRB should be accessed in 16-bit units.

17.2.33 TDERx : Timer Dead Time Enable Register x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x234 (TDERA)
0xA34 (TDERB)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	TDER
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	TDER	Dead Time Enable 0: No dead time is generated 1: Dead time is generated*1	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. TDDRA and TDDRB should be set to 1 or a larger value.

TDERA and TDERB control dead time generation in complementary PWM mode. The MTU has one TDER each for MTU3 and MTU6. TDERA and TDERB should be modified only while TCNT stops.

TDER bit (Dead Time Enable)

This bit specifies whether to generate dead time.

[Clearing condition]

- When 0 is written to TDER after reading TDER = 1

17.2.34 TBTERx : Timer Buffer Transfer Set Register x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x232 (TBTERA)
0xA32 (TBTERB)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	BTE[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	BTE[1:0]	Buffer Transfer Disable and Interrupt Skipping Link Setting These bits enable or disable transfer from the buffer registers*1 used in complementary PWM mode to the temporary registers, and specify whether to link the transfer with interrupt skipping function 1. For details, see Table 17.54.	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Applicable buffer registers (TBTERA):
MTU3.TGRC, MTU3.TGRD, MTU4.TGRC, MTU4.TGRD, and TCBRA
Applicable buffer registers (TBTERB):
MTU6.TGRC, MTU6.TGRD, MTU7.TGRC, MTU7.TGRD, and TCBRB

TBTERA and TBTERB enable or disable transfer from the buffer registers used in complementary PWM mode to the temporary registers, and specify whether to link the transfer with interrupt skipping 1 operation.

Table 17.54 Setting of TBTERA.BTE[1:0] bits and TBTERB.BTE[1:0] bits

Bit 1	Bit 0	
BTE[1]	BTE[0]	Description
0	0	Enables transfer from the buffer registers to the temporary registers*1 and does not link the transfer with interrupt skipping function 1.
0	1	Disables transfer from the buffer registers to the temporary registers.
1	0	Links transfer from the buffer registers to the temporary registers with interrupt skipping function 1.*2
1	1	Setting prohibited

Note 1. Data is transferred according to the MD3 to MD0 bit setting in TMDR1. For details, see section 17.3.8. Complementary PWM Mode.
Note 2. When interrupt skipping is disabled the T3AEN and T4VEN (T6AEN and T7VEN) bits are set to 0 in the timer interrupt skipping set register (TITCR1A (TITCR1B)) or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are set to 0), be sure to disable link of buffer transfer with interrupt skipping (set the BTE1 bit in the timer buffer transfer set register (TBTERA (TBTERB)) to 0). If link with interrupt skipping is enabled while interrupt skipping is disabled, buffer transfer will not be performed.

17.2.35 TWCRx : Timer Waveform Control Register x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x260 (TWCRA)
0xA60 (TWCRB)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CCE	—	—	—	—	—	SCC	WRE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	WRE*3	Waveform Retain Enable 0: Initial values specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are output 1: Initial output is inhibited	R/W
1	SCC*1*3	Synchronous Clearing Control (Only valid in TWCRB) 0: Clearing of MTU6.TCNT and MTU7.TCNT in response to synchronous clearing for MTU0, MTU1, MTU2 to MTU6, and MTU7 is enabled. 1: Clearing of MTU6.TCNT and MTU7.TCNT in response to synchronous clearing for MTU0, MTU1, MTU2 to MTU6, and MTU7 is disabled.	R/W
6:2	—	These bits are read as 0. The write value should be 0.	R/W
7	CCE*2	Compare Match Clear Enable 0: Counters are not cleared at MTU3.TGRA (MTU6.TGRA) compare match 1: Counters are cleared at MTU3.TGRA (MTU6.TGRA) compare match	R/W

Note 1. This bit is only valid in register TWCRB and is a reserved bit in register TWCRA.
Note 2. Do not set to 1 when complementary PWM mode 1 is not selected.

Note 3. Do not set to 1 when complementary PWM mode is not selected.

TWCRA and TWCRB control the output waveform when synchronous counter clearing occurs in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) in complementary PWM mode and specifies whether to clear the counters at MTU3.TGRA (MTU6.TGRA) compare match.

The CCE bit and WRE bit in TWCRA and TWCRB should be modified only while TCNT stops.

WRE bit (Waveform Retain Enable)

This bit selects the waveform output when synchronous counter clearing occurs in complementary PWM mode.

The initial output is inhibited with this function only when synchronous clearing occurs within the Tb interval at the trough in complementary PWM mode. When synchronous clearing occurs outside this interval, the initial values specified in TOCR1A and TOCR2A are output regardless of the WRE bit setting. The initial values specified in TOCR1A and TOCR2A are also output when synchronous clearing occurs in the Tb interval at the trough immediately after MTU3.TCNT and MTU4.TCNT start operation.

For the Tb interval at the trough in complementary PWM mode, see Figure 17.50.

[Setting condition]

- When 1 is written to the WRE bit after reading WRE = 0

SCC bit (Synchronous Clearing Control)

The setting of this bit selects whether MTU6.TCNT and MTU7.TCNT are or are not cleared when counter-synchronous clearing is generated for MTU0, MTU1, MTU2 to MTU6, and MTU7 in complementary PWM mode.

Make the complementary PWM mode settings for MTU6 and MTU7 when this function is in use. When writing a new value to the SCC bit while the counter is operating, do so in such a way that the values of the CCE and WRE bits are not changed.

Synchronous clearing from the MTU module only becomes disabled due to the setting of the SCC bit when synchronous clearing is generated outside the Tb interval in the trough. If synchronous clearing is generated within the Tb interval in the trough including immediately after the value at which MTU6.TCNT and MTU7.TCNT start, MTU6.TCNT and MTU7.TCNT are cleared.

Regarding the Tb interval in the trough in complementary PWM mode, see Figure 17.50.

[Setting condition]

- Writing of 1 to the SCC bit after reading SCC = 0

The corresponding bit in register TWCRA is reserved and is read as 0. When writing to TWCRA, write 0 to this bit.

CCE bit (Compare Match Clear Enable)

This bit specifies whether to clear counters at MTU3.TGRA (MTU6.TGRA) compare match in complementary PWM mode.

[Setting condition]

- When 1 is written to the CCE bit after reading CCE = 0

17.2.36 NFCR — Noise Filter Control Registers

17.2.36.1 NFCRn : Noise Filter Control Register n (n = 0, 3, 4, 6 to 8)

Base address: MTU_NF = 0x9000_1290

Offset address: 0x000 + 0x01 × n (n = 0 to 4, 8)
0x803 + 0x01 × (n - 6) (n = 6, 7)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	NFCS[1:0]		NFDEN	NFCEN	NFBEN	NFAEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NFAEN	Noise Filter A Enable 0: The noise filter for the MTIOCnA pin is disabled 1: The noise filter for the MTIOCnA pin is enabled.	R/W
1	NFBEN	Noise Filter B Enable 0: The noise filter for the MTIOCnB pin is disabled 1: The noise filter for the MTIOCnB pin is enabled	R/W
2	NFCEN	Noise Filter C Enable 0: The noise filter for the MTIOCnC pin is disabled 1: The noise filter for the MTIOCnC pin is enabled	R/W
3	NFDEN	Noise Filter D Enable 0: The noise filter for the MTIOCnD pin is disabled 1: The noise filter for the MTIOCnD pin is enabled	R/W
5:4	NFCS[1:0]	Noise Filter Clock Select 0 0: PCLKH/1 0 1: PCLKH/8 1 0: PCLKH/32 1 1: Clock source for counting	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

The NFCRn register controls noise filtering for the input pins of MTUn.

NFAEN bit (Noise Filter A Enable)

This bit disables or enables the noise filter for input from the MTIOCnA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR1.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFBEN bit (Noise Filter B Enable)

This bit disables or enables the noise filter for input from the MTIOCnB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR1.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFCEN bit (Noise Filter C Enable)

This bit disables or enables the noise filter for input from the MTIOCnC pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR1.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFDEN bit (Noise Filter D Enable)

This bit disables or enables the noise filter for input from the MTIOCnD pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR1.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFCS[1:0] bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. When setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval before setting the input-capture function. When the NFCS[1:0] bits are set to 11b, i.e. selecting the external clock as the source to drive counting, wait for two cycles of the external clock before setting the input capture function.

17.2.36.2 NFCRm : Noise Filter Control Register m (m = 1, 2)

Base address: MTU_NF = 0x9000_1290

Offset address: 0x001 (NFCR1), 0x002 (NFCR2)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	NFCS[1:0]		—	—	NFBEN	NFAEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NFAEN	Noise Filter A Enable 0: The noise filter for the MTIOCmA pin is disabled 1: The noise filter for the MTIOCmA pin is enabled.	R/W
1	NFBEN	Noise Filter B Enable 0: The noise filter for the MTIOCmB pin is disabled 1: The noise filter for the MTIOCmB pin is enabled	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
5:4	NFCS[1:0]	Noise Filter Clock Select 0 0: PCLKH/1 0 1: PCLKH/8 1 0: PCLKH/32 1 1: Clock source for counting	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

The NFCRm register (m = 1, 2) controls noise filtering for the input pins of MTUm.

NFAEN bit (Noise Filter A Enable)

This bit disables or enables the noise filter for input from the MTIOCmA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR1.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFBEN bit (Noise Filter B Enable)

This bit disables or enables the noise filter for input from the MTIOCmB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR1.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFCS[1:0] bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. When setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval before setting the input-capture function. When the NFCS[1:0] bits are set to 11b, i.e. selecting the external clock as the source to drive counting, wait for two cycles of the external clock before setting the input capture function.

17.2.36.3 NFCRC : Noise Filter Control Register C

Base address: MTU_NF = 0x9000_1290

Offset address: 0x009

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	NFCS[1:0]		NFDEN	NFCEN	NFBEN	NFAEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NFAEN	Noise Filter A Enable 0: The noise filter for the MTCLKA pin is disabled 1: The noise filter for the MTCLKA pin is enabled.	R/W
1	NFBEN	Noise Filter B Enable 0: The noise filter for the MTCLKB pin is disabled 1: The noise filter for the MTCLKB pin is enabled	R/W
2	NFCEN	Noise Filter C Enable 0: The noise filter for the MTCLKC pin is disabled 1: The noise filter for the MTCLKC pin is enabled	R/W
3	NFDEN	Noise Filter D Enable 0: The noise filter for the MTCLKD pin is disabled 1: The noise filter for the MTCLKD pin is enabled	R/W
5:4	NFCS[1:0]	Noise Filter Clock Select 0 0: PCLKH/1 0 1: PCLKH/2 1 0: PCLKH/8 1 1: PCLKH/32	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

The NFCRC register controls noise filtering for the external clock input pins of the MTU.

NFAEN bit (Noise Filter A Enable)

This bit disables or enables the noise filter for input from the MTCLKA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFBEN bit (Noise Filter B Enable)

This bit disables or enables the noise filter for input from the MTCLKB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFCEN bit (Noise Filter C Enable)

This bit disables or enables the noise filter for input from the MTCLKC pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFDEN bit (Noise Filter D Enable)

This bit disables or enables the noise filter for input from the MTCLKD pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFCS[1:0] bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. After setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval to set the counting start.

17.2.36.4 NFCR5 : Noise Filter Control Register 5

Base address: MTU_NF = 0x9000_1290

Offset address: 0x805

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	NFCS[1:0]		—	NFWEN	NFVEN	NFUEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NFUEN	Noise Filter U Enable 0: The noise filter for the MTIC5U pin is disabled 1: The noise filter for the MTIC5U pin is enabled	R/W

Bit	Symbol	Function	R/W
1	NFVEN	Noise Filter V Enable 0: The noise filter for the MTIC5V pin is disabled 1: The noise filter for the MTIC5V pin is enabled	R/W
2	NFWEN	Noise Filter W Enable 0: The noise filter for the MTIC5W pin is disabled 1: The noise filter for the MTIC5W pin is enabled	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
5:4	NFCS[1:0]	Noise Filter Clock Select 0 0: PCLKH/1 0 1: PCLKH/8 1 0: PCLKH/32 1 1: Clock source for counting	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

The NFCR5 register controls noise filtering for the input pins of MTU5.

NFUEN bit (Noise Filter U Enable)

This bit disables or enables the noise filter for input from the MTIC5U pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

NFVEN bit (Noise Filter V Enable)

This bit disables or enables the noise filter for input from the MTIC5V pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

NFWEN bit (Noise Filter W Enable)

This bit disables or enables the noise filter for input from the MTIC5W pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

NFCS[1:0] bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. When setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval before setting the input-capture function.

17.2.37 TADCR — Timer A/D Converter Start Request Control Registers

17.2.37.1 MTU4.TADCR : Timer A/D Converter Start Request Control Register

Base address: MTU4 = 0x9000_1200

Offset address: 0x040

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	BF[1:0]		—	—	—	—	—	—	UT4AE	DT4AE	UT4BE	DT4BE	ITA3AE	ITA4VE	ITB3AE	ITB4VE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ITB4VE	TCIV4 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG4BN and TCIV4 interrupt skipping 1 are not linked. 1: A/D converter start request signal TRG4BN and TCIV4 interrupt skipping 1 are linked.	R/W

Bit	Symbol	Function	R/W
1	ITB3AE	TGIA3 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG4BN and TGIA3 interrupt skipping 1 are not linked. 1: A/D converter start request signal TRG4BN and TGIA3 interrupt skipping 1 are linked.	R/W
2	ITA4VE	TCIV4 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG4AN and TCIV4 interrupt skipping 1 are not linked. 1: A/D converter start request signal TRG4AN and TCIV4 interrupt skipping 1 are linked.	R/W
3	ITA3AE	TGIA3 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG4AN and TGIA3 interrupt skipping 1 are not linked. 1: A/D converter start request signal TRG4AN and TGIA3 interrupt skipping 1 are linked.	R/W
4	DT4BE	Down-Count TRG4BN Enable*3 0: A/D converter start requests (TRG4BN) disabled during MTU4.TCNT down-count operation. 1: A/D converter start requests (TRG4BN) enabled during MTU4.TCNT down-count operation.	R/W
5	UT4BE	Up-Count TRG4BN Enable 0: A/D converter start requests (TRG4BN) disabled during MTU4.TCNT up-count operation. 1: A/D converter start requests (TRG4BN) enabled during MTU4.TCNT up-count operation.	R/W
6	DT4AE	Down-Count TRG4AN Enable*3 0: A/D converter start requests (TRG4AN) disabled during MTU4.TCNT down-count operation. 1: A/D converter start requests (TRG4AN) enabled during MTU4.TCNT down-count operation.	R/W
7	UT4AE	Up-Count TRG4AN Enable 0: A/D converter start requests (TRG4AN) disabled during MTU4.TCNT up-count operation. 1: A/D converter start requests (TRG4AN) enabled during MTU4.TCNT up-count operation.	R/W
13:8	—	These bits are read as 0. The write value should be 0.	R/W
15:14	BF[1:0]	MTU4.TADCOBRA/TADCOBRB Transfer Timing Select These bits specify the transfer timing from MTU4.TADCOBRA and MTU4.TADCOBRB to MTU4.TADCORA and MTU4.TADCORB. For detail, see Table 17.55.	R/W

Note: MTU4.TADCR should be accessed in 16-bit units.
Note 1. When interrupt skipping is disabled (the T3AEN and T4VEN bits in TITCR1A are cleared to 0 or the T3ACOR and T4VCOR bits in TITCR1A are cleared to 0), do not link A/D converter start requests with interrupt skipping function 1 (clear the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in MTU4.TADCR to 0).
Note 2. If link with interrupt skipping is enabled while interrupt skipping is disabled, A/D converter start requests will not be issued.
Note 3. Do not set to 1 when complementary PWM mode is not selected.

TADCR enables or disables A/D converter start requests and specifies whether to link A/D converter start requests with interrupt skipping function. The MTU has one TADCR each for MTU4 and MTU7.

Table 17.55 Setting of transfer timing by TADCR.BF[1:0] bits (MTU4) (1 of 2)

BF[1]	BF[0]	Description
0	0	Does not transfer data from the cycle set buffer register (MTU4.TADCOBRA, MTU4.TADCOBRB) to the cycle set register (MTU4.TADCORA, MTU4.TADCORB).
0	1	Data is transferred from the cycle set buffer register (MTU4.TADCOBRA, MTU4.TADCOBRB) to the cycle set register (MTU4.TADCORA, MTU4.TADCORB) when the crest of the MTU4.TCNT count is reached or the MTU4.TGRD is written to in complementary PWM mode, when a compare match occurs between MTU3.TCNT and MTU3.TGRA in reset-synchronized PWM mode, or when a compare match occurs between MTU4.TCNT and MTU4.TGRA in PWM mode 1 or normal operation mode.

Table 17.55 Setting of transfer timing by TADCR.BF[1:0] bits (MTU4) (2 of 2)

BF[1]	BF[0]	Description
1	0	Transfers data from the cycle set buffer register to the cycle set register at the trough of the MTU4.TCNT count. These settings are prohibited when complementary PWM mode is not selected.
1	1	Transfers data from the cycle set buffer register to the cycle set register at the crest and trough of the MTU4.TCNT count. These settings are prohibited when complementary PWM mode is not selected.

17.2.37.2 MTU7.TADCR : Timer A/D Converter Start Request Control Register

Base address: MTU7 = 0x9000_1A00

Offset address: 0x040

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	BF[1:0]		—	—	—	—	—	—	UT7AE	DT7AE	UT7BE	DT7BE	ITA6AE	ITA7VE	ITB6AE	ITB7VE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ITB7VE	TCIV7 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG7BN and TCIV7 interrupt skipping 1 are not linked. 1: A/D converter start request signal TRG7BN and TCIV7 interrupt skipping 1 are linked.	R/W
1	ITB6AE	TGIA6 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG7BN and TGIA6 interrupt skipping 1 are not linked. 1: A/D converter start request signal TRG7BN and TGIA6 interrupt skipping 1 are linked.	R/W
2	ITA7VE	TCIV7 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG7AN and TCIV7 interrupt skipping 1 are not linked. 1: A/D converter start request signal TRG7AN and TCIV7 interrupt skipping 1 are linked.	R/W
3	ITA6AE	TGIA6 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG7AN and TGIA6 interrupt skipping 1 are not linked. 1: A/D converter start request signal TRG7AN and TGIA6 interrupt skipping 1 are linked.	R/W
4	DT7BE	Down-Count TRG7BN Enable*3 0: A/D converter start requests (TRG7BN) disabled during MTU7.TCNT down-count operation. 1: A/D converter start requests (TRG7BN) enabled during MTU7.TCNT down-count operation.	R/W
5	UT7BE	Up-Count TRG7BN Enable 0: A/D converter start requests (TRG7BN) disabled during MTU7.TCNT up-count operation. 1: A/D converter start requests (TRG7BN) enabled during MTU7.TCNT up-count operation.	R/W
6	DT7AE	Down-Count TRG7AN Enable*3 0: A/D converter start requests (TRG7AN) disabled during MTU7.TCNT down-count operation. 1: A/D converter start requests (TRG7AN) enabled during MTU7.TCNT down-count operation.	R/W

Bit	Symbol	Function	R/W
7	UT7AE	Up-Count TRG7AN Enable 0: A/D converter start requests (TRG7AN) disabled during MTU7.TCNT up-count operation. 1: A/D converter start requests (TRG7AN) enabled during MTU7.TCNT up-count operation.	R/W
13:8	—	These bits are read as 0. The write value should be 0.	R/W
15:14	BF[1:0]	MTU7.TADCOBRA/TADCOBRB Transfer Timing Select These bits specify the transfer timing from MTU7.TADCOBRA and MTU7.TADCOBRB to MTU7.TADCORA and MTU7.TADCORB. For detail, see Table 17.56.	R/W

Note: MTU7.TADCR should be accessed in 16-bit units.
Note 1. When interrupt skipping is disabled (the T6AEN and T7VEN bits in TITCR1B are cleared to 0 or the T6ACOR and T7VCOR bits in TITCR1B are cleared to 0), do not link A/D converter start requests with interrupt skipping function 1 (clear the ITA6AE, ITA7VE, ITB6AE, and ITB7VE bits in MTU7.TADCR to 0).
Note 2. If link with interrupt skipping is enabled while interrupt skipping is disabled, A/D converter start requests are not issued.
Note 3. Do not set to 1 when complementary PWM mode is not selected.

TADCR enables or disables A/D converter start requests and specifies whether to link A/D converter start requests with interrupt skipping function.

Table 17.56 Setting of transfer timing by TADCR.BF[1:0] bits (MTU7)

BF[1]	BF[0]	Description
0	0	Does not transfer data from the cycle set buffer register (MTU7.TADCOBRA, MTU7.TADCOBRB) to the cycle set register (MTU7.TADCORA, MTU7.TADCORB).
0	1	Data is transferred from the cycle set buffer register (MTU7.TADCOBRA, MTU7.TADCOBRB) to the cycle set register (MTU7.TADCORA, MTU7.TADCORB) when the crest of the MTU7.TCNT count is reached or the MTU7.TGRD is written to in complementary PWM mode, when a compare match occurs between MTU6.TCNT and MTU6.TGRA in reset-synchronized PWM mode, or when a compare match occurs between MTU7.TCNT and MTU7.TGRA in PWM mode 1 or normal operation mode.
1	0	Transfers data from the cycle set buffer register to the cycle set register at the trough of the MTU7.TCNT count. These settings are prohibited when complementary PWM mode is not selected.
1	1	Transfers data from the cycle set buffer register to the cycle set register at the crest and trough of the MTU7.TCNT count. These settings are prohibited when complementary PWM mode is not selected.

17.2.38 TADCORx : Timer A/D Converter Start Request Cycle Set Register x (x = A, B)

Base address: MTU4 = 0x9000_1200, MTU7 = 0x9000_1A00

Offset address: 0x044 (TADCORA)
0x046 (TADCORB)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	TADCORA and TADCORB are 16-bit readable/writable registers that issue a corresponding A/D converter start request when the MTUn.TCNT (n = 4, 7) count reaches the value in TADCORA or TADCORB.	R/W

Note: The TADCORA and TADCORB registers should be accessed in 16-bit units.

When the A/D converter start request delaying function linked with skipping function 1 (for details, see section 17.3.9.4. A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 1) is used, the value of this register should be 0x0002 to TCDRA setting − 2 in MTU4 and 0x0002 to TCDRB setting − 2 in MTU7.

When interrupt skipping function 2 is used and the difference between the TADCORA value and the TADCORB value is small, the skipping count may not be counted correctly and the A/D converter start request may not be generated with the expected timing in some cases. The TADCORA and TADCORB values should satisfy the following conditions.

1. When skipping function 2 is specified with the skipping count set to 0
   - The difference between the TADCORA and TADCORB values should be equal to or greater than 4.
   - The TADCORA compare interval should be equal to or greater than 4 PCLKH cycles (the TADCORA update value should be the previous value + 4 or greater, or previous value − 4 or smaller).
   - The TADCORB compare interval should be equal to or greater than 4 PCLKH cycles (the TADCORB update value should be the previous value + 4 or greater, or previous value − 4 or smaller).
2. When skipping function 2 is specified with the skipping count set to 1 or greater
   - The difference between the TADCORA and TADCORB values should be equal to or greater than 2.
   - The TADCORB compare interval should be equal to or greater than 2 PCLKH cycles (the TADCORB update value should be the previous value + 2 or greater, or previous value − 2 or smaller)

17.2.39 TADCOBRx : Timer A/D Converter Start Request Cycle Set Buffer Register x (x = A, B)

Base address: MTU4 = 0x9000_1200, MTU7 = 0x9000_1A00

Offset address: 0x048 (TADCOBRA)
0x04A (TADCOBRB)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	TADCOBRA and TADCOBRB are 16-bit readable/writable registers whose values are transferred to TADCORA and TADCORB, respectively, when the crest or trough of the MTUn.TCNT count is reached.	R/W

Note: TADCOBRA and TADCOBRB should be accessed in 16-bit units.

17.2.40 TITMRx : Timer Interrupt Skipping Mode Register x (x = A, B)

Base address: MTU = 0x9000_1000

Offset address: 0x23A (TITMRA)
0xA3A (TITMRB)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	TITM
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TITM	Interrupt Skipping Function Select Selects one of the two types of interrupt skipping functions. 0: Selects interrupt skipping function 1 Setting the TITCR1A or TITCR1B register enables interrupt skipping function 1. 1: Selects interrupt skipping function 2 Setting the TITCR2A or TITCR2B register enables interrupt skipping function 2.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

TITMRA and TITMRB are used to select either of two skipping functions.

17.2.41 TITCR1A : Timer Interrupt Skipping Set Register 1A

Base address: MTU = 0x9000_1000

Offset address: 0x230

Bit position:	7	6	5	4	3	2	1	0
Bit field:	T3AEN	T3ACOR[2:0]			T4VEN	T4VCOR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	T4VCOR[2:0]	TCIV4 Interrupt Skipping Count Setting These bits specify the TCIV4 interrupt skipping count within the range from 0 to 7.*1 0 0 0: Does not skip TCIV4 interrupts. 0 0 1: Sets the TCIV4 interrupt skipping count to 1. 0 1 0: Sets the TCIV4 interrupt skipping count to 2. 0 1 1: Sets the TCIV4 interrupt skipping count to 3. 1 0 0: Sets the TCIV4 interrupt skipping count to 4. 1 0 1: Sets the TCIV4 interrupt skipping count to 5. 1 1 0: Sets the TCIV4 interrupt skipping count to 6. 1 1 1: Sets the TCIV4 interrupt skipping count to 7.	R/W
3	T4VEN	TCIV4 Interrupt Skipping Enable 0: Disabled 1: Enabled	R/W
6:4	T3ACOR[2:0]	TGIA3 Interrupt Skipping Count Setting These bits specify the TGIA3 interrupt skipping count within the range from 0 to 7.*1 0 0 0: Does not skip TGIA3 interrupts. 0 0 1: Sets the TGIA3 interrupt skipping count to 1. 0 1 0: Sets the TGIA3 interrupt skipping count to 2. 0 1 1: Sets the TGIA3 interrupt skipping count to 3. 1 0 0: Sets the TGIA3 interrupt skipping count to 4. 1 0 1: Sets the TGIA3 interrupt skipping count to 5. 1 1 0: Sets the TGIA3 interrupt skipping count to 6. 1 1 1: Sets the TGIA3 interrupt skipping count to 7.	R/W
7	T3AEN	TGIA3 Interrupt Skipping Enable 0: Disabled 1: Enabled	R/W

Note 1. When 0 is specified for the interrupt skipping count, no interrupt skipping will be performed. Before changing the interrupt skipping count, be sure to set the TITCR1A.T3AEN and TITCR1A.T4VEN bits to 0 to clear the skipping counter (TITCNT1A).

The TITCR1A register enables or disables interrupt skipping and specifies the interrupt skipping count. This setting is valid only while the TITMRA.TITM bit is set to 0; when the TITMRA.TITM bit is set to 1, the setting in the TITCR1A register is cleared.

17.2.42 TITCR1B : Timer Interrupt Skipping Set Register 1B

Base address: MTU = 0x9000_1000

Offset address: 0xA30

Bit position:	7	6	5	4	3	2	1	0
Bit field:	T6AEN	T6ACOR[2:0]			T7VEN	T7VCOR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	T7VCOR[2:0]	TCIV7 Interrupt Skipping Count Setting These bits specify the TCIV7 interrupt skipping count within the range from 0 to 7.*1 0 0 0: Does not skip TCIV7 interrupts. 0 0 1: Sets the TCIV7 interrupt skipping count to 1. 0 1 0: Sets the TCIV7 interrupt skipping count to 2. 0 1 1: Sets the TCIV7 interrupt skipping count to 3. 1 0 0: Sets the TCIV7 interrupt skipping count to 4. 1 0 1: Sets the TCIV7 interrupt skipping count to 5. 1 1 0: Sets the TCIV7 interrupt skipping count to 6. 1 1 1: Sets the TCIV7 interrupt skipping count to 7.	R/W
3	T7VEN	TCIV7 Interrupt Skipping Enable 0: Disabled 1: Enabled	R/W
6:4	T6ACOR[2:0]	TGIA6 Interrupt Skipping Count Setting These bits specify the TGIA6 interrupt skipping count within the range from 0 to 7.*1 0 0 0: Does not skip TGIA6 interrupts. 0 0 1: Sets the TGIA6 interrupt skipping count to 1. 0 1 0: Sets the TGIA6 interrupt skipping count to 2. 0 1 1: Sets the TGIA6 interrupt skipping count to 3. 1 0 0: Sets the TGIA6 interrupt skipping count to 4. 1 0 1: Sets the TGIA6 interrupt skipping count to 5. 1 1 0: Sets the TGIA6 interrupt skipping count to 6. 1 1 1: Sets the TGIA6 interrupt skipping count to 7.	R/W
7	T6AEN	TGIA6 Interrupt Skipping Enable 0: Disabled 1: Enabled	R/W

Note 1. When 0 is specified for the interrupt skipping count, no interrupt skipping will be performed.
Before changing the interrupt skipping count, be sure to set the TITCR1B.T6AEN and TITCR1B.T7VEN bits to 0 to clear the skipping counter (TITCNT1B).

The TITCR1B register enables or disables interrupt skipping and specifies the interrupt skipping count. This setting is valid only while the TITMRB.TITM bit is set to 0; when the TITMRB.TITM bit is set to 1, the setting in the TITCR1B register is cleared.

17.2.43 TITCNT1A : Timer Interrupt Skipping Counter 1A

Base address: MTU = 0x9000_1000

Offset address: 0x231

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	T3ACNT[2:0]			—	T4VCNT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	T4VCNT[2:0]	TCIV4 Interrupt Counter While the T4VEN bit in TITCR1A is set to 1, the count in these bits is incremented every time a TCIV4 interrupt occurs.	R
3	—	This bit is read as 0.	R
6:4	T3ACNT[2:0]	TGIA3 Interrupt Counter While the T3AEN bit in TITCR1A is set to 1, the count in these bits is incremented every time a TGIA3 interrupt occurs.	R
7	—	This bit is read as 0.	R

Note: To clear the TITCNT1A, set the TITCR1A.T3AEN and TITCR1A.T4VEN bits to 0.

TITCNT1A is 8-bit readable/writable counters. TITCNT1A retains their values even after stopping the count operation of MTU3.TCNT and MTU4.TCNT.

T4VCNT[2:0] bits (TCIV4 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRA is 1
- When the T4VEN bit in TITCR1A is set to 0
- When the T4VCOR[2:0] bits in TITCR1A are set to 000b
- When the T4VCNT[2:0] bits in TITCNT1A match the T4VCOR[2:0] bits in TITCR1A

T3ACNT[2:0] bits (TGIA3 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRA is 1
- When the T3AEN bit in TITCR1A is set to 0
- When the T3ACOR[2:0] bits in TITCR1A are set to 000b
- When the T3ACNT[2:0] bits in TITCNT1A match the T3ACOR[2:0] bits in TITCR1A

17.2.44 TITCNT1B : Timer Interrupt Skipping Counter 1B

Base address: MTU = 0x9000_1000

Offset address: 0xA31

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	T6ACNT[2:0]			—	T7VCNT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	T7VCNT[2:0]	TCIV7 Interrupt Counter While the T7VEN bit in TITCR1B is set to 1, the count in these bits is incremented every time a TCIV7 interrupt occurs.	R
3	—	This bit is read as 0.	R
6:4	T6ACNT[2:0]	TGIA6 Interrupt Counter While the T6AEN bit in TITCR1B is set to 1, the count in these bits is incremented every time a TGIA6 interrupt occurs.	R
7	—	This bit is read as 0.	R

Note: To clear the TITCNT1B, set the TITCR1B.T6AEN and TITCR1B.T7VEN bits to 0.

TITCNT1B is 8-bit readable/writable counters. TITCNT1B retains their values even after stopping the count operation of MTU6.TCNT and MTU7.TCNT.

T7VCNT[2:0] bits (TCIV7 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRB is 1
- When the T7VEN bit in TITCR1B is set to 0
- When the T7VCOR[2:0] bits in TITCR1B are set to 000b
- When the T7VCNT[2:0] bits in TITCNT1B match the T7VCOR[2:0] bits in TITCR1B

T6ACNT[2:0] bits (TGIA6 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRB is 1
- When the T6AEN bit in TITCR1B is set to 0
- When the T6ACOR[2:0] bits in TITCR1B are set to 000b

- When the T6ACNT[2:0] bits in TITCNT1B match the T6ACOR[2:0] bits in TITCR1B

17.2.45 TITCR2A : Timer Interrupt Skipping Set Register 2A

Base address: MTU = 0x9000_1000

Offset address: 0x23B

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TRG4COR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TRG4COR[2:0]	TRG4AN/TRG4BN Interrupt Skipping Count Setting These bits specify the TRG4AN/TRG4BN interrupt skipping count within the range from 0 to 7. 0 0 0: Does not skip TRG4AN and TRG4BN interrupts. 0 0 1: Sets the TRG4AN and TRG4BN interrupt skipping count to 1. 0 1 0: Sets the TRG4AN and TRG4BN interrupt skipping count to 2. 0 1 1: Sets the TRG4AN and TRG4BN interrupt skipping count to 3. 1 0 0: Sets the TRG4AN and TRG4BN interrupt skipping count to 4. 1 0 1: Sets the TRG4AN and TRG4BN interrupt skipping count to 5. 1 1 0: Sets the TRG4AN and TRG4BN interrupt skipping count to 6. 1 1 1: Sets the TRG4AN and TRG4BN interrupt skipping count to 7.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

TITCR2A specifies the interrupt skipping count for TRG4AN and TRG4BN.

This setting is valid only while TITMRA is set to 1.

17.2.46 TITCR2B : Timer Interrupt Skipping Set Register 2B

Base address: MTU = 0x9000_1000

Offset address: 0xA3B

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TRG7COR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TRG7COR[2:0]	TRG7AN/TRG7BN Interrupt Skipping Count Setting These bits specify the TRG7AN/TRG7BN interrupt skipping count within the range from 0 to 7. 0 0 0: Does not skip TRG7AN and TRG7BN interrupts. 0 0 1: Sets the TRG7AN and TRG7BN interrupt skipping count to 1. 0 1 0: Sets the TRG7AN and TRG7BN interrupt skipping count to 2. 0 1 1: Sets the TRG7AN and TRG7BN interrupt skipping count to 3. 1 0 0: Sets the TRG7AN and TRG7BN interrupt skipping count to 4. 1 0 1: Sets the TRG7AN and TRG7BN interrupt skipping count to 5. 1 1 0: Sets the TRG7AN and TRG7BN interrupt skipping count to 6. 1 1 1: Sets the TRG7AN and TRG7BN interrupt skipping count to 7.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

TITCR2B specifies the interrupt skipping count for TRG7AN and TRG7BN.

This setting is valid only while TITMRB is set to 1.

17.2.47 TITCNT2A : Timer Interrupt Skipping Counter 2A

Base address: MTU = 0x9000_1000

Offset address: 0x23C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TRG4CNT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TRG4CNT[2:0]	TRG4AN/TRG4BN Interrupt Counter These bits start counting from the value set in TRG4COR[2:0] and the count decrements every time TRG4AN or TRG4BN is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts become valid.	R
7:3	—	These bits are read as 0.	R

TITCNT2A starts counting from the values set in the TRG4COR[2:0] bits and the count decrements every time TRG4AN or TRG4BN is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts become valid.

TRG4CNT[2:0] bits (TRG4AN/TRG4BN Interrupt Counter)

These bits start counting from the value set in the TRG4COR[2:0] bits and the count decrements every time a TRG4AN or TRG4BN interrupt is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts become valid.

[Clearing conditions]

- When the TITM bit in TITMRA is 0
- When the TRG4COR[2:0] bits in TITCR2A are set to 000b
- When the count of TRG4AN and TRG4BN occurrence matches the TRG4COR[2:0] value in TITCR2A

17.2.48 TITCNT2B : Timer Interrupt Skipping Counter 2B

Base address: MTU = 0x9000_1000

Offset address: 0xA3C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TRG7CNT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TRG7CNT[2:0]	TRG7AN/TRG7BN Interrupt Counter These bits start counting from the value set in TRG7COR[2:0] and the count decrements every time TRG7AN or TRG7BN is generated. When the count reaches 0 and is reloaded, the TRG7AN and TRG7BN interrupts become valid.	R
7:3	—	These bits are read as 0.	R

TITCNT2B starts counting from the values set in the TRG7COR[2:0] bits and the count decrements every time TRG7AN or TRG7BN is generated. When the count reaches 0 and is reloaded, the TRG7AN and TRG7BN interrupts become valid.

TRG7CNT[2:0] bits (TRG7AN/TRG7BN Interrupt Counter)

These bits start counting from the value set in the TRG7COR[2:0] bits and the count decrements every time a TRG7AN or TRG7BN interrupt is generated. When the count reaches 0 and is reloaded, the TRG7AN and TRG7BN interrupts become valid.

[Clearing conditions]

- When the TITM bit in TITMRB is 0

- When the TRG7COR[2:0] bits in TITCR2B are set to 000b
- When the count of TRG7AN and TRG7BN occurrence matches the TRG7COR[2:0] value in TITCR2B

17.2.49 Bus Master Interface

The timer counter (MTU8.TCNT), general registers (MTU8.TGRn) for MTU8, and MTU1.TCNTLW, MTU1.TGRALW, and MTU1.TGRBLW registers when TMDR3.LWA = 1 are 32-bit registers. A 32-bit data bus to the bus master enables 32-bit read/write access. 8- and 16-bit read/write are not allowed. Always access these registers in 32-bit units.

The timer counters (MTU0.TCNT to MTU7.TCNT) excluding MTU8, general registers (MTU0.TGRn to MTU7.TGRn), timer subcounters (TCNTSA and TCNTSB), timer cycle buffer registers (TCBRA and TCBRB), timer dead time data registers (TDDRA and TDDRB), timer cycle data registers (TCDRA and TCDRB), timer A/D converter start request control registers (MTU4.TADCR and MTU7.TADCR), timer A/D converter start request cycle set registers (MTU4.TADCORA, MTU4.TADCORB, MTU7.TADCORA, and MTU7.TADCORB), and timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA, MTU4.TADCOBRB, MTU7.TADCOBRA, and MTU7.TADCOBRB) are 16-bit registers. A 16-bit data bus to the bus master enables 16-bit read/write access. 8-bit read/write is not allowed. Always access the registers in 16-bit units.

All registers other than the above registers are 8-bit registers. A 16-bit data bus to the CPU enables 16-bit read/write access. These registers can also be accessed in 8-bit units.

17.3 Operations

17.3.1 Basic Functions

Each channel has TCNT and TGR. TCNT performs up-counting, and is also capable of free-running operation, periodic counting, and external event counting.

Each TGR can be used as an input capture register or an output compare register.

17.3.1.1 Counter Operation

When one of bits CST0 to CST4 and CST8 in the TSTRA register, bits CST6 and CST7 in the TSTRB register, and bits CSTU5, CSTV5, and CSTW5 in the MTU5.TSTR register is set to 1, TCNT for the corresponding channel begins counting. TCNT can operate as a free-running counter, periodic counter, for example.

(1) Example of Count Operation Setting Procedure

Figure 17.5 shows an example of the count operation setting procedure.

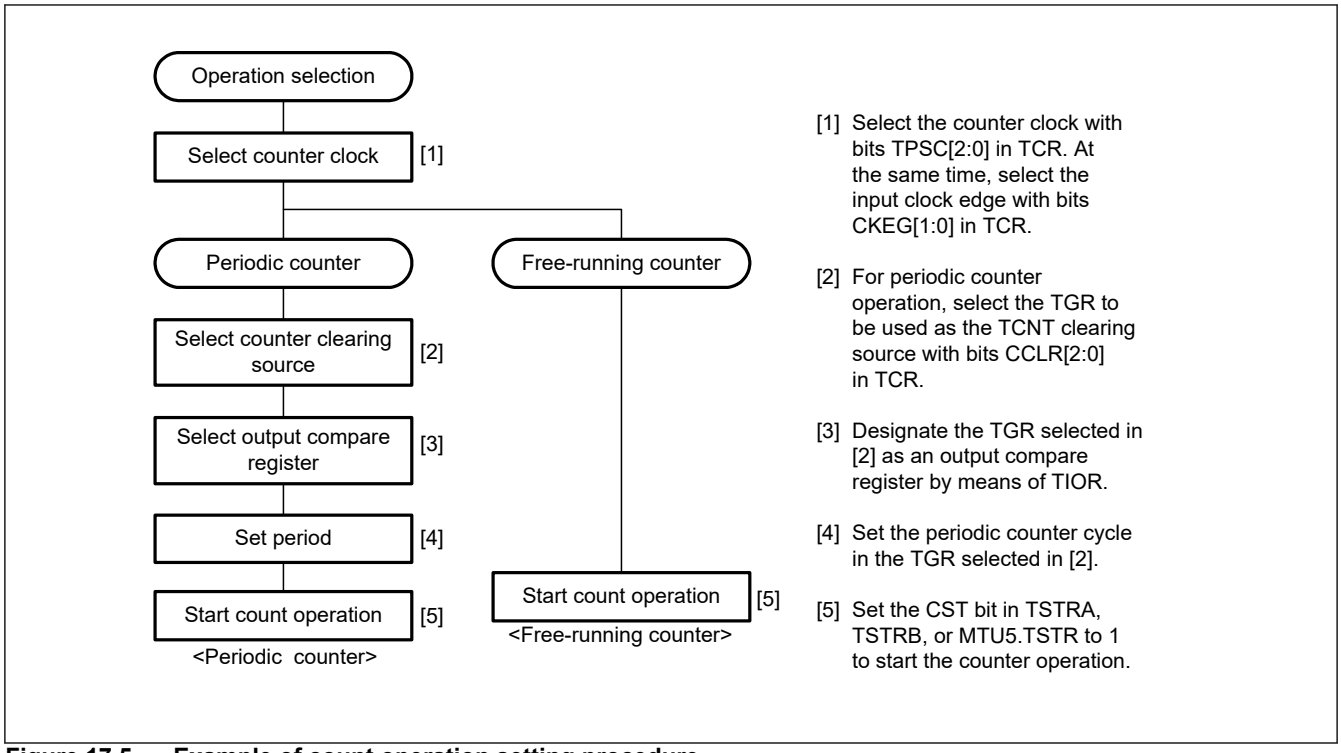

Figure 17.5 Example of count operation setting procedure

(2) Free-Running Count Operation and Periodic Count Operation

Immediately after a reset, the MTU's TCNT counters are all designated as free-running counters. When the relevant bit in TSTRA, TSTRB, or MTU5.TSTR is set to 1, the corresponding TCNT counter starts up-count operation as a free-running counter. When TCNT overflows (from 0xFFFF to 0x0000), if the corresponding TIER.TCIEV bit is 1, the MTU requests an interrupt. After an overflow, TCNT starts counting up again from 0x0000.

Figure 17.6 shows free-running counter operation.

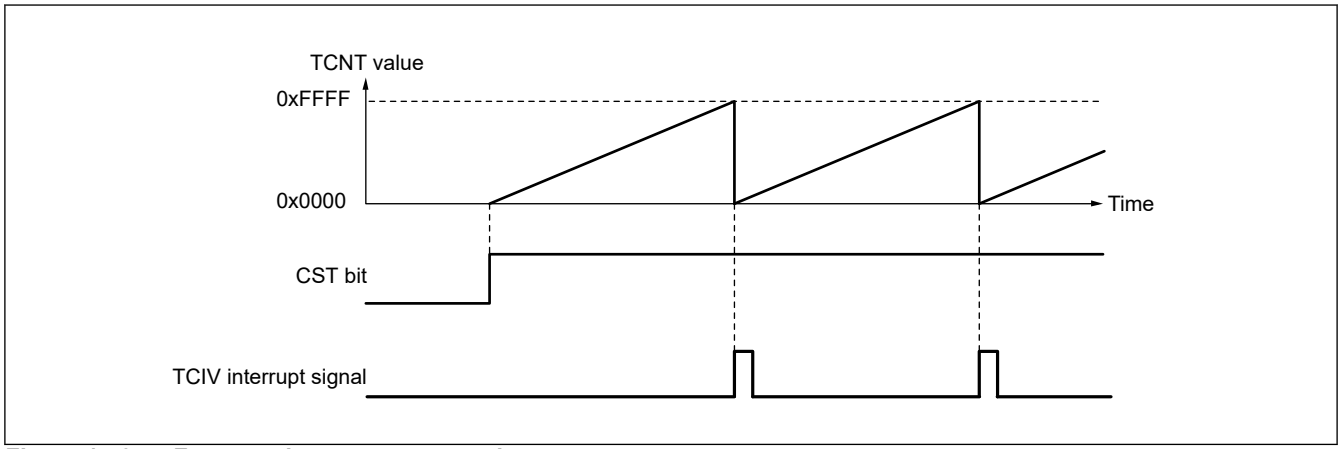

Figure 17.6 Free-running counter operation

When compare match is selected as the TCNT clearing source, TCNT for the relevant channel performs periodic count operation. TGR for setting the cycle is designated as an output compare register, and counter clearing by compare match is selected by means of bits CCLR[2:0] in TCR. After the settings have been made, TCNT starts up-count operation as a periodic counter when the corresponding bit in TSTRA, TSTRB or MTU5.TSTR is set to 1. When the count matches the value in TGR, TCNT is cleared to 0x0000.

If the value of the corresponding TIER.TGIE bit is 1 at this point, the MTU requests an interrupt. After a compare match, TCNT starts counting up again from 0x0000.

Figure 17.7 shows periodic counter operation.

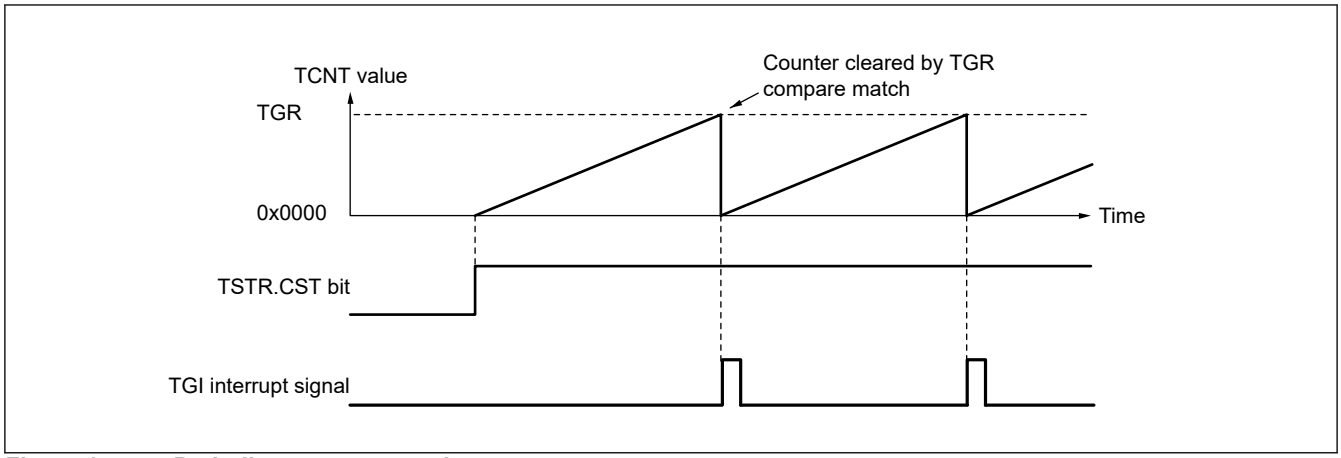

Figure 17.7 Periodic counter operation

17.3.1.2 Waveform Output by Compare Match

The MTU can output low or high or toggles output from the corresponding output pin using compare match. Note that MTU5 cannot output compare-match signals.

(1) Example of Procedure for Setting Waveform Output by Compare Match

Figure 17.8 shows an example of the procedure for setting waveform output by compare match.

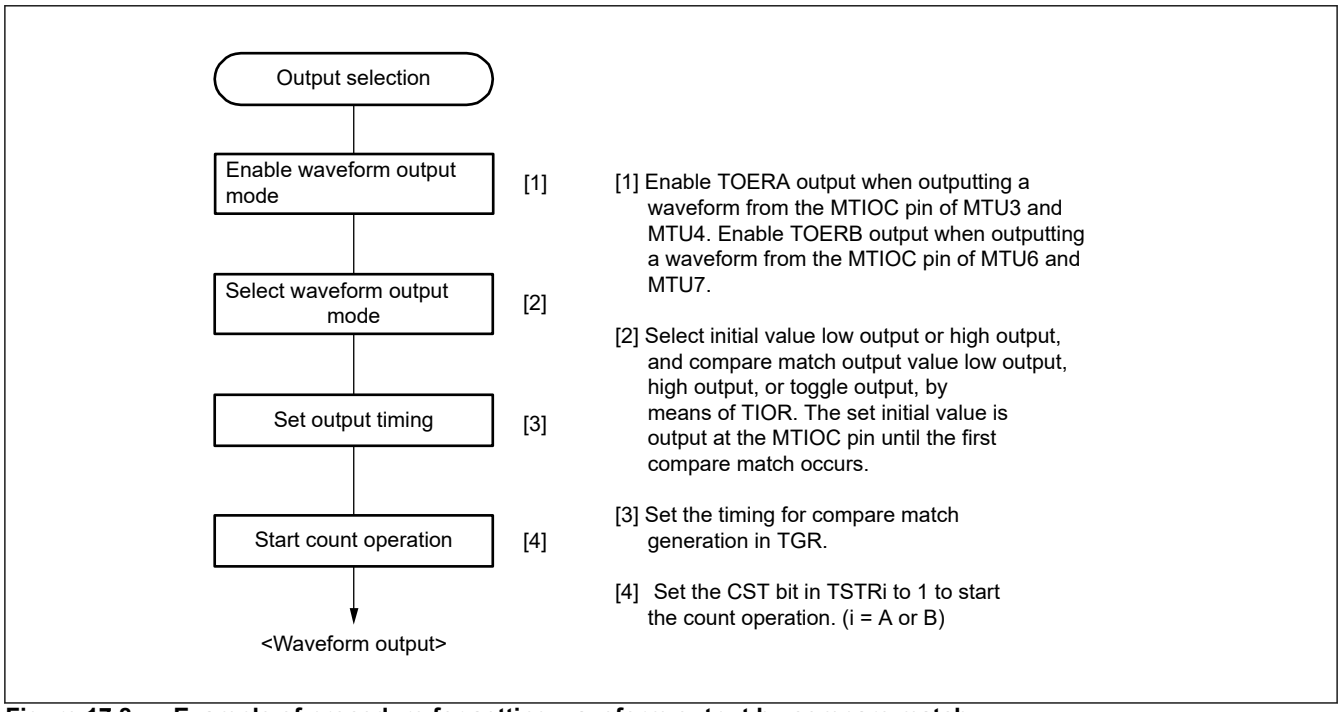

Figure 17.8 Example of procedure for setting waveform output by compare match

(2) Examples of Waveform Output Operation

Figure 17.9 shows an example of low output and high output.

In this example, TCNT has been designated as a free-running counter, and settings have been made so that high is output by compare match A and low is output by compare match B. When the pin level is the same as the specified level, the pin level does not change.

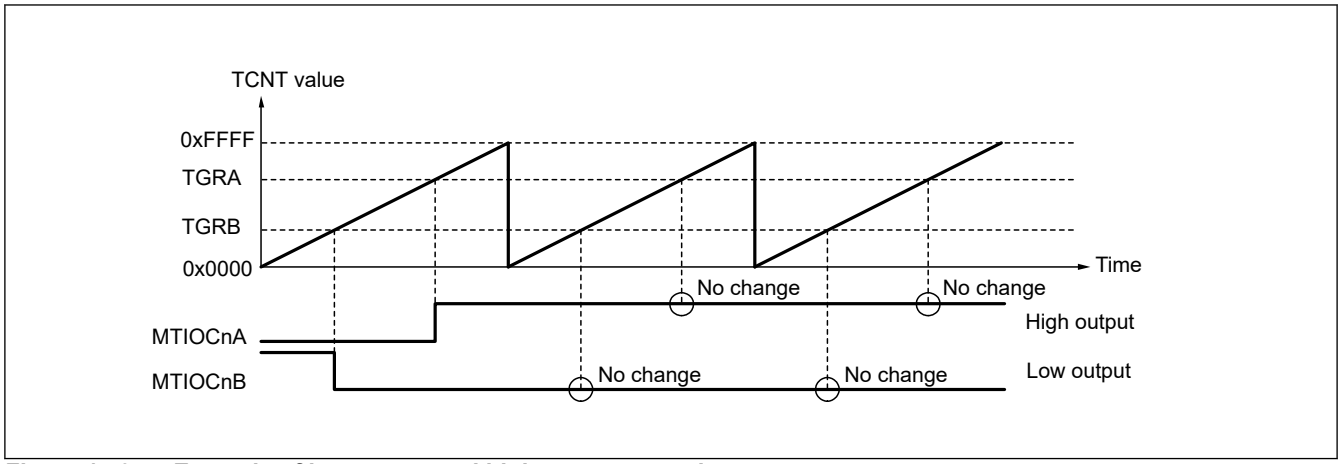

Figure 17.9 Example of low output and high output operation

Figure 17.10 shows an example of toggle output.

In this example, TCNT has been designated as a periodic counter (with counter clearing on compare match B), and settings have been made so that the output is toggled by both compare match A and compare match B.

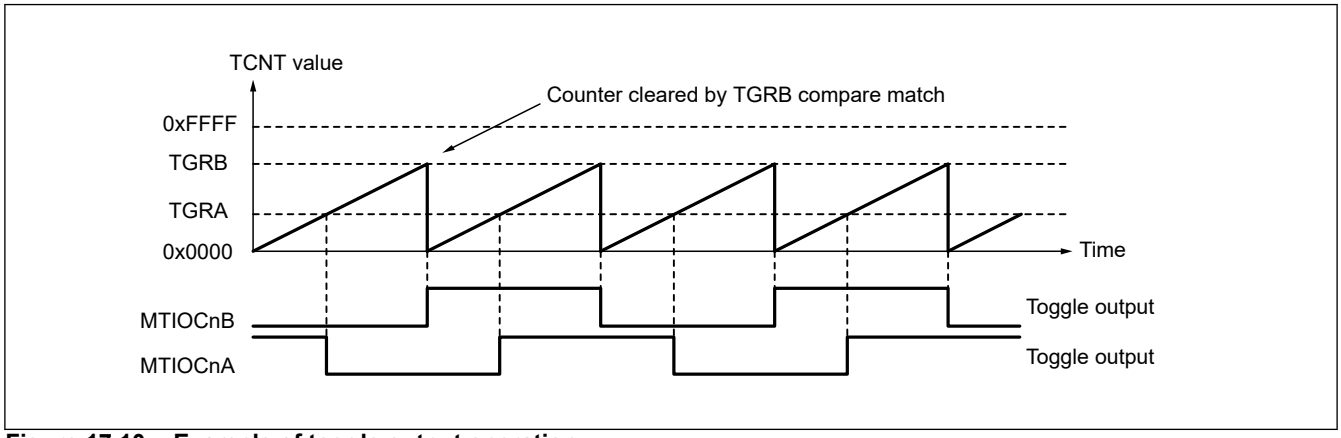

Figure 17.10 Example of toggle output operation

17.3.1.3 Input Capture Function

The TCNT value can be transferred to TGR on detection of an edge input on the MTIOCnm (n = 0 to 4, 6, 7, or 8, m = A to D), MTIC5U, MTIC5V, or MTIC5W pin.

The rising edge, falling edge, or both edges can be selected as the detection edge. For MTU0 and MTU1, a count clock of another channel or compare match signal can also be specified as the input capture source.

Note: When a count input clock of another channel is used as the input capture input for MTU0 and MTU1, PCLKH/1 should not be selected as the count input clock used for input capture input. Input capture is not generated if PCLKH/1 is selected.

(1) Example of Input Capture Operation Setting Procedure

Figure 17.11 shows an example of the input capture operation setting procedure.

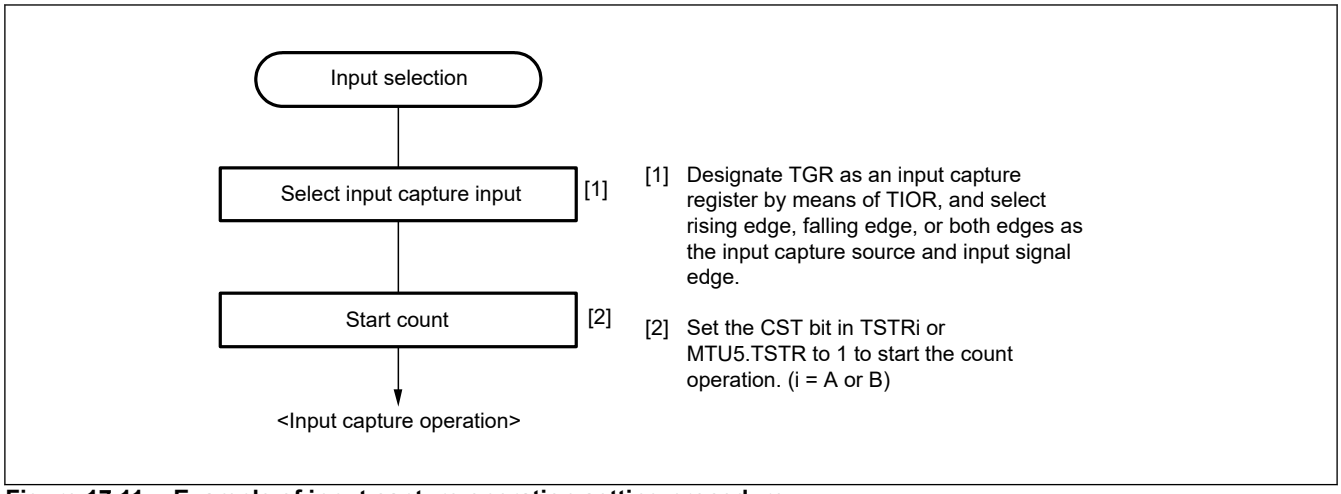

Figure 17.11 Example of input capture operation setting procedure

(2) Example of Input Capture Operation

Figure 17.12 shows an example of input capture operation.

In this example, both rising and falling edges have been selected as the MTIOCnA pin input capture input edge, the falling edge has been selected as the MTIOCnB pin input capture input edge, and counter clearing by TGRB input capture has been designated for TCNT. (n = 0 to 4, 6, 7, 8)

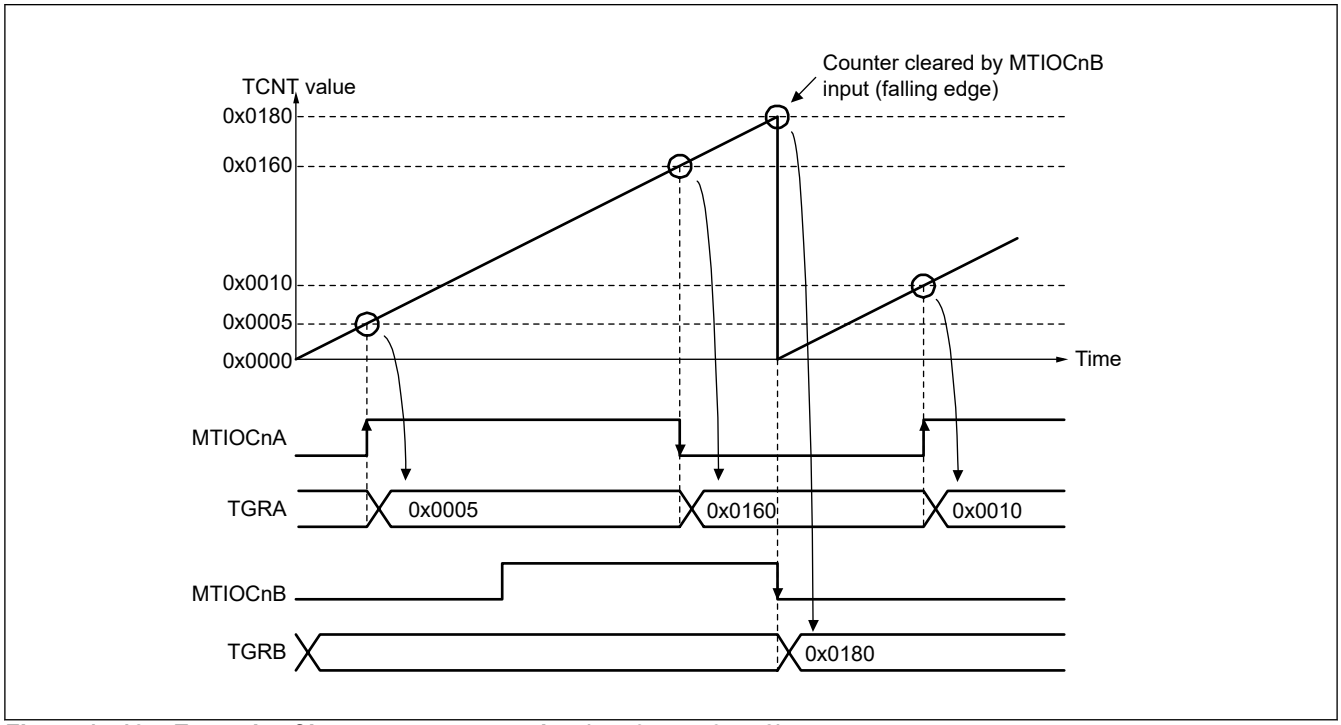

Figure 17.12 Example of input capture operation (n = 0 to 4, 6, 7, 8)

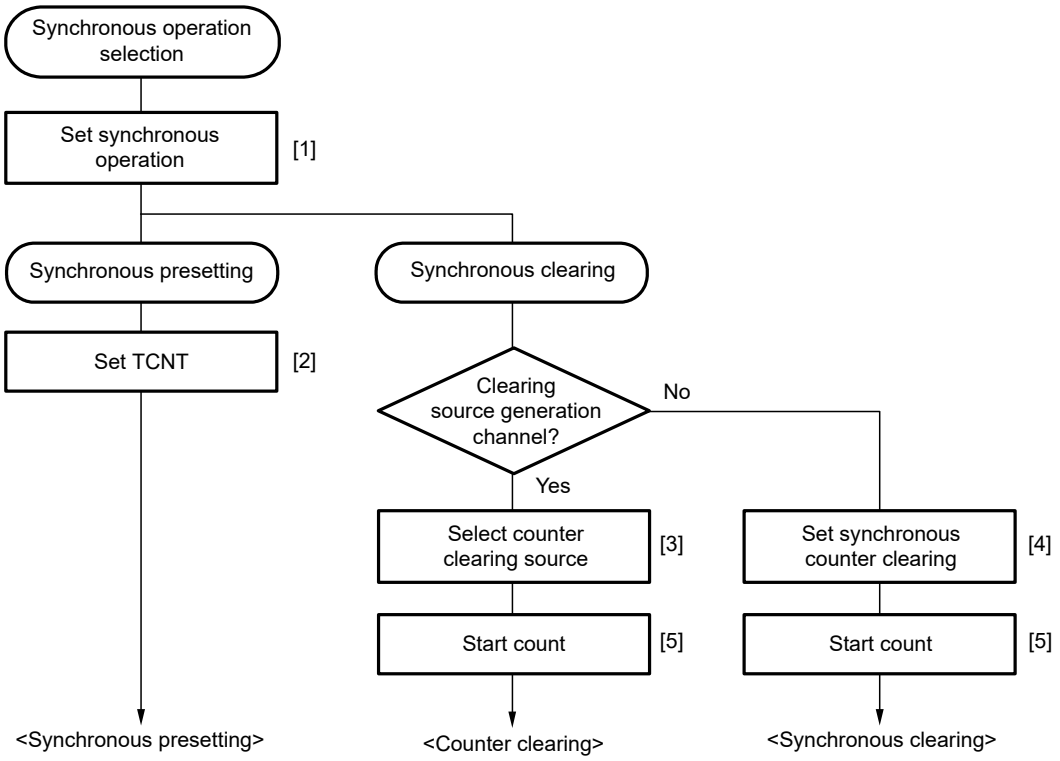
17.3.2 Synchronous Operation



In synchronous operation, the values in multiple TCNT counters can be modified simultaneously (synchronous presetting). In addition, multiple TCNT counters can be cleared simultaneously (synchronous clearing) by making the appropriate setting in TCR.

Synchronous operation increases the number of TGR registers assigned to a single time base.

MTU0 to MTU4, MTU6, and MTU7 can all be designated for synchronous operation. MTU5 and MTU8 cannot be used for synchronous operation.

17.3.2.1 Example of Synchronous Operation Setting Procedure

Figure 17.13 shows an example of the synchronous operation setting procedure.

[1] Set to 1 the SYNC bits in TSYRj corresponding to the channels to be designated for synchronous operation. (j = A or B)
[2] When the TCNT counter of any of the channels designated for synchronous operation is written to, the same value is simultaneously written to the other TCNT counters.
[3] Use bits CCLR[2:0] in TCR to specify TCNT clearing by input capture/output compare, etc.
[4] Use bits CCLR[2:0] in TCR to designate synchronous clearing for the counter clearing source.
[5] Set to 1 the CST bits in TSTRj for the relevant channels, to start the count operation. (j = A or B)

Figure 17.13 Example of synchronous operation setting procedure

17.3.2.2 Example of Synchronous Operation

Figure 17.14 shows an example of synchronous operation.

In this example, synchronous operation and PWM mode 1 have been designated for MTU0 to MTU2, MTU0.TGRB compare match has been set as the counter clearing source in MTU0, and synchronous clearing has been set for the counter clearing source in MTU1 and MTU2.

Three-phase PWM waveforms are output from pins MTIOC0A, MTIOC1A, and MTIOC2A. At this time, synchronous presetting and synchronous clearing by MTU0.TGRB compare match are performed for the TCNT counters in MTU0 to MTU2, and the data set in MTU0.TGRB is used as the PWM cycle.

For details of PWM modes, see section 17.3.5. PWM Modes.

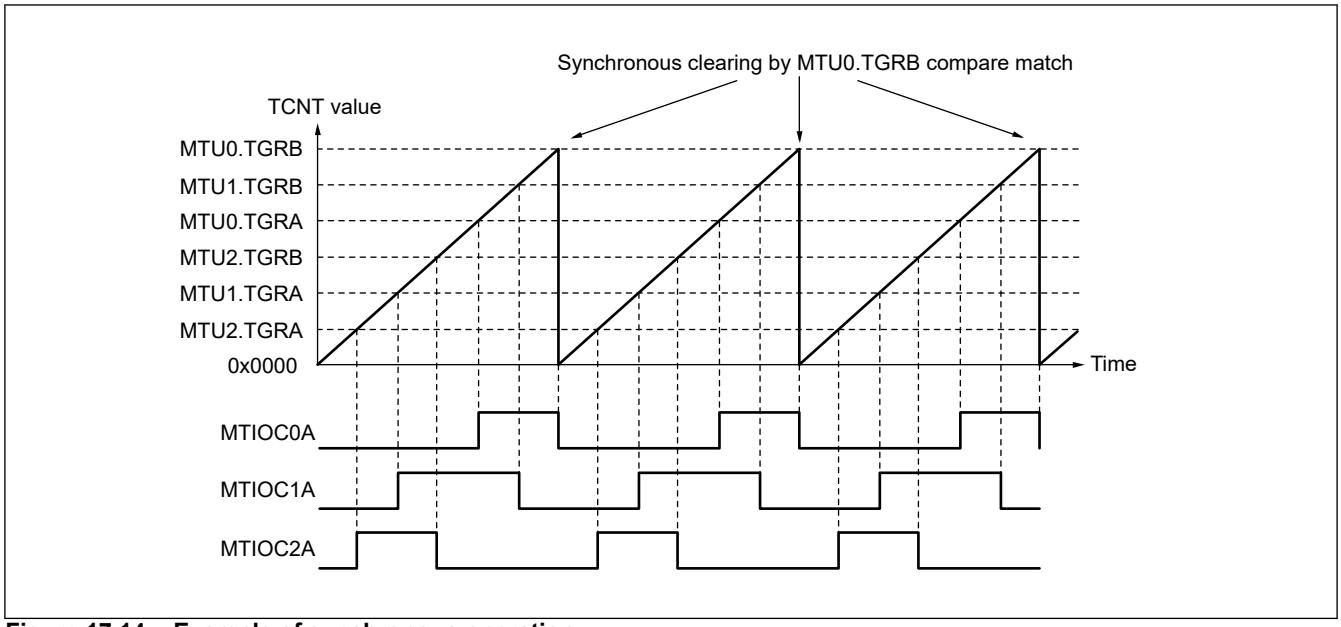


Figure 17.14 Example of synchronous operation

17.3.3 Buffer Operation

Buffer operation, provided for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8, enables TGRC and TGRD to be used as buffer registers. In MTU0, TGRF can also be used as a buffer register.

Buffer operation differs depending on whether TGR has been designated as an input capture register or as a compare match register.

Note: MTU0.TGRE cannot be designated as an input capture register and can only operate as a compare match register.

Table 17.57 shows the register combinations used in buffer operation.

Table 17.57 Register combinations in buffer operation

Channel	Timer general register	Buffer register
MTU0	TGRA	TGRC
	TGRB	TGRD
	TGRE	TGRF
MTU3	TGRA	TGRC
	TGRB	TGRD
MTU4	TGRA	TGRC
	TGRB	TGRD
MTU6	TGRA	TGRC
	TGRB	TGRD
MTU7	TGRA	TGRC
	TGRB	TGRD
MTU8	TGRA	TGRC
	TGRB	TGRD

(1) When TGR is an output compare register

When a compare match occurs, the value in the buffer register for the corresponding channel is transferred to the timer general register.

This operation is illustrated in Figure 17.15.

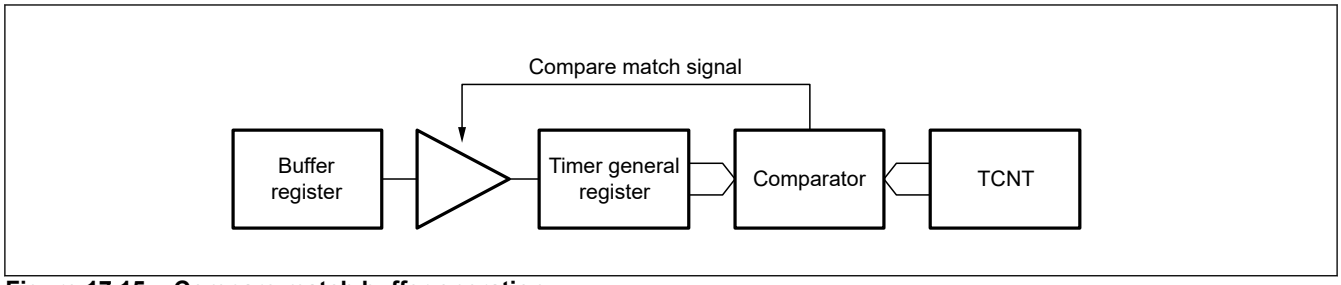

Figure 17.15 Compare match buffer operation

(2) When TGR is an input capture register

When an input capture occurs, the value in TCNT is transferred to TGR and the value previously held in TGR is transferred to the buffer register.

This operation is illustrated in Figure 17.16.

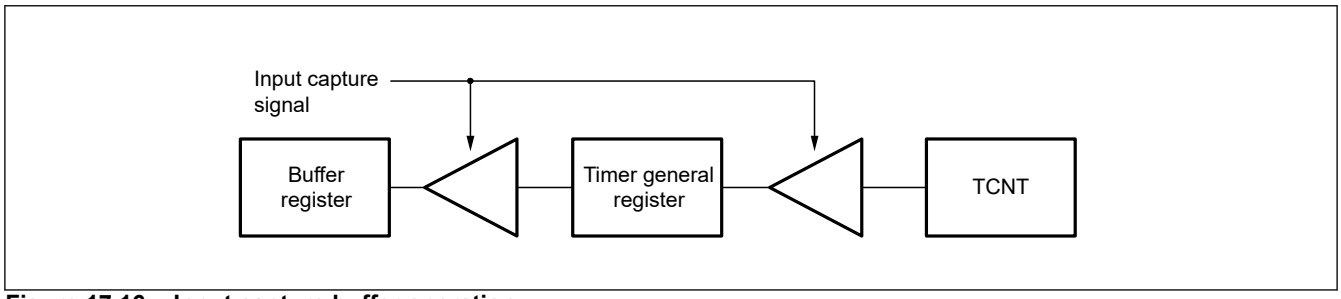

Figure 17.16 Input capture buffer operation

17.3.3.1 Example of Buffer Operation Setting Procedure

Figure 17.17 shows an example of the buffer operation setting procedure.

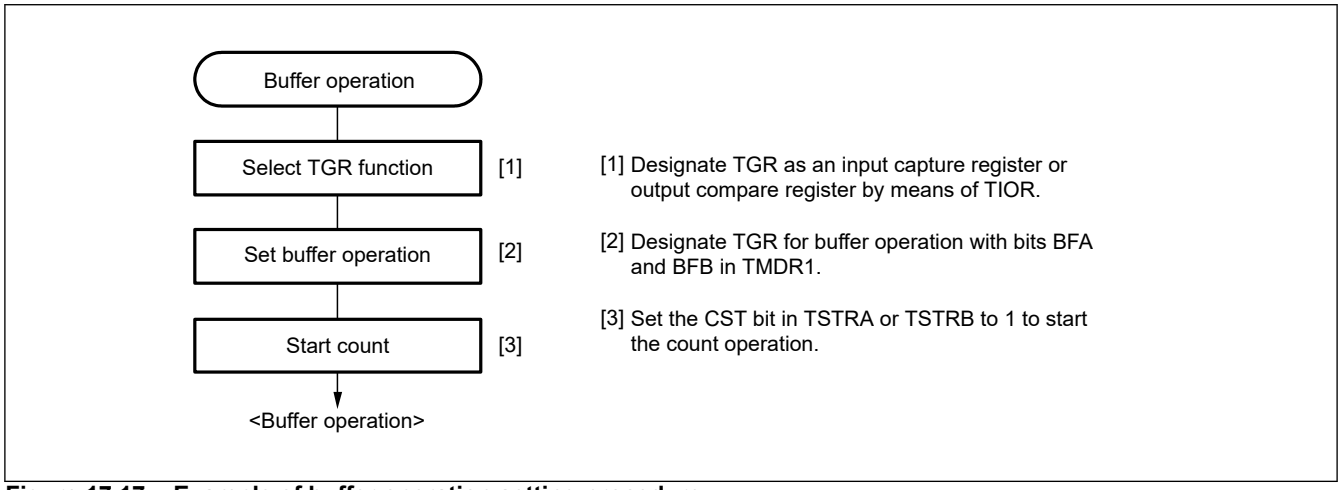

Figure 17.17 Example of buffer operation setting procedure

17.3.3.2 Examples of Buffer Operation

(1) When TGR is an Output Compare Register

Figure 17.18 shows an operation example in which PWM mode 1 has been designated for MTU0, and TGRC has been designated as a buffer register for TGRA. The settings used in this example are TCNT clearing by compare match B, high output at compare match A, and low output at compare match B. In this example, the TTSA bit in TBTM is set to 0.

As buffer operation has been set, when compare match A occurs, the output changes and the value in buffer register TGRC is simultaneously transferred to timer general register TGRA. This operation is repeated each time compare match A occurs.

For details of PWM modes, see section 17.3.5. PWM Modes.

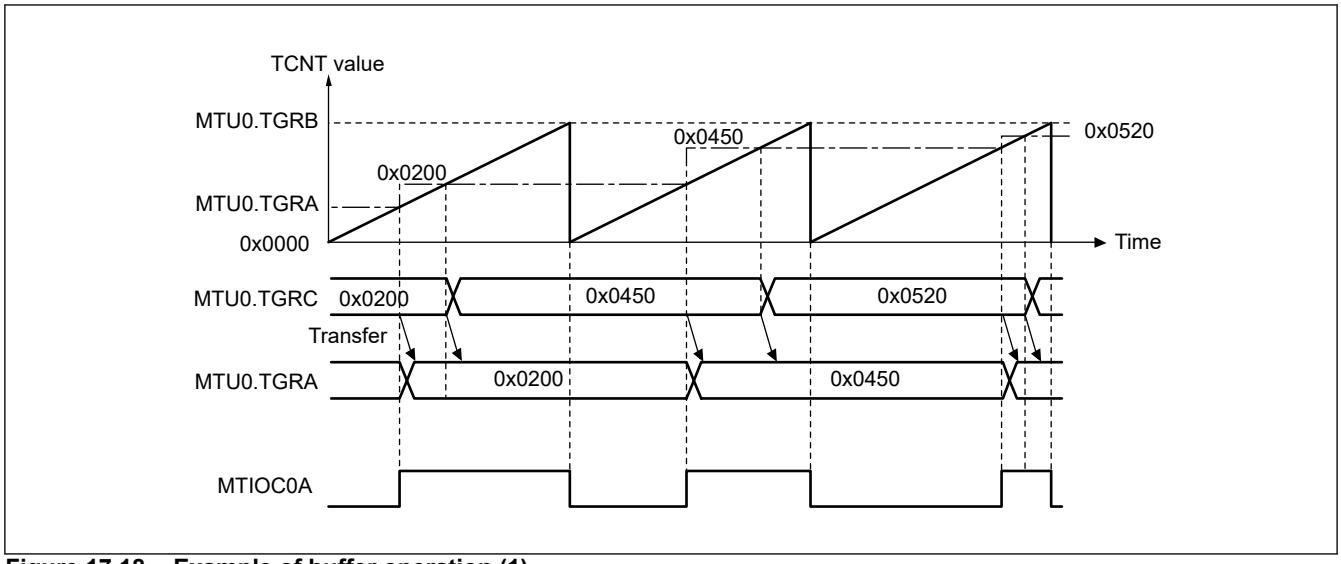

Figure 17.18 Example of buffer operation (1)

(2) When TGR is an Input Capture Register

Figure 17.19 shows an operation example in which TGRA has been designated as an input capture register, and TGRC has been designated as a buffer register for TGRA.

Counter clearing by TGRA input capture has been set for TCNT, and both rising and falling edges have been selected as the MTIOCnA pin input capture input edge. (n = 0 to 4, 6, 7, 8)

As buffer operation has been set, when the TCNT value is stored in TGRA upon occurrence of input capture A, the value previously stored in TGRA is simultaneously transferred to TGRC.

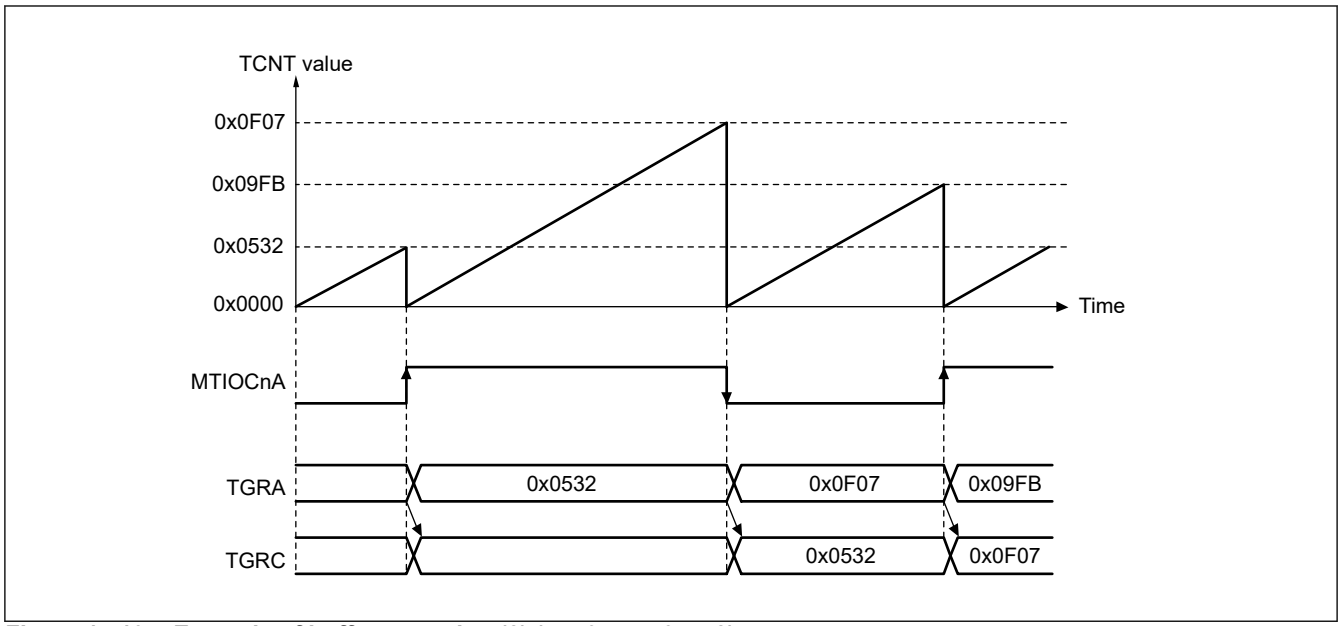

Figure 17.19 Example of buffer operation (2) (n = 0 to 4, 6, 7, 8)

17.3.3.3 Selecting Timing for Transfer from Buffer Registers to Timer General Registers in PWM Mode

The timing for transfer from buffer registers to timer general registers can be selected in PWM mode 1 or 2 for MTU0 or in PWM mode 1 for MTU3, MTU4, MTU6, and MTU7 by setting the buffer operation transfer mode registers (MTUn.TBTM (n = 0, 3, 4, 6, 7)). Either compare match (value after reset) or TCNT clearing can be selected for the transfer timing. TCNT clearing as transfer timing is one of the following cases.

- When TCNT overflows (0xFFFF to 0x0000)

- When 0x0000 is written to TCNT during counting
- When TCNT is set to 0x0000 under the condition specified in the CCLR[2:0] bits in TCR

Note: TBTM must be modified only while TCNT stops.

Figure 17.20 shows an operation example in which PWM mode 1 is designated for MTU0 and buffer operation is designated for MTU0.TGRA and MTU0.TGRC. The settings used in this example are MTU0.TCNT clearing by compare match B, high output at compare match A, and low output at compare match B. The TTSA bit in MTU0.TBTM is set to 1.

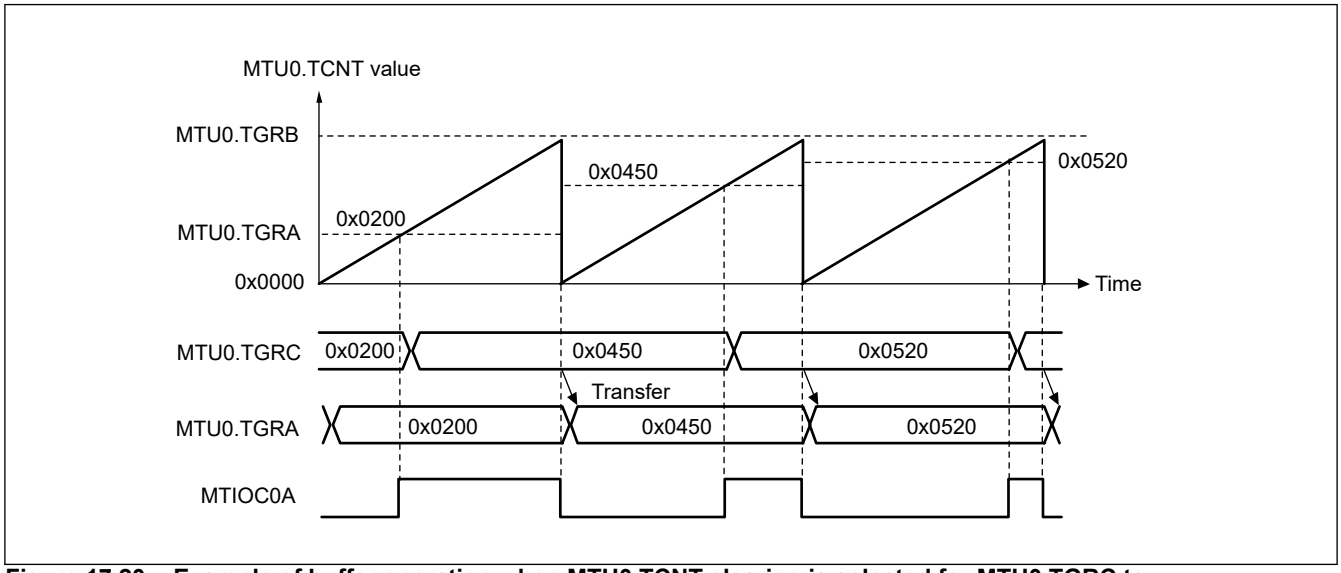

Figure 17.20 Example of buffer operation when MTU0.TCNT clearing is selected for MTU0.TGRC to MTU0.TGRA transfer timing

17.3.4 Cascaded Operation

In cascaded operation, two 16-bit counters in different channels are used together as a 32-bit counter.

There are two functions for connecting MTU1 and MTU2 to use as a 32-bit counter: cascade connection to be set when the MTU1.TMDR3.LWA bit is 0, and cascade connection 32-bit phase counting mode to be set when the MTU1.TMDR3.LWA bit is 1. For details on cascade connection 32-bit phase counting mode, see section 17.3.6.2. Cascade Connection 32-Bit Phase Counting Mode. This section describes the cascade connection function to be set when the MTU1.TMDR3.LWA bit is 0.

This function operates when the MTU1.TMDR3.LWA bit is set to 0 and the MTU1.TCR.TPSC[2:0] bits are set so that MTU1.TCNT counts at an overflow/underflow of MTU2.TCNT. Underflow occurs only when the MTU2 to which the lower 16 bits allocated is in phase counting mode.

Table 17.58 shows the register combinations used in cascaded operation.

When phase counting mode is set for MTU1, the count clock setting is invalid and the counters operate independently in phase counting mode.

Table 17.58 Cascaded combinations

Combination	Upper 16 bits	Lower 16 bits
MTU1 and MTU2	MTU1.TCNT	MTU2.TCNT

For simultaneous input capture of MTU1.TCNT and MTU2.TCNT during cascaded operation, additional input capture input pins can be specified by the input capture control register (TICCR). The input-capture condition is of edges in the signal produced by taking the logical OR of the input level on the main input pin and the input level on the added input pin. Accordingly, if either is at the high level, a change in the level of the other will not produce an edge for detection.

For details, see section 17.3.4.4. Cascaded Operation Example (c). For input capture in cascade connection, see section 17.6.21. Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection.

Table 17.59 shows the TICCR setting and input capture input pins.

Table 17.59 TICCR setting and input capture input pins

Target input capture	TICCR setting	Input capture input pin
Input capture from MTU1.TCNT to MTU1.TGRA	I2AE bit = 0 (Initial value)	MTIOC1A
	I2AE bit = 1	MTIOC1A, MTIOC2A
Input capture from MTU1.TCNT to MTU1.TGRB	I2BE bit = 0 (Initial value)	MTIOC1B
	I2BE bit = 1	MTIOC1B, MTIOC2B
Input capture from MTU2.TCNT to MTU2.TGRA	I1AE bit = 0 (Initial value)	MTIOC2A
	I1AE bit = 1	MTIOC2A, MTIOC1A
Input capture from MTU2.TCNT to MTU2.TGRB	I1BE bit = 0 (Initial value)	MTIOC2B
	I1BE bit = 1	MTIOC2B, MTIOC1B

17.3.4.1 Example of Cascaded Operation Setting Procedure

Figure 17.21 shows an example of the cascaded operation setting procedure.

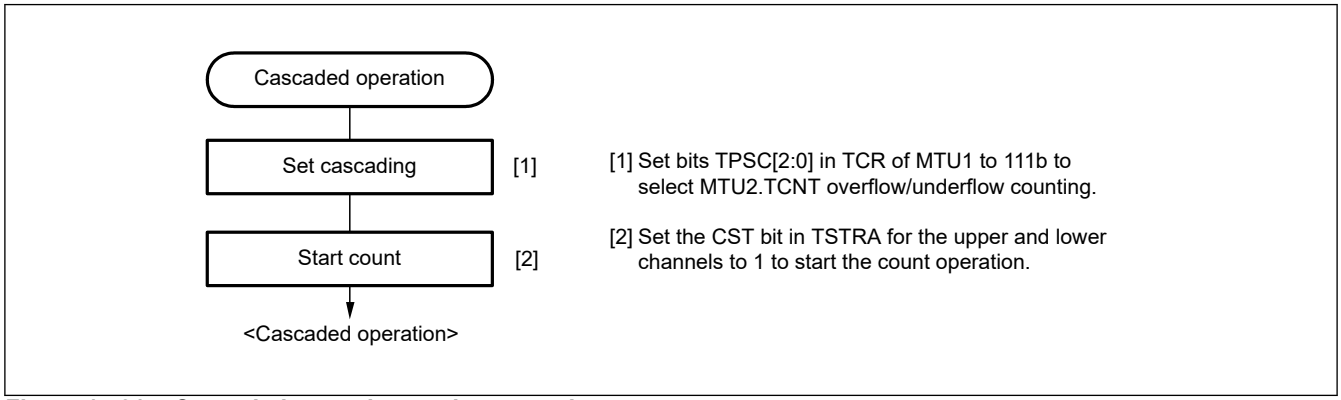

Figure 17.21 Cascaded operation setting procedure

17.3.4.2 Cascaded Operation Example (a)

Figure 17.22 shows the operation when MTU1.TCNT is set for counting at MTU2.TCNT overflow/underflow and MTU2 is set for phase counting mode while MTU1.TCNT and MTU2.TCNT are cascaded.

MTU1.TCNT is incremented by MTU2.TCNT overflow and decremented by MTU2.TCNT underflow.

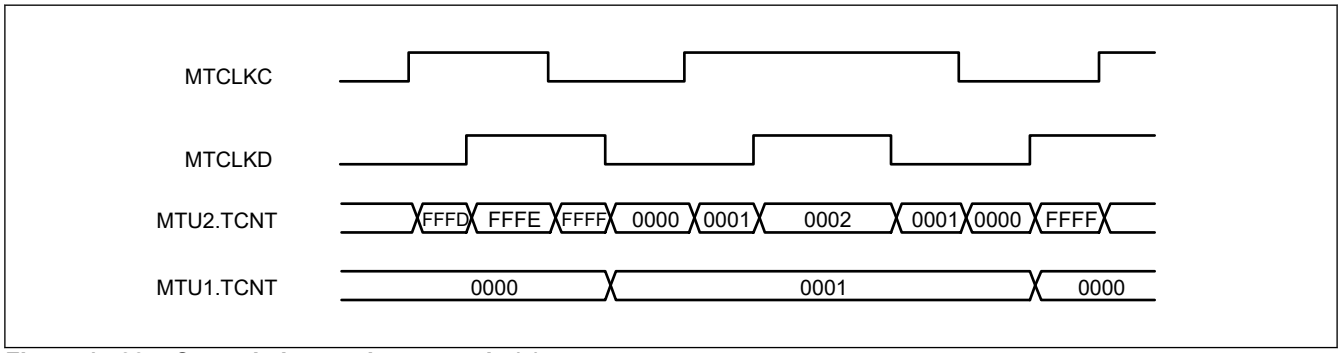

Figure 17.22 Cascaded operation example (a)

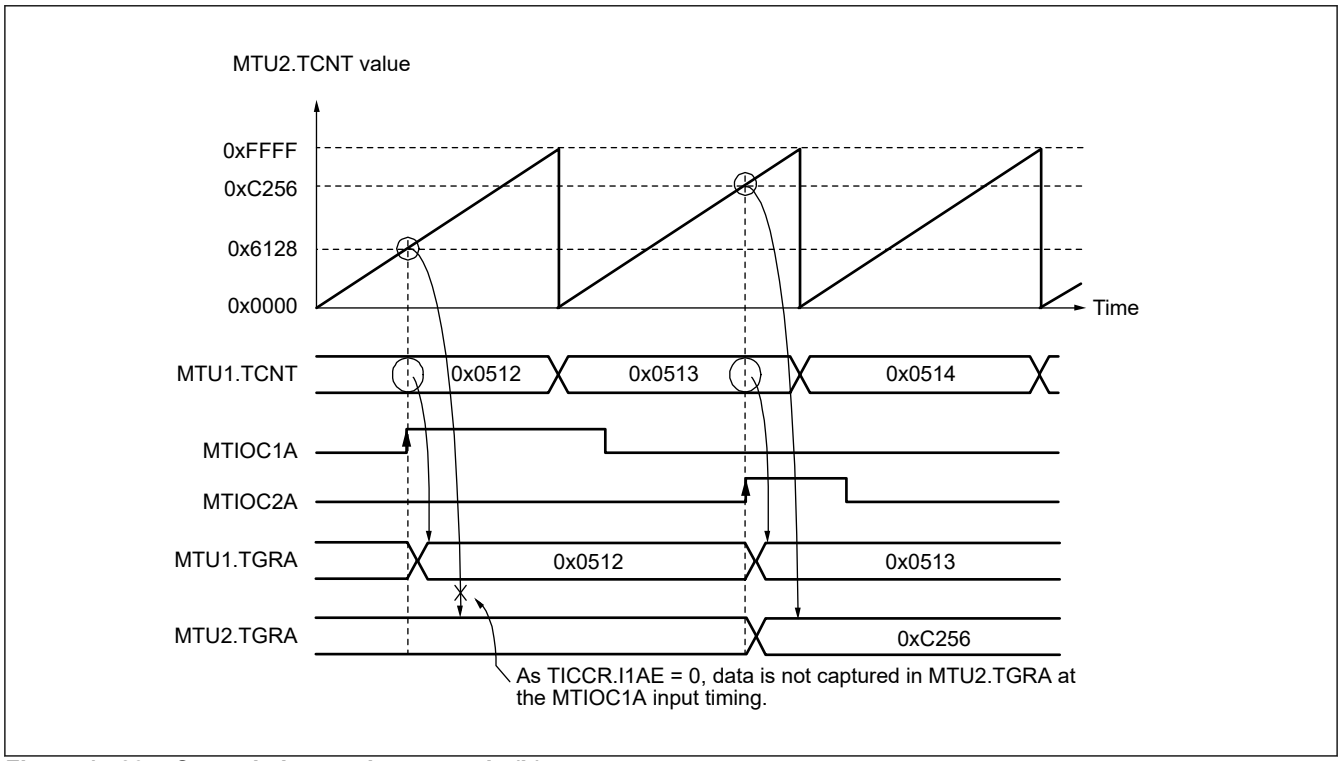
17.3.4.3 Cascaded Operation Example (b)

Figure 17.23 shows the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the I2AE bit in TICCR has been set to 1 to include the MTIOC2A pin in the MTU1.TGRA input capture conditions. In this example, the MTU1.TIOR.IOA[3:0] bits have selected the MTIOC1A rising edge for the input capture timing while the MTU2.TIOR.IOA[3:0] bits have selected the MTIOC2A rising edge for the input capture timing.

Under these conditions, the rising edge of both MTIOC1A and MTIOC2A is used for the MTU1.TGRA input capture condition. For the MTU2.TGRA input capture condition, the MTIOC2A rising edge is used.



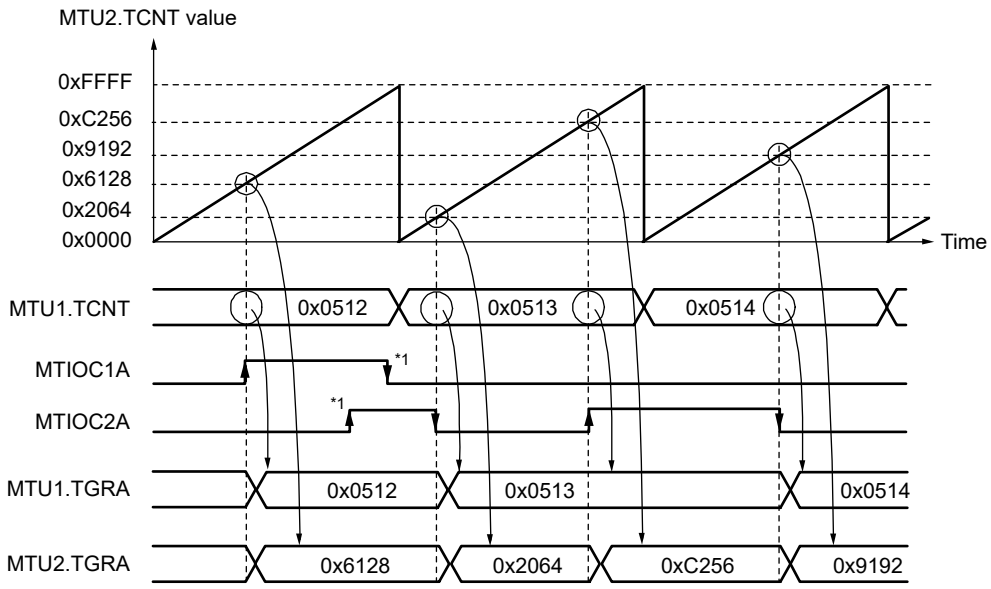


Figure 17.23 Cascaded operation example (b)

17.3.4.4 Cascaded Operation Example (c)

Figure 17.24 shows the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the TICCR.I2AE and I1AE bits have been set to 1 to include the MTIOC2A and MTIOC1A pins in the MTU1.TGRA and MTU2.TGRA input capture conditions, respectively. In this example, the IOA[3:0] bits in both MTU1.TIOR and MTU2.TIOR have selected both the rising and falling edges for the input capture timing. Under these conditions, the ORed result of MTIOC1A and MTIOC2A input is used for the MTU1.TGRA and MTU2.TGRA input capture conditions.

Note 1. When either of the input signals is driven high, the selected edge of the other cannot act as the input capture condition.

Figure 17.24 Cascaded operation example (c)

17.3.4.5 Cascaded Operation Example (d)

Figure 17.25 shows the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the TICCR.I2AE bit has been set to 1 to include the MTIOC2A pin in the MTU1.TGRA input capture conditions. In this example, the IOA[3:0] bits in MTU1.TIOR have selected occurrence of MTU0.TGRA compare match or input capture for the input capture timing while the IOA[3:0] bits in MTU2.TIOR have selected the MTIOC2A rising edge for the input capture timing.

Under these conditions, as MTU1.TIOR has selected occurrence of MTU0.TGRA compare match or input capture for the input capture timing, the MTIOC2A edge is not used for MTU1.TGRA input capture condition although the I2AE bit in TICCR has been set to 1.

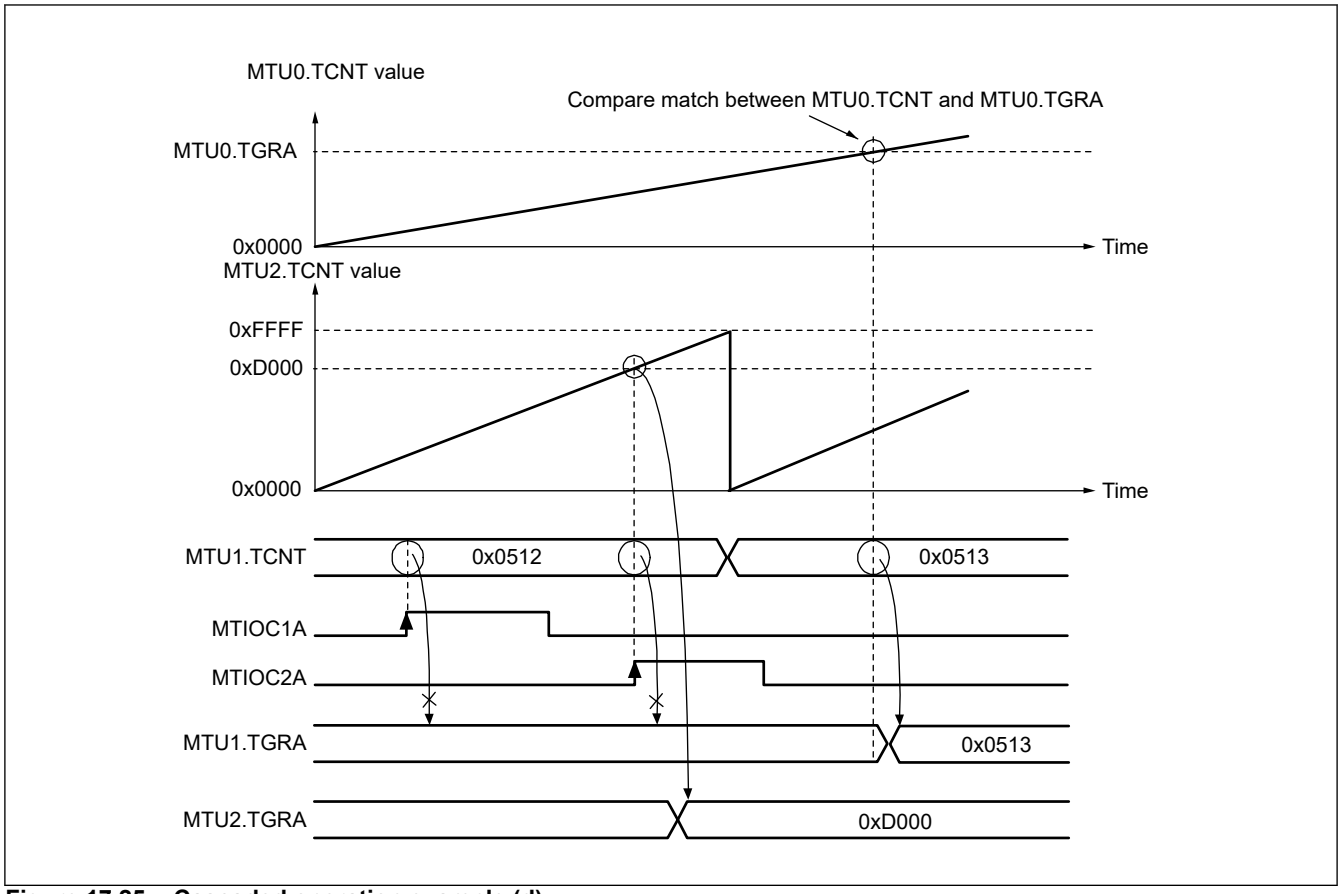

Figure 17.25 Cascaded operation example (d)

17.3.5 PWM Modes

PWM modes are provided to output PWM waveforms from the external pins. The output level can be selected as low, high, or toggle output in response to a compare match of each TGR.

PWM waveforms in the range of 0% to 100% duty cycle can be output according to the TGR settings.

By designating TGR compare match as the counter clearing source, the PWM period can be specified in that register.

Every channel except MTU5 and MTU8 can be set to PWM mode independently. Channels set to PWM mode can perform synchronous operation with each other or other channels set to any other mode.

There are two PWM modes as described below.

(1) PWM Mode 1

PWM waveforms are output from the MTIOCnA and MTIOCnC pins by pairing TGRA with TGRB and TGRC with TGRD. The levels specified by the TIOR.IOA[3:0] and IOC[3:0] bits are output from the MTIOCnA and MTIOCnC pins at compare matches A and C, and the level specified by the TIOR.IOB[3:0] and IOD[3:0] bits are output at compare matches B and D (n = 0 to 4, 6, 7). The initial output value is set in TGRA or TGRC. If the values set in paired TGRs are identical, the output value does not change even when a compare match occurs.

In PWM mode 1, PWM waveforms in up to 12 phases can be output.

(2) PWM Mode 2

PWM waveform output is generated using one TGR as the period register and the others as duty registers. The level specified in TIOR is output at compare matches. Upon counter clearing by a period register compare match, the initial value set in TIOR is output from each pin. If the values set in the period and duty registers are identical, the output value does not change even when a compare match occurs.

Up to eight phases of PWM waveforms can be output by combining synchronous clearing of channels that cannot be set to PWM mode 2 as synchronous operation.

The correspondence between PWM output pins and registers is shown in Table 17.60.

Table 17.60 PWM output registers and output pins

Channel	Register	Output pins	
		PWM mode 1	PWM mode 2
MTU0	TGRA	MTIOC0A	MTIOC0A
	TGRB		MTIOC0B
	TGRC	MTIOC0C	MTIOC0C
	TGRD		MTIOC0D
MTU1	TGRA	MTIOC1A	MTIOC1A
	TGRB		MTIOC1B
MTU2	TGRA	MTIOC2A	MTIOC2A
	TGRB		MTIOC2B
MTU3	TGRA	MTIOC3A	Setting prohibited
	TGRB		
	TGRC	MTIOC3C	
	TGRD		
MTU4	TGRA	MTIOC4A	
	TGRB		
	TGRC	MTIOC4C	
	TGRD		
MTU6	TGRA	MTIOC6A	
	TGRB		
	TGRC	MTIOC6C	
	TGRD		
MTU7	TGRA	MTIOC7A	
	TGRB		
	TGRC	MTIOC7C	
	TGRD		

Note: In PWM mode 2, PWM waveform output is not possible for the TGR register in which the PWM period is set.

17.3.5.1 Example of PWM Mode Setting Procedure

Figure 17.26 shows an example of the PWM mode setting procedure.

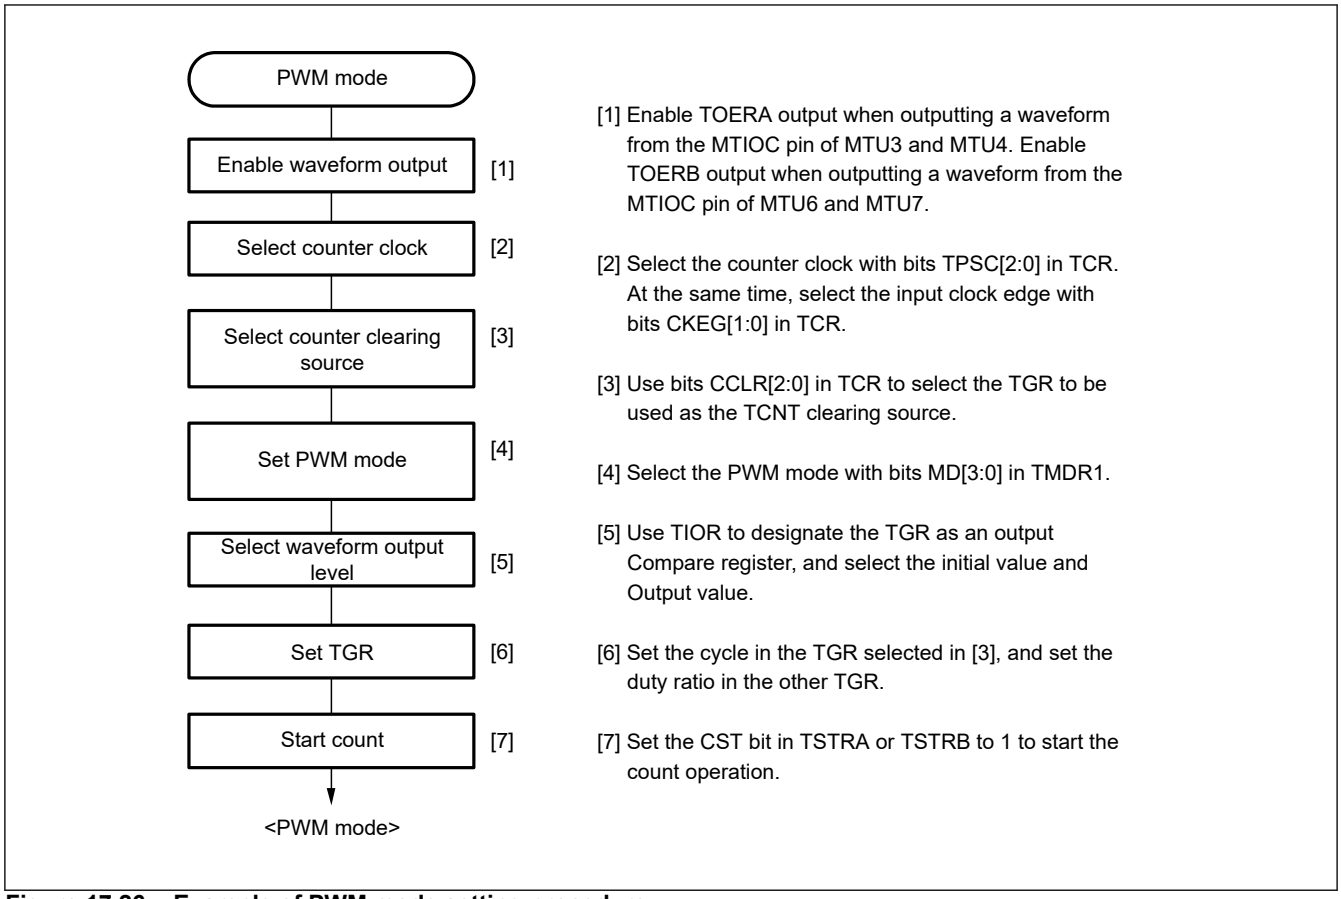

Figure 17.26 Example of PWM mode setting procedure

17.3.5.2 Examples of PWM Mode Operation

Figure 17.27 shows an example of operation in PWM mode 1.

In this example, TGRA compare match is set as the TCNT clearing source, 0 is set as the initial output value and output value for TGRA, and 1 is set as the output value for TGRB.

In this case, the value set in TGRA is used as the period, and the value set in TGRB is used as the duty ratio.

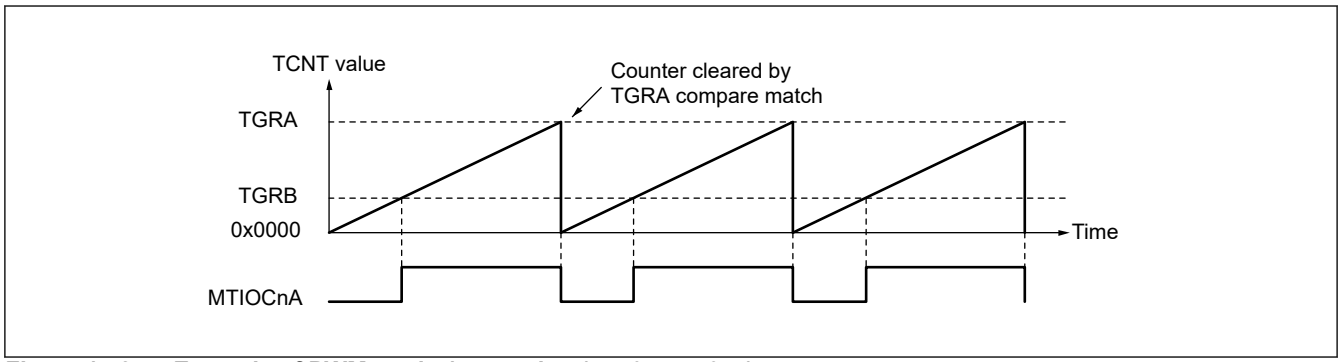

Figure 17.27 Example of PWM mode 1 operation (n = 0 to 4, 6, 7)

Figure 17.28 shows an example of operation in PWM mode 2.

In this example, synchronous operation is designated for MTU0 and MTU1, MTU1.TGRB compare match is set as the TCNT clearing source, and low is set as the initial output value and high as the output value for the other TGR registers (MTU0.TGRA to MTU0.TGRD and MTU1.TGRA), outputting 5-phase PWM waveforms.

In this case, the value set in MTU1.TGRB is used as the period, and the values set in the other TGRs are used as the duty ratio.

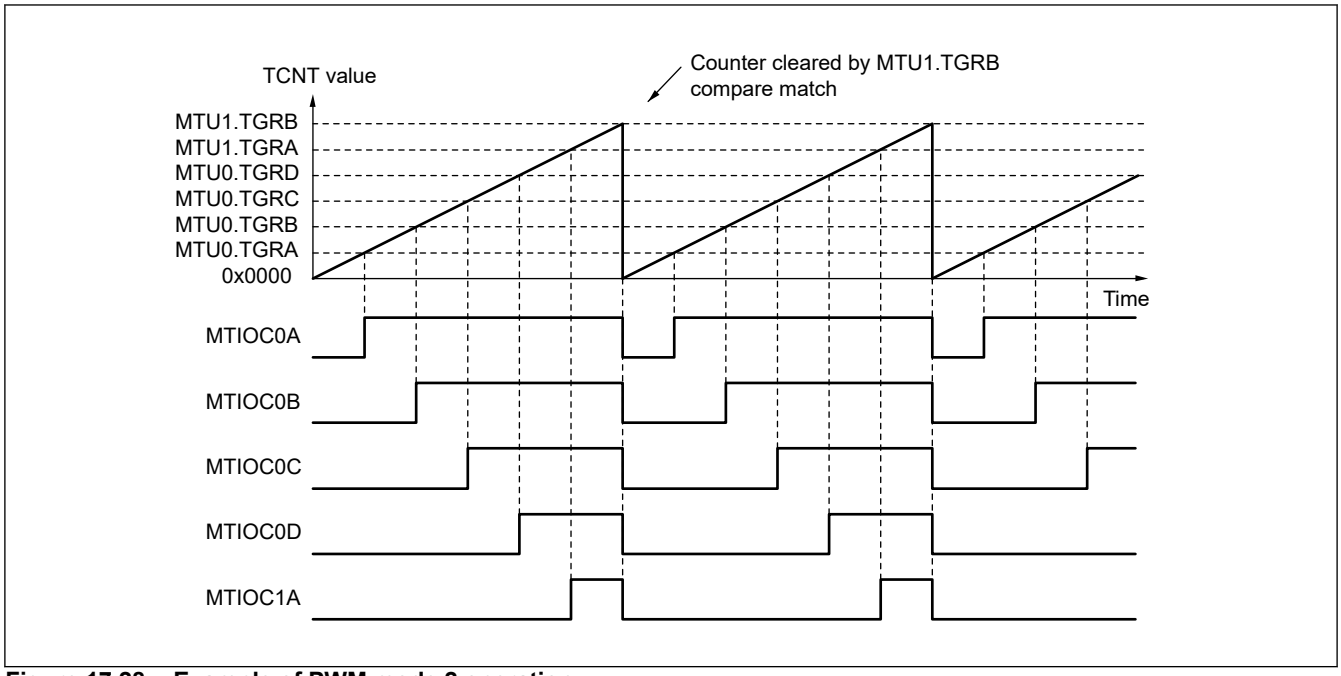

Figure 17.28 Example of PWM mode 2 operation

Figure 17.29 shows examples of PWM waveform output with 0% duty and 100% duty in PWM mode 1.

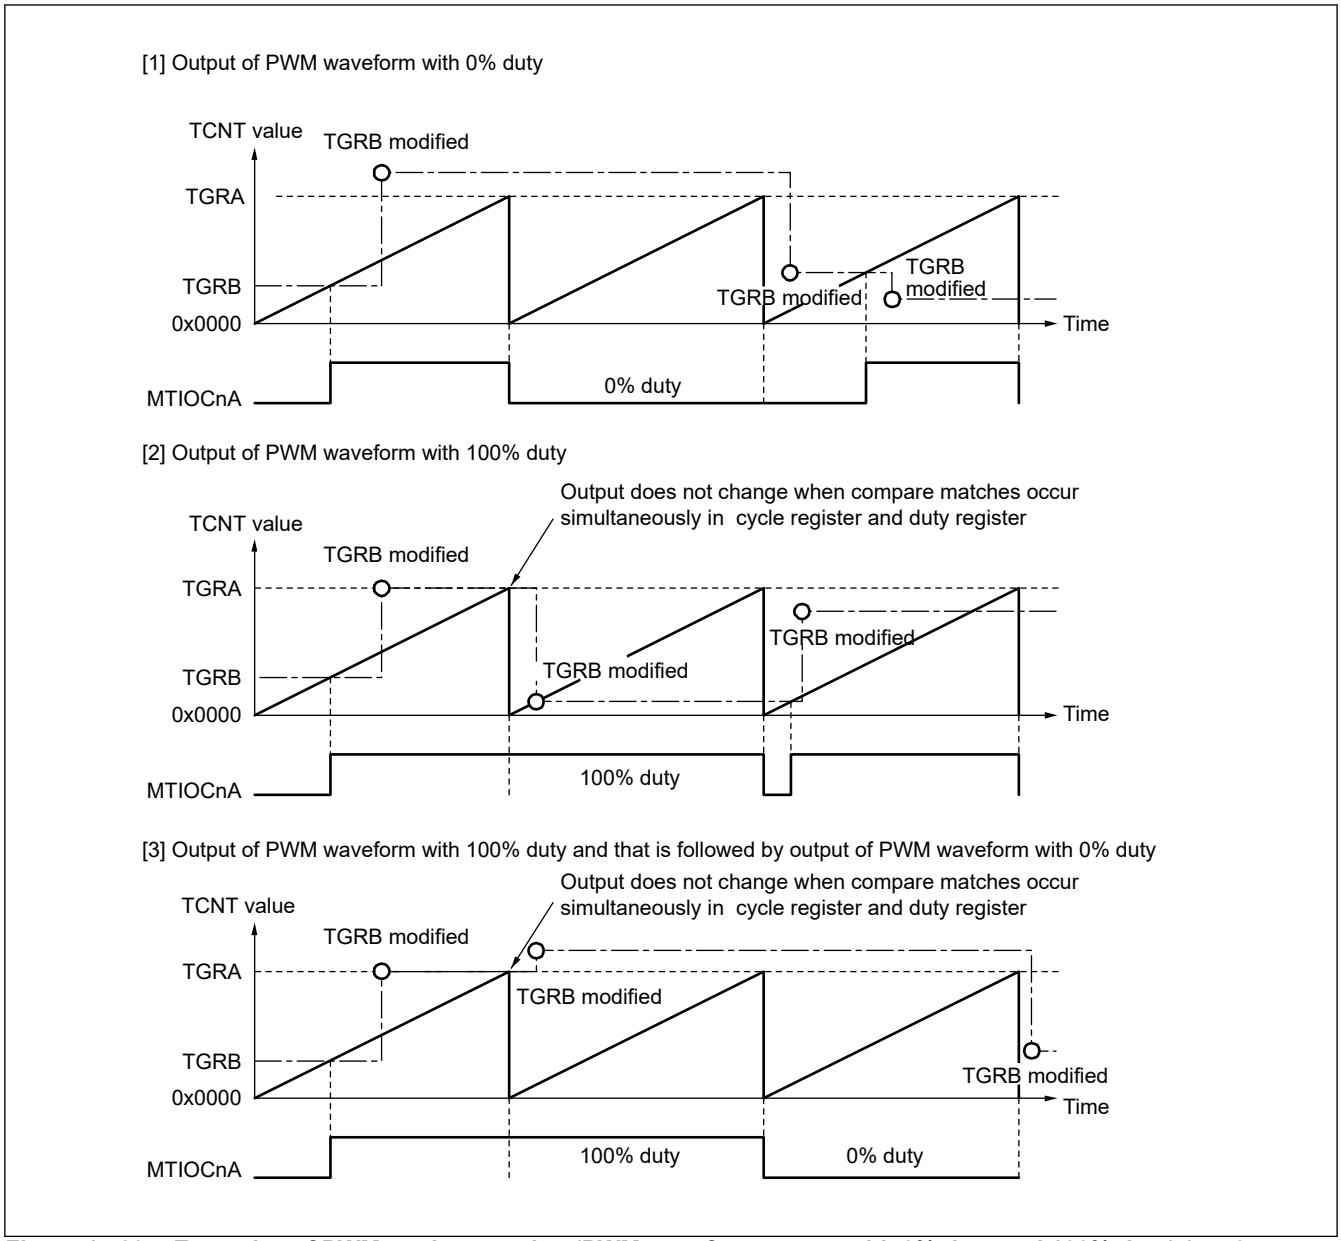

Figure 17.29 Examples of PWM mode operation (PWM waveform output with 0% duty and 100% duty) (n = 0 to 4, 6, 7)

17.3.6 Phase Counting Mode

There are two phase counting modes: 16-bit phase counting mode in which MTU1 and MTU2 operate independently, and cascade connection 32-bit phase counting mode in which MTU1 and MTU2 are cascaded.

In phase counting mode, the phase difference between two external input clocks is detected and the corresponding TCNT is incremented or decremented.

Two external clock input pins for each phase counting mode are not affected by the settings of TCR.TPSC[2:0], TCR2.TPSC2[2:0], and CKEG[1:0]. The two external clock input pins used in 16-bit phase counting mode and cascade connection 32-bit phase counting mode of MTU2 can be selected by MTU1.TMDR3.PHCKSEL. In a phase counting mode other than 16-bit phase counting mode and cascade connection 32-bit phase counting mode of MTU2, MTCLKA and MTCLKB are selected for A-phase and B-phase, respectively. In phase counting mode, the external clock pins MTCLKA, MTCLKB, MTCLKC, and MTCLKD are used for two-phase encoder pulse input.

Table 17.61 lists the external clock input pins to be connected in each phase counting mode.

Table 17.61 Clock input pins in phase counting mode

Phase counting mode	TMDR3.PHCKSEL bit	External clock input pins	
		A-phase	B-phase
MTU1 16-bit phase counting mode	x (Don't care)	MTCLKA	MTCLKB
MTU2 16-bit phase counting mode	0	MTCLKA	MTCLKB
	1 (initial value)	MTCLKC	MTCLKD
Cascade connection 32-bit phase counting mode	0	MTCLKA	MTCLKB
	1 (initial value)	MTCLKC	MTCLKD

17.3.6.1 16-Bit Phase Counting Mode

When the MTU1.TMDR3.LWA is 0, 16-bit phase counting mode can be set individually for MTU1 and MTU2.

In 16-bit phase counting mode, the phase difference between two external input clocks is detected and the 16-bit counter TCNT of the corresponding channel is incremented or decremented.

When 16-bit phase counting mode is specified, an external clock is selected as the count clock and TCNT operates as an up-counter/down-counter regardless of the setting of TCR.TPSC[2:0], TCR2.TPSC2[2:0], and CKEG[1:0]. However, the functions of TCR.CCLR[1:0], TIOR, TIER, and TGR are enabled, and input capture/compare match and interrupt functions can be used.

These external input pins can be used for two-phase encoder pulse input.

When an overflow occurs while TCNT is counting up and the corresponding TIER.TCIEV bit is 1, a TCIV interrupt is generated. When an underflow occurs while TCNT is counting down and the corresponding TIER.TCIEU bit is 1, a TCIU interrupt is generated.

The TSR.TCFD flag is the count direction flag. Read the TCFD flag to check whether TCNT is counting up and down.

17.3.6.1.1 Example of 16-Bit Phase Counting Mode Setting Procedure

Figure 17.30 shows an example of the 16-bit phase counting mode setting procedure.

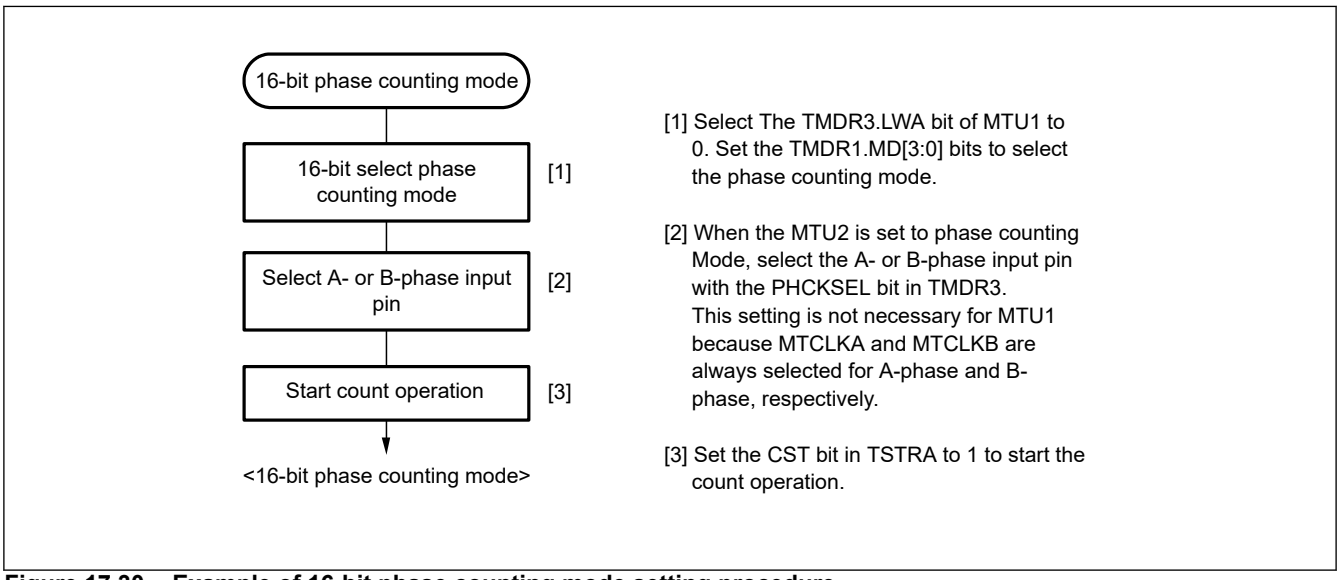

Figure 17.30 Example of 16-bit phase counting mode setting procedure

17.3.6.1.2 Examples of 16-Bit Phase Counting Mode Operation

In phase counting mode, TCNT is incremented or decremented according to the phase difference between two external clocks. There are five modes according to the count conditions. Each mode operates under the condition PHCKSEL = 1, which means the phase clock for MTU1 is input from MTCLKA or MTCLKB and that for MTU2 is input from MTCLKC or MTCLKD.

(1) Phase Counting Mode 1

Figure 17.31 shows an example of operation in phase counting mode 1, and Table 17.62 summarizes the TCNT upcounting and down-counting conditions.

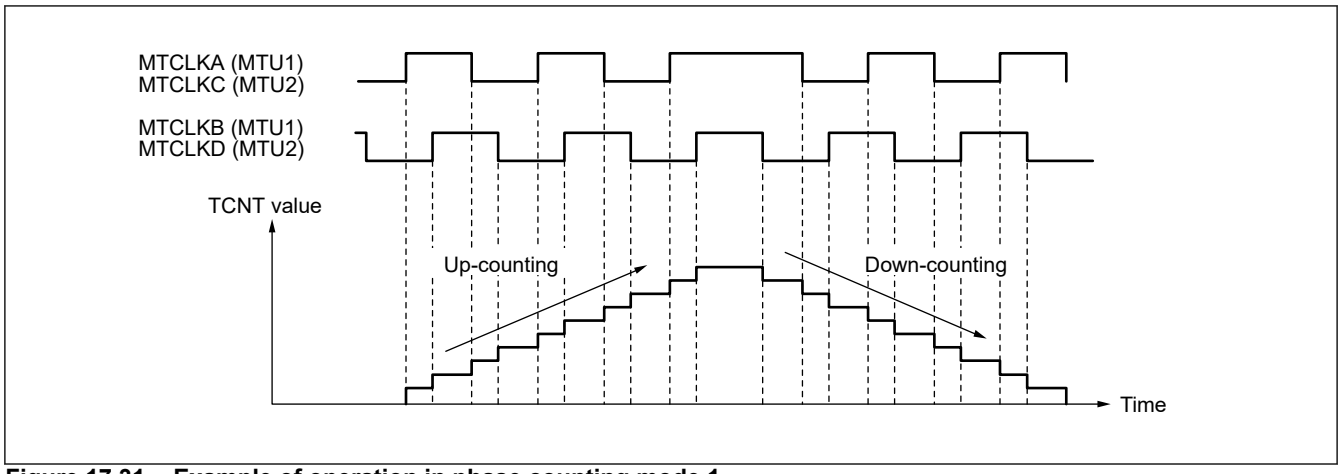

Figure 17.31 Example of operation in phase counting mode 1

17.3.6.1.3 16-Bit Phase Counting Mode Application Example

Figure 17.41 shows an example in which MTU1 is in phase counting mode, and MTU1 is coupled with MTU0 to input 2-phase encoder pulses of a servo motor in order to detect position or speed.

MTU1 is set to phase counting mode 1, and the encoder pulse A-phase and B-phase are input to MTCLKA and MTCLKB.

In MTU0, MTU0.TGRC compare match is specified as the TCNT clearing source and MTU0.TGRA and MTU0.TGRC are used for the compare match function and are set with the speed control period and position control period.

MTU0.TGRB is used for input capture, with MTU0.TGRB and MTU0.TGRD operating in buffer mode. The MTU1 count clock is designated as the MTU0.TGRB input capture source, and the widths of 2-phase encoder 4-multiplication pulses are detected.

MTU1.TGRA and MTU1.TGRB for MTU1 are designated for the input capture function and MTU0.TGRA and MTU0.TGRC compare matches in MTU0 are selected as the input capture sources to store the up/down-counter values for the control periods.

This procedure enables the accurate detection of position and speed.

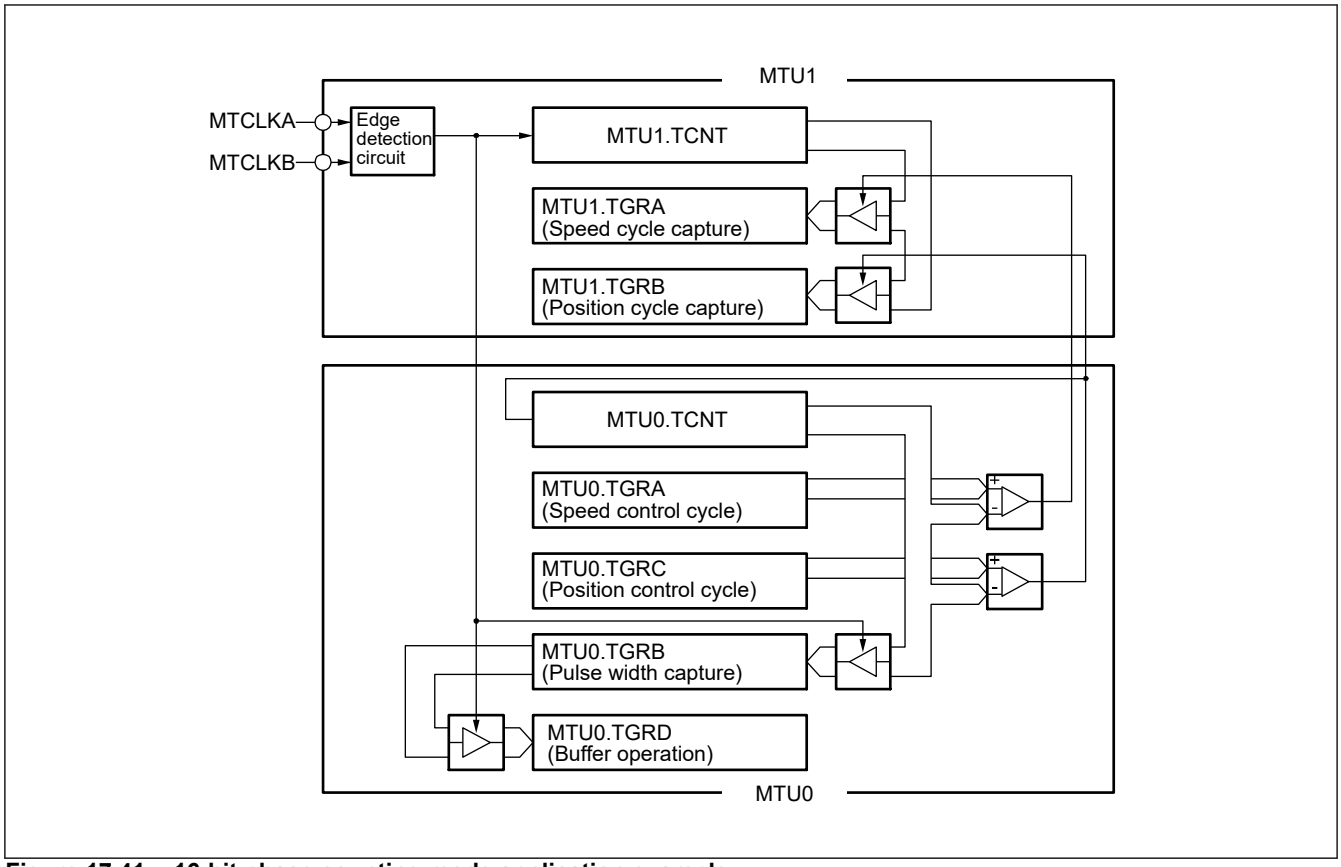

Figure 17.41 16-bit phase counting mode application example

17.3.6.2 Cascade Connection 32-Bit Phase Counting Mode

When MTU1 is set to phase counting mode by setting MTU1.TMDR3.LWA = 1, MTU1 and MTU2 are connected to operate in cascade connection 32-bit phase counting mode as shown in Figure 17.42. When this mode is used, the TCR, TCR2, TIOR, TIER, TGR, and TSR registers are controlled by MTU1 and the settings of MTU2 are disabled. See Figure 17.43 for the procedure for setting cascade connection 32-bit phase counting mode.

In this mode, three-phase (A, B, and Z) signals can be input. As an encoder pulse signal, the external input phase clocks MTCLKA and MTCLKB or MTCLKC and MTCLKD can be selected for A-phase and B-phase, and MTIOC1A can be selected for Z-phase, respectively. See Table 17.61 for selecting external clock input of A-phase and B-phase. A counter event is generated using an A-phase or B-phase pulse and counted by the 32-bit counter MTU1.TCNTLW.

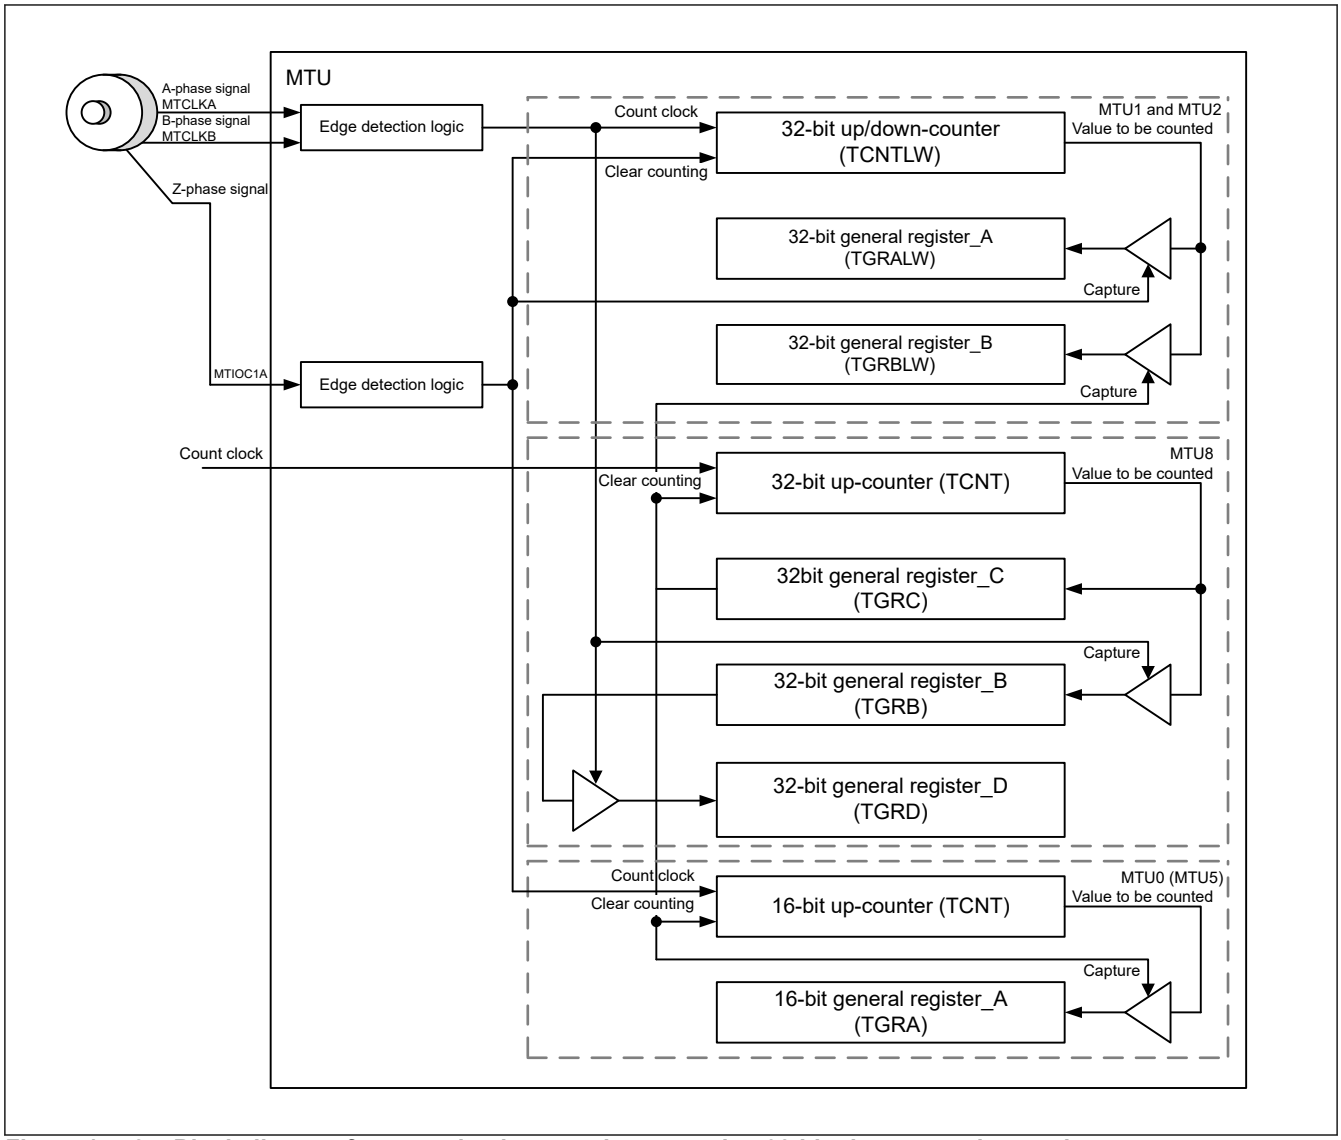
An input capture can also be generated using a Z-phase signal; thus angular velocity can be measured using the captured value in the general register.

Furthermore, MTU8 can be used as a channel for measuring a control period interval, and a compare match signal can be output at a control period interval to the MTU1 and MTU2, which operate in cascade connection 32-bit phase counting mode. That is, a compare match signal of MTU8 is used as a capture signal of MTU1 and MTU2, and the number of A-phase and B-phase pulses for a control period can be measured.

When MTU0 or MTU5 is specified as the channel for measuring a Z-phase signal pulse, the compare match signal of the MTU8.TGRC register can be output as a capture signal or clear signal to MTU0 or MTU5, thus the Z-phase count at a control period interval can be measured.

In addition, a counter event signal of combined MTU1 and MTU2 can be used as a capture signal of the MTU8.TGRD register, and measurement can be performed including the intervals of A, B, or both phase pulses. In this case, the MTU8.TGRD register should be set to buffer operation.

See section 17.3.4. Cascaded Operation, for details on the cascade connection function for connecting MTU1 and MTU2 in a mode other than cascade connection 32-bit phase counting mode.



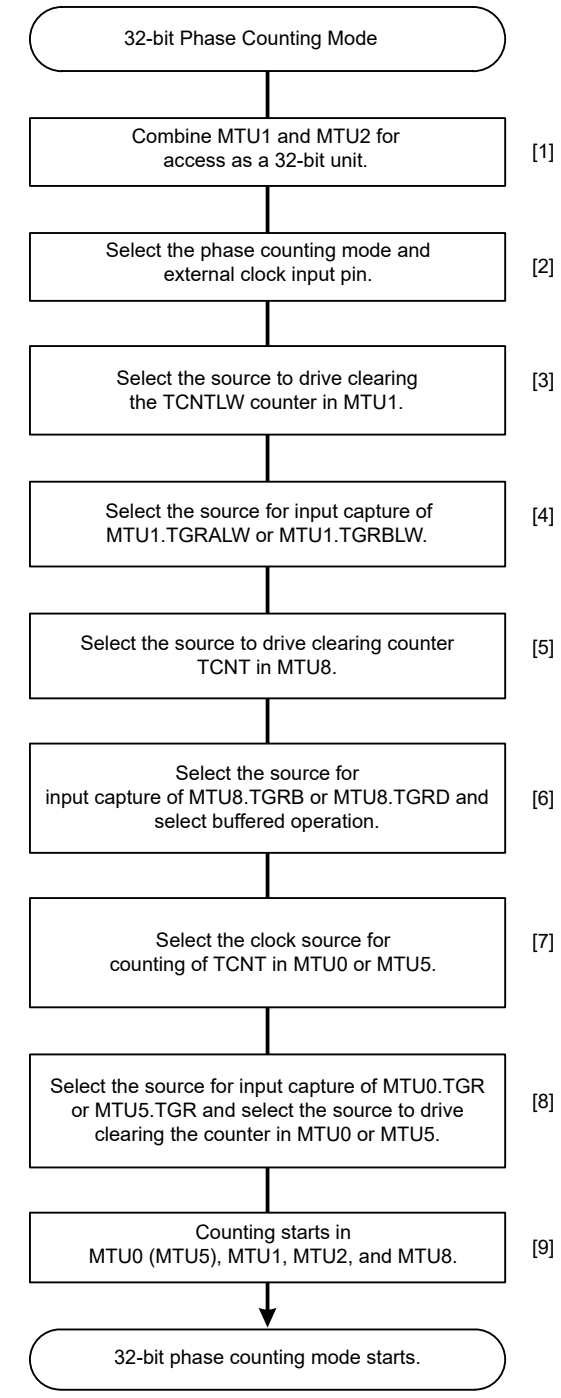


Figure 17.42 Block diagram for operation in cascade connection 32-bit phase counting mode

17.3.6.2.1 Example of Setting Cascade Connection 32-Bit Phase Counting Mode

Figure 17.43 shows an example of the procedure for setting cascade connection 32-bit phase counting mode.

[1] Set the LWA bit in MTU1.TMDR3 to 1 and combine MTU1 and MTU2 for access as a 32-bit unit.

[2] Select phase counting mode with the MD[3:0] bits in MTU1.TMDR1 and select the external clock input pin with the PHCKSEL bits in MTU1.TMDR3.

[3] Set the CCLR[2:0] bits in MTU1.TCR to 001b to select input capture of MTU1.TGRALW as the source of the signal to drive clearing counter TCNTLW in MTU1.

[4] Set the IOA[3:0] bits in MTU1.TIOR to select the effective edge (rising, falling or both) of the signal produced by input capture of TGRALW in MTU1. After that, set the IOB[3:0] bits in MTU1.TIOR to 1110b to select the compare match signal of MTU8.TGRC as the source to drive input capture of MTU1.TGRBLW.

[5] Set the CCLR[2:0] bits in MTU8.TCR to 101b to select the compare match signal of MTU8.TGRC as the source to drive clearing counter TCNT in MTU8.

[6] Select the source for input capture of MTU8.TGRB as the clock source for counting of TCNTLW in MTU1 by setting the IOB[3:0] bits in MTU8.TIORH to 1110b. At the same time, select buffered operation for TGRB and TGRD by setting the BFB bit in MTU8.TMDR1 to 1.

[7] Set the TPSC2[2:0] bits in MTU0.TCR2 to 111b to select the MTIOC1A pin as the clock source for counting of TCNT in MTU0.
(When using TCNT in MTU5, set the TPSC2[2:0] bits in MTU5.TCR2 to 111b).

[8] Select the compare match signal of MTU8.TGRC as the source to drive input capture of MTU0.TGRA by setting the IOA[3:0] bits in MTU0.TIORH to 1110b.
(When using TCNT in MTU5, set the TIORU, TIORV, or TIORW bit in MTU5 is set to 10100b).
After that, select input capture of MTU0.TGRA as the source to drive clearing counter TCNT in MTU0 by setting the CCLR[2:0] bits in MTU0.TCR to 001b.

[9] Start counting in MTU0, MTU1, MTU2, and MTU8 by setting the TSTRA bit to 00001111b.
(When using TCNT in MTU5, set the counter corresponding to TSTR in MTU5 to 1).

Note: When the LWA bit in MTU1.TMDR3 is set to 1, the TCR, TCR2, TMDR1, and TIOR registers in MTU1 are effective in controlling cascaded operation. In this case, the settings of these registers in MTU2 are ignored.

Figure 17.43 Procedure for setting cascade connection 32-bit phase counting mode

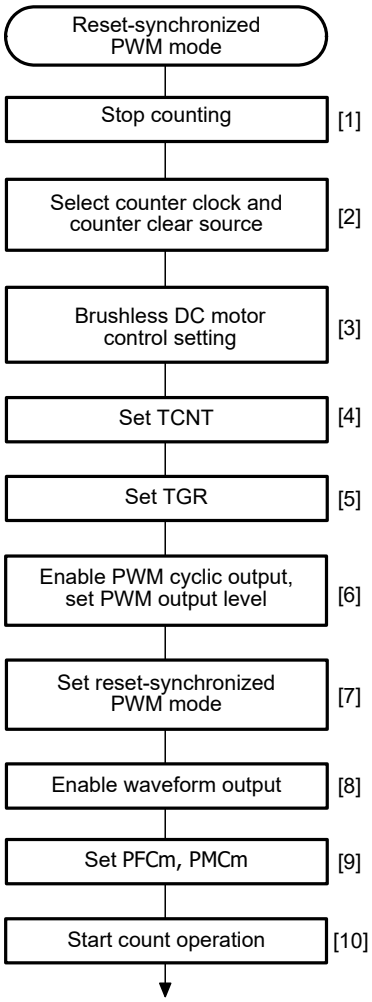
17.3.7 Reset-Synchronized PWM Mode

In the reset-synchronized PWM mode, six phases of positive and negative PWM waveforms (12 phases in total) that share a common wave transition point can be output by combining MTU3 and MTU4 and MTU6 and MTU7.

When set for reset-synchronized PWM mode, the MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, and MTIOC7D pins function as PWM output pins and timer counters 3 and 6 (MTU3.TCNT and MTU6.TCNT) functions as an up-counter.

Table 17.67 shows the PWM output pins used. Table 17.68 shows the settings of the registers.

Table 17.67 Output pins for reset-synchronized PWM mode



Channel	Output pin	Description
MTU3	MTIOC3B	PWM output pin 1
	MTIOC3D	PWM output pin 1' (negative-phase waveform of PWM output 1)
MTU4	MTIOC4A	PWM output pin 2
	MTIOC4C	PWM output pin 2' (negative-phase waveform of PWM output 2)
	MTIOC4B	PWM output pin 3
	MTIOC4D	PWM output pin 3' (negative-phase waveform of PWM output 3)
MTU6	MTIOC6B	PWM output pin 4
	MTIOC6D	PWM output pin 4' (negative-phase waveform of PWM output 4)
MTU7	MTIOC7A	PWM output pin 5
	MTIOC7C	PWM output pin 5' (negative-phase waveform of PWM output 5)
	MTIOC7B	PWM output pin 6
	MTIOC7D	PWM output pin 6' (negative-phase waveform of PWM output 6)

Table 17.68 Register settings for reset-synchronized PWM mode

Register	Setting
MTU3.TCNT	Initial setting (0x0000)
MTU4.TCNT	Initial setting (0x0000)
MTU3.TGRA	Set the count period for MTU3.TCNT
MTU3.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC3B and MTIOC3D pins
MTU4.TGRA	Set the transition point of the PWM waveform to be output from the MTIOC4A and MTIOC4C pins
MTU4.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC4B and MTIOC4D pins
MTU6.TCNT	Initial setting (0x0000)
MTU7.TCNT	Initial setting (0x0000)
MTU6.TGRA	Set the count period for MTU6.TCNT
MTU6.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC6B and MTIOC6D pins
MTU7.TGRA	Set the transition point of the PWM waveform to be output from the MTIOC7A and MTIOC7C pins
MTU7.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC7B and MTIOC7D pins

17.3.7.1 Example of Procedure for Setting Reset-Synchronized PWM Mode

Figure 17.44 shows an example of procedure for setting the reset-synchronized PWM mode.

[1] Clear the CST3 and CST4 bits in TSTRA to 0 to stop the TCNT operation. Specify the reset-synchronized PWM mode while MTU3.TCNT and MTU4.TCNT are stopped.

[2] Set bits TPSC[2:0] and CKEG[1:0] in MTU3.TCR to select the counter clock and clock edge for MTU3. Set bits CCLR[2:0] to select TGRA compare match as a counter clear source.

[3] When performing brushless DC motor control, set bit BDC in the timer gate control register (TGCRA) and set the feedback signal input source and output chopping or gate signal direct output.

[4] Set MTU3.TCNT and MTU4.TCNT to 0x0000.

[5] MTU3.TGRA is the cycle register. Set the waveform cycle value in MTU3.TGRA. Set the transition timing of the PWM output waveforms in MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB. Set times within the compare match range of MTU3.TCNT.

X = MTU3.TGRA (X: Set value)

[6] Enable or disable toggle output synchronized with the PMW cycle using bit PSYE in TOCR1A, and set the PWM output level with bits OLSP and OLSN. When specifying the PWM output level by using TOLBRA as a buffer for TOCR2A, see Figure 17.4.

[7] Set bits MD[3:0] in MTU3.TMDR1 to 1000b to select the reset-synchronized PWM mode. In addition, specify the buffer operation of the MTU3.TGRA (BFA = 1) and MTU3.TGRB (BFB = 1) when necessary. Set the MTU4.TMDR1 to the initial value (normal operation; BFA = 0 and BFB = 0).

[8] Set the enabling/disabling of the PWM waveform output pin in TOERA.

[9] Set the Port Function Control register (PFCm) and the Port Mode Control registers (PMCm) of the I/O ports.

[10] Set the CST3 bit in the TSTRA to 1 to start the count operation.

Note: The output waveform starts to toggle at the point of MTU3.TCNT = MTU3.TGRA = X by setting X = MTU3.TGRA for example, period = duty ratio.

Figure 17.44 Procedure for selecting reset-synchronized PWM mode

17.3.7.2 Example of Reset-Synchronized PWM Mode Operation

Figure 17.45 shows an example of operation in the reset-synchronized PWM mode.

MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) operate as up-counters. The counters are cleared when a compare match occurs between MTU3.TCNT (MTU6.TCNT) and MTU3.TGRA (MTU6.TGRA), and then begin incrementing from 0x0000. The output from the PWM pins toggles every time a compare match occurs in MTU3.TGRB (MTU6.TGRB), MTU4.TGRA (MTU7.TGRA), and MTU4.TGRB (MTU7.TGRB) and the counters are cleared.

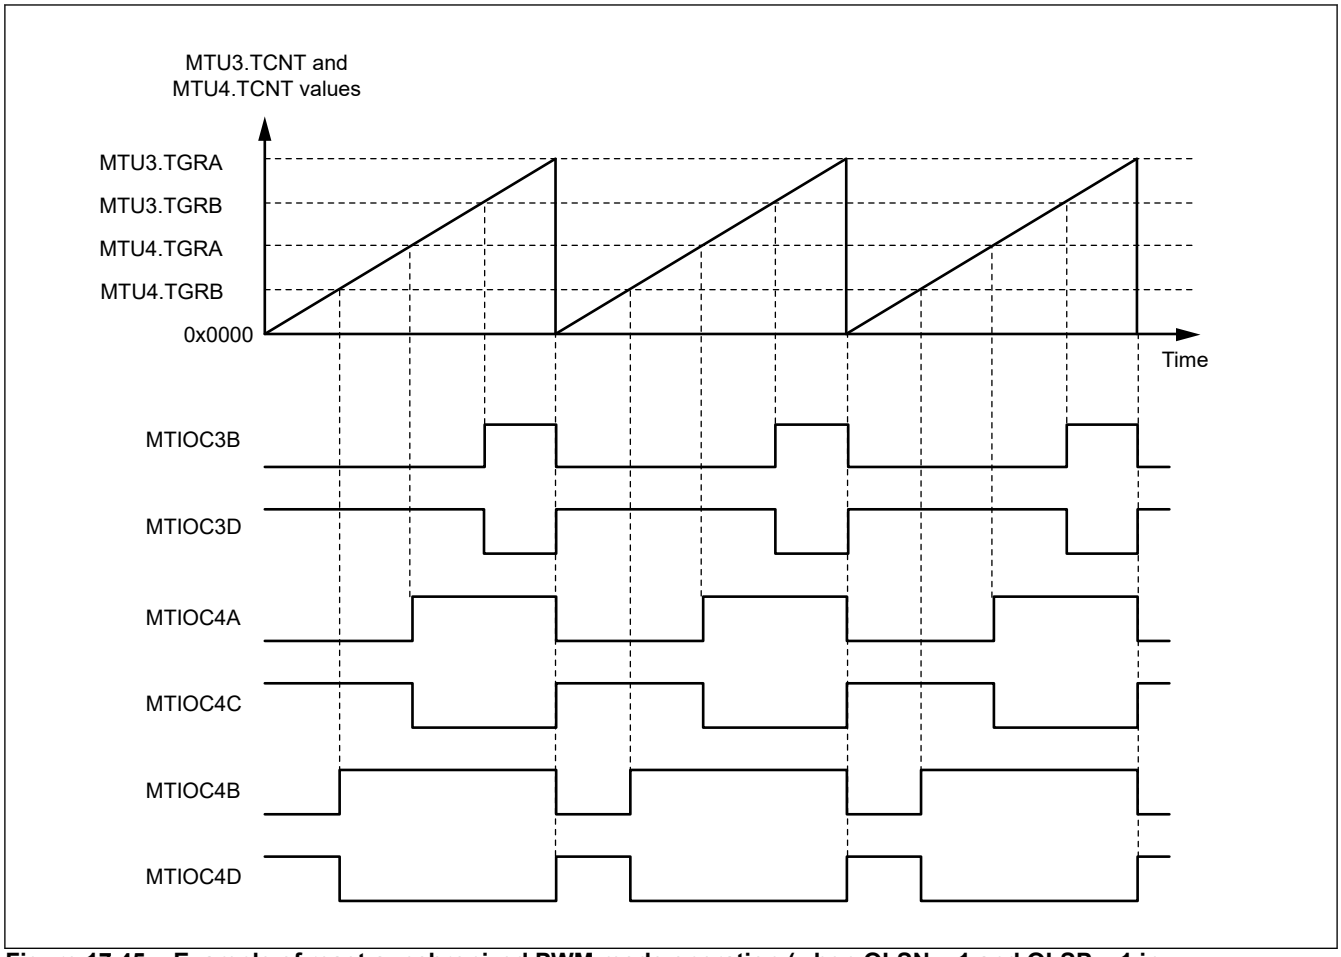


Figure 17.45 Example of reset-synchronized PWM mode operation (when OLSN = 1 and OLSP = 1 in MTU3.TOCR1A and MTU4.TOCR1A)

17.3.8 Complementary PWM Mode

In complementary PWM mode, dead time can be set for PWM waveforms to be output. The dead time is the period during which the upper and lower arm transistors are set to the inactive level in order to prevent short-circuiting of the arms.

Six positive-phase and six negative-phase PWM waveforms (12 phases in total) with dead time can be output by combining MTU3/ MTU4 and MTU6/MTU7. PWM waveforms without dead time can also be output.

In complementary PWM mode, MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D pins function as PWM output pins, and the MTIOC3A and MTIOC6A pins can be set for toggle output synchronized with the PWM period.

MTU3.TCNT, MTU4.TCNT, MTU6.TCNT, and MTU7.TCNT function as up/down-counters.

Table 17.69 shows the PWM output pins used. Table 17.70 shows the settings of the registers used.

A function to directly cut off the PWM output by using an external signal is supported as a port function.

Table 17.69 Output pins for complementary PWM mode (1 of 2)

Channel	Output pin	Description
MTU3	MTIOC3A	Toggle output synchronized with PWM period (or I/O port)
	MTIOC3B	PWM output pin 1
	MTIOC3C	I/O port*1
	MTIOC3D	PWM output pin 1' (non-overlapping negative-phase waveform of PWM output 1 — PWM output without non-overlapping interval is also available)

Table 17.69 Output pins for complementary PWM mode (2 of 2)

Channel	Output pin	Description
MTU4	MTIOC4A	PWM output pin 2
	MTIOC4C	PWM output pin 2' (non-overlapping negative-phase waveform of PWM output 2 — PWM output without non-overlapping interval is also available)
	MTIOC4B	PWM output pin 3
	MTIOC4D	PWM output pin 3' (non-overlapping negative-phase waveform of PWM output 3 — PWM output without non-overlapping interval is also available)
MTU6	MTIOC6A	Toggle output synchronized with PWM period (or I/O port)
	MTIOC6B	PWM output pin 4
	MTIOC6C	I/O port*1
	MTIOC6D	PWM output pin 4' (non-overlapping negative-phase waveform of PWM output 4 — PWM output without non-overlapping interval is also available)
MTU7	MTIOC7A	PWM output pin 5
	MTIOC7C	PWM output pin 5' (non-overlapping negative-phase waveform of PWM output 5 — PWM output without non-overlapping interval is also available)
	MTIOC7B	PWM output pin 6
	MTIOC7D	PWM output pin 6' (non-overlapping negative-phase waveform of PWM output 6 — PWM output without non-overlapping interval is also available)

Note 1. Avoid setting the MTIOC3C and MTIOC6C pins as timer I/O pins in complementary PWM mode.

Table 17.70 Register settings for complementary PWM mode (1 of 3)

Channel	Counter/ register	Description	Read/write from CPU
MTU3	TCNT	Starts up-counting from the value set in the dead time register	Maskable by TRWERA setting*1
	TGRA	Set MTU3.TCNT upper limit value (1/2 carrier period + dead time)	Maskable by TRWERA setting*1
	TGRB	PWM output 1 compare register	Maskable by TRWERA setting*1

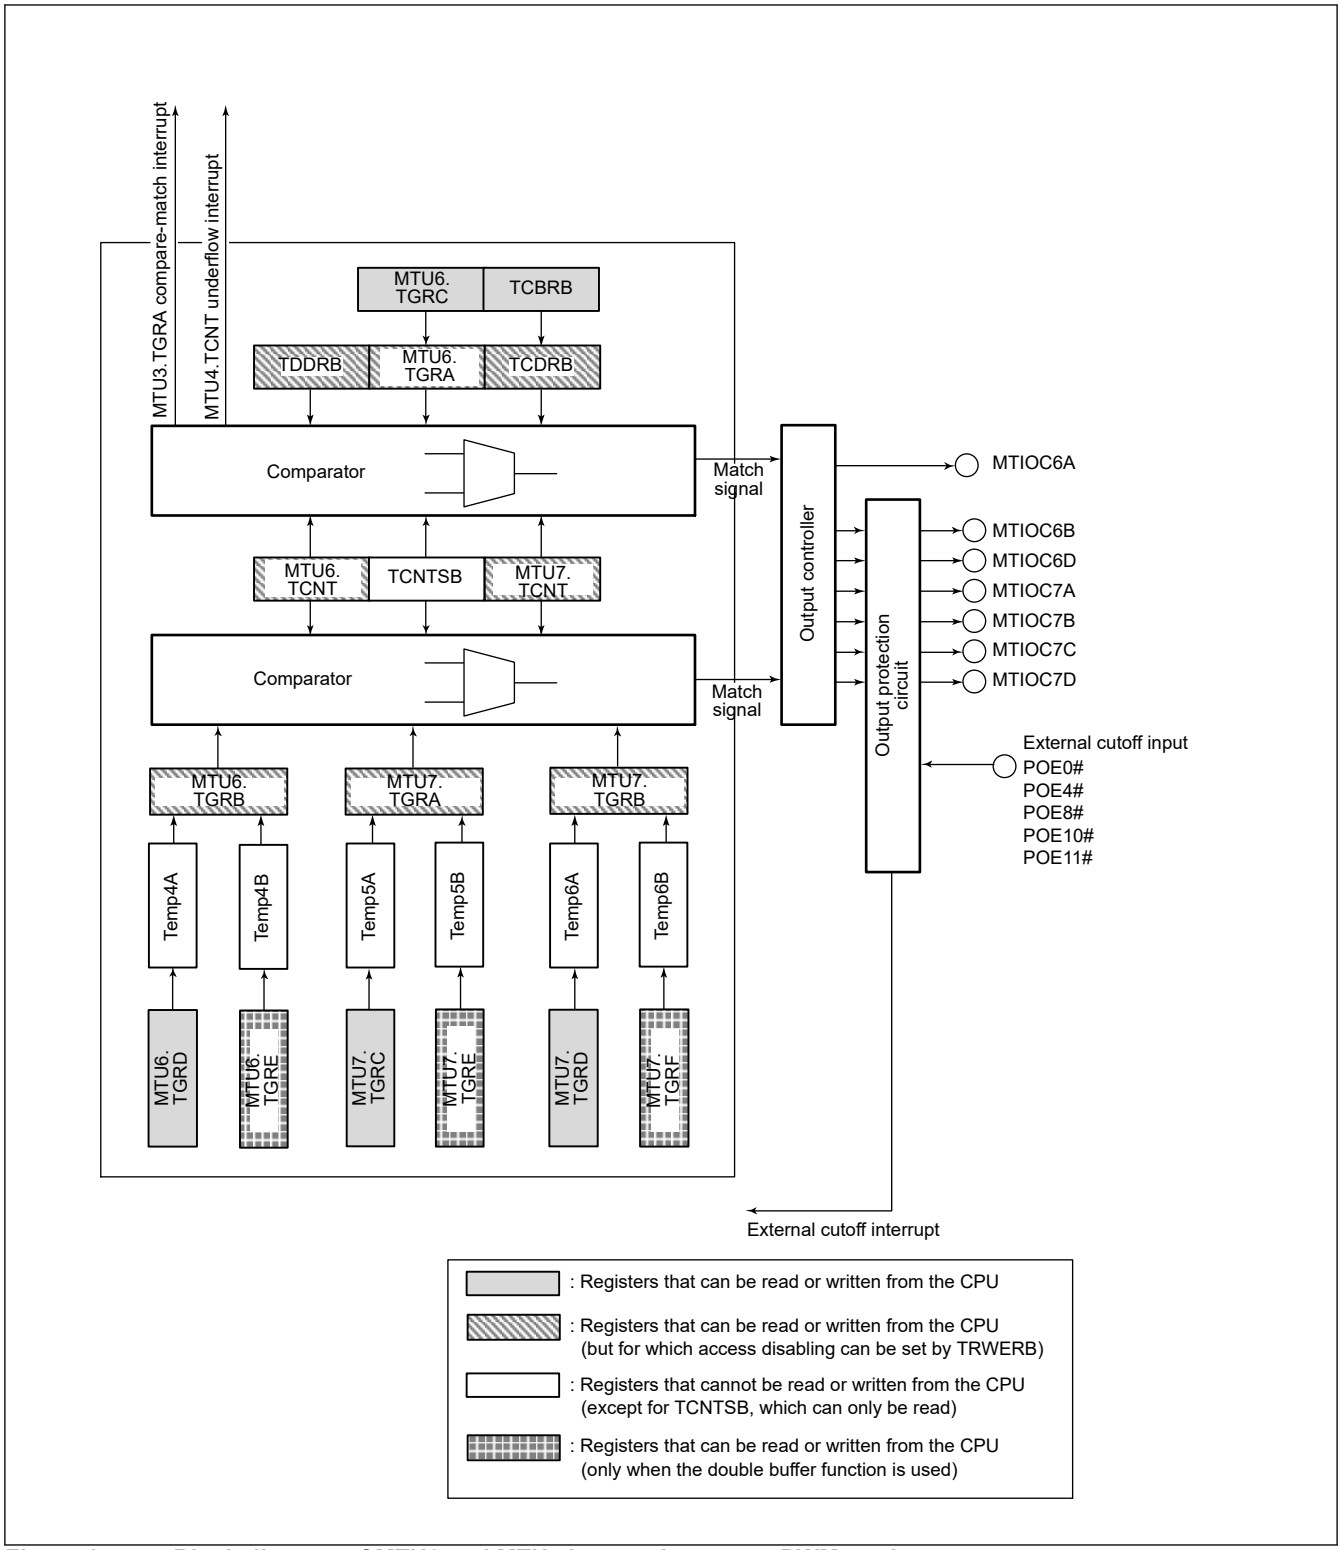

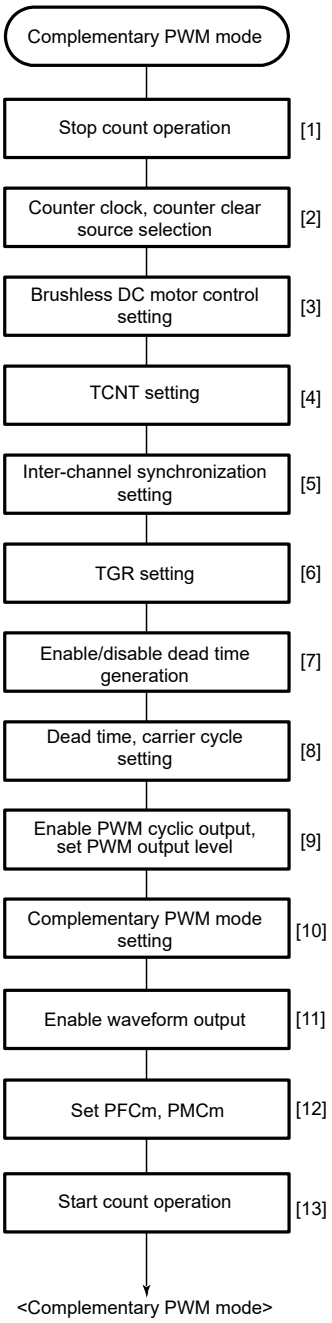

Figure 17.47 Block diagram of MTU6 and MTU7 in complementary PWM mode

17.3.8.1 Example of Complementary PWM Mode Setting Procedure

Figure 17.48 shows an example of the complementary PWM mode setting procedure.

[1] Clear bits CST3 and CST4 in the Timer Start register (TSTRA) to 0 to stop timer counter (TCNT) operation. Specify complementary PWM mode while MTU3.TCNT and MTU4.TCNT are stopped.

[2] Set the same counter clock and clock edge for MTU3 and MTU4 with bits TPSC[2:0] and bits CKEG[1:0] in the Timer Control Register (TCR). Use bits CCLR[2:0] to set synchronous clearing only when restarting by synchronous clearing with another channel during complementary PWM mode operation.

[3] When performing brushless DC motor control, set bit BDC in the Timer Gate Control register (TGCRA) and set the feedback signal input source and output chopping or gate signal direct output.

[4] Set the dead time in MTU3.TCNT. Set MTU4.TCNT to 0x0000.

[5] Set only when restarting by synchronous clearing with another channel during complementary PWM mode operation. In this case, synchronize the channel generating the synchronous clear with MTU3 and MTU4 using the Timer Synchronous register (TSYRA).

[6] Set the output PWM duty cycles in the Duty registers (MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB) and Buffer registers (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD). Be sure to set the same value in each pair of Duty register and Buffer register.
Only when using the double buffer function, set the output PWM duty value - 1 in the Buffer registers (MTU3.TGRE, MTU4.TGRE, MTU4.TGRF).

[7] This setting is necessary only when no dead time should be generated. Make appropriate settings in the Timer Dead Time Enable register (TDERA) so that no dead time is generated.

[8] Set the dead time in the Timer Dead Time register (TDDRA), 1/2 the carrier cycle in the Timer Cycle Data register (TCDRA) and Timer Cycle Buffer register (TCBRA), and 1/2 the carrier cycle plus the dead time in MTU3.
TGRA and MTU3.TGRC. When no dead time generation is selected, set 1 in TDDRA and 1/2 the carrier cycle + 1 in MTU3.TGRA and MTU3.TGRC.

[9] Enable or disable toggle output synchronized with the PWM cycle using bit PSYE in the timer output control register 1 (TOCR1A), and set the PWM output level with bits OLSP and OLSN. When specifying the PWM output level by using TOLBRA as a buffer for TOCR2A, see Figure 17.4.

[10] Select complementary PWM mode in the Timer Mode register 1 (MTU3.TMDR1). In addition, specify the buffer operation of the MTU3.TGRA (BFA = 1) and MTU3.TGRB (BFB = 1) when necessary. Enable the double buffer operation with the TMDR2 register only when the double buffer function is used.

[11] Set enabling/disabling of PWM waveform output pin output in the Timer Output Master Enable register (TOERA).

[12] Set the Port Function Control register (PFCm) and Port Mode Control registers (PMCm) of the I/O ports.

[13] Set bits CST3 and CST4 in TSTRA to 1 simultaneously to start the count operation.

Figure 17.48 Example of complementary PWM mode setting procedure

17.3.8.2 Outline of Complementary PWM Mode Operation

In complementary PWM mode, six phases (three positive and three negative) PWM waveforms can be output. Figure 17.49 shows counter operation in complementary PWM mode (MTU3 and MTU4), and Figure 17.50 shows an example of operation in complementary PWM mode.

(1) Counter Operation

In complementary PWM mode, three counters—MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) —in each unit perform up-/down-count operations.

MTU3.TCNT (MTU6.TCNT) is automatically initialized to the value set in TDDRA (TDDRB) when complementary PWM mode is selected and the CST bit in TSTRA (TSTRB) is 0. When the CST bit is set to 1, MTU3.TCNT (MTU6.TCNT)

counts up to the value set in MTU3.TGRA (MTU6.TGRA), then switches to down-counting when it matches MTU3.TGRA (MTU6.TGRA). When the MTU4.TCNT (MTU7.TCNT) value matches 0x0000, MTU3.TCNT (MTU6.TCNT) switches to up-counting, and the operation is repeated in this way.

MTU4.TCNT (MTU7.TCNT) should be initialized to 0x0000 after a reset. When the CST4 bit is set to 1, MTU4.TCNT (MTU7.TCNT) counts up in synchronization with MTU3.TCNT (MTU6.TCNT), and switches to down-counting when MTU3.TCNT (MTU6.TCNT) matches MTU3.TGRA (MTU6.TGRA). On reaching 0x0000, MTU4.TCNT (MTU7.TCNT) switches to up-counting, and the operation is repeated in this way.

MTU4.TCNT (MTU7.TCNT) should be initialized to 0x0000 after a reset. When the CST4 bit is set to 1, MTU4.TCNT (MTU7.TCNT) counts up in synchronization with MTU3.TCNT (MTU6.TCNT), and switches to down-counting when MTU3.TCNT (MTU6.TCNT) matches MTU3.TGRA (MTU6.TGRA).

On reaching 0x0000, MTU4.TCNT (MTU7.TCNT) switches to up-counting, and the operation is repeated in this way. TCNTSA (TCNTSB) is a read-only counter. It does not need to be initialized after a reset.

In counting up by MTU3.TCNT and MTU4.TCNT (or MTU6.TCNT and MTU7.TCNT), MTU3.TCNT (or MTU6.TCNT) starts counting up when it matches TCDRA (or TCDRB) and switches to counting down when it matches MTU3.TGRA (or MTU6.TGRA). Furthermore, when MTU4.TCNT (or MTU7.TCNT) matches TDDRA (or TDDRB), TCNTSA (or TCNTSB) is set to the value in MTU3.TGRA (or MTU6.TGRA) and counting is stopped.

When MTU4.TCNT (MTU7.TCNT) matches TDDRA (TDDRB) during down-counting of MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT), TCNTSA (TCNTSB) starts up-counting, and when MTU4.TCNT (MTU7.TCNT) matches 0x0000, the operation switches to down-counting. When MTU3.TCNT (MTU6.TCNT) matches TCDRA (TCDRB), TCNTSA (TCNTSB) becomes 0x0000 and stops counting.

TCNTSA (TCNTSB) is compared with the compare register and temporary register, in which the PWM duty is specified, only during the count operation.

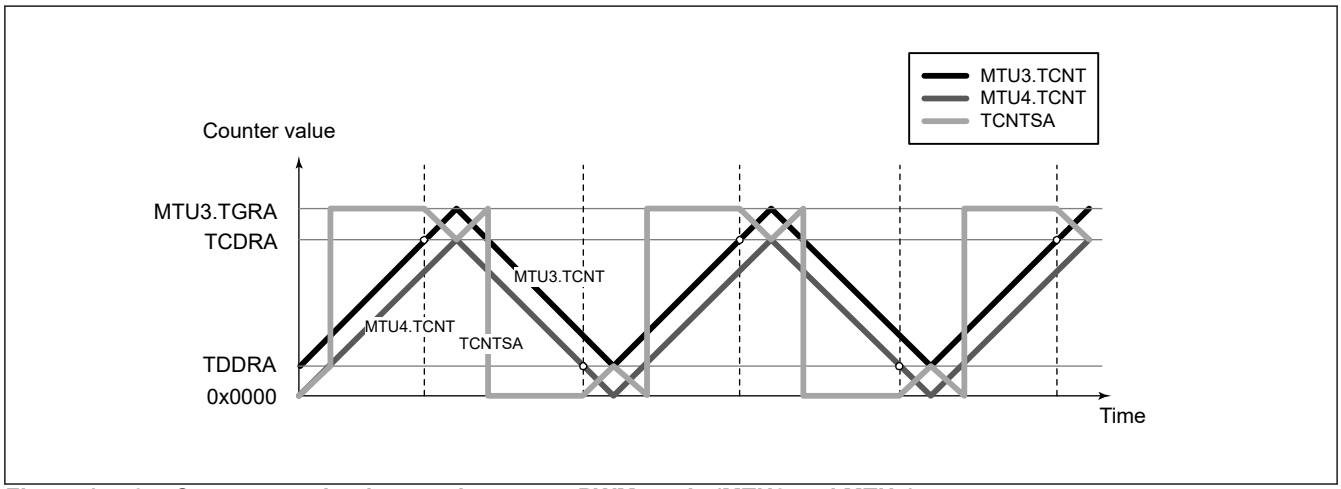

Figure 17.49 Count operation in complementary PWM mode (MTU3 and MTU4)

(2) Register Operation

In complementary PWM mode, nine registers (compare registers, buffer registers, and temporary registers) are used for each unit. Figure 17.50 shows an example of operation in complementary PWM mode (MTU3 and MTU4).

MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB) are compared with the counters to generate PWM waveforms. When these registers match the counter, the value set in the OLSN and OLSP bits in the timer output control registers (TOCR1A and TOCR1B) is output from the PWM output pin. MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD) are buffer registers for these compare registers.

When the double buffer function is used, MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF) are also used as buffer registers B. For details of double buffer operation, see (19)Double Buffer Function in Complementary PWM Mode.

Data in a compare register can be changed by writing new data to the corresponding buffer register. The buffer registers can be read or written at any time.

When modifying data in a buffer register, write to MTU4.TGRD (MTU7.TGRD) last and enable data transfer from the buffer register to a temporary register. At this time, transfer from the TCBRA (TCBRB) register and MTU3.TGRC (MTU6.TGRC) register, which operate as buffer registers for the timer period registers, to temporary registers is also enabled. Data is transferred to all five temporary registers at the same time.

When transfer is enabled in the Ta interval, data written to a buffer register is transferred to the temporary register. The data is not transferred to the temporary register in the Tb1 and Tb2 intervals. Data enabled for transfer in this interval is transferred to the temporary register at the end of this interval.

The value transferred to a temporary register is transferred to the compare register when TCNTSA (TCNTSB) for which the Tb interval ends matches MTU3.TGRA (MTU6.TGRA) while TCNTSA (TCNTSB) is counting up, or 0x0000 while counting down.

The timing for transfer from the temporary register to the compare register can be selected with bits MD[3:0] in the timer mode register 1 (TMDR1). Figure 17.50 shows an example in which the trough is selected for the transfer timing.

In the Tb interval in which data is not transferred to the temporary register (Tb1 in Figure 17.50), the temporary register has the same function as the compare register and is compared with the counter. In this interval, therefore, there are two compare match registers for one output phase; the compare register contains the pre-change data and the temporary register contains new data. In this interval, three counters MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) and two registers (compare register and temporary register) are compared, and PWM output is controlled accordingly.

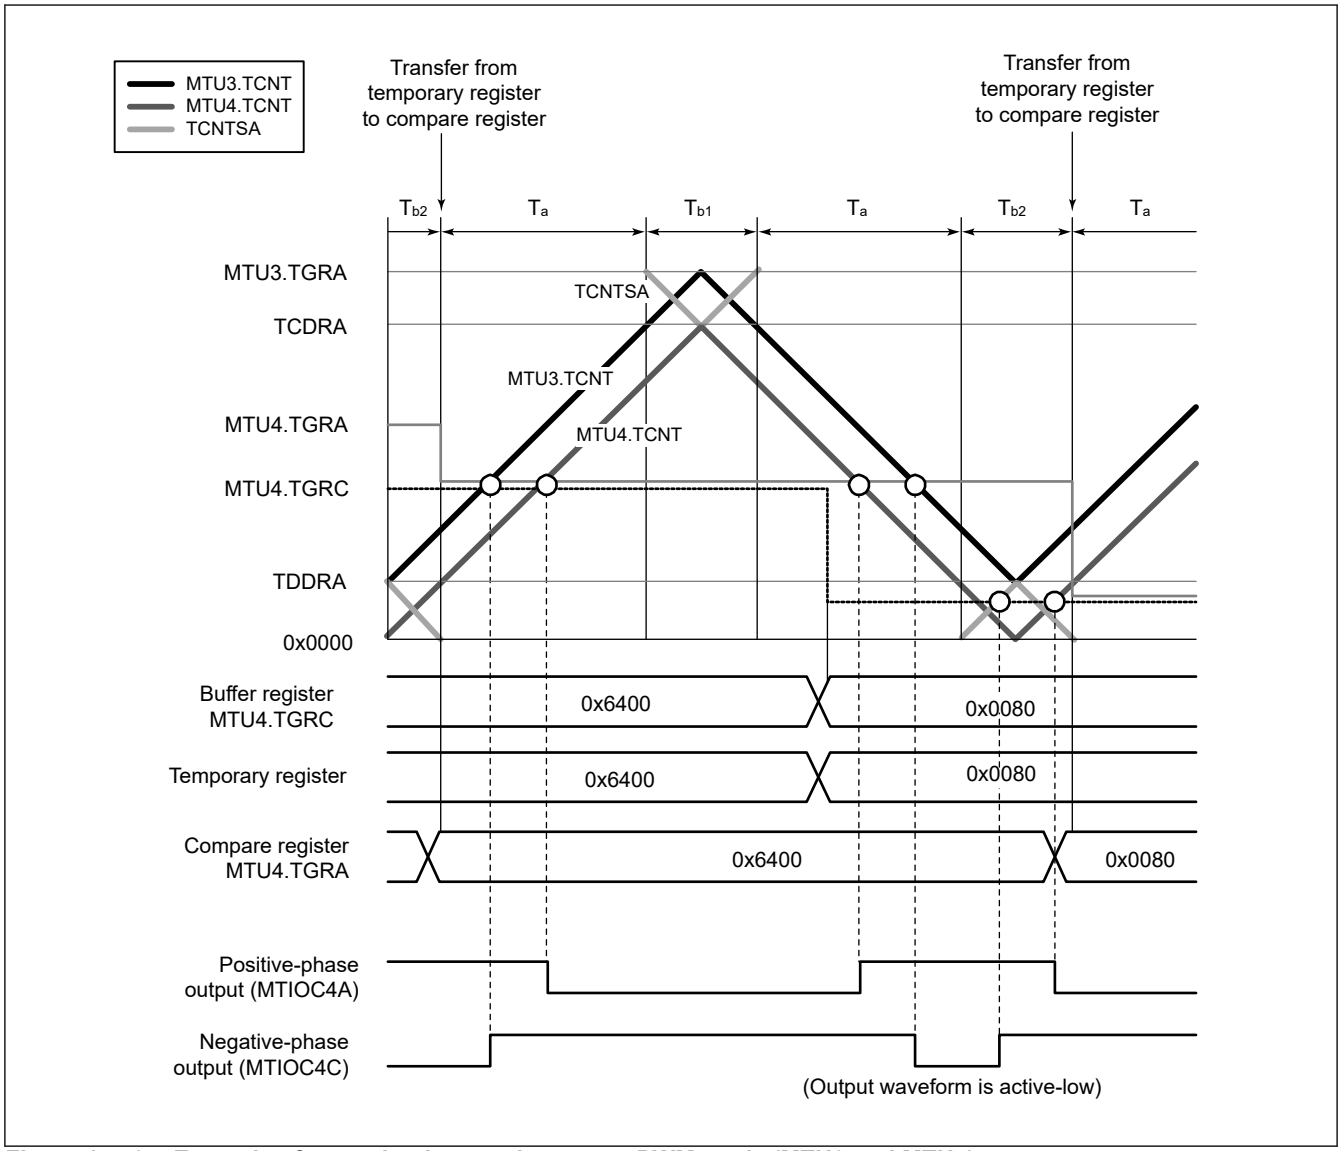

Figure 17.50 Example of operation in complementary PWM mode (MTU3 and MTU4)

(3) Initial Setting

In complementary PWM mode, there are nine registers that require initial setting. In addition, there is a register that specifies whether to generate dead time (it should be used only when dead time generation should be disabled).

Before setting complementary PWM mode with MTU3.TMDR1.MD[3:0] (MTU6.TMDR1.MD[3:0]) bits, initial values should be set in the following registers.

MTU3.TGRC (MTU6.TGRC) operates as the buffer register for MTU3.TGRA (MTU6.TGRA), and should be set with 1/2 the PWM carrier period + dead time Td. The timer cycle buffer register (TCBRA or TCBRB) operates as the buffer register for the timer cycle data register (TCDRA or TCDRB), and should be set with 1/2 the PWM carrier period. Set dead time Td in the timer dead time data register (TDDRA or TDDRB).

When dead time is not needed, the TDER bit in the timer dead time enable register (TDERA or TDERB) should be set to 0, MTU3.TGRC and MTU3.TGRA (MTU6.TGRC and MTU6.TGRA) should be set to 1/2 the PWM carrier period + 1, and TDDRA (TDDRB) should be set to 1.

Set the respective initial PWM duty values in three buffer registers A (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD)).

Set the respective (initial PWM duty − 1) values in three buffer registers B (MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF)) only when the double buffer function is used.

The values set in the five buffer registers excluding TDDRA (TDDRB) are transferred to the corresponding compare registers as soon as complementary PWM mode is set.

Set MTU4.TCNT (MTU7.TCNT) to 0x0000 before setting complementary PWM mode.

Table 17.71 Registers and counters requiring initial setting

Register and counter	Setting
TOCR1A, TOCR2A, TOCR1B, TOCR2B	PWM output level
MTU3.TGRC MTU6.TGRC	1/2 PWM carrier period + dead time Td (1/2 PWM carrier period + 1 when dead time generation is disabled by TDERA or TDERB)
TDDRA, TDDRB	Dead time Td (1 when dead time generation is disabled by TDERA or TDERB)
TCBRA, TCBRB	1/2 PWM carrier period
MTU3.TGRD, MTU4.TGRC, MTU4.TGRD MTU6.TGRD, MTU7.TGRC, MTU7.TGRD	Initial PWM duty ratio value for each phase
MTU3.TGRE, MTU4.TGRE, MTU4.TGRF MTU6.TGRE, MTU7.TGRE, MTU7.TGRF	Initial PWM duty ratio − 1 value for each phase (only when double buffer function is used)
MTU4.TCNT MTU7.TCNT	0x0000

Note: The value set in MTU3.TGRC (MTU6.TGRC) should be the sum of 1/2 the PWM carrier period set in TCBRA (TCBRB) and dead time Td set in TDDRA (TDDRB). When dead time generation is disabled by TDERA (TDERB), TGRC should be set to 1/2 the PWM carrier period + 1.

(4) PWM Output Level Setting

In complementary PWM mode, the PWM output level is set with bits OLSN and OLSP in timer output control register 1 (TOCR1A or TOCR1B) or bits OLS1P to OLS3P and OLS1N to OLS3N in timer output control register 2 (TOCR2A or TOCR2B).

The output level can be set for each of the three positive phases and three negative phases of 6-phase output.

Complementary PWM mode should be cleared before setting or changing output levels.

(5) Dead Time Setting

In complementary PWM mode, dead time can be set for PWM output.

The dead time is set in the timer dead time data register (TDDRA or TDDRB). The value set in TDDRA (TDDRB) is used as the MTU3.TCNT (MTU6.TCNT) counter start value and creates a non-overlapping interval between MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT). Complementary PWM mode should be cleared before changing the contents of TDDRA (TDDRB).

(6) Dead Time Suppressing

Dead time generation is suppressed by setting the TDER bit in the timer dead time enable register (TDERA or TDERB) to 0. TDERA (TDERB) can be set to 0 only when 0 is written to it after reading TDER = 1.

MTU3.TGRA and MTU3.TGRC (MTU6.TGRA and MTU6.TGRC) should be set to 1/2 PWM carrier period + 1 and the timer dead time data register (TDDRA or TDDRB) should be set to 1.

By the above settings, PWM waveforms without dead time can be obtained. Figure 17.51 shows an example of operation without dead time (MTU3 and MTU4).

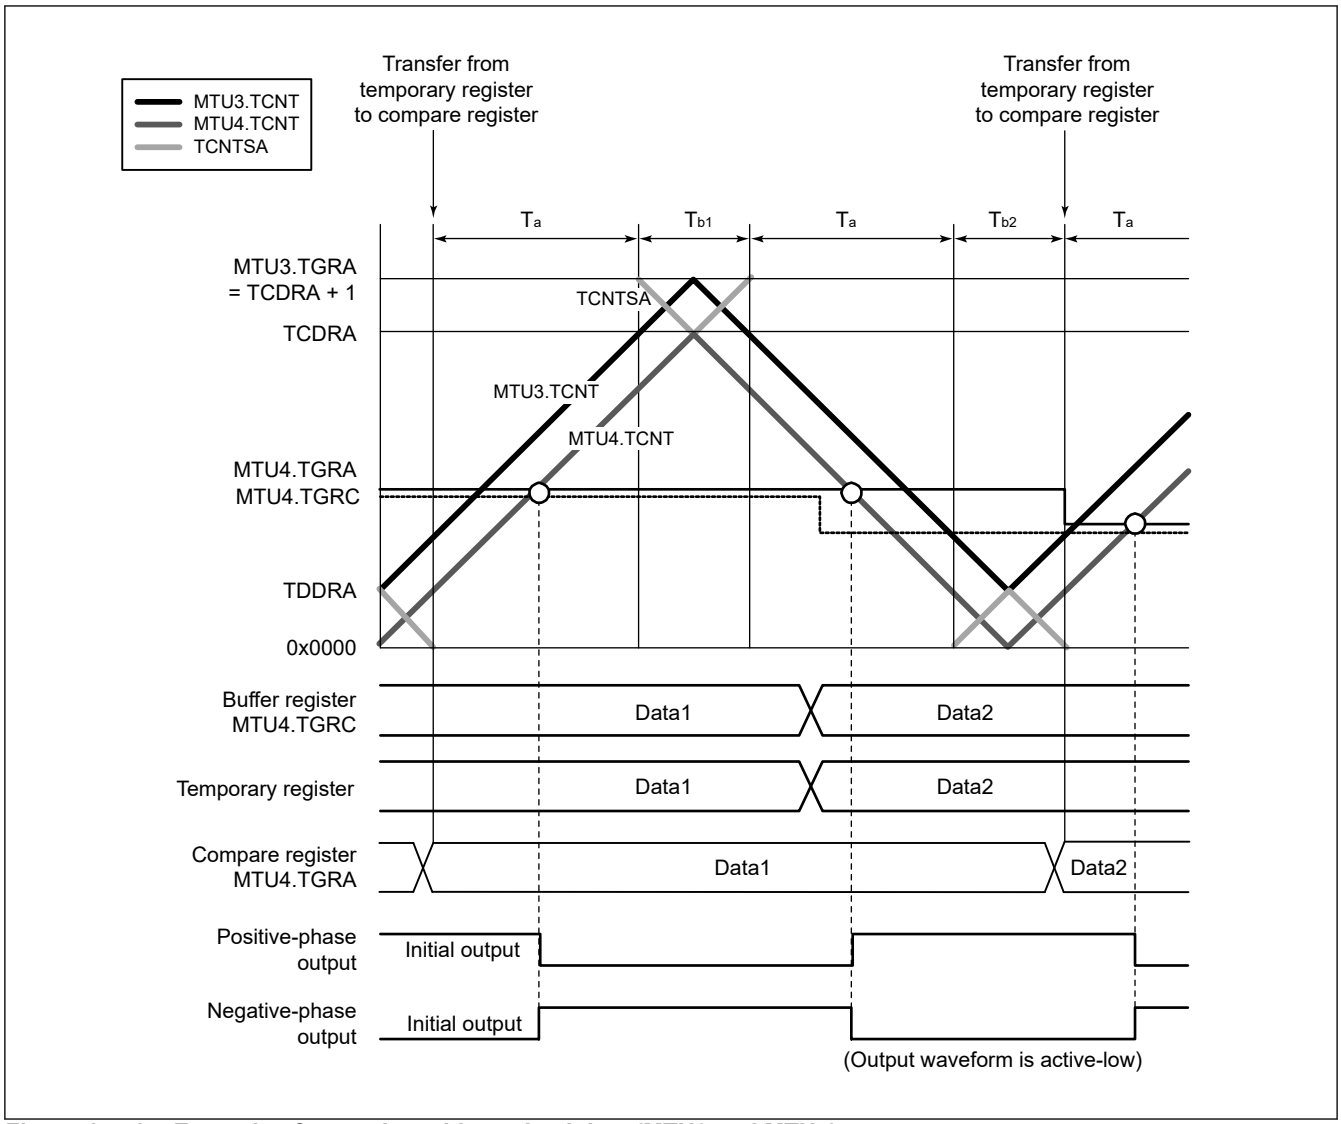

Figure 17.51 Example of operation without dead time (MTU3 and MTU4)

(7) PWM Cycle Setting

In complementary PWM mode, the PWM period is set in two registers—MTU3.TGRA (MTU6.TGRA), in which the MTU3.TCNT (MTU6.TCNT) upper limit value is set, and TCDRA (TCDRB), in which the MTU4.TCNT (MTU7.TCNT) upper limit value is set. The settings should be made so as to achieve the following relationship between these two registers:

With dead time: MTU3.TGRA (MTU6.TGRA) setting = TCDRA (TCDRB) setting + TDDRA (TDDRB) setting

Without dead time: MTU3.TGRA (MTU6.TGRA) setting = TCDRA (TCDRB) setting + 1

In addition, the settings should be made so as to achieve the following relationship between the TCDRA (TCDRB) register and the TDDRA (TDDRB) register:

TCDRA (TCDRB) setting > TDDRA (TDDRB) setting × 2 + 2

The MTU3.TGRA and TCDRA (MTU6.TGRA and TCDRB) settings are made by setting values in buffer registers MTU3.TGRC and TCBRA (MTU6.TGRC and TCBRB). The values set in MTU3.TGRC and TCBRA (MTU6.TGRC and TCBRB) are transferred simultaneously to MTU3.TGRA and TCDRA (MTU6.TGRA and TCDRB) with the transfer timing selected with bits MD[3:0] in the timer mode register 1 (TMDR1).

The new PWM period is reflected from the next cycle when data is updated at the crest, or from the current cycle when updated in the trough. Figure 17.52 shows the operation when the PWM period is updated at the crest.

See the following section, (8)Register Data Updating, for the method of updating the data in each buffer register.

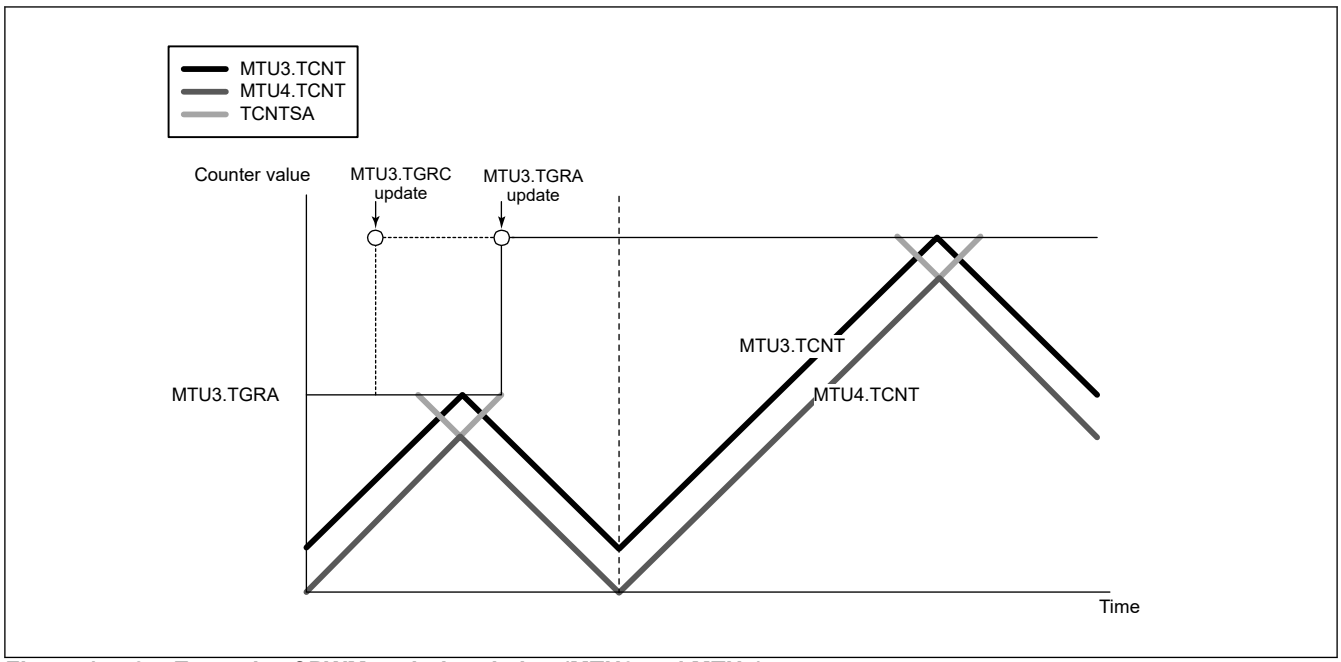

Figure 17.52 Example of PWM period updating (MTU3 and MTU4)

(8) Register Data Updating

In complementary PWM mode, the buffer register is used to update the data in a compare register. The update data can be written to the buffer register at any time. There are five registers (PWM duty and carrier cycle registers) that have buffer registers and can be updated during operation.

There is a temporary register between each of these registers and its buffer register. While subcounter TCNTSA (TCNTSB) is not counting, if buffer register data is updated, the temporary register value also changes. Data is not transferred from buffer registers to temporary registers while TCNTSA (TCNTSB) is counting; in this case, the value written to a buffer register is transferred after TCNTSA (TCNTSB) halts.

The temporary register value is transferred to the compare register at the data update timing set with bits MD[3:0] in the timer mode register 1 (TMDR1). Figure 17.53 shows an example of data updating in complementary PWM mode (MTU3 and MTU4). This example shows the mode in which data is updated at both the counter crest and trough.

When updating buffer register data, be sure to write to MTU4.TGRD (MTU7.TGRD) at the end of the update. Data is transferred from buffer registers to the temporary registers simultaneously for all five registers after the write to MTU4.TGRD (MTU7.TGRD).

Even when not updating all five registers or when not updating the MTU4.TGRD (MTU7.TGRD) data, be sure to write to MTU4.TGRD (MTU7.TGRD) after writing data to the registers to be updated. In this case, the data written to MTU4.TGRD (MTU7.TGRD) should be the same as the data prior to the write operation.

See (19)Double Buffer Function in Complementary PWM Mode, for data updating when the double buffer function is used.

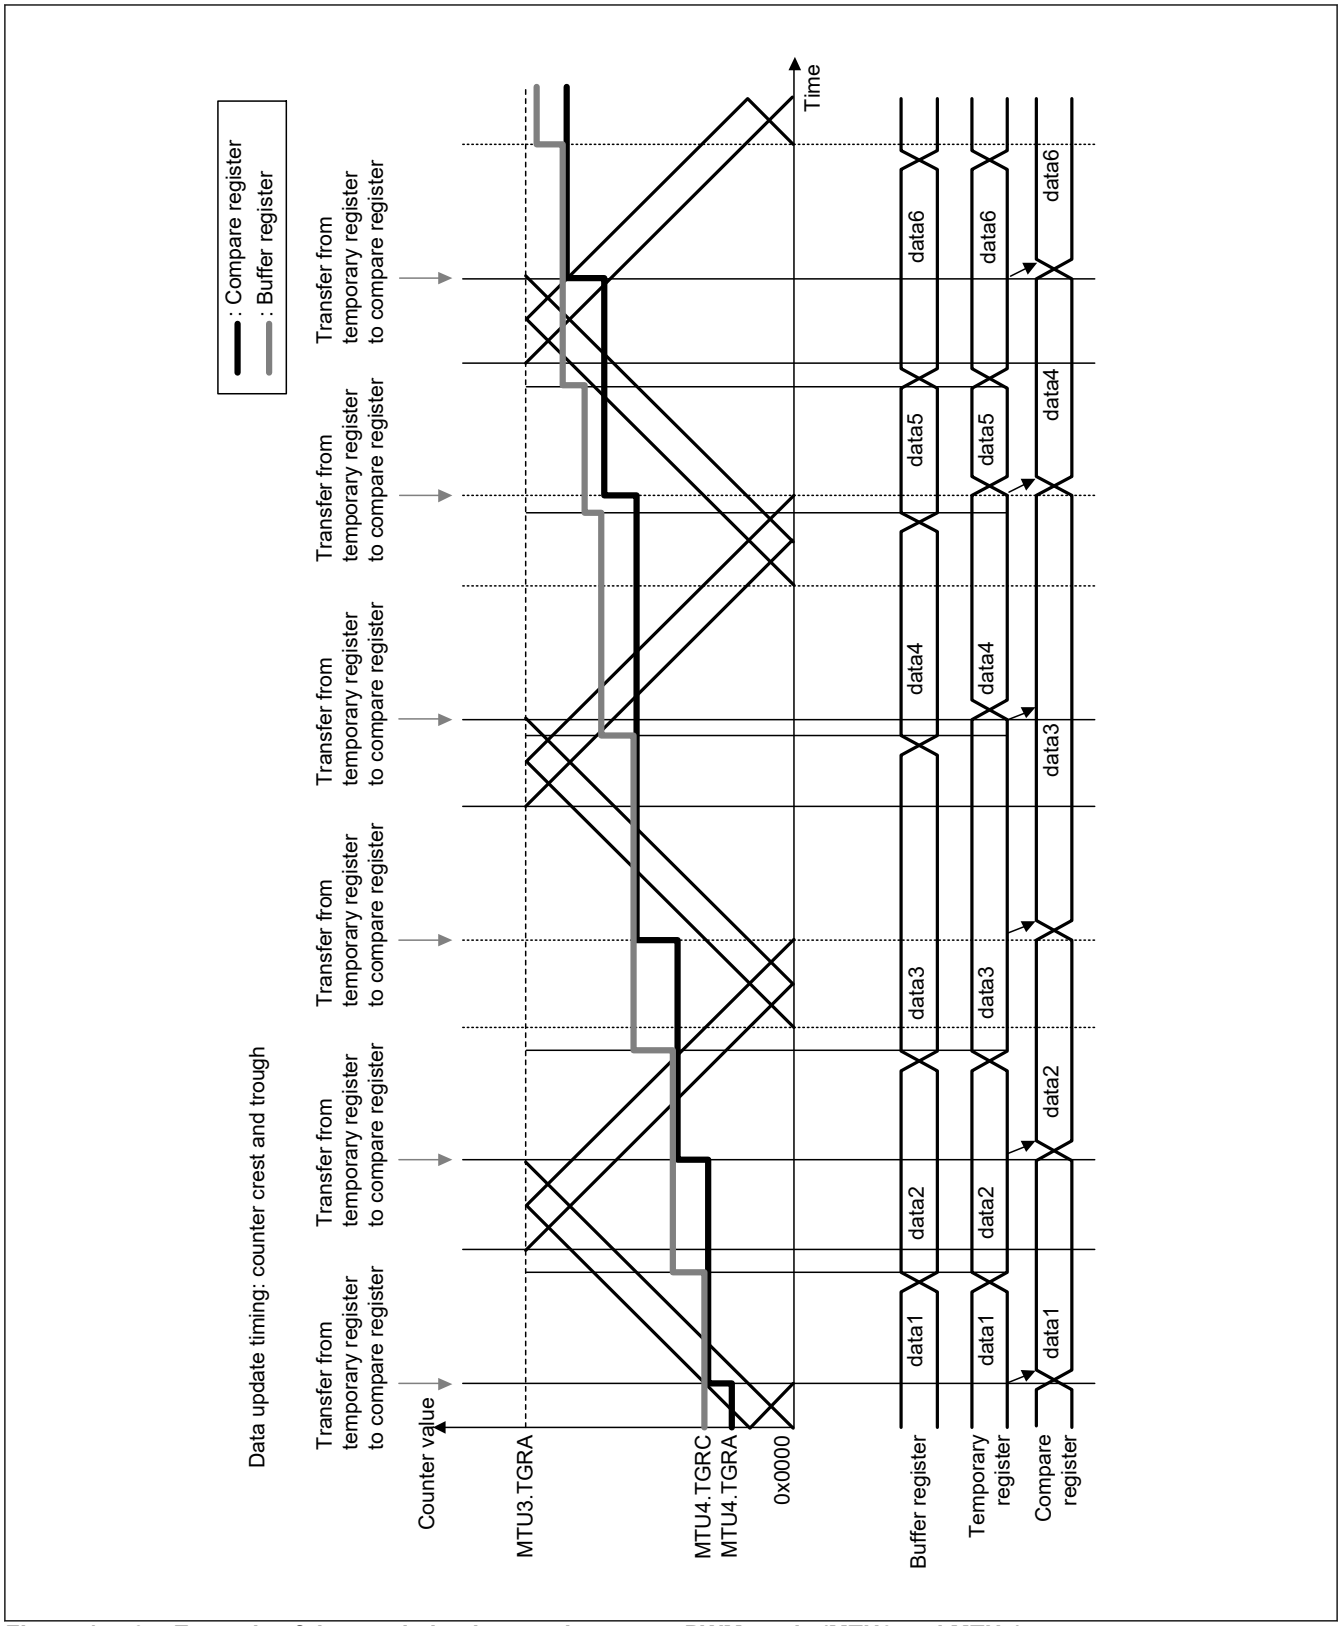

Figure 17.53 Example of data updating in complementary PWM mode (MTU3 and MTU4)

(9) Initial Output in Complementary PWM Mode

In complementary PWM mode, the initial output is determined by the setting of bits OLSN and OLSP in timer output control register 1 (TOCR1A or TOCR1B) or bits OLS1N to OLS3N and OLS1P to OLS3P in timer output control register 2 (TOCR2A or TOCR2B).

This initial output is the non-active level of the PWM pulse and continues from when complementary PWM mode is set with the timer mode register 1 (TMDR1) until MTU4.TCNT (MTU7.TCNT) exceeds the value set in the Timer dead time data register (TDDRA or TDDRB). Figure 17.54 shows an example of the initial output in complementary PWM mode.

An example of the waveform when the initial PWM duty ratio value is smaller than the TDDRA value is shown in Figure 17.55.

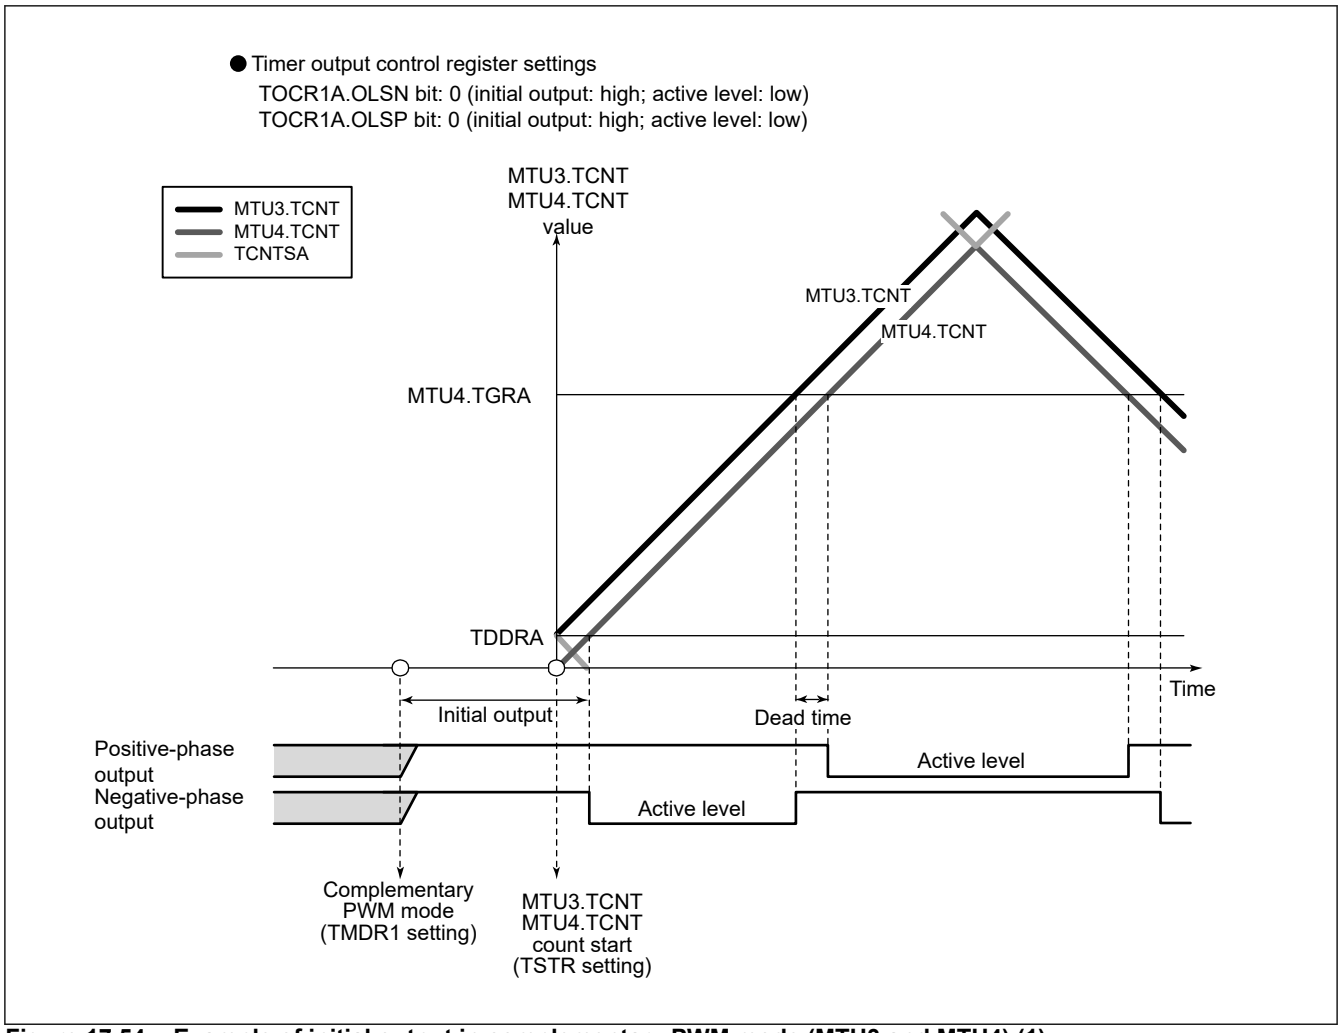

Figure 17.54 Example of initial output in complementary PWM mode (MTU3 and MTU4) (1)

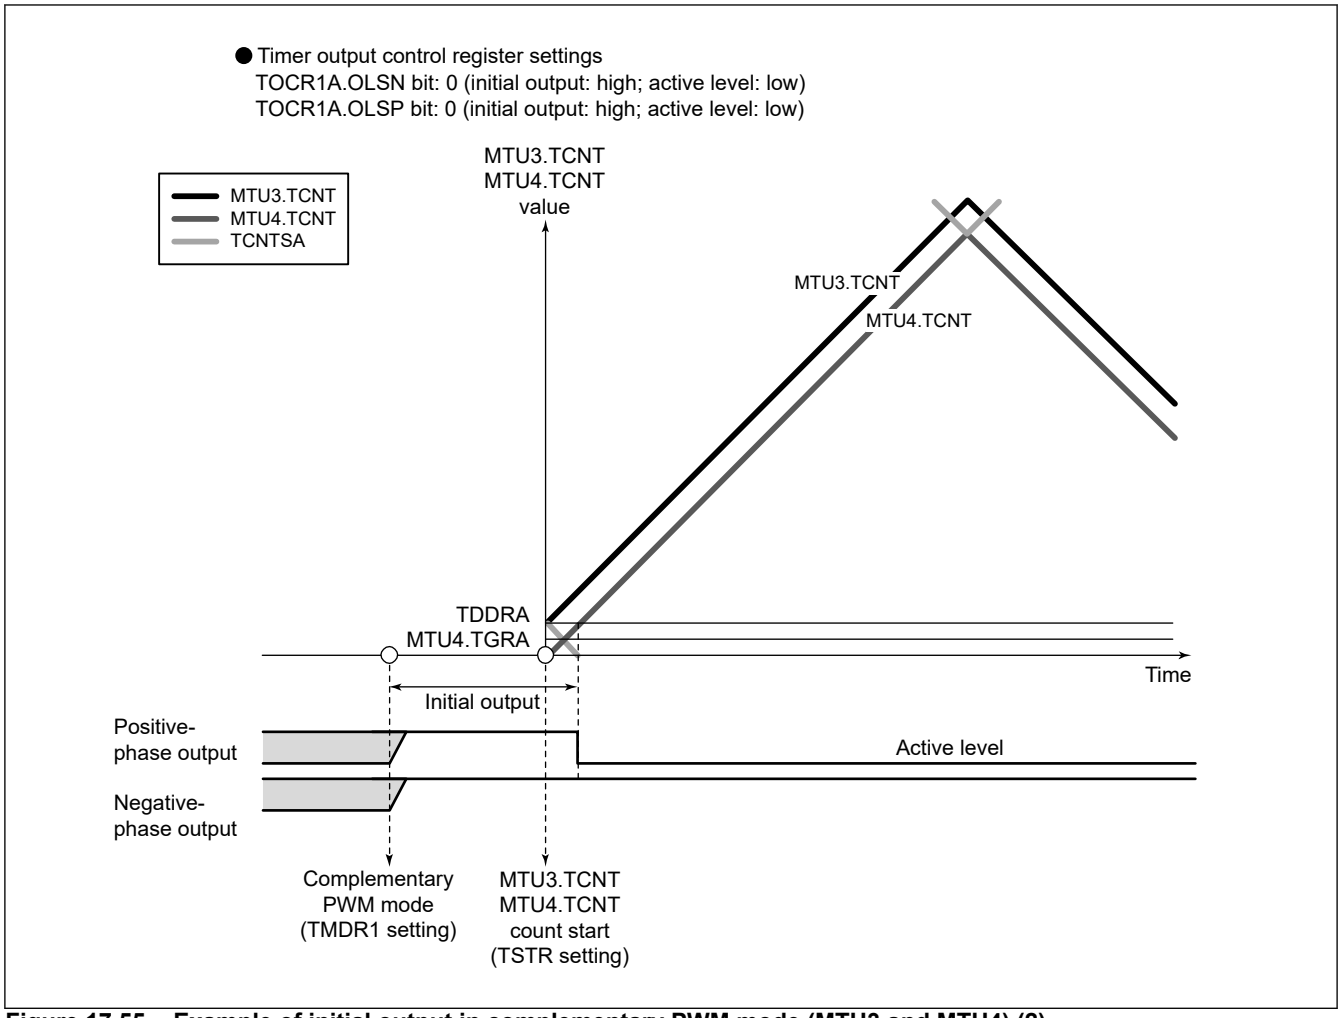

Figure 17.55 Example of initial output in complementary PWM mode (MTU3 and MTU4) (2)

(10) Method for Generating PWM Output in Complementary PWM Mode

In complementary PWM mode, six waveforms of three-phase PWM waveforms can be output. Dead time can be set for PWM waveforms to be output.

A PWM waveform is generated by output of the level selected in the Timer Output Control register in the event of a compare match between a counter and a compare register. While TCNTSA (TCNTSB) is counting, the compare register and temporary register values are simultaneously compared to create consecutive PWM pulses from 0 to 100% duty ratio. The relative timing of turn-on and turn-off compare match occurrence may vary, but the compare match that turns off each phase takes precedence to secure the dead time and ensure that the positive-phase and negative-phase turn-on times do not overlap. Figure 17.56 to Figure 17.58 show examples of waveform generation in complementary PWM mode.

The positive-phase and negative-phase turn-off timing is generated by a compare match with the counter indicated by a solid line, and the turn-on timing is generated by a compare match with the counter indicated by a dotted line, which operates with a delay equal to the dead time behind the counter indicated by a solid line. In the T1 period, compare match a that turns off the negative phase has the highest priority, and compare matches before a are ignored. In the T2 period, compare match c that turns off the positive phase has the highest priority, and compare matches before c are ignored.

In most cases, compare matches occur in the order a → b → c → d (or c → d → a' → b') as shown in Figure 17.56.

If compare matches deviate from the a → b → c → d order, since the time for which the negative phase is off is shorter than twice the dead time, the positive phase is not turned on. If compare matches deviate from the c → d → a' → b' order, since the time for which the positive phase is off is shorter than twice the dead time, the negative phase is not turned on.

As shown in Figure 17.57, if compare match c follows compare match a before compare match b, compare match b is ignored and the negative phase is turned on by compare match d. This is because turning off the positive phase has priority due to the occurrence of compare match c (positive-phase off timing) before compare match b (positive-phase on timing) (consequently, the waveform does not change because the positive phase goes from off to off).

Similarly, in the example in Figure 17.58, compare match a' with new data in the temporary register occurs before compare-match c, but until compare-match c, which turns off the positive phase, other compare matches are ignored. As a result, the negative phase is not turned on.

Thus, in complementary PWM mode, compare matches at turn-off timings take precedence, and turn-on timing compare matches that occur before a turn-off timing compare match are ignored.

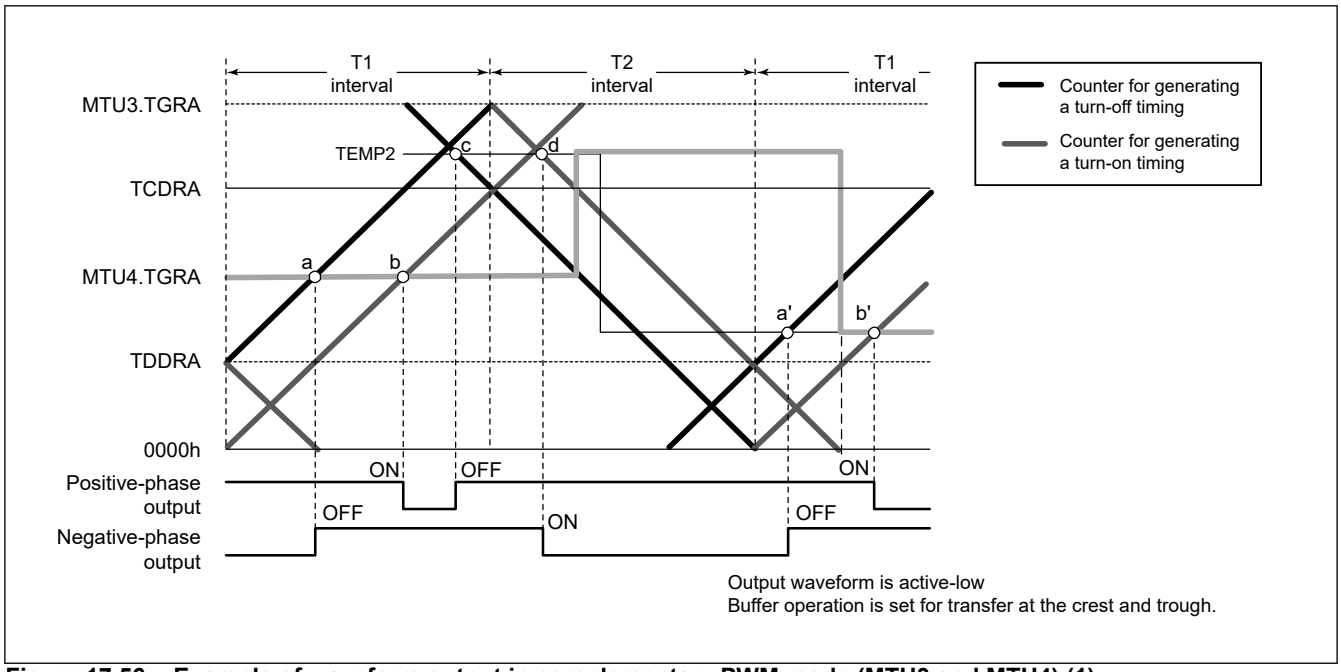

Figure 17.56 Example of waveform output in complementary PWM mode (MTU3 and MTU4) (1)

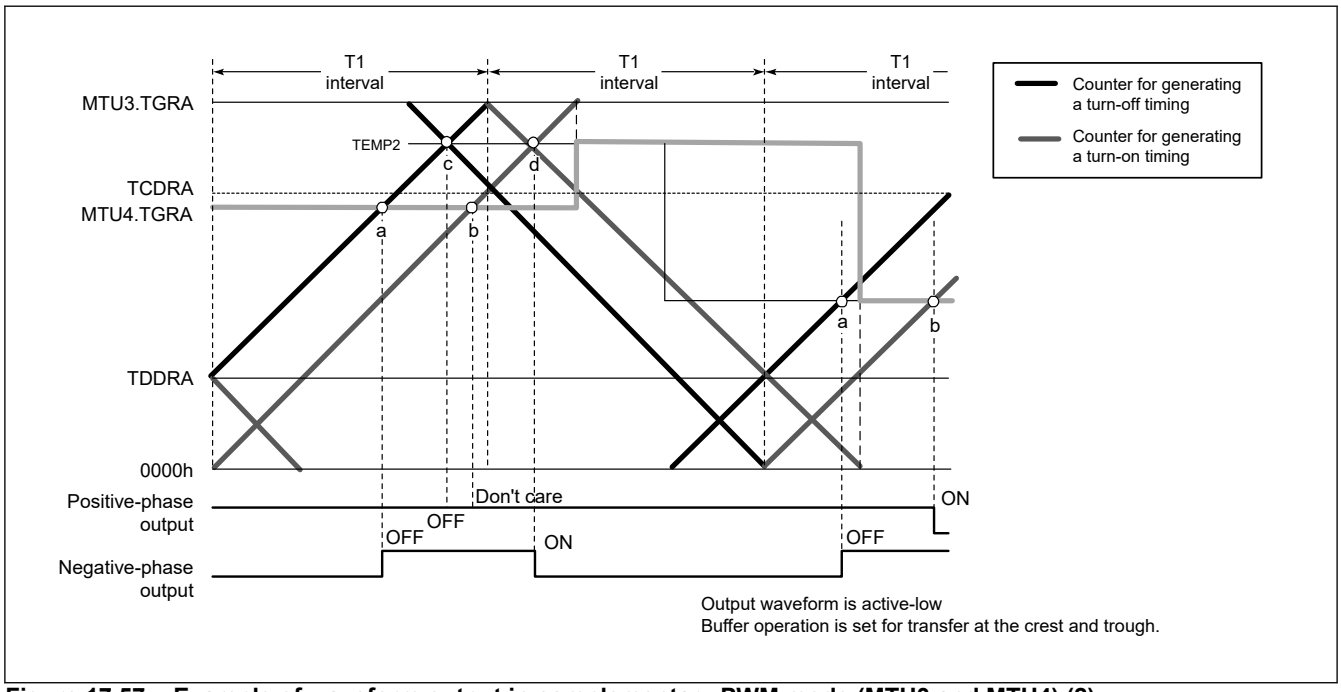

Figure 17.57 Example of waveform output in complementary PWM mode (MTU3 and MTU4) (2)

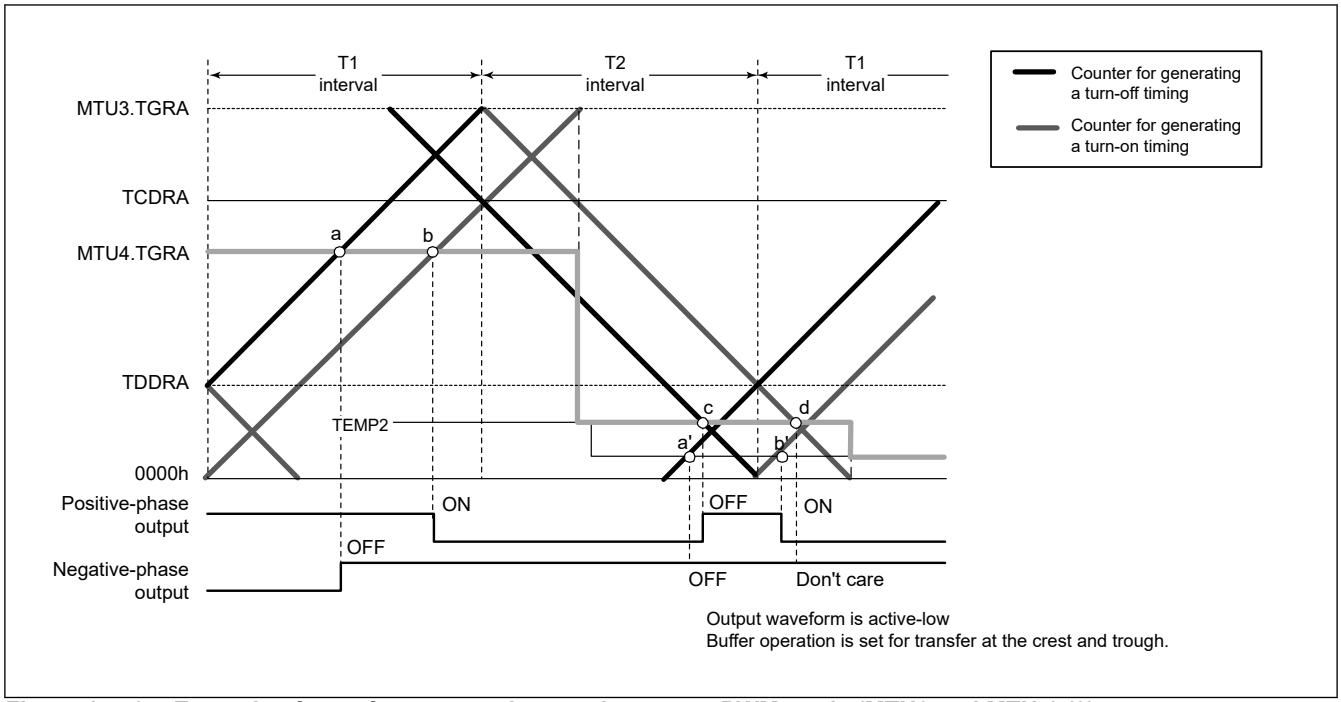

Figure 17.58 Example of waveform output in complementary PWM mode (MTU3 and MTU4) (3)

(11) 0% and 100% Duty Ratio Output in Complementary PWM Mode

In complementary PWM mode, 0% and 100% duty PWM waveforms can be output as required. Figure 17.59 to Figure 17.63 show output examples.

A 100% duty waveform is output when the compare register value is set to 0x0000. The waveform in this case has a positive phase with a 100% on-state. A 0% duty waveform is output when the compare register value is set to the same value as MTU3.TGRA (MTU6.TGRA). The waveform in this case has a positive phase with a 100% off-state.

Turn-on and turn-off compare matches occur simultaneously, but if a turn-on compare match and turn-off compare match for the same phase occur simultaneously, both compare matches are ignored and the waveform does not change.

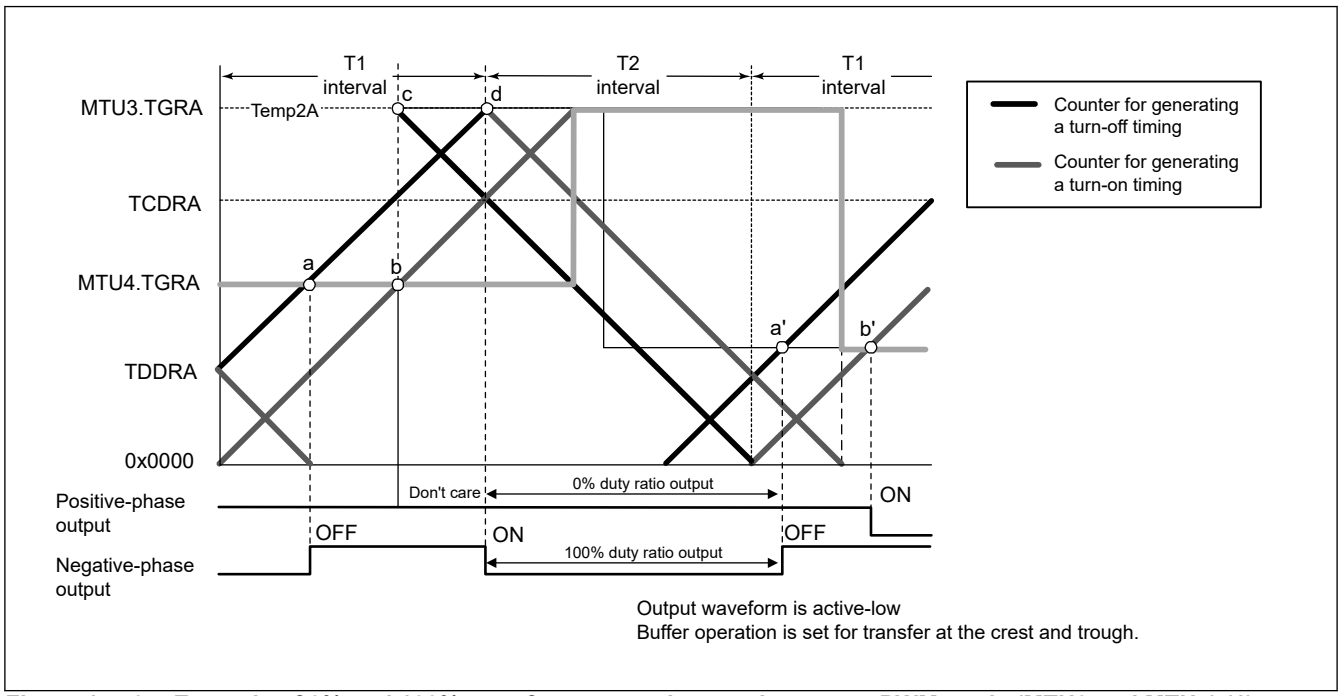

Figure 17.59 Example of 0% and 100% waveform output in complementary PWM mode (MTU3 and MTU4) (1)

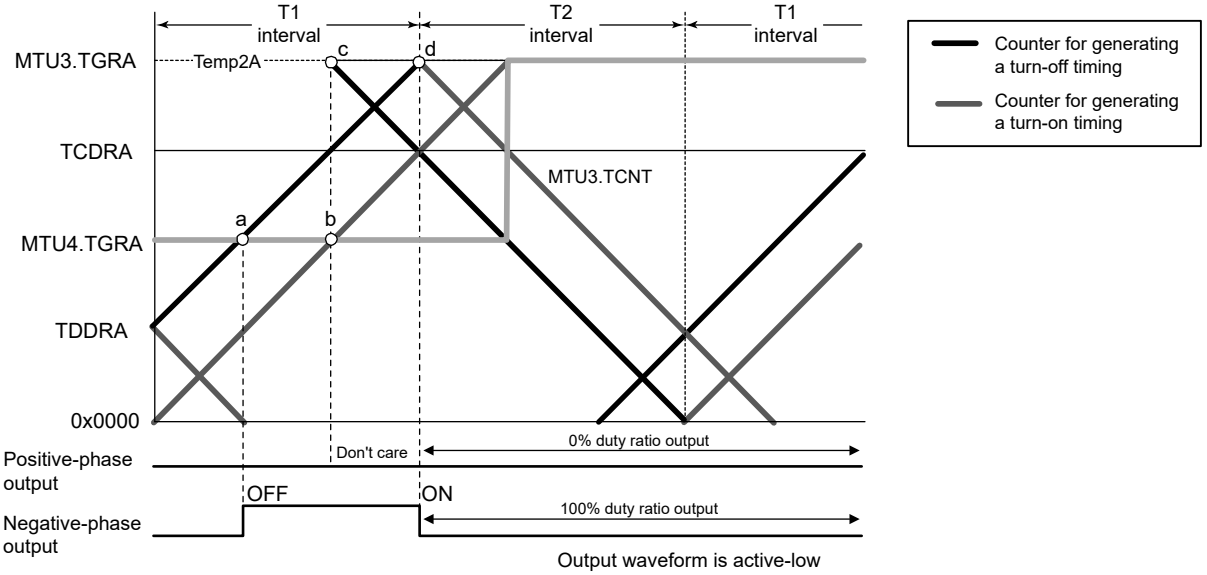

Figure 17.61 Example of 0% and 100% waveform output in complementary PWM mode (MTU3 and MTU4) (3)

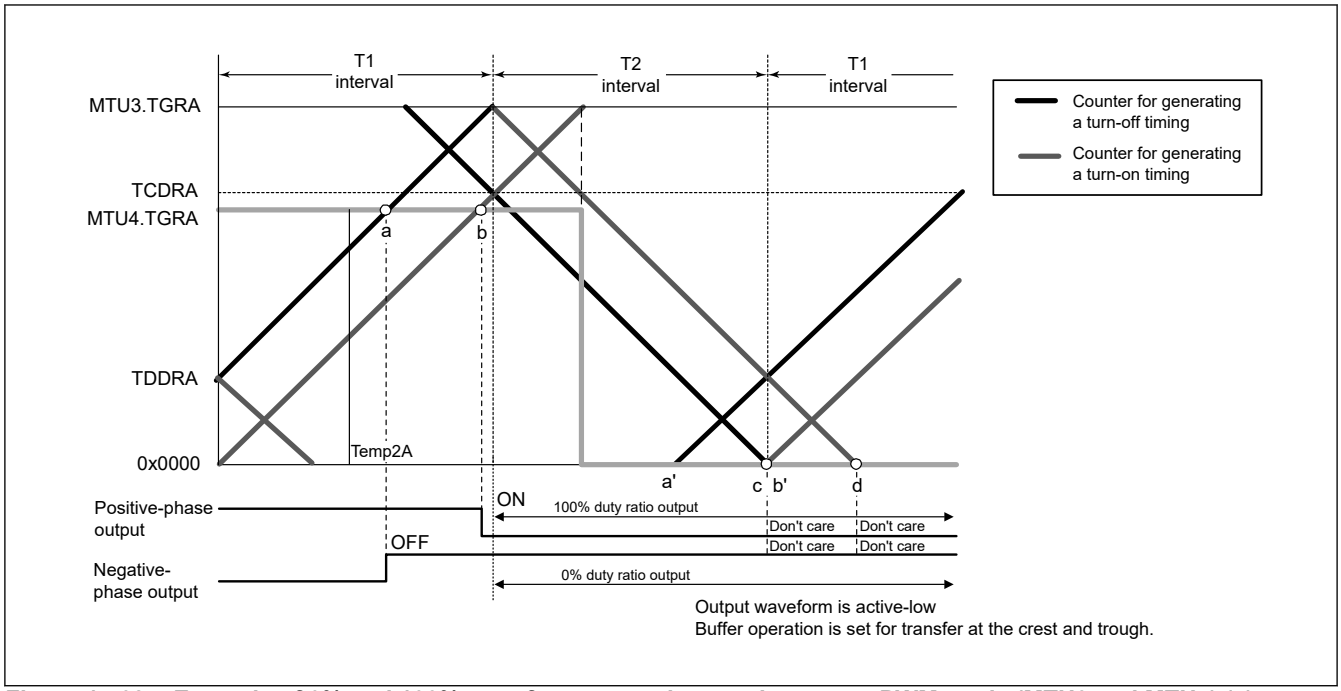

Figure 17.62 Example of 0% and 100% waveform output in complementary PWM mode (MTU3 and MTU4) (4)

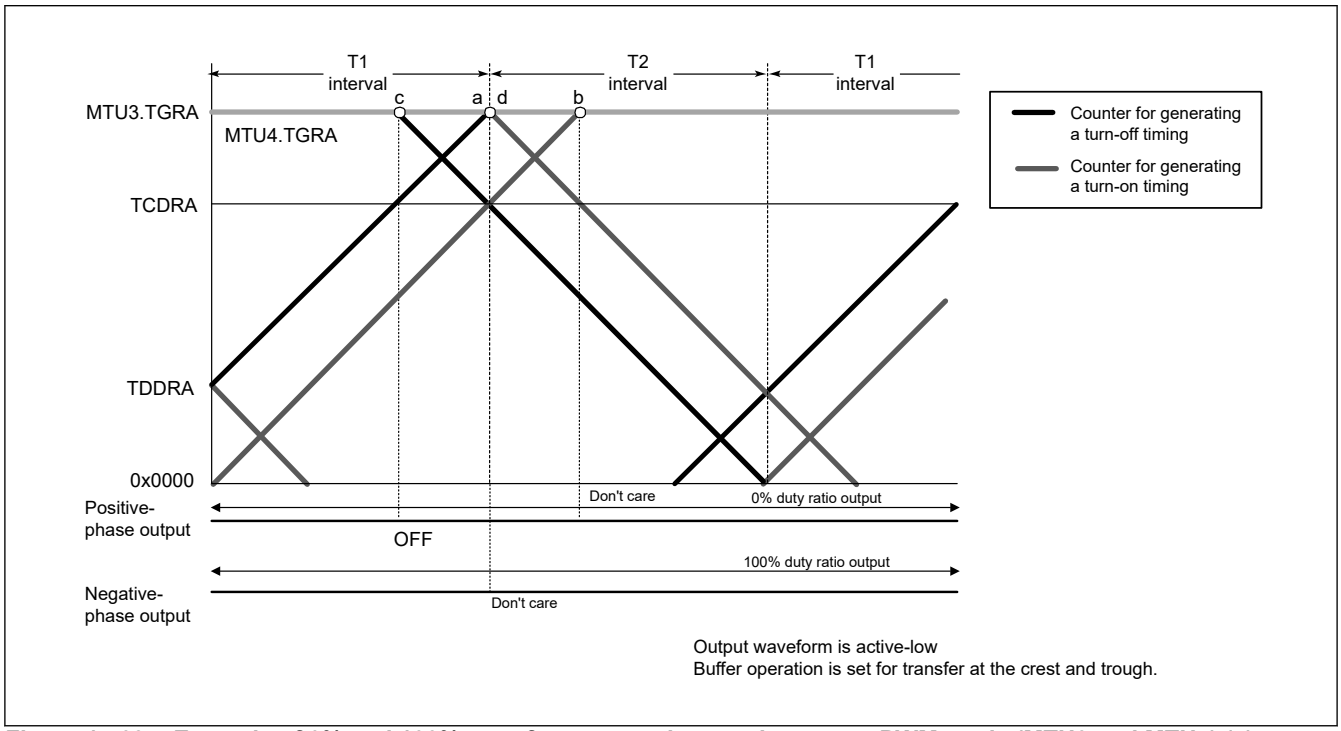

Figure 17.63 Example of 0% and 100% waveform output in complementary PWM mode (MTU3 and MTU4) (5)

(12) Toggle Output Synchronized with PWM Period

In complementary PWM mode, toggle output from the PWM output pin in synchronization with the PWM carrier period can be generated by setting the PSYE bit in the TOCR1A (TOCR1B) register to 1. An example of a toggle output waveform is shown in Figure 17.64.

This output is toggled by a compare match between MTU3.TCNT and MTU3.TGRA (MTU6.TCNT and MTU6.TGRA) and a compare match between MTU4.TCNT (MTU7.TCNT) and 0x0000.

The MTIOC3A (MTIOC6A) pin is assigned for this toggle output. The initial output is high-level.

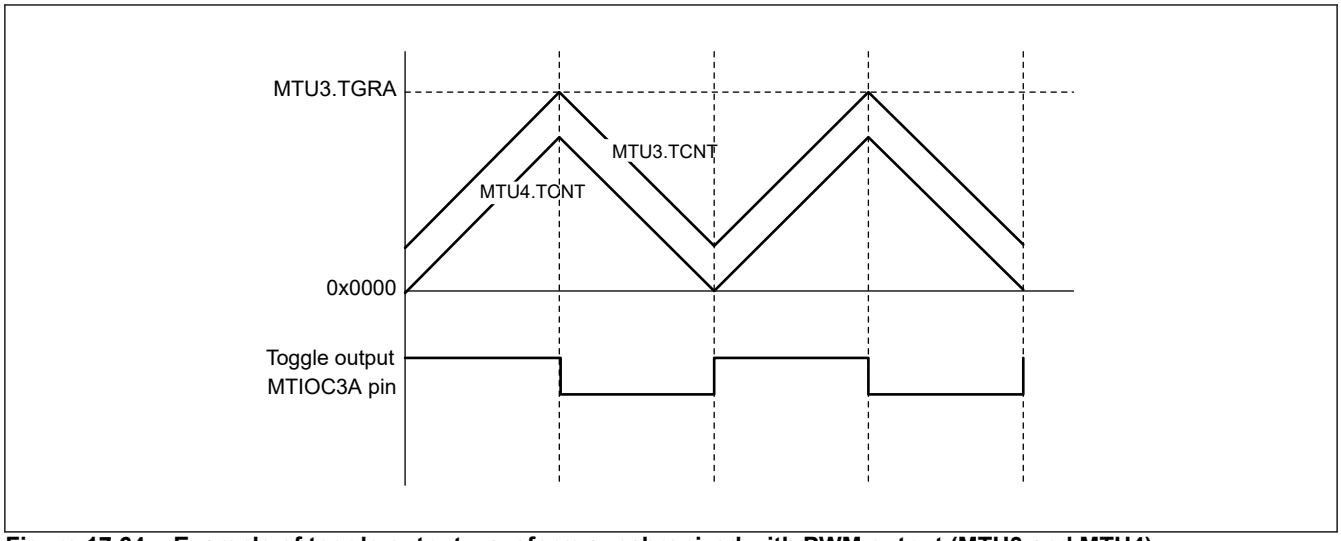

Figure 17.64 Example of toggle output waveform synchronized with PWM output (MTU3 and MTU4)

(13) Counter Clearing by Another Channel

In complementary PWM mode, MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) can be cleared by another channel when a mode for synchronization with another channel is specified through the timer synchronous register (TSYRA or TSYRB)) and synchronous clearing is selected with bits CCLR[2:0] in the timer control register (TCR).

Figure 17.65 shows an example of this operation.

Use of this function enables a counter to be cleared and restarted through an external signal.

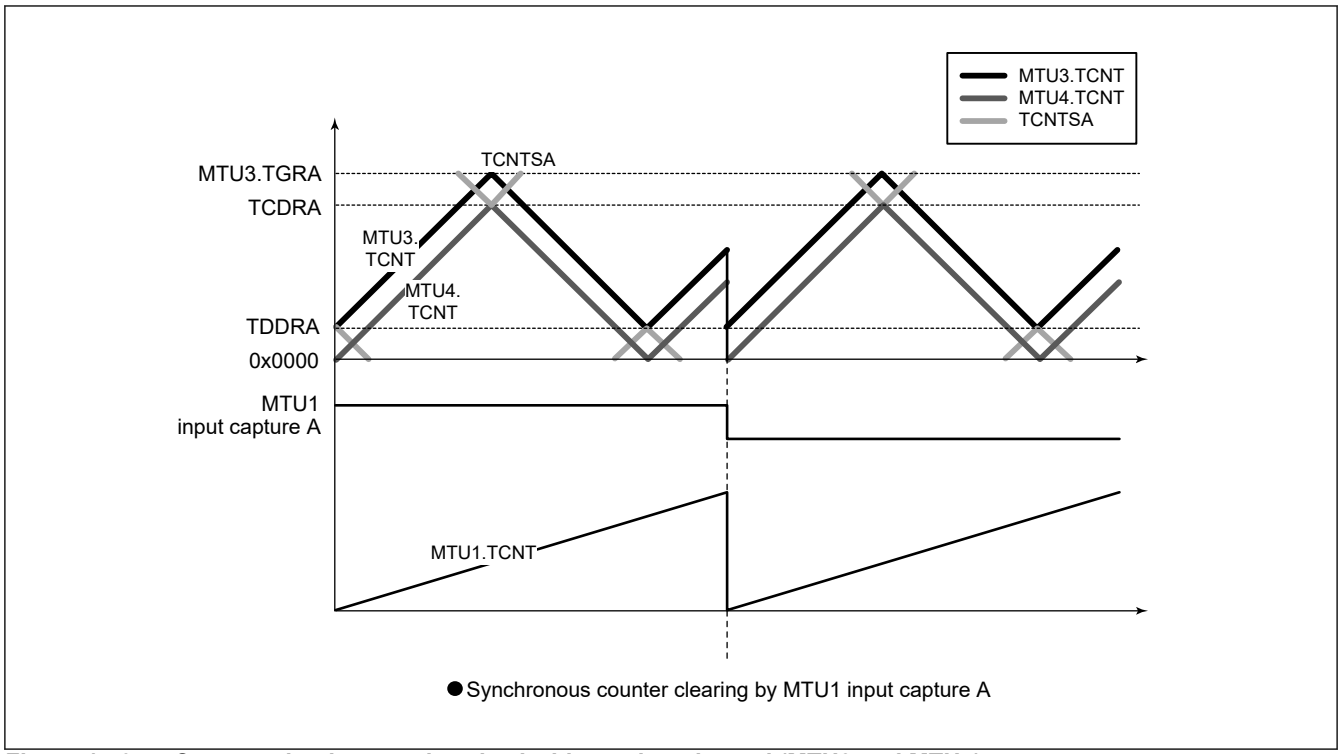

Figure 17.65 Counter clearing synchronized with another channel (MTU3 and MTU4)

(14) Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

Setting the WRE bit in TWCRA (TWCRB) to 1 suppresses initial output when synchronous counter clearing occurs in the Tb interval at the trough in complementary PWM mode and controls abrupt change in duty cycle at synchronous counter clearing.

Initial output suppression through the WRE bit = 1 is applicable only when synchronous clearing occurs in the Tb interval at the trough as indicated by (10) or (11) in Figure 17.66. When synchronous clearing occurs outside that interval, the initial value specified by the OLSN and OLSP bits in TOCR1A (TOCR1B) is output. Even in the Tb interval at the trough, if synchronous clearing occurs in the initial value output period (indicated by (1) in Figure 17.66) immediately after the counters start operation, initial value output is not suppressed.

This function can be used in both channel combinations of MTU3 and MTU4, and MTU6 and MTU7. In MTU3 and MTU4, synchronous clearing generated in MTU0 to MTU2 can cause counter clearing; in MTU6 and MTU7, compare match or input capture in any of MTU0 to MTU2 can cause counter clearing.

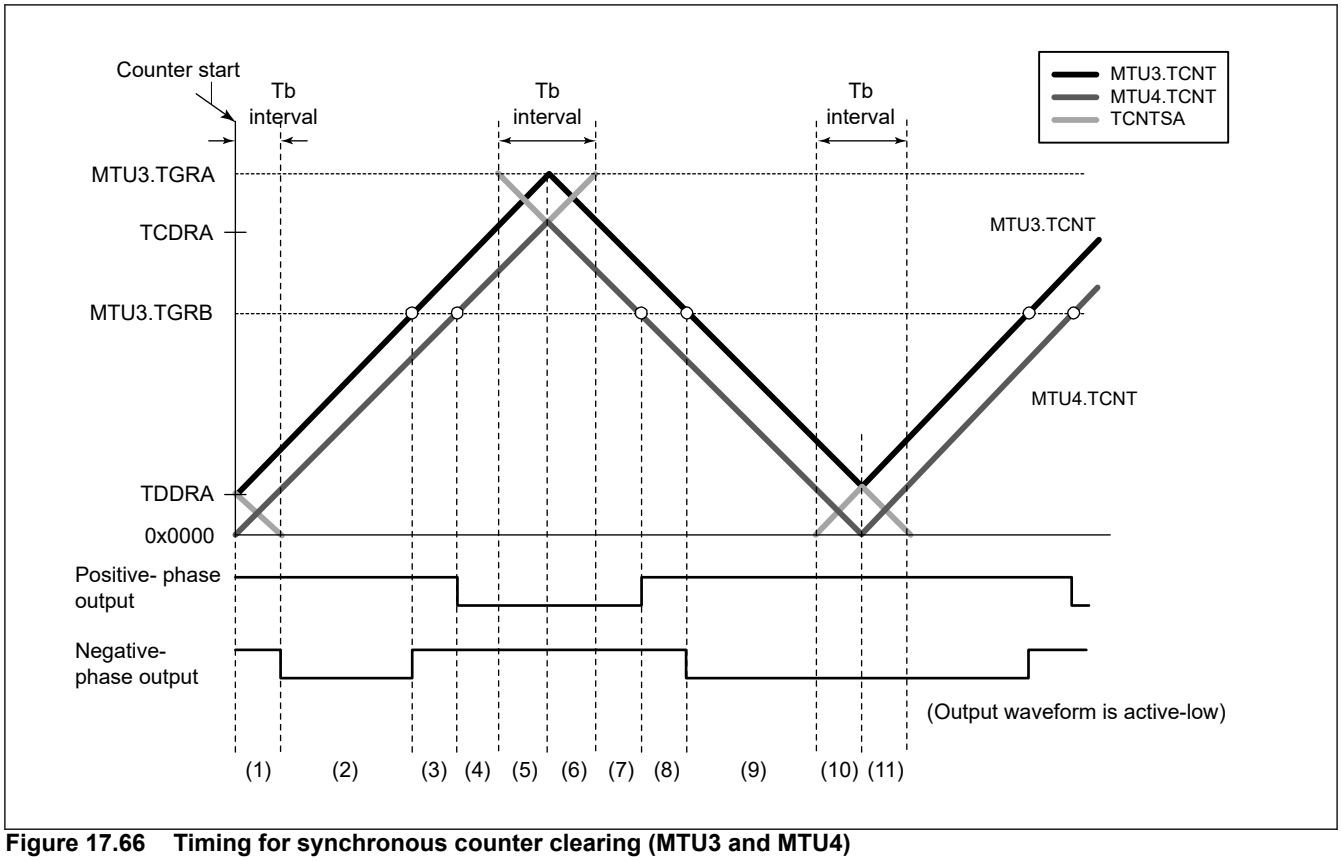

Figure 17.66 Timing for synchronous counter clearing (MTU3 and MTU4)

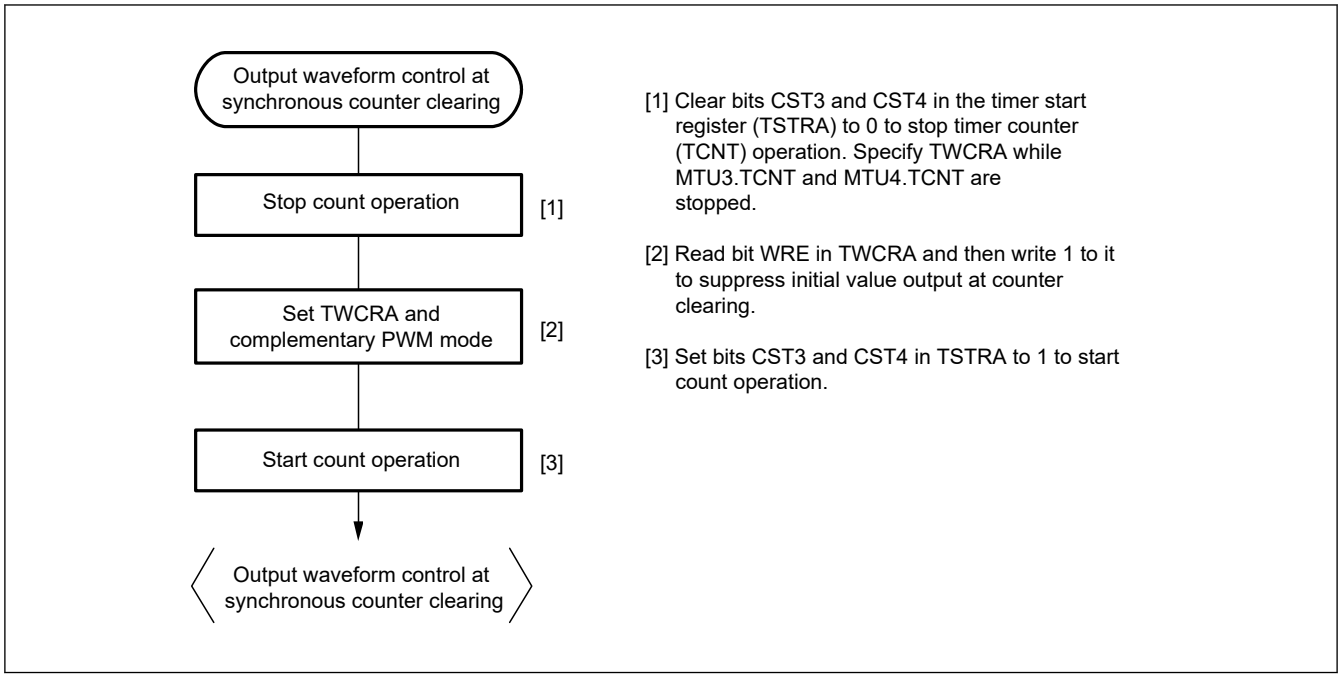
Example of Procedure for Setting Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

An example of the procedure for setting output waveform control at synchronous counter clearing in complementary PWM mode is shown in Figure 17.67.



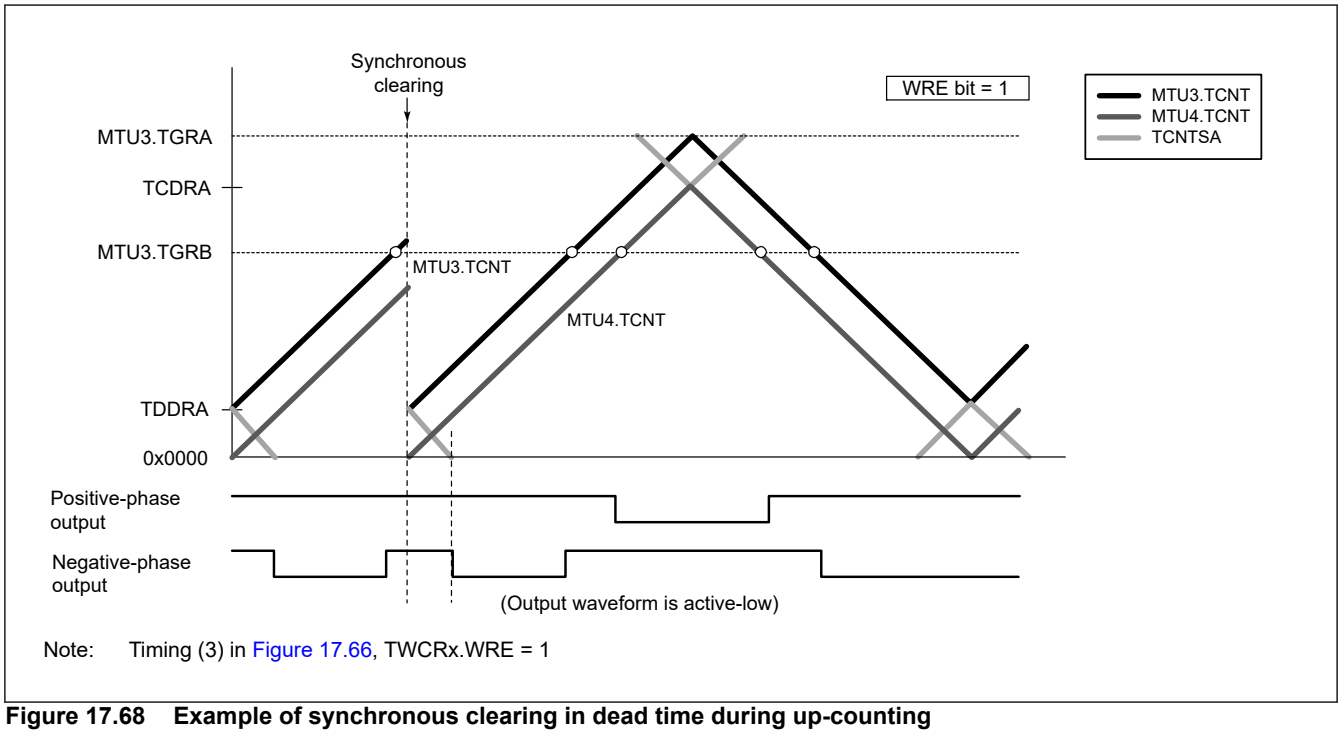


Figure 17.67 Example of procedure for setting output waveform control at synchronous counter clearing in complementary PWM mode (MTU3 and MTU4)

Examples of Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

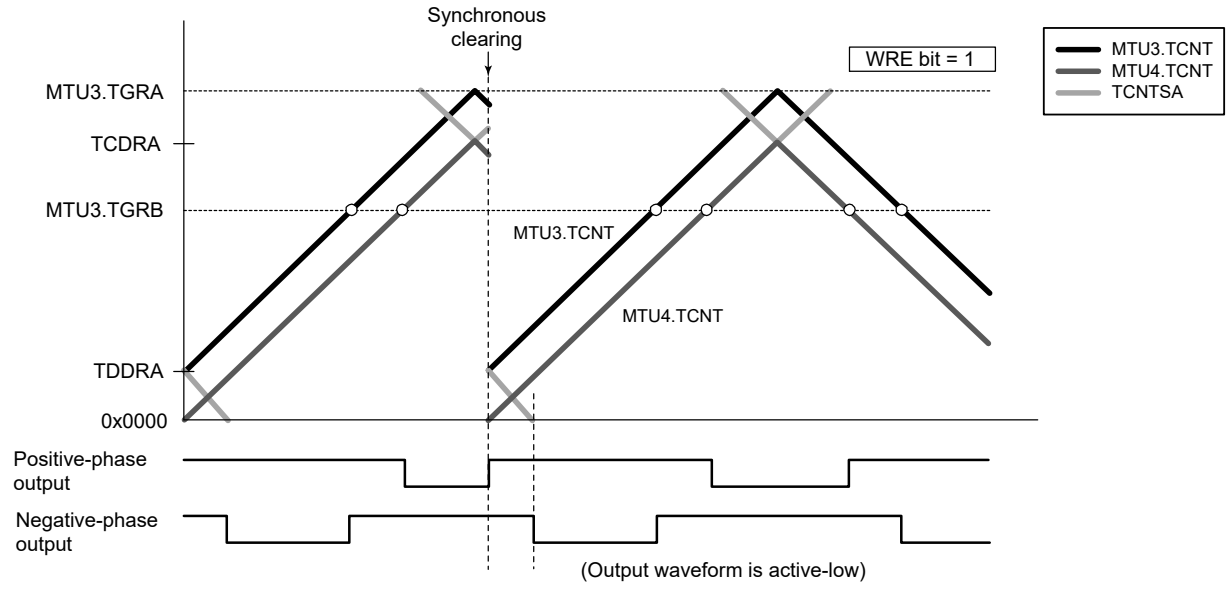

Figure 17.68 to Figure 17.71 show examples of output waveform control in which MTU3 and MTU4 operate in complementary PWM mode and synchronous counter clearing is generated while the WRE bit in TWCRA is set to 1. In the examples shown in Figure 17.68 to Figure 17.71, synchronous counter clearing occurs at timing (3), (6), (8), and (11) shown in Figure 17.66, respectively.

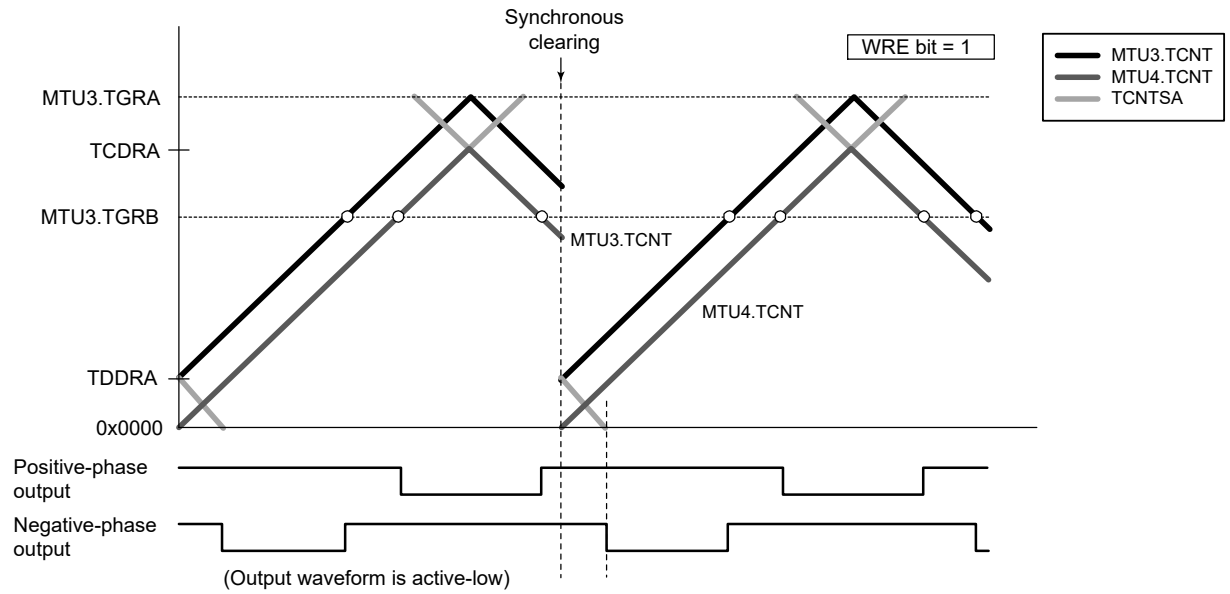
In MTU6 and MTU7, these examples are equivalent to the cases when MTU6 and MTU7 operate in complementary PWM mode and synchronous counter clearing is generated while the SCC bit is set to 0 and the WRE bit is set to 1 in TWCRB.



Note: Timing (3) in Figure 17.66, TWCRx.WRE = 1

Figure 17.68 Example of synchronous clearing in dead time during up-counting

Note: Timing (11) in Figure 17.66, TWCRx.WRE = 1

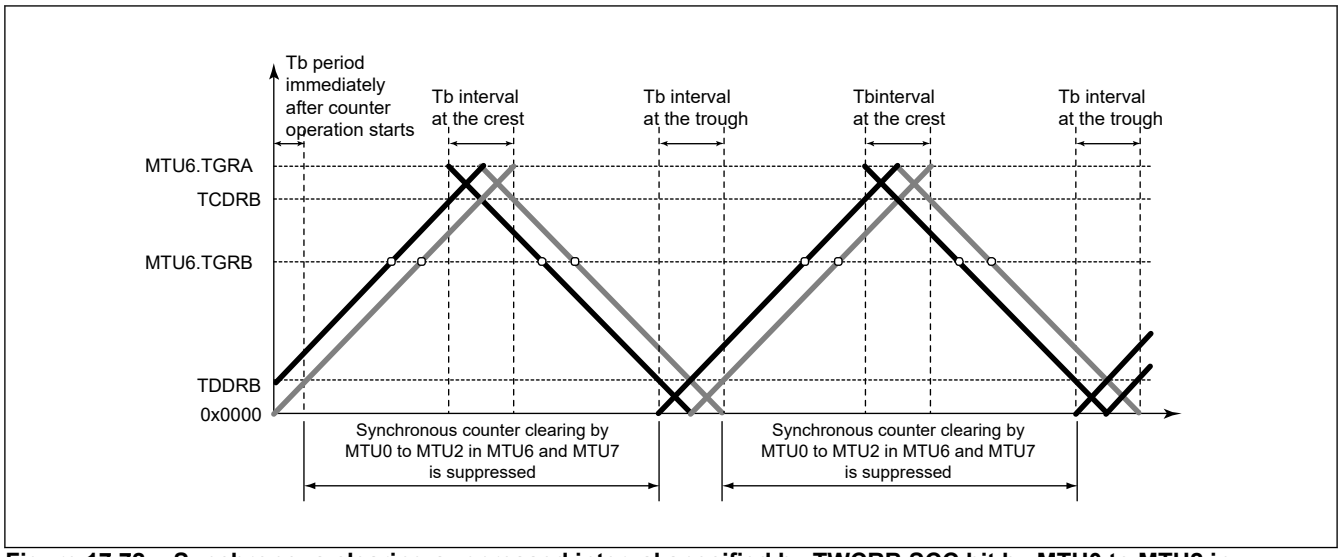
Figure 17.71 Example of synchronous clearing in interval Tb at trough

(15) Suppressing Synchronous Counter Clearing by MTU0 to MTU2 in MTU6 and MTU7

In MTU6 and MTU7, setting the SCC bit in TWCRB to 1 suppresses synchronous counter clearing caused by MTU0 to MTU2.

Synchronous counter clearing caused by MTU0 to MTU2 is suppressed only within the interval shown in Figure 17.72. When using this function, MTU6 and MTU7 should be set to complementary PWM mode.

For details of synchronous clearing caused by MTU0 to MTU2, see section 17.3.10.2. Synchronous Counter Clearing for MTU6 and MTU7.



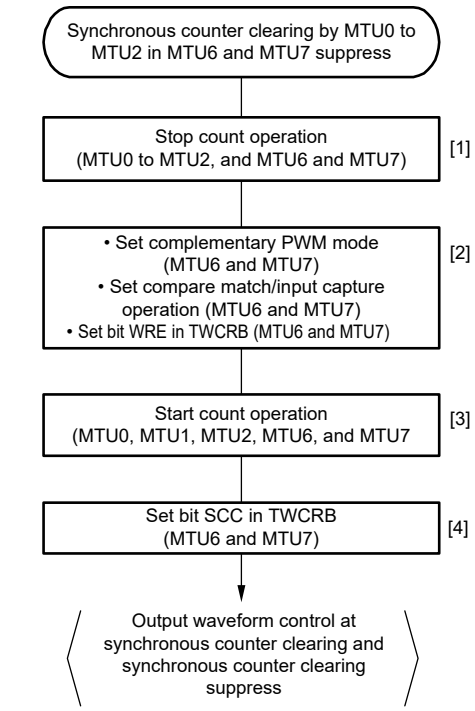


Figure 17.72 Synchronous clearing-suppressed interval specified by TWCRB.SCC bit by MTU0 to MTU2 in MTU6 and MTU7

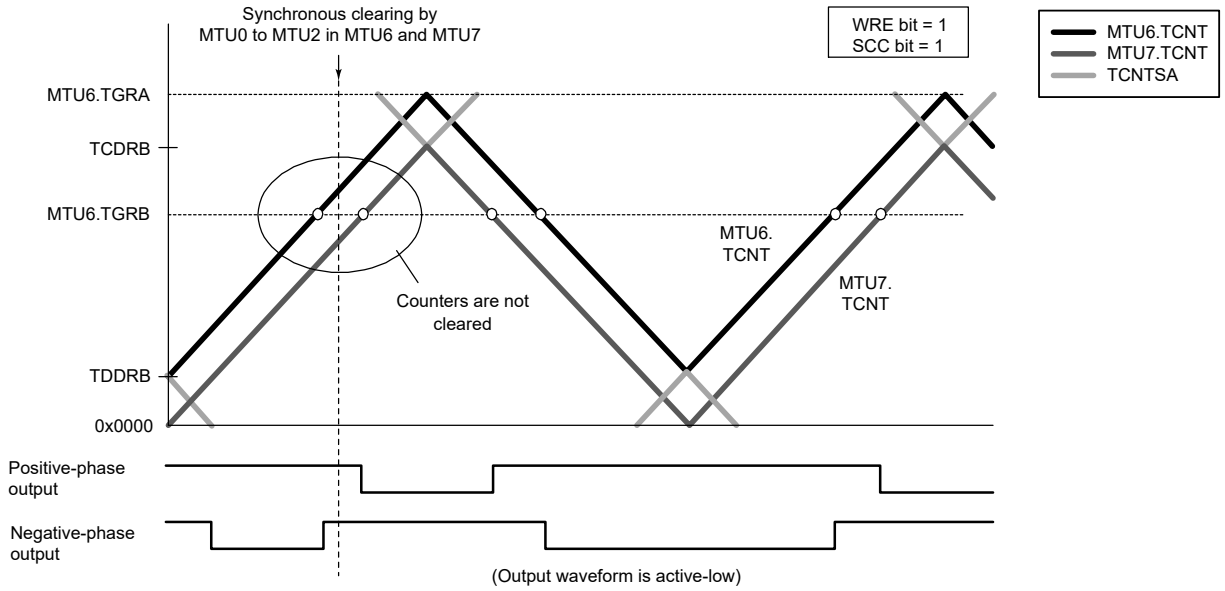
Example of Procedure for Suppressing Synchronous Counter Clearing by MTU0 to MTU2 in MTU6 and MTU7

An example of the procedure for suppressing synchronous counter clearing by MTU0 to MTU2 in MTU6 and MTU7 is shown in Figure 17.73.

[1] Clear bits CST of the timer start register (TSTRB) in MTU6 and MTU7 to 0, and stop count operation. Clear bits CST of TSTRA in MTU0, MTU1, and MTU2 to 0, and stop count operation.

[2] Set the complementary PWM mode in MTU6 and MTU7 and compare match/input capture operation in MTU0, MTU1, and MTU2.
When bit WRE in TWCRA or TWCRB should be set, make appropriate setting here.

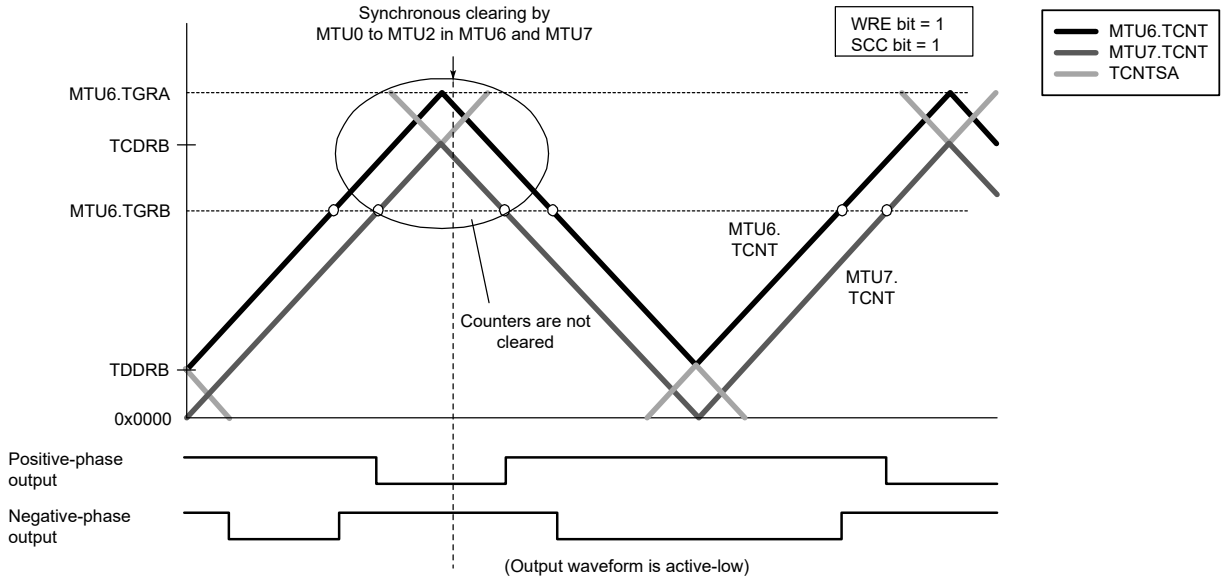
[3] Set bits CST6 and CST7 in MTU6 and MTU7 to 1 to start count operation.
For synchronous counter clearing by MTU0 to MTU2 in MTU6 and MTU7, set bits CST of TSTRA in MTU0, MTU1, and MTU2 to 1 to start count operation in any one of MTU0.TCNT to MTU2.TCNT.



[4] Read TWCRB and then set bit SCC in TWCRB to 1 to suppress synchronous counter clearing by MTU0 to MTU2 in MTU6 and MTU7*1.
Here, do not modify the CCE and WRE bit values in TWCRB of MTU6 and MTU7. Synchronous counter clearing by MTU0 to MTU2 in MTU6 and MTU7 is suppressed in the synchronous counter clearing-suppressed periods.

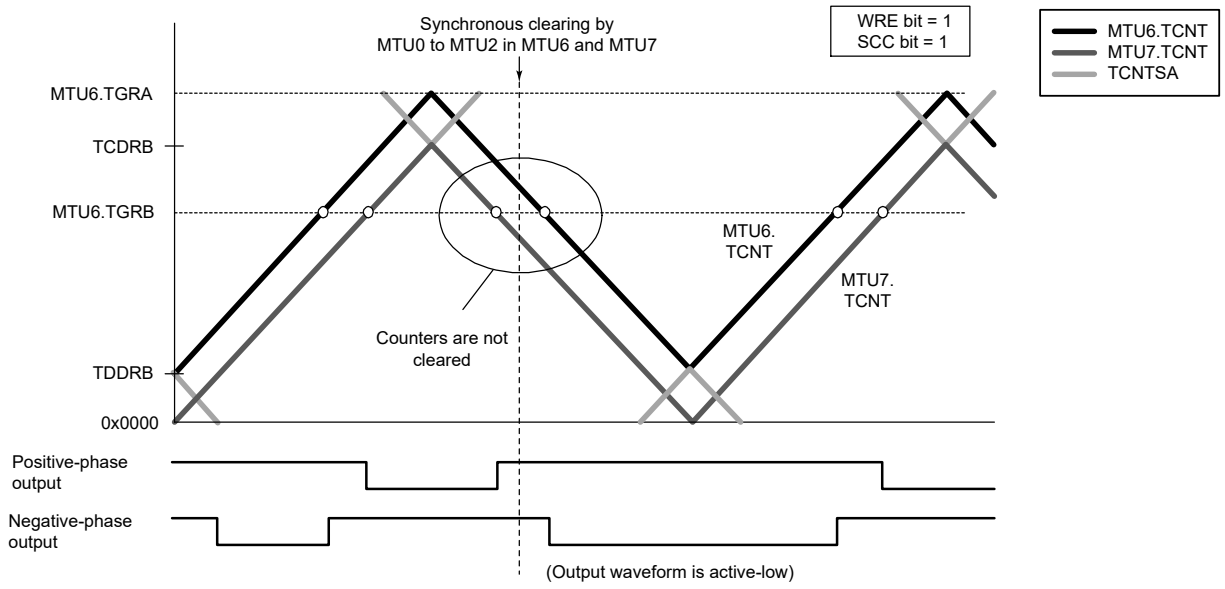
Note 1. The TWCRB.SCC bit value can be modified during counter operation.
However, if a synchronous clearing occurs when bit TWCRB.SCC is modified from 0 to 1, the synchronous clearing may not be suppressed.
If a synchronous clearing occurs when bit TWCRB.SCC is modified from 1 to 0, the synchronous clearing may be suppressed.

Figure 17.73 Example of procedure for suppressing synchronous counter clearing by MTU0 to MTU2 in MTU6 and MTU7



Examples of Suppression of Synchronous Counter Clearing by MTU0 to MTU2 in MTU6 and MTU7

Figure 17.74 to Figure 17.77 show examples of operation in which MTU6 and MTU7 operate in complementary PWM mode and synchronous counter clearing by MTU0 to MTU2 in MTU6 and MTU7 is suppressed by setting the SCC bit in TWCRB in MTU6 and MTU7 to 1. In the examples shown in Figure 17.74 to Figure 17.77, synchronous counter clearing occurs at timing (3), (6), (8), and (11) shown in Figure 17.66, respectively. In these examples, the WRE bit in TWCRB is set to 1.



Note: Timing (3) in Figure 17.66, TWCRB.WRE = 1 and TWCRB.SCC = 1 for MTU6 and MTU7

Figure 17.74 Example of synchronous clearing in dead time during up-counting

Figure 17.77 Example of synchronous clearing in interval Tb at trough

(16) Counter Clearing by MTU3.TGRA (MTU6.TGRA) Compare Match

In complementary PWM mode, MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) can be cleared by MTU3.TGRA (MTU6.TGRA) compare match when the TWCRA.CCE (TWCRB.CCE) bit is set.

Figure 17.78 shows an operation example.

Note:
- Use this function only in complementary PWM mode 1 (transfer at crest).
- Do not specify synchronous clearing by another channel (do not set 1 in the SYNC0 to SYNC4, or SYNC6 and SYNC7 bits in the timer synchronous register (TSYRA or TSYRB) and the CE0A to CE0D, CE1A, and CE1B, or CE2A and CE2B bits in TSYCR).

- Do not set the PWM duty value to 0x0000.
- Do not set the PSYE bit in timer output control register 1 (TOCR1A or TOCR1B) to 1.

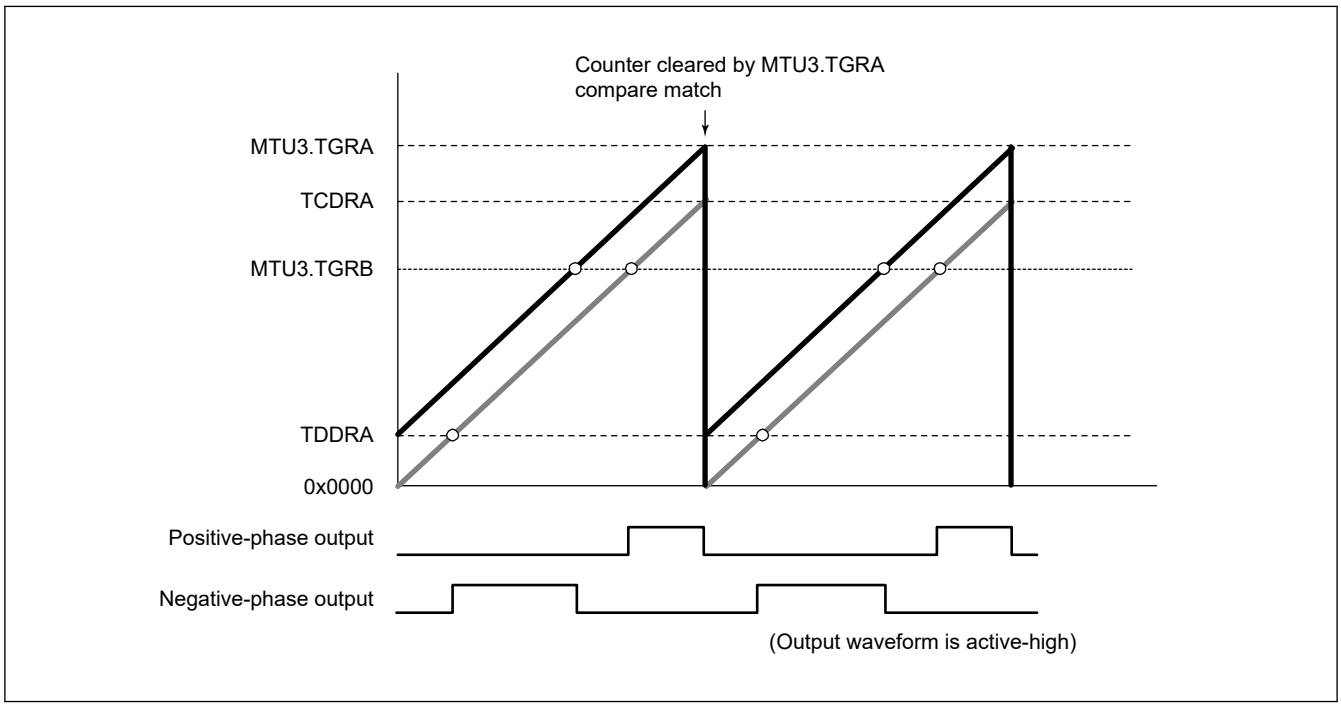

Figure 17.78 Example of counter clearing operation by MTU3.TGRA compare match

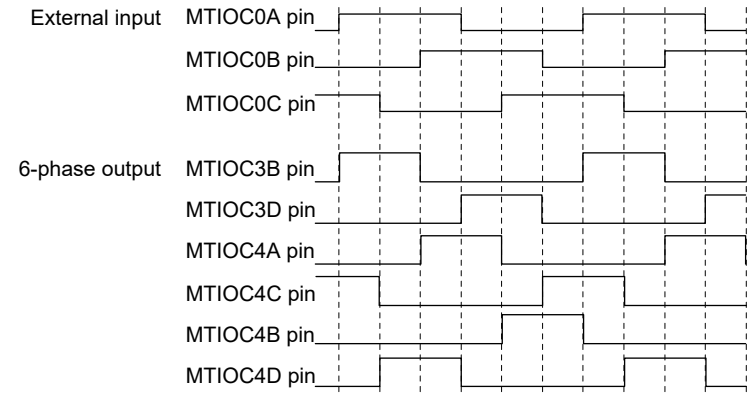
(17) Example of Waveform Output for Driving AC Synchronous Motor (Brushless DC Motor)

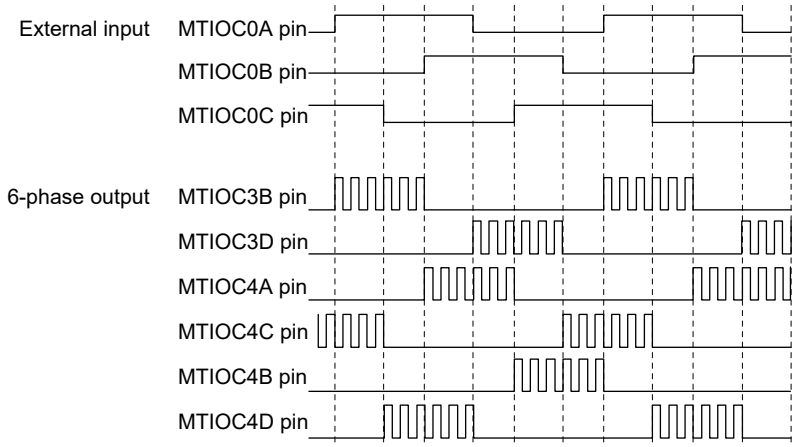
In complementary PWM mode, a brushless DC motor can easily be controlled using the TGCRA register. Figure 17.79 to Figure 17.82 show examples of brushless DC motor driving waveforms created using TGCRA.



To switch the output phases for a 3-phase brushless DC motor by means of external signals detected with a Hall element, etc., set the TGCRA.FB bit to 0. In this case, the external signals indicating the magnetic pole position should be input to timer input pins MTIOC0A, MTIOC0B, and MTIOC0C in MTU0 (specify appropriate settings with the I/O port registers of the I/O ports). When an edge is detected at pin MTIOC0A, MTIOC0B, or MTIOC0C, the output on/off state is switched automatically.

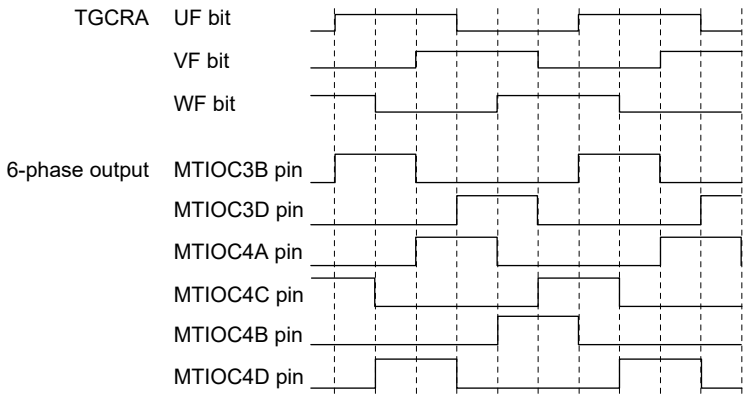
When the TGCRA.FB bit is 1, the output on/off state is switched when the UF, VF, or WF bit in TGCRA is set to 0 or 1.

The driving waveforms are output from the 6-phase output pins for complementary PWM mode.



With this 6-phase output, while the output is turned on, chopping output is available through complementary PWM mode output function by setting the N bit or P bit in TGCRA to 1. When the N bit or P bit is 0, the level output is selected.

The active level of the 6-phase output (on output level) can be set with the TOCR1A.OLSN and TOCR1A.OLSP bits regardless of the setting of the N and P bits.



■ When TGCRA.BDC = 1, TGCRA.N = 0, TGCRA.P = 0, TGCRA.FB = 0, and output active level = high

Figure 17.79 Example of output phase switching by external input (1)

■ When TGCRA.BDC = 1, TGCRA.N = 1, TGCRA.P = 1, TGCRA.FB = 0, and output active level = high

Figure 17.80 Example of output phase switching by external input (2)

■ When TGCRA.BDC = 1, TGCRA.N = 0, TGCRA.P = 0, TGCRA.FB = 1, and output active level = high

Figure 17.81 Example of output phase switching through UF, VF, and WF bit settings (1)

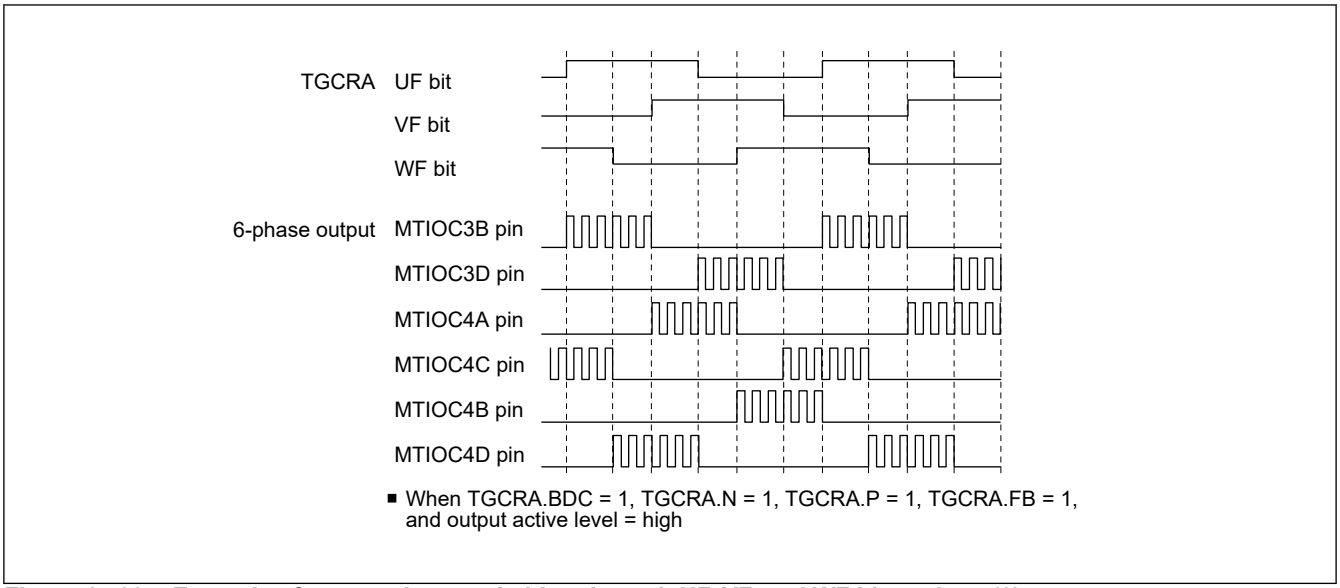


Figure 17.82 Example of output phase switching through UF, VF, and WF bit settings (2)

(18) A/D Converter Start Request Setting

In complementary PWM mode, an A/D converter start request can be issued using MTU3.TGRA (MTU6.TGRA) compare match, MTU4.TCNT (MTU7.TCNT) underflow (trough), or compare match on a channel other than MTU3 and MTU4 (MTU6 and MTU7).

When start requests using MTU3.TGRA (MTU6.TGRA) compare match are specified, A/D conversion can be started at the crest of the MTU3.TCNT (MTU6.TCNT) count.

A/D converter start requests can be specified by setting the TIER.TTGE bit to 1. To issue an A/D converter start request at an MTU4.TCNT (MTU7.TCNT) underflow (trough), set the MTU4.TIER.TTGE2 (MTU7.TIER.TTGE2) bit to 1.

(19) Double Buffer Function in Complementary PWM Mode

In complementary PWM mode 3 (transfer at the crest and trough), the PWM output setting resolution can be improved from ±2 to ±1 by setting the TMDR2A.DRS (TMDR2B.DRS) bit to 1.

When setting buffer registers A (MTU3.TGRD, MTU4.TGRC, MTU4.TGRD, MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD), set also buffer registers B (MTU3.TGRE, MTU4.TGRE, MTU4.TGRF, MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF) at the same time. Each buffer register B should be set to the buffer register A value or (buffer register A value − 1). For details of the setting procedure, see section 17.3.8.1. Example of Complementary PWM Mode Setting Procedure.

Note: When a buffer register B is set to the buffer register A value, symmetric PWM waveforms are output. When a buffer register B is set to (buffer register A value − 1), asymmetric PWM waveforms are output.

Figure 17.83 shows an example of double buffer operation.

Each register data is transferred as follows.

- After MTU4.TGRD or MTU7.TGRD (buffer A) is written to, data is transferred from MTU4.TGRD or MTU7.TGRD (buffer A) to Temp3A or Temp6A (temporary A) and from MTU4.TGRF or MTU7.TGRF (buffer B) to Temp3B or Temp6B (temporary B).
- With timing (1) in the figure, data is transferred from Temp3A or Temp6A (temporary A) to MTU4.TGRB or MTU7.TGRB (compare).
- With timing (2) in the figure, data is transferred from Temp3B or Temp6B (temporary B) to MTU4.TGRB or MTU7.TGRB (compare).

In the crest interval (Tb interval at crest), the compare register and temporary register A are valid; in the trough interval (Tb interval at trough), the compare register and temporary register B are valid.

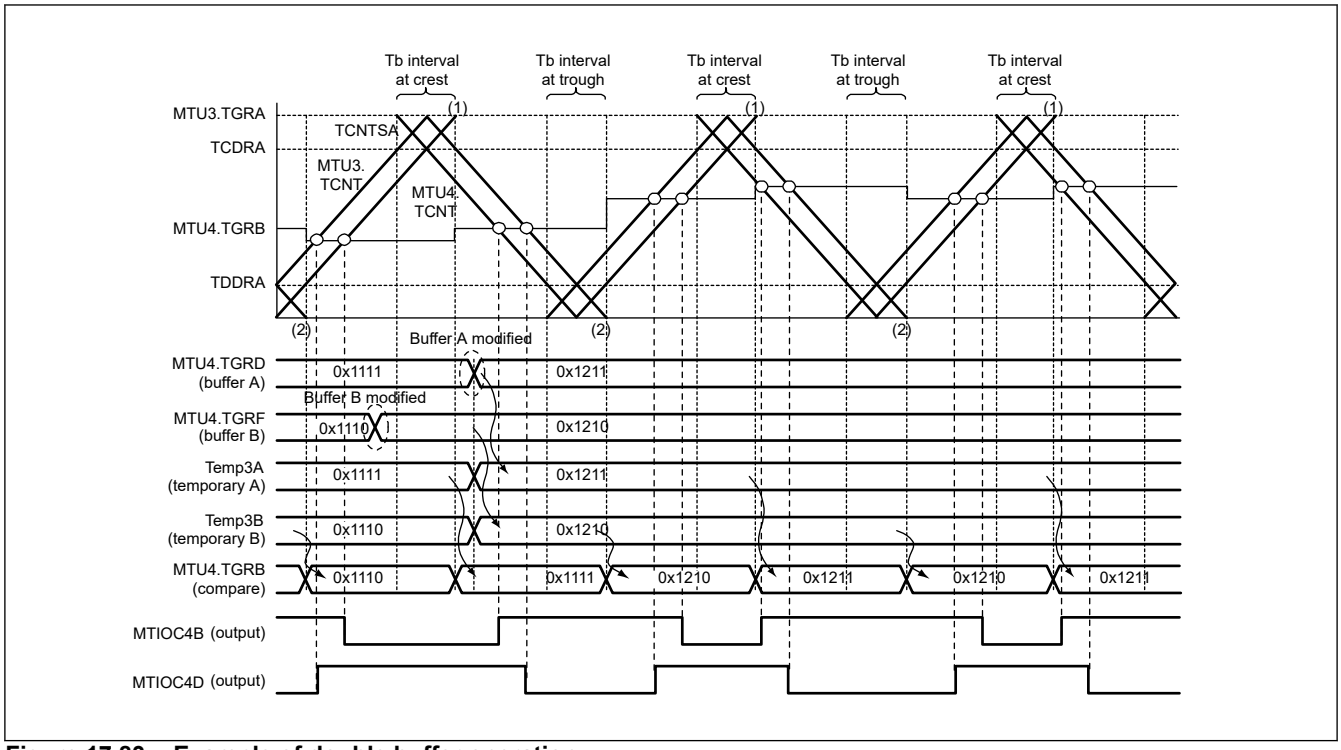

Figure 17.83 Example of double buffer operation

Figure 17.84 shows an example when the buffer write value is smaller than the TDDRA value, and Figure 17.85 shows an example when the write value is greater than TCDRA.

In the crest interval, the output is controlled according to the compare match with the compare register or temporary register A; in the trough interval, the output is controlled according to the compare match with the compare register or temporary register B.

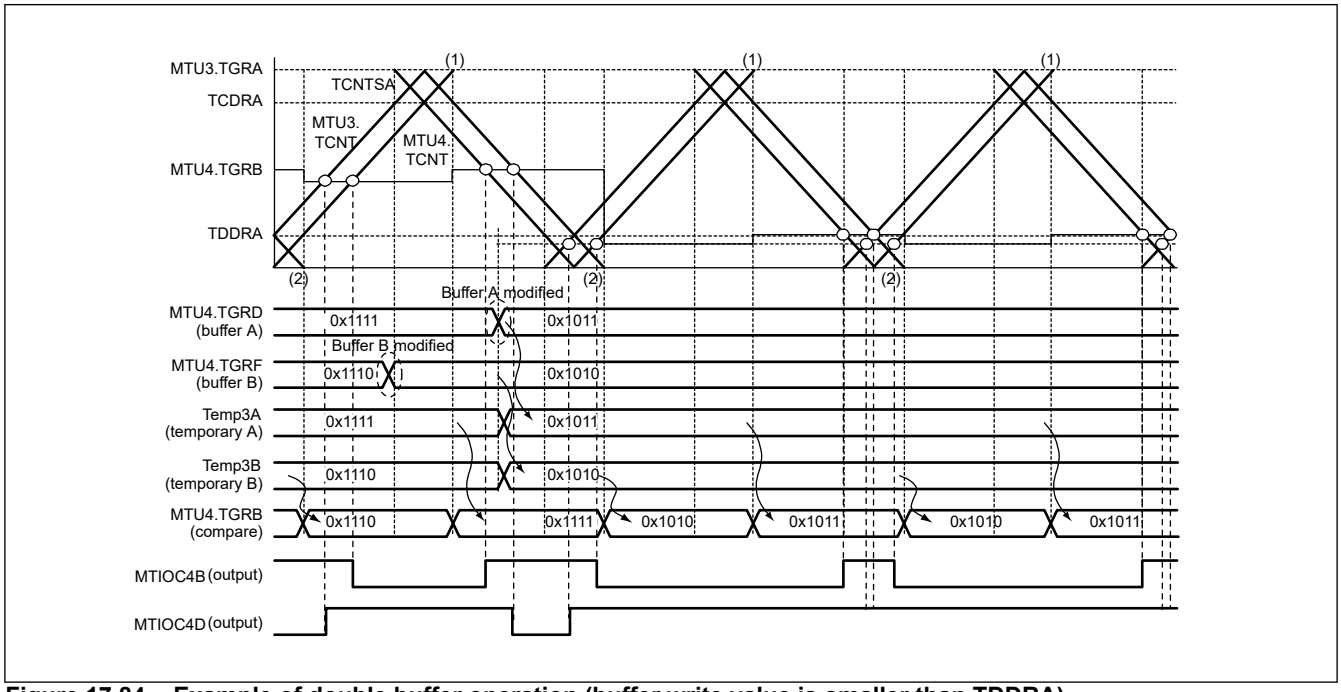

Figure 17.84 Example of double buffer operation (buffer write value is smaller than TDDRA)

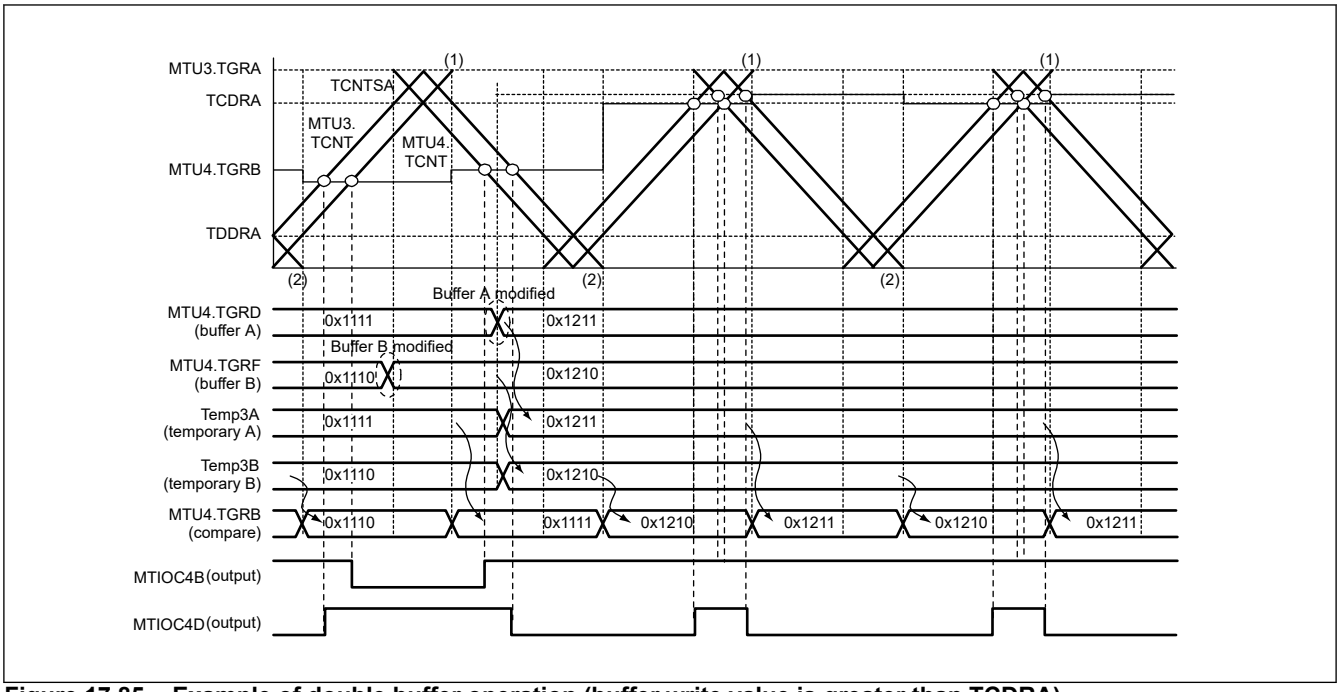

Figure 17.85 Example of double buffer operation (buffer write value is greater than TCDRA)

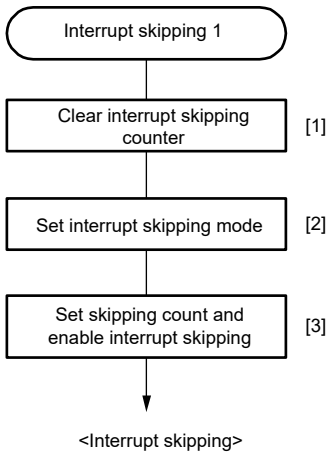
17.3.8.3 Interrupt Skipping Function 1 in Complementary PWM Mode

Interrupts TGIA3 (TGIA6) (at the crest) and TCIV4 (TCIV7) (at the trough) in MTU3 and MTU4 (MTU6 and MTU7) can be skipped up to seven times by making settings in the TITCR1A (TITCR1B) register.



Transfers from a buffer register to a temporary register or a compare register can be skipped in coordination with interrupt skipping by making settings in the TBTERA (TBTERB) register. For the linkage with buffer registers, see description (3)Buffer Transfer Control Linked with Interrupt Skipping, below.

A/D converter start requests generated by the A/D converter start request delaying function can also be skipped in coordination with interrupt skipping by making settings in the MTU4.TADCR (MTU7.TADCR) register. For the linkage with the A/D converter start request delaying function, see section 17.3.9. A/D Converter Start Request Delaying Function.

The TITCR1A (TITCR1B) register should be set while interrupt skipping function 1 is selected by setting the TITM bit in the timer interrupt skipping mode register (TITMRA or TITMRB) to 0, TGIA3 (TGIA6) interrupt requests are disabled by setting the MTU3.TIER (MTU6.TIER) register, TCIV4 (TCIV7) interrupt requests are disabled by setting the MTU4.TIER (MTU7.TIER) register, and a compare match is not generated. Before changing the skipping count, be sure to set the T3AEN (T6AEN) and T4VEN (T7VEN) bits to 0 to clear the skipping counter.

(1) Example of Interrupt Skipping Function 1 Setting Procedure

Figure 17.86 shows an example of the interrupt skipping function 1 setting procedure. Figure 17.87 shows the periods during which interrupt skipping count can be changed.

[1] Set bits T3AEN and T4VEN in the timer interrupt skipping set register 1 (TITCR1A) to 0 to clear the skipping counter.

[2] Set bit TITM in the timer interrupt skipping mode register (TITMRA) to 0 to select interrupt skipping function 1.

[3] Specify the interrupt skipping count within the range from 0 to 7 times in bits T3ACOR2 to T3ACOR0 and T4VCOR2 to T4VCOR0 in TITCR1A, and enable interrupt skipping through bits T3AEN and T4VEN.

Note: The setting of TITCR1A must be done while the TGIA3 and TCIV4 interrupt requests are disabled by the settings of MTU3.TIER and MTU4.TIER under the conditions in which a compare match is not generated. Before changing the skipping count, be sure to set the T3AEN and T4VEN bits to 0 to clear the skipping counter.

Figure 17.86 Example of interrupt skipping function 1 setting procedure

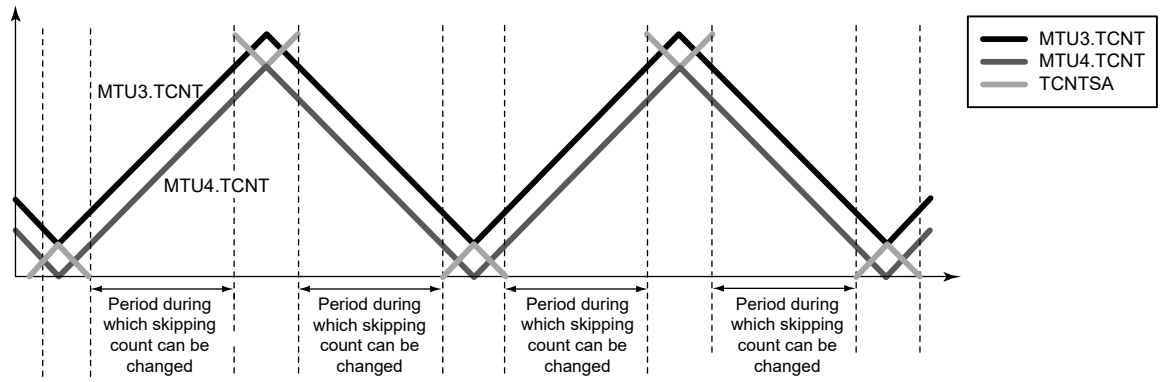


Figure 17.87 Periods during which interrupt skipping count can be changed

(2) Example of Interrupt Skipping Function 1

Figure 17.88 shows an example of TGIA3 (TGIA6) interrupt skipping in which the interrupt skipping count is set to three by the T3ACOR (T6ACOR) bits and the T3AEN (T6AEN) bit is set to 1 in the TITCR1A (TITCR1B) register.

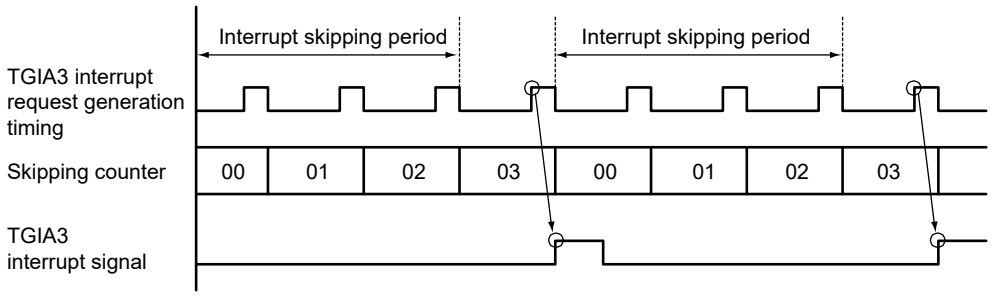

Figure 17.88 Example of interrupt skipping function 1

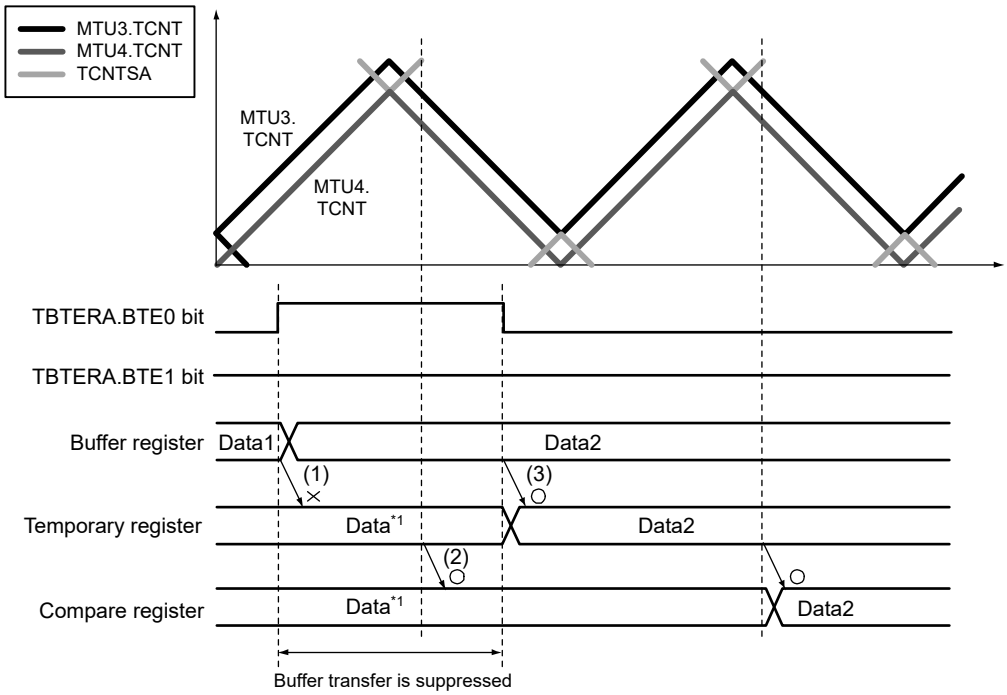
(3) Buffer Transfer Control Linked with Interrupt Skipping

In complementary PWM mode, whether to transfer data from a buffer register to a temporary register and whether to link the transfer with interrupt skipping can be specified with the BTE[1:0] bits in the TBTERA (TBTERB) register.

Figure 17.89 shows an example of operation when buffer transfer is disabled (BTE[1:0] = 01b). While this setting is valid, data is not transferred from the buffer register to the temporary register.

Figure 17.90 shows an example of operation when buffer transfer is linked with interrupt skipping (BTE[1:0] = 10b).



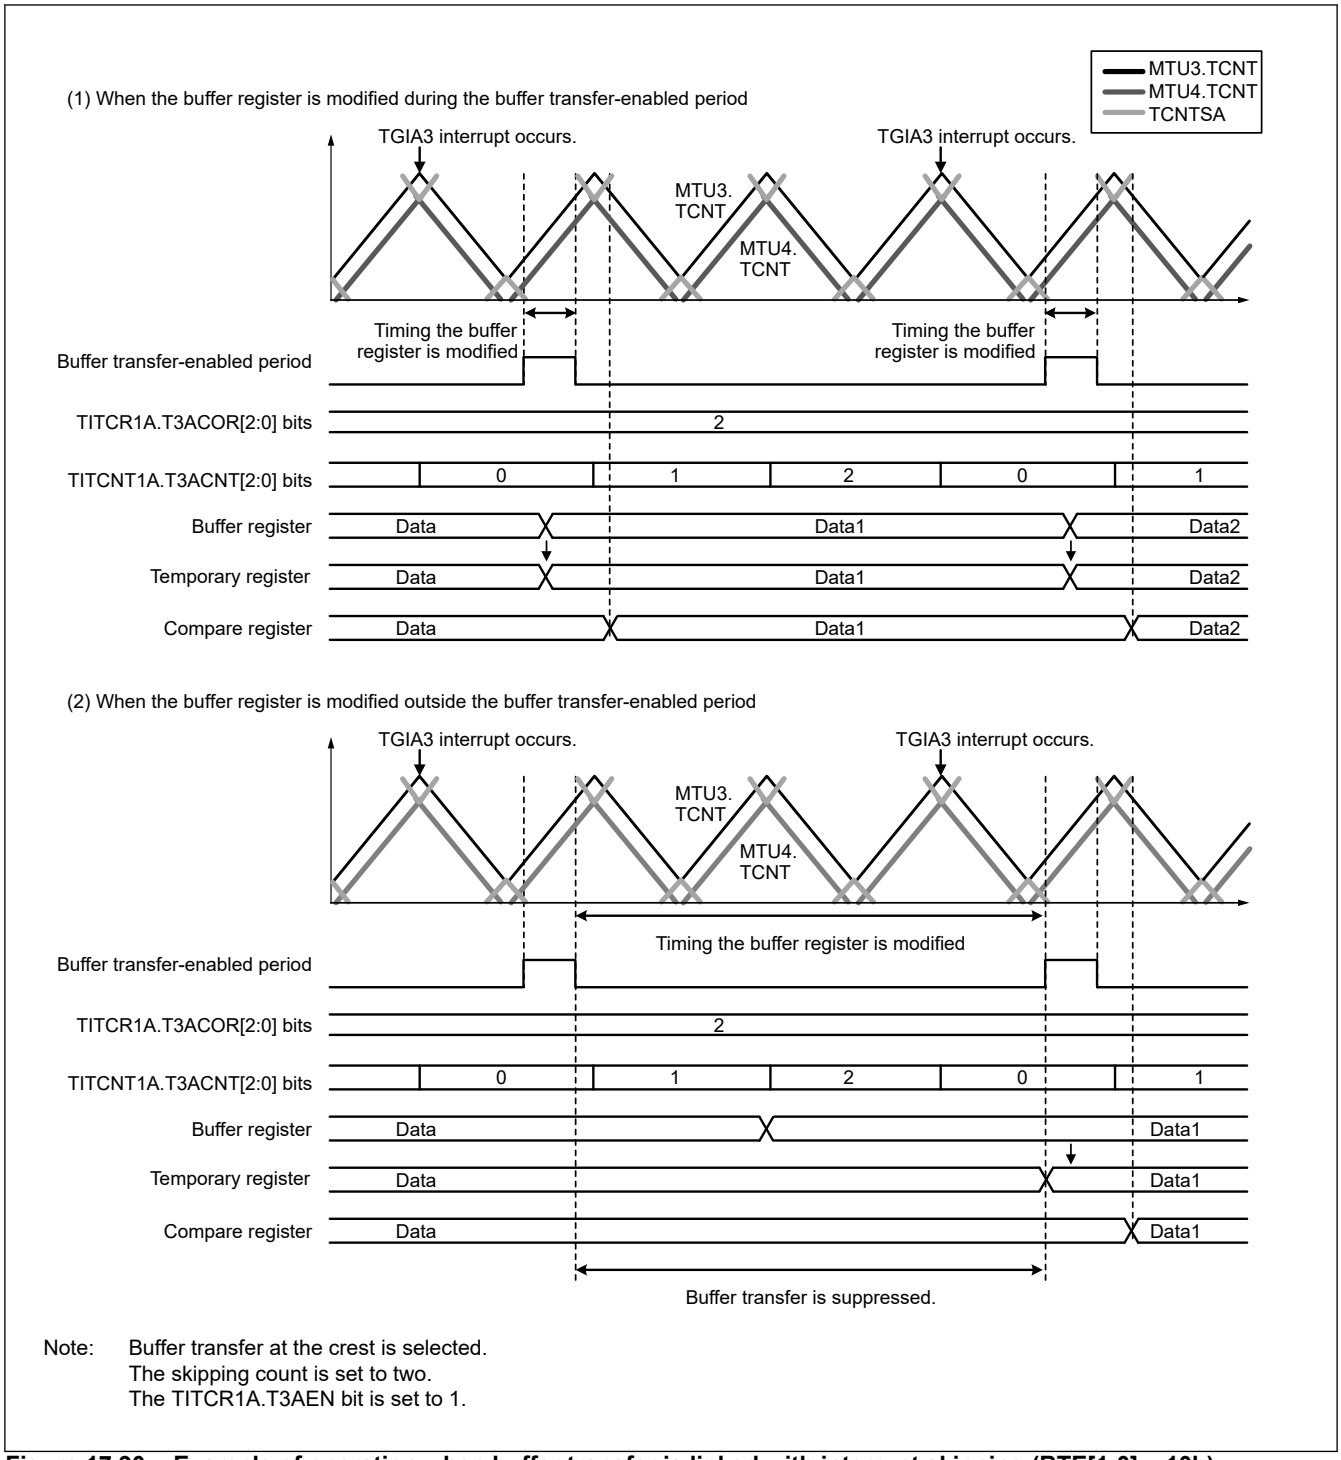
While this setting is valid, data is not transferred from the buffer register outside the buffer transfer-enabled period.

Note that the buffer transfer-enabled period depends on the T3AEN (T6AEN) and T4VEN (T7VEN) bit settings in the TITCR1A (TITCR1B) register. Figure 17.91 shows the relationship between the T3AEN (T6AEN) and T4VEN (T7VEN) bit settings in TITCR1A (TITCR1B) and buffer transfer-enabled period.

Note: This function must be used in combination with interrupt skipping function 1.

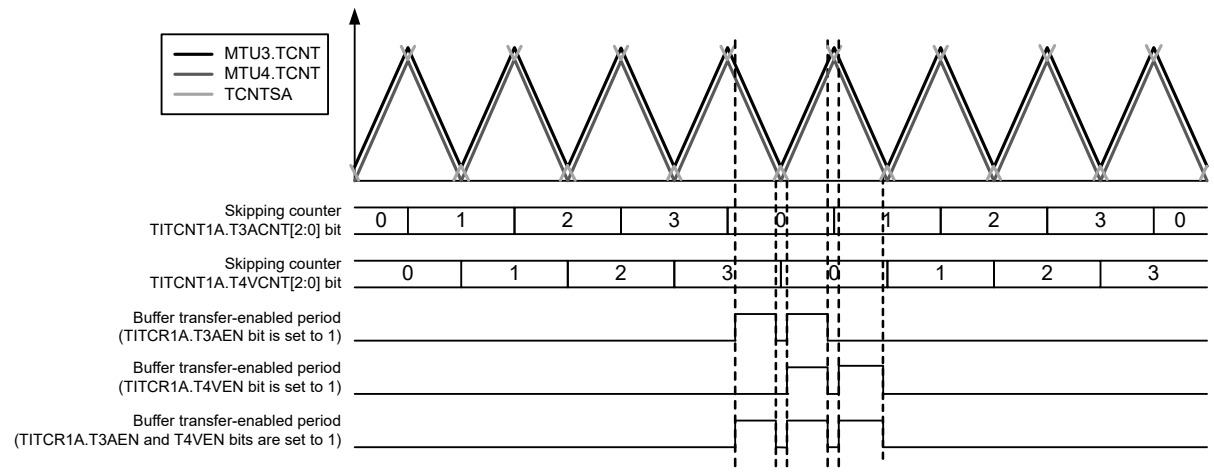
When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits in the timer interrupt skipping set register 1 (TITCR1A or TITCR1B) are set to 0 or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are set to 0), make sure that buffer transfer is not linked with interrupt skipping (set the BTE1 bit in TBTERA or TBTERB to 0).

If buffer transfer is linked with interrupt skipping while interrupt skipping is disabled, buffer transfer is never performed.



[Legend]

(1) No data is transferred from the buffer register to the temporary register in the buffer transfer-disabled period (bits BTE[1:0] in TBTERA are set to 01b).
(2) Data is transferred from the temporary register to the compare register even in the buffer transfer-disabled period.
(3) After buffer transfer is enabled, data is transferred from the buffer register to the temporary register.



Note 1. When buffer transfer at the crest is selected.

17.3.8.4 Complementary PWM Mode Output Protection Functions

The MTU provides the following protection functions for complementary PWM mode output.

(1) Register and Counter Miswrite Prevention Function

With the exception of the buffer registers, which can be modified, access by the CPU can be enabled or disabled for the mode registers, control registers, compare registers, and counters used in complementary PWM mode by means of the RWE bit in the timer read/write enable register (TRWERA or TRWERB). The applicable registers are some of the registers in MTU3, MTU4, MTU6, and MTU7 shown below:

47 registers in total

MTU3.TCR, MTU4.TCR, MTU3.TCR2, MTU4.TCR2, MTU3.TMDR1, MTU4.TMDR1, MTU3.TIORH, MTU4.TIORH, MTU3.TIORL, MTU4.TIORL, MTU3.TIER, MTU4.TIER, MTU3.TCNT, MTU4.TCNT, MTU3.TGRA, MTU4.TGRA, MTU3.TGRB, MTU4.TGRB, MTU.TOEERA, MTU.TOCR1A, MTU.TOCR2A, MTU.TGCRA, MTU.TCDRA, MTU.TDDRA, MTU6.TCR, MTU7.TCR, MTU6.TCR2, MTU7.TCR2, MTU6.TMDR1, MTU7.TMDR1, MTU6.TIORH, MTU7.TIORH, MTU6.TIORL, MTU7.TIORL, MTU6.TIER, MTU7.TIER, MTU6.TCNT, MTU7.TCNT, MTU6.TGRA, MTU7.TGRA, MTU6.TGRB, MTU7.TGRB, MTU.TOERB, MTU.TOCR1B, MTU.TOCR2B, MTU.TCDRB, and MTU.TDDRB

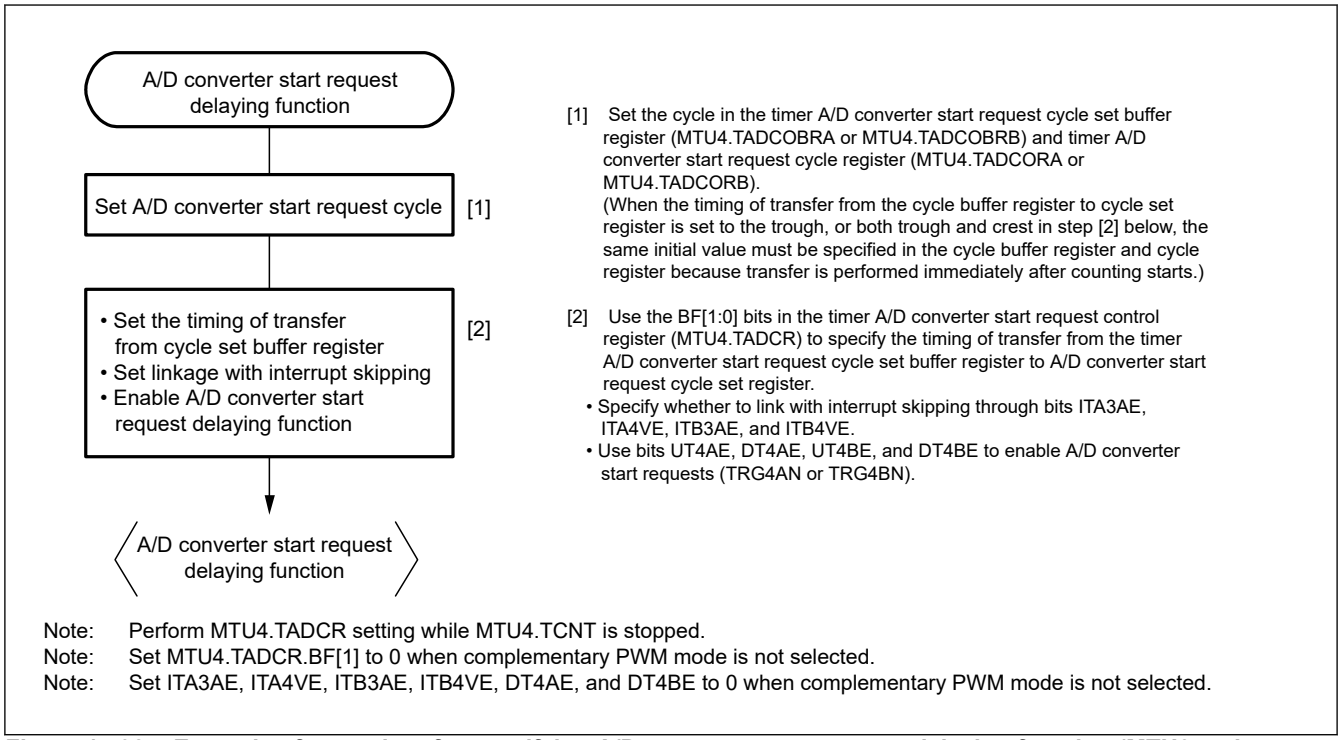
This function can disable CPU access to the mode registers, control registers, and counters to prevent miswriting due to CPU runaway. In the access-disabled state, the applicable registers are read as undefined and writing to these registers is ignored.

(2) Halting of PWM Output by External Signal

The 6-phase PWM output pins can be set to the high-impedance state automatically by inputting specified external signals.

For details, see section 18, Port Output Enable 3 (POE3).

17.3.9 A/D Converter Start Request Delaying Function



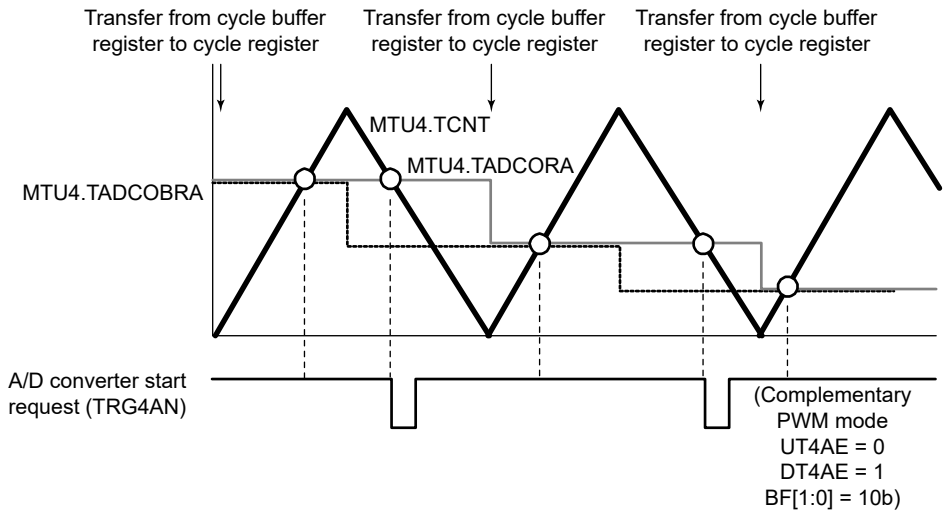
A/D converter start requests can be issued in MTU4 or MTU7 by making settings in the timer A/D converter start request control register (MTU4.TADCR or MTU7.TADCR), timer A/D converter start request cycle set registers (MTU4.TADCORA and MTU4.TADCORB, or MTU7.TADCORA and MTU7.TADCORB), and timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA and MTU4.TADCOBRB, or MTU7.TADCOBRA and MTU7.TADCOBRB).

The A/D converter start request delaying function compares MTU4.TCNT with MTU4.TADCORA or MTU4.TADCORB (MTU7.TCNT with MTU7.TADCORA or MTU7.TADCORB), and when their values match, the function issues a respective A/D converter start request (TRG4AN or TRG4BN (TRG7AN or TRG7BN)).

A/D converter start requests (TRG4AN and TRG4BN (TRG7AN and TRG7BN)) can be skipped in coordination with interrupt skipping by making settings in the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in MTU4.TADCR (the ITA6AE, ITA7VE, ITB6AE, and ITB7VE bits in MTU7.TADCR).

17.3.9.1 Example of Procedure for Specifying A/D Converter Start Request Delaying Function

Figure 17.92 shows an example of procedure for specifying the A/D converter start request delaying function.



Note: Perform MTU4.TADCR setting while MTU4.TCNT is stopped.
Note: Set MTU4.TADCR.BF[1] to 0 when complementary PWM mode is not selected.
Note: Set ITA3AE, ITA4VE, ITB3AE, ITB4VE, DT4AE, and DT4BE to 0 when complementary PWM mode is not selected.

Figure 17.92 Example of procedure for specifying A/D converter start request delaying function (MTU3 and MTU4)

17.3.9.2 Basic Example of A/D Converter Start Request Delaying Function Operation

Figure 17.93 shows a basic example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when the trough of MTU4.TCNT (MTU7.TCNT) is specified for the buffer transfer timing and an A/D converter start request signal is output during MTU4.TCNT (MTU7.TCNT) down-counting.

Note: Period in which A/D converter start requests are enabled (UT4AE = 1): 0 ≤ MTU4.TCNT ≤ TCDR − 1
Period in which A/D converter start requests are enabled (DT4AE = 1): TCDR ≥ MTU4.TCNT ≥ 1
UT4AE, DT4AE, BF[1:0]: Bits in TADCR

Figure 17.93 Basic example of A/D converter start request signal (TRG4AN) operation

17.3.9.3 Buffer Transfer

The data in the timer A/D converter start request cycle set registers (MTU4.TADCORA and MTU4.TADCORB, or MTU7.TADCORA and MTU7.TADCORB) is updated by writing data to the timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA and MTU4.TADCOBRB, or MTU7.TADCOBRA and MTU7.TADCOBRB). Data is transferred from the buffer registers to the respective cycle set registers at the timing selected with the BF[1:0] bits in the MTU4.TADCR (MTU7.TADCR) register.

In complementary PWM mode, data is also transferred from the timer A/D converter start request cycle set buffer registers to the timer A/D converter start request cycle set registers when MTU4.TGRD (MTU7.TGRD) register is updated.

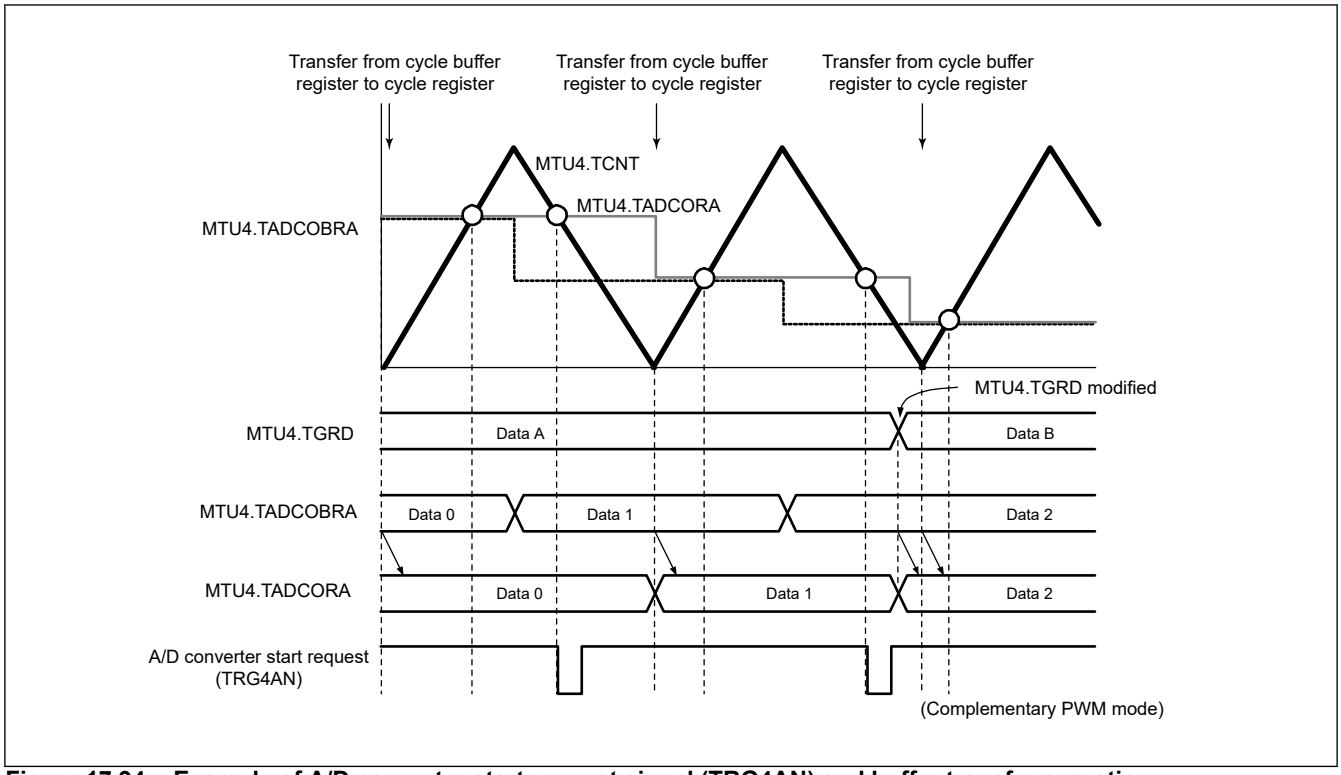


Figure 17.94 Example of A/D converter start request signal (TRG4AN) and buffer transfer operation

17.3.9.4 A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 1

A/D converter start requests (TRG4AN and TRG4BN (TRG7AN and TRG7BN)) can be issued in coordination with interrupt skipping 1 by making settings in the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits in the MTU4.TADCR (MTU7.TADCR) register.

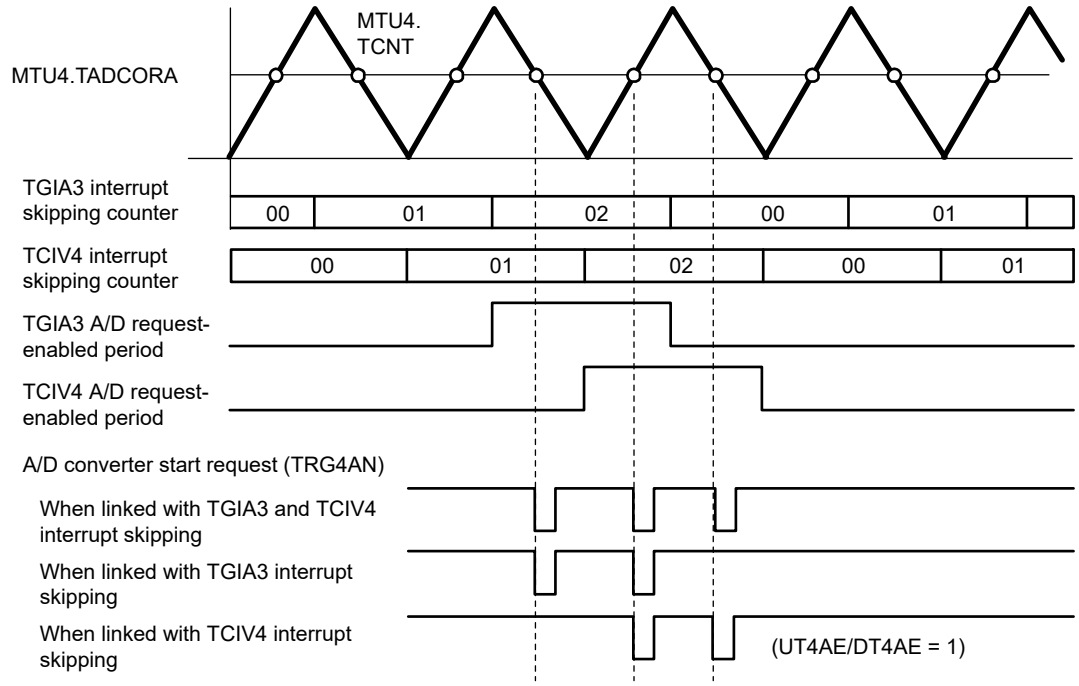

Figure 17.95 shows an example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when TRG4AN (TRG7AN) output is enabled during MTU4.TCNT (MTU7.TCNT) up-counting and down-counting and A/D converter start requests are linked with interrupt skipping 1.

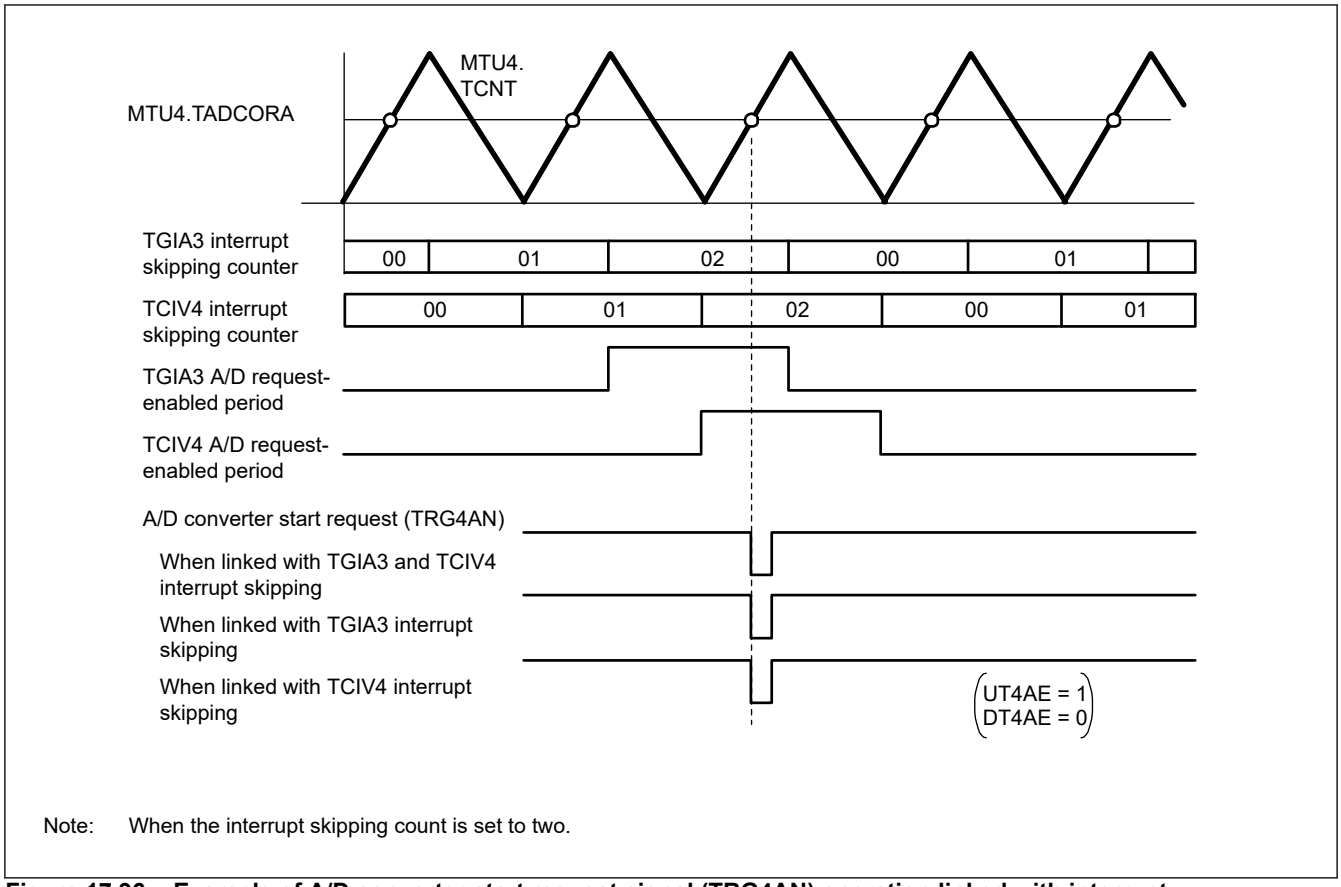
Figure 17.96 shows another example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when TRG4AN (TRG7AN) output is enabled during MTU4.TCNT (MTU7.TCNT) up-counting and A/D converter start requests are linked with interrupt skipping 1.

Note: This function should be used in combination with interrupt skipping 1.



When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits in the timer interrupt skipping set register (TITCR1A (TITCR1B)) are set to 0 or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are set to 0), make sure that A/D converter start requests are not linked with interrupt skipping 1 (set the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits in the timer A/D converter start request control register (MTU4.TADCR (MTU7.TADCR)) to 0).

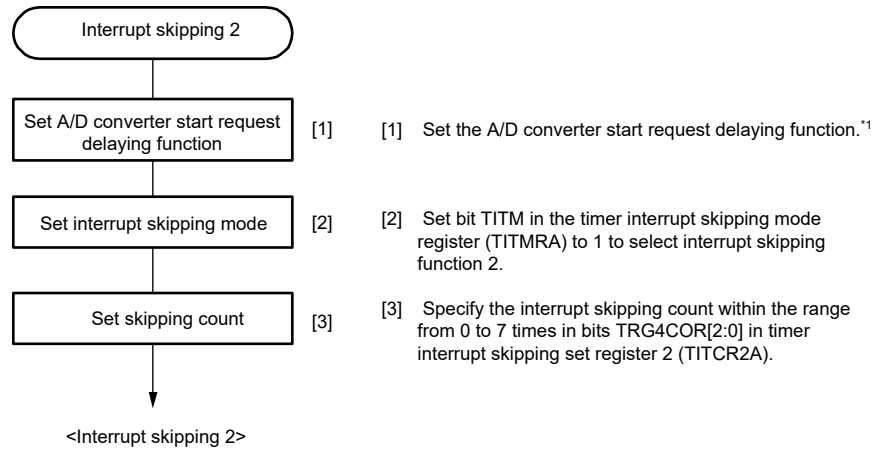
When this function is used, MTU4.TADCORA and MTU4.TADCORB (MTU7.TADCORA and MTU7.TADCORB) should be set with the value ranging 0x0002 to the value set in TCDRA minus 2 (value set in TCDRB minus 2).

Note: When the interrupt skipping count is set to two.

Figure 17.95 Example of A/D converter start request signal (TRG4AN) operation linked with interrupt skipping function 1 (UT4AE and DT4AE = 1)

Note: When the interrupt skipping count is set to two.

Figure 17.96 Example of A/D converter start request signal (TRG4AN) operation linked with interrupt skipping function 1 (UT4AE = 1, DT4AE = 0)



17.3.9.5 A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 2

By setting the TITM bit to 1 in the TITMRA (TITMRB) register, the counter starts down-counting from the value (0 to 7) set in the TRG4COR[2:0] (TRG7COR[2:0]) bits in TITCR2A (TITCR2B) register every time an A/D converter start trigger (TRG4AN or TRG4BN (TRG7AN or TRG7BN)) is generated. When the counter value reaches 0 and is reloaded, the TRG4AN and TRG4BN (TRG7AN and TRG7BN) interrupts become valid and an A/D converter start request signal (TRG4ABN (TRG7ABN)) is output.

This function is valid only when the A/D converter request delaying function is enabled.

(1) Example of Procedure for Setting Interrupt Skipping Function 2

Figure 17.97 shows an example of procedure for setting interrupt skipping function 2.

Note 1. For details, see section 17.3.9.1. Example of Procedure for Specifying A/D Converter Start Request Delaying Function.

Figure 17.97 Example of procedure for setting interrupt skipping function 2

(2) Example of Interrupt Skipping Function 2 Operation

Figure 17.98 shows an example of interrupt skipping function 2 operation.

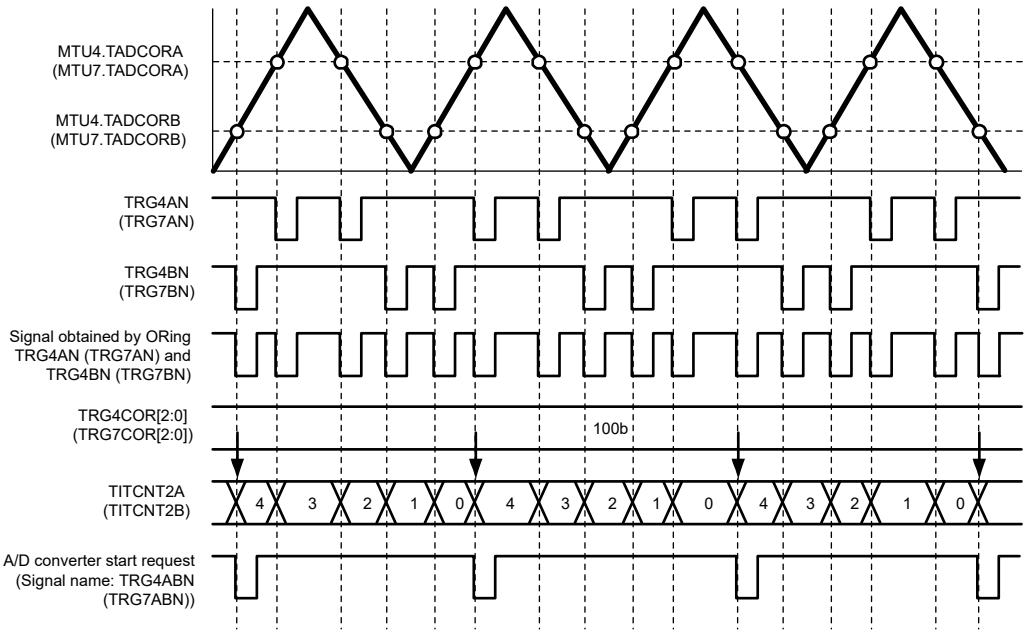


Figure 17.98 Example of interrupt skipping function 2 operation (skipping count is set to four)

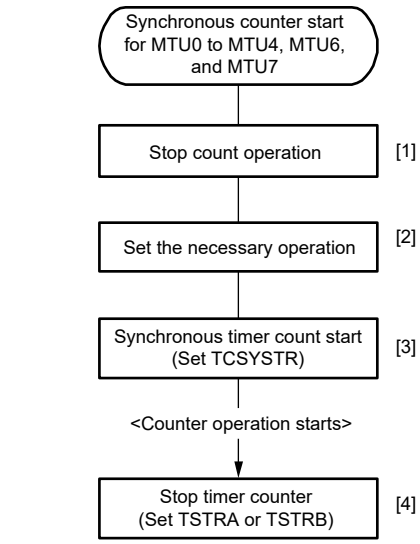


17.3.10 Synchronous Operation of MTU0 to MTU4, MTU6, and MTU7

17.3.10.1 Synchronous Counter Start for MTU0 to MTU4, MTU6, and MTU7

The counters in MTU0 to MTU4, MTU6, and MTU7 can be started synchronously by making the TCSYSTR settings.

(1) Example of Procedure for Setting Synchronous Counter Start for MTU0 to MTU4, MTU6, and MTU7

Figure 17.99 shows an example of procedure for setting synchronous counter start for MTU0 to MTU4, MTU6, and MTU7.

[1] Set TSTRA and TSTRB to stop the counters used for synchronous start operation.

[2] Specify the necessary operation with appropriate registers such as TCR, TMDR1, and TMDR2.

[3] In TCSYSTR, set the bits corresponding to the counters to be started synchronously to 1 at the same time. When TCSYSTR is set, TSTRA and TSTRB for the target timer counters are automatically set appropriately, the counters start synchronously, and TCSYSTR is automatically cleared.

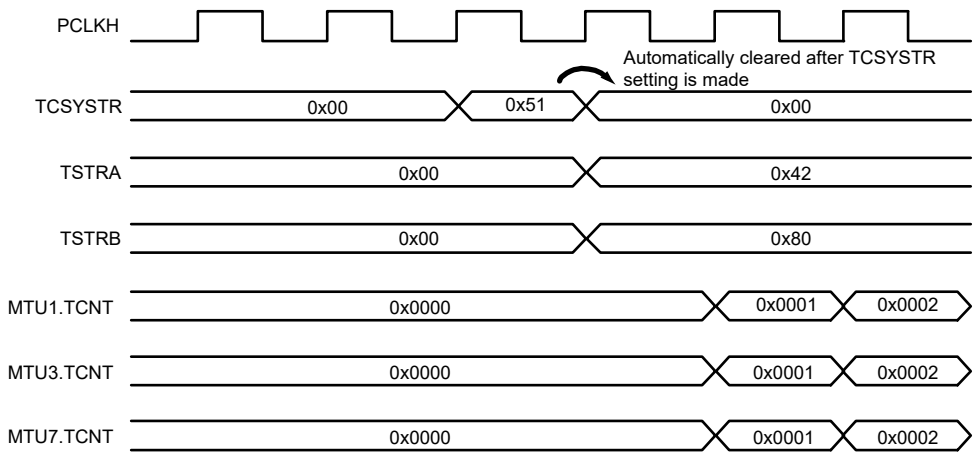
[4] To stop a timer counter, set the bit in TSTRA or TSTRB that corresponds to the counter to 0.

Note:
- Even if a bit in TCSYSTR corresponding to an operating counter is set to 0, the counter will not stop.
- To start counters synchronously in reset-synchronized PWM mode or complementary PWM mode using MTU3 and MTU4 or MTU6 and MTU7, set the bits in TCSYSTR that correspond to MTU3, MTU4, MTU6, and MTU7 to 1 at the same time.

Figure 17.99 Example of procedure for setting synchronous counter start for MTU0 to MTU4, MTU6, and MTU7

(2) Examples of Synchronous Counter Start Operation

Figure 17.100 shows an examples of synchronous counter start operation for MTU0 to MTU4, MTU6, and MTU7.



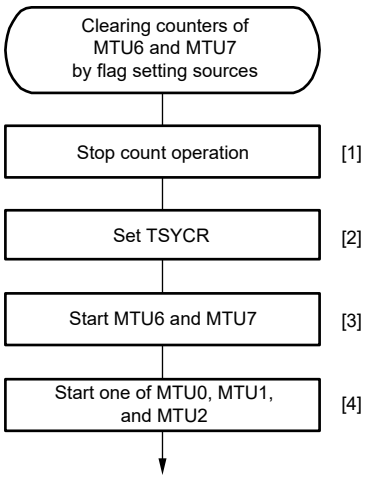


Figure 17.100 Examples of synchronous counter start operation for MTU0 to MTU4, MTU6, and MTU7

17.3.10.2 Synchronous Counter Clearing for MTU6 and MTU7

The counters in MTU6 and MTU7 can be cleared by the TGImn interrupt generation timing (m = A to D; n = 0 to 2) through the TSYCR setting.

(1) Example of Procedure for Specifying Synchronous Counter Clearing for MTU6 and MTU7

Figure 17.101 shows an example of procedure for specifying synchronous counter clearing for MTU6 and MTU7 by flag setting sources.

[1] Set TSTRA and TSTRB to stop the counters used for this function.

[2] Use TSYCR to specify the source to be used for the MTU6.TCNT and MTU7.TCNT counter clearing.

[3] Start MTU6.TCNT or MTU7.TCNT.

[4] Start MTU0.TCNT, MTU1.TCNT, or MTU2.TCNT.

Note: The TSYCR setting is ignored while the counter is stopped. The setting becomes valid after MTU6.TCNT or MTU7.TCNT is started.

Figure 17.101 Example of procedure for specifying synchronous counter clearing for MTU6 and MTU7

(2) Examples of Synchronous Counter Clearing for MTU6 and MTU7

Figure 17.102 and Figure 17.103 show examples of synchronous counter clearing for MTU6 and MTU7 by flag setting sources.

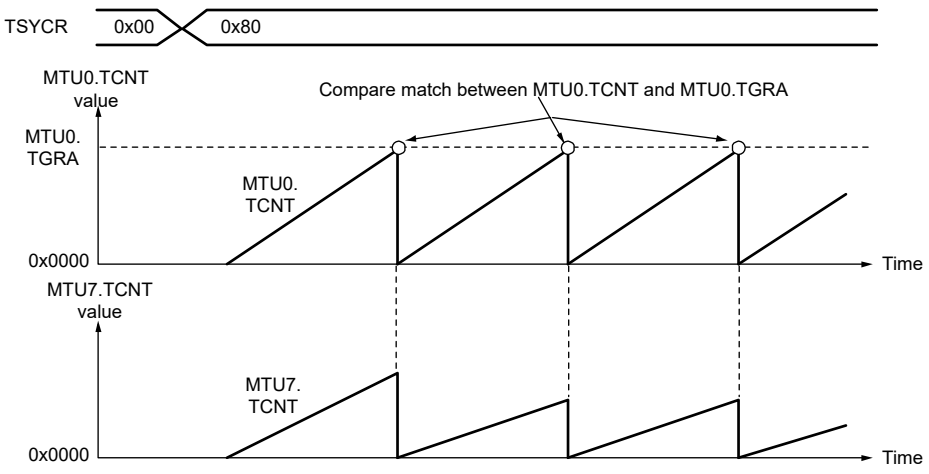

Figure 17.102 Example of synchronous counter clearing for MTU6 and MTU7 (1)

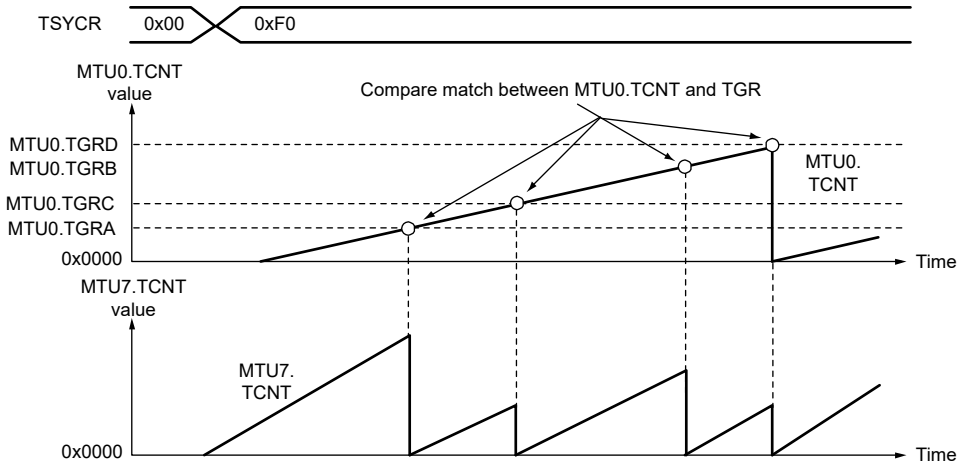

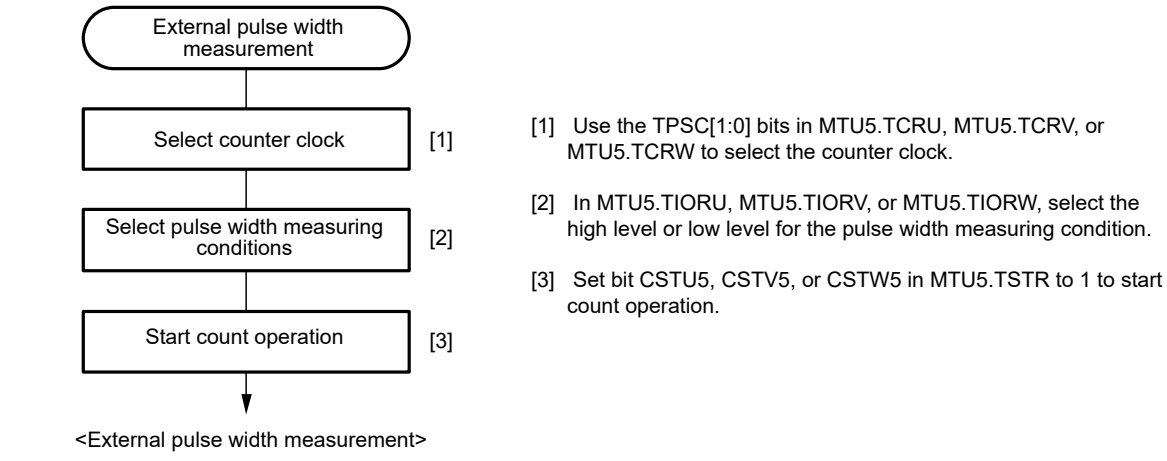

Figure 17.103 Example of synchronous counter clearing for MTU6 and MTU7 (2)

17.3.11 External Pulse Width Measurement

The pulse widths of up to three external input lines can be measured in MTU5.

When the IOC[4:0] bits in MTU5.TIORU, MTU5.TIORV, MTU5.TIORW are set for pulse width measurement, the pulse width of the signal input to the MTIC5U, MTIC5V, and MTIC5W pins are measured. TCNTU, TCNTV, and TCNTW count up while the level specified by the IOC[4:0] bits is input.

Figure 17.104 shows an example of setting external pulse width measurement and Figure 17.105 an example of external pulse width measurement.

Note:
- Set bit CMPCLR5U, CMPCLR5V, and CMPCLR5W in TCNTCMPCLR to 0.
- Set bit TGIE5U, TGIE5V, and TGIE5W in MTU5.TIER to 0.
- The value in TCNT is not captured in TGR.

Figure 17.104 Example of external pulse width measurement setting procedure

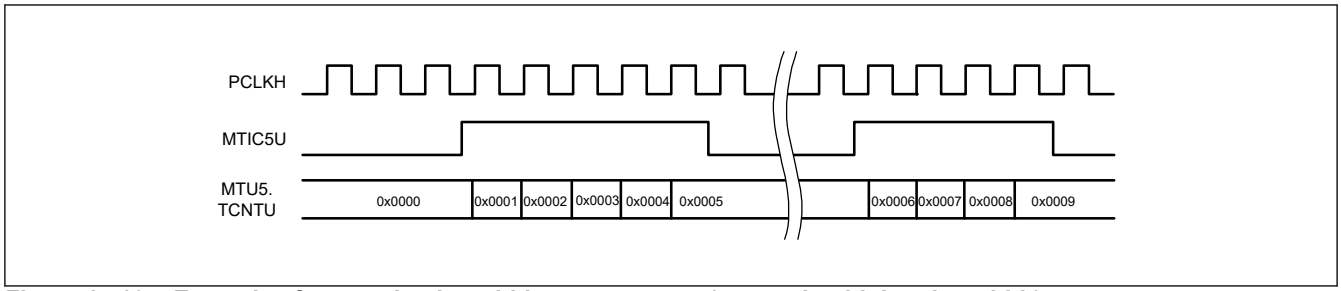

Figure 17.105 Example of external pulse width measurement (measuring high pulse width)

17.3.12 Dead Time Compensation

A dead time delay (a propagation delay of the inverter output from the complementary PWM output) can be compensated by combining MTU5 with MTU6 and MTU7. Figure 17.106 shows an example of the motor control circuit compensating a dead time delay by combining MTU5 with MTU6 and MTU7. A dead time for the PWM output waveform during complementary PWM operation using MTU6 and MTU7 can be compensated by adjusting a duty ratio set in a compare register for the PWM output after measuring a delay of the inverter output from the complementary PWM output by an external pulse measurement function for MTU5 (Figure 17.107). Figure 17.108 shows the procedure for setting dead time compensation using MTU5 to MTU7. For details on MTU5 operation at this time, see section 17.3.13. TCNTU, TCNTV, and TCNTW Capture at Crest and/or Trough in Complementary PWM Mode.

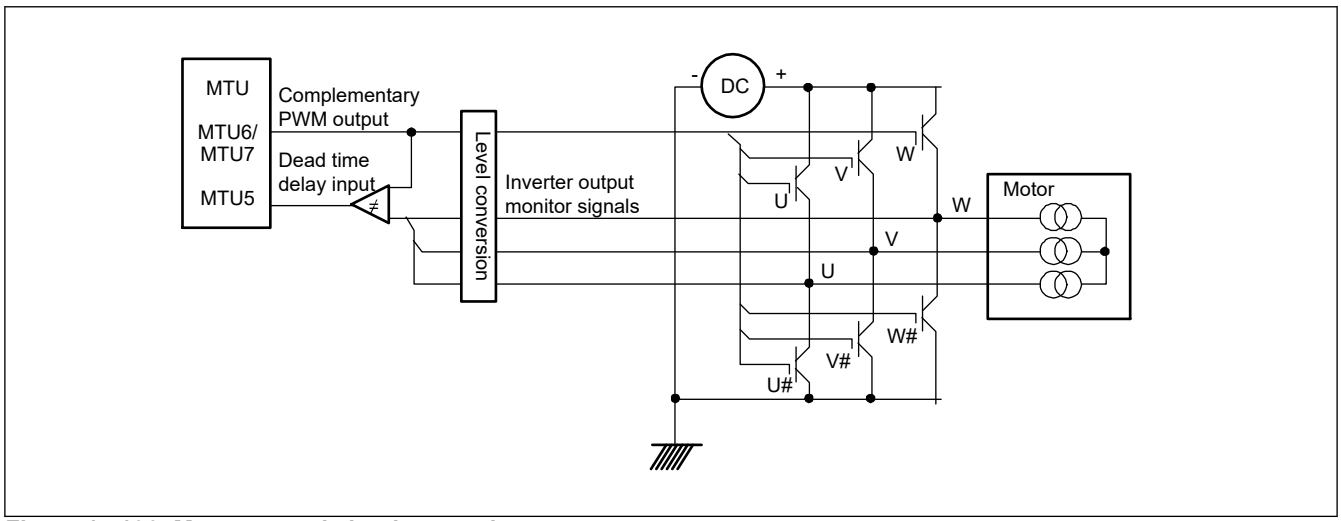

Figure 17.106 Motor control circuit example

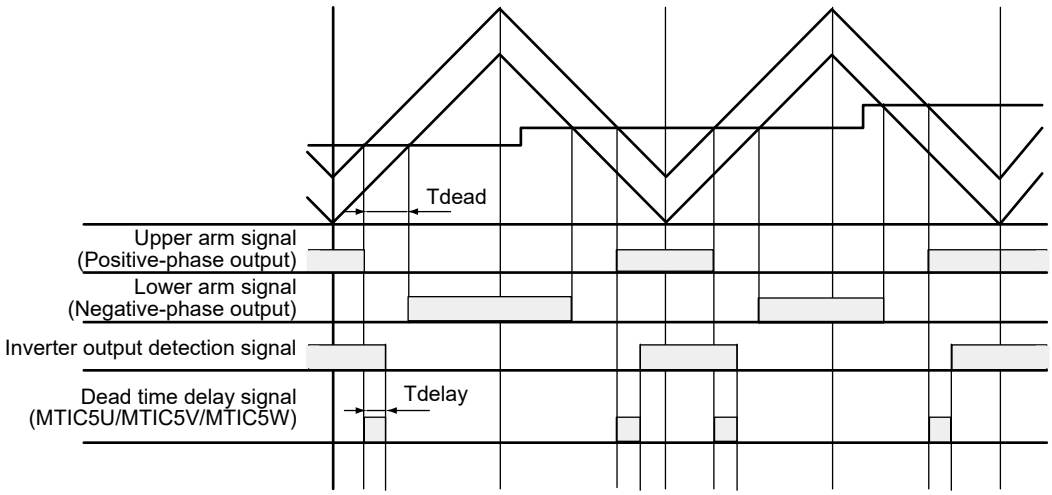

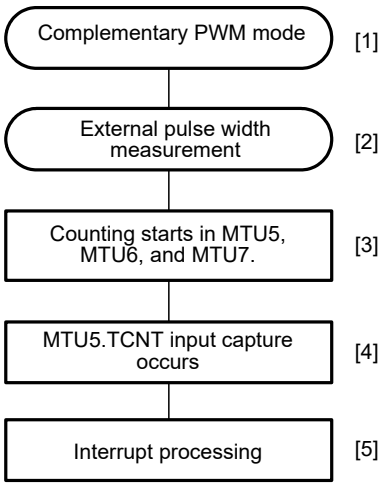

Figure 17.107 Delay in dead time in complementary PWM operation

17.3.12.1 Example of Dead Time Compensation Setting Procedure

Figure 17.108 shows an example of dead time compensation setting procedure by using three counters in MTU5.

[1] Set MTU6 and MTU7 to complementary PWM mode. For details, refer to section 17.3.8, Complementary PWM Mode.

[2] Specify the external pulse width measurement function for the target TIORx (x: U, V, W) in MTU5. For details, refer to section 17.3.11, External Pulse Width Measurement.

[3] Set bits CST6 and CST7 in TSTRB and bits CSTU5, CSTV5, and CSTW5 in MTU5.TSTR to 1 to start count operation.

[4] When the capture condition specified in TIORx is satisfied, the MTU5.TCNT value is captured in MTU5.TGRx (x: U, V, W). To prevent the generation of the MTU5.TGIm5 interrupt (m = U, V, W) request under the capture condition specified in TIORx, do not enable interrupt requests in MTU5.TIER.

[5] For U-phase dead time compensation, when an interrupt is generated at the crest (TGIA6) or trough (TCIV7) in complementary PWM mode, read the MTU5.TGRU value, calculate the difference in time between MTU6.TGRB and write the corrected value to MTU6.TGRD in the interrupt processing. For the V phase and W phase, read the MTU5.TGRV and MTU5.TGRW values and write the corrected values to MTU7.TGRC and TGRD, respectively, in the same way as for U-phase compensation. The MTU5.TCNT value should be cleared through the TCNTCMPCLR setting or by software.

Note: The I/O port registers of the I/O ports should be set up in advance.
As the interrupt flag is set under the capture condition specified in TIORx, do not enable interrupt requests in MTU5.TIER.

Figure 17.108 Example of dead time compensation setting procedure

17.3.13 TCNTU, TCNTV, and TCNTW Capture at Crest and/or Trough in Complementary PWM Mode

The MTU5 external pulse width measurement function allows to transfer the value in TCNTU, TCNTV, and TCNTW to TGRU, TGRV, and TGRW at the crest, or trough, or crest and trough when MTU6 and MTU7 operate in complementary PWM mode. The transfer timing is set in TIORU, TIORV, and TIORW. When the CMPCLR5U, CMPCLR5V, and CMPCLR5W bits in the TCNTCMPCLR register are set to 1, TCNTU, TCNTV, and TCNTW become 0x0000 at the transfer timing for TGRU, TGRV, and TGRW.

Figure 17.109 shows an operation example in which MTU5.TCNTU is used as a free-running counter without being cleared, and the value is captured in TGR at the crest and trough in complementary PWM mode.

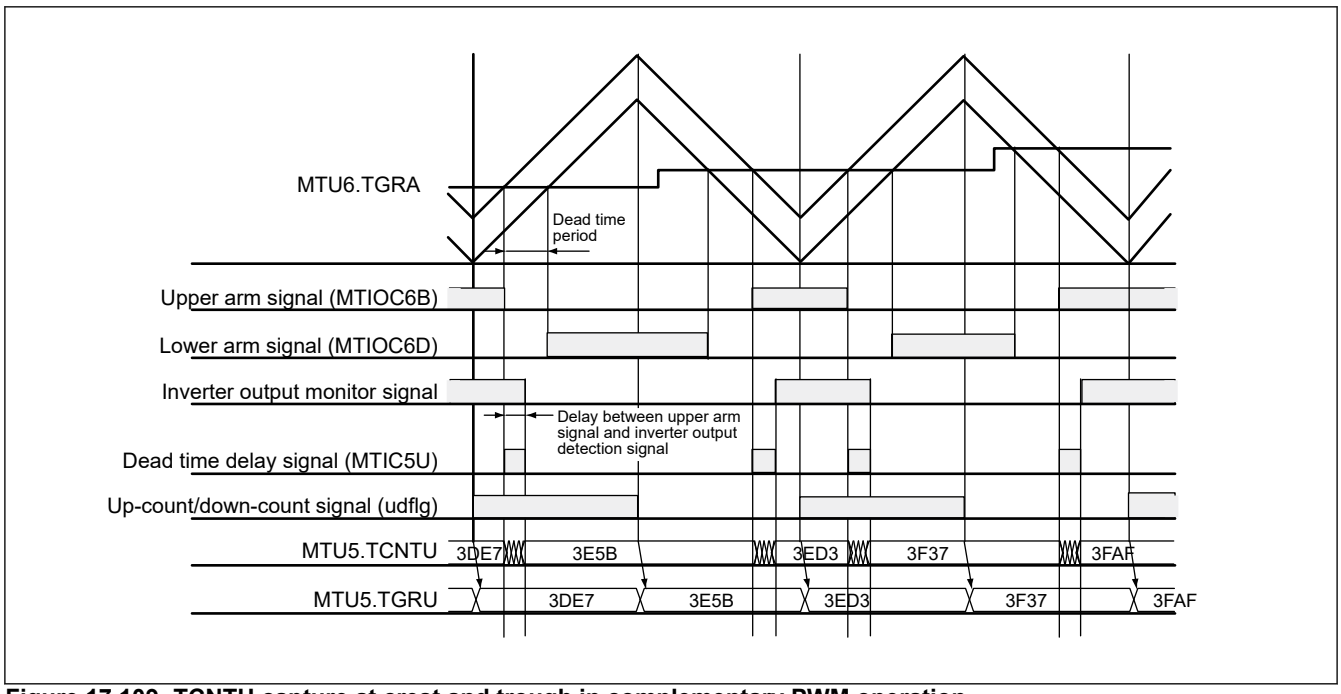

Figure 17.109 TCNTU capture at crest and trough in complementary PWM operation

17.3.14 Noise Filter Function

The input capture input pins and external pulse input pins have a noise filter function.

Set the NFCRn register (n = 0 to 8, C) to enable or disable the noise filter function and set the sampling clock. The noise filter for each pin can be enabled or disabled individually, and the sampling clock can be set for each channel.

Figure 17.110 shows the timing of noise filtering.

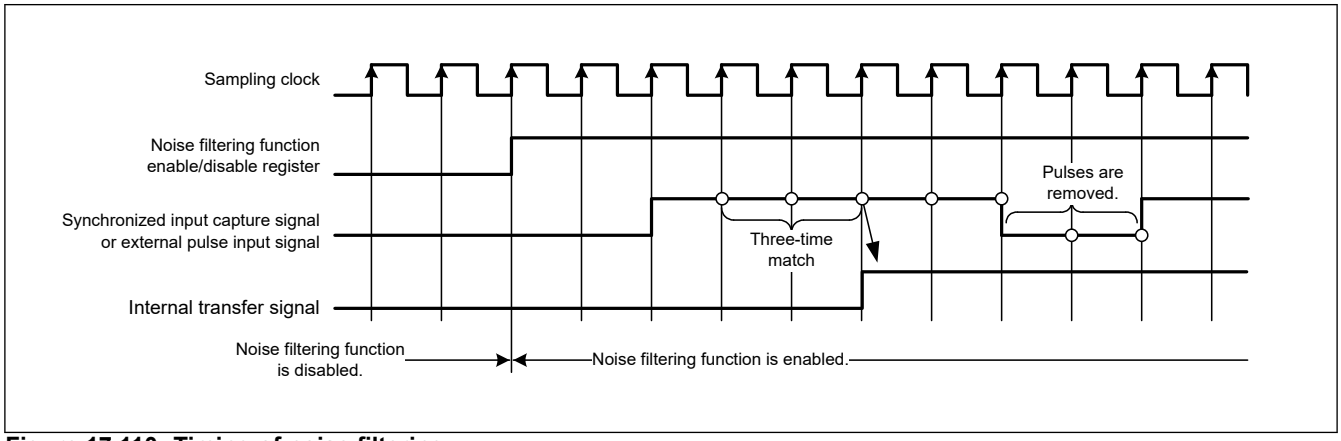

Figure 17.110 Timing of noise filtering

17.4 Interrupt Sources

17.4.1 Interrupt Sources and Priorities

There are three kinds of MTU interrupt sources:

- TGR input capture/compare match
- TCNT overflow
- TCNT underflow

Each interrupt source has its own enable/disable bit, allowing the generation of interrupt request signals to be enabled or disabled individually.

When an interrupt source is generated, if the corresponding enable/disable bit in TIER is set to 1, an interrupt is requested.

Relative channel priorities can be changed by the interrupt controller. For details, see section 11, Interrupt Controller (ICU). Table 17.72 lists the MTU interrupt sources.

Table 17.72 MTU interrupt sources

Channel	Name	Interrupt source	DMAC activation	Priority
MTU0	TGIA0	ch0 input capture/compare match A interrupt	Possible	High
	TGIB0	ch0 input capture/compare match B interrupt	Possible	↑
	TGIC0	ch0 input capture/compare match C interrupt	Possible	↑
	TGID0	ch0 input capture/compare match D interrupt	Possible	↑
	TCIV0	ch0 overflow interrupt	Not possible	↑
	TGIE0	ch0 compare match E interrupt	Not possible	↑
	TGIF0	ch0 compare match F interrupt	Not possible	↑
MTU1	TGIA1	ch1 input capture/compare match A interrupt	Possible	↑
	TGIB1	ch1 input capture/compare match B interrupt	Possible	↑
	TCIV1	ch1 overflow interrupt	Not possible	↑
	TCIU1	ch1 underflow interrupt	Not possible	↑
MTU2	TGIA2	ch2 input capture/compare match A interrupt	Possible	↑
	TGIB2	ch2 input capture/compare match B interrupt	Possible	↑
	TCIV2	ch2 overflow interrupt	Not possible	↑
	TCIU2	ch2 underflow interrupt	Not possible	↑
MTU3	TGIA3	ch3 input capture/compare match A interrupt	Possible	↑
	TGIB3	ch3 input capture/compare match B interrupt	Possible	↑
	TGIC3	ch3 input capture/compare match C interrupt	Possible	↑
	TGID3	ch3 input capture/compare match D interrupt	Possible	↑
	TCIV3	ch3 overflow interrupt	Not possible	↑
MTU4	TGIA4	ch4 input capture/compare match A interrupt	Possible	↑
	TGIB4	ch4 input capture/compare match B interrupt	Possible	↑
	TGIC4	ch4 input capture/compare match C interrupt	Possible	↑
	TGID4	ch4 input capture/compare match D interrupt	Possible	↑
	TCIV4	ch4 overflow/underflow interrupt*1	Possible	↑
MTU5	TGIU5	ch5 input capture/compare match U interrupt	Possible	↑
	TGIV5	ch5 input capture/compare match V interrupt	Possible	↑
	TGIW5	ch5 input capture/compare match W interrupt	Possible	↑
MTU6	TGIA6	ch6 compare match A interrupt	Possible	↑
	TGIB6	ch6 compare match B interrupt	Possible	↑
	TGIC6	ch6 compare match C interrupt	Possible	↑
	TGID6	ch6 compare match D interrupt	Possible	↑
	TCIV6	ch6 overflow interrupt	Not possible	↑
MTU7	TGIA7	ch7 compare match A interrupt	Possible	↑
	TGIB7	ch7 compare match B interrupt	Possible	↑
	TGIC7	ch7 compare match C interrupt	Possible	↑
	TGID7	ch7 compare match D interrupt	Possible	↑
	TCIV7	ch7 overflow/underflow interrupt*1	Possible	↑
MTU8	TGIA8	ch8 compare match A interrupt	Possible	↑
	TGIB8	ch8 compare match B interrupt	Possible	↑
	TGIC8	ch8 compare match C interrupt	Possible	↑
	TGID8	ch8 compare match D interrupt	Possible	↑
	TCIV8	ch8 overflow interrupt	Not possible	Low

Note: This table shows the initial state immediately after a reset. The relative channel priorities can be changed by the interrupt controller.
Note 1. Only in complementary PWM mode.

(1) Input Capture/Compare Match Interrupt

If the TIER.TGIE bit is set to 1 when a TGR input capture/compare match occurs on a channel, an interrupt is requested. The MTU has 33 input capture/compare match interrupts (six for MTU0, four each for MTU3, MTU4, MTU6, MTU7, and MTU8, two each for MTU1 and MTU2, and three for MTU5).

(2) Overflow Interrupt

If the TIER.TCIEV bit is set to 1 when a TCNT overflow occurs on a channel, an interrupt is requested. The MTU has eight overflow interrupts (one for each channel).

(3) Underflow Interrupt

If the TIER.TCIEU bit is set to 1 when a TCNT underflow occurs on a channel, an interrupt is requested. The MTU has two underflow interrupts (one each for MTU1 and MTU2).

17.4.2 DMAC Trigger Sources

The DMAC can be triggered by the TGR input capture/compare match interrupt in each channel and the overflow interrupt in MTU4 and MTU7. For details, see section 14, DMA Controller (DMAC).

The MTU provides a total of 33 input capture/compare match interrupts and overflow interrupts that can be used as DMAC trigger sources: four each for MTU0, MTU3, MTU6, and MTU8, two each for MTU1 and MTU2, five each for MTU4 and MTU7, and three for MTU5.

17.4.3 A/D Converter Trigger Sources

The A/D converter can be triggered by one of the following three methods in the MTU. Table 17.73 shows the relationship between interrupt sources and A/D converter start request signals.

(1) A/D Conversion Start by MTUn.TGRA (n = 0 to 4, 6, 7) Input Capture/Compare Match or at Trough of MTUm.TCNT (m = 4 or 7) in Complementary PWM Mode

The A/D converter can be triggered by the occurrence of a TGRA input capture/compare match in channels 0 to 4, 6, and 7. In addition, if complementary PWM operation is performed while the TTGE2 bit in MTU4.TIER is set to 1, the A/D converter can be triggered at the trough of MTUm.TCNT count (MTUm.TCNT = 0x0000) (m = 4 or 7).

A/D converter start request signal TRGAnN is issued to the A/D converter under either of the following conditions (n = 0 to 4, 6, 7).

- When a TGRA input capture/compare match occurs on a channel while the TIER.TTGE bit is set to 1
- When the MTUm.TCNT count reaches the trough (MTUm.TCNT = 0x0000) during complementary PWM operation while the TTGE2 bit in MTUm.TIER is set to 1

When either condition is satisfied, if A/D converter start signal TRGAnN from the MTU is selected as the trigger in the A/D converter, A/D conversion will start.

(2) A/D Conversion Start by Compare Match between MTU0.TCNT and MTU0.TGRE

A/D converter start request signal TRG0N is issued to the A/D converter when a compare match occurs between MTU0.TCNT and MTU0.TGRE.

When a compare match occurs between MTU0.TCNT and MTU0.TGRE while the TTGE2 bit in MTU0.TIER2 is set to 1, A/D converter start request TRG0N is issued to the A/D converter. If A/D converter start signal TRG0N from the MTU is selected as the trigger in the A/D converter, A/D conversion will start.

(3) A/D Conversion Start by A/D Converter Start Request Delaying Function (MTU4 and MTU7)

The A/D converter can be triggered by generating A/D converter start request signal TRG4AN or TRG4BN (TRG7AN or TRG7BN) when the MTU4.TCNT (MTU7.TCNT) count matches the MTU4.TADCORA or MTU4.TADCORB (MTU7.TADCORA or MTU7.TADCORB) value if the UT4AE, DT4AE, UT4BE, or DT4BE (UT7AE, DT7AE, UT7BE, or DT7BE) bit in the A/D converter start request control register (MTU4.TADCR (MTU7.TADCR)) is set to 1. For details, see section 17.3.9. A/D Converter Start Request Delaying Function.

A/D conversion will start when TRG4AN (TRG7AN) is generated if A/D converter start signal TRG4AN (TRG7AN) from the MTU is selected as the trigger in the A/D converter, when TRG4BN (TRG7BN) is generated if TRG4BN (TRG7BN) from the MTU is selected as the trigger in the A/D converter, or when TRG4ABN (TRG7ABN) is generated if TRG4ABN (TRG7ABN) from the MTU is selected as the trigger in the A/D converter.

Table 17.73 Interrupt sources and A/D converter start request signals

Target registers	Interrupt source	A/D converter start request signal
MTU0.TGRA and MTU0.TCNT	Input capture/compare match	TRGA0N
MTU1.TGRA and MTU1.TCNT		TRGA1N
MTU2.TGRA and MTU2.TCNT		TRGA2N
MTU3.TGRA and MTU3.TCNT		TRGA3N
MTU4.TGRA and MTU4.TCNT*1		TRGA4N
MTU4.TCNT	MTU4.TCNT trough in complementary PWM mode	
MTU6.TGRA and MTU6.TCNT	Input capture/compare match	TRGA6N
MTU7.TGRA and MTU7.TCNT*1		TRGA7N
MTU7.TCNT	MTU7.TCNT trough in complementary PWM mode	TRGA7N
MTU0.TGRE and MTU0.TCNT	Compare match	TRG0N
MTU4.TADCORA and MTU4.TCNT		TRG4AN
MTU4.TADCORB and MTU4.TCNT		TRG4BN
MTU7.TADCORA and MTU7.TCNT		TRG7AN
MTU7.TADCORB and MTU7.TCNT		TRG7BN
MTU4.TADCORA and MTU4.TCNT, MTU4.TADCORB and MTU4.TCNT	Compare match (interrupt skipping function 2)	TRG4ABN
MTU7.TADCORA and MTU7.TCNT, MTU7.TADCORB and MTU7.TCNT		TRG7ABN

Note 1. Since PWM waveforms are generated in complementary PWM mode, MTU4.TGRA (MTU7.TGRA) compare match not only with MTU4.TCNT (MTU7.TCNT) but also with MTU3.TCNT (MTU6.TCNT) and TCNTSA (TCNTSB) is detected. Accordingly, when compare match with MTU3.TCNT (MTU6.TCNT) and TCNTSA (TCNTSB) occurs, TRGA4N (TRGA7N) is also generated. When MTU3 and MTU 4 (MTU 6 and MTU7) are made to operate in complementary PWM mode for generating an A/D converter start request, use the A/D converter start request by compare match between MTU4.TCNT (MTU7.TCNT) and MTU4.TADCORA/TADCORB (MTU7.TADCORA/TADCORB).

17.5 Operation Timing

17.5.1 Input/Output Timing

17.5.1.1 TCNT Count Timing

Figure 17.111 and Figure 17.112 show the TCNT count timing in internal clock operation, Figure 17.113 shows the TCNT count timing in external clock operation (normal mode), and Figure 17.114 shows the TCNT count timing in external clock operation (phase counting mode).

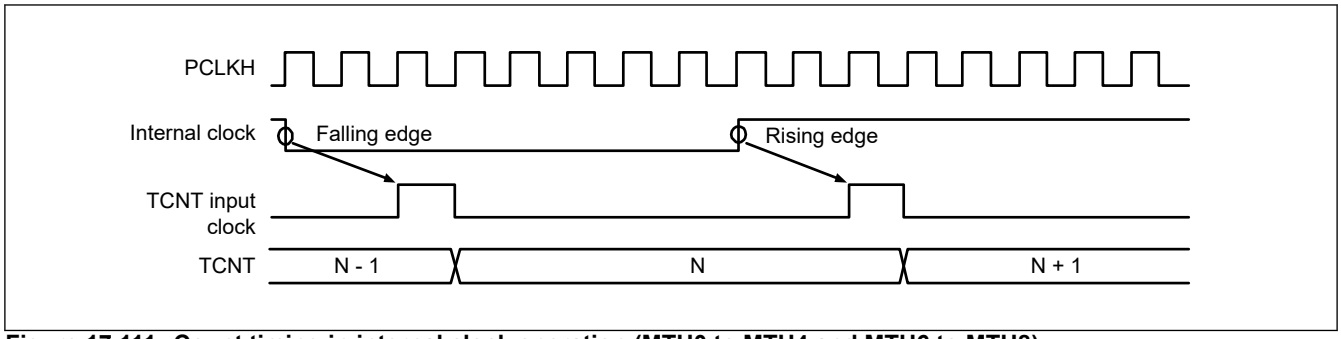

Figure 17.111 Count timing in internal clock operation (MTU0 to MTU4 and MTU6 to MTU8)

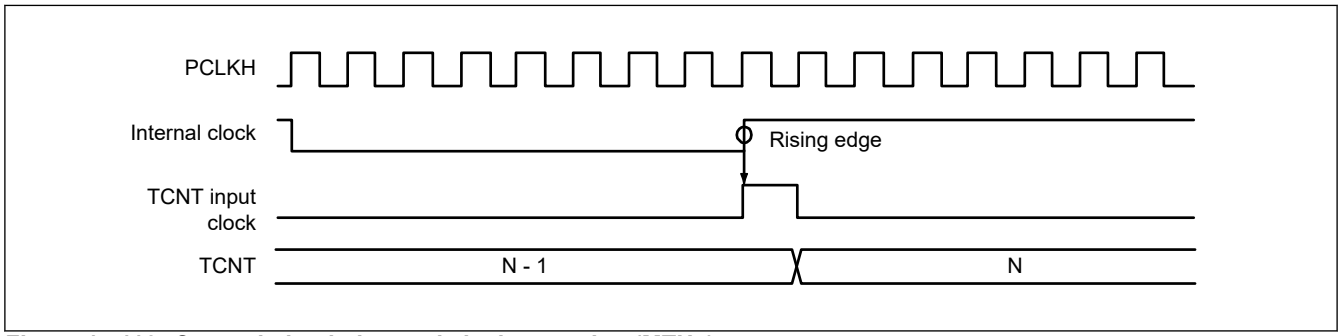

Figure 17.112 Count timing in internal clock operation (MTU5)

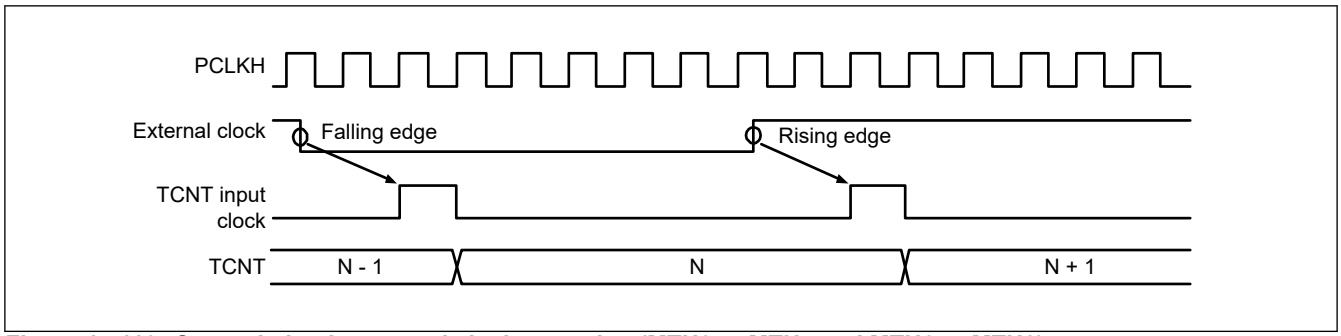

Figure 17.113 Count timing in external clock operation (MTU0 to MTU4 and MTU6 to MTU8)

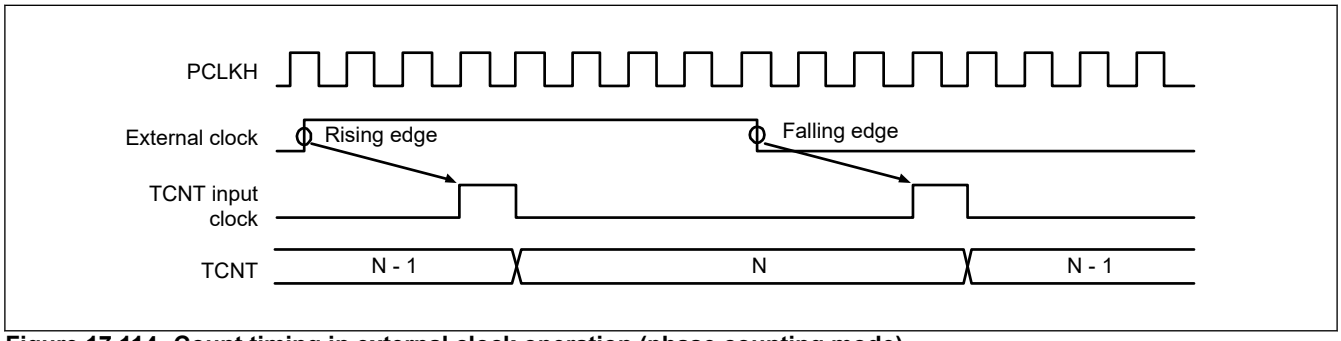

Figure 17.114 Count timing in external clock operation (phase counting mode)

17.5.1.2 Output Compare Output Timing

A compare match signal is generated in the final state in which TCNT and TGR match (the point at which the count value matched by TCNT is updated). When a compare match signal is generated, the value set in TIOR is output from MTIOCnm pin (n = 0 to 4, 6, 7, 8; m = A to D). After a match between TCNT and TGR, the compare match signal is not generated until the TCNT input clock is generated.

Figure 17.115 shows the output compare output timing (normal mode or PWM mode) and Figure 17.116 shows the output compare output timing (complementary PWM mode or reset-synchronized PWM mode).

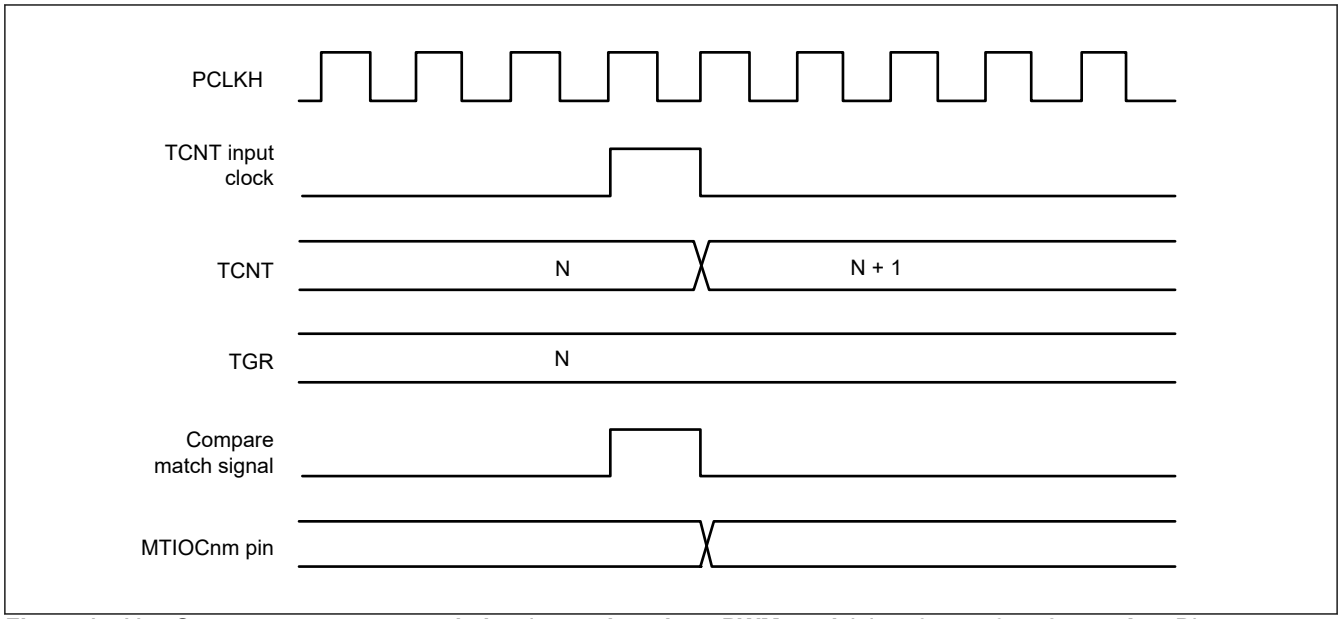

Figure 17.115 Output compare output timing (normal mode or PWM mode) (n = 0 to 4, 6, 7, 8; m = A to D)

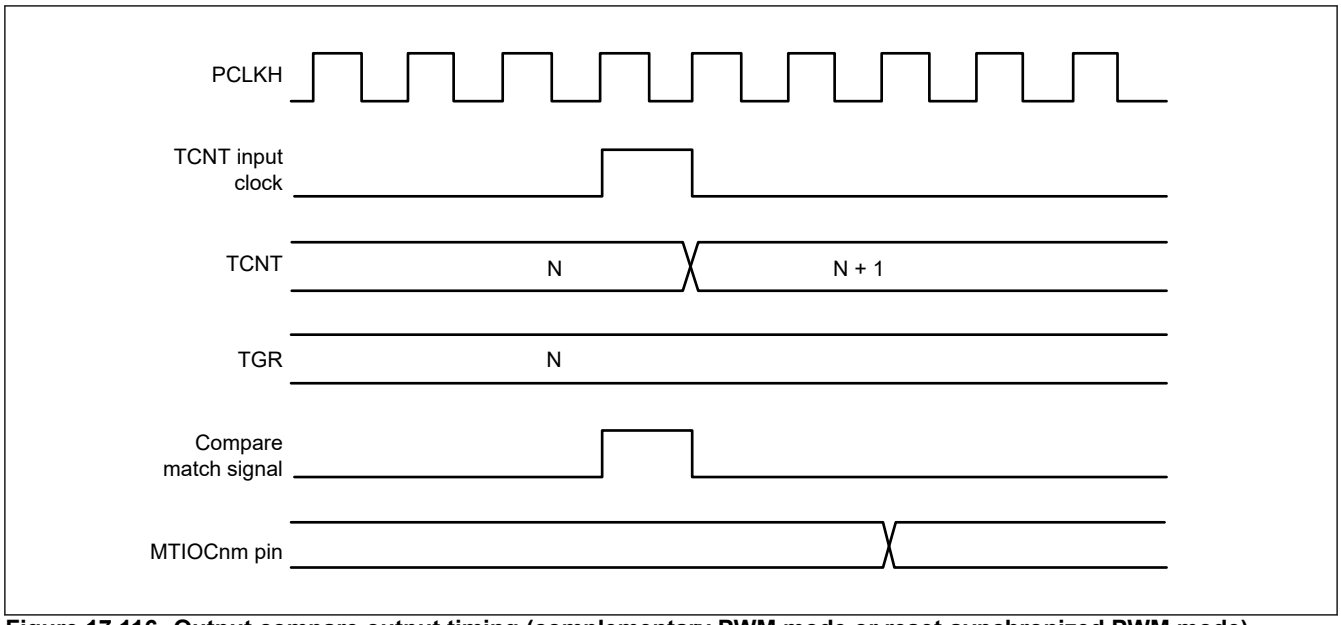

Figure 17.116 Output compare output timing (complementary PWM mode or reset-synchronized PWM mode) (n = 3, 4, 6, 7; m = A to D)

17.5.1.3 Input Capture Signal Timing

Figure 17.117 shows the input capture signal timing.

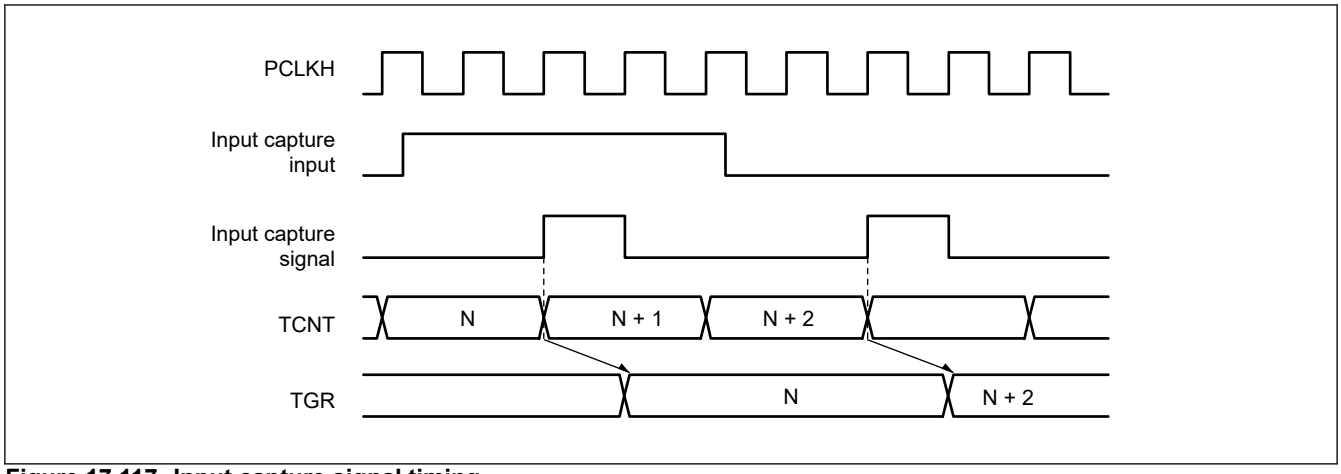

Figure 17.117 Input capture signal timing

17.5.1.4 Timing for Counter Clearing by Compare Match/Input Capture

Figure 17.118 and Figure 17.119 show the timing when counter clearing on compare match is specified, and Figure 17.120 shows the timing when counter clearing on input capture is specified.

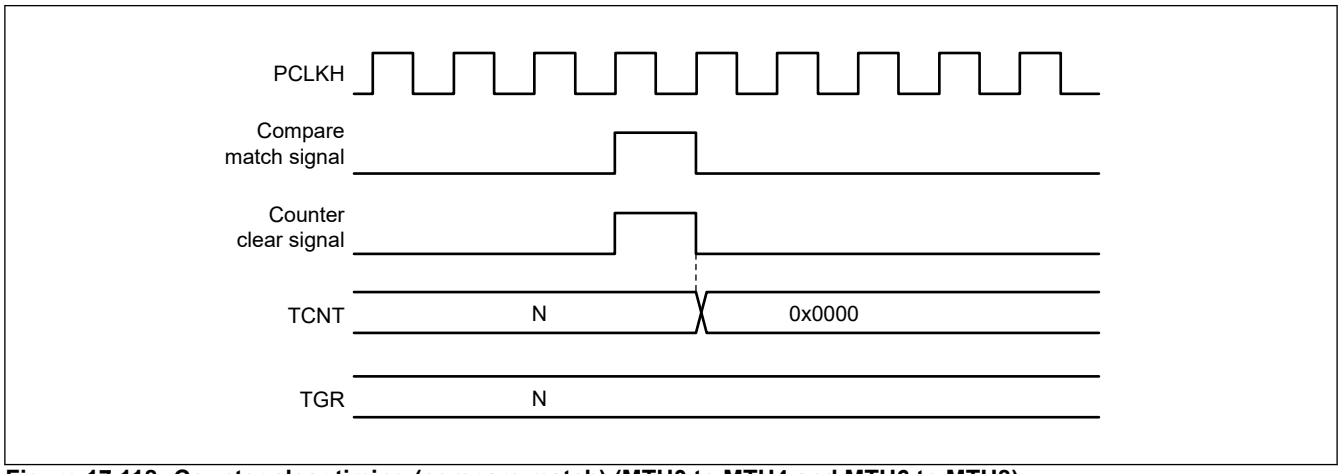

Figure 17.118 Counter clear timing (compare match) (MTU0 to MTU4 and MTU6 to MTU8)

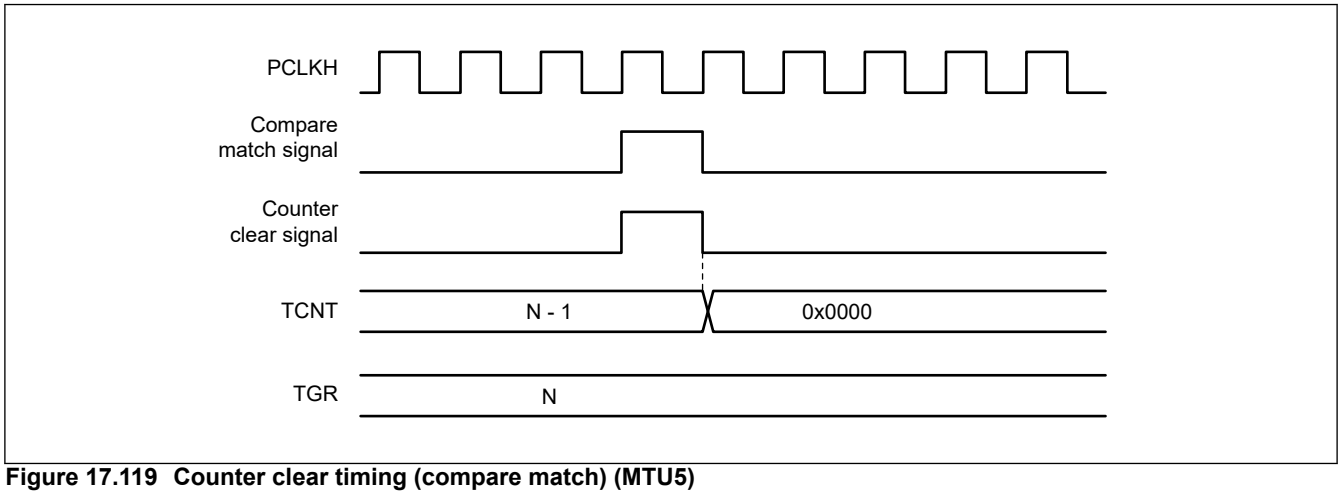

Figure 17.119 Counter clear timing (compare match) (MTU5)

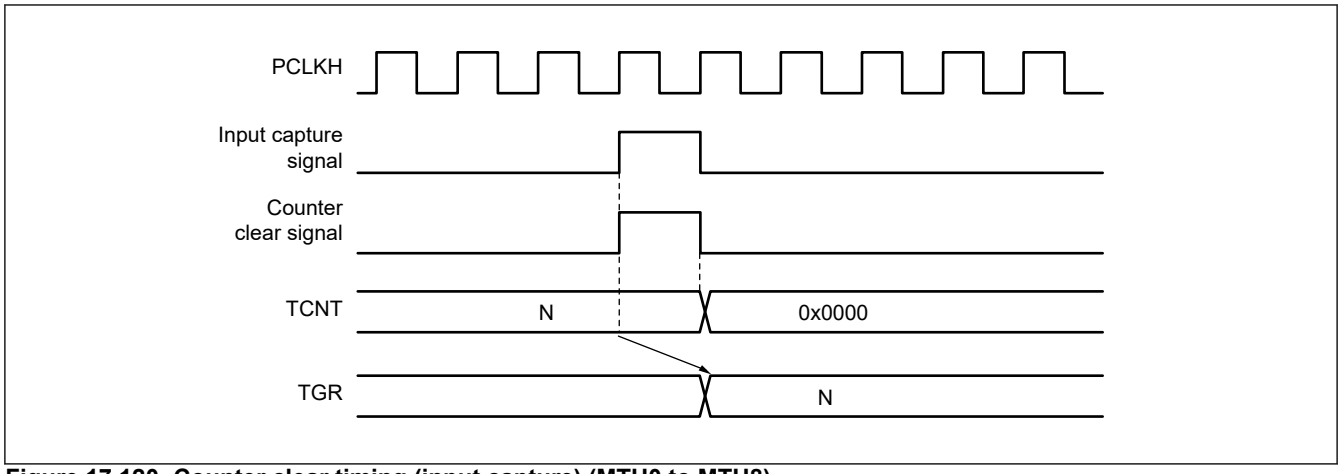

Figure 17.120 Counter clear timing (input capture) (MTU0 to MTU8)

17.5.1.5 Buffer Operation Timing

Figure 17.121 to Figure 17.123 show the timing in buffer operation.

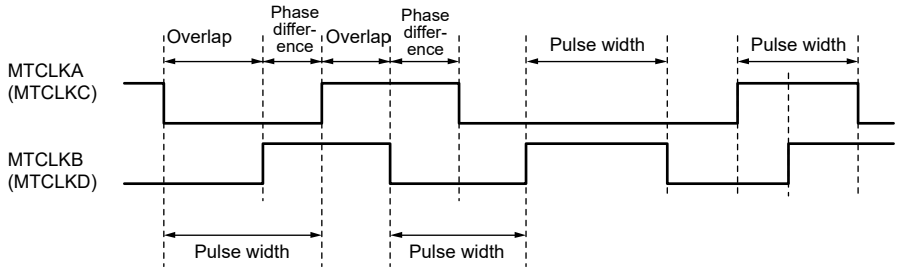
17.6 Usage Notes



17.6.1 Module Stop Function Setting

MTU operation can be disabled or enabled using the module stop control register. MTU operation is stopped with the initial setting. Register access is enabled by releasing the module clock stop state. For details, see section 8, Low-Power Consumption Function.

17.6.2 Input Clock Restrictions

The input clock pulse width must be at least three PCLKH cycles for single-edge detection, and at least five PCLKH cycles for both-edge detection. The MTU will not operate properly at narrower pulse widths.

In phase counting mode, the phase difference and overlap between the two input clocks must be at least three PCLKH cycles, and the pulse width must be at least five PCLKH cycles. Figure 17.133 shows the input clock conditions in phase counting mode.

Note: Phase difference and overlap: 3 PCLKH cycles or more.
Pulse width: 5 PCLKH cycles or more.

Figure 17.133 Phase difference, overlap, and pulse width in phase counting mode

17.6.3 Note on Period Setting

When counter clearing on compare match is set, TCNT is cleared in the final state in which it matches the TGR value (the point at which TCNT updates the matched count value). Consequently, the actual counter frequency is given by the following formula:

- MTU0 to MTU4 and MTU6 to MTU8
  $f = \frac{CNTCLK}{N+1}$
- MTU5
  $f = \frac{CNTCLK}{N}$

f: Counter frequency

CNTCLK: The counter clock frequency set by TCR.TPSC[2:0] and TCR2.TPSC2[2:0]

N: TGR setting

17.6.4 Contention between TCNT Write and Clear Operations

If the counter clear signal is generated in the TCNT write cycle, TCNT clearing takes precedence and TCNT write operation is not performed.

Figure 17.134 shows the timing in this case.

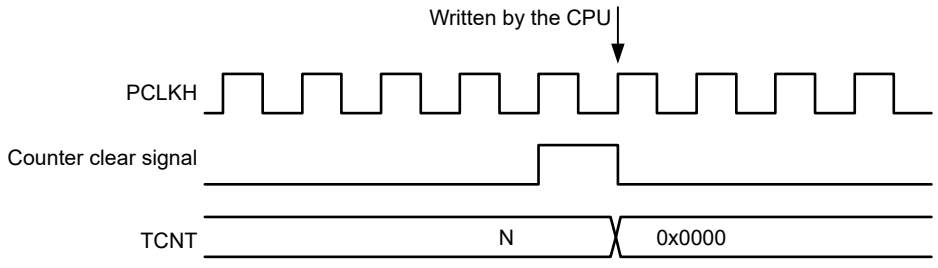


Figure 17.134 Contention between TCNT write and clear operations

17.6.5 Contention between TCNT Write and Increment Operations

If incrementing occurs in the TCNT write cycle, TCNT write operation takes precedence and TCNT is not incremented.

Figure 17.135 shows the timing in this case.

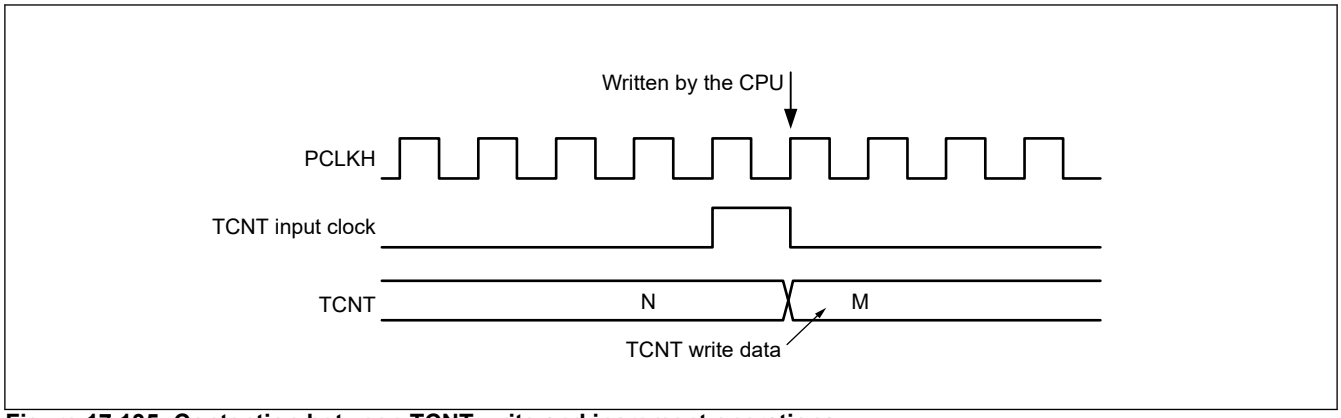

Figure 17.135 Contention between TCNT write and increment operations

17.6.6 Contention between TGR Write Operation and Compare Match

If a compare match occurs in a TGR write cycle, TGR write operation is executed and the compare match signal is also generated.

Figure 17.136 shows the timing in this case.

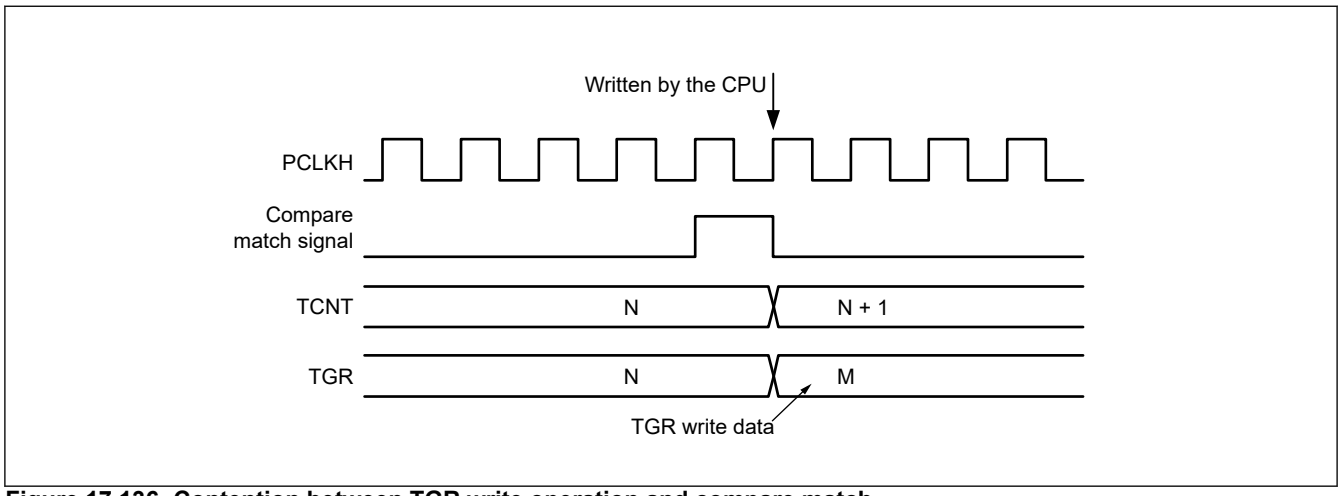

Figure 17.136 Contention between TGR write operation and compare match

17.6.7 Contention between Buffer Register Write Operation and Compare Match

If a compare match occurs in a TGR write cycle, the data before write operation is transferred to TGR by the buffer operation.

Figure 17.137 shows the timing in this case.

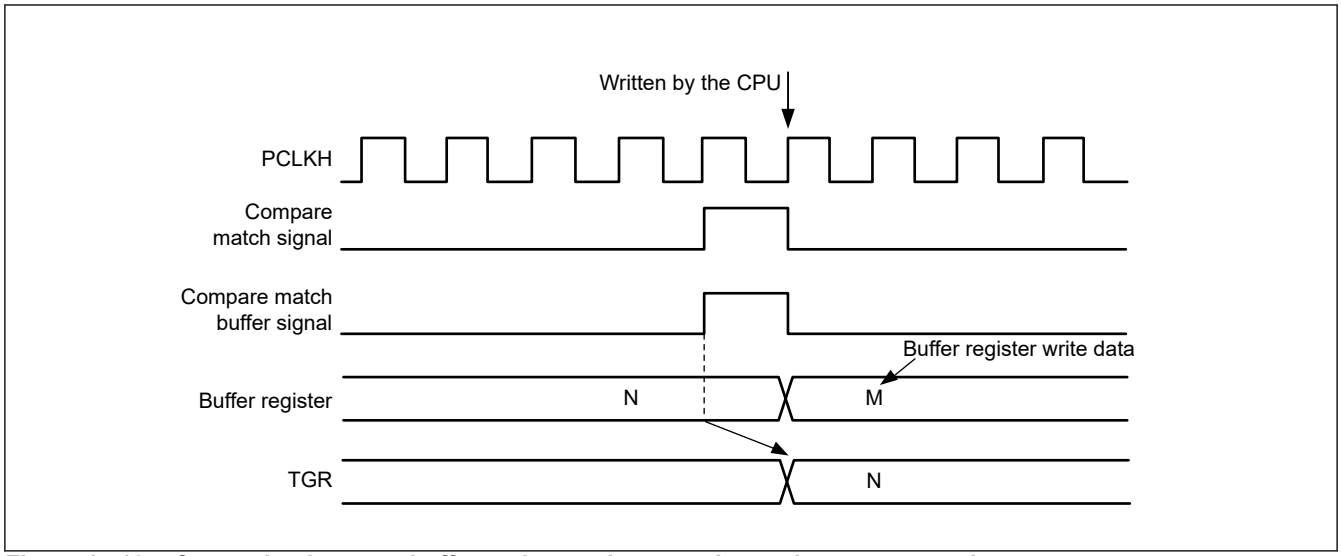

Figure 17.137 Contention between buffer register write operation and compare match

17.6.8 Contention between Buffer Register Write and TCNT Clear Operations

When the buffer transfer timing is set at the TCNT clear timing by the timer buffer operation transfer mode register (TBTM), if TCNT clearing occurs in the TGR write cycle, the data before write operation is transferred to TGR by the buffer operation.

Figure 17.138 shows the timing in this case.

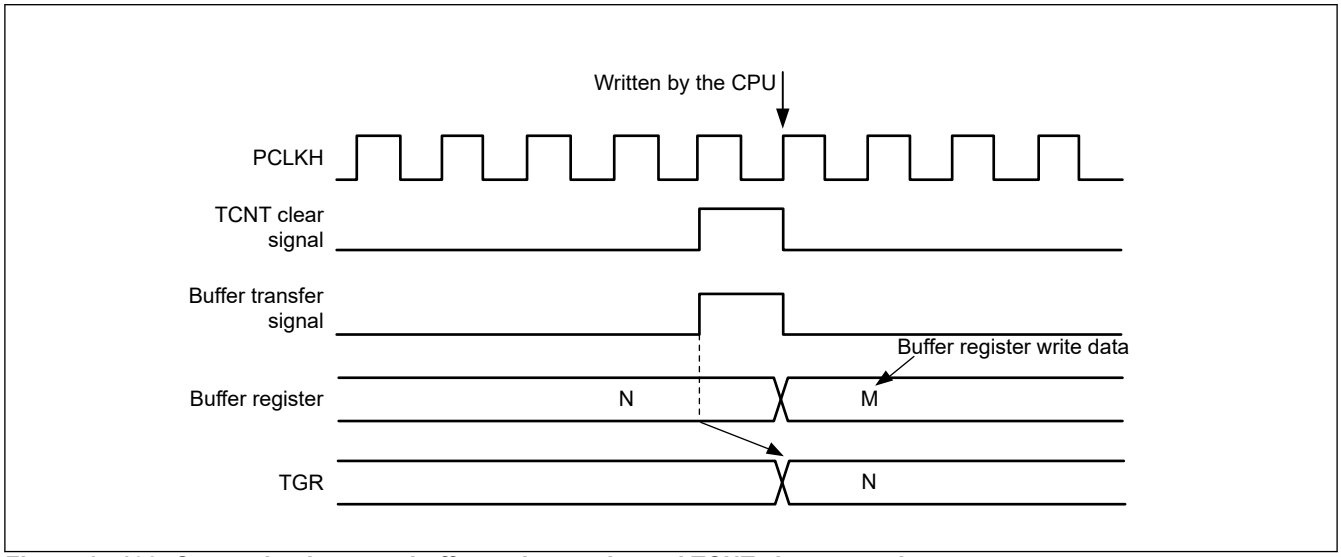

Figure 17.138 Contention between buffer register write and TCNT clear operations

17.6.9 Contention between TGR Read Operation and Input Capture

If an input capture signal is generated in the TGR read cycle, the data before input capture transfer is read.

Figure 17.139 shows the timing in this case.

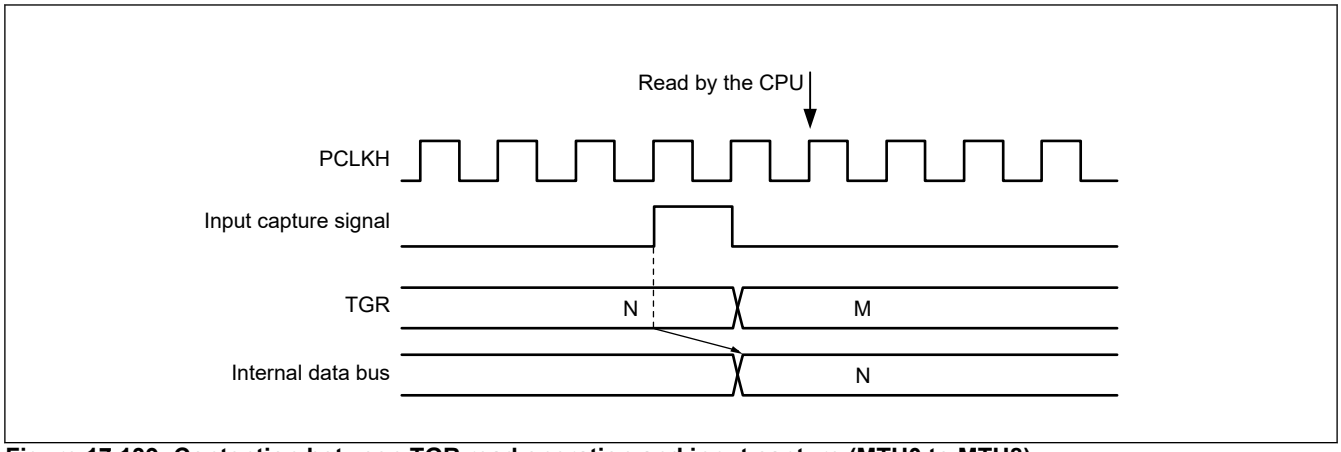

Figure 17.139 Contention between TGR read operation and input capture (MTU0 to MTU8)

17.6.10 Contention between TGR Write Operation and Input Capture

If an input capture signal is generated in a TGR write cycle, the input capture operation takes precedence and the TGR write operation is not performed in MTU0 to MTU4 and MTU6 to MTU8. In MTU5, the TGR write operation is performed and the input capture signal is generated.

Figure 17.140 and Figure 17.141 show the timing in this case.

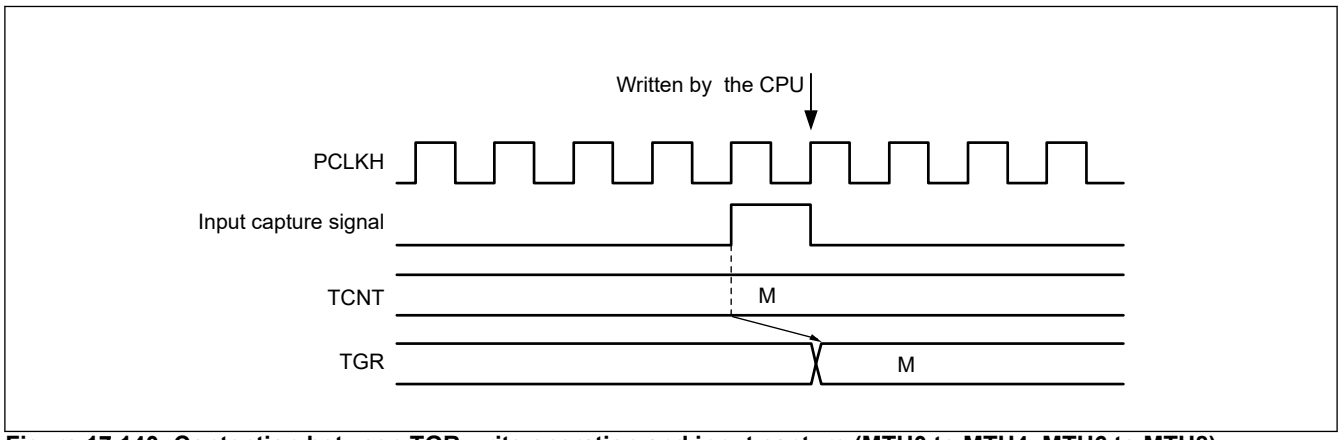

Figure 17.140 Contention between TGR write operation and input capture (MTU0 to MTU4, MTU6 to MTU8)

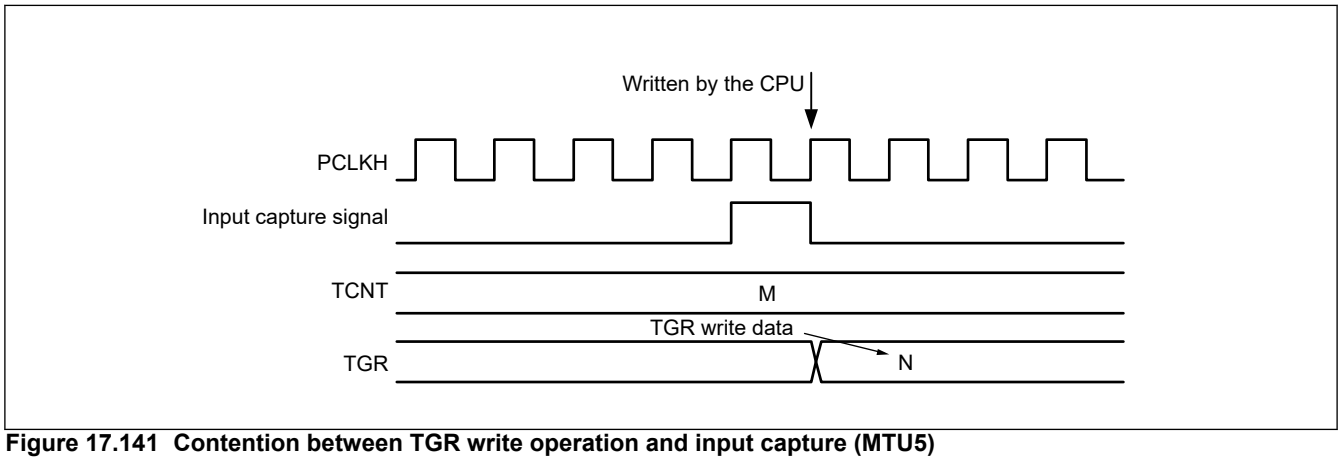

Figure 17.141 Contention between TGR write operation and input capture (MTU5)

17.6.11 Contention between Buffer Register Write Operation and Input Capture

If an input capture signal is generated in a buffer register write cycle, the buffer operation takes precedence and the buffer register write operation is not performed.

Figure 17.142 shows the timing in this case.

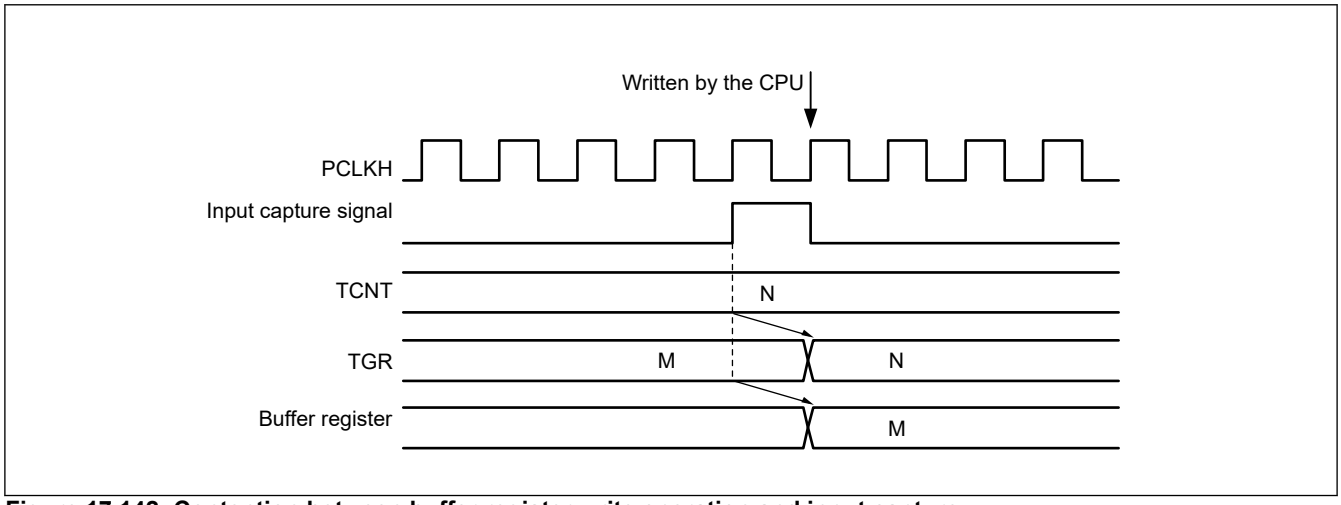

Figure 17.142 Contention between buffer register write operation and input capture

17.6.12 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation

With timer counters MTU1.TCNT and MTU2.TCNT in a cascade, when a contention occurs between MTU1.TCNT counting (an MTU2.TCNT overflow/underflow) and the MTU2.TCNT write operation, the MTU2.TCNT write operation is performed and the MTU1.TCNT count signal is disabled. In this case, if MTU1.TGRA works as a compare match register and there is a match between the MTU1.TGRA and MTU1.TCNT values, a compare match signal is issued.

Furthermore, when the MTU1.TCNT count clock is selected as the input capture source of MTU0, MTU0.TGRA to MTU0.TGRD work in input capture mode. In addition, when the MTU0.TGRC compare match/input capture is selected as the input capture source of MTU1.TGRB, MTU1.TGRB works in input capture mode.

Figure 17.143 shows the timing in this case.

When setting the TCNT clearing function in cascaded operation, be sure to synchronize MTU1 and MTU2.

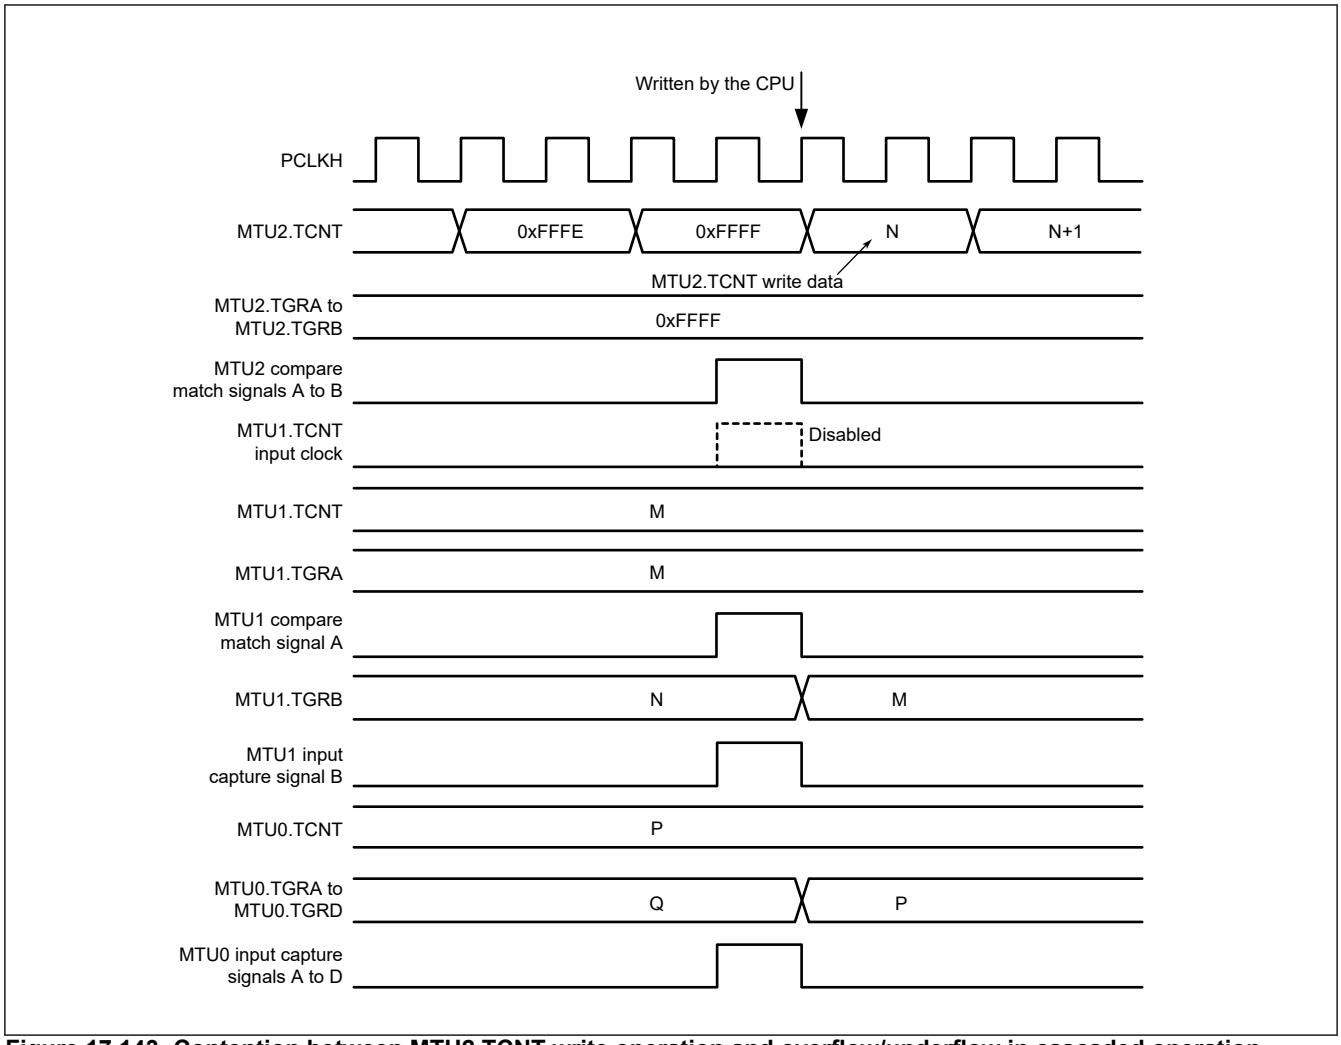

Figure 17.143 Contention between MTU2.TCNT write operation and overflow/underflow in cascaded operation

17.6.13 Counter Value When Count Operation is Stopped in Complementary PWM Mode

When counting operation in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) is stopped in complementary PWM mode, the MTU3.TCNT (MTU6.TCNT) value is set to the timer dead time data register (TDDRA (TDDRB)) value and MTU4.TCNT (MTU7.TCNT) is set to 0x0000.

When operation is restarted in complementary PWM mode, counting begins automatically from the initial setting state.

Figure 17.144 shows this operation.

When counting begins in another operating mode, be sure to make initial settings in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT).

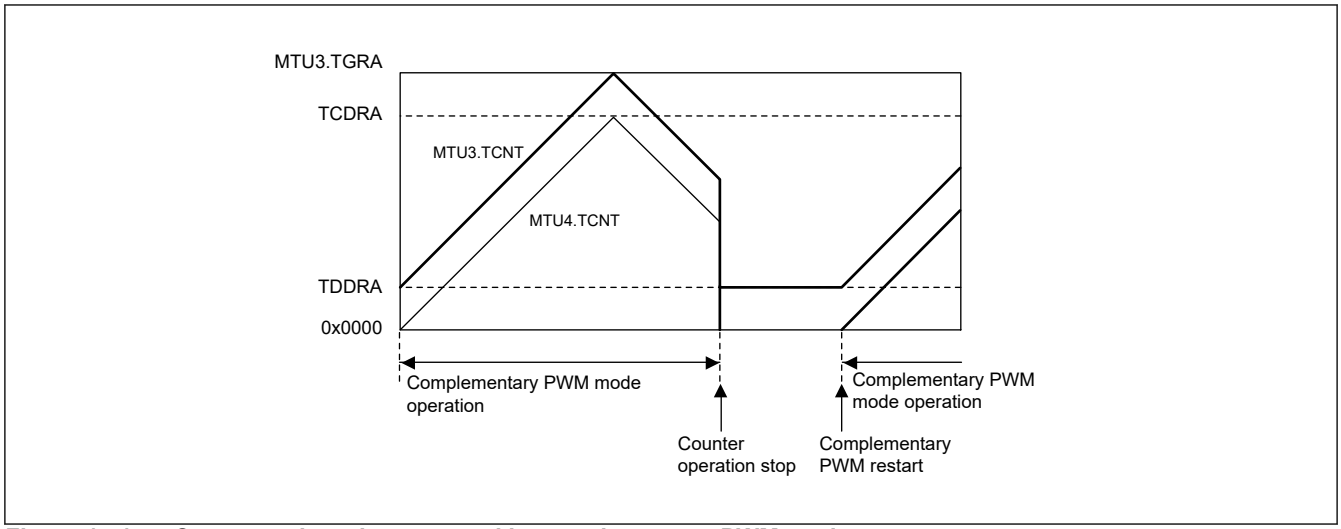

Figure 17.144 Counter value when stopped in complementary PWM mode

17.6.14 Buffer Operation Setting in Complementary PWM Mode

When modifying the PWM period set register (MTU3.TGRA or MTU6.TGRA), timer cycle data register (TCDRA or TCDRB), and duty set registers (MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB)) in complementary PWM mode, be sure to use buffer operation. In addition, set the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) to 0. The MTIOC4C (MTIOC7C) pin cannot output waveforms if the BFA bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1. Likewise, the MTIOC4D (MTIOC7D) pin cannot output waveforms if the BFB bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1.

In complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in bits BFA and BFB of MTU3.TMDR1 (MTU6.TMDR1). When the BFA bit in MTU3.TMDR1 (MTU6.TMDR1) is set to 1, MTU3.TGRC (MTU6.TGRC) functions as a buffer register for MTU3.TGRA (MTU6.TGRA). At the same time, MTU4.TGRC (MTU7.TGRC) functions as a buffer register for MTU4.TGRA (MTU7.TGRA), and TCBRA (TCBRB) functions as a buffer register for TCDRA (TCDRB).

17.6.15 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode

When setting buffer operation in reset-synchronized PWM mode, set the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) to 0. The MTIOC4C (MTIOC7C) pin cannot output waveforms if the BFA bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1. Likewise, the MTIOC4D (MTIOC7D) pin cannot output waveforms if the BFB bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1.

In reset-synchronized PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in the BFA and BFB bits of MTU3.TMDR1 (MTU6.TMDR1). For example, if the BFA bit in MTU3.TMDR1 (MTU6.TMDR1) is set to 1, MTU3.TGRC (MTU6.TGRC) functions as a buffer register for MTU3.TGRA (MTU6.TGRA). At the same time, MTU4.TGRC (MTU7.TGRC) functions as a buffer register for MTU4.TGRA (MTU7.TGRA).

While the MTU3.TGRC (MTU6.TGRC) and MTU3.TGRD (MTU6.TGRD) are operating as buffer registers, a TGImn interrupt (m = C, D; n = 3, 4 or 6, 7) is not generated.

Figure 17.145 shows an example of MTU3.TGR (MTU6.TGR), MTU4.TGR (MTU7.TGR), MTIOC3 (MTIOC6), and MTIOC4 (MTIOC7) operation with the BFA and BFB bits in MTU3.TMDR1 (MTU6.TMDR1) set to 1 and the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) set to 0.

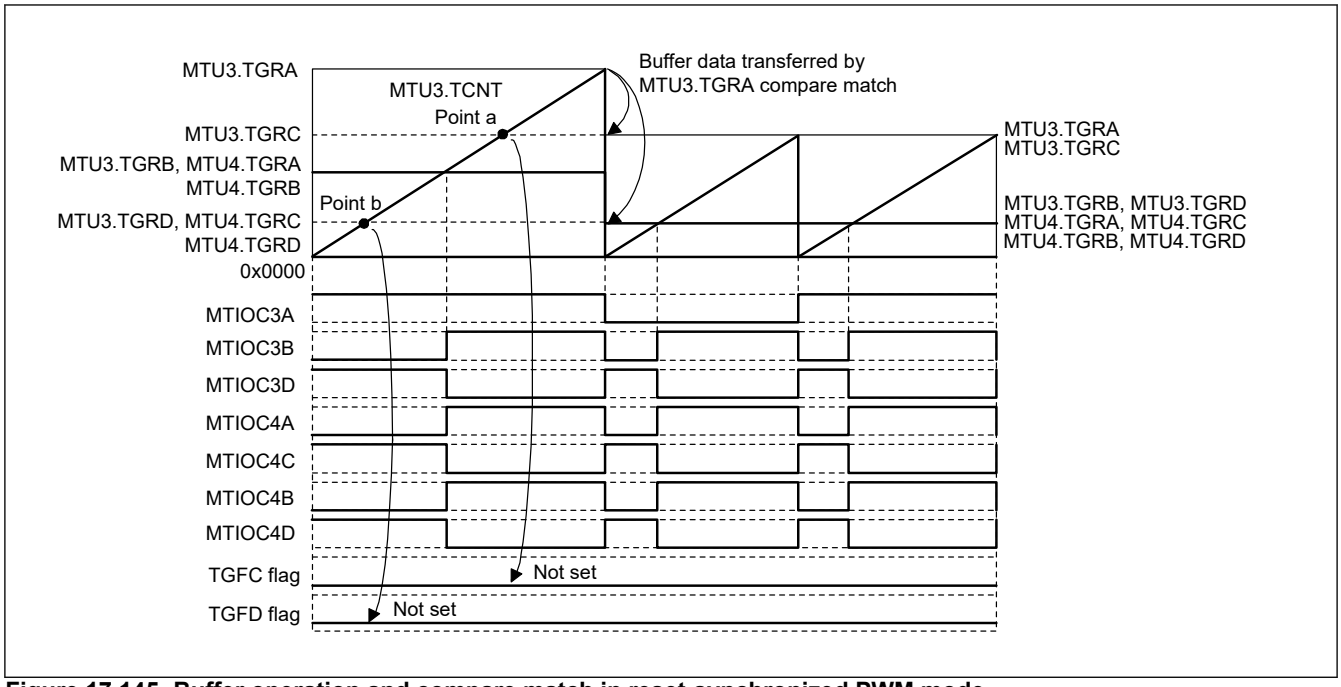

Figure 17.145 Buffer operation and compare match in reset-synchronized PWM mode

17.6.16 Overflow in Reset-Synchronized PWM Mode

After reset-synchronized PWM mode is selected, MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) start counting when the CST3 (CST6) bit of TSTRA (TSTRB) is set to 1. In this state, the MTU4.TCNT (MTU7.TCNT) count clock source and count edge are determined by the MTU3.TCR (MTU6.TCR) setting.

In reset-synchronized PWM mode, with period register MTU3.TGRA (MTU6.TGRA) set to 0xFFFF and the MTU3.TGRA (MTU6.TGRA) compare match selected as the counter clearing source, MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) count up to 0xFFFF, then a compare match occurs with MTU3.TGRA (MTU6.TGRA), and MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) are both cleared. In this case, a TCIVn interrupt (n = 3, 4 or 6, 7) is not generated.

Figure 17.146 shows an example of operation in reset-synchronized PWM mode with period register MTU3.TGRA (MTU6.TGRA) set to 0xFFFF and the MTU3.TGRA (MTU6.TGRA) compare match specified for the counter clearing source.

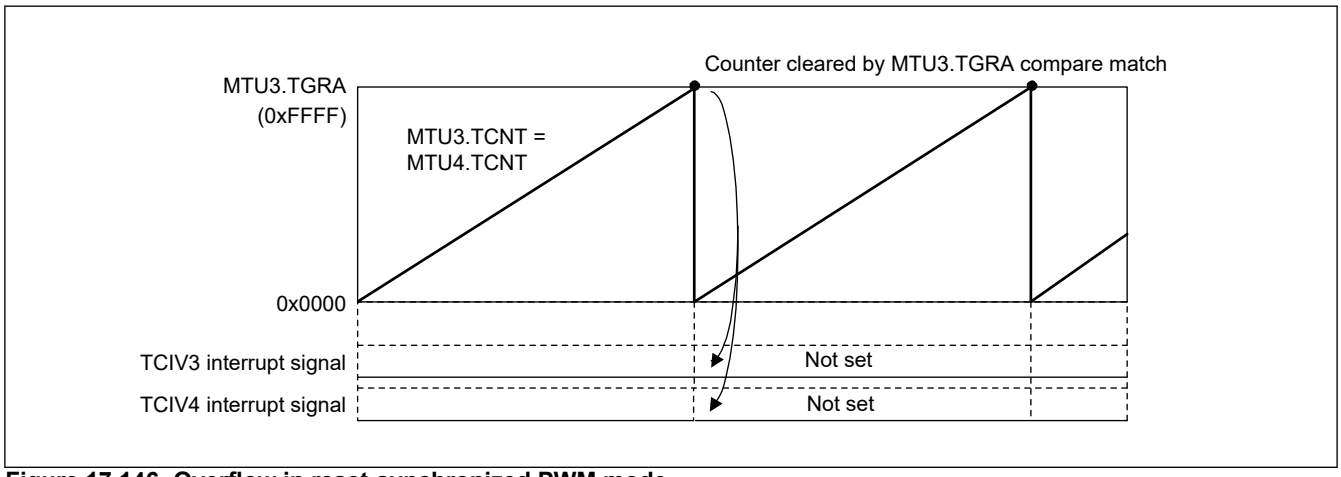

Figure 17.146 Overflow in reset-synchronized PWM mode

17.6.17 Contention between Overflow/Underflow and Counter Clearing

If an overflow/underflow and counter clearing occur simultaneously, neither a TCIVn interrupt (n = 0 to 4, 6 to 8) nor a TCIUn interrupt (n = 1, 2) is generated and TCNT clearing takes precedence.

Figure 17.147 shows the operation timing when a TGR compare match is specified as the clearing source and TGR is set to 0xFFFF.

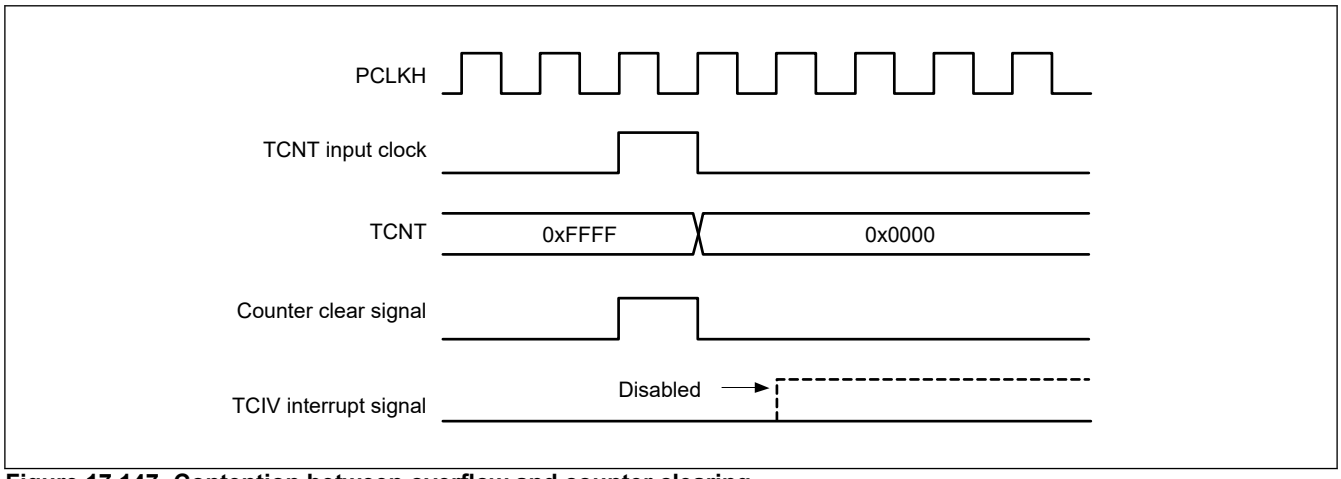

Figure 17.147 Contention between overflow and counter clearing

17.6.18 Contention between TCNT Write Operation and Overflow/Underflow

If TCNT counts up or down in a TCNT write cycle and an overflow or an underflow occurs, the TCNT write operation takes precedence. A TCIVn interrupt (n = 0 to 4, 6 to 8) nor a TCIUn interrupt (n = 1, 2) is not generated.

Figure 17.148 shows the operation timing when there is contention between TCNT write operation and overflow.

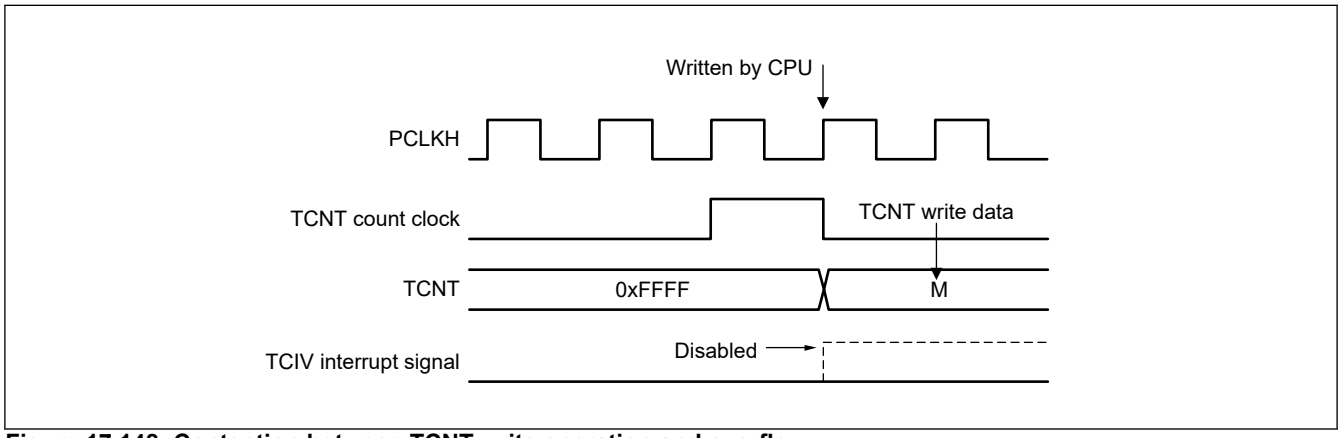

Figure 17.148 Contention between TCNT write operation and overflow

17.6.19 Note on Transition from Normal Mode or PWM Mode 1 to Reset-Synchronized PWM Mode

When making a transition from normal operation or PWM mode 1 to reset-synchronized PWM mode in MTU3 and MTU4 (or MTU6 and MTU7), if the counter is stopped while the output pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, and MTIOC7D) are held at a high level and then operation is started after a transition to reset-synchronized PWM mode, the initial pin output will not be correct.

When making a transition from normal mode to reset-synchronized PWM mode, write 0x11 to MTU3.TIORH, MTU3.TIORL, MTU4.TIORH, and MTU4.TIORL (MTU6.TIORH, MTU6.TIORL, MTU7.TIORH, and MTU7.TIORL) to initialize the output pin state to a low level, then set the registers to the initial value (0x00) before making the mode transition.

When making a transition from PWM mode 1 to reset-synchronized PWM mode, switch to normal mode, initialize the output pin state to a low level, and then set the registers to the initial value (0x00) before making the transition to reset-synchronized PWM mode.

17.6.20 Output Level in Complementary PWM Mode and Reset-Synchronized PWM Mode

When MTU3 and MTU4 (or MTU6 and MTU7) are in complementary PWM mode or reset-synchronized PWM mode, the PWM waveform output level is determined by the OLSP and OLSN bits in the timer output control register (TOCR1A or TOCR1B). In complementary PWM mode or reset-synchronized PWM mode, TIOR should be set to 0x00.

The output level in negative phase when the TDERA.TDER (TDERB.TDER) bit is set to 0 in complementary PWM mode (the dead time is not generated) does not depend on the setting of the TOCR1A.OLSN (TOCR1B.OLSN) bit. It is equivalent to the inverted level of positive phase output based on the setting of the TOCR1A.OLSP (TOCR1B.OLSP) bit.

17.6.21 Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection

When timer counters 1 and 2 (MTU1.TCNT and MTU2.TCNT) operate as a 32-bit counter in cascade connection, the cascaded counter value cannot be captured successfully in some cases even if input-capture input is simultaneously done to MTIOC1A and MTIOC2A or to MTIOC1B and MTIOC2B. This is because the input timing of MTIOC1A and MTIOC2A or to MTIOC1B and MTIOC2B may not be the same when external input-capture signals input into MTU1.TCNT and MTU2.TCNT are taken in synchronization with the internal clock.

For example, MTU1.TCNT (the counter for upper 16 bits) does not capture the count-up value by an overflow from MTU2.TCNT (the counter for lower 16 bits) but captures the count value before the up-counting. In this case, the values of MTU1.TCNT = 0xFFF1 and MTU2.TCNT = 0x0000 should be transferred to MTU1.TGRA and MTU2.TGRA or to MTU1.TGRB and MTU2.TGRB, but the values of MTU1.TCNT = 0xFFF0 and MTU2.TCNT = 0x0000 are erroneously transferred.

The MTU has a new function that allows simultaneous capture of MTU1.TCNT and MTU2.TCNT with a single input capture input as the trigger. This function can be used to read the 32-bit counter such that MTU1.TCNT and MTU2.TCNT are captured at the same time. For details, see section 17.2.12. TICCR : Timer Input Capture Control Register.

17.6.22 Interrupt Skipping Function 2

When interrupt skipping function 2 is in use and the difference between the values in MTU4.TADCORA and MTU4.TADCORB is small, correct counting of the number skipped may not be possible, in which case requests for A/D conversion will not be generated with the expected timing. The conditions listed below thus apply to these settings.

For MTU6 and MTU7, the same conditions apply to the settings of MTU7.TADCORA and MTU7.TADCORB.

1. When the number skipped is zero for skipping function 2
   - The difference between the values in MTU4.TADCORA and MTU4.TADCORB must be at least four.
   - The interval of comparison for MTU4.TADCORA must be at least four cycles of PCLKH (the updated value of MTU4.TADCORA is set to the previous value plus or minus at least four).
   - The interval of comparison for MTU4.TADCORB must be at least four cycles of PCLKH (the updated value of MTU4.TADCORB is set to the previous value plus or minus at least four).
2. When the number skipped is one or more for skipping function 2
   - The difference between the values in MTU4.TADCORA and MTU4.TADCORB must be at least two.
   - The interval of comparison for MTU4.TADCORB must be at least two cycles of PCLKH (the updated value of MTU4.TADCORB is set to the previous value plus or minus at least two).

17.6.23 Notes When Complementary PWM Mode Output Protection Function is Not Used

The complementary PWM mode output protection function is initially enabled. If it is not used, write 0x00 in the POE3.POECR2 register.

17.6.24 Notes Regarding Timer Counter (MTU5.TCNT) and Timer General Register (MTU5.TGR)

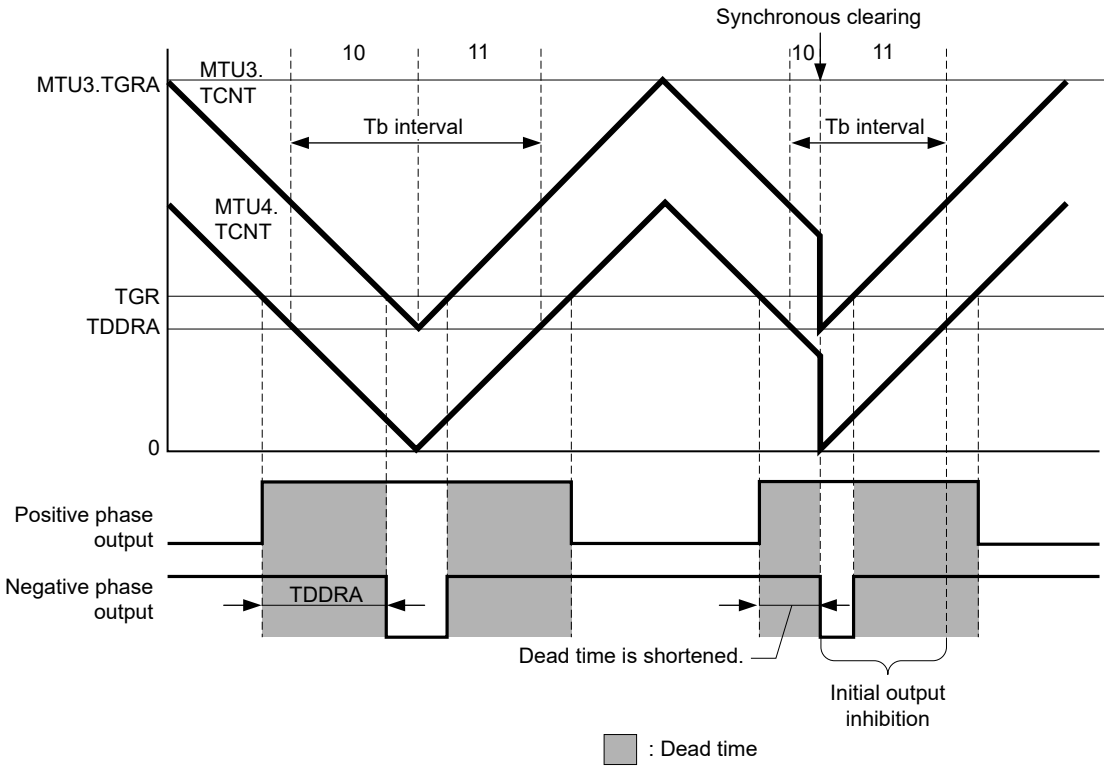
Do not set an MTU5.TGRj (j = U, V, W) bit to the value of the corresponding MTU5.TCNTj (j = U, V, W) plus one while counting by the MTU5.TCNTj (j = U, V, W) register is stopped. If an MTU5.TGRj (j = U, V, W) bit is set to the value of the

corresponding MTU5.TCNTj (j = U, V, W) plus one while counting by the MTU5.TCNTj (j = U, V, W) is stopped, a compare-match will be generated even though counting is stopped.

In this case, if the compare match enable bit (MTU5.TIER.TGIE5j (j = U, V, W) bit is set to 1 (enabling interrupts), a compare-match interrupt will also be generated. If the value of the timer compare match clear register is 1 (enabled), the timer is automatically cleared to 0x0000 when the compare-match is generated, regardless of whether interrupts from the MTU5.TCNTj (j = U, V, W) are enabled or disabled.

17.6.25 Notes to Prevent Malfunctions in Synchronous Clearing for Complementary PWM Mode

If control of the output waveform is enabled (TWCRA.WRE bit = 1 or TWCRB.WRE bit = 1) at the time of synchronous counter clearing in complementary PWM mode, satisfaction of either condition 1 or 2 below has the following effects.



- Dead time on the PWM output pins is shortened (or disappears).
- The active level is output on the negative phase PWM output pins beyond the period for active-level output.

Condition 1: In portion (10) of the initial output inhibition period in Figure 17.149, synchronous clearing occurs within the dead-time period for PWM output.

Condition 2: In portions (10) and (11) of the initial output inhibition period in Figure 17.150, synchronous clearing occurs when any condition from among MTU3.TGRB (MTU6.TGRB) ≤ TDDRA, MTU4.TGRA (MTU7.TGRA) ≤ TDDRA, or MTU4.TGRB (MTU7.TGRB) ≤ TDDRA is satisfied.

The following method avoids the above phenomena.

Ensure that synchronous clearing proceeds with the value of each comparison register (MTU3.TGRB (MTU6.TGRB), MTU4.TGRA (MTU7.TGRA), and MTU4.TGRB (MTU7.TGRB)) set to at least double the value of the TDDRA register (TDDRB register).

Note: PWM output is active-low.

Figure 17.149 Example of synchronous clearing (when condition 1 applies)

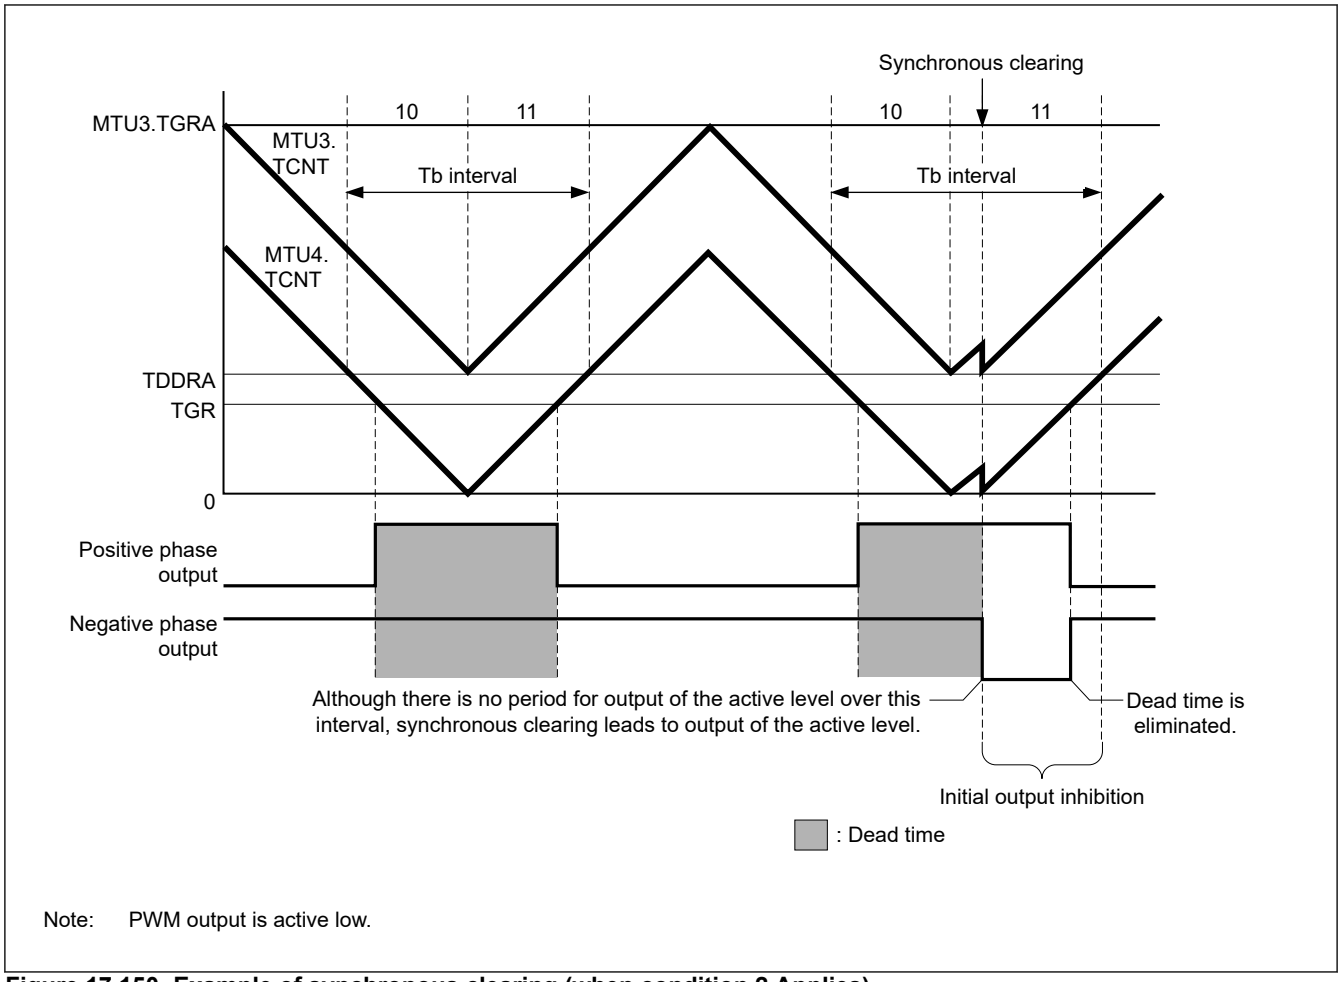


Figure 17.150 Example of synchronous clearing (when condition 2 Applies)

17.6.26 Notes on Timer Mode Register Setting for ELC Event Input

When MTU is used in ELC operation, set the timer mode register (TMDR) of the relevant channel to its initial value (0x00).

17.6.27 Continuous Output of Interrupt Signal in Response to a Compare Match

When the TGR register is set to 0x0000, the PCLKH/1 clock is set as the counter clock, and compare match is set as the trigger for clearing of the counter clock, the value of the TCNT counter remains 0x0000, and the interrupt signal is output continuously (i.e. its level is flat) rather than output over a single cycle. Consequently, interrupts are not detected in response to second and subsequent compare matches.

Figure 17.151 shows the timing for continuous output of the interrupt signal in response to a compare match.

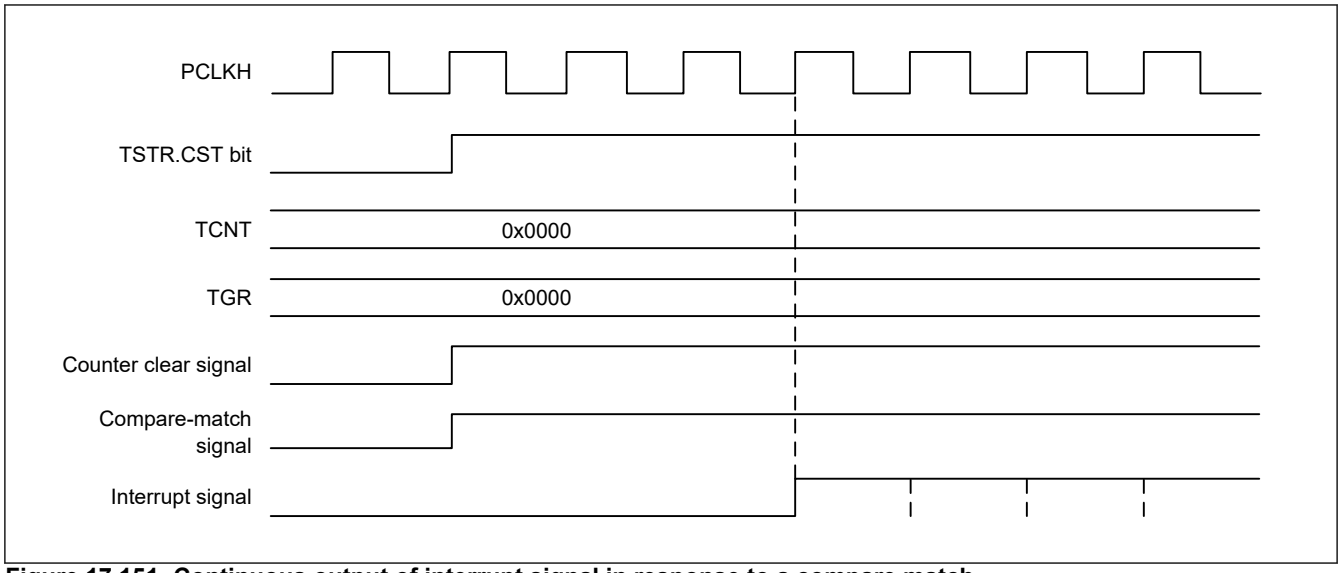

Figure 17.151 Continuous output of interrupt signal in response to a compare match

17.7 MTU Output Pin Initialization

17.7.1 Operating Modes

The MTU has the following six operating modes. Waveforms can be output in any of these modes.

- Normal mode (MTU0 to MTU4 and MTU6 to MTU8)
- PWM mode 1 (MTU0 to MTU4, MTU6, and MTU7)
- PWM mode 2 (MTU0 to MTU2)
- Phase counting modes 1 to 5 (MTU1 and MTU2)
- Complementary PWM mode (MTU3, MTU4, MTU6, and MTU7)
- Reset-synchronized PWM mode (MTU3, MTU4, MTU6, and MTU7)

This section describes how to initialize the MTU output pins in each of these modes.

17.7.2 Operation in Case of Re-Setting Due to Error during Operation

If an error occurs during MTU operation, MTU output should be cut off by the system. The output can be cut off by allowing non-active level output from the pins by setting the pins as general output ports using the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports. MTU output can be disabled through TIOR settings. Complementary PWM output (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D) should be specified through TOERA and TOERB settings. For PWM output pins, output can also be cut by hardware, using port output enable 3 (POE3). The pin initialization procedures for re-setting due to an error during operation and the procedures for restarting in a different mode after re-setting are described below.

The MTU has six operating modes, as stated above. There are thus 36 mode transition combinations, but some transitions are not available with certain channel and mode combinations. Available mode transition combinations are shown in Table 17.74.

Table 17.74 Mode transition combinations (1 of 2)

	Normal	PWM1	PWM2	PCM	CPWM	RPWM
Normal	(1)	(2)	(3)	(4)	(5)	(6)

RPWM: Reset-synchronized PWM mode

17.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error During Operation

- When making a transition to a mode (Normal, PWM1, PWM2, or PCM) in which the pin output level is selected by the timer I/O control register (TIOR) setting, initialize the pins by means of TIOR setting.
- In PWM mode 1, waveforms are not output to the MTIOCnB and MTIOCnD (n = 3, 4, 6, 7) pins. If no other module outputs signals through these pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.
- In PWM mode 2, waveforms are not output to the cycle register pins. If no other module outputs signals through these pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.
- In normal mode or PWM mode 2, if TGRC and TGRD operate as buffer registers, waveforms are not output to the corresponding pins. If no other module outputs signals through these pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.
- In PWM mode 1, if either TGRC or TGRD operates as a buffer register, waveforms are not output to the corresponding pins. If no other module outputs signals through these pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.
- When making a transition to a mode (CPWM or RPWM) in which the pin output level is selected by the Timer Output Control register (TOCR1A, TOCR2A, TOCR1B, or TOCR2B) setting, temporarily disable output in MTU3 and MTU4 (or MTU6 and MTU7) with the Timer Output Master Enable register (TOERA or TOERB). At this time, if no other module outputs signals through these pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports. Switch to normal mode, perform initialization with TIOR, restore TIOR to its initial value, then operate the MTU in accordance with the mode setting procedure (TOCR1A setting, TOCR2A setting, TMDR1 setting, and TOERA setting (TOCR1B setting, TOCR2B setting, TMDR1 setting, and TOERB setting)).

Note: Channel number is substituted for "n" indicated in this section, unless otherwise stated.

Pin initialization procedures are described below for the numbered combinations in Table 17.74. The active level is assumed to be low.

17.7.3.1 Operation When Error Occurs in Normal Mode and Operation is Restarted in Normal Mode

Figure 17.152 shows a case in which an error occurs in normal mode and operation is restarted in normal mode after resetting.

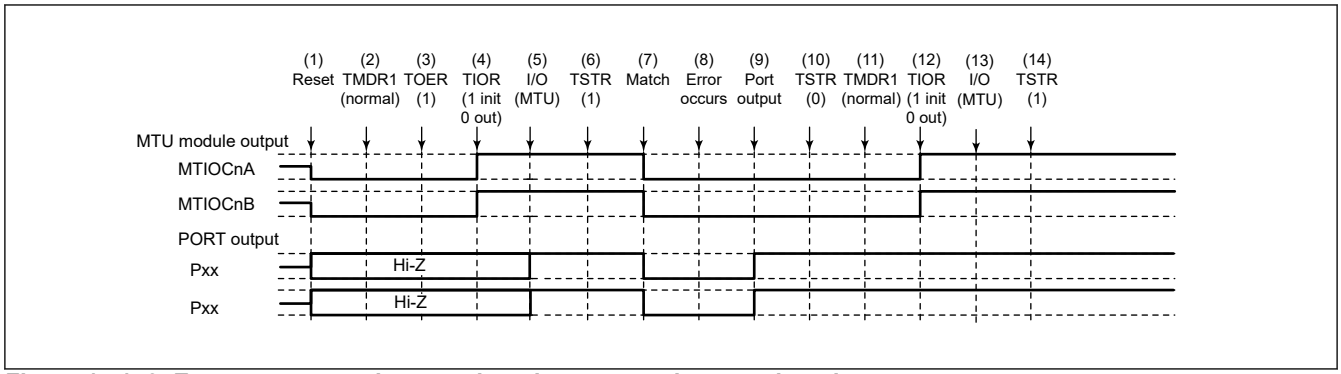

Figure 17.152 Error occurrence in normal mode, recovery in normal mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) After a reset, the TMDR1 setting is for normal mode.

(3) For MTU3 and MTU4 (MTU6 and MTU7), enable output with the TOERA (TOERB) register before initializing the pins with the TIOR register.

(4) Initialize the pins with the TIOR register. (In the example, the initial output is a high level, and a low level is output on compare match occurrence.)

(5) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(6) Start count operation by setting the TSTRA (TSTRB) register.

(7) Output goes low on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.

(10) Stop count operation by setting the TSTRA (TSTRB) register.

(11) This step is not necessary when restarting in normal mode.

(12) Initialize the pins with the TIOR register.

(13) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.2 Operation When Error Occurs in Normal Mode and Operation is Restarted in PWM Mode 1

Figure 17.153 shows a case in which an error occurs in normal mode and operation is restarted in PWM mode 1 after re-setting.

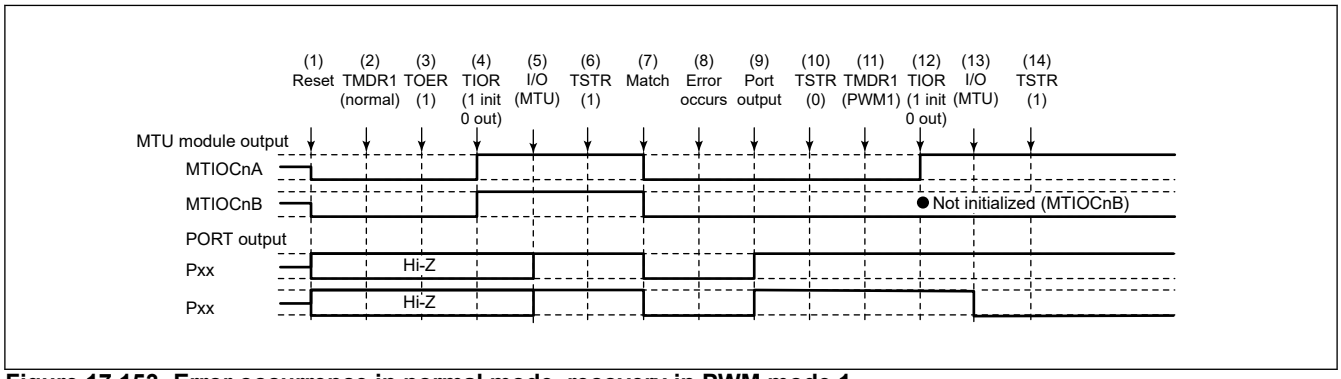

Figure 17.153 Error occurrence in normal mode, recovery in PWM mode 1

(1) to (10) are the same as in Figure 17.152.

(11) Set PWM mode 1.

(12) Initialize the pins with the TIOR register. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(13) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.3 Operation When Error Occurs in Normal Mode and Operation is Restarted in PWM mode 2

Figure 17.154 shows a case in which an error occurs in normal mode and operation is restarted in PWM mode 2 after re-setting.

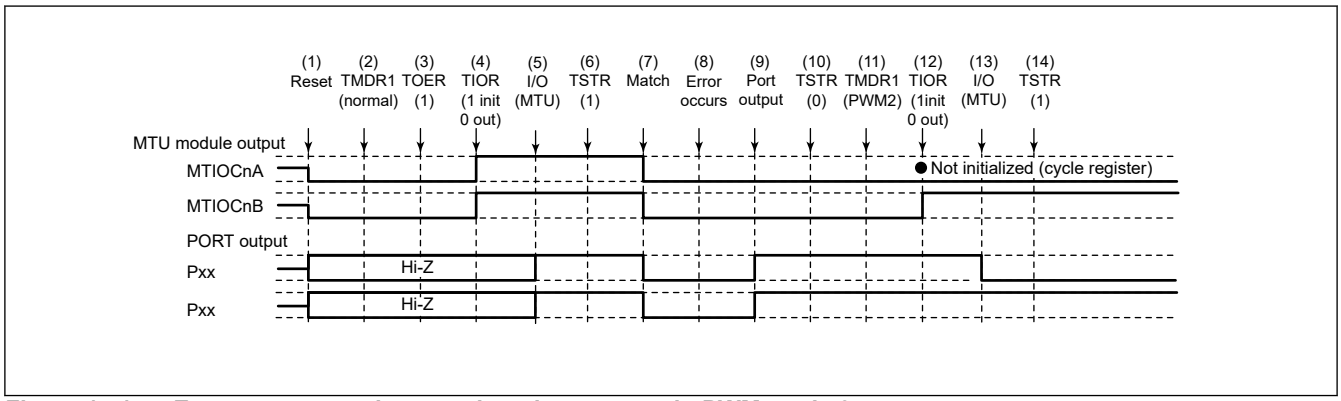

Figure 17.154 Error occurrence in normal mode, recovery in PWM mode 2

(1) to (10) are the same as in Figure 17.152.

(11) Set PWM mode 2.

(12) Initialize the pins with the TIOR register. (In PWM mode 2, a waveform is not output to the pin that corresponds to the TGR register used as a period register. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(13) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA register.

Note: PWM mode 2 can only be selected for MTU0 to MTU2, and therefore the TOERA register setting is not necessary.

17.7.3.4 Operation When Error Occurs in Normal Mode and Operation is Restarted in Phase Counting Mode

Figure 17.155 shows a case in which an error occurs in normal mode and operation is restarted in phase counting mode after re-setting.

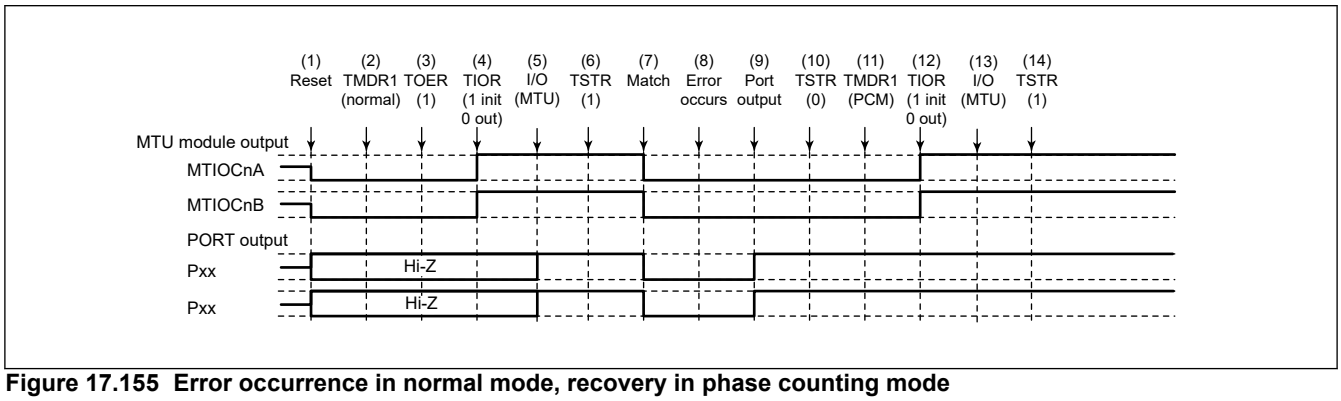

Figure 17.155 Error occurrence in normal mode, recovery in phase counting mode

(1) to (10) are the same as in Figure 17.152.

(11) Set the phase counting mode.

(12) Initialize the pins with the TIOR register.

(13) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA register.

Note: The phase counting mode can only be selected for MTU1 and MTU2, and therefore the TOERA register setting is not necessary.

17.7.3.5 Operation When Error Occurs in Normal Mode and Operation is Restarted in Complementary PWM Mode

Figure 17.156 shows a case in which an error occurs in normal mode and operation is restarted in complementary PWM mode after re-setting.

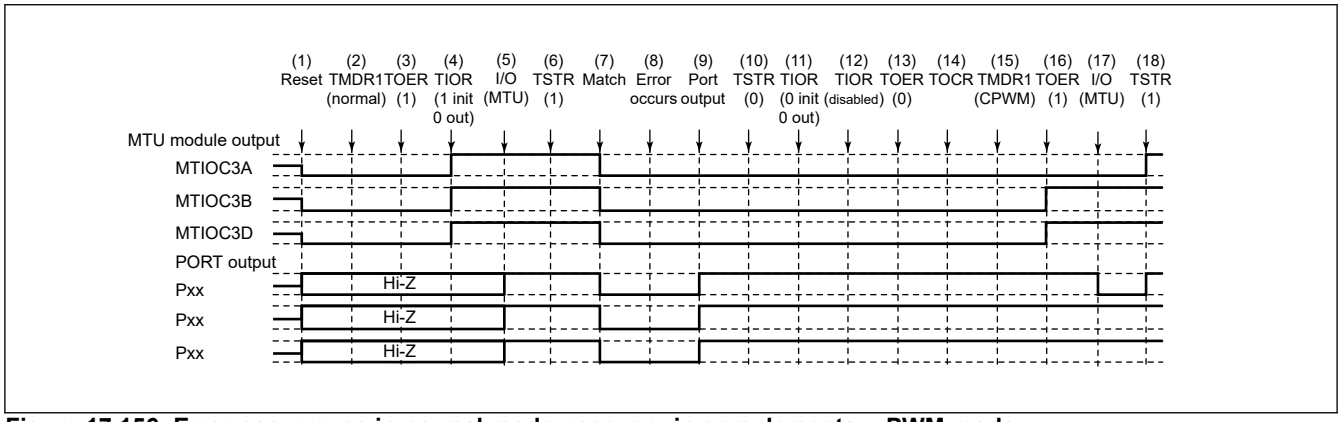

Figure 17.156 Error occurrence in normal mode, recovery in complementary PWM mode

(1) to (10) are the same as in Figure 17.152.

(11) Initialize the normal mode waveform generation block with the TIOR register.

(12) Disable operation of the normal mode waveform generation block with the TIOR register.

(13) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(14) Select the complementary PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(15) Set complementary PWM mode.

(16) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(17) Set MTU output using the I/O port registers corresponding to the I/O ports.

(18) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.6 Operation When Error Occurs in Normal Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 17.157 shows a case in which an error occurs in normal mode and operation is restarted in reset-synchronized PWM mode after re-setting.

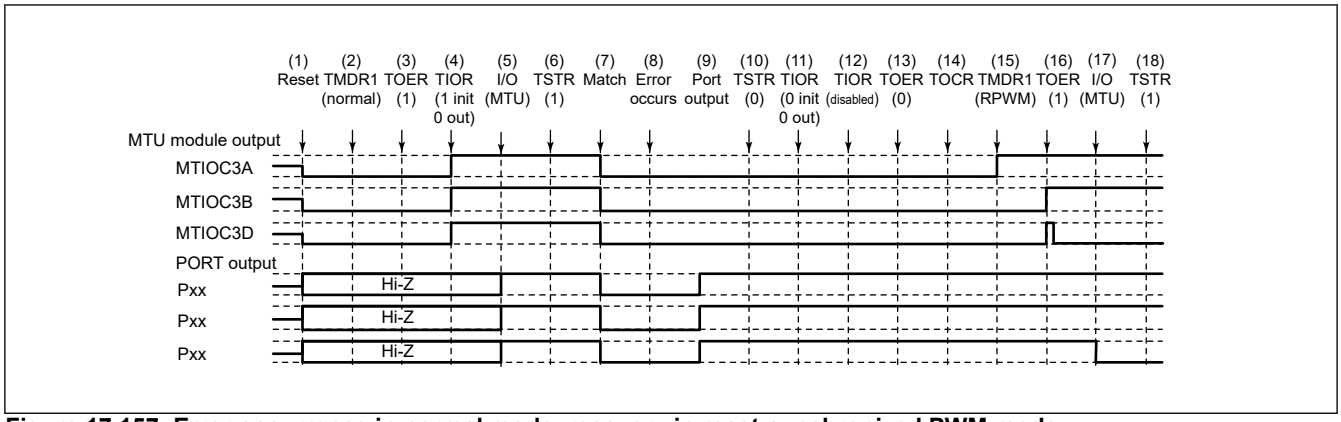

Figure 17.157 Error occurrence in normal mode, recovery in reset-synchronized PWM mode

(1) to (13) are the same as in Figure 17.156.

(14) Select the reset-synchronized PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(15) Set reset-synchronized PWM mode.

(16) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(17) Set MTU output using the I/O port registers corresponding to the I/O ports.

(18) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.7 Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Normal Mode

Figure 17.158 shows a case in which an error occurs in PWM mode 1 and operation is restarted in normal mode after re-setting.

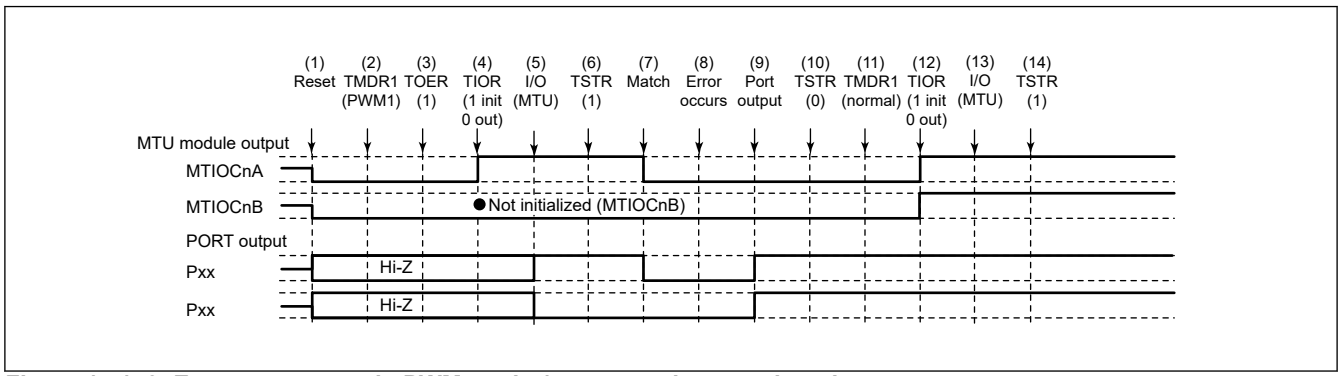

Figure 17.158 Error occurrence in PWM mode 1, recovery in normal mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Set PWM mode 1.

(3) For MTU3 and MTU4 (MTU6 and MTU7), enable output with the TOERA (TOERB) register before initializing the pins with the TIOR register.

(4) Initialize the pins with the TIOR register. (In the example, the initial output is a high level, and a low level is output on compare match occurrence. In PWM mode 1, the MTIOCnB side is not initialized.)

(5) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(6) Start count operation by setting the TSTRA (TSTRB) register.

(7) Output goes low on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.

(10) Stop count operation by setting the TSTRA (TSTRB) register.

(11) Set normal mode.

(12) Initialize the pins with the TIOR register.

(13) Set MTU output using the I/O port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.8 Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in PWM mode 1

Figure 17.159 shows a case in which an error occurs in PWM mode 1 and operation is restarted in PWM mode 1 after re-setting.

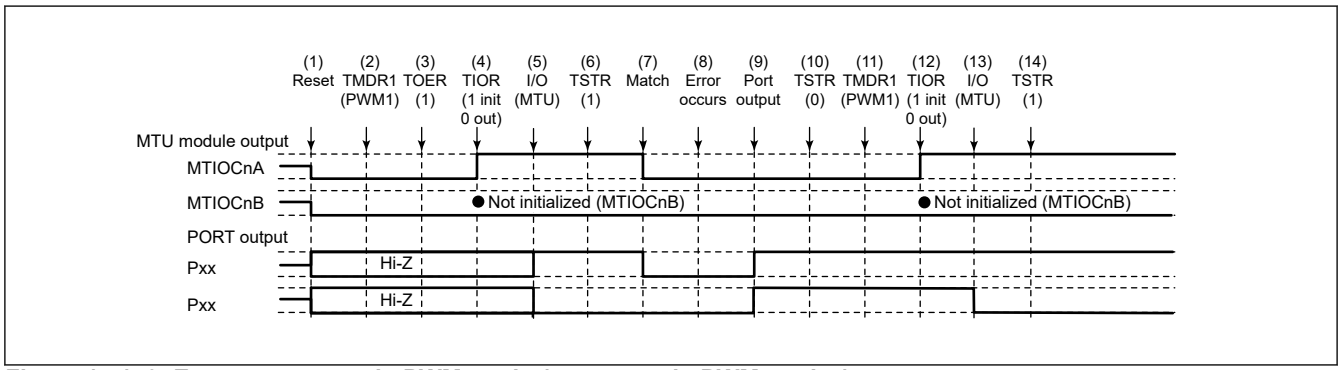

Figure 17.159 Error occurrence in PWM mode 1, recovery in PWM mode 1

(1) to (10) are the same as in Figure 17.158.

(11) This step is not necessary when restarting in PWM mode 1.

(12) Initialize the pins with the TIOR register. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(13) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.9 Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in PWM mode 2

Figure 17.160 shows a case in which an error occurs in PWM mode 1 and operation is restarted in PWM mode 2 after re-setting.

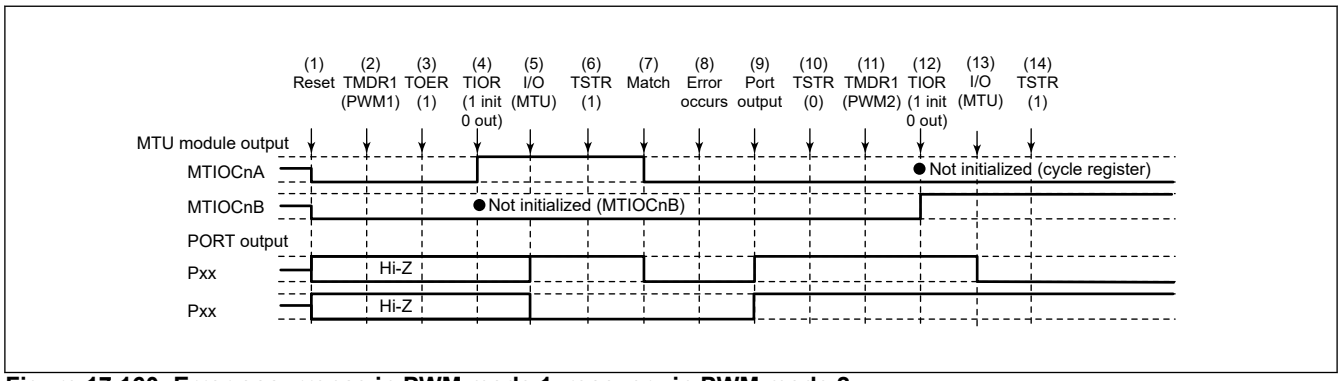

Figure 17.160 Error occurrence in PWM mode 1, recovery in PWM mode 2

(1) to (10) are the same as in Figure 17.158.

(11) Set PWM mode 2.

(12) Initialize the pins with the TIOR register. (In PWM mode 2, a waveform is not output to the pin that corresponds to the TGR register used as a period register. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(13) Set MTU output using the I/O port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA register.

Note: PWM mode 2 can only be selected for MTU0 to MTU2, and therefore the TOERA register setting is not necessary.

17.7.3.10 Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Phase Counting Mode

Figure 17.161 shows a case in which an error occurs in PWM mode 1 and operation is restarted in phase counting mode after re-setting.

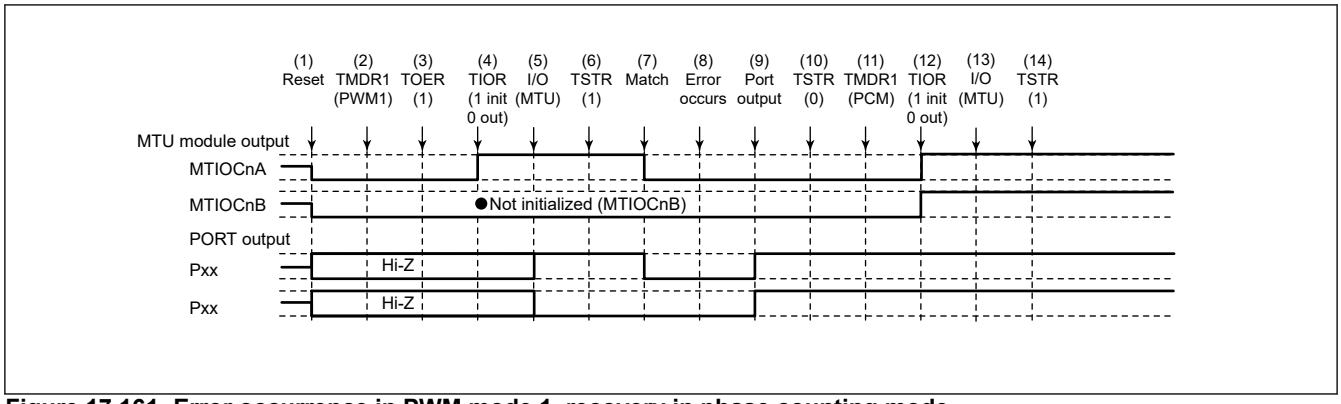

Figure 17.161 Error occurrence in PWM mode 1, recovery in phase counting mode

(1) to (10) are the same as in Figure 17.158.

(11) Set the phase counting mode.

(12) Initialize the pins with the TIOR register.

(13) Set MTU output using the I/O port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA register.

Note: The phase counting mode can only be selected for MTU1 and MTU2, and therefore the TOERA register setting is not necessary.

17.7.3.11 Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Complementary PWM Mode

Figure 17.162 shows a case in which an error occurs in PWM mode 1 and operation is restarted in complementary PWM mode after re-setting.

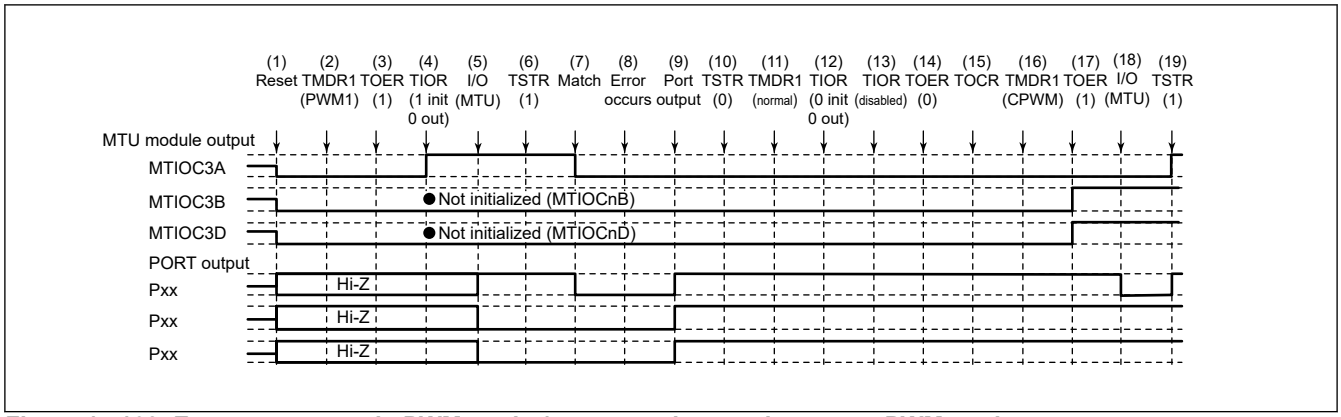

Figure 17.162 Error occurrence in PWM mode 1, recovery in complementary PWM mode

(1) to (10) are the same as in Figure 17.158.

(11) Set normal mode to initialize the normal mode waveform generation block.

(12) Initialize the PWM mode 1 waveform generation block with the TIOR register.

(13) Disable operation of the PWM mode 1 waveform generation block with the TIOR register.

(14) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(15) Select the complementary PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TSTRB).

(16) Set complementary PWM mode.

(17) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(18) Set MTU output using the I/O port registers corresponding to the I/O ports.

(19) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.12 Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 17.163 shows a case in which an error occurs in PWM mode 1 and operation is restarted in reset-synchronized PWM mode after re-setting.

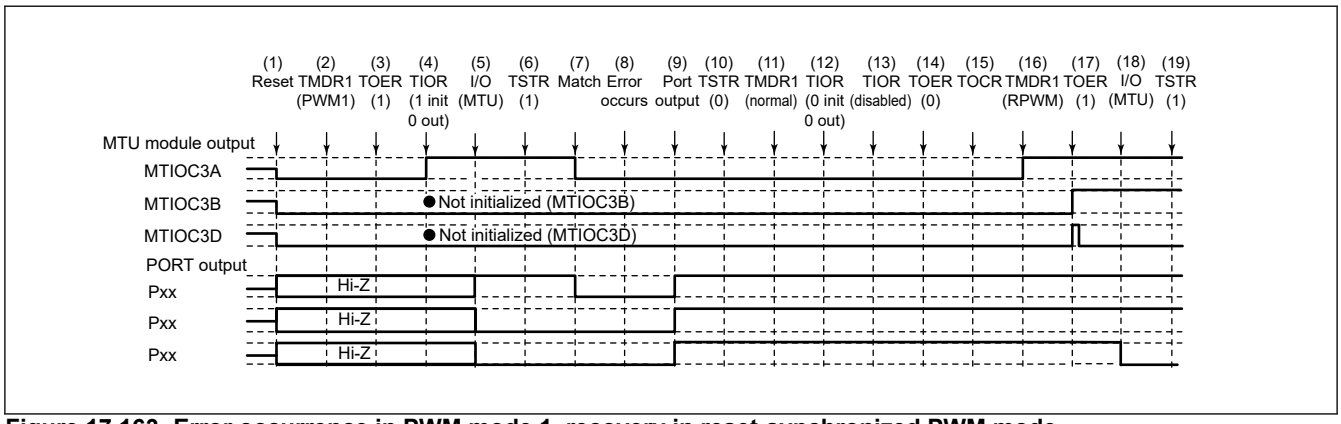

Figure 17.163 Error occurrence in PWM mode 1, recovery in reset-synchronized PWM mode

(1) to (14) are the same as in Figure 17.162.

(15) Select the reset-synchronized PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(16) Set reset-synchronized PWM mode.

(17) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(18) Set MTU output using the I/O port registers corresponding to the I/O ports.

(19) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.13 Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in Normal Mode

Figure 17.164 shows a case in which an error occurs in PWM mode 2 and operation is restarted in normal mode after re-setting.

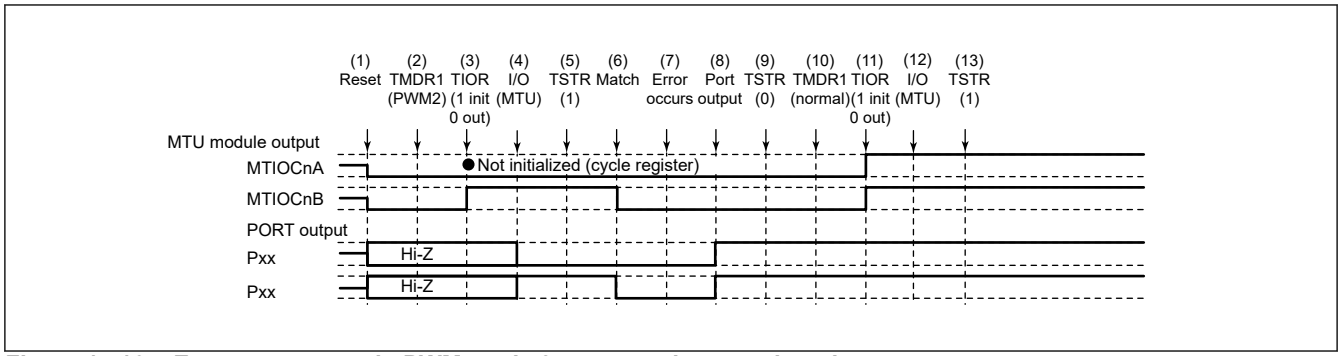

Figure 17.164 Error occurrence in PWM mode 2, recovery in normal mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Set PWM mode 2.

(3) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence. In PWM mode 2, the cycle register pins are not initialized. In the example, MTIOCnA is the cycle register.)

(4) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(5) Start count operation by setting the TSTRA (TSTRB) register.

(6) Output goes low on compare match occurrence.

(7) An error occurs.

(8) Allow non-active level output by setting the pins as general output ports using the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.

(9) Stop count operation by setting the TSTRA (TSTRB) register.

(10) Set normal mode.

(11) Initialize the pins with the TIOR register.

(12) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(13) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.14 Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in PWM Mode 1

Figure 17.165 shows a case in which an error occurs in PWM mode 2 and operation is restarted in PWM mode 1 after re-setting.

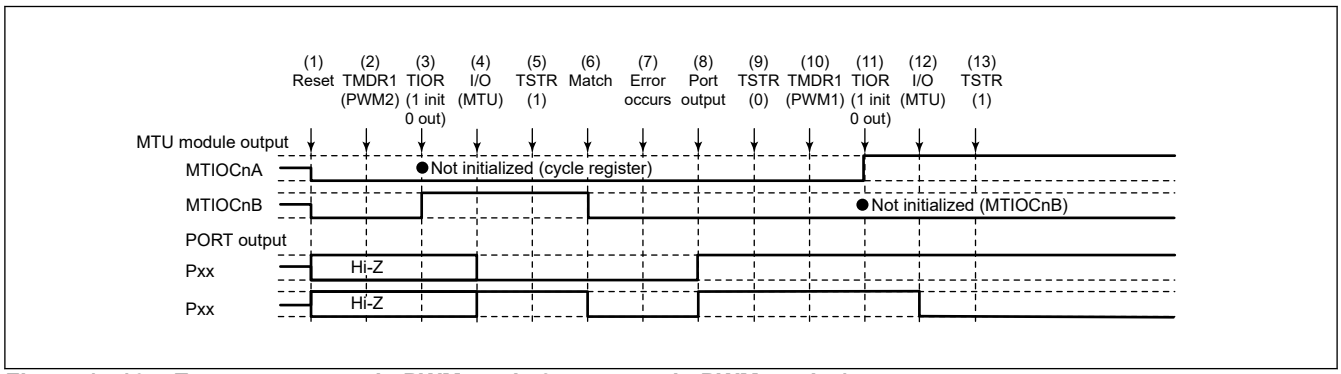

Figure 17.165 Error occurrence in PWM mode 2, recovery in PWM mode 1

(1) to (9) are the same as in Figure 17.164.

(10) Set PWM mode 1.

(11) Initialize the pins with the TIOR register. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(12) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(13) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.15 Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in PWM Mode 2

Figure 17.166 shows a case in which an error occurs in PWM mode 2 and operation is restarted in PWM mode 2 after re-setting.

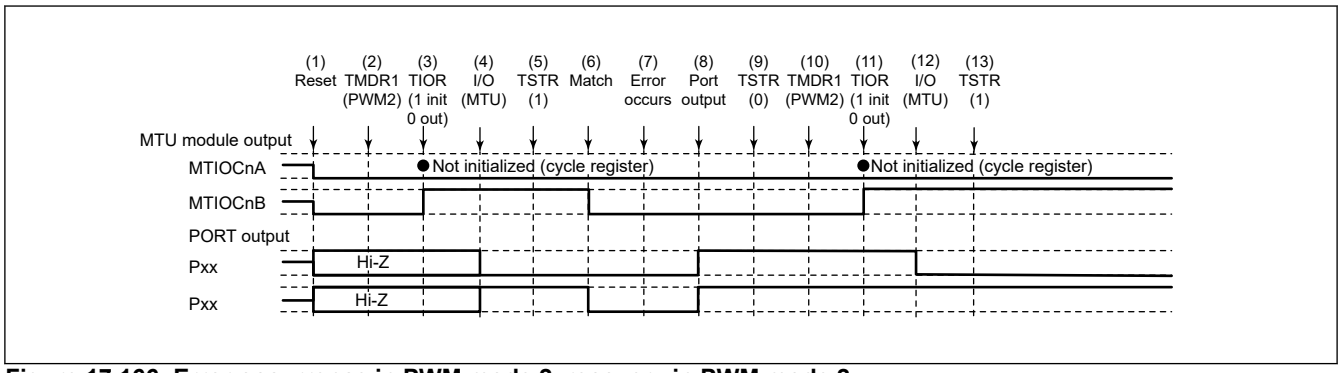

Figure 17.166 Error occurrence in PWM mode 2, recovery in PWM mode 2

(1) to (9) are the same as in Figure 17.164.

(10) This step is not necessary when restarting in PWM mode 2.

(11) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the cycle register pins. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(12) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(13) Restart operation by setting the TSTRA register.

17.7.3.16 Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in Phase Counting Mode

Figure 17.167 shows a case in which an error occurs in PWM mode 2 and operation is restarted in phase counting mode after re-setting.

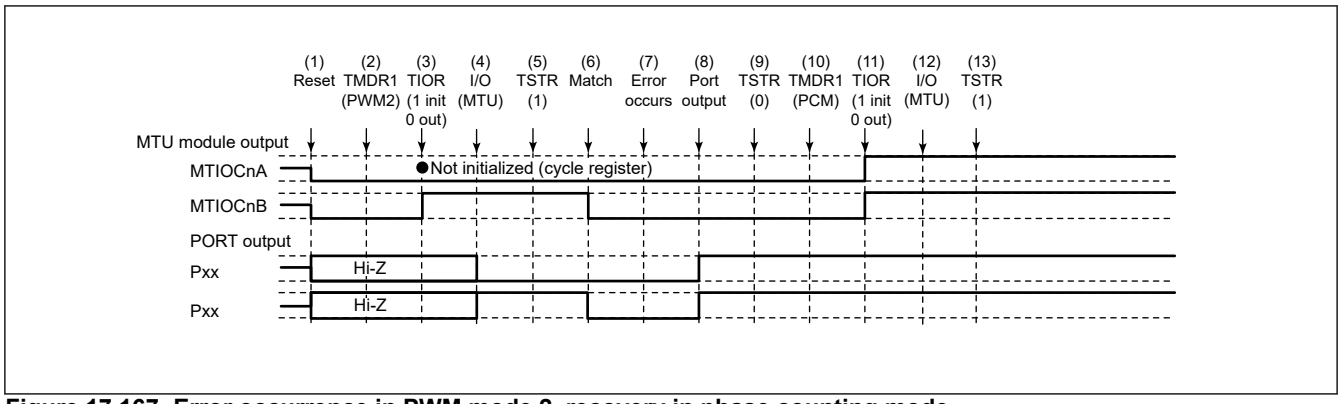

Figure 17.167 Error occurrence in PWM mode 2, recovery in phase counting mode

(1) to (9) are the same as in Figure 17.164.

(10) Set the phase counting mode.

(11) Initialize the pins with the TIOR register.

(12) Set MTU output using the I/O port registers corresponding to the I/O ports.

(13) Restart operation by setting the TSTRA register.

17.7.3.17 Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in Normal Mode

Figure 17.168 shows a case in which an error occurs in phase counting mode and operation is restarted in normal mode after re-setting.

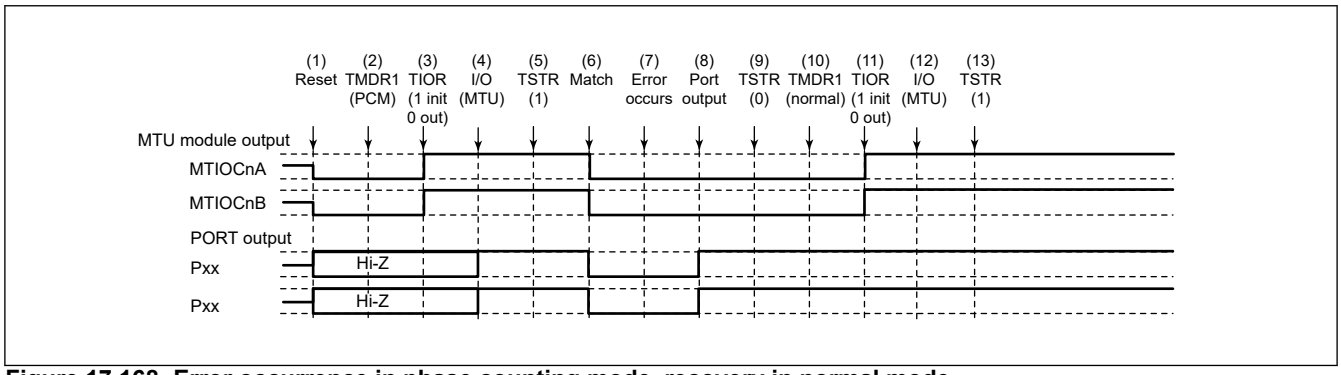

Figure 17.168 Error occurrence in phase counting mode, recovery in normal mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Set phase counting mode.

(3) Initialize the pins with the TIOR register. (In the example, the initial output is a high level, and a low level is output on compare match occurrence.)

(4) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(5) Start count operation by setting the TSTRA (TSTRB) register.

(6) Output goes low on compare match occurrence.

(7) An error occurs.

(8) Allow non-active level output by setting the pins as general output ports using the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.

(9) Stop count operation by setting the TSTRA (TSTRB) register.

(10) Set normal mode.

(11) Initialize the pins with the TIOR register.

(12) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(13) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.18 Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in PWM Mode 1

Figure 17.169 shows a case in which an error occurs in phase counting mode and operation is restarted in PWM mode 1 after re-setting.

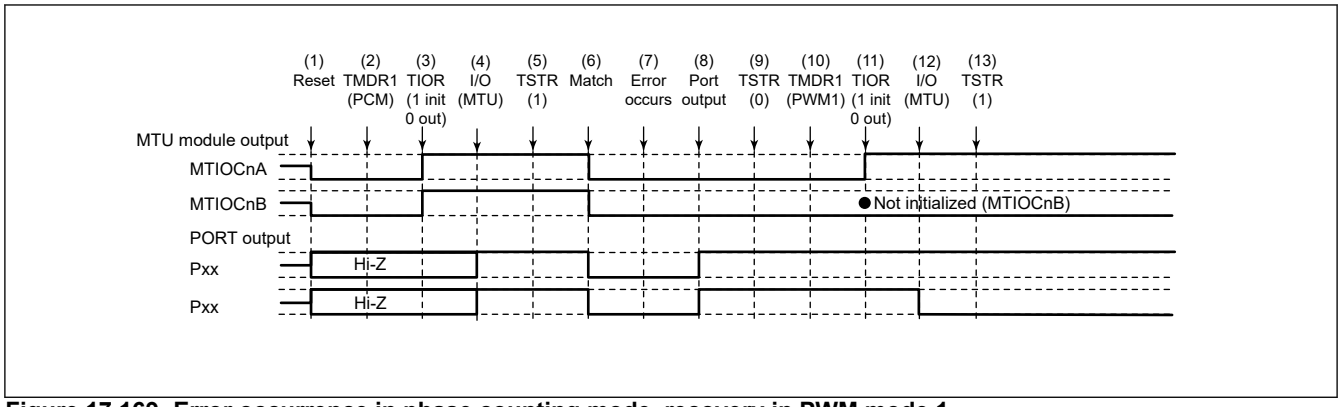

Figure 17.169 Error occurrence in phase counting mode, recovery in PWM mode 1

(1) to (9) are the same as in Figure 17.168.

(10) Set PWM mode 1.

(11) Initialize the pins with the TIOR register. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(12) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(13) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.19 Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in PWM Mode 2

Figure 17.170 shows a case in which an error occurs in phase counting mode and operation is restarted in PWM mode 2 after re-setting.

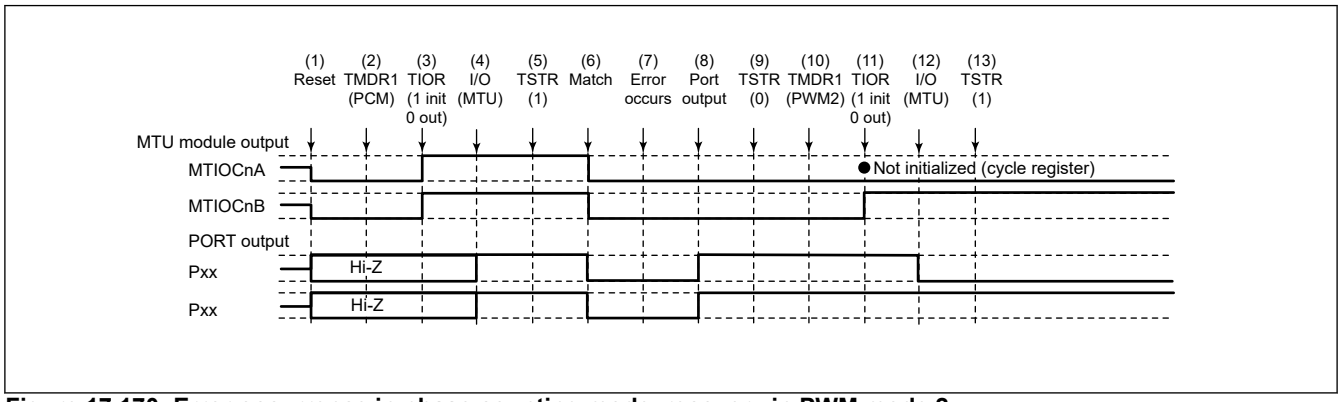

Figure 17.170 Error occurrence in phase counting mode, recovery in PWM mode 2

(1) to (9) are the same as in Figure 17.168.

(10) Set PWM mode 2.

(11) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the cycle register pins. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(12) Set MTU output using the I/O port registers corresponding to the I/O ports.

(13) Restart operation by setting the TSTRA register.

17.7.3.20 Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in Phase Counting Mode

Figure 17.171 shows a case in which an error occurs in phase counting mode and operation is restarted in phase counting mode after re-setting.

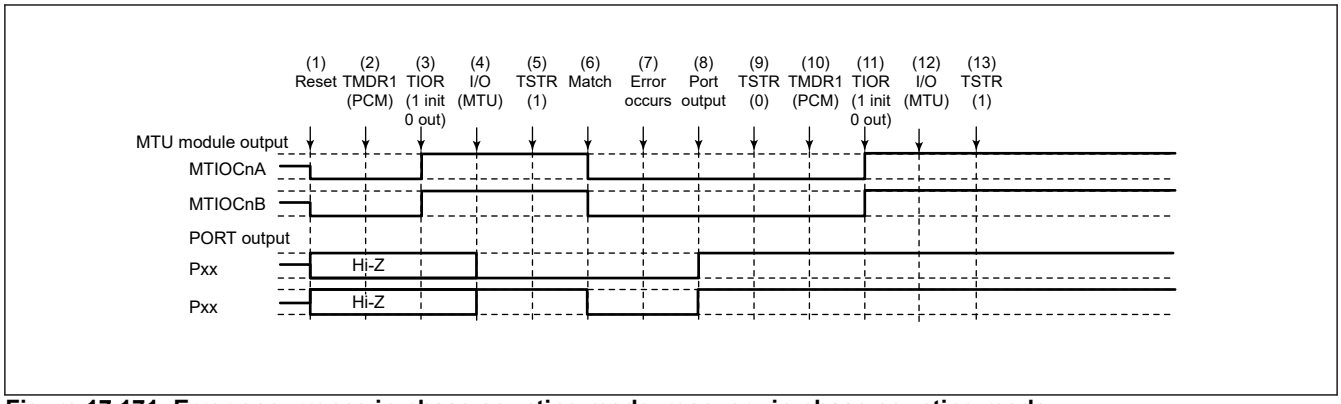

Figure 17.171 Error occurrence in phase counting mode, recovery in phase counting mode

(1) to (9) are the same as in Figure 17.168.

(10) This step is not necessary when restarting in phase counting mode.

(11) Initialize the pins with the TIOR register.

(12) Set MTU output using the I/O port registers corresponding to the I/O ports.

(13) Restart operation by setting the TSTRA register.

17.7.3.21 Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Normal Mode

Figure 17.172 shows a case in which an error occurs in complementary PWM mode and operation is restarted in normal mode after re-setting.

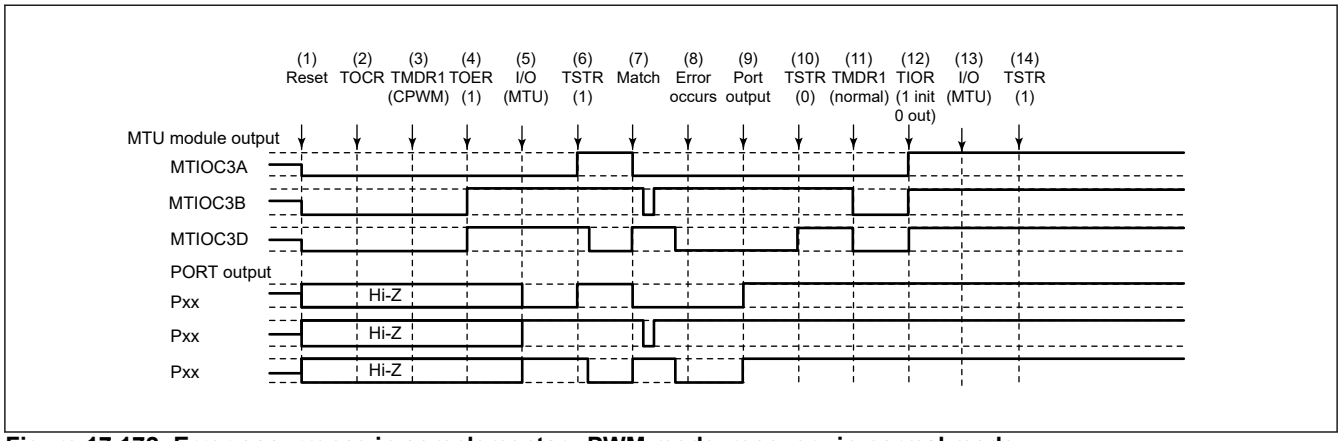

Figure 17.172 Error occurrence in complementary PWM mode, recovery in normal mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Select the complementary PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(3) Set complementary PWM mode.

(4) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(5) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(6) Start count operation by setting the TSTRA (TSTRB) register.

(7) The complementary PWM waveform is output on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.

(10) Stop count operation by setting the TSTRA (TSTRB) register. (MTU output becomes the initial complementary PWM output value).

(11) Set normal mode (MTU output goes low).

(12) Initialize the pins with the TIOR register.

(13) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.22 Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in PWM Mode 1

Figure 17.173 shows a case in which an error occurs in complementary PWM mode and operation is restarted in PWM mode 1 after re-setting.

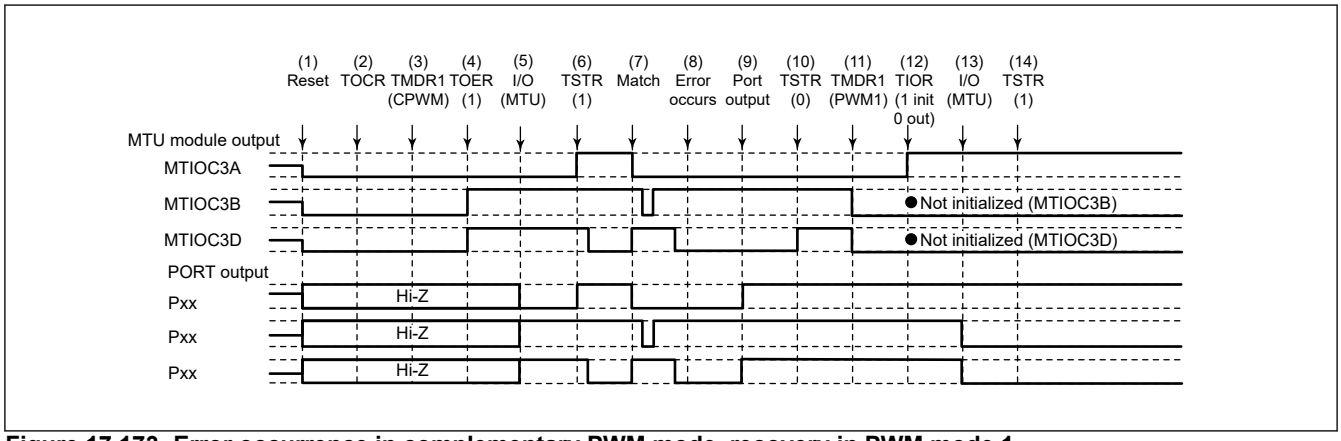

Figure 17.173 Error occurrence in complementary PWM mode, recovery in PWM mode 1

(1) to (10) are the same as in Figure 17.172.

(11) Set PWM mode 1 (MTU output goes low).

(12) Initialize the pins with the TIOR register. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(13) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.23 Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Complementary PWM Mode

Figure 17.174 shows a case in which an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (when operation is restarted using the period and duty settings at the time of stopping the counter).

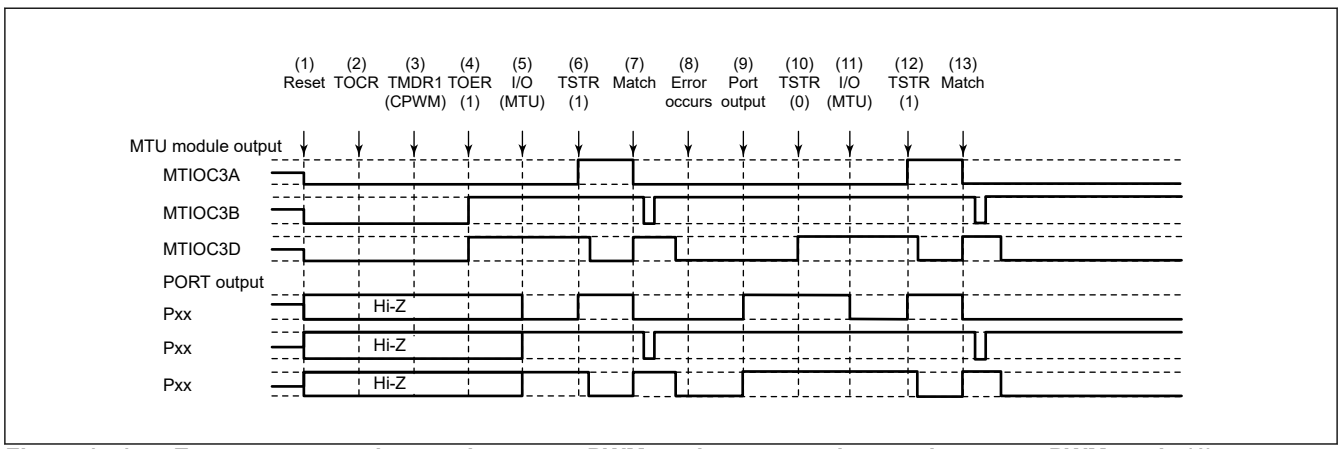

Figure 17.174 Error occurrence in complementary PWM mode, recovery in complementary PWM mode (1)

(1) to (10) are the same as in Figure 17.172.

(11) Set MTU output using the I/O port registers corresponding to the I/O ports.

(12) Restart operation by setting the TSTRA (TSTRB) register.

(13) The complementary PWM waveform is output on compare match occurrence.

17.7.3.24 Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Complementary PWM Mode with New Settings

Figure 17.175 shows a case in which an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (operation is restarted using new period and duty ratio settings).

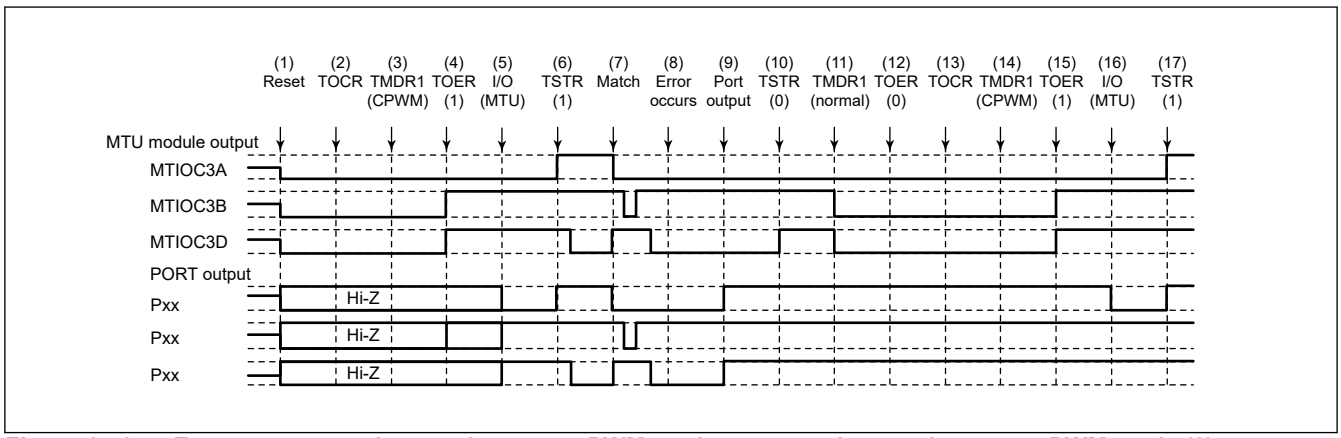

Figure 17.175 Error occurrence in complementary PWM mode, recovery in complementary PWM mode (2)

(1) to (10) are the same as in Figure 17.172.

(11) Set normal mode and make new settings (MTU output goes low).

(12) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(13) Select the complementary PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(14) Set complementary PWM mode.

(15) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(16) Set MTU output using the I/O port registers corresponding to the I/O ports.

(17) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.25 Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 17.176 shows a case in which an error occurs in complementary PWM mode and operation is restarted in reset-synchronized PWM mode after re-setting.

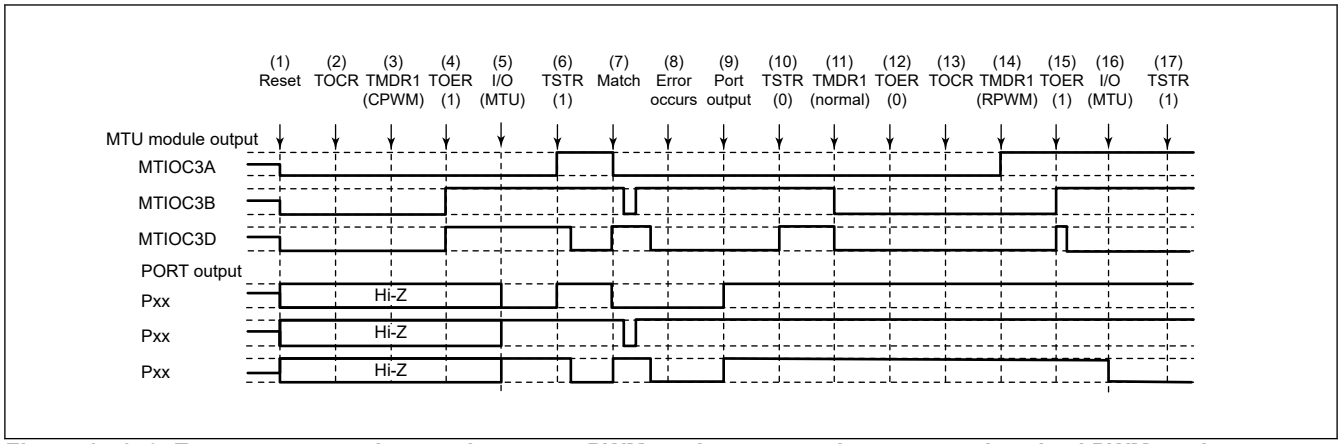

Figure 17.176 Error occurrence in complementary PWM mode, recovery in reset-synchronized PWM mode

(1) to (10) are the same as in Figure 17.172.

(11) Set normal mode (MTU output goes low).

(12) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(13) Select the reset-synchronized PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(14) Set reset-synchronized PWM mode.

(15) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(16) Set MTU output using the I/O port registers corresponding to the I/O ports.

(17) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.26 Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Normal Mode

Figure 17.177 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in normal mode after re-setting.

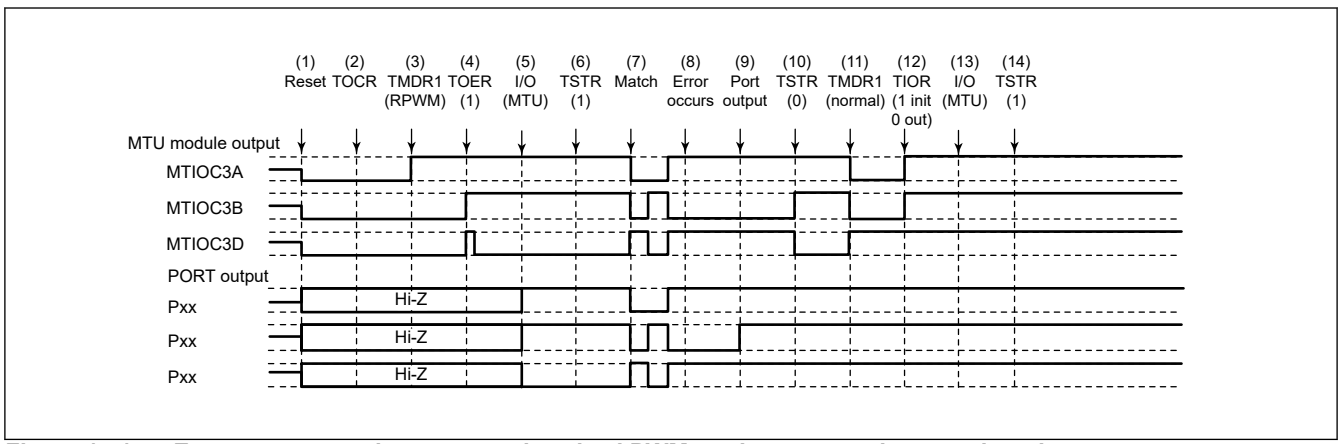

Figure 17.177 Error occurrence in reset-synchronized PWM mode, recovery in normal mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Select the reset-synchronized PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(3) Set reset-synchronized PWM mode.

(4) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(5) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(6) Start count operation by setting the TSTRA (TSTRB) register.

(7) The reset-synchronized PWM waveform is output on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.

(10) Stop count operation by setting the TSTRA (TSTRB) register. (MTU output becomes the initial reset-synchronized PWM output value.)

(11) Set normal mode (positive-phase MTU output goes low, and negative-phase output goes high).

(12) Initialize the pins with the TIOR register.

(13) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.27 Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in PWM Mode 1

Figure 17.178 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in PWM mode 1 after re-setting.

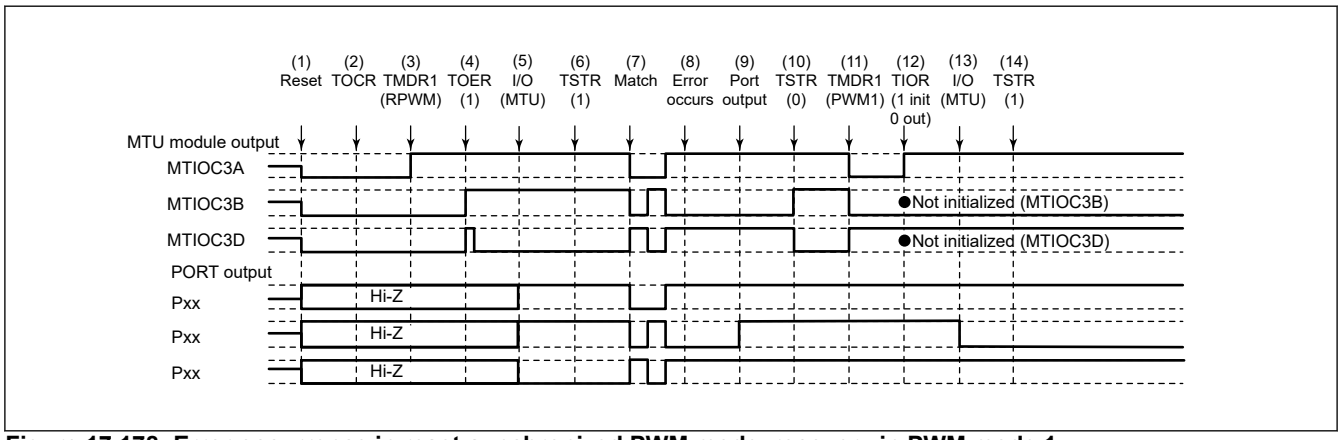

Figure 17.178 Error occurrence in reset-synchronized PWM mode, recovery in PWM mode 1

(1) to (10) are the same as in Figure 17.177.

(11) Set PWM mode 1 (positive-phase MTU output goes low, and negative-phase output goes high).

(12) Initialize the pins with the TIOR register. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode control register (PMCm), port mode register (PMm), and port register (Pm) of the I/O ports.)

(13) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(14) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.28 Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Complementary PWM Mode

Figure 17.179 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in complementary PWM mode after re-setting.

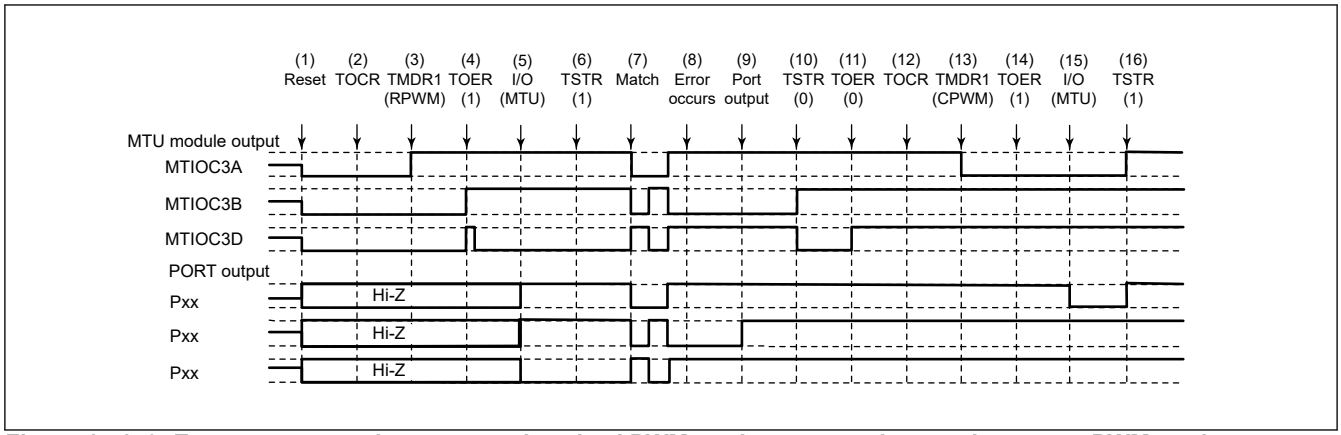

Figure 17.179 Error occurrence in reset-synchronized PWM mode, recovery in complementary PWM mode

(1) to (10) are the same as in Figure 17.177.

(11) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(12) Select the complementary PWM output level and enable or disable cyclic output with registers TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(13) Set complementary PWM mode (MTU cyclic output pin goes low).

(14) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with the TOERA (TOERB) register.

(15) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(16) Restart operation by setting the TSTRA (TSTRB) register.

17.7.3.29 Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 17.180 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in reset-synchronized PWM mode after re-setting.

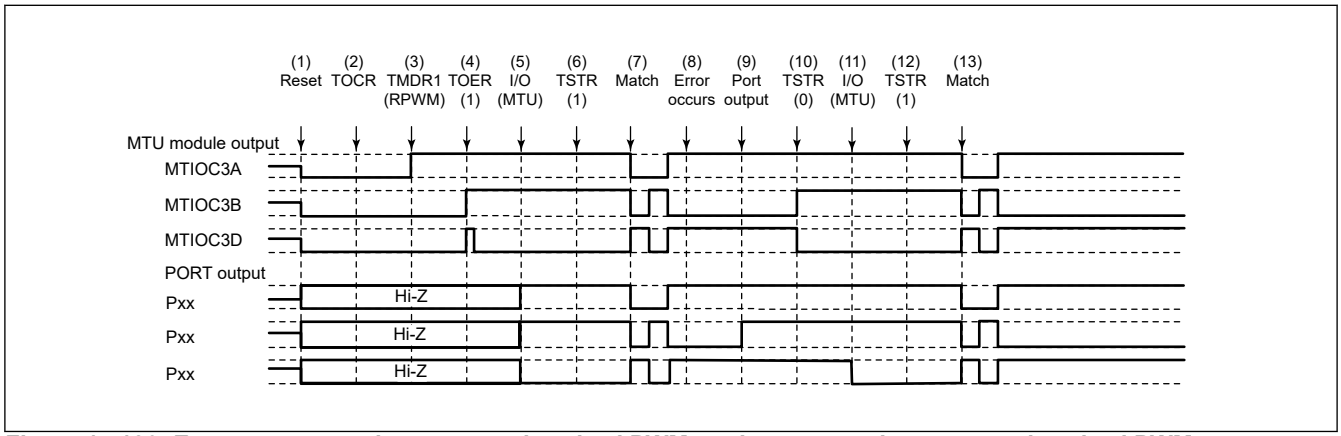

Figure 17.180 Error occurrence in reset-synchronized PWM mode, recovery in reset-synchronized PWM mode

(1) to (10) are the same as in Figure 17.177.

(11) Set MTU output using the I/O Port registers corresponding to the I/O ports.

(12) Restart operation by setting the TSTRA (TSTRB) register.

(13) The reset-synchronized PWM waveform is output on compare match occurrence.

17.8 Operations Linked by the ELC

17.8.1 Event Signal Output to the ELC

The MTU is capable of operation linked with another module set in advance when its interrupt request signal is used as an event signal by the event link controller (ELC).

The MTU outputs the event signal regardless of the setting of the corresponding interrupt request enable bit.

17.8.2 MTU Operations in Response to Receiving Event Signals from the ELC

The MTU can perform the following operations in response to the event set in advance in the ELC_SSEL0 register of the event link controller (ELC).

(1) Start Counting Operation

Select "counting is started" as the operation of the MTU by setting the ELOPA or ELOPB register in the ELC. The ELOPA register controls the operation of MTU0 and MTU3 and the ELOPB register controls the operation of MTU4. When the event specified in the ELC_SSEL0 register occurs, the CSTn bit in the TSTRA register shown in Table 17.75 is set to 1, and the MTU counter starts.

However, when the specified event is generated while the CSTn bit in the TSTRA register has already been set to 1, the event has no effect. Table 17.75 lists the TSTRA register bits used for each channel.

Table 17.75 Counter start bit set by the ELC

Channel no.	Counter start bit
MTU0	TSTRA.CST0 bit
MTU3	TSTRA.CST3 bit
MTU4	TSTRA.CST4 bit

(2) Input Capture Operation

Select "input capture" as the operation of the MTU by setting the ELOPA or ELOPB register in the ELC. The ELOPA register controls the operation of MTU0 and MTU3 and the ELOPB register controls the operation of MTU4. When the event specified in the ELC_SSEL0 register occurs, the value of the TCNT register is captured in the TGR register. When using input capture in response to an event, the corresponding bit of the TIOR register in the MTU should be set for input capture and the CSTn bit of TSTRA register should be set to 1 to start counting by the counter.

In this case, the TIOCnA pin (input capture pin) input has no effect.

Table 17.76 lists the timer general register and I/O control bit used for each channel in input capture operations in response to the ELC.

Table 17.76 Timer general register and I/O control bit used in the Input capture operation

Channel no.	Timer general register	I/O control bit
MTU0	MTU0.TGRA	MTU0.TIORH.IOA[3:0] bits
MTU3	MTU3.TGRA	MTU3.TIORH.IOA[3:0] bits
MTU4	MTU4.TGRA	MTU4.TIORH.IOA[3:0] bits

(3) Restart Counting (Clear Counter) Operation

Select "counting is restarted" as the operation of the MTU by setting the ELOPA or ELOPB register in the ELC. The ELOPA register controls the operation of MTU0 and MTU3 and the ELOPB register controls the operation of MTU4. When the event specified in the ELC_SSEL0 register occurs, the TCNT register is cleared. If the corresponding CSTn bit in the TSTRA register is set to 1, counting continues. For the CSTn bits in the TSTRA register, see Table 17.75.

17.8.3 Usage Notes on MTU Operation by Event Signal Reception from the ELC

The following notes on usage apply when the MTU is used in event link operation.

(1) Start Counting

If the event specified in the ELC_SSEL0 register occurs during a cycle of writing to a CSTn bit in the TSTRA register, writing to the CSTn bit in the TSTRA register does not proceed because setting of the bit to 1 due to the event takes priority.

(2) Restart Counting (Clear Counter)

If the event specified in the ELC_SSEL0 register occurs during a cycle of writing to the TCNT counter, writing to the TCNT counter does not proceed because clearing of the counter due to the event takes priority.

In addition, for MTU3 and MTU4 in complementary PWM mode, do not use the counter restarting by the ELC.

18. Port Output Enable 3 (POE3)

18.1 Overview

The LSI incorporates a port output enable 3 (POE3) module that can be used to place output pins for the MTU3 in the high-impedance state under various conditions. Every output signal is put in the high-impedance state when the output is disabled.

Table 18.1 lists the specifications of the POE3 and Figure 18.1 shows a block diagram of the POE3.

Table 18.1 POE3 specifications

Parameter	Description
Target pins to be placed in the high-impedance state	• MTU3 output pins MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D) MTU3 pins (MTIOC3B, MTIOC3D) MTU4 pins (MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D) MTU6 pins (MTIOC6B, MTIOC6D) MTU7 pins (MTIOC7A, MTIOC7B, MTIOC7C, MTIOC7D)
Conditions for the high-impedance state	• Setting pins as inputs: setting the POE0#, POE4#, POE8#, POE10#, and POE11# pins as inputs (falling edge or low-level sampling) • Short-circuits between output pins: a match (short circuit) between the output signal levels at the active level over one or more cycle on the following combination of pins: – MTU complementary PWM output pins 1. MTIOC3B and MTIOC3D 2. MTIOC4A and MTIOC4C 3. MTIOC4B and MTIOC4D 4. MTIOC6B and MTIOC6D 5. MTIOC7A and MTIOC7C 6. MTIOC7B and MTIOC7D • SPOER register setting being made • Detection that the clock generation circuit had stopped oscillating or the oscillation is abnormal (CLMA0: PLL0, CLMA1: PLL1, CLMA3: main clock) • DSMIF error interrupt
Function	• Each of the POE0#, POE4#, POE8#, POE10#, and POE11# input pins can be set for falling edge, PCLKH/8 × 16, PCLKH/16 × 16, or PCLKH/128 × 16 low-level sampling. • The outputs of the target pins can be in the high-impedance state by falling-edge or low-level sampling of the POE0#, POE4#, POE8#, POE10#, or POE11# pin. • The outputs of the target pins can be in the high-impedance state when oscillation stop is detected by the oscillation stop detection function of the clock generator. • The outputs of the target pins can be in the high-impedance state when DSMIF error occurs. • The MTU complementary PWM outputs can be in the high-impedance state when output levels of the MTU complementary PWM output pins are compared and simultaneous active-level output continues for one cycle or more. • The outputs of the target pins can be in the high-impedance state by modifying the settings of the POE3 registers. • Interrupts can be generated by input-level sampling or output-level comparison results.

The POE3 has input-level detection circuits, pin selection circuits, output-level comparison circuits, and a high-impedance request/interrupt request generating circuit as shown in Figure 18.1.

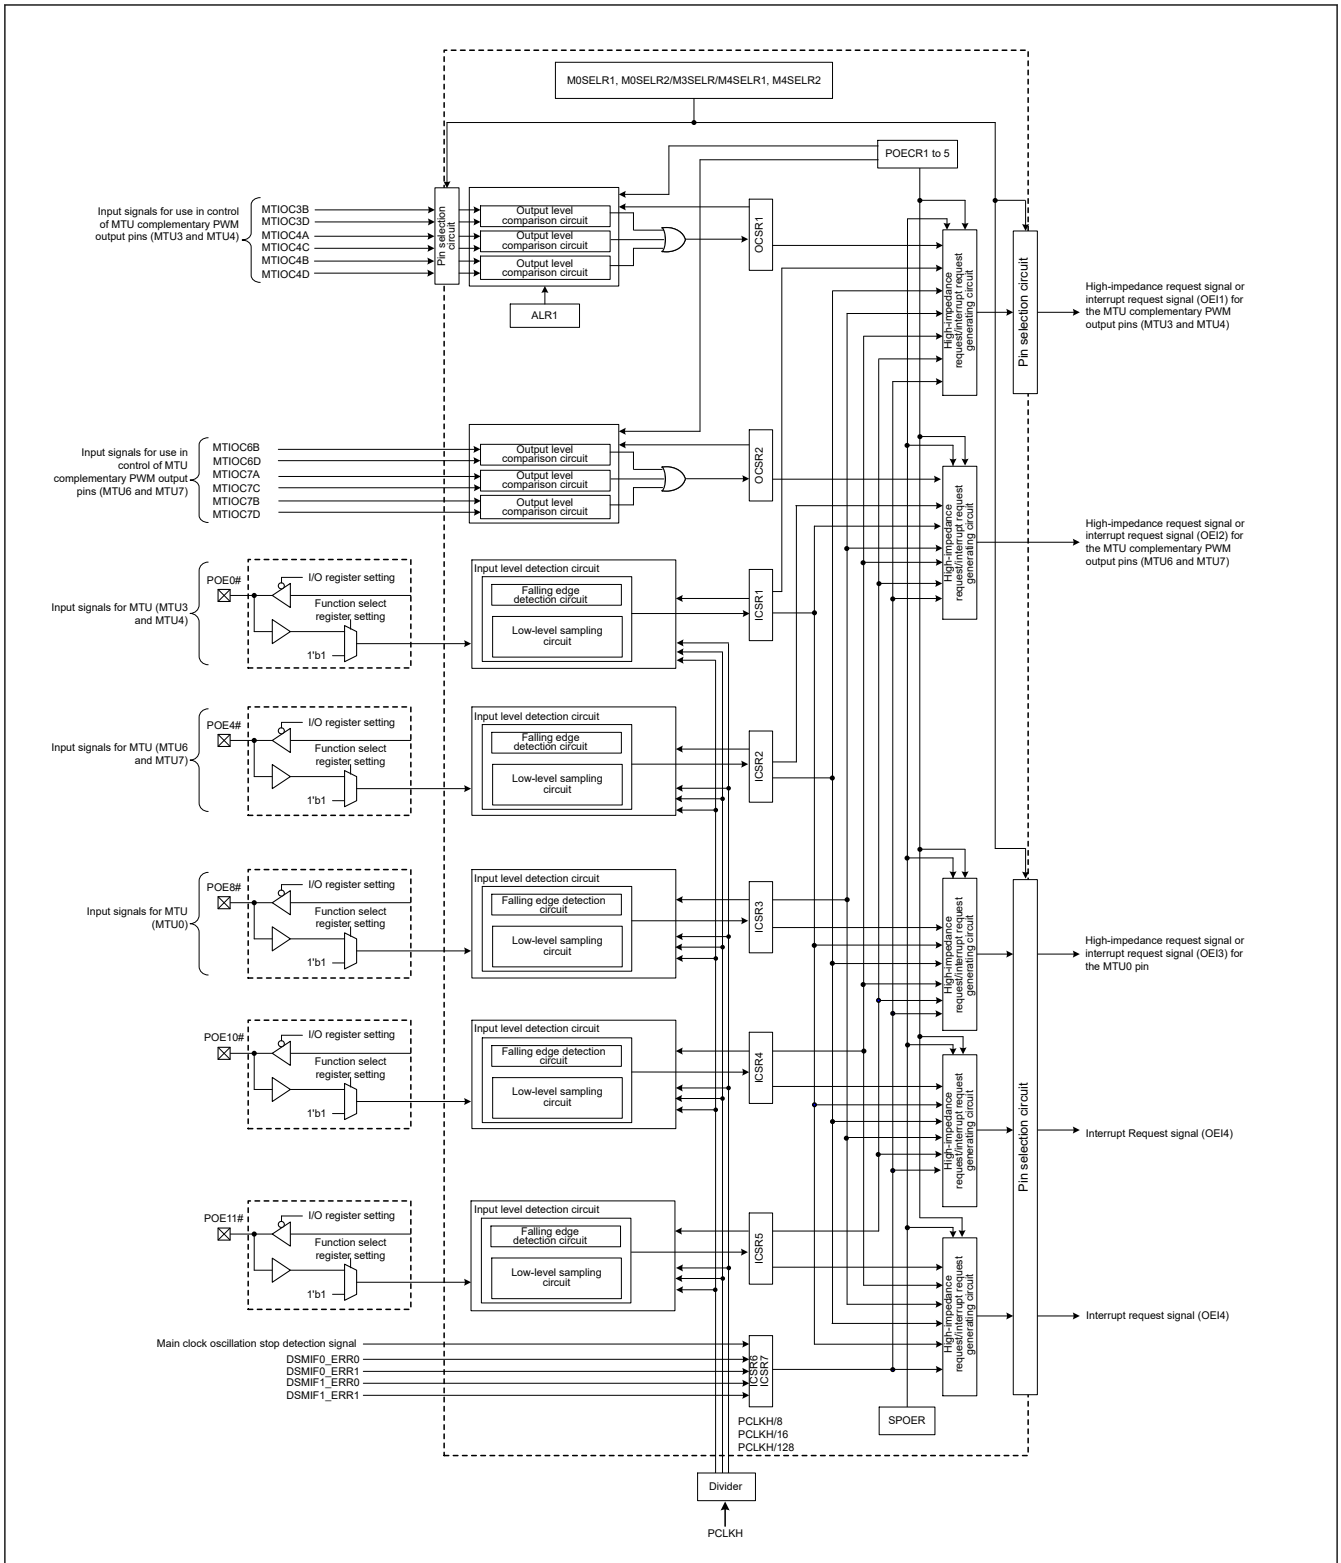

Figure 18.1 POE3 block diagram

Table 18.2 shows I/O pins to be used by the POE3.

Table 18.2 POE3 I/O pins

Pin name	I/O	Description
POE0#	Input	Input pin for the request signal to place the MTU3 and MTU4 pins for MTU complementary PWM output in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU0, MTU6, and MTU7 pins in the high-impedance state.
POE4#	Input	Input pin for the request signal to place the MTU6 and MTU7 pins for MTU complementary PWM output in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU0, MTU3, and MTU4 pins in the high-impedance state.
POE8#	Input	Input pin for the request signal to place the pins for MTU0 in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU3 and MTU4 pins or MTU6 and MTU7 pins for MTU complementary PWM output.
POE10#	Input	In accord with register settings, this pin is capable of placing the any target pins in high-impedance state.
POE11#	Input	In accord with register settings, this pin is capable of placing the any target pins in high-impedance state.

Table 18.3 shows output-level comparisons with pin combinations.

Table 18.3 Pin combinations

Pin combination	I/O	Description
MTIOC3B and MTIOC3D	Output	The MTU3 and MTU4 pins for MTU complementary PWM output are placed in high-impedance state when both pins of a pair simultaneously output the active level*1 for one or more cycles of the peripheral clock (PCLKH). Pin combinations for output comparison and high-impedance control can be selected by registers of POE3.
MTIOC4A and MTIOC4C	Output	
MTIOC4B and MTIOC4D	Output	
MTIOC6B and MTIOC6D	Output	The MTU6 and MTU7 pins for MTU complementary PWM output are placed in high-impedance state when both pins of a pair simultaneously output the active level*2 for one or more cycles of the peripheral clock (PCLKH). Pin combinations for output comparison and high-impedance control can be selected by registers of POE3.
MTIOC7A and MTIOC7C	Output	
MTIOC7B and MTIOC7D	Output	

Note 1. The low level is output when the OLSP bit in TOCR1A of MTUn is 0 with the TOCS bit in TOCR1A of MTUn cleared to 0, or the high level is output when the OLSP bit is 1. Otherwise, the low level is output when the OLS3N, OLS3P, OLS2N, OLS2P, OLS1N, and OLS1P bits in TOCR2A of MTUn are 0 with the TOCS bit in TOCR1A of MTUn set to 1, or the high level is output when these bits are 1.

Note 2. The low level is output when the OLSP bit in TOCR1B of MTUn is 0 with the TOCS bit in TOCR1B of MTUn cleared to 0, or the high level is output when the OLSP bit is 1. Otherwise, the low level is output when the OLS3N, OLS3P, OLS2N, OLS2P, OLS1N, and OLS1P bits in TOCR2B of MTUn are 0 with the TOCS bit in TOCR1B of MTUn set to 1, or the high level is output when these bits are 1.

18.2 Register Descriptions

The POE3 registers are initialized by a reset.

18.2.1 ICSR1 : Input Level Control/Status Register 1

Base address: POE3 = 0x9000_5000

Offset address: 0x00

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	POE0F	—	—	—	PIE1	—	—	—	—	—	—	POE0M[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	POE0M[1:0]	POE0 Mode Select 0 0: Accepts a request on the falling edge of POE0# pin input 0 1: Accepts a request when POE0# pin input has been sampled 16 times at PCLKH/8 clock pulses and all are low level 1 0: Accepts a request when POE0# pin input has been sampled 16 times at PCLKH/16 clock pulses and all are low level 1 1: Accepts a request when POE0# pin input has been sampled 16 times at PCLKH/128 clock pulses and all are low level	R/W*1

Bit	Symbol	Function	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
8	PIE1	Port Interrupt Enable 1 0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
11:9	—	These bits are read as 0. The write value should be 0.	R/W
12	POE0F	POE0 Flag 0: Indicates that a high-impedance request has not been input to the POE0# pin 1: Indicates that a high-impedance request has been input to the POE0# pin	R/W*2
15:13	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed method.

The ICSR1 register selects the input mode for the POE0# pin, controls the enable/disable of interrupts, and indicates status.

POE0M[1:0] bits (POE0 Mode Select)

These bits select the input mode of the POE0# pin.

PIE1 bit (Port Interrupt Enable 1)

This bit enables or disables interrupt requests when the POE0F flag in ICSR1 is set to 1.

POE0F flag (POE0 Flag)

This flag indicates that a high-impedance request has been input to the POE0# pin.

[Setting condition]

- When the input set by the POE0M[1:0] bits occurs at the POE0# pin

[Clearing condition]

- By writing 0 to the POE0F flag after reading POE0F = 1

18.2.2 ICSR2 : Input Level Control/Status Register 2

Base address: POE3 = 0x9000_5000

Offset address: 0x04

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	POE4F	—	—	—	PIE2	—	—	—	—	—	—	POE4M[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	POE4M[1:0]	POE4 Mode Select 0 0: Accepts a request on the falling edge of POE4# pin input 0 1: Accepts a request when POE4# pin input has been sampled 16 times at PCLKH/8 clock pulses and all are low level 1 0: Accepts a request when POE4# pin input has been sampled 16 times at PCLKH/16 clock pulses and all are low level 1 1: Accepts a request when POE4# pin input has been sampled 16 times at PCLKH/128 clock pulses and all are low level	R/W*1
7:2	—	These bits are read as 0. The write value should be 0.	R/W
8	PIE2	Port Interrupt Enable 2 0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
11:9	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
12	POE4F	POE4 Flag 0: Indicates that a high-impedance request has not been input to the POE4# pin 1: Indicates that a high-impedance request has been input to the POE4# pin	R/W*2
15:13	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed method.

The ICSR2 register selects the input mode for the POE4# pin, controls the enable/disable of interrupts, and indicates status.

POE4M[1:0] bits (POE4 Mode Select)

These bits select the input mode of the POE4# pin.

PIE2 bit (Port Interrupt Enable 2)

This bit enables or disables interrupt requests when the POE4F flag in ICSR2 is set to 1.

POE4F flag (POE4 Flag)

This flag indicates that a high-impedance request has been input to the POE4# pin.

[Setting condition]

- When the input set by the POE4M[1:0] bits occurs at the POE4# pin

[Clearing condition]

- By writing 0 to the POE4F flag after reading POE4F = 1

18.2.3 ICSR3 : Input Level Control/Status Register 3

Base address: POE3 = 0x9000_5000

Offset address: 0x08

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	POE8F	—	—	POE8E	PIE3	—	—	—	—	—	—	POE8M[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	POE8M[1:0]	POE8 Mode Select 0 0: Accepts a request on the falling edge of POE8# pin input 0 1: Accepts a request when POE8# pin input has been sampled 16 times at PCLKH/8 clock pulses and all are low level 1 0: Accepts a request when POE8# pin input has been sampled 16 times at PCLKH/16 clock pulses and all are low level 1 1: Accepts a request when POE8# pin input has been sampled 16 times at PCLKH/128 clock pulses and all are low level	R/W*1
7:2	—	These bits are read as 0. The write value should be 0.	R/W
8	PIE3	Port Interrupt Enable 3 0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
9	POE8E	POE8 High-Impedance Enable 0: Does not place the pin in the high-impedance state 1: Places the pin in the high-impedance state	R/W*1
11:10	—	These bits are read as 0. The write value should be 0.	R/W
12	POE8F	POE8 Flag 0: Indicates that a high-impedance request has not been input to the POE8# pin. 1: Indicates that a high-impedance request has been input to the POE8# pin.	R/W*2
15:13	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed method.

The ICSR3 register selects the input mode for the POE8# pin, controls the enable/disable of interrupts, and indicates status.

POE8M[1:0] bits (POE8 Mode Select)

These bits select the input mode of the POE8# pin.

PIE3 bit (Port Interrupt Enable 3)

This bit enables or disables interrupt requests when the POE8F flag in ICSR3 is set to 1.

POE8E bit (POE8 High-Impedance Enable)

This bit specifies whether to place the corresponding pin in the high-impedance state when the POE8F flag is set to 1.

POE8F flag (POE8 Flag)

This flag indicates that a high-impedance request has been input to the POE8# pin.

[Setting condition]

- When the input set by the POE8M[1:0] bits occurs at the POE8# pin

[Clearing condition]

- By writing 0 to the POE8F flag after reading POE8F = 1

18.2.4 ICSR4 : Input Level Control/Status Register 4

Base address: POE3 = 0x9000_5000

Offset address: 0x16

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	POE10F	—	—	POE10E	PIE4	—	—	—	—	—	—	POE10M[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	POE10M[1:0]	POE10 Mode Select 0 0: Accepts a request on the falling edge of POE10# pin input 0 1: Accepts a request when POE10# pin input has been sampled 16 times at PCLKH/8 clock pulses and all are low level 1 0: Accepts a request when POE10# pin input has been sampled 16 times at PCLKH/16 clock pulses and all are low level 1 1: Accepts a request when POE10# pin input has been sampled 16 times at PCLKH/128 clock pulses and all are low level	R/W*1
7:2	—	These bits are read as 0. The write value should be 0.	R/W
8	PIE4	Port Interrupt Enable 4 0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
9	POE10E	POE10 High-Impedance Enable 0: Does not place the pin in the high-impedance state 1: Places the pin in the high-impedance state	R/W*1
11:10	—	These bits are read as 0. The write value should be 0.	R/W
12	POE10F	POE10 Flag 0: Indicates that a high-impedance request has not been input to the POE10# pin 1: Indicates that a high-impedance request has been input to the POE10# pin	R/W*2
15:13	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed method.

The ICSR4 register selects the input mode for the POE10# pin, controls the enable/disable of interrupts, and indicates status.

POE10M[1:0] bits (POE10 Mode Select)

These bits select the input mode of the POE10# pin.

PIE4 bit (Port Interrupt Enable 4)

This bit enables or disables interrupt requests when the POE10F flag in ICSR4 is set to 1.

POE10E bit (POE10 High-Impedance Enable)

This bit specifies whether to place the corresponding pin in the high-impedance state when the POE10F flag is set to 1.

POE10F flag (POE10 Flag)

This flag indicates that a high-impedance request has been input to the POE10# pin.

[Setting condition]

- When the input set by the POE10M[1:0] bits occurs at the POE10# pin

[Clearing condition]

- By writing 0 to the POE10F flag after reading POE10F = 1

18.2.5 ICSR5 : Input Level Control/Status Register 5

Base address: POE3 = 0x9000_5000

Offset address: 0x18

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	POE11F	—	—	POE11E	PIE5	—	—	—	—	—	—	POE11M[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	POE11M[1:0]	POE11 Mode Select 0 0: Accepts a request on the falling edge of POE11# pin input 0 1: Accepts a request when POE11# pin input has been sampled 16 times at PCLKH/8 clock pulses and all are low level 1 0: Accepts a request when POE11# pin input has been sampled 16 times at PCLKH/16 clock pulses and all are low level 1 1: Accepts a request when POE11# pin input has been sampled 16 times at PCLKH/128 clock pulses and all are low level	R/W*1
7:2	—	These bits are read as 0. The write value should be 0.	R/W
8	PIE5	Port Interrupt Enable 5 0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
9	POE11E	POE11 High-Impedance Enable 0: Does not place the pin in the high-impedance state 1: Places the pin in the high-impedance state	R/W*1
11:10	—	These bits are read as 0. The write value should be 0.	R/W
12	POE11F	POE11 Flag 0: Indicates that a high-impedance request has not been input to the POE11# pin 1: Indicates that a high-impedance request has been input to the POE11# pin	R/W*2
15:13	—	These bits are read as 0. The write value should be 0.	R/W

Note: For the ICSR5 register, set the values the same as those in the ICSR4 register.
Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed method.

The ICSR5 register selects the pin input mode of the POE11#, controls the enable/disable of interrupts, and indicates status.

POE11M[1:0] bits (POE11 Mode Select)

These bits select the input mode of the POE11# pin.

PIE5 bit (Port Interrupt Enable 5)

This bit enables or disables interrupt requests when the POE11F flag in ICSR5 is set to 1.

POE11E bit (POE11 High-Impedance Enable)

This bit specifies whether to place the corresponding pin in the high-impedance state when the POE11F flag is set to 1. The interrupt output is multiplexed with OEI4.

POE11F flag (POE11 Flag)

This flag indicates that a high-impedance request has been input to the POE11# pin.

[Setting condition]

- When the input set by the POE11M[1:0] bits occurs at the POE11# pin

[Clearing condition]

- By writing 0 to the POE11F flag after reading POE11F = 1

18.2.6 ICSR6 : Input Level Control/Status Register 6

Base address: POE3 = 0x9000_5000

Offset address: 0x1C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	OSTSTF	—	—	OSTSTE	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	—	These bits are read as 0. The write value should be 0.	R/W
9	OSTSTE	Oscillation Stop High-Impedance Enable 0: Does not place the MTU complementary PWM output pins and MTU0 pins in high-impedance state 1: Places the MTU complementary PWM output pins and MTU0 pins in high-impedance state	R/W*1
11:10	—	These bits are read as 0. The write value should be 0.	R/W
12	OSTSTF	Oscillation Stop High-Impedance Flag 0: Indicates that a high-impedance request or oscillation abnormality has not been generated. 1: Indicates that a high-impedance request by oscillation stop or oscillation abnormality has been generated.	R/W*2
15:13	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed method.

The ICSR6 register controls the high-impedance for stopped oscillation or oscillation abnormality and indicates the status.

OSTSTE bit (Oscillation Stop High-Impedance Enable)

This bit enables or disables the MTU complementary PWM output pins and MTU0 pins to be placed in the high-impedance state when stopped oscillation or oscillation abnormality of the PLL is detected.

OSTSTF flag (Oscillation Stop High-Impedance Flag)

This flag indicates that a stopped oscillation high-impedance request has been generated.

When stopped oscillation is detected, this flag is set to 1. When clearing this flag, write 0 while the detection signal for stopped oscillation or oscillation abnormality of the PLL is negated. Writing 0 to this flag while the detection signal for

stopped oscillation or oscillation abnormality is asserted does not clear this flag to 0. After clearing this flag, confirm that the flag has actually been modified to 0.

[Setting condition]

- When stopped oscillation is detected

[Clearing condition]

- By writing 0 to the OSTSTF flag after reading OSTSTF = 1

18.2.7 ICSR7 : Input Level Control/Status Register 7

Base address: POE3 = 0x9000_5000

Offset address: 0x1E

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	D1ER R0ST	D0ER R0ST	D1ER R1ST	D0ER R1ST	—	—	—	D1ER R0IE	D0ER R0IE	D1ER R1IE	D0ER R1IE	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	D0ERR1IE	DSMIF0 Error 1 Interrupt enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
5	D1ERR1IE	DSMIF1 Error 1 Interrupt enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
6	D0ERR0IE	DSMIF0 Error 0 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
7	D1ERR0IE	DSMIF1 Error 0 Interrupt Enable 0: Interrupt is disabled 1: Interrupt is enabled	R/W
10:8	—	These bits are read as 0. The write value should be 0.	R/W
11	D0ERR1ST	DSMIF0 Error 1 Status 0: Indicates that DSMIF0 error 1 has not been generated 1: Indicates that DSMIF0 error 1 has been generated	R
12	D1ERR1ST	DSMIF1 Error 1 Status 0: Indicates that DSMIF1 error 1 has not been generated 1: Indicates that DSMIF1 error 1 has been generated	R
13	D0ERR0ST	DSMIF0 Error 0 Status 0: Indicates that DSMIF0 error 0 has not been generated 1: Indicates that DSMIF0 error 0 has been generated	R
14	D1ERR0ST	DSMIF1 Error 0 Status 0: Indicates that DSMIF1 error 0 has not been generated 1: Indicates that DSMIF1 error 0 has been generated	R
15	—	This bit is read as 0. The write value should be 0.	R/W

The ICSR7 register controls the high-impedance for DSMIF error and indicates the status.

D0ERR1IE bit (DSMIF0 Error 1 Interrupt enable)

This bit enables or disables the interrupt request when DSMIF0 error 1 interrupt is detected. The interrupt output is multiplexed with OEI4.

D1ERR1IE bit (DSMIF1 Error 1 Interrupt enable)

This bit enables or disables the interrupt request when DSMIF1 error 1 interrupt is detected. The interrupt output is multiplexed with OEI4.

D0ERR0IE bit (DSMIF0 Error 0 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF0 error 0 interrupt is detected. The interrupt output is multiplexed with OEI4.

D1ERR0IE bit (DSMIF1 Error 0 Interrupt Enable)

This bit enables or disables the interrupt request when DSMIF1 error 0 interrupt is detected. The interrupt output is multiplexed with OEI4.

D0ERR1ST bit (DSMIF0 Error 1 Status)

This bit indicates that DSMIF0 error 1 interrupt request has been generated.

When DSMIF0 error 1 is detected, this bit is set to 1.

D1ERR1ST bit (DSMIF1 Error 1 Status)

This bit indicates that DSMIF1 error 1 interrupt request has been generated.

When DSMIF1 error 1 is detected, this bit is set to 1.

D0ERR0ST bit (DSMIF0 Error 0 Status)

This bit indicates that a DSMIF0 error 0 interrupt request has been generated.

When DSMIF0 error 0 is detected, this bit is set to 1.

D1ERR0ST bit (DSMIF1 Error 0 Status)

This bit indicates that a DSMIF1 error 0 interrupt request has been generated.

When DSMIF1 error 0 is detected, this bit is set to 1.

18.2.8 OCSR1 : Output Level Control/Status Register 1

Base address: POE3 = 0x9000_5000

Offset address: 0x02

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	OSF1	—	—	—	—	—	OCE1	OIE1	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	—	These bits are read as 0. The write value should be 0.	R/W
8	OIE1	Output Short Circuit Interrupt Enable 1 0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
9	OCE1	Output Short Circuit High-Impedance Enable 1 0: Does not place the pins in the high-impedance state 1: Places the pins in the high-impedance state	R/W*1
14:10	—	These bits are read as 0. The write value should be 0.	R/W
15	OSF1	Output Short Circuit Flag 1 0: Indicates that outputs have not simultaneously become an active level 1: Indicates that outputs have simultaneously become an active level	R/W*2

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed method.

The OCSR1 register controls the enable or disable of output-level comparison and interrupts and indicates status.

OIE1 bit (Output Short Circuit Interrupt Enable 1)

This bit enables or disables interrupt requests when the OSF1 flag is set to 1.

OCE1 bit (Output Short Circuit High-Impedance Enable 1)

This bit specifies whether to place the pins in high-impedance state when the OSF1 bit in OCSR1 is set to 1.

OSF1 flag (Output Short Circuit Flag 1)

This flag indicates that any one of the three pairs of 2-phase MTU3 and MTU4 pins for MTU complementary PWM output to be compared has simultaneously become an active level.

[Setting condition]

- When any one of the three pairs of 2-phase outputs has simultaneously become an active level

[Clearing condition]

- By writing 0 to the OSF1 flag after reading OSF1 = 1

18.2.9 OCSR2 : Output Level Control/Status Register 2

Base address: POE3 = 0x9000_5000

Offset address: 0x06

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	OSF2	—	—	—	—	—	OCE2	OIE2	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	—	These bits are read as 0. The write value should be 0.	R/W
8	OIE2	Output Short Circuit Interrupt Enable 2 0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
9	OCE2	Output Short Circuit High-Impedance Enable 2 0: Does not place the pins in the high-impedance state 1: Places the pins in the high-impedance state	R/W*1
14:10	—	These bits are read as 0. The write value should be 0.	R/W
15	OSF2	Output Short Circuit Flag 2 0: Indicates that outputs have not simultaneously become an active level 1: Indicates that outputs have simultaneously become an active level	R/W*2

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed method.

The OCSR2 register controls the enable or disable of output-level comparison and interrupts and indicates status.

OIE2 bit (Output Short Circuit Interrupt Enable 2)

This bit enables or disables interrupt requests when the OSF2 flag in OCSR2 is set to 1.

OCE2 bit (Output Short Circuit High-Impedance Enable 2)

This bit specifies whether to place the pins in the high-impedance state when the OSF2 flag in OCSR2 is set to 1.

OSF2 flag (Output Short Circuit Flag 2)

This flag indicates that any one of the three pairs of 2-phase MTU6 and MTU7 pins for MTU complementary PWM output to be compared has simultaneously become an active level.

[Setting condition]

- When any one of the three pairs of 2-phase outputs has simultaneously become an active level

[Clearing condition]

- By writing 0 to the OSF2 flag after reading OSF2 = 1

18.2.10 ALR1 : Active Level Setting Register 1

Base address: POE3 = 0x9000_5000

Offset address: 0x1A

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	OLSEN	—	OLSG2B	OLSG2A	OLSG1B	OLSG1A	OLSG0B	OLSG0A
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OLSG0A	MTIOC3B Pin Active Level Setting 0: Active-low 1: Active-high	R/W*1
1	OLSG0B	MTIOC3D Pin Active Level Setting 0: Active-low 1: Active-high	R/W*1
2	OLSG1A	MTIOC4A Pin Active Level Setting 0: Active-low 1: Active-high	R/W*1
3	OLSG1B	MTIOC4C Pin Active Level Setting 0: Active-low 1: Active-high	R/W*1
4	OLSG2A	MTIOC4B Pin Active Level Setting 0: Active-low 1: Active-high	R/W*1
5	OLSG2B	MTIOC4D Pin Active Level Setting 0: Active low 1: Active high	R/W*1
6	—	This bit is read as 0. The write value should be 0.	R/W
7	OLSEN	Active Level Setting Enable 0: Disabled 1: Enabled	R/W*1
15:8	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

The ALR1 register specifies the active levels of the MTU outputs selected by the I/O Ports, as the active levels for detection of short circuits of those outputs reflected in OCSR1.

OLSG0A bit (MTIOC3B Pin Active Level Setting)

This bit sets the active level of the MTIOC3B output. Specifically, setting the OLSG0A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of short circuits.

OLSG0B bit (MTIOC3D Pin Active Level Setting)

This bit sets the active level of the MTIOC3D output. Specifically, setting the OLSG0B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of short circuits.

OLSG1A bit (MTIOC4A Pin Active Level Setting)

This bit sets the active level of the MTIOC4A output. Specifically, setting the OLSG1A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of short circuits.

OLSG1B bit (MTIOC4C Pin Active Level Setting)

This bit sets the active level of the MTIOC4C output. Specifically, setting the OLSG1B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of short circuits.

OLSG2A bit (MTIOC4B Pin Active Level Setting)

This bit sets the active level of the MTIOC4B output. Specifically, setting the OLSG2A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of short circuits.

OLSG2B bit (MTIOC4D Pin Active Level Setting)

This bit sets the active level of the MTIOC4D output. Specifically, setting the OLSG2B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of short circuits.

OLSEN bit (Active Level Setting Enable)

This bit enables or disables the active-level settings in the OLSGnm bits (n = 0 to 2; m = A, B). Clearing the OLSEN bit to 0 disables the OLSGnm bits, in which case the active levels of the MTU output are determined by the MTU.TOCR1A and MTU.TOCR2A registers. Setting the OLSEN bit to 1 enables the OLSGnm bits, in which case the active levels of the MTU output are as selected by the OLSGnm bits in this register.

18.2.11 SPOER : Software Port Output Enable Register

Base address: POE3 = 0x9000_5000

Offset address: 0x0A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	MTUCH0HIZ	MTUCH67HIZ	MTUCH34HIZ
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MTUCH34HIZ	MTU3 and MTU4 Output High-Impedance Enable 0: Does not place the pins in the high-impedance state 1: Places the pins in the high-impedance state	R/W
1	MTUCH67HIZ	MTU6 and MTU7 Output High-Impedance Enable 0: Does not place the pins in the high-impedance state 1: Places the pins in the high-impedance state	R/W
2	MTUCH0HIZ	MTU0 Pin High-Impedance Enable 0: Does not place the pins in the high-impedance state 1: Places the pins in the high-impedance state	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

The SPOER register controls the high-impedance state of the pins.

MTUCH34HIZ bit (MTU3 and MTU4 Output High-Impedance Enable)

This bit specifies whether to place the MTU complementary PWM output pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, and MTIOC4D) in high-impedance state.

[Setting condition]

- By writing 1 to the MTUCH34HIZ bit

[Clearing conditions]

- Reset
- By writing 0 to the MTUCH34HIZ bit after reading MTUCH34HIZ = 1.
  To write 0 to this bit, be sure to read 1 first and then write 0.

MTUCH67HIZ bit (MTU6 and MTU7 Output High-Impedance Enable)

This bit specifies whether to place the MTU complementary PWM output pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D) in the high-impedance state.

[Setting condition]

- By writing 1 to the MTUCH67HIZ bit

[Clearing conditions]

- Reset
- By writing 0 to the MTUCH67HIZ bit after reading MTUCH67HIZ = 1.
  To write 0 to this bit, be sure to read 1 first and then write 0.

MTUCH0HIZ bit (MTU0 Pin High-Impedance Enable)

This bit specifies whether to place the MTU0 pins in the high-impedance state.

[Setting condition]

- By writing 1 to the MTUCH0HIZ bit

[Clearing conditions]

- Reset
- By writing 0 to the MTUCH0HIZ bit after reading MTUCH0HIZ = 1.
  To write 0 to this bit, be sure to read 1 first and then write 0.

18.2.12 POECR1 : Port Output Enable Control Register 1

Base address: POE3 = 0x9000_5000

Offset address: 0x0B

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	MTU0 DZE	MTU0 CZE	MTU0 BZE	MTU0 AZE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MTU0AZE	MTIOC0A High-Impedance Enable 0: Does not place the pin in high-impedance state 1: Places the pin in high-impedance state	R/W*1
1	MTU0BZE	MTIOC0B High-Impedance Enable 0: Does not place the pin in high-impedance state 1: Places the pin in high-impedance state	R/W*1
2	MTU0CZE	MTIOC0C High-Impedance Enable 0: Does not place the pin in high-impedance state 1: Places the pin in high-impedance state	R/W*1
3	MTU0DZE	MTIOC0D High-Impedance Enable 0: Does not place the pin in high-impedance state 1: Places the pin in high-impedance state	R/W*1
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

The POECR1 register controls high-impedance state of the MTU0 pins.

MTU0AZE bit (MTIOC0A High-Impedance Enable)

This bit specifies whether to place the MTIOC0A output for the MTU0 pin in the high-impedance state when any of the ICSR3.POE8F flag, SPOER.MTUCH0HIZ bit, and ICSR6.OSTSTF flag (when the OSTSTE bit is 1), or, as additionally

specified in the POECR5 register, the ICSRn.POEmF flag (n = 1, 2, 4, 5; m = 0, 4, 10, 11), ICSR7.DmERRnST (m = 0, 1; n = 0, 1), is set to 1.

MTU0BZE bit (MTIOC0B High-Impedance Enable)

This bit specifies whether to place the MTIOC0B output for the MTU0 pin in the high-impedance state when any of the ICSR3.POE8F flag, SPOER.MTUCH0HIZ bit, and ICSR6.OSTSTF flag (when the OSTSTE bit is 1), or, as additionally specified in the POECR5 register, the ICSRn.POEmF flag (n = 1, 2, 4, 5; m = 0, 4, 10, 11), ICSR7.DmERRnST (m = 0, 1; n = 0, 1), is set to 1.

MTU0CZE bit (MTIOC0C High-Impedance Enable)

This bit specifies whether to place the MTIOC0C output for the MTU0 pin in the high-impedance state when any of the ICSR3.POE8F flag, SPOER.MTUCH0HIZ bit, and ICSR6.OSTSTF flag (when the OSTSTE bit is 1), or, as additionally specified in the POECR5 register, the ICSRn.POEmF flag (n = 1, 2, 4, 5; m = 0, 4, 10, 11), ICSR7.DmERRnST (m = 0, 1; n = 0, 1), is set to 1.

MTU0DZE bit (MTIOC0D High-Impedance Enable)

This bit specifies whether to place the MTIOC0D output for the MTU0 pin in the high-impedance state when any of the ICSR3.POE8F flag, SPOER.MTUCH0HIZ bit, and ICSR6.OSTSTF flag (when the OSTSTE bit is 1), or, as additionally specified in the POECR5 register, the ICSRn.POEmF flag (n = 1, 2, 4, 5; m = 0, 4, 10, 11), ICSR7.DmERRnST (m = 0, 1; n = 0, 1), is set to 1.

18.2.13 POECR2 : Port Output Enable Control Register 2

Base address: POE3 = 0x9000_5000

Offset address: 0x0C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	MTU3 BDZE	MTU4 ACZE	MTU4 BDZE	—	—	—	—	—	MTU6 BDZE	MTU7 ACZE	MTU7 BDZE
Value after reset:	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1

Bit	Symbol	Function	R/W
0	MTU7BDZE	MTIOC7B/MTIOC7D High-Impedance Enable 0: Does not place the pins in high-impedance state 1: Places the pins in high-impedance state	R/W*1
1	MTU7ACZE	MTIOC7A/MTIOC7C High-Impedance Enable 0: Does not place the pins in high-impedance state 1: Places the pins in high-impedance state	R/W*1
2	MTU6BDZE	MTIOC6B/MTIOC6D High-Impedance Enable 0: Does not place the pins in high-impedance state 1: Places the pins in high-impedance state	R/W*1
7:3	—	These bits are read as 0. The write value should be 0.	R/W
8	MTU4BDZE	MTIOC4B/MTIOC4D High-Impedance Enable 0: Does not place the pins in high-impedance state 1: Places the pins in high-impedance state	R/W*1
9	MTU4ACZE	MTIOC4A/MTIOC4C High-Impedance Enable 0: Does not place the pins in high-impedance state 1: Places the pins in high-impedance state	R/W*1
10	MTU3BDZE	MTIOC3B/MTIOC3D High-Impedance Enable 0: Does not place the pins in high-impedance state 1: Places the pins in high-impedance state	R/W*1
15:11	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

The POECR2 register controls high-impedance state of the MTU complementary PWM output pins (MTU3, MTU4, MTU6, and MTU7 pins).

MTU7BDZE bit (MTIOC7B/MTIOC7D High-Impedance Enable)

This bit specifies whether to place the MTIOC7B output and MTIOC7D output for the MTU7 pin in the high-impedance state when any one of the OCSR2.OSF2 flag, ICSR2.POE4F flag, SPOER.MTUCH67HIZ bit, ICSR6.OSTSTF flag (when the OSTSTE bit is 1), or, as additionally specified in the POECR4 register, the ICSRn.POEmF flag (n = 1, 3 to 5; m = 0, 8, 10, 11), ICSR7.DmERRnST (m = 0, 1; n = 0, 1), is set to 1.

MTU7ACZE bit (MTIOC7A/MTIOC7C High-Impedance Enable)

This bit specifies whether to place the MTIOC7A output and MTIOC7C output for the MTU7 pin in the high-impedance state when any one of the OCSR2.OSF2 flag, ICSR2.POE4F flag, SPOER.MTUCH67HIZ bit, ICSR6.OSTSTF flag (when the OSTSTE bit is 1), or, as additionally specified in the POECR4 register, the ICSRn.POEmF flag (n = 1, 3 to 5; m = 0, 8, 10, 11), ICSR7.DmERRnST (m = 0, 1; n = 0, 1), is set to 1.

MTU6BDZE bit (MTIOC6B/MTIOC6D High-Impedance Enable)

This bit specifies whether to place the MTIOC6B output and MTIOC6D output for the MTU6 pin in the high-impedance state when any one of the OCSR2.OSF2 flag, ICSR2.POE4F flag, SPOER.MTUCH67HIZ bit, ICSR6.OSTSTF flag (when the OSTSTE bit is 1), or, as additionally specified in the POECR4 register, the ICSRn.POEmF flag (n = 1, 3 to 5; m = 0, 8, 10, 11), ICSR7.DmERRnST (m = 0, 1; n = 0, 1), is set to 1.

MTU4BDZE bit (MTIOC4B/MTIOC4D High-Impedance Enable)

This bit specifies whether to place the MTIOC4B output and MTIOC4D output for the MTU4 pin in the high-impedance state when any one of the OCSR1.OSF1 flag, ICSR1.POE0F flag, SPOER.MTUCH34HIZ bit, ICSR6.OSTSTF flag (when the OSTSTE bit is 1), or, as additionally specified in the POECR4 register, the ICSRn.POEmF flag (n = 2 to 5; m = 4, 8, 10, 11), ICSR7.DmERRnST (m = 0, 1; n = 0, 1), is set to 1.

MTU4ACZE bit (MTIOC4A/MTIOC4C High-Impedance Enable)

This bit specifies whether to place the MTIOC4A output and MTIOC4C output for the MTU4 pin in the high-impedance state when any one of the OCSR1.OSF1 flag, ICSR1.POE0F flag, SPOER.MTUCH34HIZ bit, ICSR6.OSTSTF flag (when the OSTSTE bit is 1), or, as additionally specified in the POECR4 register, the ICSRn.POEmF flag (n = 2 to 5; m = 4, 8, 10, 11), ICSR7.DmERRnST (m = 0, 1; n = 0, 1), is set to 1.

MTU3BDZE bit (MTIOC3B/MTIOC3D High-Impedance Enable)

This bit specifies whether to place the MTIOC3B output and MTIOC3D output for the MTU3 pin in the high-impedance state when any one of the OCSR1.OSF1 flag, ICSR1.POE0F flag, SPOER.MTUCH34HIZ bit, ICSR6.OSTSTF flag (when the OSTSTE bit is 1), or, as additionally specified in the POECR4 register, the ICSRn.POEmF flag (n = 2 to 5; m = 4, 8, 10, 11), ICSR7.DmERRnST (m = 0, 1; n = 0, 1), is set to 1.

18.2.14 POECR4 : Port Output Enable Control Register 4

Base address: POE3 = 0x9000_5000

Offset address: 0x10

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

12	IC4ADDMT67ZE	MTU6 and MTU7 High-Impedance POE10F Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
13	IC5ADDMT67ZE	MTU6 and MTU7 High-Impedance POE11F Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
14	D0E0ADDMT67ZE	MTU6 and MTU7 High-Impedance D0ERR0ST Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
15	D1E0ADDMT67ZE	MTU6 and MTU7 High-Impedance D1ERR0ST Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

The POECR4 register is used to extend the control conditions of the high-impedance state for the MTU complementary PWM output pins (MTU3, MTU4, MTU6, and MTU7).

For details about the targets and conditions of high-impedance control, see Figure 18.2.

D0E1ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D0ERR1ST Add)

Adds the ICSR7.D0ERR1ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D1E1ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D1ERR1ST Add)

Adds the ICSR7.D1ERR1ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

IC2ADDMT34ZE bit (MTU3 and MTU4 High-Impedance POE4F Add)

Adds the ICSR2.POE4F flag (POE4#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

IC3ADDMT34ZE bit (MTU3 and MTU4 High-Impedance POE8F Add)

Adds the ICSR3.POE8F flag (POE8#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

IC4ADDMT34ZE bit (MTU3 and MTU4 High-Impedance POE10F Add)

Adds the ICSR4.POE10F flag (POE10#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

IC5ADDMT34ZE bit (MTU3 and MTU4 High-Impedance POE11F Add)

Adds the ICSR5.POE11F flag (POE11#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D0E0ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D0ERR0ST Add)

Adds the ICSR7.D0ERR0ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D1E0ADDMT34ZE bit (MTU3 and MTU4 High-Impedance D1ERR0ST Add)

Adds the ICSR7.D1ERR0ST to the high-impedance control conditions for MTU3 and MTU4 pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D).

D0E1ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D0ERR1ST Add)

Adds the ICSR7.D0ERR1ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

IC1ADDMT67ZE bit (MTU6 and MTU7 High-Impedance POE0F Add)

Adds the ICSR1.POE0F flag (POE0#) to the high-impedance control conditions for the MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D1E1ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D1ERR1ST Add)

Adds the ICSR7.D1ERR1ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

IC3ADDMT67ZE bit (MTU6 and MTU7 High-Impedance POE8F Add)

Adds the ICSR3.POE8F flag (POE8#) to the high-impedance control conditions for the MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

IC4ADDMT67ZE bit (MTU6 and MTU7 High-Impedance POE10F Add)

Adds the ICSR4.POE10F flag (POE10#) to the high-impedance control conditions for the MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

IC5ADDMT67ZE bit (MTU6 and MTU7 High-Impedance POE11F Add)

Adds the ICSR5.POE11F flag (POE11#) to the high-impedance control conditions for the MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D0E0ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D0ERR0ST Add)

Adds the ICSR7.D0ERR0ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

D1E0ADDMT67ZE bit (MTU6 and MTU7 High-Impedance D1ERR0ST Add)

Adds the ICSR7.D1ERR0ST to the high-impedance control conditions for MTU6 and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, MTIOC7D).

18.2.15 POECR5 : Port Output Enable Control Register 5

Base address: POE3 = 0x9000_5000

Offset address: 0x12

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	D1E0ADDMT0ZE	D0E0ADDMT0ZE	IC5ADDMT0ZE	IC4ADDMT0ZE	D1E1ADDMT0ZE	IC2ADDMT0ZE	IC1ADDMT0ZE	D0E1ADDMT0ZE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	D0E1ADDMT0ZE	MTU0 High-Impedance D0ERR1ST Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
1	IC1ADDMT0ZE	MTU0 High-Impedance POE0F Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
2	IC2ADDMT0ZE	MTU0 High-Impedance POE4F Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
3	D1E1ADDMT0ZE	MTU0 High-Impedance D1ERR1ST Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
4	IC4ADDMT0ZE	MTU0 High-Impedance POE10F Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
5	IC5ADDMT0ZE	MTU0 High-Impedance POE11F Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
6	D0E0ADDMT0ZE	MTU0 High-Impedance D0ERR0ST Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
7	D1E0ADDMT0ZE	MTU0 High-Impedance D1ERR0ST Add 0: Does not add the flag to the high-impedance control conditions 1: Adds the flag to the high-impedance control conditions	R/W*1
15:8	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

The POECR5 register is used to extend the control conditions to place the output of the MTU0 pins in the high-impedance state.

D0E1ADDMT0ZE bit (MTU0 High-Impedance D0ERR1ST Add)

Adds the ICSR7.D0ERR1ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

IC1ADDMT0ZE bit (MTU0 High-Impedance POE0F Add)

Adds the ICSR1.POE0F flag (POE0#) to the high-impedance control conditions for the MTU0 pin (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

IC2ADDMT0ZE bit (MTU0 High-Impedance POE4F Add)

Adds the ICSR2.POE4F flag (POE4#) to the high-impedance control conditions for the MTU0 pin (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

D1E1ADDMT0ZE bit (MTU0 High-Impedance D1ERR1ST Add)

Adds the ICSR7.D1ERR1ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

IC4ADDMT0ZE bit (MTU0 High-Impedance POE10F Add)

Adds the ICSR4.POE10F flag (POE10#) to the high-impedance control conditions for the MTU0 pin (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

IC5ADDMT0ZE bit (MTU0 High-Impedance POE11F Add)

Adds the ICSR5.POE11F flag (POE11#) to the high-impedance control conditions for the MTU0 pin (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

D0E0ADDMT0ZE bit (MTU0 High-Impedance D0ERR0ST Add)

Adds the ICSR7.D0ERR0ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

D1E0ADDMT0ZE bit (MTU0 High-Impedance D1ERR0ST Add)

Adds the ICSR7.D1ERR0ST to the high-impedance control conditions for MTU0 pins (MTIOC0A, MTIOC0C, MTIOC0B, MTIOC0D).

18.2.16 M0SELR1 : MTU0 Pin Select Register 1

Base address: POE3 = 0x9000_5000

Offset address: 0x24

Bit position:	7	6	5	4	3	2	1	0
Bit field:	M0BSEL[3:0]				M0ASEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	M0ASEL[3:0]	MTU0-A (MTIOC0A) Pin Select 0x0: Controls the high-impedance state of P13_2 when it is in use as the MTIOC0A pin 0x1: Controls the high-impedance state of P14_3 when it is in use as the MTIOC0A pin 0x2: Controls the high-impedance state of P23_7 when it is in use as the MTIOC0A pin Others: Setting prohibited.	R/W*1
7:4	M0BSEL[3:0]	MTU0-B (MTIOC0B) Pin Select 0x0: Setting prohibited. 0x1: Controls the high-impedance state of P14_4 when it is in use as the MTIOC0B pin 0x2: Controls the high-impedance state of P24_0 when it is in use as the MTIOC0B pin 0x3: Controls the high-impedance state of P13_3 when it is in use as the MTIOC0B pin Others: Setting prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

The M0SELR1 register is an 8-bit readable/writable register that selects the MTU0-A/B pins as targets for high-impedance control.

M0ASEL[3:0] bits (MTU0-A (MTIOC0A) Pin Select)

These bits select the target MTIOC0A pin for high-impedance control.

M0BSEL[3:0] bits (MTU0-B (MTIOC0B) Pin Select)

These bits select the target MTIOC0B pin for high-impedance control.

18.2.17 M0SELR2 : MTU0 Pin Select Register 2

Base address: POE3 = 0x9000_5000

Offset address: 0x25

Bit position:	7	6	5	4	3	2	1	0
Bit field:	M0DSEL[3:0]				M0CSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	M0CSEL[3:0]	MTU0-C (MTIOC0C) Pin Select 0x0: Controls the high-impedance state of P13_3 when it is in use as the MTIOC0C pin 0x1: Controls the high-impedance state of P15_1 when it is in use as the MTIOC0C pin 0x2: Controls the high-impedance state of P24_1 when it is in use as the MTIOC0C pin Others: Setting prohibited.	R/W*1
7:4	M0DSEL[3:0]	MTU0-D (MTIOC0D) Pin Select 0x0: Controls the high-impedance state of P13_4 when it is in use as the MTIOC0D pin 0x1: Controls the high-impedance state of P15_2 when it is in use as the MTIOC0D pin 0x2: Controls the high-impedance state of P24_2 when it is in use as the MTIOC0D pin Others: Setting prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

The M0SELR2 register is an 8-bit readable/writable register that selects the MTU0-C/D pins as targets for high-impedance control.

M0CSEL[3:0] bits (MTU0-C (MTIOC0C) Pin Select)

These bits select the target MTIOC0C pin for high-impedance control.

M0DSEL[3:0] bits (MTU0-D (MTIOC0D) Pin Select)

These bits select the target MTIOC0D pin for high-impedance control.

18.2.18 M3SELR : MTU3 Pin Select Register

Base address: POE3 = 0x9000_5000

Offset address: 0x26

Bit position:	7	6	5	4	3	2	1	0
Bit field:	M3DSEL[3:0]				M3BSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	M3BSEL[3:0]	MTU3-B (MTIOC3B) Pin Select 0x0: Controls the high-impedance state of P17_6 when it is in use as the MTIOC3B pin 0x1: Controls the high-impedance state of P00_6 when it is in use as the MTIOC3B pin 0x2: Controls the high-impedance state of P08_6 when it is in use as the MTIOC3B pin Others: Setting prohibited.	R/W*1
7:4	M3DSEL[3:0]	MTU3-D (MTIOC3D) Pin Select 0x0: Controls the high-impedance state of P18_1 when it is in use as the MTIOC3D pin 0x1: Controls the high-impedance state of P01_1 when it is in use as the MTIOC3D pin 0x2: Controls the high-impedance state of P08_7 when it is in use as the MTIOC3D pin Others: Setting prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

The M3SELR register is an 8-bit readable/writable register that selects the MTU3-B/D pins as targets for high-impedance control.

M3BSEL[3:0] bits (MTU3-B (MTIOC3B) Pin Select)

These bits select the target MTIOC3B pin for high-impedance control.

M3DSEL[3:0] bits (MTU3-D (MTIOC3D) Pin Select)

These bits select the target MTIOC3D pin for high-impedance control.

18.2.19 M4SELR1 : MTU4 Pin Select Register 1

Base address: POE3 = 0x9000_5000

Offset address: 0x27

Bit position:	7	6	5	4	3	2	1	0
Bit field:	M4CSEL[3:0]				M4ASEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	M4ASEL[3:0]	MTU4-A (MTIOC4A) Pin Select 0x0: Controls the high-impedance state of P17_7 when it is in use as the MTIOC4A pin 0x1: Controls the high-impedance state of P01_5 when it is in use as the MTIOC4A pin 0x2: Controls the high-impedance state of P09_0 when it is in use as the MTIOC4A pin 0x3: Controls the high-impedance state of P18_0 when it is in use as the MTIOC4A pin Others: Setting prohibited.	R/W*1
7:4	M4CSEL[3:0]	MTU4-C (MTIOC4C) Pin Select 0x0: Controls the high-impedance state of P18_0 when it is in use as the MTIOC4C pin 0x1: Controls the high-impedance state of P01_0 when it is in use as the MTIOC4C pin 0x2: Controls the high-impedance state of P09_1 when it is in use as the MTIOC4C pin 0x3: Controls the high-impedance state of P17_7 when it is in use as the MTIOC4C pin Others: Setting prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

The M4SELR1 register is an 8-bit readable/writable register that selects the MTU4-A/C pins as targets for high-impedance control.

M4ASEL[3:0] bits (MTU4-A (MTIOC4A) Pin Select)

These bits select the target MTIOC4A pin for high-impedance control.

M4CSEL[3:0] bits (MTU4-C (MTIOC4C) Pin Select)

These bits select the target MTIOC4C pin for high-impedance control.

18.2.20 M4SELR2 : MTU4 Pin Select Register 2

Base address: POE3 = 0x9000_5000

Offset address: 0x28

Bit position:	7	6	5	4	3	2	1	0
Bit field:	M4DSEL[3:0]				M4BSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	M4BSEL[3:0]	MTU4-B (MTIOC4B) Pin Select 0x0: Controls the high-impedance state of P18_2 when it is in use as the MTIOC4B pin 0x1: Controls the high-impedance state of P01_2 when it is in use as the MTIOC4B pin 0x2: Controls the high-impedance state of P09_2 when it is in use as the MTIOC4B pin 0x3: Controls the high-impedance state of P18_3 when it is in use as the MTIOC4B pin Others: Setting prohibited.	R/W*1

Bit	Symbol	Function	R/W
7:4	M4DSEL[3:0]	MTU4-D (MTIOC4D) Pin Select 0x0: Controls the high-impedance state of P18_3 when it is in use as the MTIOC4D pin 0x1: Controls the high-impedance state of P01_3 when it is in use as the MTIOC4D pin 0x2: Controls the high-impedance state of P09_3 when it is in use as the MTIOC4D pin 0x3: Controls the high-impedance state of P18_2 when it is in use as the MTIOC4D pin Others: Setting prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

The M4SELR2 register is an 8-bit readable/writable register that selects the MTU4-B/D pins as targets for high-impedance control.

M4BSEL[3:0] bits (MTU4-B (MTIOC4B) Pin Select)

These bits select the target MTIOC4B pin for high-impedance control.

M4DSEL[3:0] bits (MTU4-D (MTIOC4D) Pin Select)

These bits select the target MTIOC4D pin for high-impedance control.

18.2.21 M6SELR : MTU6 Pin Select Register

Base address: POE3 = 0x9000_5000

Offset address: 0x2A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	M6DSEL[3:0]				M6BSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	M6BSEL[3:0]	MTU6-B (MTIOC6B) Pin Select 0x0: Setting prohibited. 0x1: Controls the high-impedance state of P21_2 when it is in use as the MTIOC6B pin 0x2: Controls the high-impedance state of P08_5 when it is in use as the MTIOC6B pin Others: Setting prohibited.	R/W*1
7:4	M6DSEL[3:0]	MTU6-D (MTIOC6D) Pin Select 0x0: Setting prohibited. 0x1: Controls the high-impedance state of P21_4 when it is in use as the MTIOC6D pin 0x2: Controls the high-impedance state of P08_7 when it is in use as the MTIOC6D pin Others: Setting prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

The M6SELR register is an 8-bit readable/writable register that selects the MTU6-B/D pins as targets for high-impedance control.

M6BSEL[3:0] bits (MTU6-B (MTIOC6B) Pin Select)

These bits select the target MTIOC6B pin for high-impedance control.

M6DSEL[3:0] bits (MTU6-D (MTIOC6D) Pin Select)

These bits select the target MTIOC6D pin for high-impedance control.

18.2.22 M7SELR1 : MTU7 Pin Select Register 1

Base address: POE3 = 0x9000_5000

Offset address: 0x2B

Bit position:	7	6	5	4	3	2	1	0
Bit field:	M7CSEL[3:0]				M7ASEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	M7ASEL[3:0]	MTU7-A (MTIOC7A) Pin Select 0x0: Setting prohibited. 0x1: Controls the high-impedance state of P21_5 when it is in use as the MTIOC7A pin 0x2: Controls the high-impedance state of P09_0 when it is in use as the MTIOC7A pin Others: Setting prohibited.	R/W*1
7:4	M7CSEL[3:0]	MTU7-C (MTIOC7C) Pin Select 0x0: Setting prohibited. 0x1: Controls the high-impedance state of P21_7 when it is in use as the MTIOC7C pin 0x2: Controls the high-impedance state of P09_2 when it is in use as the MTIOC7C pin Others: Setting prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

The M7SELR1 register is an 8-bit readable/writable register that selects the MTU7-A/C pins as targets for high-impedance control.

M7ASEL[3:0] bits (MTU7-A (MTIOC7A) Pin Select)

The M7ASEL[3:0] bits select the target MTIOC7A pin for high-impedance control.

M7CSEL[3:0] bits (MTU7-C (MTIOC7C) Pin Select)

The M7CSEL[3:0] bits select the target MTIOC7C pin for high-impedance control.

18.2.23 M7SELR2 : MTU7 Pin Select Register 2

Base address: POE3 = 0x9000_5000

Offset address: 0x2C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	M7DSEL[3:0]				M7BSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	M7BSEL[3:0]	MTU7-B (MTIOC7B) Pin Select 0x0: Setting prohibited. 0x1: Controls the high-impedance state of P21_6 when it is in use as the MTIOC7B pin 0x2: Controls the high-impedance state of P09_1 when it is in use as the MTIOC7B pin Others: Setting prohibited.	R/W*1
7:4	M7DSEL[3:0]	MTU7-D (MTIOC7D) Pin Select 0x0: Setting prohibited. 0x1: Controls the high-impedance state of P22_0 when it is in use as the MTIOC7D pin 0x2: Controls the high-impedance state of P09_3 when it is in use as the MTIOC7D pin Others: Setting prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

The M7SELR2 register is an 8-bit readable/writable register that selects the MTU7-B/D pins as targets for high-impedance control.

M7BSEL[3:0] bits (MTU7-B (MTIOC7B) Pin Select)

The M7BSEL[3:0] bits select the target MTIOC7B pin for high-impedance control.

M7DSEL[3:0] bits (MTU7-D (MTIOC7D) Pin Select)

The M7DSEL[3:0] bits select the target MTIOC7D pin for high-impedance control.

18.3 Operation

Table 18.4 shows the target pins for high-impedance control and conditions to place the pins in high-impedance state.

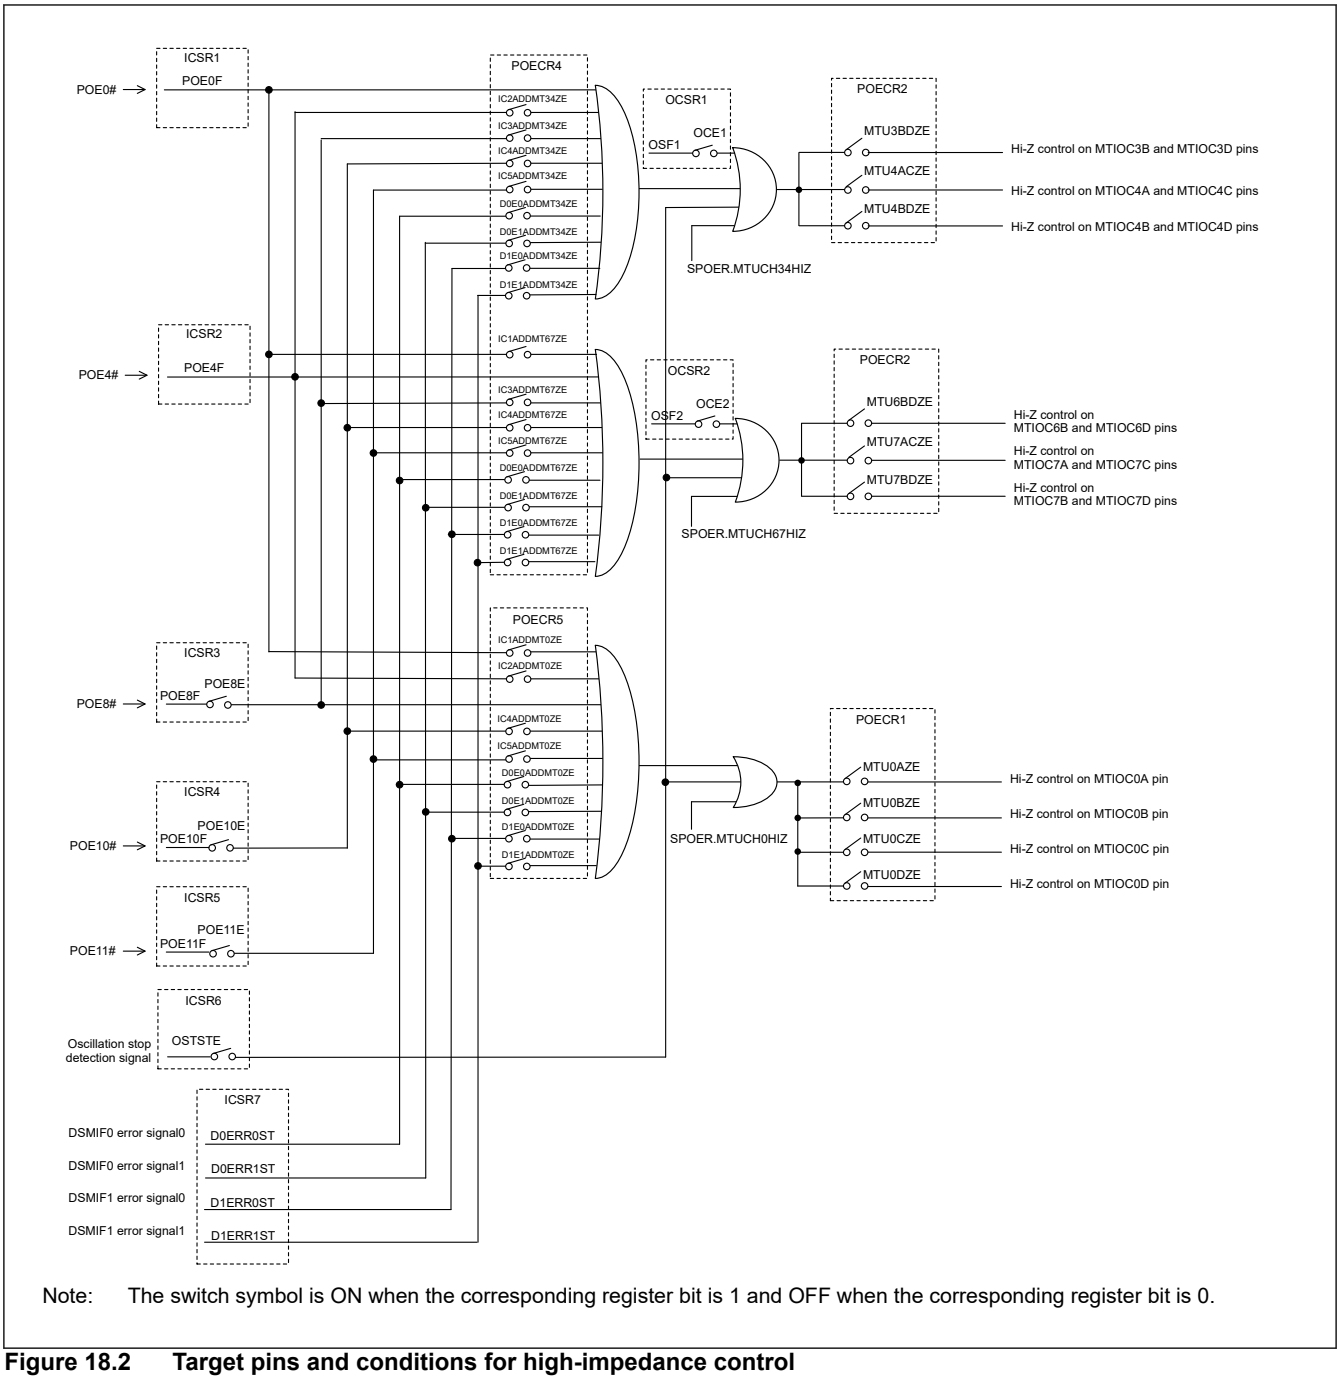

Table 18.4 Target pins and conditions for high-impedance control (1 of 2)

Pins	Conditions	Detailed conditions
MTU3 pins (MTIOC3B and MTIOC3D)	• Operation for detection of the POE0# input level • Operation for comparison of the output levels on the MTIOC3B and MTIOC3D pins • SPOER setting • Additional conditions of the POECR4 • Detection of stopped oscillation or oscillation abnormality • DSMIF error interrupt	MTU3BDZE • ((POE0F) + (OSF1 • OCE1) + (MTUCH34HIZ) + (IC2ADDMT34ZE • POE4F) + (IC3ADDMT34ZE • POE8E • POE8F) + (IC4ADDMT34ZE • POE10E • POE10F) + (IC5ADDMT34ZE • POE11E • POE11F) + (OSTSTE • OSTSTF) + (D0E1ADDMT34ZE•D0ERR1ST) + (D1E1ADDMT34ZE•D1ERR1ST) + (D0E0ADDMT34ZE•D0ERR0ST) + (D1E0ADDMT34ZE•D1ERR0ST))
MTU4 pins (MTIOC4A and MTIOC4C)	• Operation for detection of the POE0# input level • Operation for comparison of the output levels on the MTIOC4A and MTIOC4C pins • SPOER setting • Additional conditions of the POECR4 • Detection of stopped oscillation or oscillation abnormality • DSMIF error interrupt	MTU4ACZE • ((POE0F) + (OSF1 • OCE1) + (MTUCH34HIZ) + (IC2ADDMT34ZE • POE4F) + (IC3ADDMT34ZE • POE8E • POE8F) + (IC4ADDMT34ZE • POE10E • POE10F) + (IC5ADDMT34ZE • POE11E • POE11F) + (OSTSTE • OSTSTF) + (D0E1ADDMT34ZE•D0ERR1ST) + (D1E1ADDMT34ZE•D1ERR1ST) + (D0E0ADDMT34ZE•D0ERR0ST) + (D1E0ADDMT34ZE•D1ERR0ST))
MTU4 pins (MTIOC4B and MTIOC4D)	• Operation for detection of the POE0# input level • Operation for comparison of the output levels on the MTIOC4B and MTIOC4D pins • SPOER setting • Additional conditions of the POECR4 • Detection of stopped oscillation or oscillation abnormality • DSMIF error interrupt	MTU4BDZE • ((POE0F) + (OSF1 • OCE1) + (MTUCH34HIZ) + (IC2ADDMT34ZE • POE4F) + (IC3ADDMT34ZE • POE8E • POE8F) + (IC4ADDMT34ZE • POE10E • POE10F) + (IC5ADDMT34ZE • POE11E • POE11F) + (OSTSTE • OSTSTF) + (D0E1ADDMT34ZE•D0ERR1ST) + (D1E1ADDMT34ZE•D1ERR1ST) + (D0E0ADDMT34ZE•D0ERR0ST) + (D1E0ADDMT34ZE•D1ERR0ST))
MTU6 pins (MTIOC6B and MTIOC6D)	• Operation for detection of the POE4# input level • Operation for comparison of the output levels on the MTIOC6B and MTIOC6D pins • SPOER setting • Additional conditions of the POECR4 • Detection of stopped oscillation or oscillation abnormality • DSMIF error interrupt	MTU6BDZE • ((POE4F) + (OSF2 • OCE2) + (MTUCH67HIZ) + (IC1ADDMT67ZE • POE0F) + (IC3ADDMT67ZE • POE8E • POE8F) + (IC4ADDMT67ZE • POE10E • POE10F) + (IC5ADDMT67ZE • POE11E • POE11F) + (OSTSTE • OSTSTF) + (D0E1ADDMT67ZE•D0ERR1ST) + (D1E1ADDMT67ZE•D1ERR1ST) + (D0E0ADDMT67ZE•D0ERR0ST) + (D1E0ADDMT67ZE•D1ERR0ST))
MTU7 pins (MTIOC7A and MTIOC7C)	• Operation for detection of the POE4# input level • Operation for comparison of the output levels on the MTIOC7A and MTIOC7C pins • SPOER setting • Additional conditions of the POECR4 • Detection of stopped oscillation or oscillation abnormality • DSMIF error interrupt	MTU7ACZE • ((POE4F) + (OSF2 • OCE2) + (MTUCH67HIZ) + (IC1ADDMT67ZE • POE0F) + (IC3ADDMT67ZE • POE8E • POE8F) + (IC4ADDMT67ZE • POE10E • POE10F) + (IC5ADDMT67ZE • POE11E • POE11F) + (OSTSTE • OSTSTF) + (D0E1ADDMT67ZE•D0ERR1ST) + (D1E1ADDMT67ZE•D1ERR1ST) + (D0E0ADDMT67ZE•D0ERR0ST) + (D1E0ADDMT67ZE•D1ERR0ST))

Table 18.4 Target pins and conditions for high-impedance control (2 of 2)

Pins	Conditions	Detailed conditions
MTU7 pins (MTIOC7B and MTIOC7D)	• Operation for detection of the POE4# input level • Operation for comparison of the output levels on the MTIOC7B and MTIOC7D pins • SPOER setting • Additional conditions of the POECR4 • Detection of stopped oscillation or oscillation abnormality • DSMIF error interrupt	MTU7BDZE • ((POE4F) + (OSF2 • OCE2) + (MTUCH67HIZ) + (IC1ADDMT67ZE • POE4F) + (IC3ADDMT67ZE • POE8E • POE8F) + (IC4ADDMT67ZE • POE10E • POE10F) + (IC5ADDMT67ZE • POE11E • POE11F) + (OSTSTE • OSTSTF) + (D0E1ADDMT67ZE•D0ERR1ST) + (D1E1ADDMT67ZE•D1ERR1ST) + (D0E0ADDMT67ZE•D0ERR0ST) + (D1E0ADDMT67ZE•D1ERR0ST))
MTU0 pin (MTIOC0A)	• Operation for detection of the POE8# input level • SPOER setting • Additional conditions of the POECR5 • Detection of stopped oscillation or oscillation abnormality*1 • DSMIF error interrupt	MTU0AZE • ((POE8F • POE8E) + (MTUCH0HIZ) + (IC1ADDMT0ZE • POE0F) + (IC2ADDMT0ZE • POE4F) + (IC4ADDMT0ZE • POE10E • POE10F) + (IC5ADDMT0ZE • POE11E • POE11F) + (OSTSTE • OSTSTF) + (D0E1ADDMT0ZE•D0ERR1ST) + (D1E1ADDMT0ZE•D1ERR1ST) + (D0E0ADDMT0ZE•D0ERR0ST) + (D1E0ADDMT0ZE•D1ERR0ST))
MTU0 pin (MTIOC0B)	• Operation for detection of the POE8# input level • SPOER setting • Additional conditions of the POECR5 • Detection of stopped oscillation or oscillation abnormality*1 • DSMIF error interrupt	MTU0BZE • ((POE8F • POE8E) + (MTUCH0HIZ) + (IC1ADDMT0ZE • POE0F) + (IC2ADDMT0ZE • POE4F) + (IC4ADDMT0ZE • POE10E • POE10F) + (IC5ADDMT0ZE • POE11E • POE11F) + (OSTSTE • OSTSTF) + (D0E1ADDMT0ZE•D0ERR1ST) + (D1E1ADDMT0ZE•D1ERR1ST) + (D0E0ADDMT0ZE•D0ERR0ST) + (D1E0ADDMT0ZE•D1ERR0ST))
MTU0 pin (MTIOC0C)	• Operation for detection of the POE8# input level • SPOER setting • Additional conditions of the POECR5 • Detection of stopped oscillation or oscillation abnormality*1 • DSMIF error interrupt	MTU0CZE • ((POE8F • POE8E) + (MTUCH0HIZ) + (IC1ADDMT0ZE • POE0F) + (IC2ADDMT0ZE • POE4F) + (IC4ADDMT0ZE • POE10E • POE10F) + (IC5ADDMT0ZE • POE11E • POE11F) + (OSTSTE • OSTSTF) + (D0E1ADDMT0ZE•D0ERR1ST) + (D1E1ADDMT0ZE•D1ERR1ST) + (D0E0ADDMT0ZE•D0ERR0ST) + (D1E0ADDMT0ZE•D1ERR0ST))
MTU0 pin (MTIOC0D)	• Operation for detection of the POE8# input level • SPOER setting • Additional conditions of the POECR5 • Detection of stopped oscillation or oscillation abnormality*1 • DSMIF error interrupt	MTU0DZE • ((POE8F • POE8E) + (MTUCH0HIZ) + (IC1ADDMT0ZE • POE0F) + (IC2ADDMT0ZE • POE4F) + (IC4ADDMT0ZE • POE10E • POE10F) + (IC5ADDMT0ZE • POE11E • POE11F) + (OSTSTE • OSTSTF) + (D0E1ADDMT0ZE•D0ERR1ST) + (D1E1ADDMT0ZE•D1ERR1ST) + (D0E0ADDMT0ZE•D0ERR0ST) + (D1E0ADDMT0ZE•D1ERR0ST))

Note 1. The clock monitor circuit (CLMA3) can detect the oscillation abnormality.

Note: The switch symbol is ON when the corresponding register bit is 1 and OFF when the corresponding register bit is 0.

Figure 18.2 Target pins and conditions for high-impedance control

High-impedance requests to individual pins can be controlled by the settings in the POECR1 to POECR2 registers.

The following input pins can be added to high-impedance control conditions by the settings in the POECR4 to POECR5 registers:

- Input pins other than the POE0# pin for the MTU3 and MTU4 pins
- Input pins other than the POE4# pin for the MTU6 and MTU7 pins
- Input pins other than the POE8# pin for the MTU0 pins

For example, setting the IC2ADDMT34ZE bit in POECR4 to 1 outputs high-impedance requests to the MTU3 and MTU4 pins even when the POE4# input is detected.

High-impedance requests due to the detection of POE8# input, POE10# input, POE11# input, stopped oscillation, or oscillation abnormality can be controlled by the settings in the ICSR3 to ICSR6 registers. The ICSR1 and ICSR2 registers do not control enabling or disabling of output of high-impedance requests.

High-impedance requests to the MTU3, MTU4, MTU6, and MTU7 pins as the results of output level comparison can be controlled by the settings in the OCSR1 and OCSR2 registers.

18.3.1 MTU3 Pin Selection

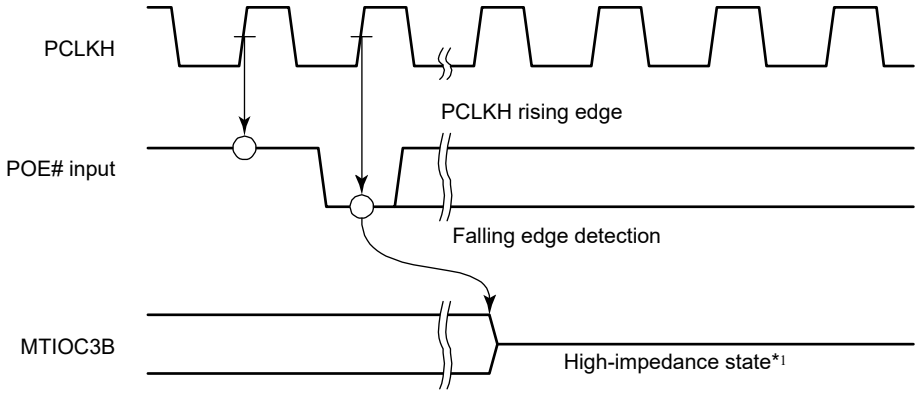
In RZ/T2, the pin functions for MTU are respectively assigned to multiple sets of port pins. The target pins for high-impedance control can be selected by the pin select register in POE3 (M0SELR1, M0SELR2, M3SELR, M4SELR1, M4SELR2, M6SELR, M7SELR1, or M7SELR7 register). Table 18.5 shows the correspondence between MTU pins and select registers.

Note: Settings for pins to be used as MTU must be separately made in the registers of the I/O Ports. Take care so that there are no differences between the pins selected in the POE3 registers and the pins selected in the I/O port registers. For details of I/O port registers, see section 16, I/O Ports.

Table 18.5 Correspondence between MTU

MTU pin functions	Corresponding ports	Select registers
MTIOC0A	P13_2, P14_3, P23_7	M0SELR1
MTIOC0B	P14_4, P24_0, P13_3	
MTIOC0C	P13_3, P15_1, P24_1	M0SELR2
MTIOC0D	P13_4, P15_2, P24_2	
MTIOC3B	P17_6, P00_6, P08_6	M3SELR
MTIOC3D	P18_1, P01_1, P08_7	
MTIOC4A	P17_7, P01_5, P09_0, P18_0	M4SELR1
MTIOC4C	P18_0, P01_0, P09_1, P17_7	
MTIOC4B	P18_2, P01_2, P09_2, P18_3	M4SELR2
MTIOC4D	P18_3, P01_3, P09_3, P18_2	
MTIOC6B	P21_2, P08_5	M6SELR
MTIOC6D	P21_4, P08_7	
MTIOC7A	P21_5, P09_0	M7SELR1
MTIOC7C	P21_7, P09_2	
MTIOC7B	P21_6, P09_1	M7SELR2
MTIOC7D	P22_0, P09_3	

18.3.2 Input-Level Detection Operation



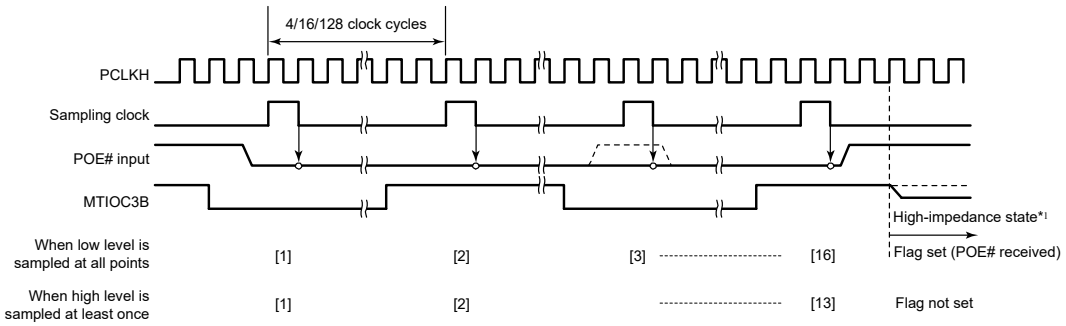
If the input conditions set by ICSR1 to ICSR5 occur on the POE0#, POE4#, POE8#, POE10#, and POE11# pins, the MTU3 and MTU4 pins for the MTU complementary PWM output, and MTU0 pins are placed in high-impedance state.

Note: These pins are still placed in the high-impedance state even when the MTU3 function is not selected for the pins on which they are multiplexed.

(1) Falling Edge Detection

When a change from a high to low level is input to the POE0#, POE4#, POE8#, POE10#, and POE11# pins, the pin functions which are multiplexed with the pins for the MTU complementary PWM output, and MTU0 pins are placed in high-impedance state.

Figure 18.3 shows a sample timing after the level changes in input to the POE0#, POE4#, POE8#, POE10#, and POE11# pins until the respective pins enter the high-impedance state.



Note 1. Other pins also enter the high-impedance state at the same timing.

Figure 18.3 Falling edge detection

(2) Low-Level Detection

Figure 18.4 shows the low-level detection operation. When the POE# input has been sampled 16 times at the clock pulses selected by ICSR1 to ICSR5 and all are low level, the request is accepted. If even one high level is detected during this interval, the request is not accepted.

The timing when pins for the MTU complementary PWM output, and MTU0 pins enter the high-impedance state after the sampling clock is input is the same in both falling-edge detection and in low-level detection.

Note 1. Other pins also enter the high-impedance state at the same timing.

Figure 18.4 Low-level detection operation

18.3.3 Output-Level Compare Operation

Figure 18.5 shows an example of the output-level compare operation for the combination of MTIOC3B and MTIOC3D. The operation is the same for the other pin combinations.

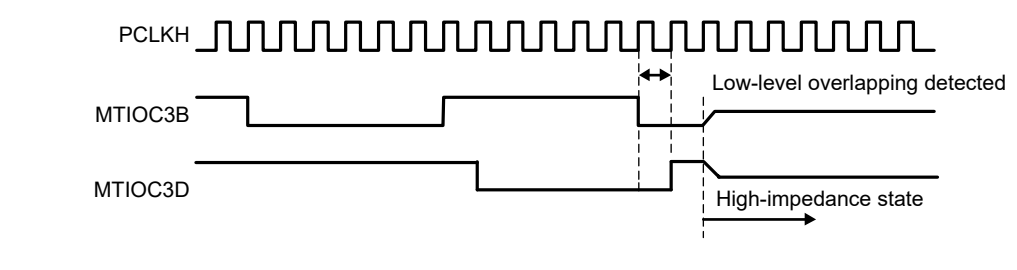


Figure 18.5 Output-level compare operation

18.3.4 High-Impedance Control Using Registers

The high-impedance state of the MTU pins (MTU0, MTU3, MTU4, MTU6, and MTU7) can be directly controlled by using the Software Port Output Enable Register (SPOER).

For instance, setting the MTUCH34HIZ bit in SPOER to 1 places the MTU3 and MTU4 pins specified by the Port Output Enable Control Register 2 (POECR2) in the high-impedance state.

The high-impedance state of other pins can also be controlled by setting the appropriate bits in SPOER.

18.3.5 High-Impedance Control through Detection of Stopped Oscillation and Oscillation Abnormality

When the oscillation-stop detection circuit in the clock pulse generator detects the stopped oscillation or the clock monitor circuit detects the oscillation abnormality for PLL0, PLL1, and main clock, with the OSTSTE bit in ICSR6 set, the MTU3 and MTU4 or MTU6 and MTU7 pins if specified in the Port Output Enable Control Register 2 (POECR2), the MTU0 pins if specified in the Port Output Enable Control Register 1 (POECR1) can be placed in the high-impedance state.

18.3.6 Additional Functions for High-Impedance Control

Settings in the Port Output Enable Control Registers 4 to 5 (POECR4 to POECR5) can add additional high-impedance control conditions for the MTU complementary PWM output, MTU0 pins.

For instance, the following settings can be added as high-impedance control conditions for the MTU3 and MTU4 pins:

- Setting the POECR4.IC2ADDMT34ZE bit to 1 adds the input-level detection by the POE4# pin
- Setting the POECR4.IC3ADDMT34ZE bit to 1 and adds the input-level detection by the POE8# pin
- Setting the POECR4.IC4ADDMT34ZE bit to 1 and adds the input-level detection by the POE10# pin
- Setting the POECR4.IC5ADDMT34ZE bit to 1 and adds the input-level detection by the POE11# pin

The high-impedance control of other pins can also be controlled by setting the appropriate bits in the POECR4 and POECR5 registers.

18.3.7 Recover from High-Impedance State

The outputs which have been in the high-impedance state due to input-level detection can be recovered from the state either by returning them to their initial state with a reset, or by clearing all of the ICSR1.POE0F, ICSR2.POE4F, ICSR3.POE8F, ICSR4.POE10F, and ICSR5.POE11F flags. However, when low-level sampling is selected with the ICSR1.POE0M[1:0], ICSR2.POE4M[1:0], ICSR3.POE8M[1:0], ICSR4.POE10M[1:0], and ICSR5.POE11M[1:0] bits, just writing 0 to a flag is ignored (the flag is not set to 0). Flag can be cleared by writing 0 to it only after a high level is input to the POE0#, POE4#, POE8#, POE10#, and POE11# pins and is detected.

The outputs which have been in the high-impedance state due to output-level detection can be recovered from the state either by returning them to their initial state with a reset, or by setting the OCSR1.OSF1 flag or the OCSR2.OSF2 flag to 0. However, just writing 0 to a flag is ignored (the flag is not set to 0). Flag can be cleared by writing 0 to it only after setting the inactive level to be output from the pin. In the MTU, the inactive level (initial output level) can be output by stopping the count operation.

The outputs which have been in the high-impedance state due to SPOER register setting can be recovered from the state either by returning them to their initial state with reset, or by setting the SPOER.MTUCH34HIZ bit, SPOER.MTUCH67HIZ bit or SPOER.MTUCH0HIZ bit to 0.

The outputs which have been in the high-impedance state due to oscillation stop detection for PLL0, PLL1, and main clock can be recovered from the state by returning them to their initial state with a reset.

The outputs which have been in the high-impedance state due to DSMIF error detection can be recovered from the state either by returning them to their initial state with reset, or by clearing DSMIF error status flags.

18.4 POE3 Setting Procedure

The procedure for setting POE3 is described in the section that follows. It shows an example of high-impedance control in response to comparison of the output levels on the MTU3 pins (MTIOC3B/MTIOC3D). In the procedure, P17_6 is selected as the MTIOC3B pin and P18_1 is selected as the MTIOC3D pin.

Set the MTU3 pins (P17_6 and P18_1) for the peripheral function by the PMCm and PFCm registers of the I/O Ports before making the following settings:

1. Set PMC17.PMC6 and PMC18.PMC1 bit to 1.
   Set the PMC17 and PMC18 registers of the I/O Ports to select P17_6 and P18_1 for the peripheral function pins.
2. Set PFC17.PFC6[3:0] bits to 0x0 and PFC18.PFC1[3:0] bits to 0x1.
   Set the PFC17 and PFC18 registers of the I/O Ports to select P17_6 for the MTIOC3B pin and P18_1 for the MTIOC3D pin.
3. Set the M3SELR.M3BSEL[3:0] bits to 0x0 and M3SELR.M3DSEL[3:0] bits to 0x0.
   Set the M3SELR register to control the high-impedance state of P17_6 for MTIOC3B and P18_1 for MTIOC3D.
4. Set the ALR1.OLSG0A and OLSG0B bits to 0 and the OLSEN bit to 1 to set MTIOC3B and MTIOC3D as active-low.
5. Set the POECR2.MTU3BDZE bit to 1 to enable high-impedance control on the MTIOC3B and MTIOC3D pins.
6. Specify the setting to operate MTU3.

After the above settings, if MTIOC3B (P17_6) and MTIOC3D (P18_1) are simultaneously at the low level, then the pins are placed in high-impedance state and the OCSR1.OSF1 bit is set.

For the method of releasing high-impedance, see section 18.3.7. Recover from High-Impedance State.

18.5 Interrupts

The POE3 issues a request to generate an interrupt when the specified condition is satisfied during input-level detection or output-level comparison. Table 18.6 shows the interrupt sources and their conditions.

Table 18.6 Interrupt sources and conditions

Name	Interrupt source	Interrupt flag	Condition
OEI1	Output enable interrupt 1	POE0F and OSF1	PIE1 • POE0F + OIE1 • OSF1
OEI2	Output enable interrupt 2	POE4F and OSF2	PIE2 • POE4F + OIE2 • OSF2
OEI3	Output enable interrupt 3	POE8F	PIE3 • POE8F
OEI4	Output enable interrupt 4	POE10F, POE11F, D0ERR0ST, D1ERR0ST, D0ERR1ST, and D1ERR1ST	PIE4 • POE10F + PIE5 • POE11F + D0ERR0IE • D0ERR0ST + D1ERR0IE • D1ERR0ST + D0ERR1IE • D0ERR1ST + D1ERR1IE • D1ERR1ST

18.6 Usage Notes

18.6.1 High-Impedance Control when the MTU is not Selected

If high-impedance control for a pin having a multiplexed MTU pin function on a register POECR1 to POECR2 is enabled and the high-impedance condition is satisfied, the pin is placed in the high-impedance state even if the MTU function is not selected for the pin on which it is multiplexed.

To avoid unintended high-impedance states, ensure that there are no differences between the settings for MTU pin selection in the PMCm and PFCm registers of the I/O Ports and for MTU pin selection in the pin select register of the POE.

19. General PWM Timer (GPT)

19.1 Overview

The LSI has a General PWM Timer (GPT) that is a 32-bit timer with 18 channels. These 18 channels are divided into three groups (LLPP, NONSAFETY, and SAFETY). Also, each group is independent of each other. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. The GPT can also be used as a general-purpose timer.

Table 19.1 lists the specifications for the GPT and Figure 19.1 shows a block diagram of the GPT. Table 19.2 lists the I/O pins and Table 19.3 lists the GPT interrupt sources.

Table 19.1 GPT specifications

Parameter	Description
Number of channels	• 18 channels • 7 channels in LLPP (GPT0 to GPT6) • 7 channels in NONSAFETY (GPT7 to GPT13) • 4 channels in SAFTY (GPT14 to GPT17)
Functions	• 32 bits • Up-counting or down-counting (saw waves) or up/down-counting (triangle waves) for each counter • Clock sources independently selectable for each channel • 2 I/O pins per channel • 2 output compare/input capture registers per channel • For the two output compare/input capture registers of each channel, four registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use • In output compare operation, buffer switching can be at crests or troughs, enabling the generation of laterally asymmetric PWM waveforms • Registers for setting up frame cycles in each channel with capability for generating interrupts at overflow or underflow • Generation of dead times in PWM operation • Count direction switching is available in the triangle-wave PWM modes • Synchronous starting, stopping, clearing, and switching counters for arbitrary channels within group (LLPP, NONSAFETY, SAFETY) • Starting, stopping, clearing, switching, and capturing up/down counters in response to a maximum of eight ELC events for channels in LLPP and NONSAFETY • Starting, stopping, and clearing up/down counters in response to input level comparison • Starting, stopping, clearing, switching, and capturing up/down counters in response to a maximum of four external triggers • Output pin disable function by dead time error and detected short circuits between output pins • A/D converter start trigger can be generated • Compare match A to F event and overflow/underflow event can be output to the ELC for channels in LLPP and NONSAFETY • Enables the noise filter for input capture • Bus clock: PCLKH in LLPP, PCLKM in NONSAFETY, and PCLKM in SAFETY • Core clock: PCLKGPTL in LLPP, PCLKM in NONSAFETY, and PCLKM in SAFETY
Prescaler	• 9 dividing clocks are output • Selectable from any of core clock, core clock/2, core clock/4, core clock/8, core clock/16, core clock/32, core clock/64, core clock/256, core clock/1024
Interrupts	9 sources: • GTCCRA compare match/input capture (GPTn_CCMPA) • GTCCRB compare match/input capture (GPTn_CCMPB) • GTCCRC compare match (GPTn_CMPC) • GTCCRD compare match (GPTn_CMPD) • GTCCRE compare match (GPTn_CMPE) • GTCCRF compare match (GPTn_CMPF) • GTADTRA compare match (GPTn_ADTRGA) → only ELC for channels in LLPP and NONSAFETY • GTADTRB compare match (GPTn_ADTRGB) → only ELC for channels in LLPP and NONSAFETY • GTCNT overflow (GTPR compare match) (GPTn_OVF) • GTCNT underflow (GPTn_UDF) • Dead time error (GPTn_DTE) → only for channels in LLPP and NONSAFETY
Module-stop function	Module-stop state can be set to reduce power consumption

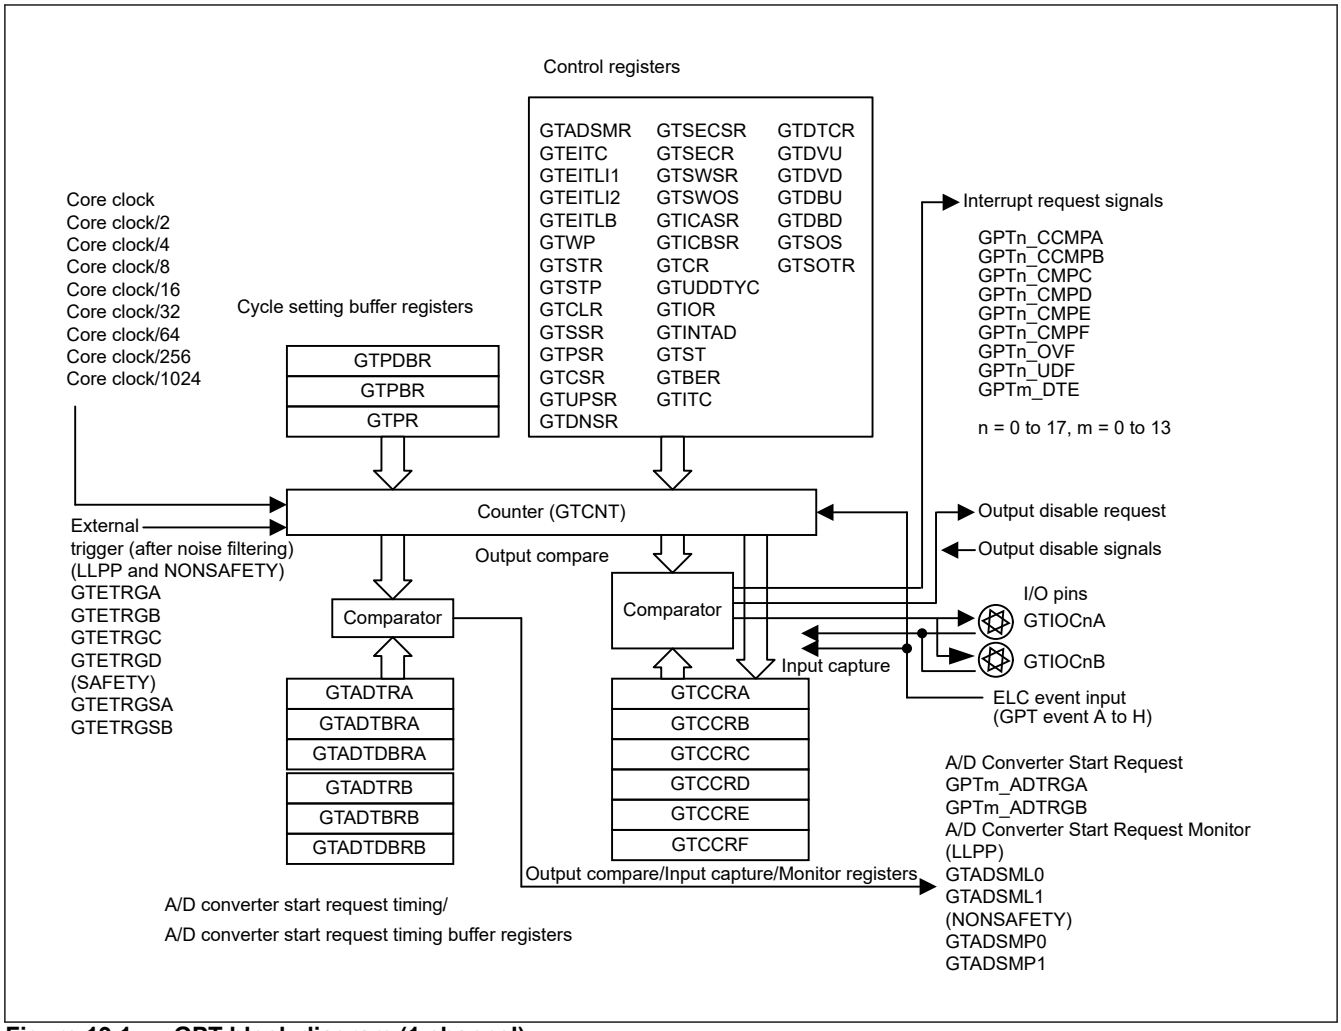

Figure 19.1 GPT block diagram (1 channel)

Table 19.2 GPT I/O pins (1 of 3)

Channel	Pin name	I/O	Function
Shared (LLPP and NONSAFETY)	GTETRGA	Input	External trigger input pin A (after noise filtering) for channels in LLPP and NONSAFETY
	GTETRGB	Input	External trigger input pin B (after noise filtering) for channels in LLPP and NONSAFETY
	GTETRGC	Input	External trigger input pin C (after noise filtering) for channels in LLPP and NONSAFETY
	GTETRGD	Input	External trigger input pin D (after noise filtering) for channels in LLPP and NONSAFETY
Shared (SAFETY)	GTETRGSA	Input	External trigger input pin A (after noise filtering) for channels in SAFETY
	GTETRGSB	Input	External trigger input pin B (after noise filtering) for channels in SAFETY
Shared (LLPP)	GTADSML0	Output	A/D conversion start request monitor 0 output pin for channels in LLPP
	GTADSML1	Output	A/D conversion start request monitor 1 output pin for channels in LLPP
Shared (NONSAFETY)	GTADSMP0	Output	A/D conversion start request monitor 0 output pin for channels in NONSAFETY
	GTADSMP1	Output	A/D conversion start request monitor 1 output pin for channels in NONSAFETY

Table 19.2 GPT I/O pins (2 of 3)

Channel	Pin name	I/O	Function
GPT0 (LLPP)	GTIOC0A	I/O	GPT0 GTCCRA register input capture input/output compare output/PWM output pin
	GTIOC0B	I/O	GPT0 GTCCRB register input capture input/output compare output/PWM output pin
GPT1 (LLPP)	GTIOC1A	I/O	GPT1 GTCCRA register input capture input/output compare output/PWM output pin
	GTIOC1B	I/O	GPT1 GTCCRB register input capture input/output compare output/PWM output pin
GPT2 (LLPP)	GTIOC2A	I/O	GPT2 GTCCRA register input capture input/output compare output/PWM output pin
	GTIOC2B	I/O	GPT2 GTCCRB register input capture input/output compare output/PWM output pin
GPT3 (LLPP)	GTIOC3A	I/O	GPT3 GTCCRA register input capture input/output compare output/PWM output pin
	GTIOC3B	I/O	GPT3 GTCCRB register input capture input/output compare output/PWM output pin
GPT4 (LLPP)	GTIOC4A	I/O	GPT4 GTCCRA register input capture input/output compare output/PWM output pin
	GTIOC4B	I/O	GPT4 GTCCRB register input capture input/output compare output/PWM output pin
GPT5 (LLPP)	GTIOC5A	I/O	GPT5 GTCCRA register input capture input/output compare output/PWM output pin
	GTIOC5B	I/O	GPT5 GTCCRB register input capture input/output compare output/PWM output pin
GPT6 (LLPP)	GTIOC6A	I/O	GPT6 GTCCRA register input capture input/output compare output/PWM output pin
	GTIOC6B	I/O	GPT6 GTCCRB register input capture input/output compare output/PWM output pin
GPT7 (NONSAFETY)	GTIOC7A	I/O	GPT7 GTCCRA register input capture input/output compare output/PWM output pin

GPT17 (SAFETY)	GTIOC17A	I/O	GPT17 GTCCRA register input capture input/output compare output/PWM output pin
	GTIOC17B	I/O	GPT17 GTCCRB register input capture input/output compare output/PWM output pin

Note: External triggers are available through POEG.

Table 19.3 GPT interrupt sources

Name	Interrupt sources	CPU0 GIC request	DMAC activation
GPTn_CCMPA	GTCCRA input capture / compare match	Possible	Possible for n = 0 to 13 Not Possible for n = 14 to 17
GPTn_CCMPB	GTCCRB input capture / compare match	Possible	Possible for n = 0 to 13 Not Possible for n = 14 to 17
GPTn_CMPC	GTCCRC compare match	Possible	Possible for n = 0 to 13 Not Possible for n = 14 to 17
GPTn_CMPD	GTCCRD compare match	Possible	Possible for n = 0 to 13 Not Possible for n = 14 to 17
GPTn_CMPE	GTCCRE compare match	Possible	Possible for n = 0 to 13 Not Possible for n = 14 to 17
GPTn_CMPF	GTCCRF compare match	Possible	Possible for n = 0 to 13 Not Possible for n = 14 to 17
GPTn_OVF	GTCNT overflow (GTPR compare match)	Possible	Possible for n = 0 to 13 Not Possible for n = 14 to 17
GPTn_UDF	GTCNT underflow	Possible	Possible for n = 0 to 13 Not Possible for n = 14 to 17
GPTm_DTE	Dead time error	Possible	Not possible
GPTm_ADTRGA*1	GTADTRA compare match (A/D Converter Start Request A)	Not possible	Not possible
GPTm_ADTRGB*1	GTADTRB compare match (A/D Converter Start Request B)	Not possible	Not possible

Note: n = 0 to 17, m = 0 to 13.
Note 1. A/D converter start requests are only used for ELC.

19.2 Register Descriptions

19.2.1 GTWP : General PWM Timer Write-Protection Register

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PRKEY[7:0]								—	—	—	CMNWP	CLRWP	STPWP	STRWP	WP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	WP	Register Write Disabled 0: Write to the register is enabled 1: Write to the register is disabled	R/W
1	STRWP	GTSTR.CSTRT Bit Write Disabled 0: Write to the bit is enabled 1: Write to the bit is disabled	R/W
2	STPWP	GTSTP.CSTOP Bit Write Disabled 0: Write to the bit is enabled 1: Write to the bit is disabled	R/W
3	CLRWP	GTCLR.CCLR Bit Write Disabled 0: Write to the bit is enabled 1: Write to the bit is disabled	R/W
4	CMNWP	Common Register Write Disabled 0: Write to the register is enabled 1: Write to the register is disabled	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
15:8	PRKEY[7:0]	GTWP Key Code To modify the WP, STRWP, STPWP, CLRWP, and CMNWP bits, write 0xA5.	W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

For detail, see section 19.8.1. Write-Protection for Registers.

19.2.2 GTSTR : General PWM Timer Software Start Register

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	CSTRT6	CSTRT5	CSTRT4	CSTRT3	CSTRT2	CSTRT1	CSTRT0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CSTRT0	Channel 0 Count Start 0: (Reading) The counter is stopped (Writing) No effect 1: (Reading) The counter is running (Writing) The counter starts running	R/W
1	CSTRT1	Channel 1 Count Start 0: (Reading) The counter is stopped (Writing) No effect 1: (Reading) The counter is running (Writing) The counter starts running	R/W
2	CSTRT2	Channel 2 Count Start 0: (Reading) The counter is stopped (Writing) No effect 1: (Reading) The counter is running (Writing) The counter starts running	R/W
3	CSTRT3	Channel 3 Count Start 0: (Reading) The counter is stopped (Writing) No effect 1: (Reading) The counter is running (Writing) The counter starts running	R/W
4	CSTRT4	Channel 4 Count Start 0: (Reading) The counter is stopped (Writing) No effect 1: (Reading) The counter is running (Writing) The counter starts running	R/W
5	CSTRT5	Channel 5 Count Start 0: (Reading) The counter is stopped (Writing) No effect 1: (Reading) The counter is running (Writing) The counter starts running	R/W
6	CSTRT6	Channel 6 Count Start 0: (Reading) The counter is stopped (Writing) No effect 1: (Reading) The counter is running (Writing) The counter starts running	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

The GTSTR register starts the GTCNT counter operation of each channel in the same domain group.

General PWM Timers are grouped by each of the following domains:

- LLPP
- NONSAFETY
- SAFETY

Bit 0 to bit 6 bits are available for the GTSTR register of LLPP and NONSAFETY domain group, and bit 0 to bit 3 are available for the GTSTR register of SAFTY domain group.

A bit position of the GTSTR register indicates a channel number assigned from 0th for each domain group. For example GPT7 is assigned bit 0 in the GTSTR register of NONSAFETY domain. The GTSTR register of each channel is a common register, and writing 1 to the GTSTR register in any channel and updating it can start operation of the GTCNT counter in all the channels related to the position of the bit written with 1. A change in counter operation and the register value is not generated by writing 0 to the bit.

19.2.3 GTSTP : General PWM Timer Software Stop Register

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

Offset address: 0x08

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	CSTOP6	CSTOP5	CSTOP4	CSTOP3	CSTOP2	CSTOP1	CSTOP0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	CSTOP0	Channel 0 Count Stop 0: (Reading) The counter is operating (Writing) No effect 1: (Reading) The counter is stopped (Writing) The counter is stopped	R/W
1	CSTOP1	Channel 1 Count Stop 0: (Reading) The counter is operating (Writing) No effect 1: (Reading) The counter is stopped (Writing) The counter is stopped	R/W
2	CSTOP2	Channel 2 Count Stop 0: (Reading) The counter is operating (Writing) No effect 1: (Reading) The counter is stopped (Writing) The counter is stopped	R/W
3	CSTOP3	Channel 3 Count Stop 0: (Reading) The counter is operating (Writing) No effect 1: (Reading) The counter is stopped (Writing) The counter is stopped	R/W
4	CSTOP4	Channel 4 Count Stop 0: (Reading) The counter is operating (Writing) No effect 1: (Reading) The counter is stopped (Writing) The counter is stopped	R/W
5	CSTOP5	Channel 5 Count Stop 0: (Reading) The counter is operating (Writing) No effect 1: (Reading) The counter is stopped (Writing) The counter is stopped	R/W
6	CSTOP6	Channel 6 Count Stop 0: (Reading) The counter is operating (Writing) No effect 1: (Reading) The counter is stopped (Writing) The counter is stopped	R/W
31:7	—	These bits are read as 1. The write value should be 1.	R/W

The GTSTP register stops the GTCNT counter operation of each channel in the same domain group.

General PWM Timers are grouped by each of the following domains:

- LLPP
- NONSAFETY

- SAFETY

Bit 0 to bit 6 are available for the GTSTP register of LLPP and NONSAFETY domain group, and bit 0 to bit 3 are available for the GTSTP register of SAFTY domain group.

A bit position of the GTSTP register indicates a channel number assigned from 0th for each domain group. For example GPT7 is assigned bit 0 in the GTSTP register of NONSAFETY domain. The GTSTP register of each channel is a common register, and writing 1 to the GTSTP register in any channel and updating it can stop operation of the GTCNT counter in all the channels related to the position of the bit written with 1. A change in counter operation and the register value is not generated by writing 0 to the bit.

19.2.4 GTCLR : General PWM Timer Software Clear Register

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

Offset address: 0x0C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	CCLR6	CCLR5	CCLR4	CCLR3	CCLR2	CCLR1	CCLR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CCLR0	Channel 0 Count Clear 0: The counter is not cleared 1: The counter is cleared	W
1	CCLR1	Channel 1 Count Clear 0: The counter is not cleared 1: The counter is cleared	W
2	CCLR2	Channel 2 Count Clear 0: The counter is not cleared 1: The counter is cleared	W
3	CCLR3	Channel 3 Count Clear 0: The counter is not cleared 1: The counter is cleared	W
4	CCLR4	Channel 4 Count Clear 0: The counter is not cleared 1: The counter is cleared	W
5	CCLR5	Channel 5 Count Clear 0: The counter is not cleared 1: The counter is cleared	W
6	CCLR6	Channel 6 Count Clear 0: The counter is not cleared 1: The counter is cleared	W
31:7	—	The write value should be 0.	W

The GTCLR register is a write-only register that sets the clearing of the GTCNT counter of each channel in the same domain group. A bit position of the GTCLR register indicates a channel number assigned from 0th for each domain group. For example GPT7 is assigned bit 0 in the GTCLR register of NONSAFETY domain. The GTCLR register of each channel is a common register, and writing 1 to the GTCLR register in any channel and updating it can clear the GTCNT counter in all the channels related to the position of the bit written with 1. A change in counter operation and the register value is not generated by writing 0 to the bit.

General PWM Timers are grouped by each domain, LLPP, NONSAFETY and SAFETY. Bit 0 to bit 6 are available for the GTCLR register of LLPP and NONSAFETY domain group, and bit 0 to bit 3 are available for the GTCLR register of SAFTY domain group.

19.2.5 GTSSR : General PWM Timer Start Source Select Register

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

Offset address: 0x10

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	CSTRT	—	—	—	—	—	—	—	SSELCH	SSELCG	SSELCF	SSELCE	SSELCD	SSELCC	SSELCB	SSELCA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 19.4 Settings of GTIOA[4:0] bits, GTIOB[4:0] bits

GTIOA/GTIOB bits					Function		
[4]	[3]	[2]	[1]	[0]	bit [4]	bits [3:2]	bits [1:0]
0	0	0	0	0	Initial output is low	Output retained at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
0	0	0	0	1			Low output at GTCCRA/GTCCRB compare match
0	0	0	1	0			High output at GTCCRA/GTCCRB compare match
0	0	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	0	1	0	0		Low output at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
0	0	1	0	1			Low output at GTCCRA/GTCCRB compare match
0	0	1	1	0			High output at GTCCRA/GTCCRB compare match
0	0	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	1	0	0	0		High output at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
0	1	0	0	1			Low output at GTCCRA/GTCCRB compare match
0	1	0	1	0			High output at GTCCRA/GTCCRB compare match
0	1	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	1	1	0	0		Output toggled at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
0	1	1	0	1			Low output at GTCCRA/GTCCRB compare match
0	1	1	1	0			High output at GTCCRA/GTCCRB compare match
0	1	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	0	0	0	0	Initial output is high	Output retained at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
1	0	0	0	1			Low output at GTCCRA/GTCCRB compare match
1	0	0	1	0			High output at GTCCRA/GTCCRB compare match
1	0	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	0	1	0	0		Low output at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
1	0	1	0	1			Low output at GTCCRA/GTCCRB compare match
1	0	1	1	0			High output at GTCCRA/GTCCRB compare match
1	0	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	1	0	0	0		High output at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
1	1	0	0	1			Low output at GTCCRA/GTCCRB compare match
1	1	0	1	0			High output at GTCCRA/GTCCRB compare match
1	1	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	1	1	0	0		Output toggled at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
1	1	1	0	1			Low output at GTCCRA/GTCCRB compare match
1	1	1	1	0			High output at GTCCRA/GTCCRB compare match
1	1	1	1	1			Output toggled at GTCCRA/GTCCRB compare match

Note:
- In sawtooth-wave mode, "end of a cycle" refers to an overflow (the value of the GTCNT counter changing from that of the GTPR register to 0x00000000 in up-counting), an underflow (the value of the GTCNT counter changing from 0x00000000 to that of the GTPR register in down-counting), or counter clearing. It refers to a trough in triangle-wave mode (the value of the GTCNT counter changing from 0x00000000 to 0x00000001).
- When the timing of an end of a cycle and the timing of a GTCCRA/GTCCRB register compare match are the same in a compare-match operation, the bit 3 and bit 2 settings are given priority in sawtooth-wave PWM mode, and the bit 1 and bit 0 settings are given priority in any other mode.
- During the event count operation (when at least one bit among the bits for the GTUPSR and GTDNSR registers is set to 1), bit 3 and bit 2 settings become invalid.

19.2.15 GTINTAD : General PWM Timer Interrupt Output Setting Register

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	TUCF	—	—	—	—	ITCNT[2:0]			—	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	—	These bits are read as 0. The write value should be 0.	R/W
10:8	ITCNT[2:0]	GPTn_OVF/GPTn_UDF Interrupt Skipping Count Counter Counter for counting the number of times a timer interrupt has been skipped. The counter is incremented by 1 every time the interrupt source which is selected in GTITC.IVTC[1:0] is generated. Cleared when the interrupt skip count matches the specified count (GTITC.IVTT[2:0]) or when the count operation has stopped.	R
14:11	—	These bits are read as 0. The write value should be 0.	R/W
15	TUCF	Count Direction Flag 0: The GTCNT counter counts downward 1: The GTCNT counter counts upward	R
16	ADTRAUF	GTADTRA Register Compare Match (Up-Counting) A/D Converter Start Request Flag 0: No GTADTRA register compare match has occurred in up-counting 1: A GTADTRA register compare match has occurred in up-counting	R/W*1

Bit	Symbol	Function	R/W
17	ADTRADF	GTADTRA Register Compare Match (Down-Counting) A/D Converter Start Request Flag 0: No GTADTRA register compare match has occurred in down-counting 1: A GTADTRA register compare match has occurred in down-counting	R/W*1
18	ADTRBUF	GTADTRB Register Compare Match (Up-Counting) A/D Converter Start Request Flag 0: No GTADTRB register compare match has occurred in up-counting 1: A GTADTRB register compare match has occurred in up-counting	R/W*1
19	ADTRBDF	GTADTRB Register Compare Match (Down-Counting) A/D Converter Start Request Flag 0: No GTADTRB register compare match has occurred in down-counting 1: A GTADTRB register compare match has occurred in down-counting	R/W*1
23:20	—	These bits are read as 0. The write value should be 0.	R/W
24	ODF	Output Stop Request Flag This flag monitors the output stop request for the group selected by GTINTAD.GRP[1:0] bits. 0: No output stop request has occurred 1: An output stop request has occurred	R
27:25	—	These bits are read as 0. The write value should be 0.	R/W
28	DTEF	Dead Time Error Flag This flag returns to 0 when the timer output toggle point after the automatic addition of dead time is back within the period. 0: No dead time error has occurred 1: A dead time error has occurred	R
29	OABHF	Simultaneous High Output Flag When one of pins changes to 0, the flag changes to 0. 0: No simultaneous generation of high output both for the GTIOCA and GTIOCB pins has occurred 1: A simultaneous generation of high output both for the GTIOCA and GTIOCB pins has occurred	R
30	OABLF	Simultaneous Low Output Flag When one of pins changes to 1, the flag changes to 0. 0: No simultaneous generation of low output both for the GTIOCA and GTIOCB pins has occurred 1: A simultaneous generation of low output both for the GTIOCA and GTIOCB pins has occurred	R
31	—	This bit is read as 0. The write value should be 0.	R/W

Note 1. Only 0 can be written to clear the flag. When clearing the ADTRAUF, ADTRADF, ADTRBUF, or ADTRBDF flag, be sure to write 0 only to the target flag or flags for clearing and to write 1 to the other flags not for clearing.

19.2.17 GTBER : General PWM Timer Buffer Enable Register

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

19.2.19 GTCNT : General PWM Timer Counter

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

Offset address: 0x48

Bit position:	31																													0
Bit field:																														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	The GTCNT counter is a 32-bit readable/writable counter. There is one GTCNT counter for each channel. Writing is available only when counting is stopped, and thus writing is disabled while counting is in progress (when CST = 1). Access in 8-bit or 16-bit units to the GTCNT counter is prohibited, and it should be accessed in 32-bit units. Set the range of the GTCNT counter within the range of 0 ≤ GTCNT counter ≤ GTPR register.	R/W

19.2.20 GTCCRm : General PWM Timer Compare Capture Register m (m = A to F)

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

Offset address: 0x4C (GTCCRA), 0x50 (GTCCRB), 0x54 (GTCCRC)
0x58 (GTCCRE), 0x5C (GTCCRD), 0x60 (GTCCRF)

Bit position:	31																													0
Bit field:																														
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	The GTCCRm register is a 32-bit readable/writable register. Access in 8-bit or 16-bit units to the GTCCRm register is prohibited, and it should be accessed in 32-bit units. The GTCCRA and GTCCRB registers are used for both output compare and input capture. The GTCCRC and GTCCRE registers are compare match registers, and can also function as buffer registers for the GTCCRA and GTCCRB registers. The GTCCRD and GTCCRF registers are compare match registers, and can also function as buffer registers for the GTCCRC and GTCCRE registers (double buffer registers for the GTCCRA and GTCCRB registers).	R/W

19.2.21 GTPR : General PWM Timer Cycle Setting Register

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

Offset address: 0x64

Bit position:	31																													0
Bit field:																														
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	The GTPR register is a 32-bit readable/writable register that sets the maximum count value of the GTCNT counter. Access in 8-bit or 16-bit units to the GTPR register is prohibited, and it should be accessed in 32-bit units. In sawtooth-wave mode, the value of (GTPR register + 1) is the count period. In triangle-wave mode, the value of (GTPR register value × 2) is the count period.	R/W

19.2.22 GTPBR : General PWM Timer Cycle Setting Buffer Register

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

Offset address: 0x68

Bit position:	31																													0
Bit field:																														
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	The GTPBR register is a 32-bit readable/writable register that functions as a buffer register for the GTPR register. Access in 8-bit or 16-bit units to the GTPBR register is prohibited, and it should be accessed in 32-bit units.	R/W

19.2.23 GTPDBR : General PWM Timer Cycle Setting Double-Buffer Register

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

Offset address: 0x6C

Bit position:	31																												0
Bit field:																													
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	The GTPDBR register is a 32-bit readable/writable register that functions as a buffer register for the GTPBR register (a double buffer register for the GTPR register). Access in 8-bit or 16-bit units to the GTPDBR register is prohibited, and it should be accessed in 32-bit units.	R/W

19.2.24 GTADTRm : A/D Converter Start Request Timing Register m (m = A, B)

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)

Offset address: 0x70 (GTADTRA)
0x7C (GTADTRB)

Bit position:	31																												0
Bit field:																													
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	The GTADTRm register is a 32-bit readable/writable register that sets the timing of A/D converter start request generation. Access in 8-bit or 16-bit units to the GTADTRm register is prohibited, and it should be accessed in 32-bit units. When the GTADTRm register value matches the GTCNT counter value, an A/D converter start request is generated.	R/W

SAFTY has not A/D Converter Start request.

19.2.25 GTADTBRm : A/D Converter Start Request Timing Buffer Register m (m = A, B)

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)

Offset address: 0x74 (GTADTBRA)
0x80 (GTADTBRB)

Bit position:	31																												0
Bit field:																													
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	The GTADTBRm register is a 32-bit readable/writable register that functions as buffer register for the GTADTRm register. Access in 8-bit or 16-bit units to the GTADTBRm register is prohibited, and it should be accessed in 32-bit units.	R/W

SAFTY has not A/D Converter Start request.

19.2.26 GTADTDBRm : A/D Converter Start Request Timing Double-Buffer Register m (m = A, B)

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)

Offset address: 0x78 (GTADTDBRA)
0x84 (GTADTDBRB)

Bit position:	31																												0
Bit field:																													
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	The GTADTDBRm register is a 32-bit readable/writable register that functions as a buffer register for the GTADTBRm register (double buffer register for the GTADTRm register). Access in 8-bit or 16-bit units to the GTADTDBRm register is prohibited, and it should be accessed in 32-bit units.	R/W

SAFTY has not A/D Converter Start request.

19.2.27 GTDTCR : General PWM Timer Dead Time Control Register

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

Offset address: 0x88

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	TDFER	—	—	TDBDE	TDBUE	—	—	—	TDE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TDE	Negative-Phase Waveform Setting 0: GTCCRB register is set without using GTDVU and GTDVD registers 1: GTDVU and GTDVD registers are used to set the compare match value for negative-phase waveform with dead time automatically in GTCCRB register	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
4	TDBUE	GTDVU Register Buffer Operation Enable 0: GTDVU register buffer operation is disabled 1: GTDVU register buffer operation is enabled	R/W
5	TDBDE	GTDVD Register Buffer Operation Enable 0: GTDVD register buffer operation is disabled 1: GTDVD register buffer operation is enabled	R/W

Bit	Symbol	Function	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
8	TDFER	GTDVD Register Setting 0: GTDVU and GTDVD registers are set separately 1: The value written to GTDVU register is automatically set to GTDVD register	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

The GTDTCR register enables automatic setting of a compare match value for negative-phase waveform with dead time. This register is invalid during the event count operation.

19.2.28 GTDVm : General PWM Timer Dead Time Value Register m (m = U, D)

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

Offset address: 0x8C (GTDVU)
0x90 (GTDVD)

Bit position:	31																													0
Bit field:																														
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	The GTDVm register is a 32-bit readable/writable register that sets the dead time for generating PWM waveforms with dead time. Access in 8-bit or 16-bit units to the GTDVm register is prohibited, and it should be accessed in 32-bit units. The GTDVU register is used for up-counting. The GTDVD register is used for down-counting. The setting which the value for the GTDVm register is equal to or larger than the value for the GTPR register is prohibited. In addition, when using the automatic dead time setting function, do not set a value that makes a change point of the waveform exceeding the count period. The change point of the negative-phase waveform, which is automatically calculated, is obtained by reading the GTCCRB register. When using the GTDVm register, writing to the GTCCRB register is prohibited. When setting this register to 0, waveforms without dead time are output. When the GTDTCR.TDFER bit is 1, the writing to the GTDVD register has no effect. At this time, when the GTDVD register is read, the value for the GTDVU register is read.	R/W

19.2.29 GTDBm : General PWM Timer Dead Time Value Buffer Register m (m = U, D)

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

Offset address: 0x94 (GTDBU)
0x98 (GTDBD)

Bit position:	31																													0
Bit field:																														
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	The GTDBm register is a 32-bit readable/writable register that functions as a buffer register for the GTDVm register. Access in 8-bit or 16-bit units to the GTDBm register is prohibited, and it should be accessed in 32-bit units.	R/W

19.2.30 GTSOS : General PWM Timer Output Protection Function Status Register

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

Offset address: 0x9C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOS[1:0]	
Value after reset:	0	0	0	0	0	0	x	x	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	SOS[1:0]	Output Protection Function Status 0 0: Normal operation 0 1: Protected state (GTCCRA = 0 is set during transfer at trough or crest) 1 0: Protected state (GTCCRA ≥ GTPR is set during transfer at trough) 1 1: Protected state (GTCCRA ≥ GTPR is set during transfer at crest)	R
31:2	—	These bits are read as 0.	R

The GTSOS register is a status register that indicates the status of the output protection function. The output protection function is enabled only when the dead time is automatically set (the GTDTCR.TDE bit is 1) in triangle-wave mode.

19.2.31 GTSOTR : General PWM Timer Output Protection Function Temporary Release Register

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

Offset address: 0xA0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

17:16	ADSMS1[1:0]	A/D Conversion Start Request Signal Monitor 1 Selection 0 0: A/D conversion start request signal generated by the GTADTRA register during up-counting 0 1: A/D conversion start request signal generated by the GTADTRA register during down-counting 1 0: A/D conversion start request signal generated by the GTADTRB register during up-counting 1 1: A/D conversion start request signal generated by the GTADTRB register during down-counting	R/W
23:18	—	These bits are read as 0. The write value should be 0.	R/W
24	ADSMEN1	A/D Conversion Start Request Signal Monitor 1 Output Enabling 0: Output of A/D conversion start request signal monitor 1 is disabled 1: Output of A/D conversion start request signal monitor 1 is enabled	R/W
31:25	—	These bits are read as 0. The write value should be 0.	R/W

SAFTY has not A/D conversion Start Request.

The GTADSMR register is used to control monitors for the A/D conversion start request signal that is synchronized with a frame period.

When the output of the same A/D converter start request signal monitoring output is enabled for multiple channels, ORed signals will be output.

19.2.33 GTEITC : General PWM Timer Extended Interrupt Skipping Counter Control Register

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)

31	—	This bit is read as 0. The write value should be 0.	R/W

The GTEITLI1 register sets the extended skipping function for interrupts such as compare match/input capture, overflow, and underflow.

Setting only with this register does not perform skipping. The GTEITC register should be set so that a corresponding extended interrupt skipping counter operates the counting.

The setting is operated independently from the interrupt skipping by the GTITC register.

The setting is invalid during the event count operation.

Table 19.5 Setting the function select for the GTEITLI1 register

EITLy[2:0] bits	Function
000b	Do not perform an extended interrupt skipping
001b	Skip an interrupt in the period when the value for the extended interrupt skipping counter 1 is other than 0. An interrupt is output in the period of EITCNT1[3:0] bits = 0000b.
010b	Skip an interrupt in the period when the value for the extended interrupt skipping counter 2 is other than 0. An interrupt is output in the period of EITCNT2[3:0] bits = 0000b.
011b	Skip an interrupt in the period the value for the extended interrupt skipping counter 1 or 2 is other than 0. An interrupt is output in the period of EITCNT1[3:0] bits = 0000b and EITCNT2[3:0] bits = 0000b.
100b	Do not set this value
101b	Skip an interrupt in the period when the value for the extended interrupt skipping counter 1 is other than the skipping count. An interrupt is output in the period of EITCNT1[3:0] bits = EIVTT1[3:0] bits.
110b	Skip an interrupt in the period when the value for the extended interrupt skipping counter 2 is other than the skipping count. An interrupt is output in the period of EITCNT2[3:0] bits = EIVTT2[3:0] bits.
111b	Skip an interrupt in the period when the value for the extended interrupt skipping counter 1 or 2 is other than the skipping count. An interrupt is output in the period of EITCNT1[3:0] bits = EIVTT1[3:0] bits and EITCNT2[3:0] bits = EIVTT2[3:0] bits.

Note:
- y = A, B, C, D, E, F, V, U; k = 1, 2
- When the intended skipping counter is set as not to count (EIVTCk[1:0] bits = 00b or EIVTTk[3:0] bits = 0000b), skipping is not performed.
- When the EITLy[2:0] bits are set to 011b or 111b, or when one of the skipping counters is set as not to count, skipping is not performed.

19.2.35 GTEITLI2 : General PWM Timer Extended Interrupt Skipping Setting Register 2

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

Offset address: 0xB0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	EADTBL[2:0]			—	EADTAL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	EADTAL[2:0]	GTADTRA A/D Converter Start Request Extended Skipping Function Select See Table 19.6.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
6:4	EADTBL[2:0]	GTADTRB A/D Converter Start Request Extended Skipping Function Select See Table 19.6.	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

The GTEITLI2 register sets the extended skipping function for A/D converter start requests.

Setting only with this register does not perform skipping. The GTEITC register should be set so that a corresponding extended interrupt skipping counter operates the counting.

The setting is operated independently from the interrupt skipping by the GTITC register.

The setting is invalid during the event count operation.

Table 19.6 Setting the function select for the GTEITLI2 register

EADTmL[2:0] bits	Function
000b	Do not perform an extended interrupt skipping
001b	Skip an A/D converter start request in the period when the value for the extended interrupt skipping counter 1 is other than 0. An A/D converter start request is output in the period of EITCNT1[3:0] bits = 0000b.
010b	Skip an A/D converter start request in the period when the value for the extended interrupt skipping counter 2 is other than 0. An A/D converter start request is output in the period of EITCNT2[3:0] bits = 0000b.
011b	Skip an A/D converter start request in the period when the value for the extended interrupt skipping counter 1 or 2 is other than 0. An A/D converter start request is output in the period of EITCNT1[3:0] bits = 0000b and EITCNT2[3:0] bits = 0000b.
100b	Do not set this value
101b	Skip an A/D converter start request in the period when the value for the extended interrupt skipping counter 1 is other than the skipping count. An A/D converter start request is output in the period of EITCNT1[3:0] bits = EIVTT1[3:0] bits.
110b	Skip an A/D converter start request in the period when the value for the extended interrupt skipping counter 2 is other than the skipping count. An A/D converter start request is output in the period of EITCNT2[3:0] bits = EIVTT2[3:0] bits.
111b	Skip an A/D converter start request in the period when the value for the extended interrupt skipping counter 1 or 2 is other than the skipping count. An A/D converter start request is output in the period of EITCNT1[3:0] bits = EIVTT1[3:0] bits and EITCNT2[3:0] bits = EIVTT2[3:0] bits.

Note:
- m = A, B; k = 1, 2
- When the intended skipping counter is set as not to count (EIVTCk[1:0] bits = 00b or EIVTTk[3:0] bits = 0000b), skipping is not performed.
- When the EADTmL[2:0] bits are set to 011b or 111b, or when one of the skipping counters is set as not to count, skipping is not performed.

31	—	This bit is read as 0. The write value should be 0.	R/W

The GTEITLB register sets the extended skipping function for buffer transfers.

Setting only with this register does not perform skipping. The GTEITC register should be set so that a corresponding extended interrupt skipping counter operates the counting.

The setting is operated independently from the interrupt skipping by the GTITC register.

The setting is invalid during the event count operation.

Table 19.7 Setting the function select for the GTEITLB register

EBTLx[2:0] bits	Function
000b	Do not perform an extended interrupt skipping
001b	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 is other than 0. A buffer transfer is output in the period of EITCNT1[3:0] bits = 0000b.
010b	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 2 is other than 0. A buffer transfer is output in the period of EITCNT2[3:0] bits = 0000b.
011b	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 or 2 is other than 0. A buffer transfer is output in the period of EITCNT1[3:0] bits = 0000b and EITCNT2[3:0] bits = 0000b.
100b	Do not set this value
101b	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 is other than the skipping count. A buffer transfer is output in the period of EITCNT1[3:0] bits = EIVTT1[3:0] bits.
110b	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 2 is other than the skipping count. A buffer transfer is output in the period of EITCNT2[3:0] bits = EIVTT2[3:0] bits.
111b	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 or 2 is other than the skipping count. A buffer transfer is output in the period of EITCNT1[3:0] bits = EIVTT1[3:0] bits and EITCNT2[3:0] bits = EIVTT2[3:0] bits.

Note:
- x = CA, CB, PR, ADA, ADB, DVU, DVD; k = 1, 2
- When the intended skipping counter is set as not to count (EIVTCk[1:0] bits = 00b or EIVTTk[3:0] bits = 0000b), skipping is not performed.
- When the EBTLx[2:0] bits are set to 011b or 111b, or when one of the skipping counters is set as not to count, skipping is not performed.

31:7	—	These bits are read as 0. The write value should be 0.	R/W

The GTSECSR register selects an intended channel for updating an operation enable bit by the GTSECR register.

A bit position for the GTSECSR register indicates a channel number. The GTSECSR register of each channel is a common register, and writing 1 to a bit in the GTSECSR register in any channel and updating it changes a channel, related to the position of the bit written with 1 by the GTSECSR register, to be simultaneously controlled of the operation enable bit by the GTSECR register.

19.2.38 GTSECR : General PWM Timer Operation Enable Bit Simultaneous Control Register

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)

31:12	—	These bits are read as 0. The write value should be 0.	R/W

The GTSECR register simultaneously updates the value for operation enable bits of a channel set by the GTSECSR register.

Writing 1 to a bit in the GTSECR register in any channel and updating it updates an operation enable bit for all channels, related to the position of the bit written with 1 by the all GTSECSR registers. It is reflected in the GTBER.BDn (n = 0 to 3) bits of simultaneous channels. Setting enable and disable bits for the same operation enable bit to 1 in the GTSECR is prohibited.

A bit written to 1 is automatically cleared. When the GTSECR is read, 0 is read.

Access in 8-bit or 16-bit units to the GTSECR register is prohibited, and it should be accessed in 32-bit units.

19.2.39 GTSWSR : General PWM Timer Switch Source Select Register

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

31:24	—	These bits are read as 0. The write value should be 0.	R/W

The GTSWSR register sets a counter switch source for the GTCNT counter. Count switch can be executed whether the counter is running (GTCR.CST = 1) or stopped (GTCR.CST = 0). Inputs from the GTETRGA, GTETRGB, GTETRGC, and GTETRGD, (GTETRGSA and GTETRGSB for SAFETY) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

19.2.40 GTSWOS : General PWM Timer Switch Offset Setting Register

Base address: GPTi = 0x9000_2000 + 0x0100 × i (i = 0 to 6)
GPTj = 0x8000_0000 + 0x0100 × (j - 7) (j = 7 to 13)
GPTk = 0x8100_0000 + 0x0100 × (k - 14) (k = 14 to 17)

Offset address: 0xDC

Bit position:	31																													0
Bit field:																														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The GTSWOS register is a readable/writable register that sets the offset value of GTCNT counter which is reloaded by count switch operation. Access in 8-bit or 16-bit units to the GTSWOS register is prohibited, and it should be accessed in 32-bit units. The GTSWOS register is writable even while the GTCNT counter operation. If the GTSWOS register writing and the event input of count switch occur at the same time, the GTSWOS register setting before writing is reloaded to GTCNT counter. Write the GTSWOS register earlier than the event input of count switch to ensure that the written GTSWOS register value is reloaded by the count switch operation.

19.3 Operation

19.3.1 Basic Operation

The timer in each channel performs periodic count operation by count clock or hardware source. The GTCNT counter performs up-counting, or down-counting. The timer period is controlled by the GTPR register. When the GTCNT counter value matches the values for GTCCRA or GTCCRB register, the GTIOCnA or GTIOCnB pin outputs (n = 0 to 17) can be changed respectively. Also, the GTCCRA or GTCCRB register can be used as the input capture register by hardware source. The GTCCRC and GTCCRD registers can be performed as buffer registers for GTCCRA register, and the GTCCRE and GTCCRF registers can be performed as buffer registers for GTCCRB register.

19.3.1.1 Counter Operation

(1) Count Start/Count Stop

The counter in each channel starts counting operation when the corresponding GTCR.CST bit is set to 1, and stops counting when the bit is set to 0.

CST bit value can be changed by the following sources:

- Writing to the GTCR register
- Writing 1 to the bit corresponding to the channel number for the GTSTR register while the GTSSR.CSTRT bit is 1
- Writing 1 to the bit corresponding to the channel number for the GTSTP register while the GTPSR.CSTOP bit is 1
- Hardware source specified by the GTSSR register
- Hardware source specified by the GTPSR register

(2) Periodic Count Operation (In Up-Counting by the Count Clock)

The counter in each channel starts up-counting when the corresponding CST bit is set to 1 while the GTUPSR register and the GTDNSR register are 0x00000000. When the value of the GTCNT counter changes from that of the GTPR register to 0x00000000 (an overflow) while the GTINTAD.GTINTPR[0] bit is 1, a GTPn_OVF interrupt request is also issued. After GTCNT counter overflows, up-counting is resumed from 0x00000000.

Figure 19.2 shows an example of periodic count operation in up-counting by count clock.

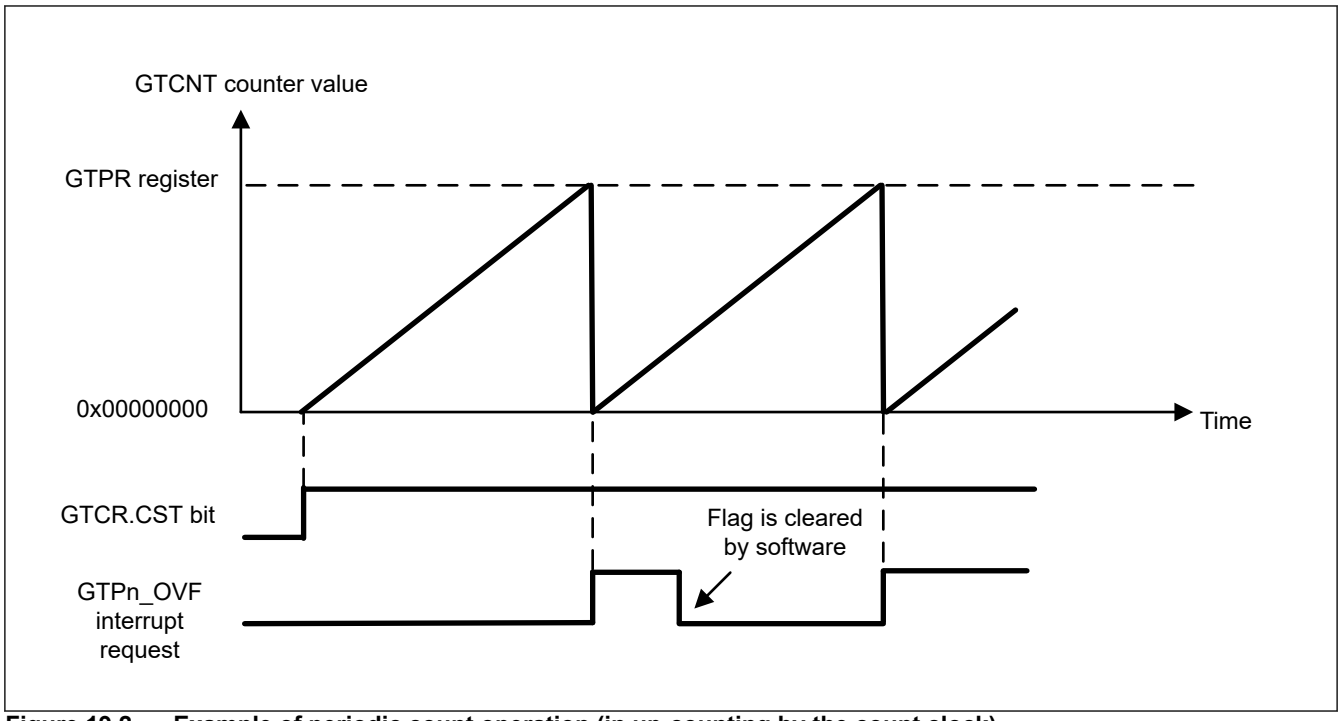

Figure 19.2 Example of periodic count operation (in up-counting by the count clock)

The following example shows the setting for periodic count operation in up-counting by count clock.

1. Set operating mode
   Set the operating mode with GTCR.MD[2:0] bits. In Figure 19.2, 000b (sawtooth-wave PWM mode) is set.
2. Set count direction
   Select the count direction with the GTUDDTYC register. In Figure 19.2, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter. In Figure 19.2, 0x00000000 is set.
6. Start count operation
   Set the GTCR.CST bit to 1 to start count operation.

(3) Periodic Count Operation (In Down-Counting by the Count Clock)

The counter in each channel can start down-counting when the corresponding GTUDDTYC.UD bit is set in a state of the GTUPSR register and the GTDNSR register as 0x00000000. When the value of the GTCNT counter changes from 0x00000000 to that of the GTPR register (an underflow) while the GTINTAD.GTINTPR[1] bit is 1, a GTPn_UDF interrupt request is also issued. After GTCNT counter underflows, down-counting is resumed from GTPR register value.

Figure 19.3 shows an example of periodic count operation in down-counting by count clock.

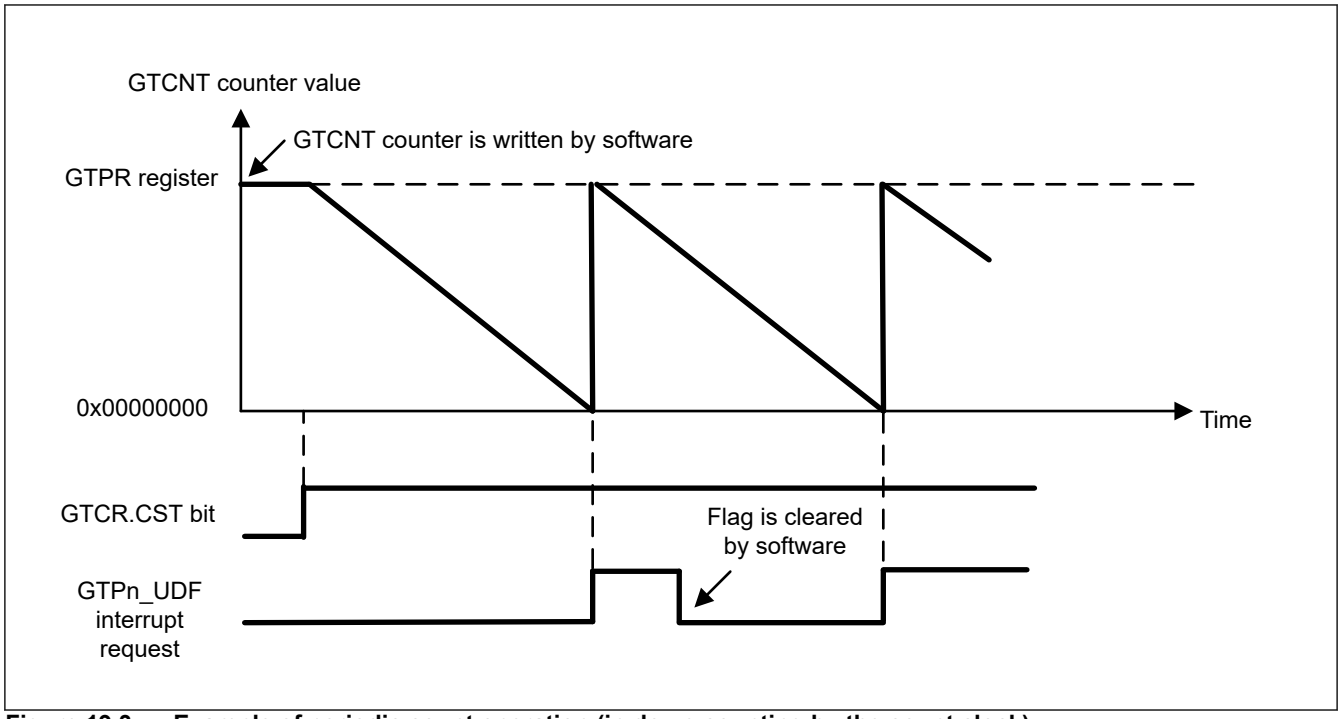

Figure 19.3 Example of periodic count operation (in down-counting by the count clock)

The following example shows the setting for periodic count operation in down-counting by count clock.

1. Set operating mode
   Set the operating mode with GTCR.MD[2:0] bits. In Figure 19.3, 000b (sawtooth-wave PWM mode) is set.
2. Set count direction
   Select the count direction with the GTUDDTYC register. In Figure 19.3, the lower 2 bits of the GTUDDTYC register is set to 10b and then to 00b for down-counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter. In Figure 19.3, the GTPR register value is set.
6. Start count operation
   Set the GTCR.CST bit to 1 to start count operation.

(4) Event Count Operation (In Up-Counting by Hardware Source)

The counter in each channel can start up-counting by hardware source by setting the GTUPSR register. When the GTUPSR register is set, the count clock selected by the GTCR.TPCS[3:0] bits and the count direction set by the GTUDDTYC.UD bit are invalid. If the hardware source in up-counting and the hardware source in down-counting are generated at the same time, the GTCNT counter value does not change.

Operation due to overflow in up-counting by hardware source is the same as the periodic count operation by the count clock.

To perform up-counting by hardware source, start count operation by setting the GTCR.CST bit to 1. At the start, the count operation is synchronized with the count clock selected by GTCR.TPCS[3:0] bits, set the CST bit to 1, and wait until the first cycle of the count clock elapses to start the up-counting operation. To start up-counting after 1 PCLKGPTL (LLPP)/ PCLKM (NONSAFETY, SAFETY) from setting the CST bit to 1, set the GTCR.TPCS[3:0] bits to 0000b.

Figure 19.4 shows an example of up-counting operation by hardware source.

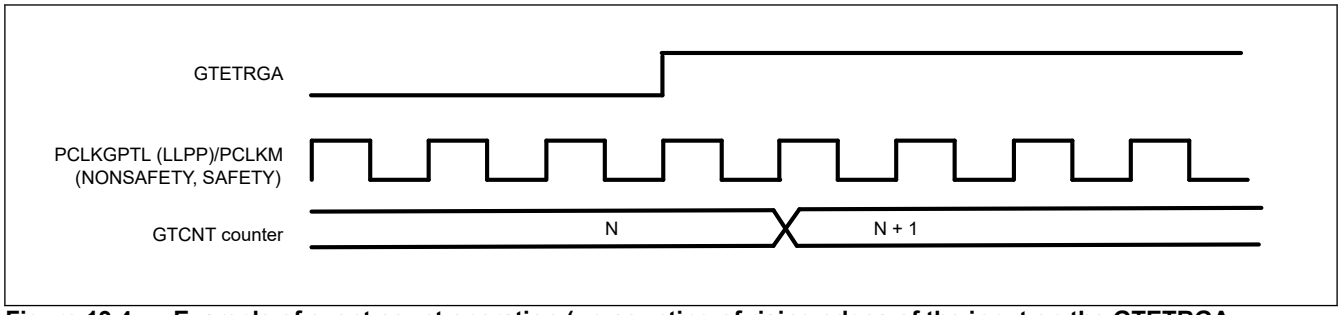

Figure 19.4 Example of event count operation (up-counting of rising edges of the input on the GTETRGA pin)

The following example shows the setting for event count operation in up-counting by a hardware source.

1. Set count-up source
   Select the count-up source with the GTUPSR register.
2. Period setting
   Set a period in the GTPR register.
3. Set initial value for counter
   Set the initial value in the GTCNT counter.
4. Start count operation
   Set the GTCR.CST bit to 1 to start count operation.

(5) Event Count Operation (In Down-Counting by Hardware Source)

The counter in each channel can start down-counting by hardware source by setting the GTDNSR register. When the GTDNSR register is set, the count clock selected by the GTCR.TPCS[3:0] bits and the count direction set by the GTUDDTYC.UD bit are invalid. If the hardware source in up-counting and the hardware source in down-counting are generated at the same time, the GTCNT counter value does not change.

Operation due to underflow in down-counting by hardware source is the same as the periodic count operation by the count clock.

To perform down-counting by hardware source, start count operation by setting the GTCR.CST bit to 1. At the start, the count operation is synchronized with the count clock selected by GTCR.TPCS[3:0] bits, set the CST bit to 1, and wait until the first cycle of the count clock elapses to start down-counting operation. To start down-counting after 1 PCLKGPTL (LLPP)/PCLKM (NONSAFETY, SAFETY) from setting the CST bit to 1, set the GTCR.TPCS[3:0] bits to 0000b.

Figure 19.5 shows an example of down-counting operation by hardware source.

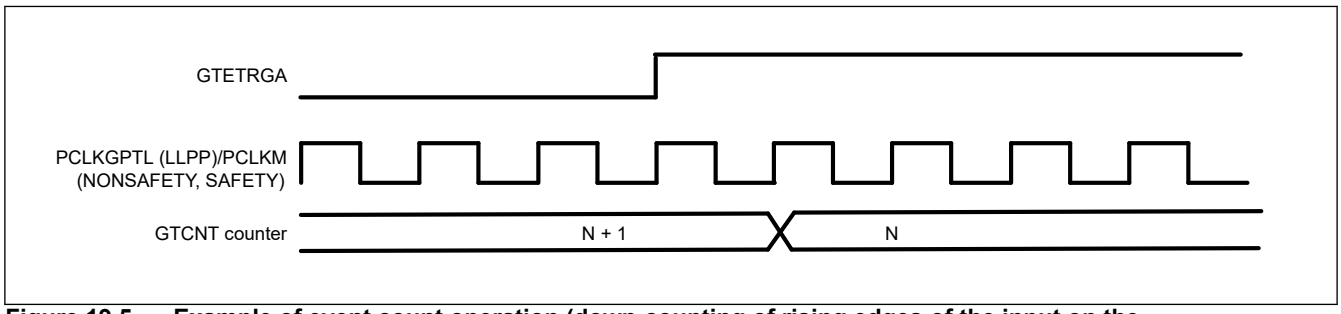

Figure 19.5 Example of event count operation (down-counting of rising edges of the input on the GTETRGA pin)

The following example shows the setting for event count operation in down-counting by hardware source.

1. Set count-down source
   Select the count-down source with the GTDNSR register.
2. Period setting
   Set a period in the GTPR register.
3. Set initial value for counter
   Set the initial value in the GTCNT counter.

4. Start count operation
   Set the GTCR.CST bit to 1 to start count operation.

(6) Counter Clearing Operation

The counter in each channel can be cleared by the following sources:

- Writing to the GTCNT counter
- Writing 1 to the bit corresponding to the channel number for the GTCLR register while the GTCSR.CCLR bit is 1
- Hardware source specified by the GTCSR register

Write access during counting (when CST = 1) is disabled.

GTCLR register can be written to and cleared by hardware source whether the count operation is performed (GTCR.CST bit = 1) or is stopped (CST bit = 0). When the count direction flag is set as decrement (GTST.TUCF flag = 0) in sawtooth-wave mode selected with GTCR.MD[2:0] bits, the GTCNT counter value for writing to the GTCLR register and for clearing by hardware source becomes the GTPR register value whether the counter is in operation or is stopped. The GTCNT counter value becomes 0x00000000 for other settings.

When the event count operation is set (at least one of the bits for the GTUPSR or the GTDNSR register is set as 1), writing to the GTCLR register and clearing by hardware source are performed right after the clear source is generated (the operation is based on PCLKGPTL (LLPP)/PCLKM (NONSAFETY, SAFETY)). For other settings, clearing operation is synchronized with the count clock selected with the GTCR.TPCS[3:0] bits.

19.3.1.2 Waveform Output by Compare Match Counter Operation

Compare match refers to when the GTCNT counter value matches the GTCCRA or GTCCRB register value. The output of the corresponding GTIOCnA or GTIOCnB pin (n = 0 to 17) can be set to be driven low, high, or toggled in synchronization with the counter clock (including in the case of event counting) after the match.

In addition, the GTIOCnA or GTIOCnB pin output can be driven low, high, or toggled at the "end of the cycle" which is determined by the GTPR register. The end of the cycle is as follows:

- For sawtooth waves in up-counting: When the GTCNT counter value changes from the GTPR register value to 0x00000000 (overflow)
- For sawtooth waves in down-counting: When the GTCNT counter value changes from 0x00000000 to the GTPR register value (underflow)
- For sawtooth waves with the GTCNT counter clear
- For triangle waves: When the GTCNT counter value changes from 0x00000000 to 0x00000001 (trough)

(1) Low Output and High Output

Figure 19.6 shows an example of low output and high output operation by a compare match of the GTCNT counter and GTCCRA register, and of the GTCNT counter and GTCCRB register.

In this example, the GPT0.GTCNT counter performs up-counting, and settings are made so that high is output from the GTIOC0A pin by a GPT0.GTCCRA register compare match, and low is output from the GTIOC0B pin by a GPT0.GTCCRB register compare match. The pin level does not change when the specified level and pin level match.

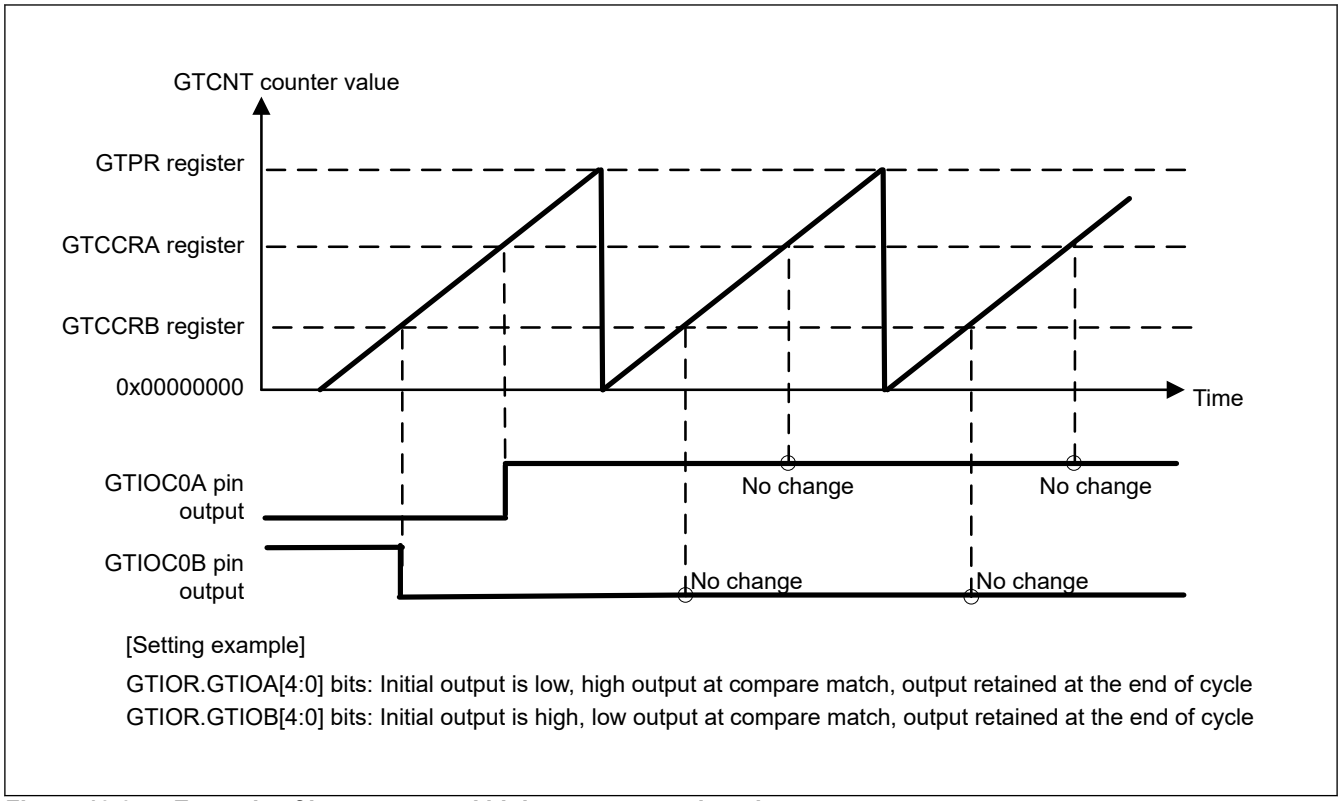

Figure 19.6 Example of low output and high output operation pin

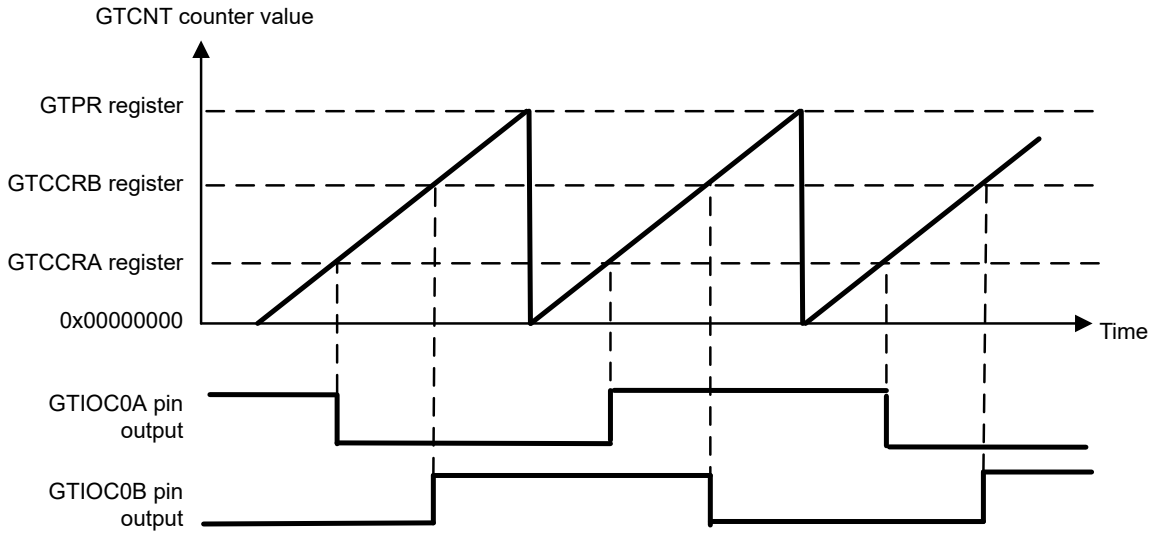
The following example shows the setting for low/high output operation.



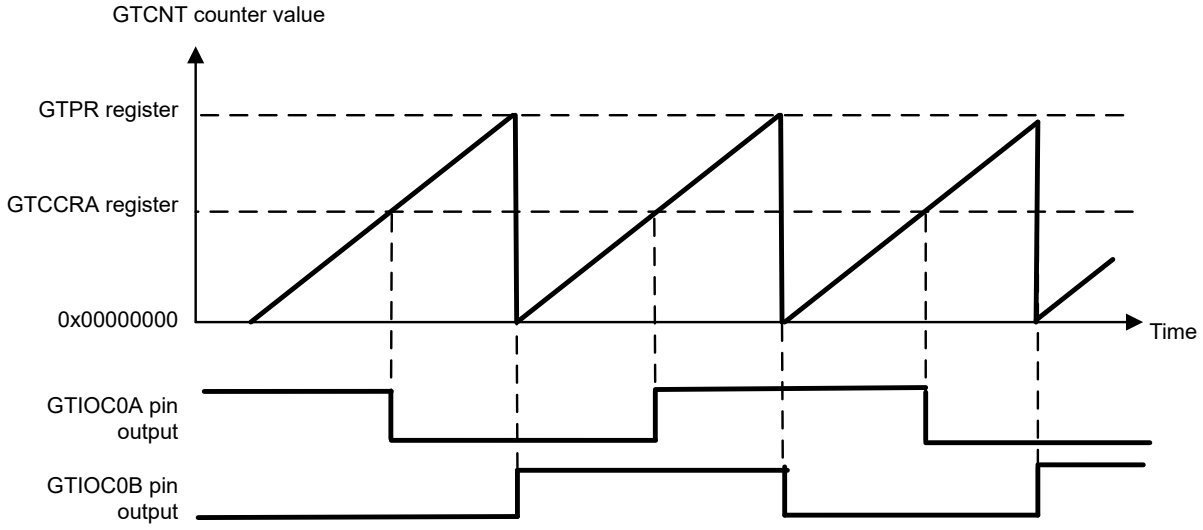
1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits. In Figure 19.6, 000b (sawtooth-wave PWM mode) is set.
2. Set count direction
   Select the count direction (up or down) with the GTUDDTYC register.
   In Figure 19.6, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set GTIOCnm pin function
   Set the GTIOCnm pin function with GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register.
   In Figure 19.6, GTIOA[4:0] bits = 00010b and GTIOB[4:0] bits = 10001b.
7. Enable GTIOCnm pin output
   Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8. Set compare match value
   Set compare match values in the GTCCRA and GTCCRB registers.
9. Set count operation
   Set the GTCR.CST bit to 1 to start count operation.

(2) Toggled Output

Figure 19.7 and Figure 19.8 show examples of toggle output operations by compare match between the GPT0.GTCNT counter and the GTCCRA and GTCCRB registers.

In Figure 19.7, the GPT0.GTCNT counter performs up-counting. Settings are made so that the GTIOC0A pin output by a GPT0.GTCCRA register compare match and GTIOC0B pin output by a GPT0.GTCCRB register compare match are toggled.

In Figure 19.8, the GPT0.GTCNT counter performs up-counting. Settings are made so that the GTIOC0A pin output is toggled by a compare match of GPT0.GTCCRA register and the GTIOC0B pin output is toggled at the end of the cycle.



[Setting example]

GTIOR.GTIOA[4:0] bits: Initial output is high, output toggled at compare match, output retained at the end of cycle

GTIOR.GTIOB[4:0] bits: Initial output is low, output toggled at compare match, output retained at the end of cycle

Figure 19.7 Example of toggled output operation (1)

[Setting example]

GTIOR.GTIOA[4:0] bits: Initial output is high, output toggled at compare match, output retained at the end of cycle

GTIOR.GTIOB[4:0] bits: Initial output is low, output retained at compare match, output toggled at the end of cycle

Figure 19.8 Example of toggled output operation (2)

The following example shows the setting for toggled output operation.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 19.7 and Figure 19.8, 000b (sawtooth-wave PWM mode) is set.
2. Set count direction
   Select the count direction (up or down) with the GTUDDTYC register.
   In Figure 19.7 and Figure 19.8, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set GTIOCnm pin function
   Set the GTIOCnm pin function with GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register.
   In Figure 19.7, GTIOA[4:0] bits = 10011b and GTIOB[4:0] bits = 00011b.
   In Figure 19.8, GTIOA[4:0] bits = 10011b and GTIOB[4:0] bits = 01100b.
7. Enable GTIOCnm pin output
   Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8. Set compare match value
   Set compare match values in the GTCCRA and GTCCRB registers.
9. Set count operation
   Set the GTCR.CST bit to 1 to start count operation.

19.3.1.3 Input Capture Function

Through detecting hardware sources selected by the GTICASR and GTICBSR registers, the GTCNT counter values can be transferred to the GTCCRA and GTCCRB registers, respectively.

Figure 19.9 shows an example of input capture function operation.

In this example, the GPT0.GTCNT counter performs up-counting by count clock, and settings are made so that an input capture is performed at both edges of the GTIOC0A pin input in the GTCCRA register and at the rising edge of the GTIOC0B pin input in the GTCCRB register.

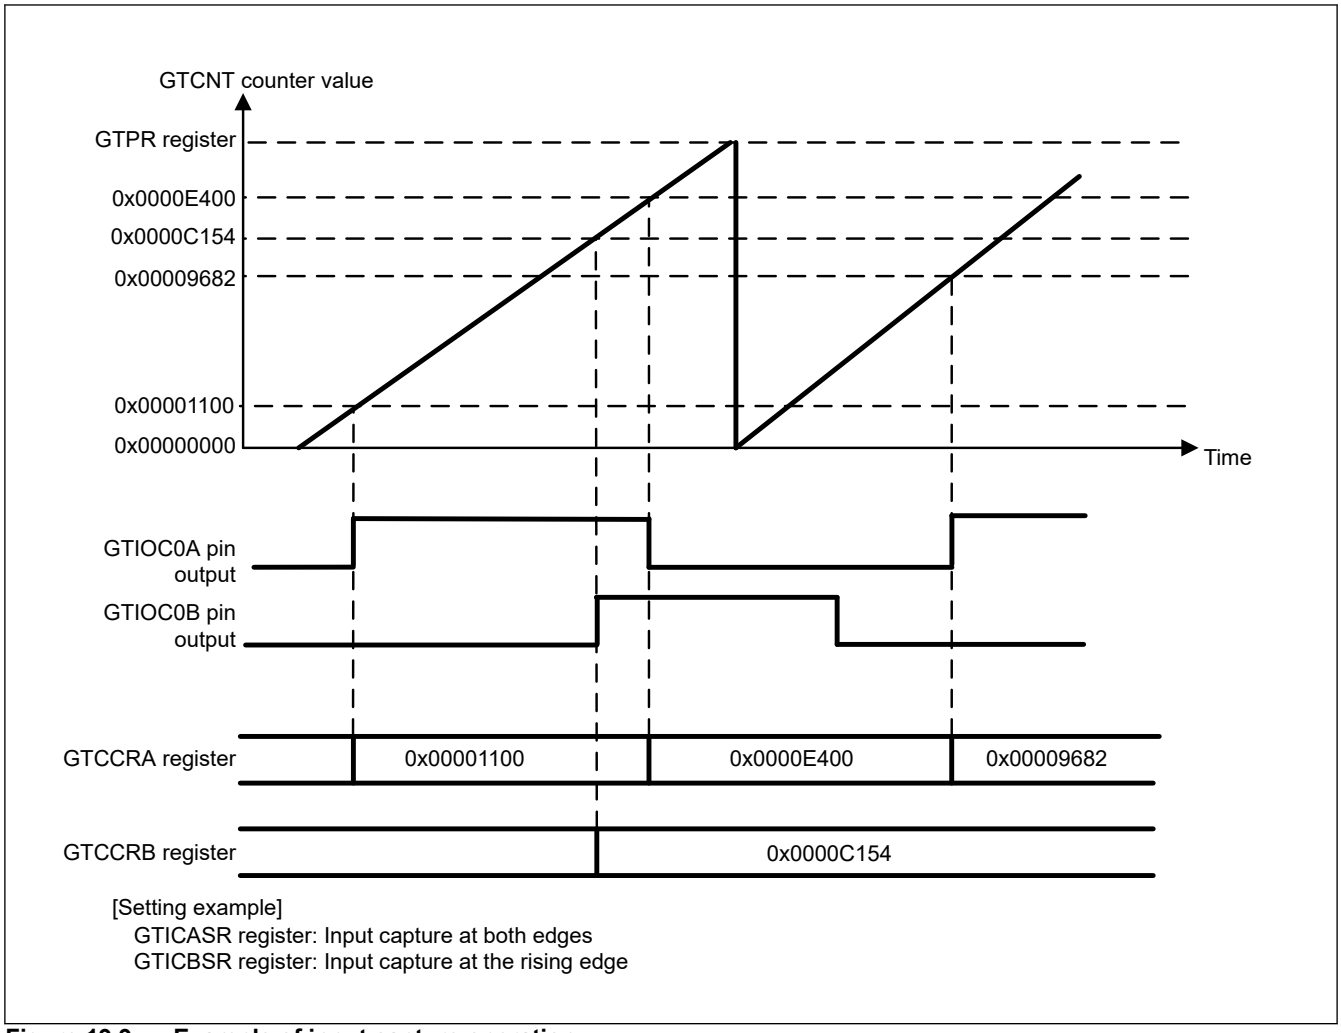


Figure 19.9 Example of input capture operation

The following example shows the setting for input capture operation.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 19.9, 000b (sawtooth-wave PWM mode) is set.
2. Set count direction
   Select the count direction (up or down) with the GTUDDTYC register. In Figure 19.9, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Select input capture source
   Select the input capture sources with the GTICASR and GTICBSR registers.
   In Figure 19.9, GTICASR = 0x00000F00 and GTICBSR = 0x00003000.
7. Set count operation
   Set the GTCR.CST bit to 1 to start count operation.

19.3.2 Buffer Operation

The following buffer operations can be set with the GTBER register:

- With the GTPR, GTPBR, and GTPDBR registers used together
- With the GTCCRA, GTCCRC, and GTCCRD registers used together
- With the GTCCRB, GTCCRE, and GTCCRF registers used together
- With the GTADTRA, GTADTBRA, and GTADTDBRA registers used together
- With the GTADTRB, GTADTBRB, and GTADTDBRB registers used together

The following buffer operations can be set with the GTDTCR register:

- With the GTDVU and GTDBU registers used together
- With the GTDVD and GTDBD registers used together

19.3.2.1 GTPR Register Buffer Operation

The GTPBR register can function as a buffer register for the GTPR register, and the GTPDBR register can function as a buffer register for the GTPBR register (double buffer register for the GTPR register).

The buffer transfer is performed at an overflow (in up-counting) or underflow (in down-counting) in sawtooth-wave mode or in event counting, or at a trough in triangle-wave mode.

When in sawtooth-wave mode and in event counting, the buffer transfer is performed even when the counter clearing occurs during the count is in operation.

- Hardware source clearing (clear source selected with bits [23:0] of GTCSR register)
- Clearing by software (when the GTCLR.CCLRn bit is written to 1 while GTCSR.CCLR bit is set to 1) (n = 0 to 17)

To set the GTPR register to function as double buffer, set the GTBER.PR[1:0] bits to 10b or 11b. For single buffer operation, set 01b. For not to function as buffer, set 00b.

Figure 19.10 to Figure 19.12 show examples of the GTPR register buffer operation.

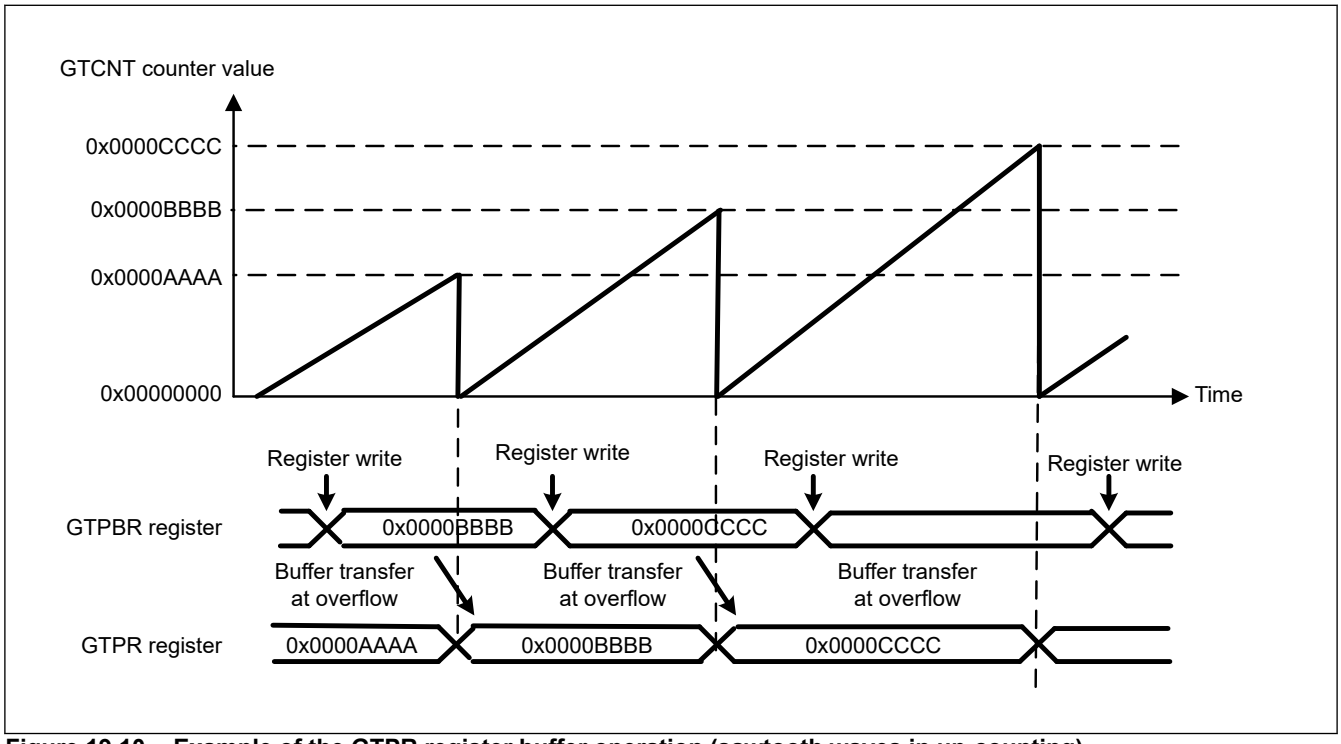

Figure 19.10 Example of the GTPR register buffer operation (sawtooth waves in up-counting)

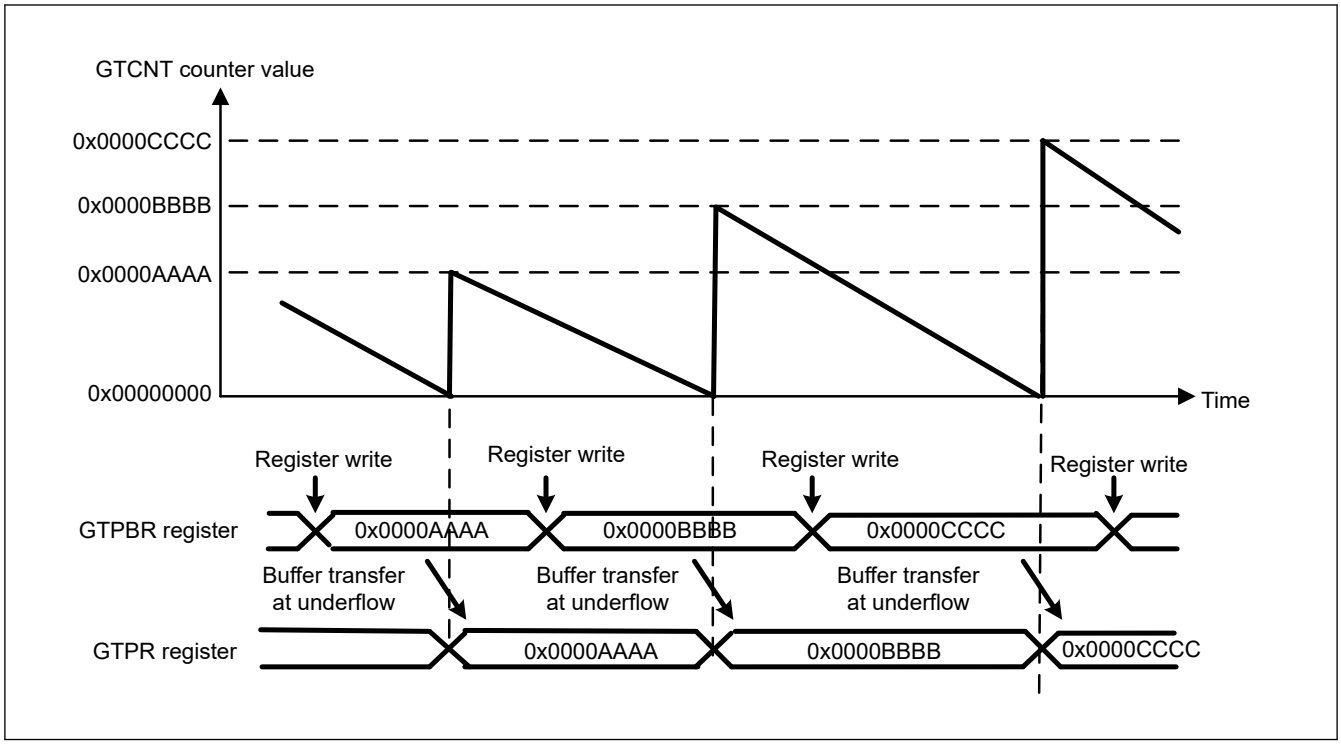

Figure 19.11 Example of the GTPR register buffer operation (sawtooth waves in down-counting)

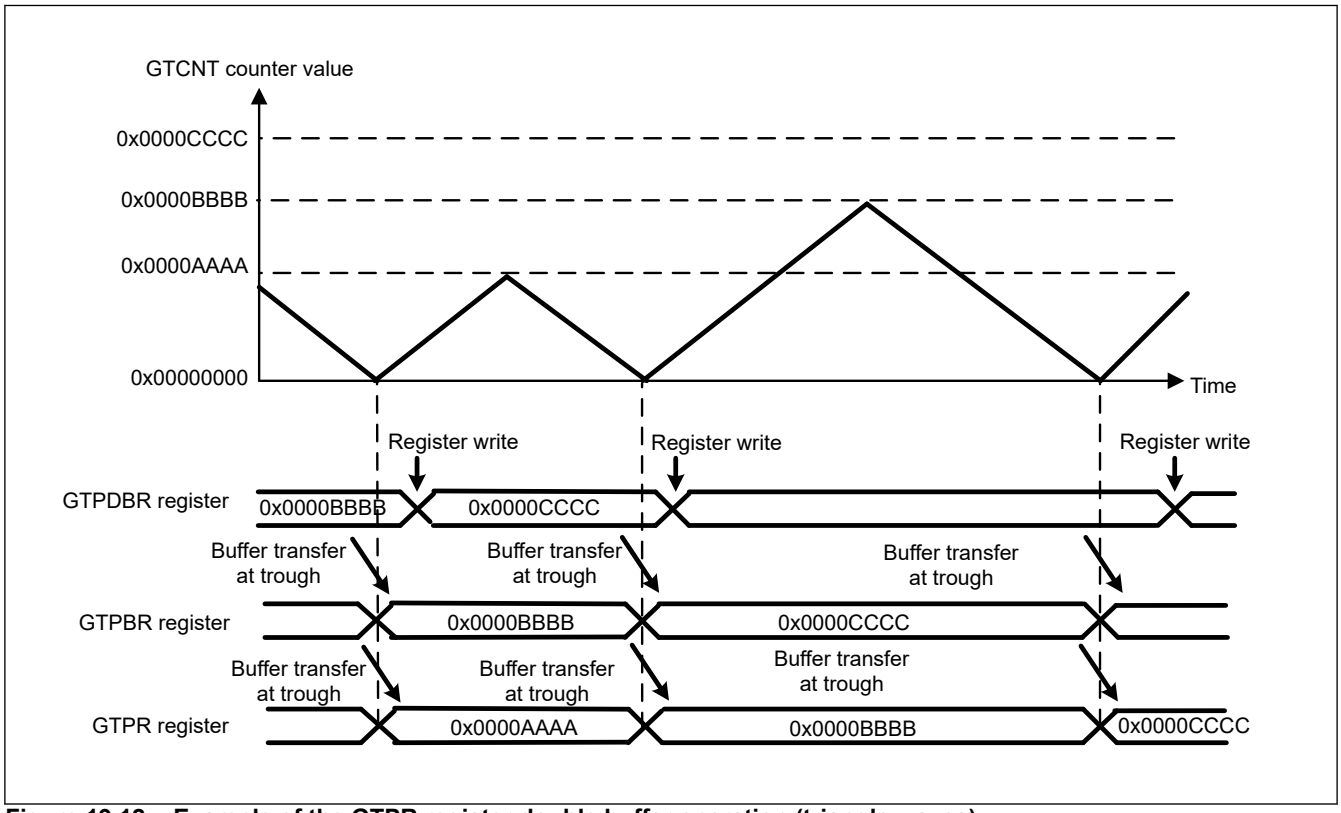

Figure 19.12 Example of the GTPR register double buffer operation (triangle waves)

The following example shows the setting for the GTPR register buffer operation.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 19.10 and Figure 19.11, 000b (sawtooth-wave PWM mode) is set, and in Figure 19.12, 100b (triangle-wave PWM mode 1) is set.
2. Set count direction

Select the count direction (up or down) with the GTUDDTYC register. In Figure 19.10, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting. In Figure 19.11, the lower 2 bits of the GTUDDTYC register is set to 10b and then to 10b for down-counting.

3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set buffer operation
   Set buffer operation with the GTBER.PR[1:0] bits.
   In Figure 19.10 and Figure 19.11, PR[1:0] bits = 01b. In Figure 19.12, PR[1:0] bits = 1xb.
7. Set buffer value
   For buffer operation, set a period value for the next cycle from the current cycle in the GTPBR register. For double buffer operation, also set a period value for the cycle after the next cycle in the GTPDBR register.
8. Set count operation
   Set the GTCR.CST bit to 1 to start count operation.
9. Set buffer value by cycle
   For buffer operation, set a period value for the next cycle from the current in the GTPBR register. For double buffer operation, set a period value for the cycle after the next cycle in the GTPDBR register.

19.3.2.2 Buffer Operation for the GTCCRA and GTCCRB Registers

The GTCCRC register can function as the GTCCRA buffer register and the GTCCRD register can function as the GTCCRC buffer register (double buffer register for the GTCCRA register). Similarly, the GTCCRE register can function as the GTCCRB buffer register and the GTCCRF register can function as the GTCCRE buffer register (double buffer register for the GTCCRB register).

To set the GTCCRA or GTCCRB register to function as a double buffer, set the GTBER.CCRA[1:0] or GTBER.CCRB[1:0] bits to 10b or 11b. For single buffer operation, set 01b. Not to function as buffer, set 00b.

The following describes buffer operation during output compare and input capture operation.

(1) When the GTCCRA or GTCCRB Register Functions as Output Compare Register

Buffer transfer is performed for the following three cases:

- Buffer transfer at an overflow (in up-counting) and underflow (in down-counting)
  Buffer transfer is performed at an overflow (in up-counting) or an underflow (in down-counting) in sawtooth-wave mode and in event counting, and at a trough (triangle-wave PWM mode 1) or at a crest/trough (triangle-wave PWM mode 2) in triangle-wave mode.
- Buffer transfer by counter clearing
  In sawtooth-wave mode and in event counting, the buffer transfer by similar counter clearing sources in counting operation and in section 19.3.2.1. GTPR Register Buffer Operation, is performed in the same way at an overflow (in up-counting) or an underflow (in down-counting).
  In triangle-wave mode, buffer transfer by counter clearing is not performed.
- Forcible buffer transfer
  In both sawtooth-wave mode and triangle-wave mode, buffer transfer of the GTCCRA and GTCCRB registers is forcibly performed by writing 1 to the GTBER.CCRSWT bit while the counting is stopped.
  In sawtooth-wave one-shot pulse mode and triangle-wave PWM mode 3, buffer transfer from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B is also performed using the forcible buffer operation.

When the setting of the GTBER.DBRTECm (m = A, B) bit is 1 in sawtooth-wave one-shot pulse mode or triangle-wave PWM mode 3, transfer from the intermediate buffers to the GTCCRm (m = A, B) registers is repeated on a cyclic basis even while buffer transfer is disabled by the setting of the GTBER.BD0 bit or buffer transfer extended skipping function

(function for repeated double-buffer operation while buffer transfer is disabled). For details, see section 19.8.2.2. Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer.

Figure 19.13 to Figure 19.15 show examples of the GTCCRA and GTCCRB registers buffer operations.

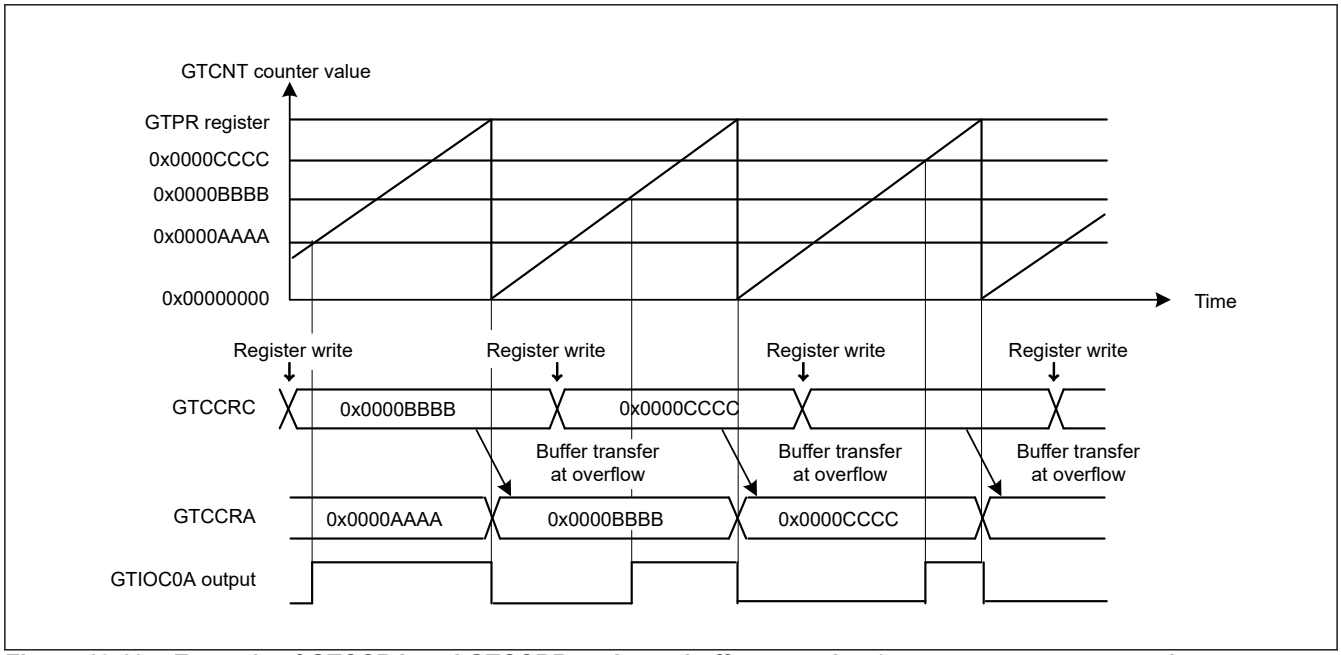

Figure 19.13 Example of GTCCRA and GTCCRB registers buffer operation (output compare, sawtooth waves in up-counting, high output at GTCCRA register compare match, low output at the end of the cycle)

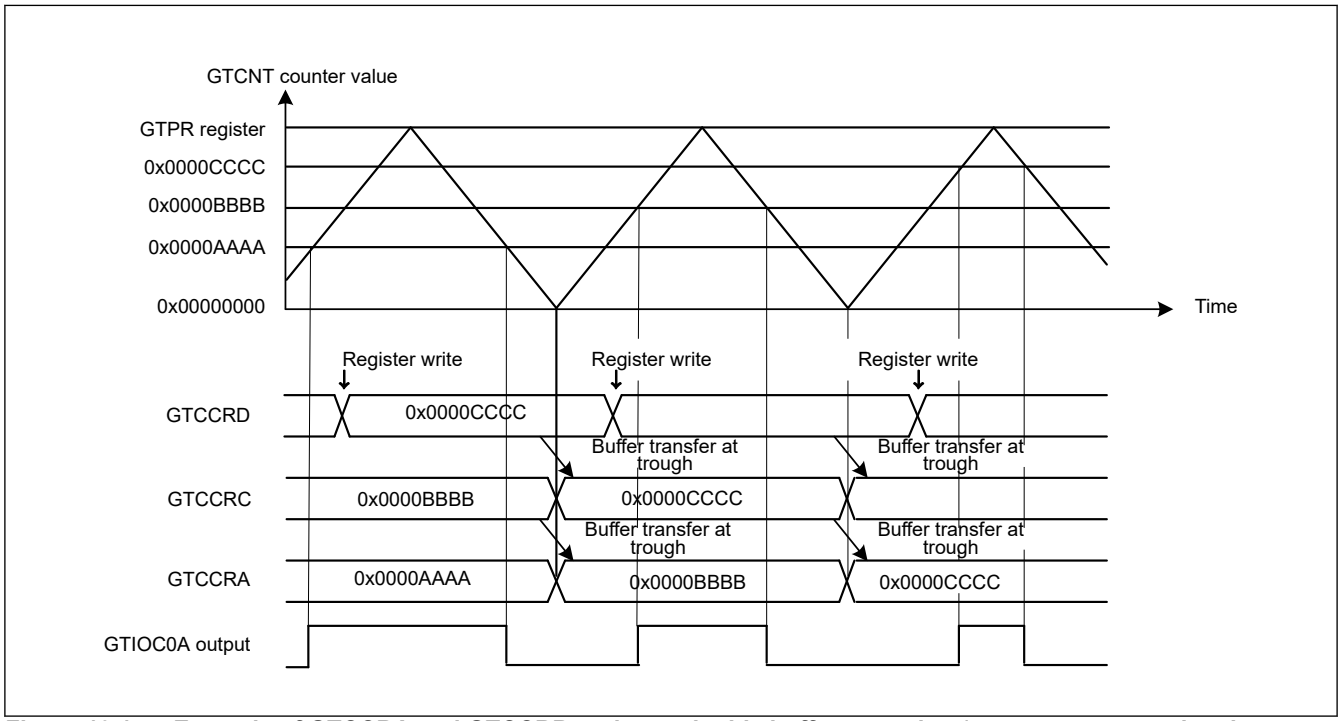

Figure 19.14 Example of GTCCRA and GTCCRB registers double buffer operation (output compare, triangle waves, buffer operation at trough, output toggled at GTCCRA register compare match, output retained at the end of the cycle)

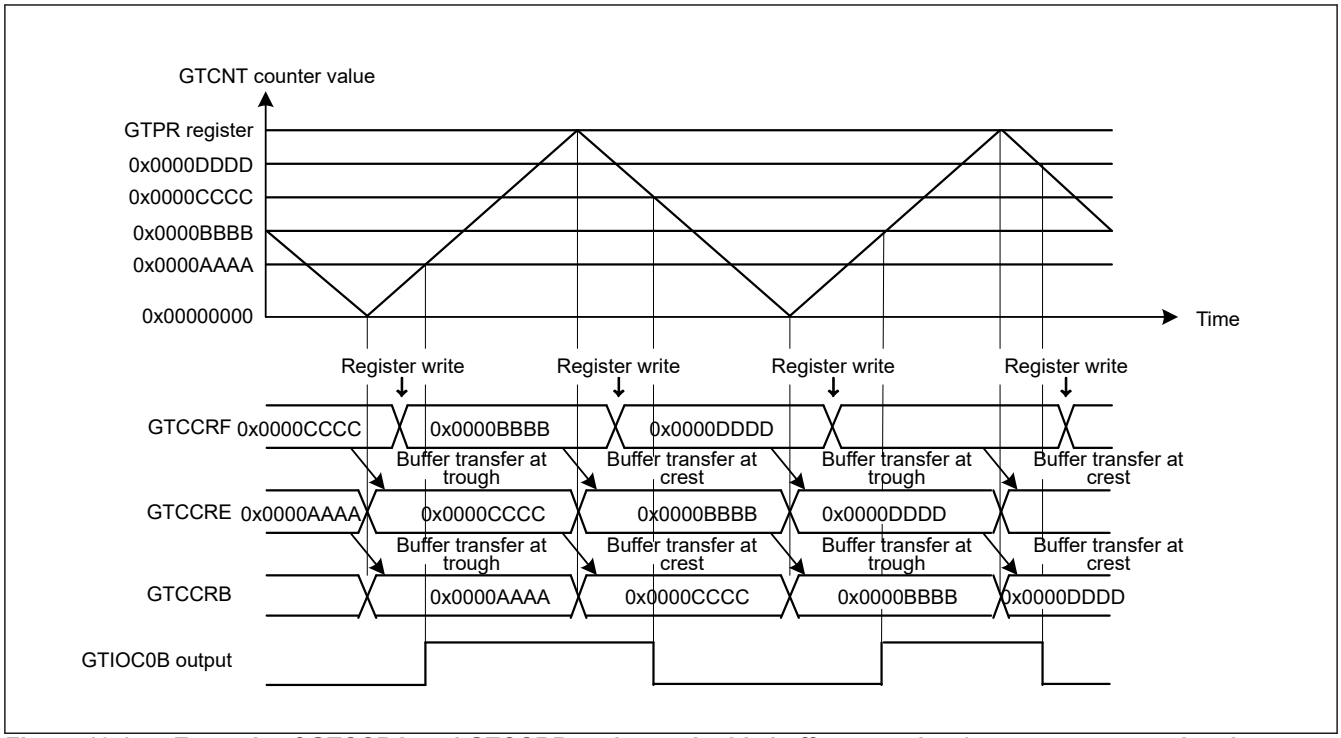

Figure 19.15 Example of GTCCRA and GTCCRB registers double buffer operation (output compare, triangle waves, buffer operation at both troughs and crests, output toggled at GTCCRB register compare match, output retained at the end of the cycle)

The following example shows setting for buffer operation of the GTCCRA and GTCCRB registers for output compare.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 19.13, 000b (sawtooth-wave PWM mode) is set, in Figure 19.14, 100b (triangle-wave PWM mode 1) is set, and in Figure 19.15, 101b (triangle-wave PWM mode 2) is set.
2. Set count direction
   Select the count direction (up or down) with the GTUDDTYC register.
   In Figure 19.13, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set GTIOCnm pin function
   Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 19.13, GTIOA[4:0] bits = 00110b, in Figure 19.14, GTIOA[4:0] bits = 00011b, and in Figure 19.15, GTIOB[4:0] bits = 00011b.
7. Enable GTIOCnm pin output
   Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8. Set buffer operation
   Set buffer operation with the GTBER.CCRA[1:0] bits and CCRB[1:0] bits.
   In Figure 19.13, CCRA[1:0] bits = 01b, in Figure 19.14, CCRA[1:0] bits = 1xb, and in Figure 19.15, CCRB[1:0] bits = 1xb.
9. Set compare match value
   Set the GTIOCnA pin changing point in the GTCCRA register and GTIOCnB pin changing point in the GTCCRB register.
10. Set buffer value

For buffer operation, set the GTIOCnA pin and GTIOCnB pin changing points in one cycle after the current cycle (in sawtooth-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA pin and GTIOCnB pin changing points in two cycles after the current cycle (in sawtooth-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRD and GTCCRF registers, respectively.

11. Set count operation
    Set the GTCR.CST bit to 1 to start count operation.
12. Set buffer value by cycle
    For buffer operation, set the GTIOCnA pin and GTIOCnB pin changing points in one cycle after the current cycle (in sawtooth-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA pin and GTIOCnB pin changing points in two cycles after the current cycle (in sawtooth-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRD and GTCCRF registers, respectively.

(2) When the GTCCRA or GTCCRB Register Functions as Input Capture Register

The timing of transfer to the buffers is when an input capture is generated. When an input capture is generated, the GTCNT counter value is transferred to GTCCRA and GTCCRB registers and the stored GTCCRA and GTCCRB registers values are transferred to buffer registers. Buffer transfer by counter clearing is not performed at input capture.

Figure 19.16 and Figure 19.17 show examples of buffer operation of the GTCCRA and GTCCRB registers.

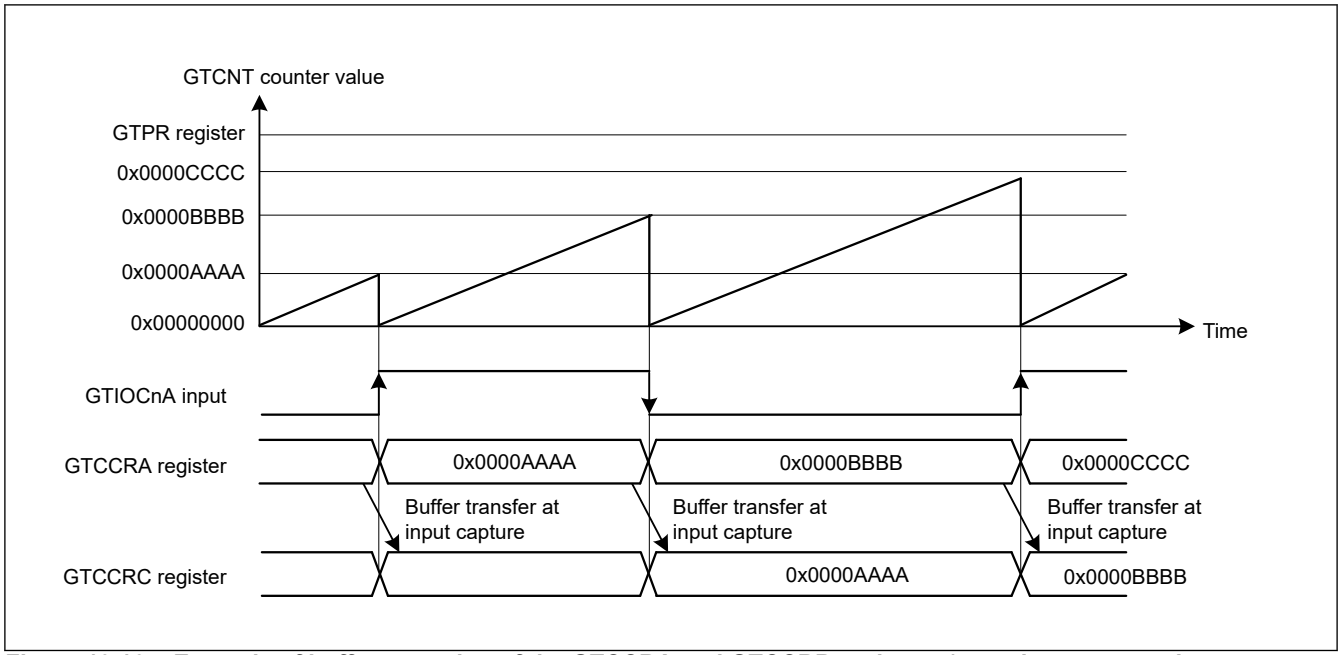

Figure 19.16 Example of buffer operation of the GTCCRA and GTCCRB registers (counting up to produce a sawtooth wave, and clearing the GTCNT counter and input capture on both edges of the input on the GTIOCnA pin) (n = 0 to 17)

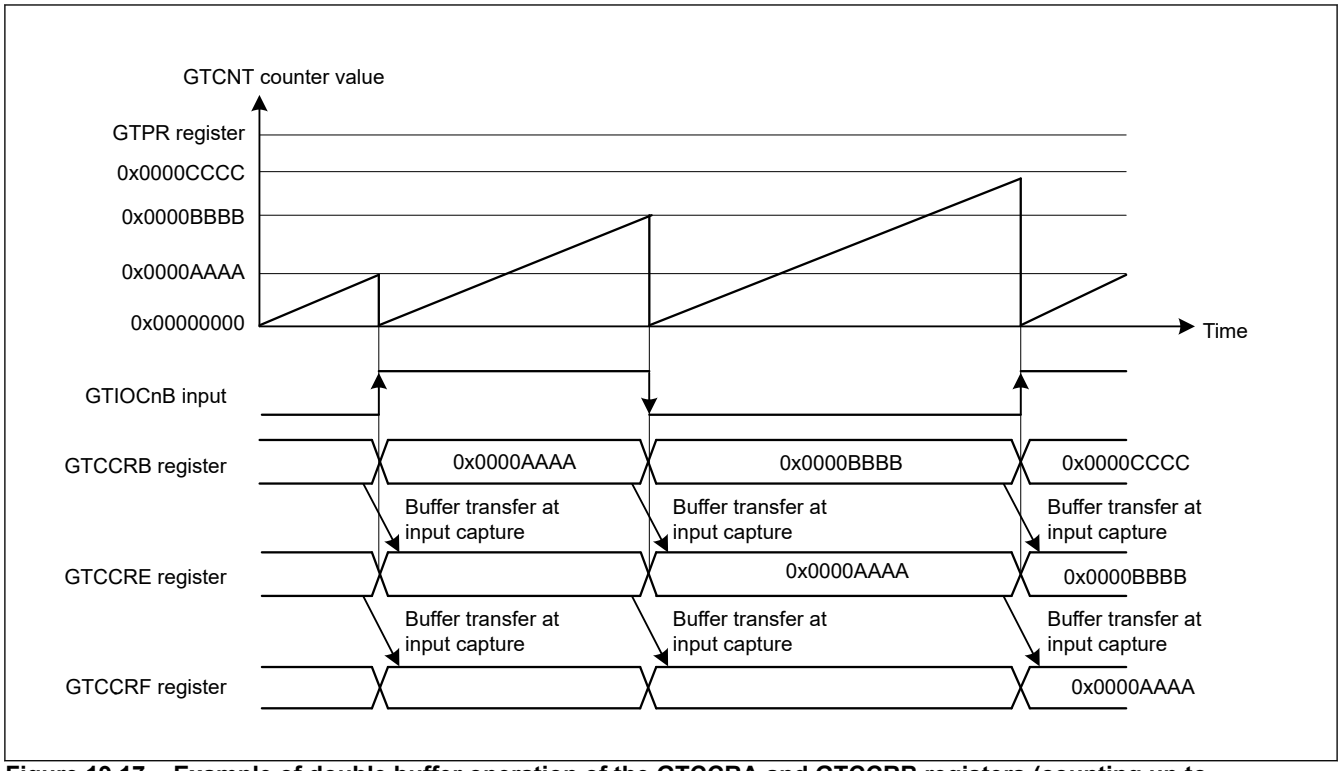

Figure 19.17 Example of double buffer operation of the GTCCRA and GTCCRB registers (counting up to produce a sawtooth wave, and clearing the GTCNT counter and input capture on both edges of the input on the GTIOCnB pin) (n = 0 to 17)

The following example shows setting for buffer operation of the GTCCRA and GTCCRB registers for input capture.

1. Set operating mode and counter clear source
   Set the operating mode with GTCR.MD[2:0] and counter clear source with the GTCSR register. In Figure 19.16, MD[2:0] = 000b (sawtooth-wave PWM mode) and GTCSR register = 0x00000F00 and in Figure 19.17, MD[2:0] bits = 000b (sawtooth-wave PWM mode) and GTCSR register = 0x0000F000.
2. Select count direction
   Select the count direction (up or down) with the GTUDDTYC register.
   In Figure 19.16, the lower 2 bits of GTUDDTYC register is set to 11b and then to 01b for up-counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set input capture source
   Select input capture sources with the GTICASR and GTICBSR registers. In Figure 19.16, GTICASR register = 0x00000F00 and in Figure 19.17, GTICBSR register = 0x0000F000.
7. Set buffer operation
   Set buffer operation with the GTBER.CCRA[1:0] bits and CCRB[1:0] bits.
   In Figure 19.16, CCRA[1:0] bits = 01b and in Figure 19.17, CCRB[1:0] bits = 1xb.
8. Set count operation
   Set the GTCR.CST bit to 1 to start count operation.

19.3.2.3 Buffer Operation for the GTADTRA and GTADTRB Registers

The GTADTBRA register can function as the GTADTRA buffer register and the GTADTDBRA register can function as the GTADTBRA buffer register (double buffer register for the GTADTRA register). Similarly, the GTADTBRB register can

function as the GTADTRB buffer register and the GTADTDBRB register can function as the GTADTBRB buffer register (double buffer register for the GTADTRB register).

To set the GTADTRA or GTADTRB register to function as a double buffer, set the GTBER.ADTDA or ADTDB bit to 1. For single buffer operation, set 0. Not to function as buffer, set the GTBER.ADTTA[1:0] or ADTTB[1:0] bits to 00b. The buffer transfer timing can be set with the ADTTA[1:0] and ADTTB[1:0] bits to an overflow (in up-counting) or an underflow (in down-counting) in sawtooth-wave mode, with ADTTA[1:0] and ADTTB[1:0] bits to 01b for a crest, to 10b for a trough, or to 11b for both crest and trough in triangle-wave mode.

In sawtooth-wave mode, when the ADTTA[1:0] and ADTTB[1:0] bits are set to value other than 00b and in count operation, the buffer transfer, by similar counter clearing sources in section 19.3.2.1. GTPR Register Buffer Operation, is performed in the same way at an overflow (in up-counting) or an underflow (in down-counting).

Figure 19.18 to Figure 19.20 show examples of buffer operation of the GTADTRA and GTADTRB registers.

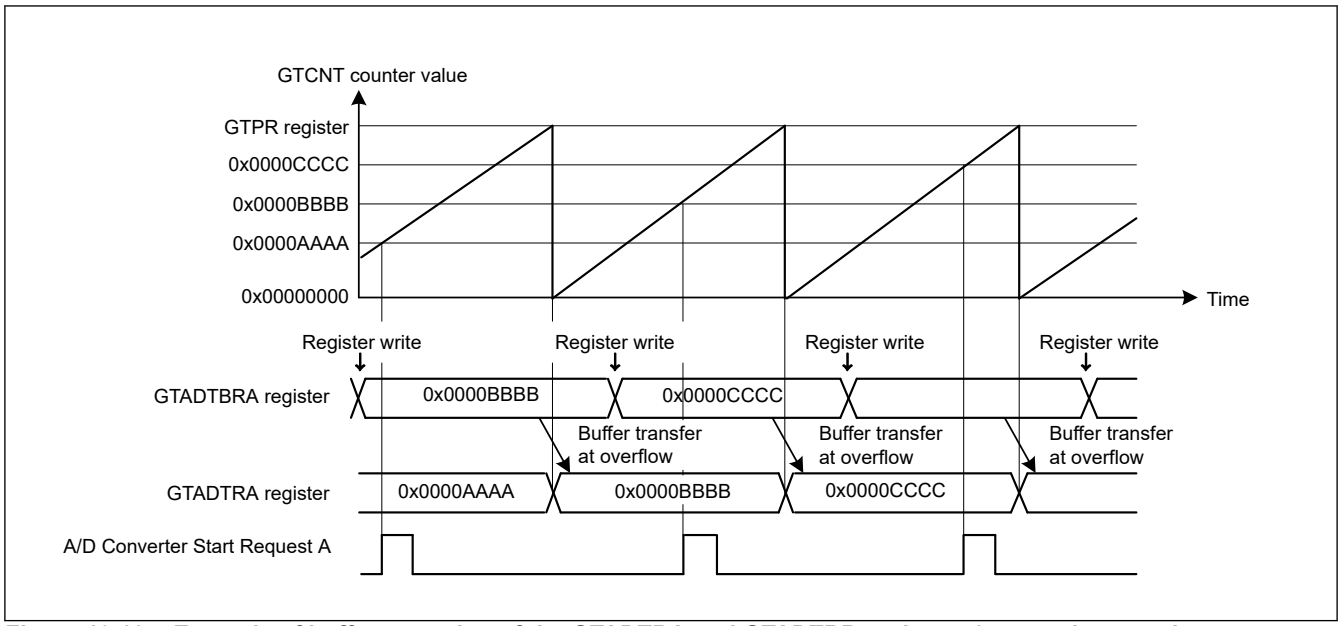

Figure 19.18 Example of buffer operation of the GTADTRA and GTADTRB registers (sawtooth waves in up-counting, A/D converter start request generated by up-counting)

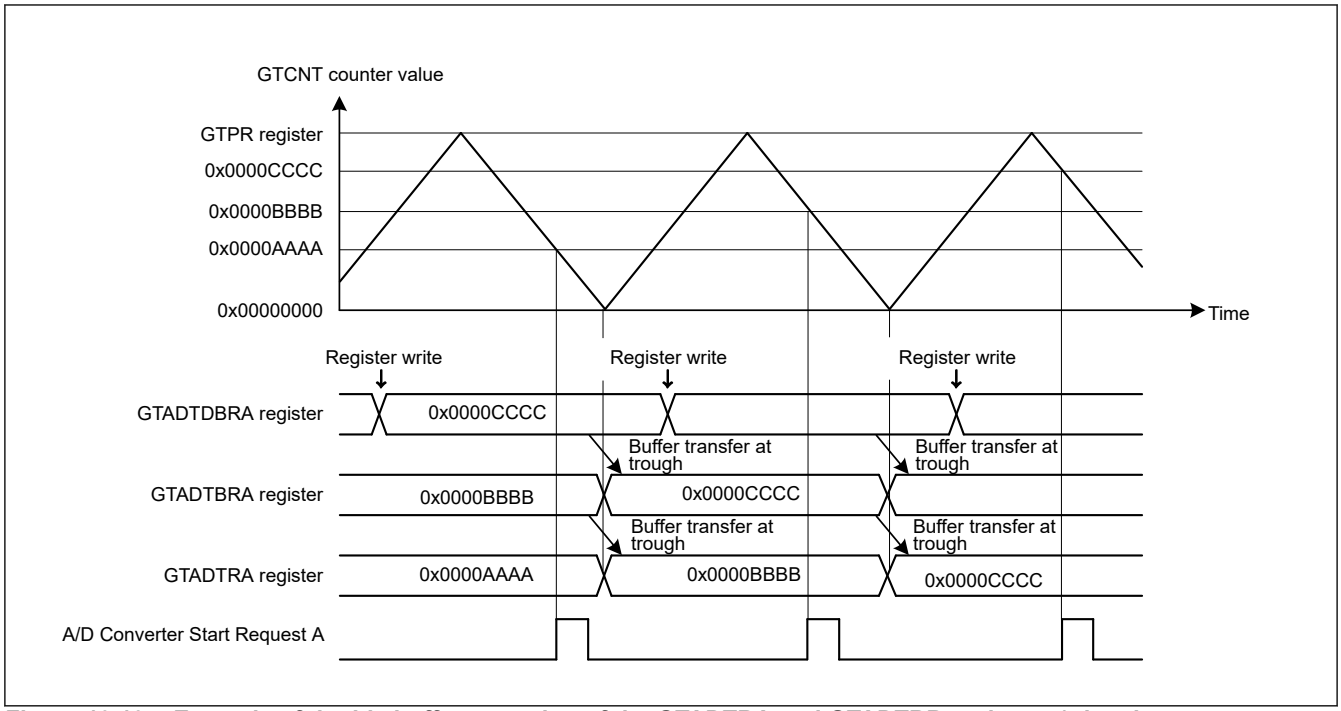

Figure 19.19 Example of double buffer operation of the GTADTRA and GTADTRB registers (triangle waves, buffer transfer at troughs, A/D converter start request generated by down-counting)

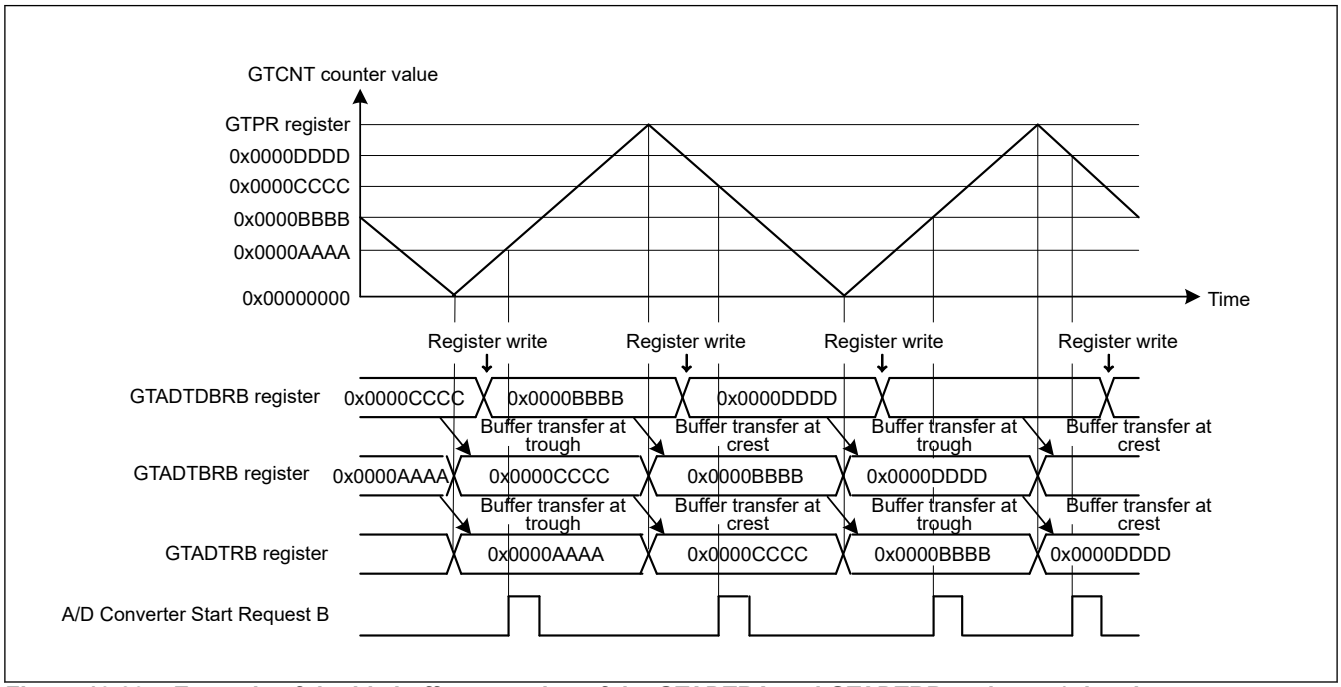

Figure 19.20 Example of double buffer operation of the GTADTRA and GTADTRB registers (triangle waves, buffer transfer at both troughs and crests, A/D converter start request generated by both up-counting and down-counting)

The following example shows setting for buffer operation of the GTADTRA and GTADTRB registers.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 19.18, 000b (sawtooth-wave PWM mode) is set, and in Figure 19.19 and Figure 19.20, 100b, 101b, or 110b (triangle-wave PWM mode) is set.
2. Set count direction
   Select the count direction (up or down) with the GTUDDTYC register.
   In Figure 19.18, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.

3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set buffer operation
   Set buffer operation with the ADTTA[1:0], ADTTB[1:0], ADTDA, and ADTDB bits in the GTBER register. In Figure 19.18, ADTTA[1:0] bits = 01b, 10b, or 11b and ADTDA bit = 0. In Figure 19.19, ADTTA[1:0] bits = 10b and ADTDA bit = 1, and in Figure 19.20, ADTTB[1:0] bits = 11b and ADTDB bit = 1.
7. Set compare match value
   Set the A/D converter start request point in the GTADTRA and GTADTRB registers.
8. Set buffer value
   For buffer operation, set the A/D converter start request point in one cycle after the current cycle (in sawtooth-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers. For double buffer operation, also set the A/D converter start request points in two cycle after the current cycle (in sawtooth-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTDBRA and GTADTDBRB registers.
9. Enable A/D converter start request
   Set the enable A/D converter start request with the ADTRAUEN, ADTRADEN, ADTRBUEN, and ADTRBDEN bits in the GTINTAD register. In Figure 19.18, ADTRAUEN bit = 1, in Figure 19.19, ADTRADEN bit = 1, and in Figure 19.20, ADTRBUEN bit = 1 and ADTRBDEN bit = 1 .
10. Set count operation
    Set the GTCR.CST bit to 1 to start count operation.
11. Set buffer value for each cycle
    For buffer operation, set the A/D converter start request point in one cycle after the current cycle (in sawtooth-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers. For double buffer operation, set the A/D converter start request points in two cycle after the current cycle (in sawtooth-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTDBRA and GTADTDBRB registers.

19.3.3 PWM Output Operating Mode

The GPT can output PWM waveforms to the GTIOCnA pin or GTIOCnB pin (n = 0 to 17) by a compare match between the GTCNT counter and the GTCCRA or GTCCRB register.

By setting the GTDTCR, GTDVU, and GTDVD registers, the compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.

(1) Sawtooth-Wave PWM Mode

In sawtooth-wave PWM mode, the GTCNT counter performs sawtooth-wave (half-wave) operation by setting the period in the GTPR register and a PWM waveform is output to the GTIOCnA or GTIOCnB pin when a GTCCRA or GTCCRB register compare match occurs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the end of the cycle according to the GTIOR register setting.

Figure 19.21 shows an example of sawtooth-wave PWM mode operation.

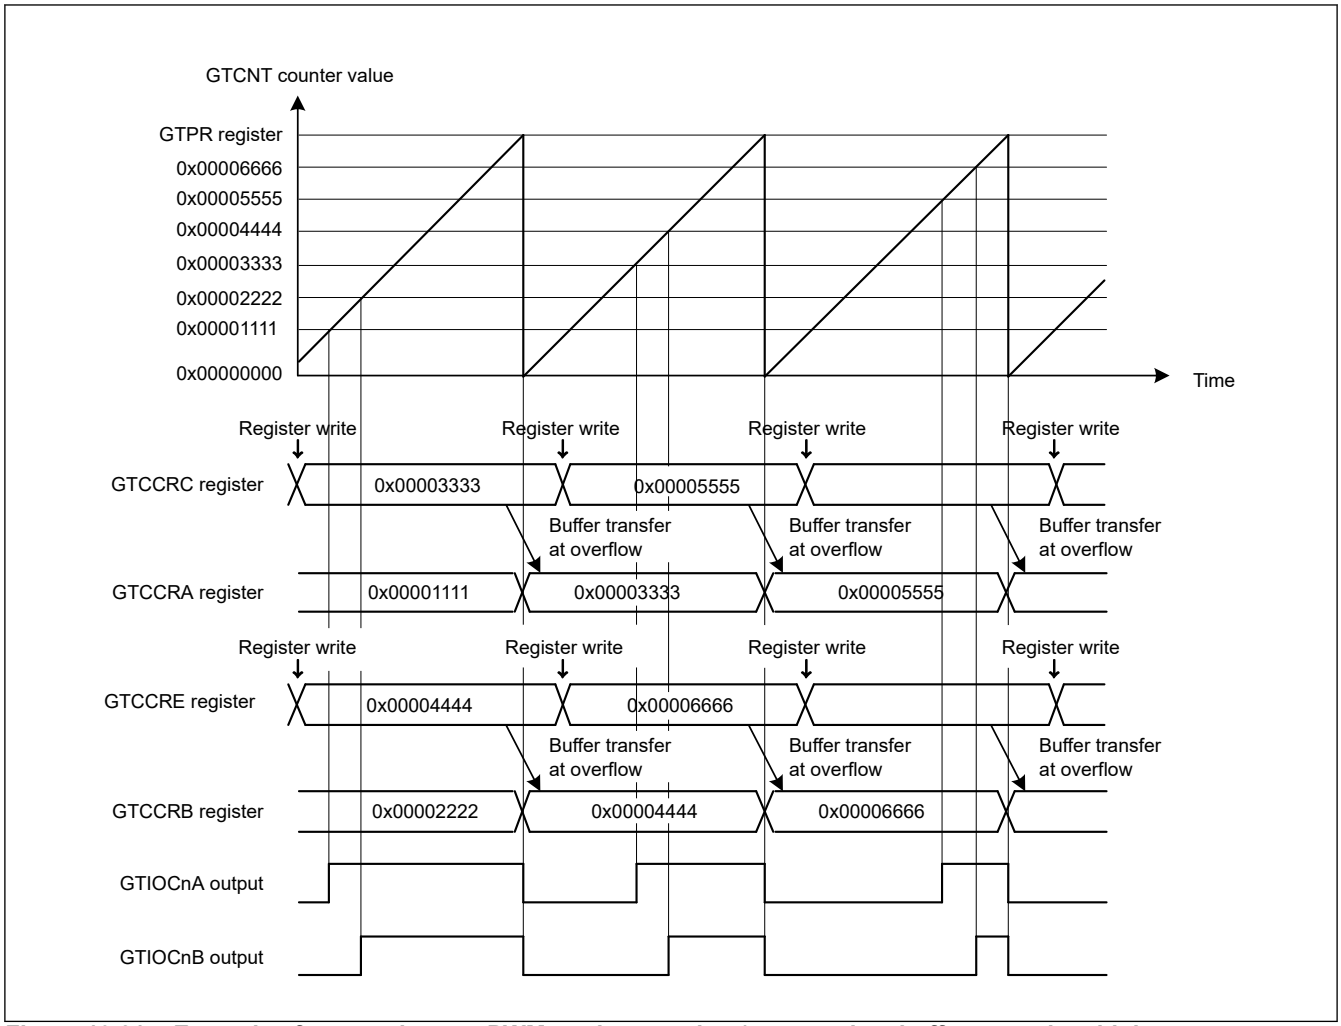

Figure 19.21 Example of sawtooth-wave PWM mode operation (up-counting, buffer operation, high output at GTCCRA/GTCCRB register compare match, low output at the end of the cycle) (n = 0 to 17)

The following example shows setting for sawtooth-wave PWM mode.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 19.21, 000b (sawtooth-wave PWM mode) is set.
2. Set count direction
   Select the count direction (up or down) with the GTUDDTYC register.
   In Figure 19.21, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set GTIOCnm pin function
   Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 19.21, GTIOA[4:0] bits = 00110b and GTIOB[4:0] bits = 00110b.
7. Enable GTIOCnm pin output
   Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8. Set buffer operation
   Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register.
   In Figure 19.21, CCRA[1:0] bits = 01b and CCRB[1:0] bits = 01b.

9. Set compare match value
   Set the GTIOCnA pin changing point in the GTCCRA register and the GTIOCnB pin changing point in the GTCCRB register.
10. Set buffer value
    For buffer operation, set the GTIOCnA and the GTIOCnB pin changing points in one cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA pin and GTIOCnB pin changing points in two cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.
11. Set count operation
    Set the GTCR.CST bit to 1 to start count operation.
12. Set buffer value for each cycle
    For buffer operation, set the GTIOCnA pin and the GTIOCnB pin changing point in one cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively.
    For double buffer operation, set the GTIOCnA pin and GTIOCnB pin changing points in two cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.

Note: n = 0 to 17, m = A, B

(2) Sawtooth-Wave One-Shot Pulse Mode

The sawtooth-wave one-shot pulse mode is a mode in which the period is set in the GTPR register, the GTCNT counter performs sawtooth-wave (half-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 17) at a compare match of the GTCCRA or GTCCRB register with buffer operation fixed.

Buffer operation in sawtooth-wave one-shot pulse mode is different from the usual buffer operation. Buffer transfer is performed from the following registers:

- GTCCRC register to GTCCRA register at the end of the cycle
- GTCCRE register to GTCCRB register at the end of the cycle
- GTCCRD register to temporary register A at the end of the cycle
- GTCCRF register to temporary register B at the end of the cycle
- Temporary register A to GTCCRA register at a GTCCRA register compare match
- Temporary register B to GTCCRB register at a GTCCRB register compare match

The pin output value can be selected from low output, high output, or toggle output separately for a compare match and the end of the cycle according to the GTIOR register setting.

The temporary register A and the temporary register B can perform forcible buffer transfer from the GTCCRD register to the temporary register A and from the GTCCRF register to the temporary register B respectively by writing 1 to the GTBER.CCRSW bit while the count is stopped.

By setting the GTDTCR, GTDVU, and GTDVD registers, a compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.

When the GTBER.DBRTECm (m = A, B) bit is set to 1, transfer from an intermediate buffer to the GTCCRm register is repeated on a cyclic basis by using the temporary register x (x = C, E) and temporary register m which operate as intermediate buffers for the GTCCRx and GTCCRm registers, respectively, even while buffer transfer is disabled (repeated double buffer operation function during disabling of buffer transfer). For details, see section 19.8.2.2. Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer.

Figure 19.22 shows an example of sawtooth-wave one-shot pulse mode operation.

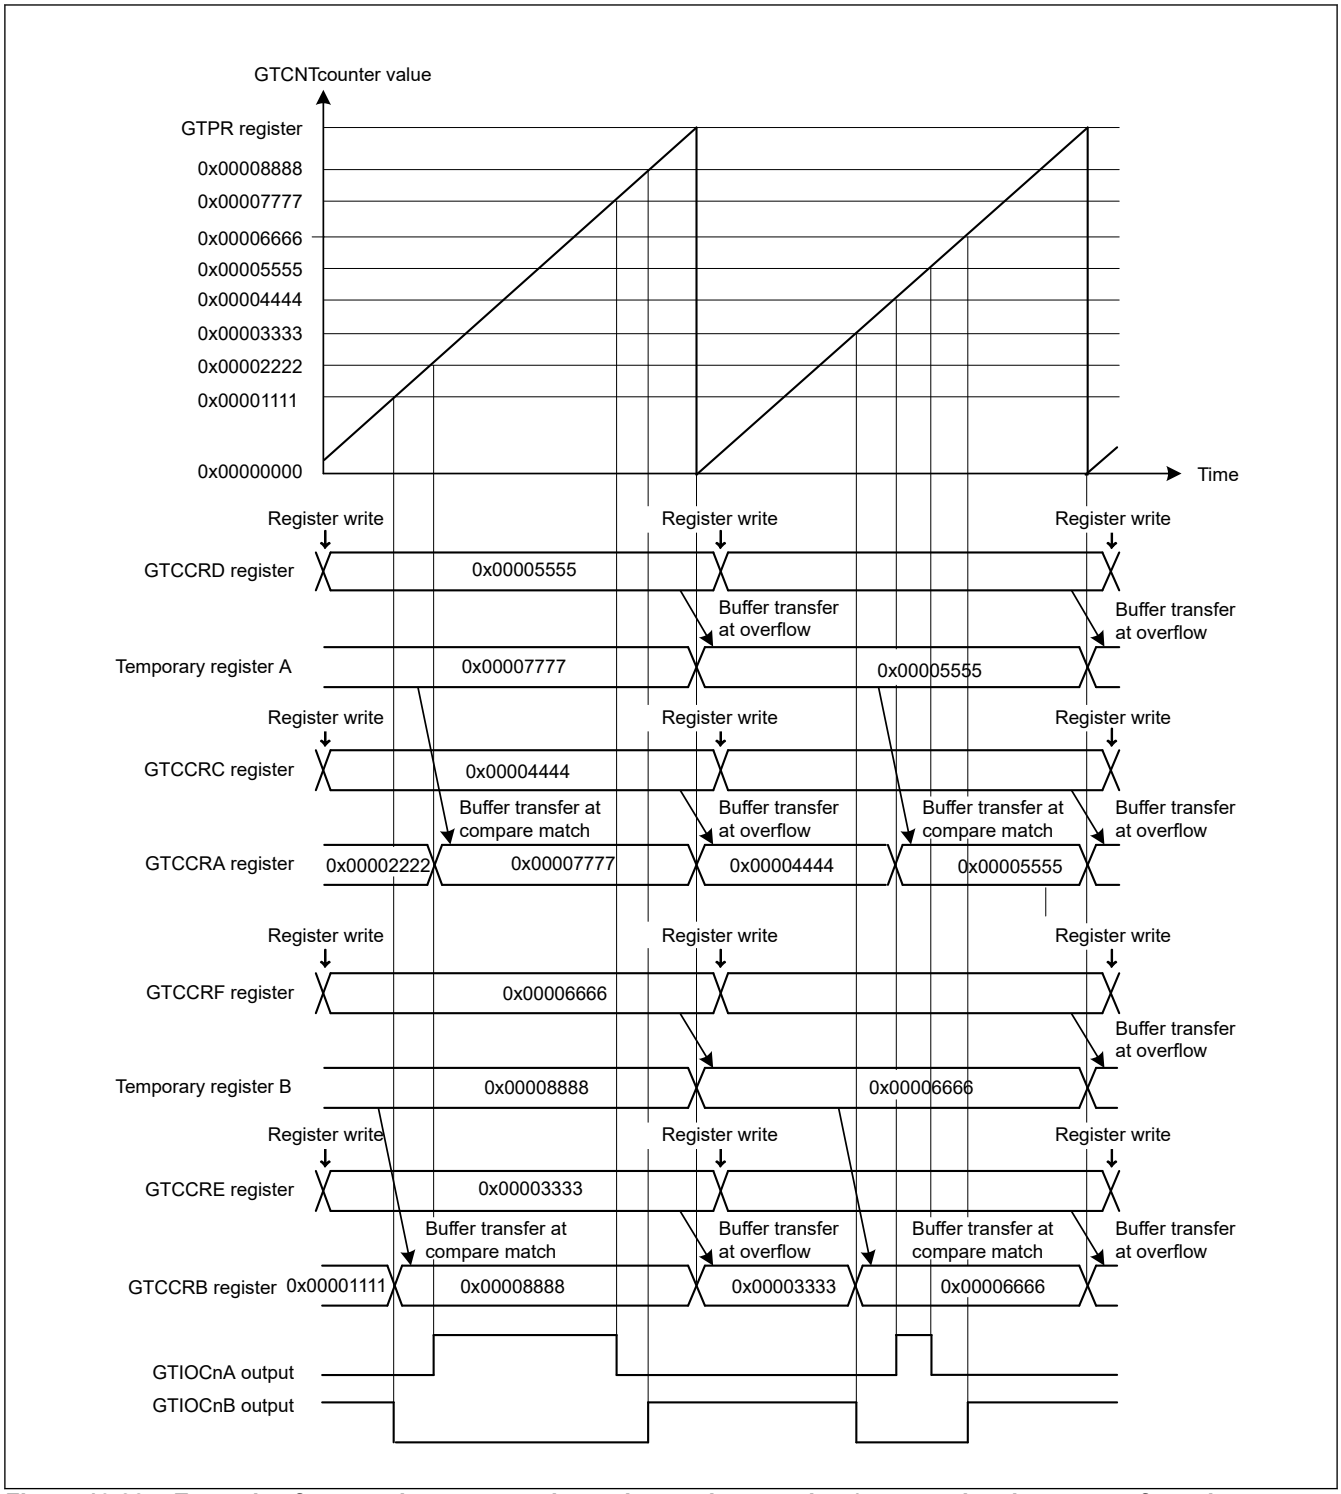

Figure 19.22 Example of sawtooth-wave one-shot pulse mode operation (up-counting, low output from the GTIOCnA pin and high output from the GTIOCnB pin at initial output, output toggled at GTCCRA/GTCCRB register compare match, output retained at the end of the cycle)

The following example shows setting for sawtooth-wave one-shot PWM mode.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits. In Figure 19.22, 001b (sawtooth-wave PWM one-shot mode) is set.
2. Set count direction
   Select the count direction (up or down) with the GTUDDTYC register.
   In Figure 19.22, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.

3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set GTIOCnm pin function
   Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register.
   In Figure 19.22, GTIOA[4:0] bits = 00011b and GTIOB[4:0] bits = 10011b.
7. Enable GTIOCnm pin output
   Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8. Set buffer value
   Set the GTIOCnA pin changing point immediately after the count start in the GTCCRC and GTCCRD registers and the GTIOCnB pin changing point in the GTCCRE and GTCCRF registers.
9. Set forcible buffer transfer
   Set the GTBER.CCRSWT bit to 1 to forcibly transfer buffer register data.
10. Set buffer value
    For buffer operation, set the GTIOCnA pin changing point for the next cycle from the current cycle to the GTCCRC and GRCCRD registers, and set the GTIOCnB pin changing point for the next cycle from the current cycle to the GTCCRE and GTCCRF registers.
11. Set count operation
    Set the GTCR.CST bit to 1 to start count operation.
12. Set buffer value by cycle
    For buffer operation, set the GTIOCnA pin changing point for next cycle from the current cycle to the GTCCRC and GTCCRD registers and set the GTIOCnB pin changing point for the next cycle from the current cycle to the GTCCRE and GTCCRF registers.

Note: n = 0 to 17, m = A, B

(3) Triangle-Wave PWM Mode 1 (32-Bit Transfer at Trough)

The triangle-wave PWM mode 1 is a mode in which the period is set in the GTPR register, the GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 17) when a GTCCRA or GTCCRB register compare match occurs.

Buffer transfer is performed at the trough. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the end of the cycle according to the GTIOR register setting.

By setting the GTDTCR, GTDVU, and GTDVD registers, a compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.

Figure 19.23 shows an example of triangle-wave PWM mode 1 operation.

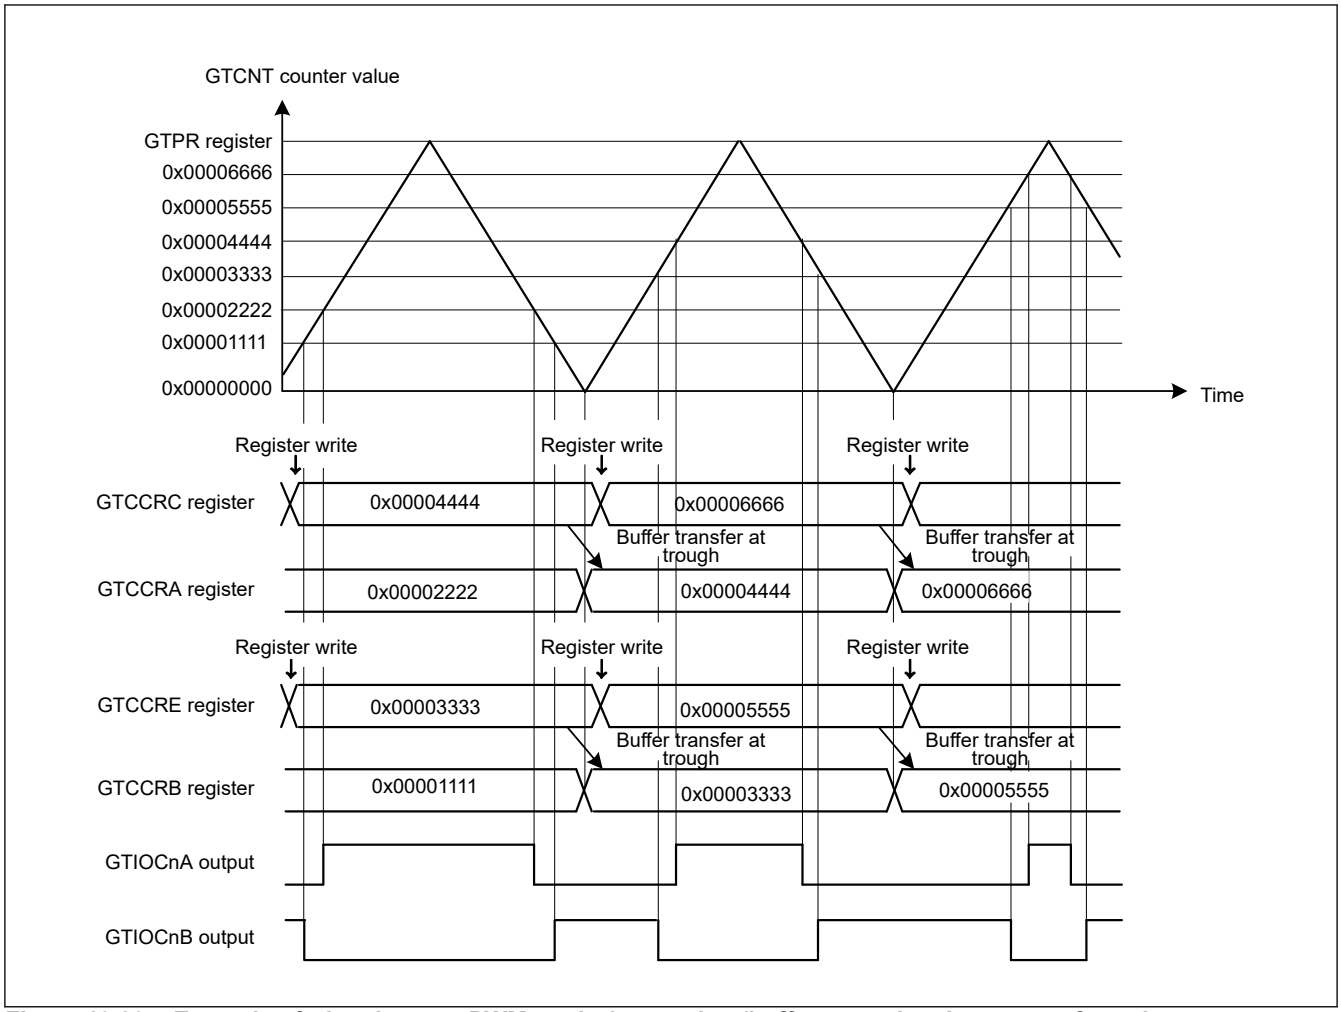

Figure 19.23 Example of triangle-wave PWM mode 1 operation (buffer operation, low output from the GTIOCnA pin and high output from the GTIOCnB pin at initial output, output toggled at GTCCRA/GTCCRB register compare match, output retained at the end of the cycle) (n = 0 to 17)

The following example shows setting for triangle-wave PWM mode 1.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 19.23, 100b (triangle-wave PWM mode 1) is set.
2. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
3. Period setting
   Set a period in the GTPR register.
4. Set initial value for counter
   Set the initial value in the GTCNT counter.
5. Set GTIOCnm pin function
   Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 19.23, GTIOA[4:0] bits = 00011b and GTIOB[4:0] bits = 10011b.
6. Enable GTIOCnm pin output
   Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
7. Set buffer operation
   Set buffer operation with CCRA[1:0] and CCRB[1:0] bits in the GTBER register.
   In Figure 19.23, CCRA[1:0] bits = 01b and CCRB[1:0] bits = 01b.
8. Set compare match value

Set the GTIOCnA pin changing point in the GTCCRA register and GTIOCnB pin changing point in the GTCCRB register.

9. Set buffer value
   For buffer operation, set the GTIOCnA pin and GTIOCnB pin changing points in one cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA pin and GTIOCnB pin changing points in two cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.
10. Set count operation
    Set the GTCR.CST bit to 1 to start count operation.
11. Set buffer value by cycle
    For buffer operation, set the GTIOCnA pin and GTIOCnB pin changing points in one cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively.
    For double buffer operation, set the GTIOCnA pin and GTIOCnB pin changing points in two cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.

Note: n = 0 to 17, m = A, B

(4) Triangle-Wave PWM Mode 2 (32-Bit Transfer at Crest and Trough)

Similarly to triangle-wave PWM mode 1, in triangle-wave PWM mode 2, the period is set in the GTPR register, the GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 17) when a GTCCRA or GTCCRB register compare match occurs. The buffer transfer is performed at both crests and troughs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the end of the cycle according to the GTIOR register setting.

By setting the GTDTCR, GTDVU, and GTDVD registers, a compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.

Figure 19.24 shows an example of triangle-wave PWM mode 2 operation.

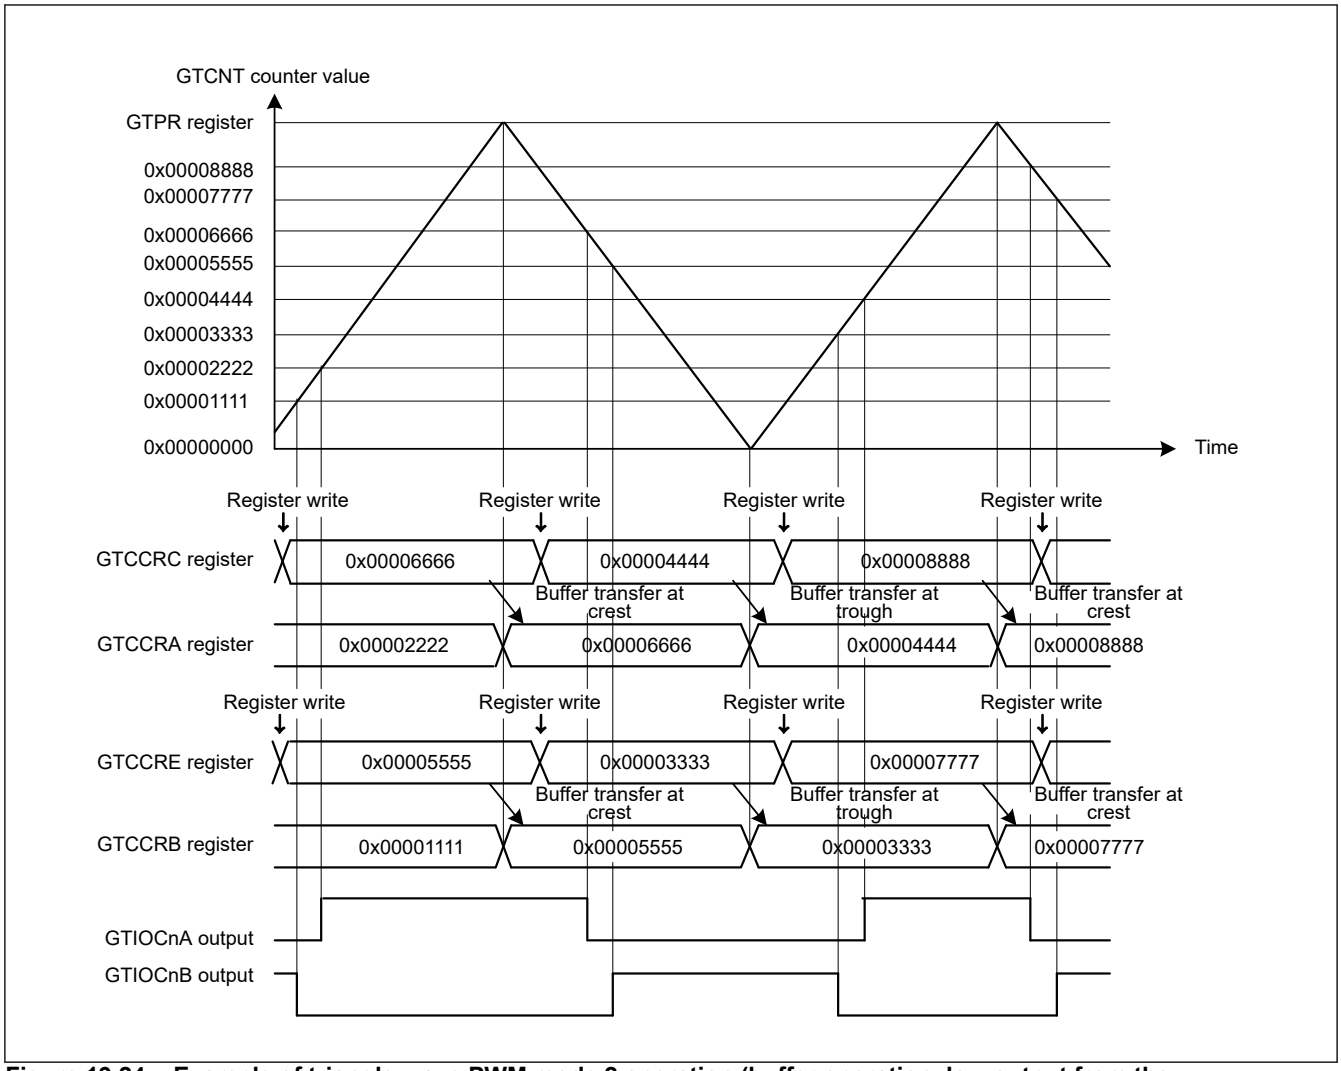

Figure 19.24 Example of triangle-wave PWM mode 2 operation (buffer operation, low output from the GTIOCnA pin and high output from the GTIOCnB pin at initial output, output toggled at GTCCRA/GTCCRB register compare match, output retained at the end of the cycle) (n = 0 to 17)

The following example shows setting for triangle-wave PWM mode 2.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 19.24, 101b (triangle-wave PWM mode 2) is set.
2. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
3. Period setting
   Set a period in the GTPR register.
4. Set initial value for counter
   Set the initial value in the GTCNT counter.
5. Set GTIOCnm pin function
   Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 19.24, GTIOA[4:0] bits = 00011b and GTIOB[4:0] bits = 10011b.
6. Enable GTIOCnm pin output
   Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
7. Set buffer operation
   Set buffer operation with CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In Figure 19.24, CCRA[1:0] bits = 01b and CCRB[1:0] bits = 01b.

8. Set compare match value
   Set the GTIOCnA pin changing point in the GTCCRA register and GTIOCnB pin changing point in the GTCCRB register.
9. Set buffer value
   For buffer operation, set the GTIOCnA pin and GTIOCnB pin changing points in half cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively.
   For double buffer operation, also set the GTIOCnA pin and GTIOCnB pin changing points in one cycle after the current cycle in the GTCCRD and GTCCRF registers, respectively.
10. Set count operation
    Set the GTCR.CST bit to 1 to start count operation.
11. Set buffer value by half cycle
    For buffer operation, set the GTIOCnA pin and GTIOCnB pin changing points in half cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively.
    For double buffer operation, also set the GTIOCnA pin and GTIOCnB pin changing points in one cycle after the current cycle in the GTCCRD and GTCCRF registers, respectively.

Note: n = 0 to 17, m = A, B

(5) Triangle-Wave PWM Mode 3 (64-Bit Transfer at Trough)

The triangle-wave PWM mode 3 is a mode in which the period is set in the GTPR register, the GTCNT counter performs triangle-wave (full-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 17) at a compare match of the GTCCRA or GTCCRB register with buffer operation fixed. Buffer operation in triangle-wave PWM mode 3 is different from the usual buffer operation. Buffer transfer is performed from the following registers:

- GTCCRC register to GTCCRA register at the trough
- GTCCRE register to GTCCRB register at the trough
- GTCCRD register to temporary register A at the trough
- GTCCRF register to temporary register B at the trough
- Temporary register A to GTCCRA register at the crest
- Temporary register B to GTCCRB register at the crest

The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the end of the cycle according to the GTIOR register setting.

By setting the GTDTCR, GTDVU, and GTDVD registers, a compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.

When the GTBER.DBRTECm (m = A, B) bit is set to 1, transfer from an intermediate buffer to the GTCCRm (m = A, B) register is repeated on a cyclic basis using the temporary register x (x = C, E) and temporary register m (m = A, B) which operate as intermediate buffers for the GTCCRx (x = C, E) and GTCCRm registers, respectively, even while buffer transfer is disabled (repeated double buffer operation function during disabling of buffer transfer). For details, see section 19.8.2.2. Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer.

Figure 19.25 shows an example of triangle-wave PWM mode 3 operation.

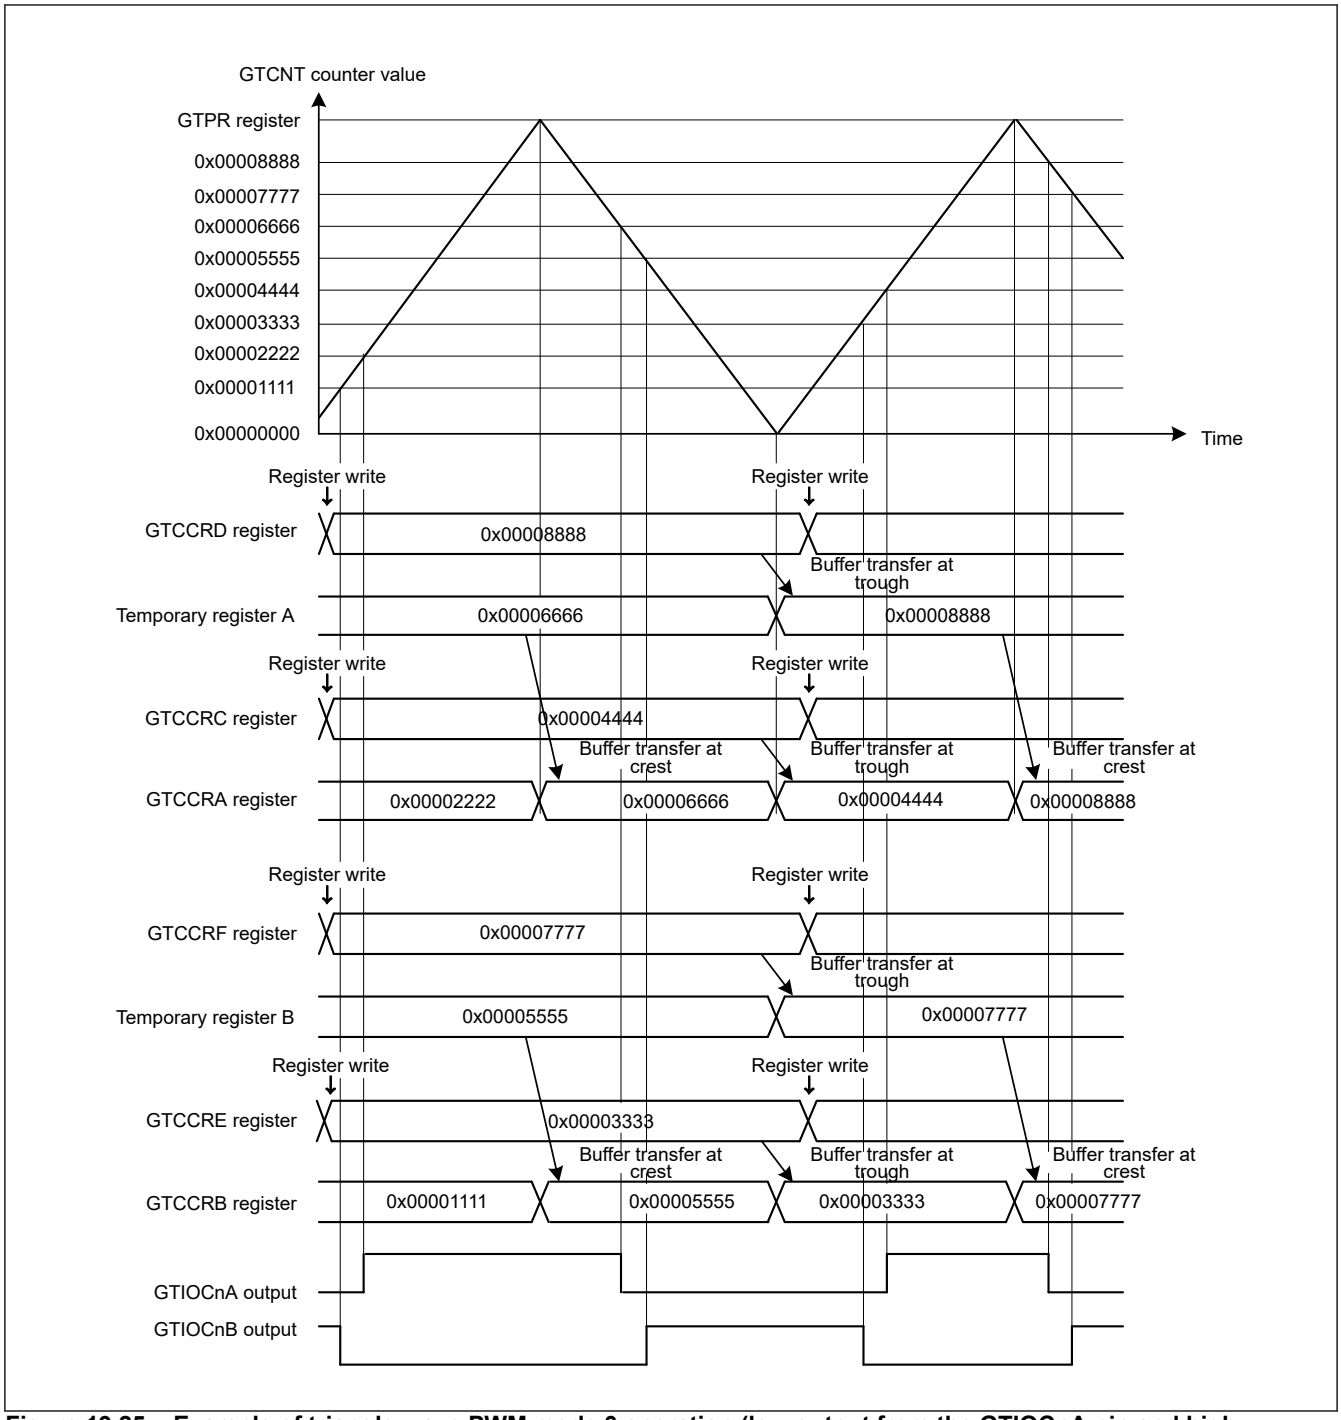

Figure 19.25 Example of triangle-wave PWM mode 3 operation (low output from the GTIOCnA pin and high output from the GTIOCnB pin at initial output, output toggled at GTCCRA/GTCCRB register compare match, output retained at the end of the cycle) (n = 0 to 17)

The following example shows setting for triangle-wave PWM mode 3.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 19.25, 110b (triangle-wave PWM mode 3) is set.
2. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
3. Period setting
   Set a period in the GTPR register.
4. Set initial value for counter

Set the initial value in the GTCNT counter.

5. Set GTIOCnm pin function
   Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 19.25, GTIOA[4:0] bits = 00011b and GTIOB[4:0] bits = 10011b.
6. Enable GTIOCnm pin output
   Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
7. Set buffer value
   Set the GTIOCnA pin changing point immediately after the count start in the GTCCRC and GTCCRD registers and the GTIOCnB pin changing point in the GTCCRE and GTCCRF registers.
8. Set forcible buffer transfer
   Set the GTBER.CCRSWT bit to 1 to forcibly transfer buffer register data.
9. Set buffer value
   For buffer operation, set the GTIOCnA pin changing point for the next cycle from the current cycle to the GTCCRC and GRCCRD registers, and set the GTIOCnB pin changing point for the next cycle from the current cycle to the GTCCRE and GTCCRF registers.
10. Set count operation
    Set the GTCR.CST bit to 1 to start count operation.
11. Set buffer value by cycle
    For buffer operation, set the GTIOCnA pin changing point for next cycle from the current cycle to the GTCCRC and GTCCRD registers and set the GTIOCnB pin changing point for the next cycle from the current cycle to the GTCCRE and GTCCRF registers.

Note: n = 0 to 17, m = A, B

19.3.4 Automatic Dead Time Setting Function

By setting the GTDTCR register, a compare match value for a negative waveform with dead time obtained by a compare match value for a positive waveform (the GTCCRA register value) and specified dead time values (the GTDVU and GTDVD registers values) can automatically be set to the GTCCRB register.

The automatic dead time setting function can be used in sawtooth-wave one-shot pulse mode and all the triangle PWM modes.

Dead time can be separately set for the first half and second half of a waveform. Dead time for the changing point in the first half of a negative waveform is set in the GTDVU register and that in the second half is set in the GTDVD register. The same dead time can also be set for the first and second halves by setting the GTDTCR.TDFER bit to 1.

The GTDBU register can be used as a buffer register of the GTDVU register, and the GTDBD register can be used as a buffer register of the GTDVD register. Buffer transfer is performed at the end of the cycle (in sawtooth-wave mode: either of an overflow of the GTCNT counter (up-counting), an underflow (down-counting), or the GTCNT counter clearing in triangle-wave mode: a trough).

The change point of the negative-phase waveform, which is automatically calculated, is obtained by reading the GTCCRB register. Writing to the GTCCRB register is prohibited when the automatic dead time setting function is used.

Do not set the dead-time that makes the change point of the waveform exceeding the count period. When a dead-time setting which would generate a dead-time error is made, adjust the change points of the positive- and negative-phase waveforms to generate waveforms with secured dead-time as shown in Table 19.8. The adjusted change point of the negative-phase waveform is automatically set in the GTCCRB register. An internal signal is used to determine the change point of the positive-phase waveform, thus the value of the GTCCRA register is not updated by the adjusted value.

In sawtooth-wave one-shot pulse mode, if the order of the change point becomes inconsistent by adjustment of the waveform change point due to occurrence of dead time errors, or if the change point exceeds the count period even after the adjustment, the complementary relation between the positive- and negative-phases cannot be guaranteed.

In triangle-wave PWM mode, if dead-time exceeds the count period by setting 0x00000000 or a value greater than or equal to the setting value of the GTPR register is set in the GTCCRA register, output change is controlled by the output protection function (see section 19.8.4. GTIOCnm Protection Function for GTIOCnm Pin Output (n = 0 to 17, m = A, B)). When GTCCRA register is greater than or equal to [GTPR register + GTDVm (m = U, D) register], [GTPR register − 1] is set in the GTCCRB register as the upper limit.

Automatic setting for a dead time value to the GTCCRB register is performed at the next count clock after the register value for calculating the automatic setting value is updated. In triangle-wave mode, it can also be done at the next count clock from the current crest.

Table 19.8 Adjustment of the waveform change point when a dead-time error occurs

Mode	Count direction	Period	Condition for dead-time error	Change point of the positive-phase waveform after adjustment	Change point of the negative-phase waveform after adjustment
Sawtooth-wave one-shot pulse mode	Up-counting	First half	GTCCRA − GTDVU < 0	GTDVU	0
		Second half	GTCCRA + GTDVD > GTPR	GTPR − GTDVD	GTPR
	Down-counting	First half	GTCCRA + GTDVU > GTPR	GTPR − GTDVU	GTPR
		Second half	GTCCRA − GTDVD < 0	GTDVD	0
Triangle-wave PWM mode 1/2/3	Up-counting	(First half)	GTCCRA − GTDVU ≤ 0	GTDVU + 1	1
	Down-counting	(Second half)	GTCCRA − GTDVD < 0	GTDVD	0

Figure 19.26 to Figure 19.28 show examples of automatic dead time setting function operation.

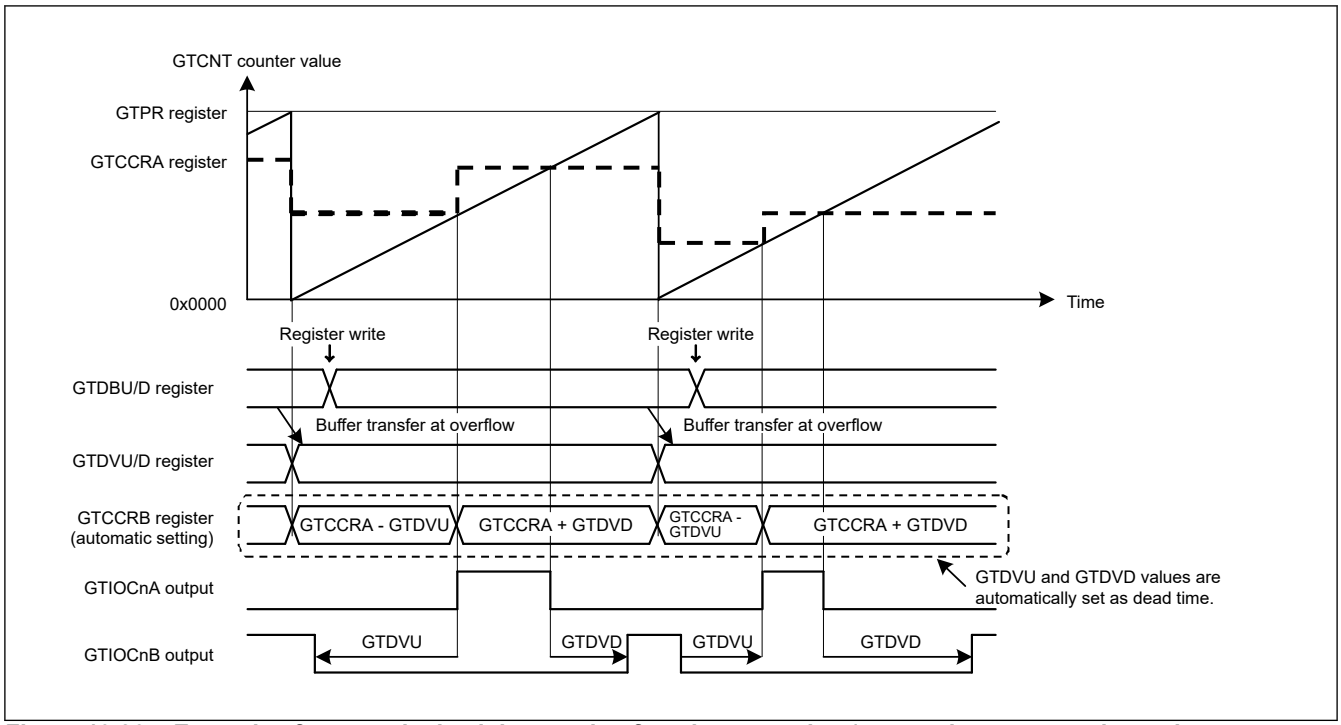

Figure 19.26 Example of automatic dead time setting function operation (sawtooth-wave one-shot pulse mode, up-counting, GTDVU and GTDVD registers set to buffer operation, active-level: high) (n = 0 to 17)

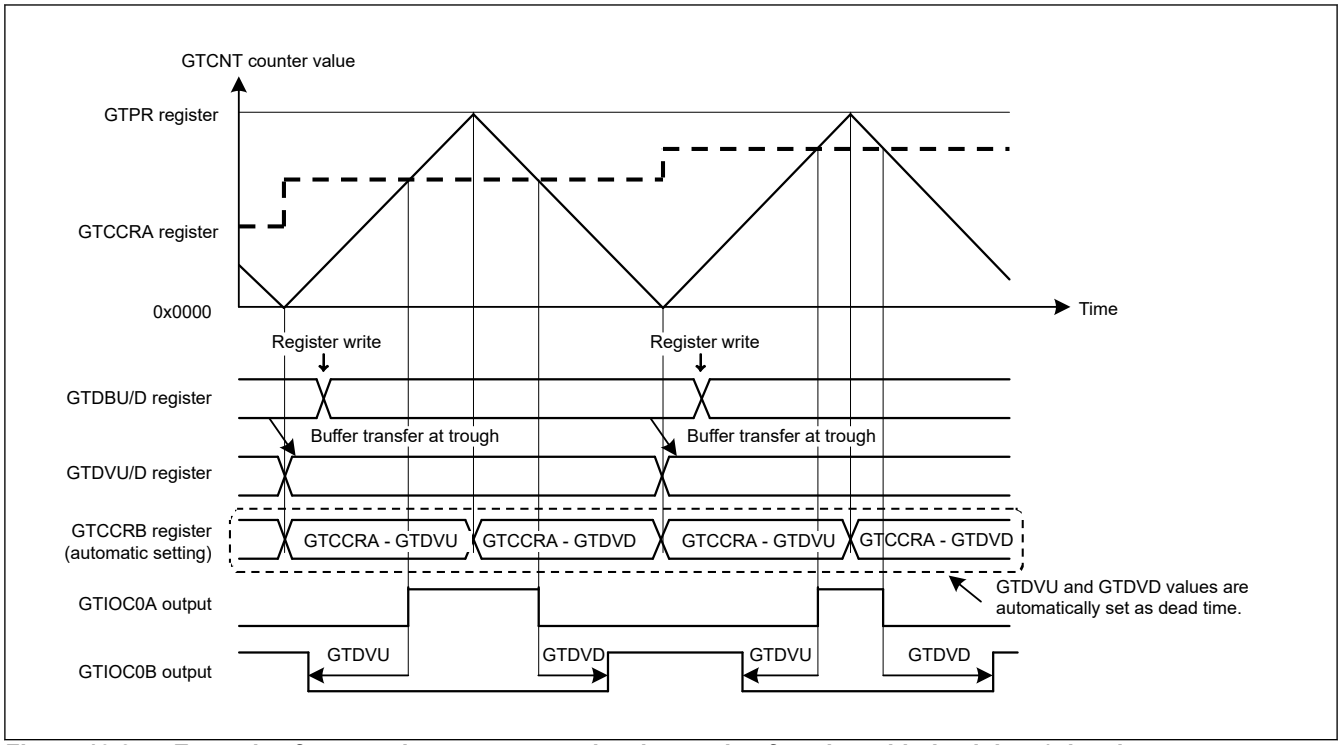

Figure 19.27 Example of automatic compare-match value setting function with dead time (triangle-wave PWM mode 1, GTDVU and GTDVD registers set to buffer operation, active-level: high)

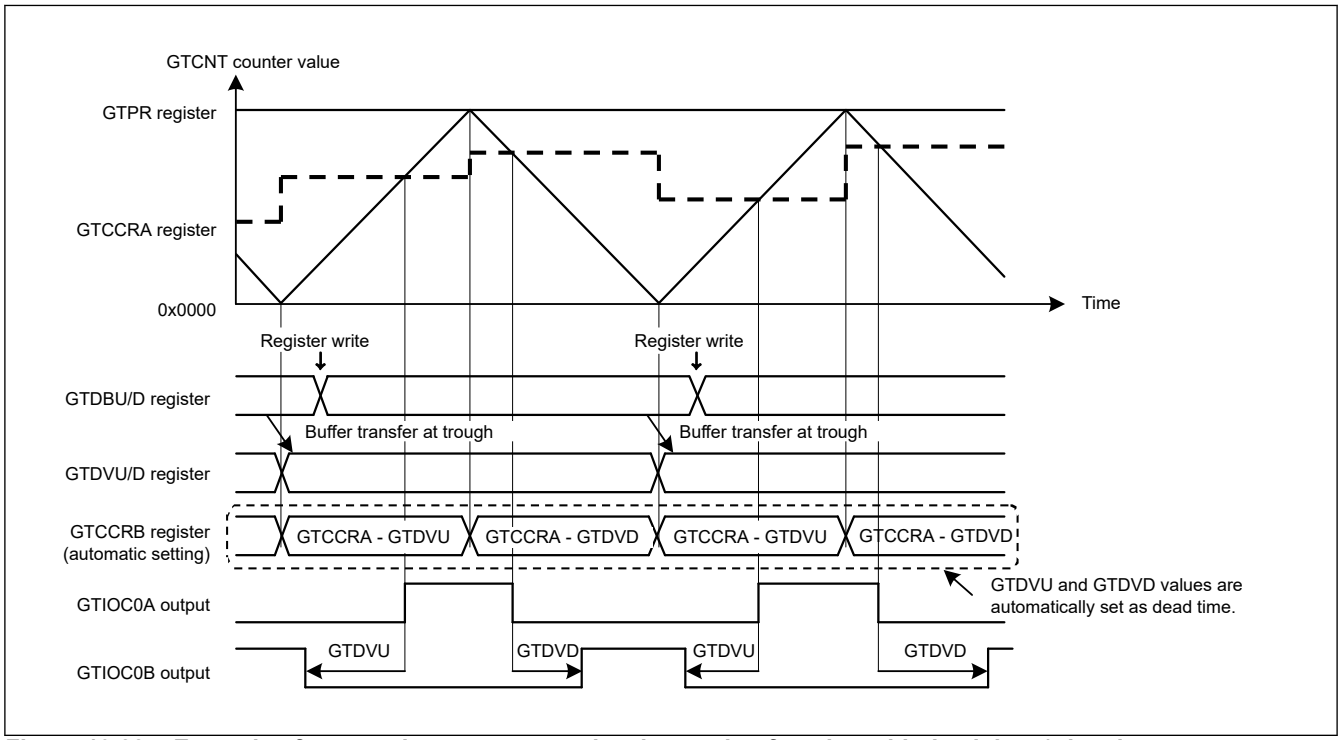

Figure 19.28 Example of automatic compare-match value setting function with dead time (triangle-wave PWM mode 2 or 3, GTDVU and GTDVD registers set to buffer operation, active-level: high)

The following example shows setting for automatic dead time setting function (sawtooth-wave one-shot pulse mode, triangle-wave PWM mode 3).

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 19.26, 001b (sawtooth-wave one-shot pulse mode) is set. In Figure 19.28, 110b (triangle-wave PWM mode 3) is set.

2. Select count direction
   Select the count direction (up or down) with the GTUDDTYC register. In Figure 19.26, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
6. Set GTIOCnm pin function
   Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 19.26 and Figure 19.28, GTIOA[4:0] bits = 00011b and GTIOB[4:0] bits = 10011b.
7. Enable GTIOCnm pin output
   Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8. Set buffer value for compare match
   Set the GTIOCnA pin changing point immediately after the count start in the GTCCRC and GTCCRD registers.
9. Set forcible buffer transfer for compare match
   Set the GTBER.CCRSWT bit to 1 to transfer buffer register data forcibly to the GTCCRA register.
10. Set buffer value for compare match
    Set the GTIOCnA pin changing point in one cycle after the count start in the GTCCRC and GTCCRD registers.
11. Set automatic dead time setting function
    Set GTDTCR.TDE to 1 to enable the automatic dead time setting function.
12. Set buffer operation for dead time setting
    Set buffer operation with the TDBUE and TDBDE bits in the GTDTCR register.
13. Set dead time value
    Set the first half dead time value in the GTDVU register and the second half dead time in the GTDVD register. When the GTDVU register is set with the GTDTCR.TDFER bit set to 1, the same value is also set to the GTDVD register, the same dead time value can be set for the first and second halves.
14. Set buffer value for dead time
    For buffer operation, set the first half dead time in one cycle after the current cycle in the GTDBU register and the second half dead time in the GTDBD register.
15. Set count operation
    Set the GTCR.CST bit to 1 to start count operation.
16. Set buffer value by cycle
    Set the GTIOCnA pin changing point for the next cycle from the current cycle to the GTCCRC and GTCCRD registers. When the dead time register is used for buffer operation, set the dead time value in the first half of the next cycle from the current cycle to the GTDBU register and the dead time value in the second half to the GTDBD register.

Note: n = 0 to 17, m = A, B

The following example shows setting for automatic dead time setting function (triangle-wave PWM mode 1 or 2).

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 19.27, 100b (triangle-wave PWM mode 1) is set.
   In Figure 19.28, 101b (triangle-wave PWM mode 2) is set.
2. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
3. Period setting
   Set a period in the GTPR register.
4. Set initial value for counter
   Set the initial value in the GTCNT counter.

5. Set GTIOCnm pin function
   Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register.
   In Figure 19.27 and Figure 19.28, GTIOA[4:0] bits = 00011b and GTIOB[4:0] bits = 10011b.
6. Enable GTIOCnm pin output
   Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
7. Set buffer operation for compare match
   Set buffer operation with the GTBER.CCRA[1:0] bits.
8. Set the value for compare match
   Set the GTIOCnA pin changing point to the GTCCRA register.
9. Set buffer value for compare match
   For buffer operation, set the GTIOCnA pin changing point in one cycle after the current cycle (in triangle-wave PWM mode 1) or half cycle after the current cycle (in triangle-wave PWM mode 2) in the GTCCRC register. For double buffer operation, also set the GTIOCnA pin changing point in two cycles after the current cycle (in triangle-wave PWM mode 1) or one cycle after the current cycle (in triangle-wave PWM mode 2) in the GTCCRD register.
10. Set automatic dead time setting function
    Set GTDTCR.TDE to 1 to enable the automatic dead time setting function.
11. Set buffer operation for dead time setting
    Set buffer operation with the TDBUE and TDBDE bits in the GTDTCR register.
12. Set dead time value
    Set the first half dead time value in the GTDVU register and the second half dead time in the GTDVD register. When the GTDVU register is set with the GTDTCR.TDFER bit set to 1, the same value is also set to the GTDVD register, the same dead time value can be set for the first and second halves.
13. Set buffer value for dead time
    For buffer operation, set the first half dead time in one cycle after the current cycle in the GTDBU register and the second half dead time in the GTDBD register.
14. Set count operation
    Set the GTCR.CST bit to 1 to start count operation.
15. Set buffer value by cycle
    For buffer operation of compare match register, set the GTIOCnA pin changing point in one cycle after the current cycle (in triangle-wave PWM mode 1) or half cycle after the current cycle (in triangle-wave PWM mode 2) in the GTCCRC register. For double buffered operation of compare match register, set the GTICCnA pin changing point in two cycles after the current cycle (in triangle-wave PWM mode 1) or one cycle after the current cycle (in triangle-wave PWM mode 2) in the GTCCRD register.
    In the same way, set the dead time value in the first half of the cycle after the current cycle in the GTDBU register and the dead time in the second half in the GTDBD register.

Note: n = 0 to 17, m = A, B

19.3.5 Count Direction Changing Function

The count direction of the GTCNT counter can be changed by modifying the GTUDDTYC.UD bit.

In sawtooth-wave mode, if the UD bit is modified during count operation, the count direction is changed at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the UD bit is modified while count operation is stopped and the GTUDDTYC.UDF bit is 0, the UD bit modification is not reflected at the start of counting and the count direction is changed at an overflow or an underflow. If the UDF bit is set to 1 while count operation is stopped, the UD bit value at that time is reflected at the start of counting.

In triangle-wave mode, changing the value of the GTUDDTYC.UD bit during counting does not switch the direction of counting. Likewise, changing the value of the GTUDDTYC.UD bit while the GTUDDTYC.UDF bit is 0 and counting is stopped does not actually update the value of the bit. If 1 is written to the GTUDDTYC.UDF bit while counting is stopped, the value of the GTUDDTYC.UD bit at that time is reflected from the time counting is started.

When counting direction is switched during count operation in sawtooth-wave mode, the value of GTPR register after the start of up-counting is reflected in the count period in up-counting operation, and the value of GTPR register after the start of down-counting is reflected in the count period in down-counting operation.

Figure 19.29 shows an example of the count direction changing function operation.

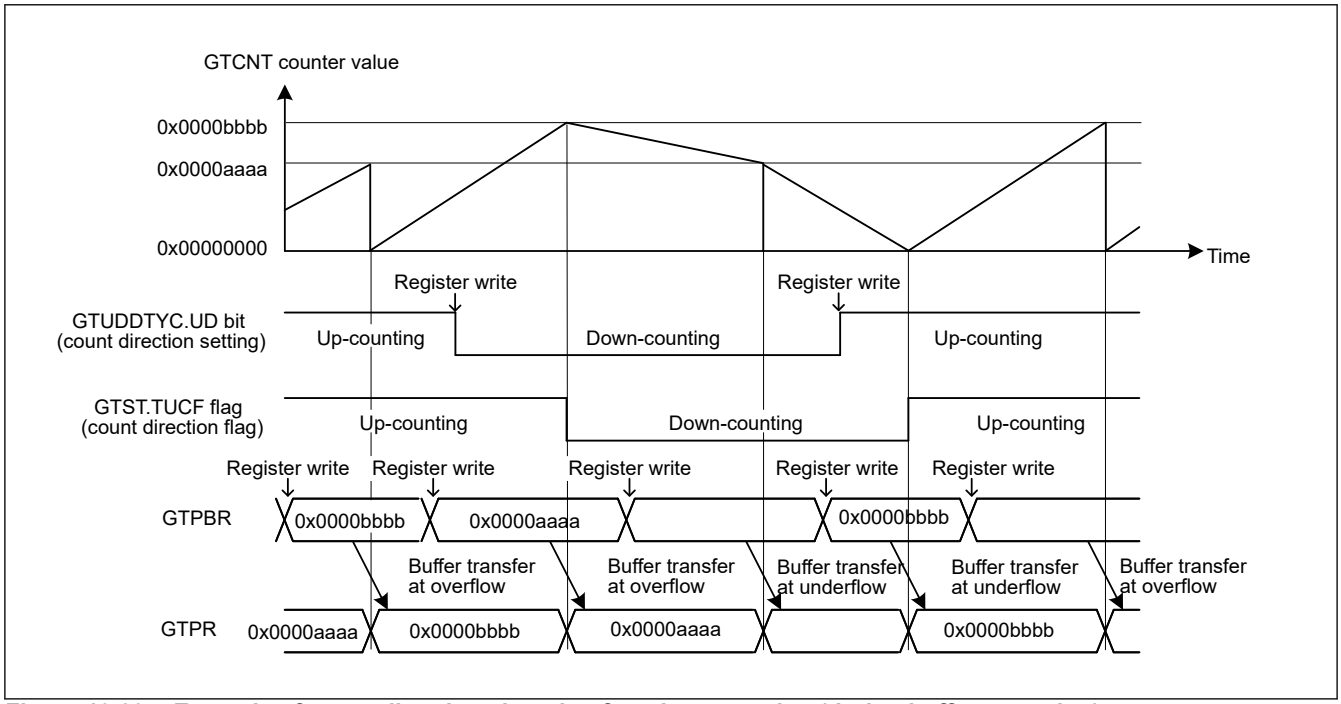

Figure 19.29 Example of count direction changing function operation (during buffer operation)

19.3.6 Function of Output Duty 0% and 100%

Changing the value of the GTUDDTYC.OADTY[1:0] bits and GTUDDTYC.OBDTY[1:0] bits specifies the output duty setting on the GTIOCnA and GTIOCnB pins to 0% or 100% (n = 0 to 17).

In sawtooth-wave mode, if the value of the OADTY[1:0] bits or OBDTY[1:0] bits is changed during the count operation, the output duty-cycle setting is reflected at an overflow (when changed during up-counting) or an underflow (when changed during down-counting). When the GTUDDTYC.OADTYF bit or GTUDDTYC.OBDTYF bit is 0 while count operation is stopped and the value of the OADTY[1:0] bits or OBDTY[1:0] bits is changed, the output duty-cycle setting changed at the start of counting is not reflected, but the output duty-cycle setting changed at an overflow or underflow is reflected. When the OADTYF bit or OBDTYF bit is 1 while count operation is stopped and the value of the OADTY[1:0] bits or OBDTY[1:0] bits is changed, the value of the OADTY[1:0] bits or OBDTY[1:0] bits at that time is reflected at the start of counting.

In triangle-wave mode, if the value of the OADTY[1:0] bits or OBDTY[1:0] bits is changed during the count operation, in the case of OABDTYT bit = 0, the output duty-cycle setting is reflected at trough of triangle-wave and in the case of OABDTYT bit = 1, the output duty-cycle setting is reflected at trough and crest of triangle-wave.

When the OADTYF bit or OBDTYF bit is 0 while count operation is stopped and the value of the OADTY[1:0] bits or OBDTY[1:0] bits is changed, the output duty-cycle setting changed at the start of counting is not reflected, but the output duty-cycle setting changed at trough is reflected. When the OADTYF bit or OBDTYF bit is 1 while count operation is stopped and the value of the OADTY[1:0] bits or OBDTY[1:0] bits is changed, the value of the OADTY[1:0] bits or OBDTY[1:0] bits at that time is reflected at the start of counting.

During the operation under the settings of duty cycle for 0% or 100%, compare match operation inside the GPT continues to perform interrupt outputs and buffer operations.

When the output duty setting is changed from 0% or 100% due to a compare match, the GTIOR.GTIOA[3:2] bits and the GTUDDTYC.OADTYR bits determine the level output on the GTIOCnA pin and GTIOR.GTIOB[3:2] bits and GTUDDTYC.OBDTYR bits determine the level output on the GTIOCnB pin at the end of the cycle. When the GTIOA[3:2] and GTIOB[3:2] bits are set as 01b, output is driven low at the end of the cycle, and when set as 10b, output is driven high at the end of the cycle.

The output is retained at the end of the cycles when the GTIOA[3:2] or GTIOB[3:2] bits are 00b, and toggled at the end of the cycles when the GTIOA[3:2] or GTIOB[3:2] bits are 11b. A value to be output is selectable in the OADTYR or OBDTYR bit when the corresponding GTIOA[3:2] or GTIOB[3:2] bits are either 00b or 11b.

In triangle-wave mode and OABDTYT bit = 1, output duty-cycle setting is reflected at trough and crest of triangle-wave.

When masking by a duty cycle 0% or 100% release at crest of triangle-wave, the level output on the GTIOCnA pin and GTIOCnB pin is determined by value at compare match output.

Table 19.9 lists the output values at the end of the cycle when the output setting is changed from duty 0% or 100% to compare match.

Table 19.9 Output value after release of duty 0% or 100%

GTIOR.GTIOm[3:2]	Value at compare match output at the end of the cycle when masking by a duty cycle 0% or 100%	GTUDDTYC.OmDTYR bit at duty 0% setting		GTUDDTYC.OmDTYR bit at duty 100% setting	
		0	1	0	1
00b (output retained at the end of the cycle)	0	0	0	1	0
	1	0	1	1	1
01b (low output at the end of the cycle)	—	0	0	0	0
10b (high output at the end of the cycle)	—	1	1	1	1
11b (toggle output at the end of the cycle)	0	1	1	0	1
	1	1	0	0	0

Note: m = A, B

Figure 19.30 shows an example of operation of the output of the duty cycle 0% or 100%.

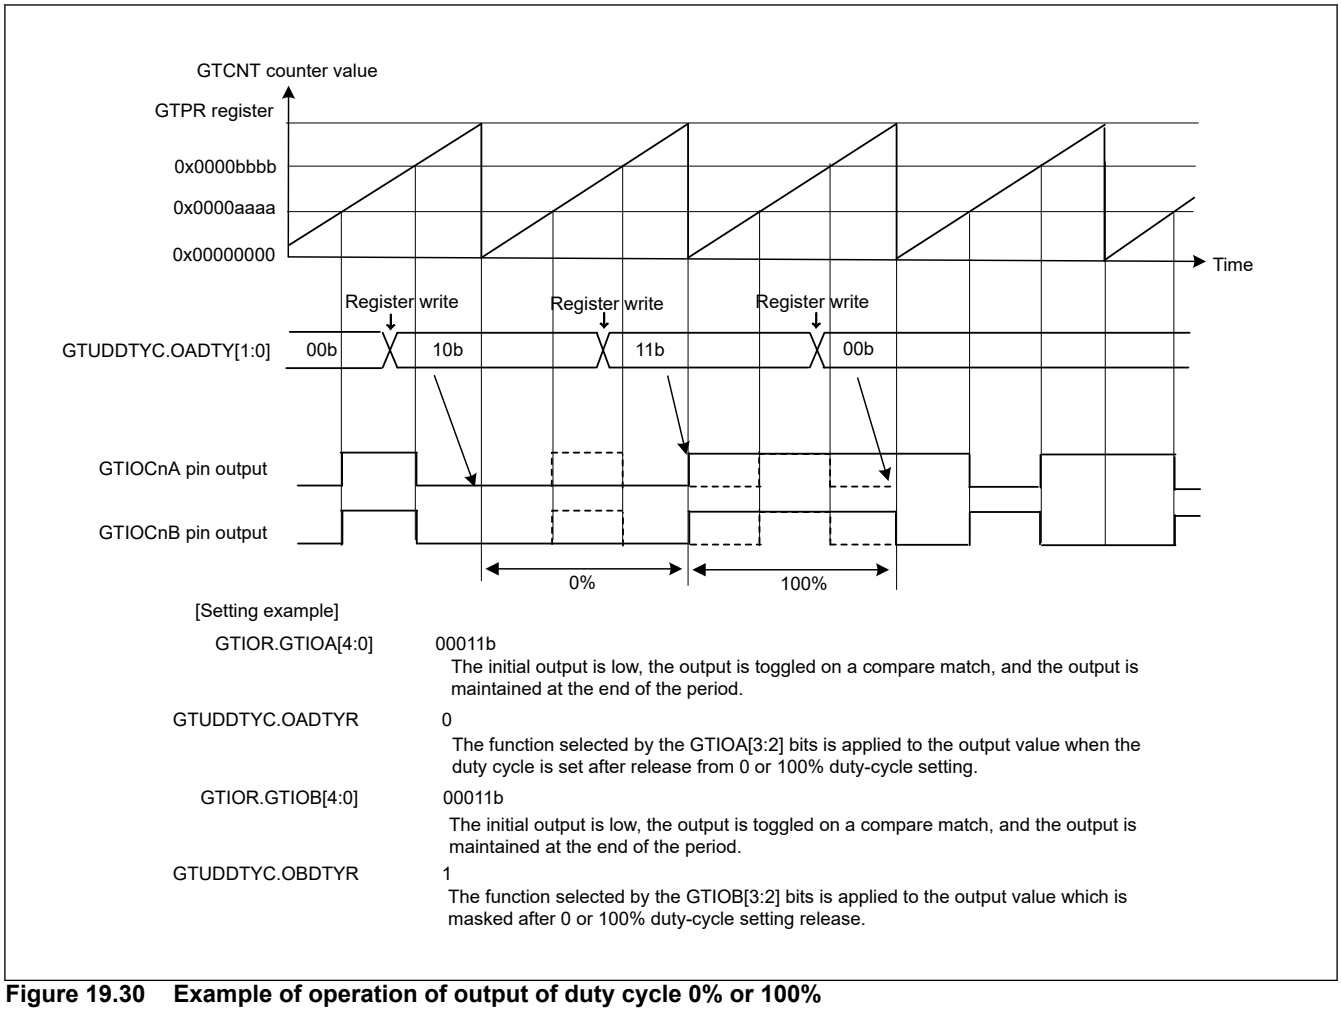

Figure 19.30 Example of operation of output of duty cycle 0% or 100%

19.3.7 Hardware Count Start/Count Stop and Clear Operation

The GTCNT counter can be started, stopped, or cleared by hardware sources. There are 3 types of hardware sources, including external trigger input, ELC event input, and GTIOCnm pin input (n = 0 to 17, m = A, B).

19.3.7.1 Hardware Start Operation

The GTCNT counter can be started by a hardware source. Select a hardware source to start counting using the GTSSR register, and enable to start counting.

Figure 19.31 shows an example of count start operation by a hardware source.

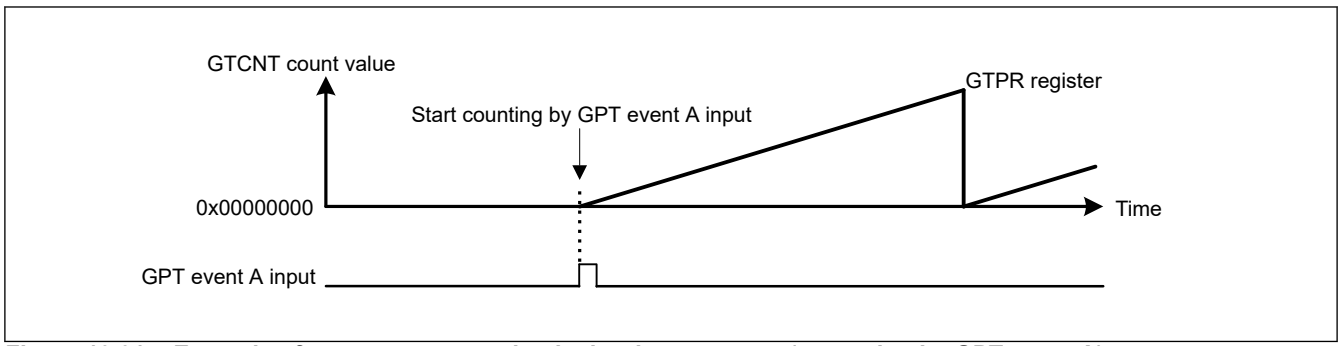

Figure 19.31 Example of count start operation by hardware source (at starting by GPT event A)

The following example shows setting for count start operation by hardware source.

1. Set operating mode

Set the operating mode with the GTCR.MD[2:0] bits.
In Figure 19.31, 000b (sawtooth-wave PWM mode 1) is set.

2. Set count direction
Select the count direction (up or down) with the GTUDDTYC register.
In Figure 19.31, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.
3. Select count clock
Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
Set a period in the GTPR register.
5. Set initial value for counter
Set the initial value in the GTCNT counter.
In Figure 19.31, 0x00000000 is set.
6. Set hardware count start
Select a hardware source to start count operation with the GTSSR register.
In Figure 19.31, GTSSR.SSELCA bit = 1.
7. Start hardware source operation
Set operation of the hardware source selected by the GTSSR register and start counting.
In Figure 19.31, the GPT event A input operation is set.

19.3.7.2 Hardware Stop Operation

The GTCNT counter can be stopped by a hardware source. Select a hardware source to stop counting with the GTPSR register, and enable to stop counting.

Figure 19.32 shows an example of count stop operation by a hardware source. In this example, the count operation is stopped by the GPT event A input, and is restarted by the GPT event B input.

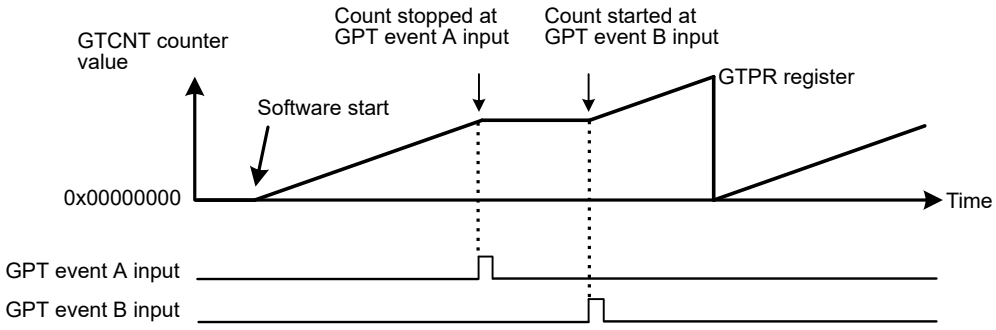

Figure 19.32 Example of count stop operation by hardware source (started by software, stopped at GPT event A input, and restarted at GPT event B input)

The following example shows setting for count stop operation by hardware source.

1. Set operating mode
Set the operating mode with the GTCR.MD[2:0] bits.
In Figure 19.32, 000b (sawtooth-wave PWM mode) is set.
2. Set count direction
Select the count direction (up or down) with the GTUDDTYC register.
In Figure 19.32, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.
3. Select count clock
Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
Set a period in the GTPR register.
5. Set initial value for counter

Set the initial value in the GTCNT counter.
In Figure 19.32, 0x00000000 is set.

6. Set hardware count start
Select a hardware source for starting count operation with the GTSSR register.
In Figure 19.32, GTSSR.SSELCB bit = 1.

7. Set hardware count stop
Select a hardware source for starting count operation with the GTPSR register.
In Figure 19.32, GTPSR.PSELCA bit = 1.

8. Start hardware source operation
Set operation of the hardware source selected by the GTSSR or GTPSR register then start and stop counting.
In Figure 19.32, the GPT event A and GPT event B input operations are set.

Figure 19.33 shows an example of count start/stop operation by a hardware source.

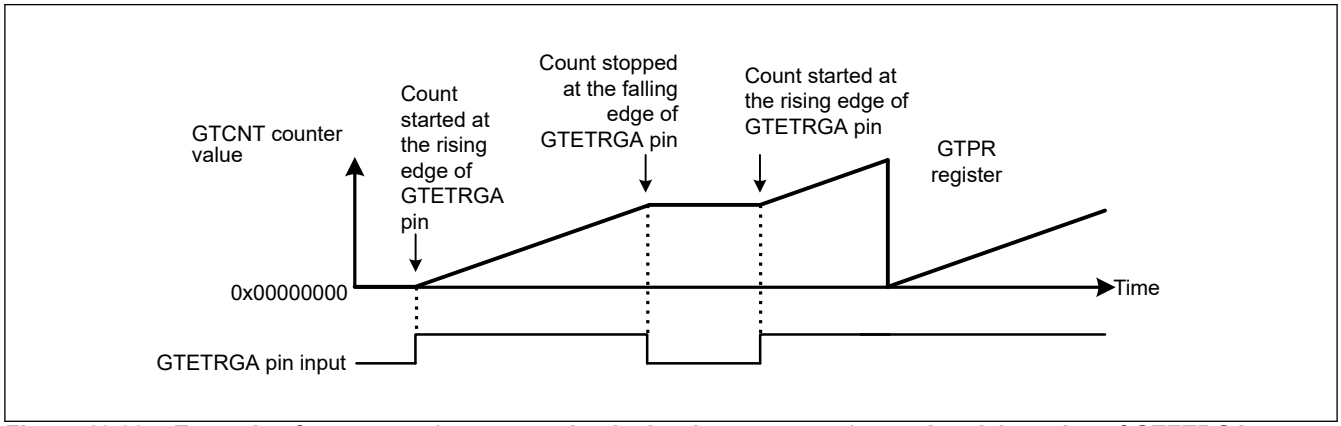

Figure 19.33 Example of count start/stop operation by hardware source (started at rising edge of GTETRGA pin input, stopped at falling edge of GTETRGA pin input)

The following example shows setting for count start/stop operation by hardware source.

1. Set operating mode
Set the operating mode with the GTCR.MD[2:0] bits.
In Figure 19.33, 000b (sawtooth-wave PWM mode) is set.

2. Set count direction
Select the count direction (up or down) with the GTUDDTYC register.
In Figure 19.33, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.

3. Select count clock
Select the count clock with GTCR.TPCS[3:0] bits.

4. Period setting
Set a period in the GTPR register.

5. Set initial value for counter
Set the initial value in the GTCNT counter.
In Figure 19.33, 0x00000000 is set.

6. Set hardware count start
Select a hardware source for starting count operation with the GTSSR register.
In Figure 19.33, GTSSR.SSGTRGAFR[1:0] bits = 01b.

7. Set hardware count stop
Select a hardware source for stopping count operation with the GTPSR register.
In Figure 19.33, GTPSR.PSGTRGAFR[1:0] bits = 10b.

8. Start hardware source operation
Set operation of the hardware source selected by the GTSSR or GTPSR register then start and stop counting.
In Figure 19.33, the GTETRGA pin operation is set.

19.3.7.3 Hardware Clear Operation

The GTCNT counter can be cleared by a hardware source. Select a hardware source to clear the counter with the GTCSR register, and enable to clear the counter.

Note: The GTPn_OVF/GTPn_UDF interrupt (overflow/underflow interrupt) is not generated when the GTCNT counter is cleared by a hardware source or by software.

Figure 19.34 and Figure 19.35 show examples of the GTCNT counter clearing operation by a hardware source.

In this example, the GTCNT counter is started at the GPT event A input, and is stopped/cleared at the GPT event B input.

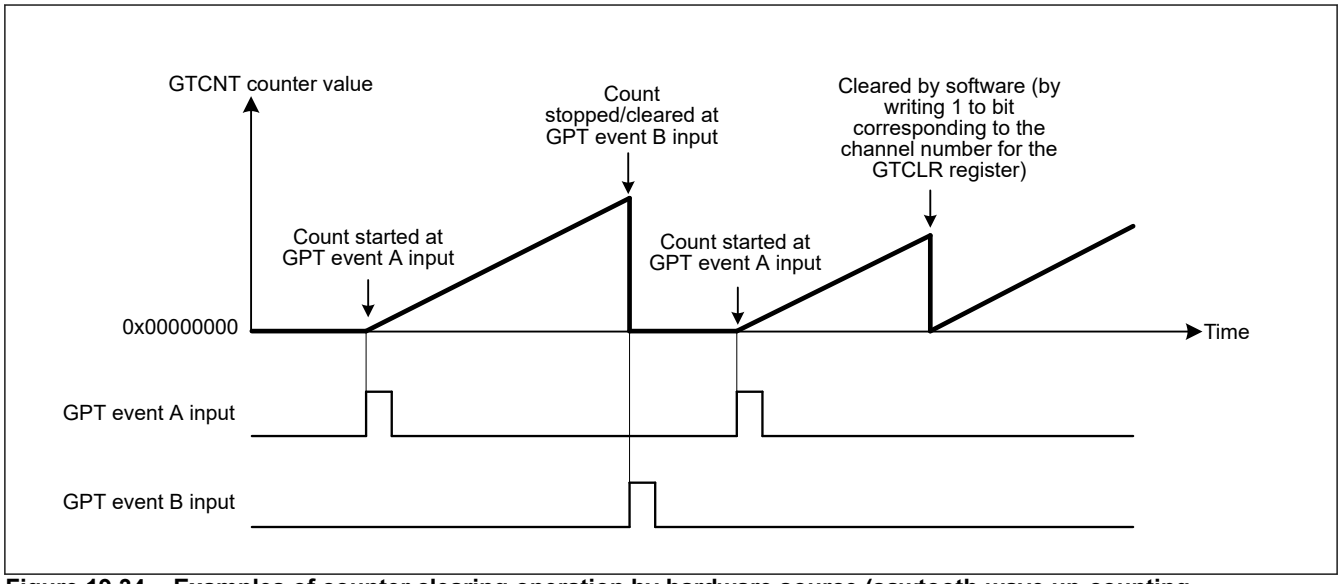

Figure 19.34 Examples of counter clearing operation by hardware source (sawtooth-wave up-counting, started at GPT event A input, and count stopped/counter cleared at GPT event B input)

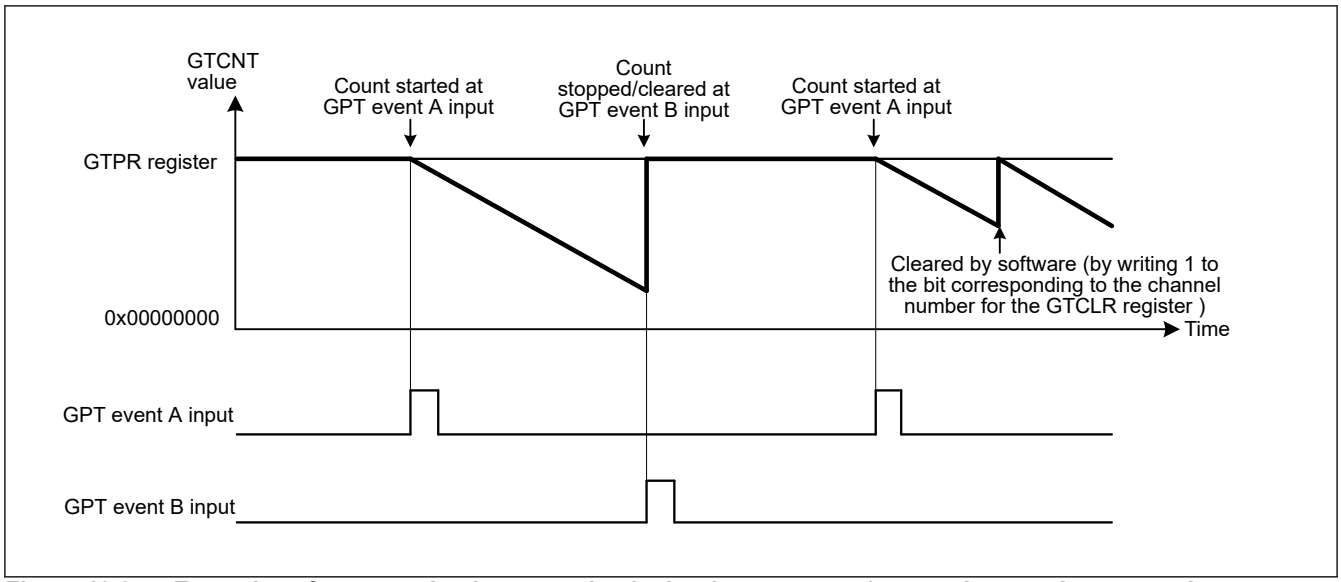

Figure 19.35 Examples of counter clearing operation by hardware source (sawtooth-wave down-counting, started at GPT event A input, and count stopped/counter cleared at GPT event B input)

The following example shows setting for counter clearing operation by hardware source.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits.
   In Figure 19.34 and Figure 19.35, 000b (sawtooth-wave PWM mode 1) is set.
2. Set count direction

Select the count direction (up or down) with the GTUDDTYC register.
In Figure 19.34, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.
In Figure 19.35, the lower 2 bits of the GTUDDTYC register is set to 10b and then to 00b for down-counting.

3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
4. Period setting
   Set a period in the GTPR register.
5. Set initial value for counter
   Set the initial value in the GTCNT counter.
   In Figure 19.34, 0x00000000 is set.
   In Figure 19.35, the GTPR register value is set.
6. Set hardware count start
   Select a hardware source for starting count operation with the GTSSR register and wait for count start by the hardware source.
   In Figure 19.34 and Figure 19.35, GTSSR.SSELCA bit = 1.
7. Set hardware count stop
   Select a hardware source for stopping count operation with the GTPSR register and wait for count stop by the hardware source.
   In Figure 19.34 and Figure 19.35, GTPSR.PSELCB bit = 1.
8. Set hardware count clear
   Select a hardware source to clear the counter with the GTCSR register and wait for count clearing by the hardware source.
   In Figure 19.34 and Figure 19.35, GTPSR.CSELCB bit = 1.
9. Start hardware source operation
   Set operation of the hardware source selected by the GTSSR, GTPSR, or GTCSR register then start, stop, or clear counting.
   In Figure 19.34 and Figure 19.35, the GPT event A and B inputs operations are set.

The GTPn_OVF/GTPn_UDF interrupt (overflow/underflow interrupt) does not occur when the counter is cleared by a hardware source. In the same way, the GTPn_OVF/GTPn_UDF interrupt does not occur when the counter is cleared by software.

Figure 19.36 shows the relationship between counter clearing by a hardware source and the GTPn_OVF interrupt.

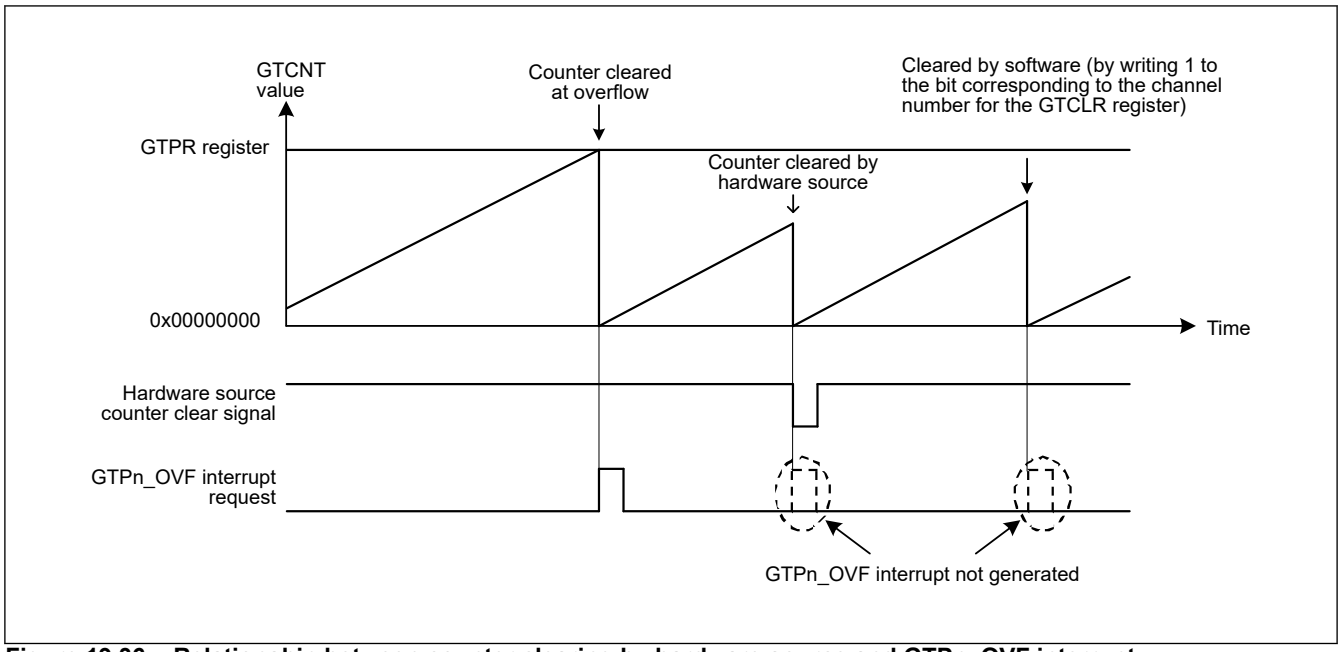

Figure 19.36 Relationship between counter clearing by hardware source and GTPn_OVF interrupt

19.3.8 Hardware Count Switch Operation

In the triangle-wave PWM mode, the GTCNT counter can be switched by a hardware source. Select the count switch operation with the GTCR.SWMD[2:0] bits and select a hardware source to switch the counter with the GTSWSR register and enable to switch the counter.

When the offset reload is enabled by the GTCR.SWMD[2:0] bits, the offset value of the GTCNT counter reloaded by count switch is set by the GTSWOS register in the range of 0 to GTPR.

If the count switch and counter clear occur at the same time, the counter clear has priority.

Figure 19.37 to Figure 19.40 show examples of the GTCNT count switch operation by a hardware source.

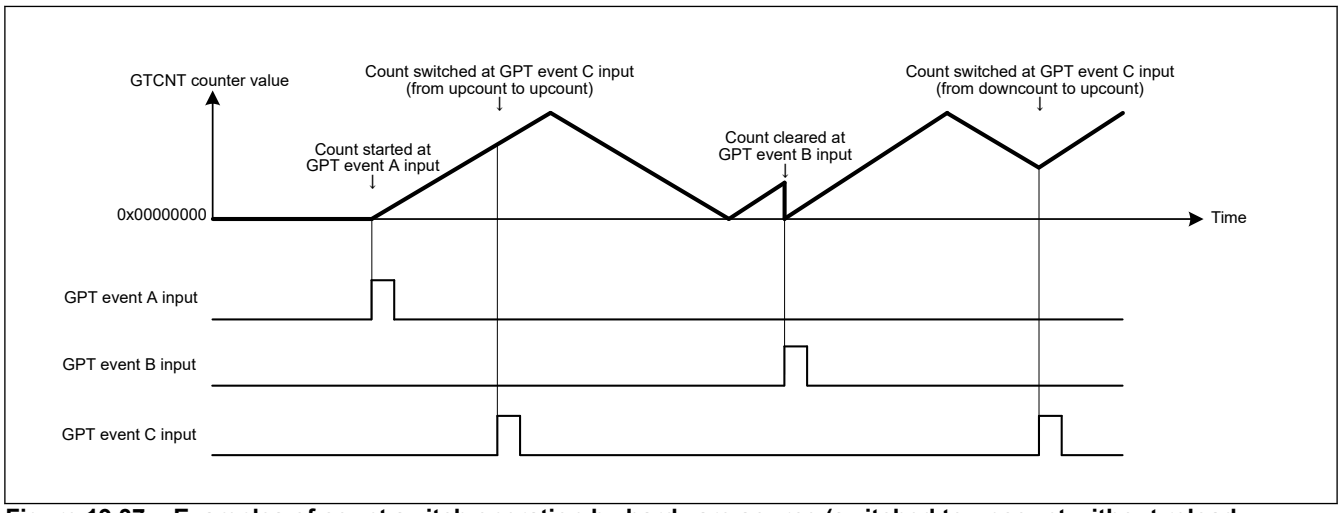

Figure 19.37 Examples of count switch operation by hardware source (switched to upcount without reload at GPT event C input)

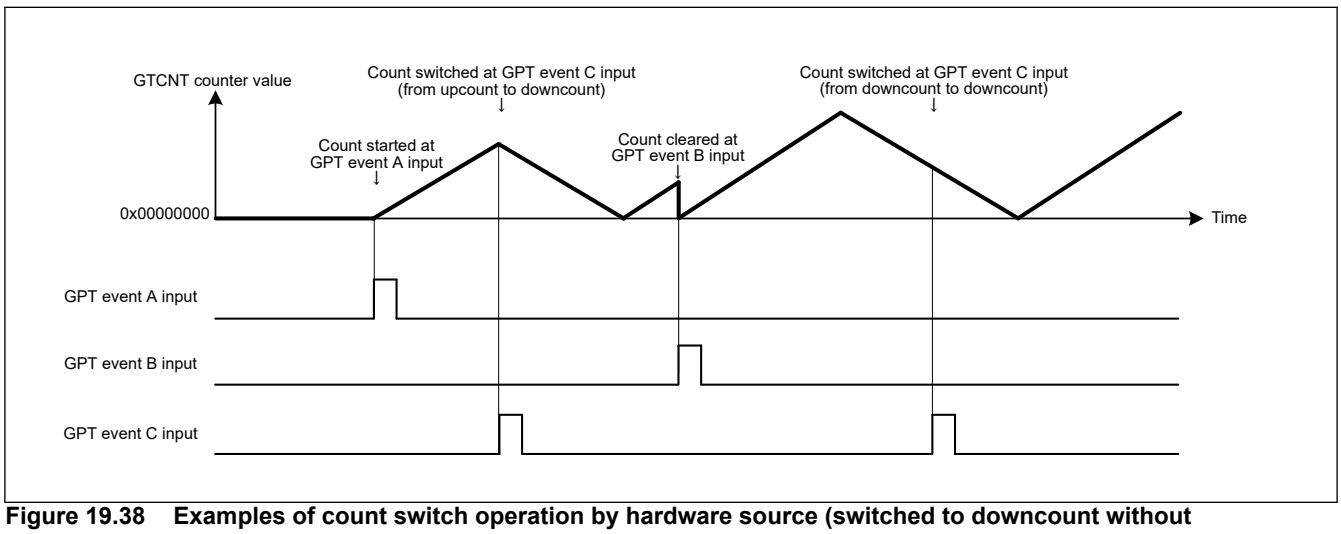

Figure 19.38 Examples of count switch operation by hardware source (switched to downcount without reload at GPT event C input)

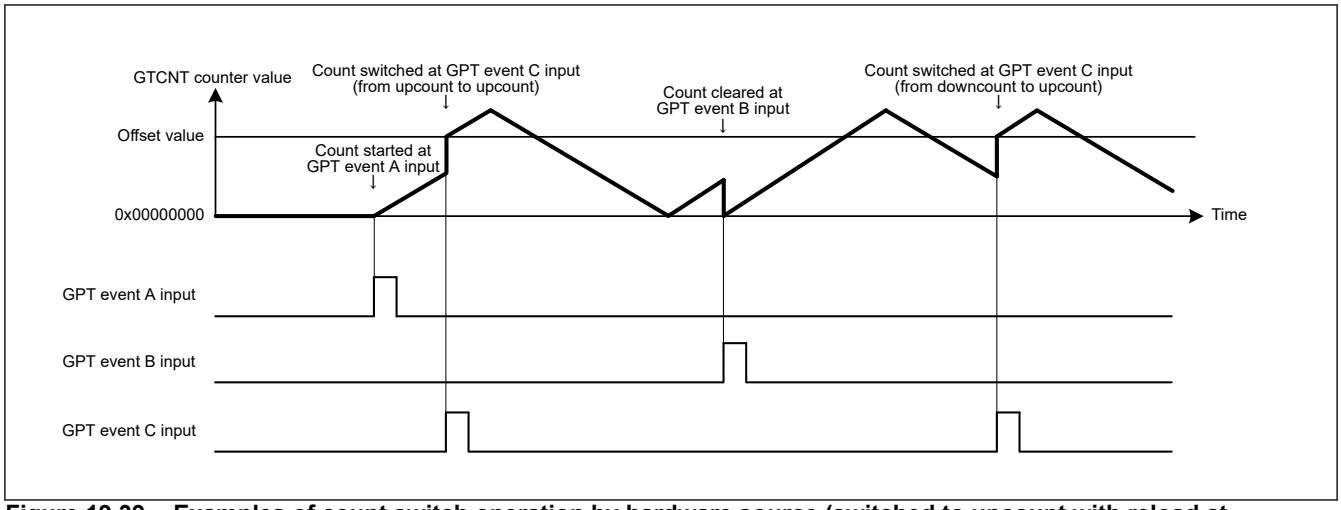

Figure 19.39 Examples of count switch operation by hardware source (switched to upcount with reload at GPT event C input)

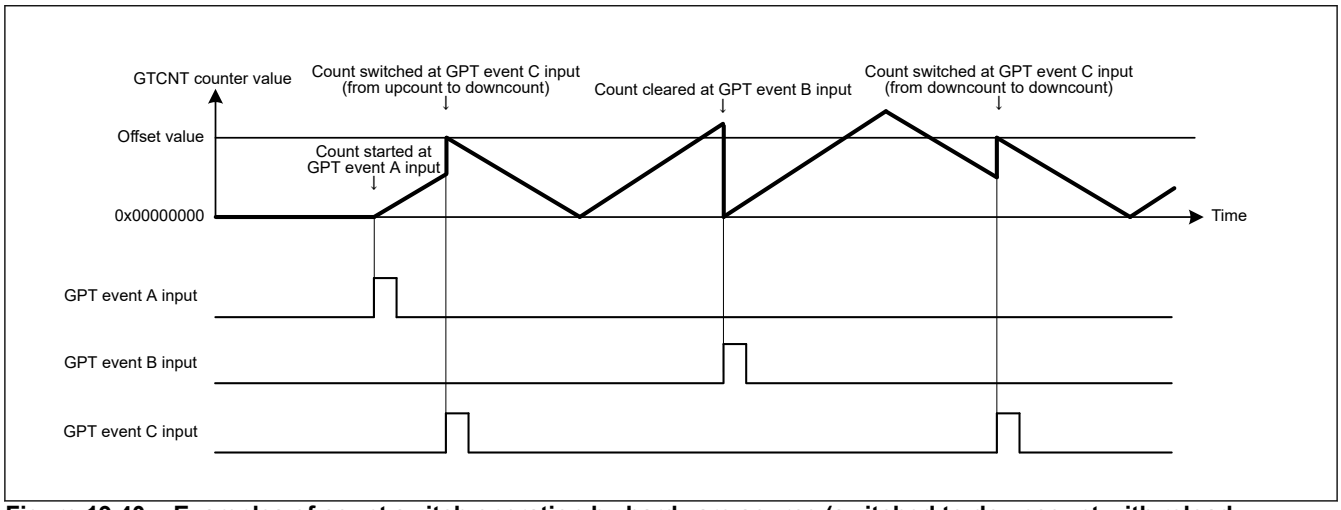

Figure 19.40 Examples of count switch operation by hardware source (switched to downcount with reload at GPT event C input)

The following procedure shows the setting example. In this example, the GTCNT counter started at the GTP event A input, is stopped/cleared at the GTP event B input, and is switched at the GTP event C input.

1. Set operating mode
   Set the operating mode to the triangle-wave PWM mode with the GTCR.MD[2:0] bits.
   In Figure 19.37, Figure 19.38, Figure 19.39, and Figure 19.40, 100b (triangle-wave PWM mode 1) is set.
2. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits.
3. Period setting
   Set a period in the GTPR register.
4. Set initial value for counter
   Set the initial value in the GTCNT counter.
   In Figure 19.37, Figure 19.38, Figure 19.39, and Figure 19.40, 0x00000000 is set.
5. Set switch mode
   Set the switch mode with the GTCR.SWMD[2:0] bits.
   In Figure 19.37, 101b is set, in Figure 19.38, 110b is set, in Figure 19.39, 001b is set, in Figure 19.40, 010b is set.
6. Set hardware count start
   Select a hardware source for starting count operation with the GTSSR register and wait for count start by the hardware source.
   In Figure 19.37, Figure 19.38, Figure 19.39, and Figure 19.40, GTSSR.SSELCA bit = 1.

7. Set hardware count stop
   Select a hardware source for stopping count operation with the GTPSR register and wait for count stop by the hardware source.
8. Set hardware count clear
   Select a hardware source to clear the counter with the GTCSR register and wait for counter clearing by the hardware source.
   In Figure 19.37, Figure 19.38, Figure 19.39, and Figure 19.40, GTCSR.CSELCB bit = 1.
9. Set hardware count switch
   Select a hardware source to switch the counter with the GTSWSR register and wait for count switch by the hardware source.
   In Figure 19.37, Figure 19.38, Figure 19.39, and Figure 19.40, GTSWSR.WSELCC bit = 1.
10. Set hardware source operation
    Set operation of the hardware source selected with the GTSSR register, GTPSR register, GTCSR register, or GTSWSR register and start, stop, clear, or switch the counter.
    In Figure 19.37, Figure 19.38, Figure 19.39, and Figure 19.40, the GPT event A, GPT event B, and GPT event C input operations are set.

The compare match operation is valid even when the count switch and the compare match occur at the same time. Similarly, even when the count switch occurs at the crest (GTCNT counter matches GTPR register value during upcounting) or trough (GTCNT counter is 0 during downcounting) of triangle-waves, overflow or underflow interrupt is output and the buffer transfer of crest or trough functions normally.

If the count switch is performed at the crest or trough without the offset reload, the crest or trough occurs and then the count direction changes to downcount or upcount regardless of the count switch setting. Also, if the count switch is performed at the count clear state (GTCNT counter value is 0 during upcount) without the offset reload, the count direction continues upcount regardless of the count switch setting.

If the switch mode is set to Switch to upcount with offset reload with the SWMD[2:0] bits and the offset is set to 0 with the GTSWOS register, the count switch functions the same as the counter clear and the GTCNT counter does not operate as the trough. Also, if the switch mode is set to Switch to downcount with offset reload and the offset is set to the GTPR value, the GTCNT counter does not operate as the crest. On the other hand, if the switch mode is set to Switch to upcount with offset reload and the offset is set to the GTPR value, the GTCNT counter operates as the crest, if the switch mode is set to Switch to downcount with offset reload and the offset is set to 0, the GTCNT counter operates as the trough, and in these cases, the interrupt outputs and the buffer transfers of the crest and the trough functions normally.

If the crest or the trough due to the count switch occurs at the timing when the GTCNT counter value is the crest or the trough, the buffer transfer and the interrupt output at the crest or trough will occur twice in a row.

Table 19.10 Triangle-waves condition after the count switch with offset reload

Count direction of switch mode (GTCR.SWMD[2:0])	Offset (GTSWOS)	The triangle-waves condition after the count switch			
		GTCNT	GTST.TUCF	Triangle-waves condition	Buffer transfer/ Interrupt output
Upcount	0	GTSWOS register value	1	Counter clear (start of upcount)	Nothing
	1 to GTPR - 1			Upcount	Nothing
	GTPR			Crest (end of upcount)	Buffer transfer available (only Triangle-Wave PWM Mode 2)/ GTPn_OVF Output
Downcount	0		0	Trough (end of downcount)	Buffer transfer available/ GTPn_UDF Output
	1 to GTPR - 1			Downcount	Nothing
	GTPR			Start of downcount	Nothing

Figure 19.41 and Figure 19.42 show examples of the buffer operation due to the count switch when the offset is set to 0 and GTPR. Figure 19.43 shows example of the buffer operation due to the count switch when the offset is set other than the crest and trough.

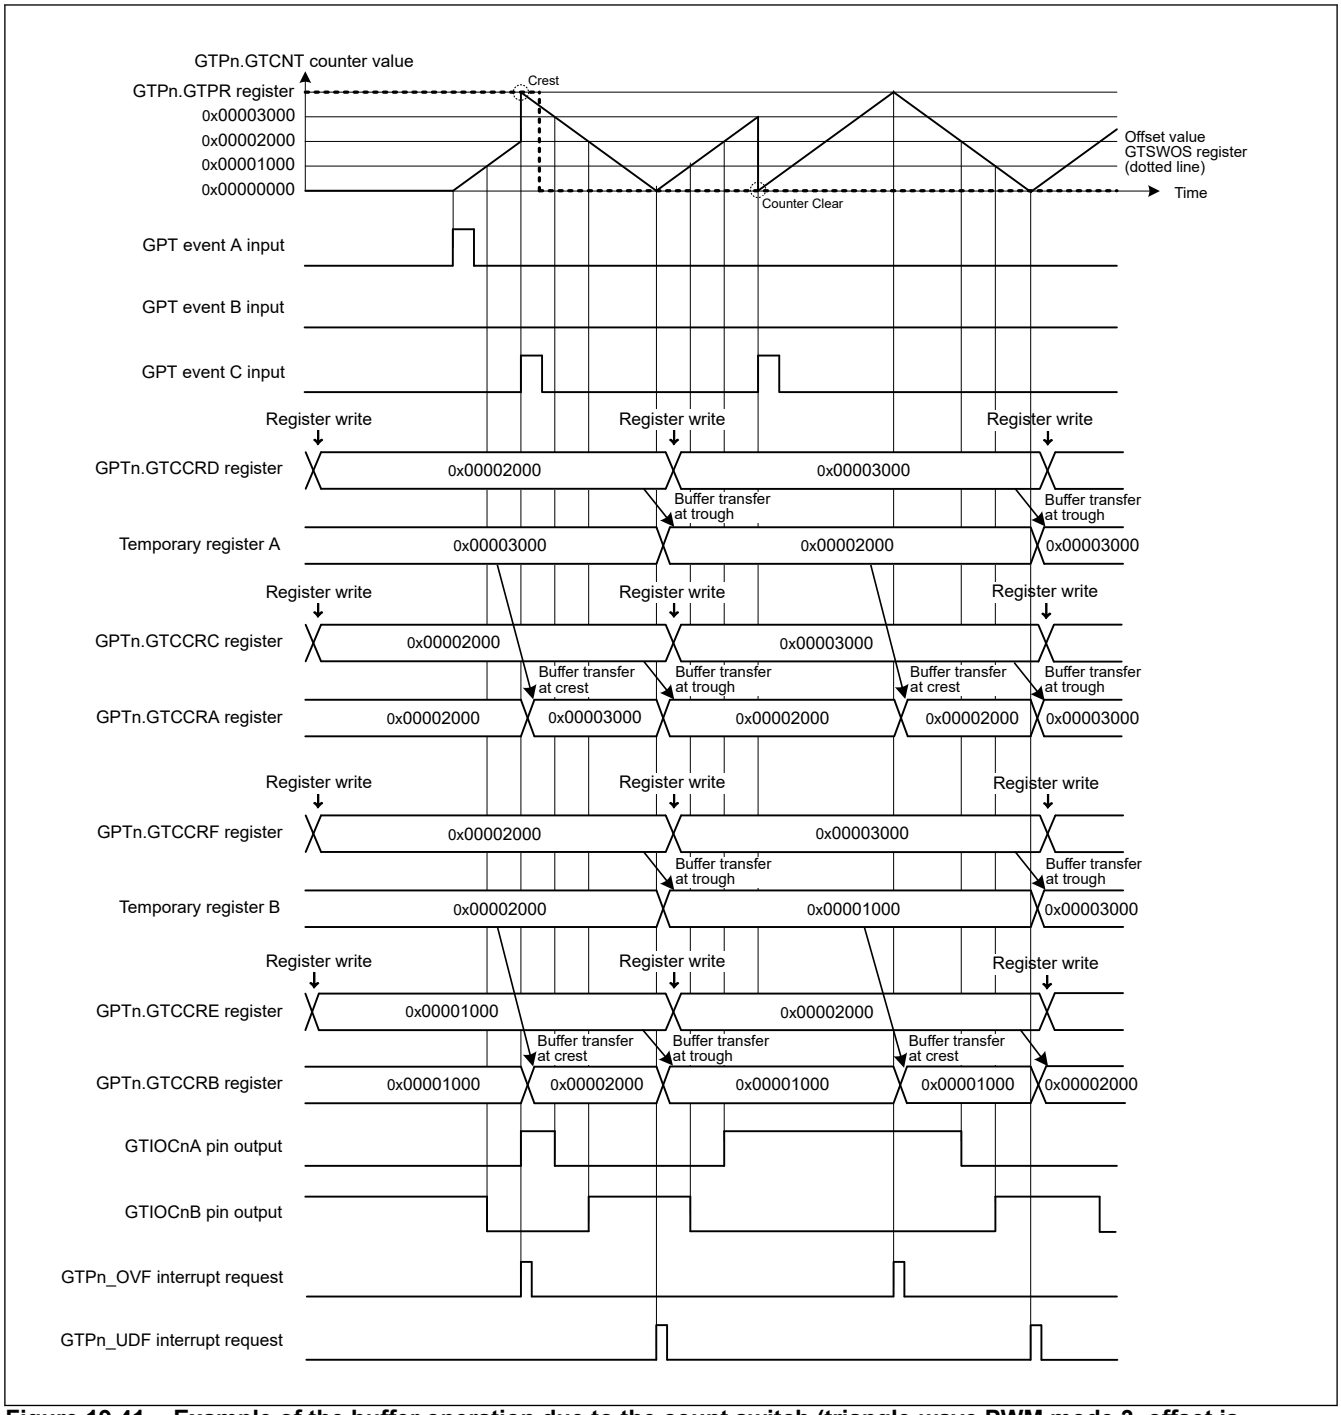

Figure 19.41 Example of the buffer operation due to the count switch (triangle-wave PWM mode 3, offset is set to 0 and GTPR, and switch to upcount)

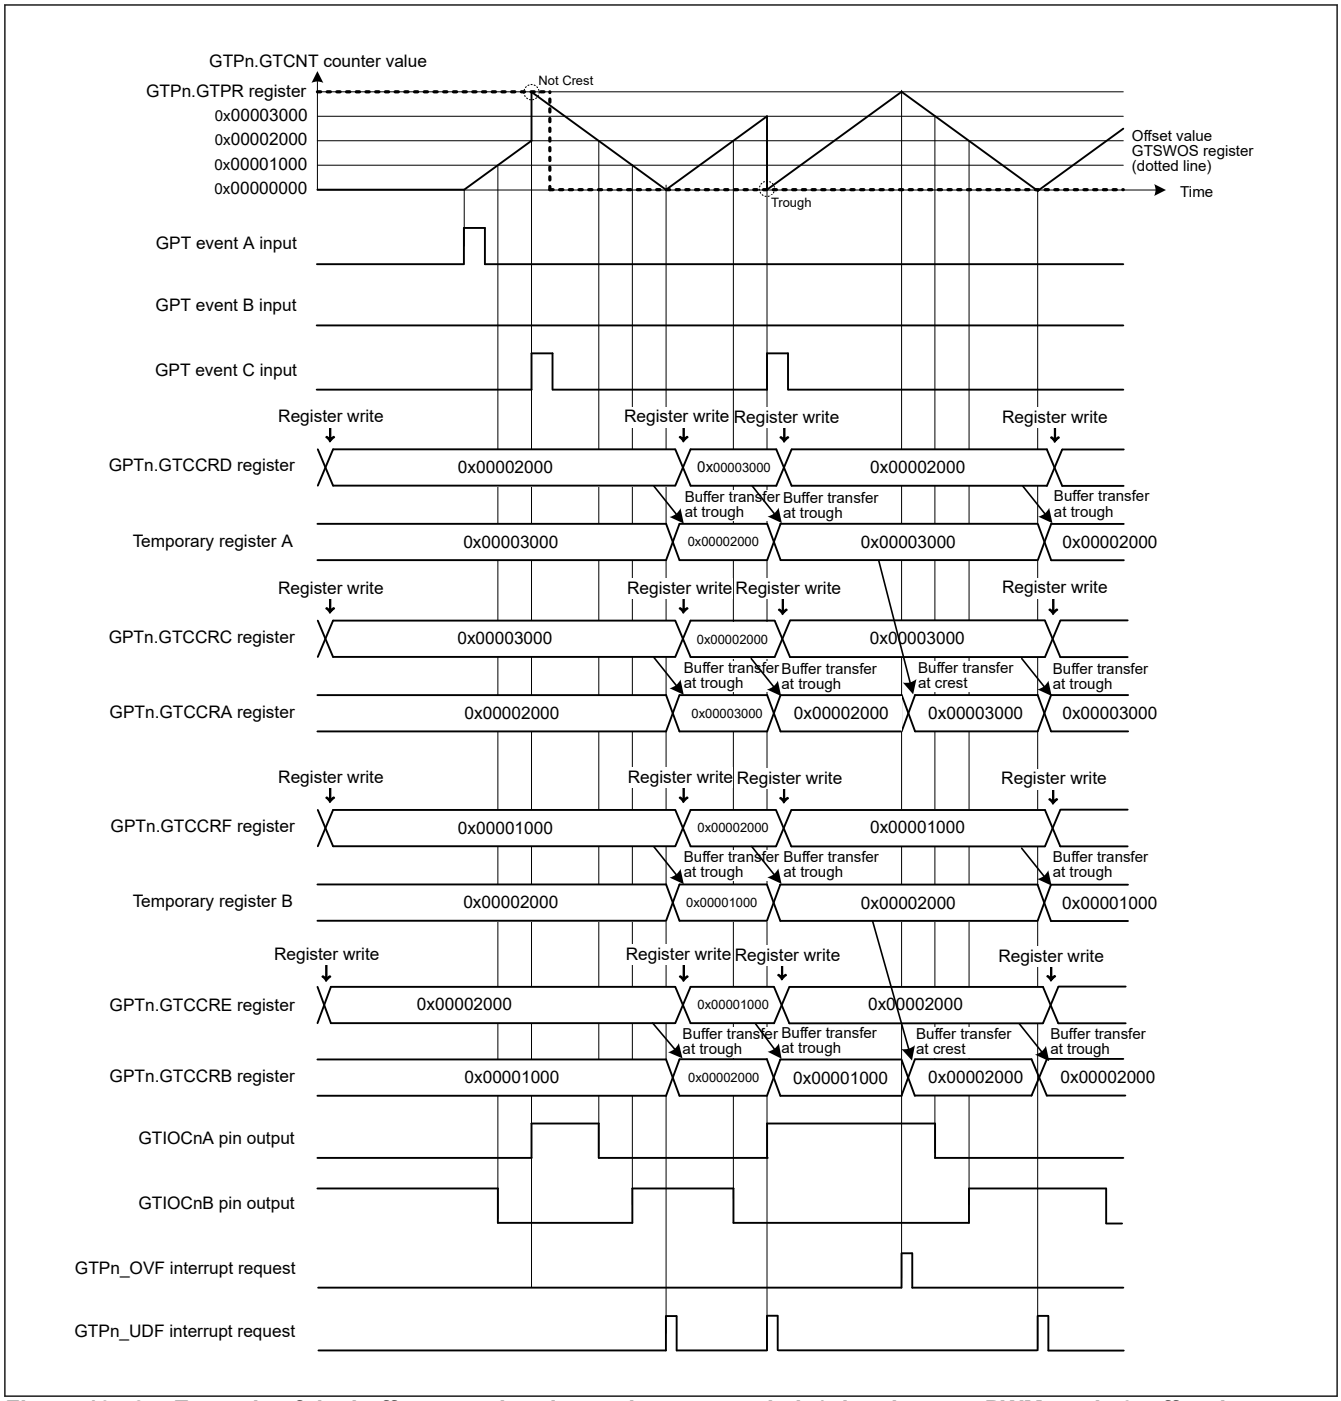

Figure 19.42 Example of the buffer operation due to the count switch (triangle-wave PWM mode 3, offset is set to 0 and GTPR, and switch to downcount)

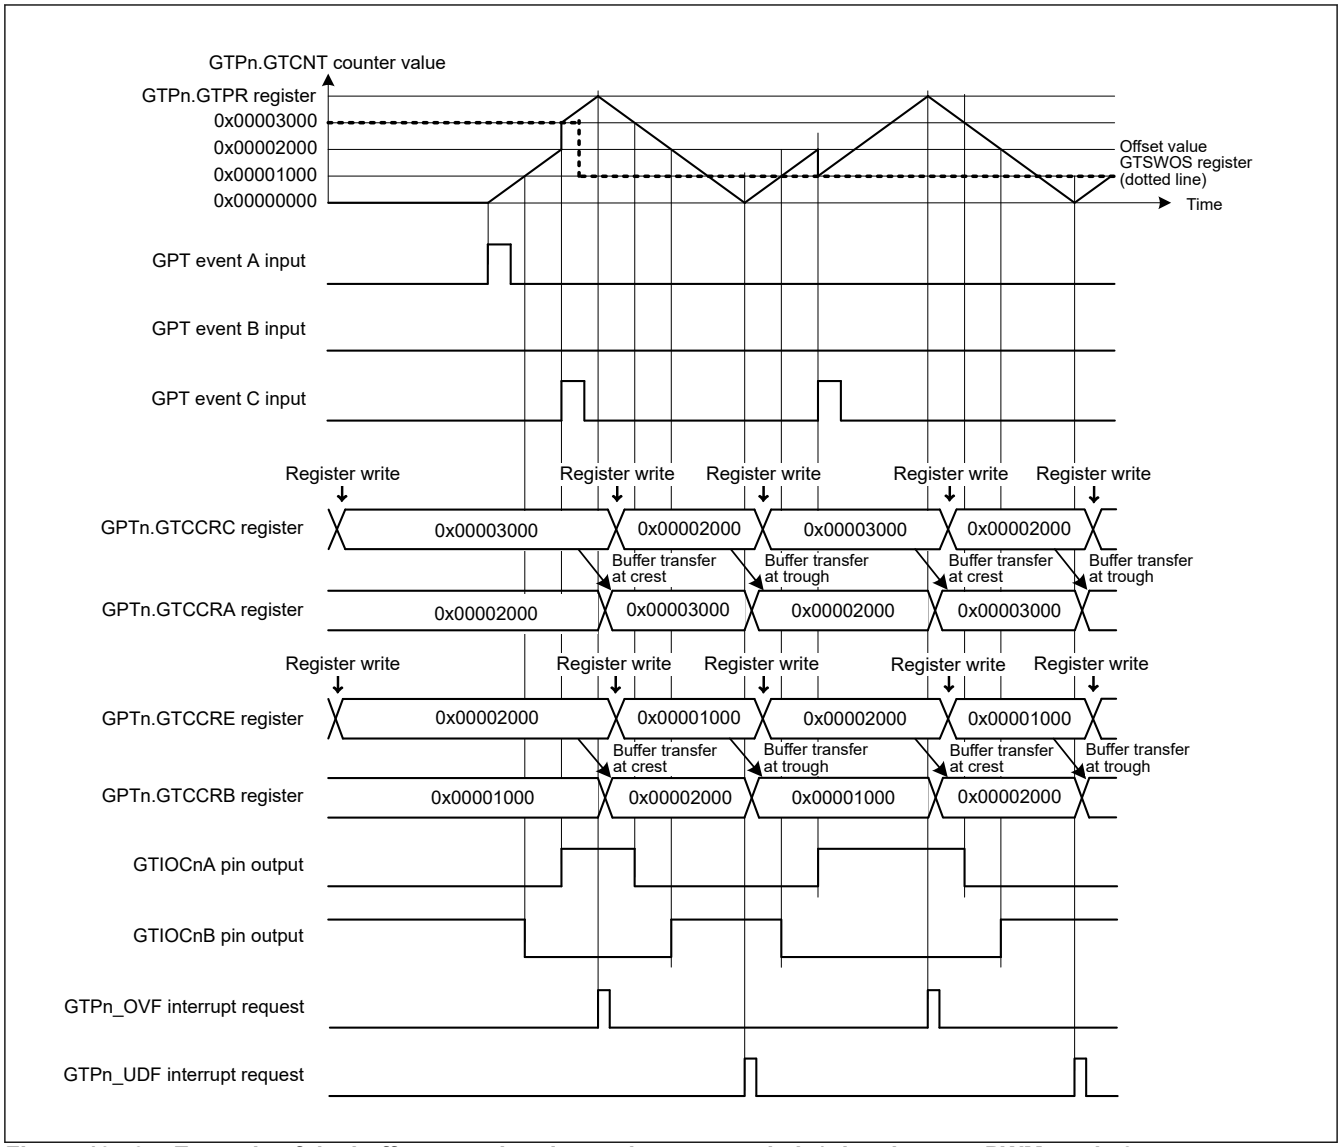

Figure 19.43 Example of the buffer operation due to the count switch (triangle-wave PWM mode 2, no crest and trough occurrence due to the count switch)

When the counter value skips the compare match value by the count switch, no compare match occurs and the GTIOCnm pin output does not change. Figure 19.44 shows example of the operation when the compare match is skipped by switch operation.

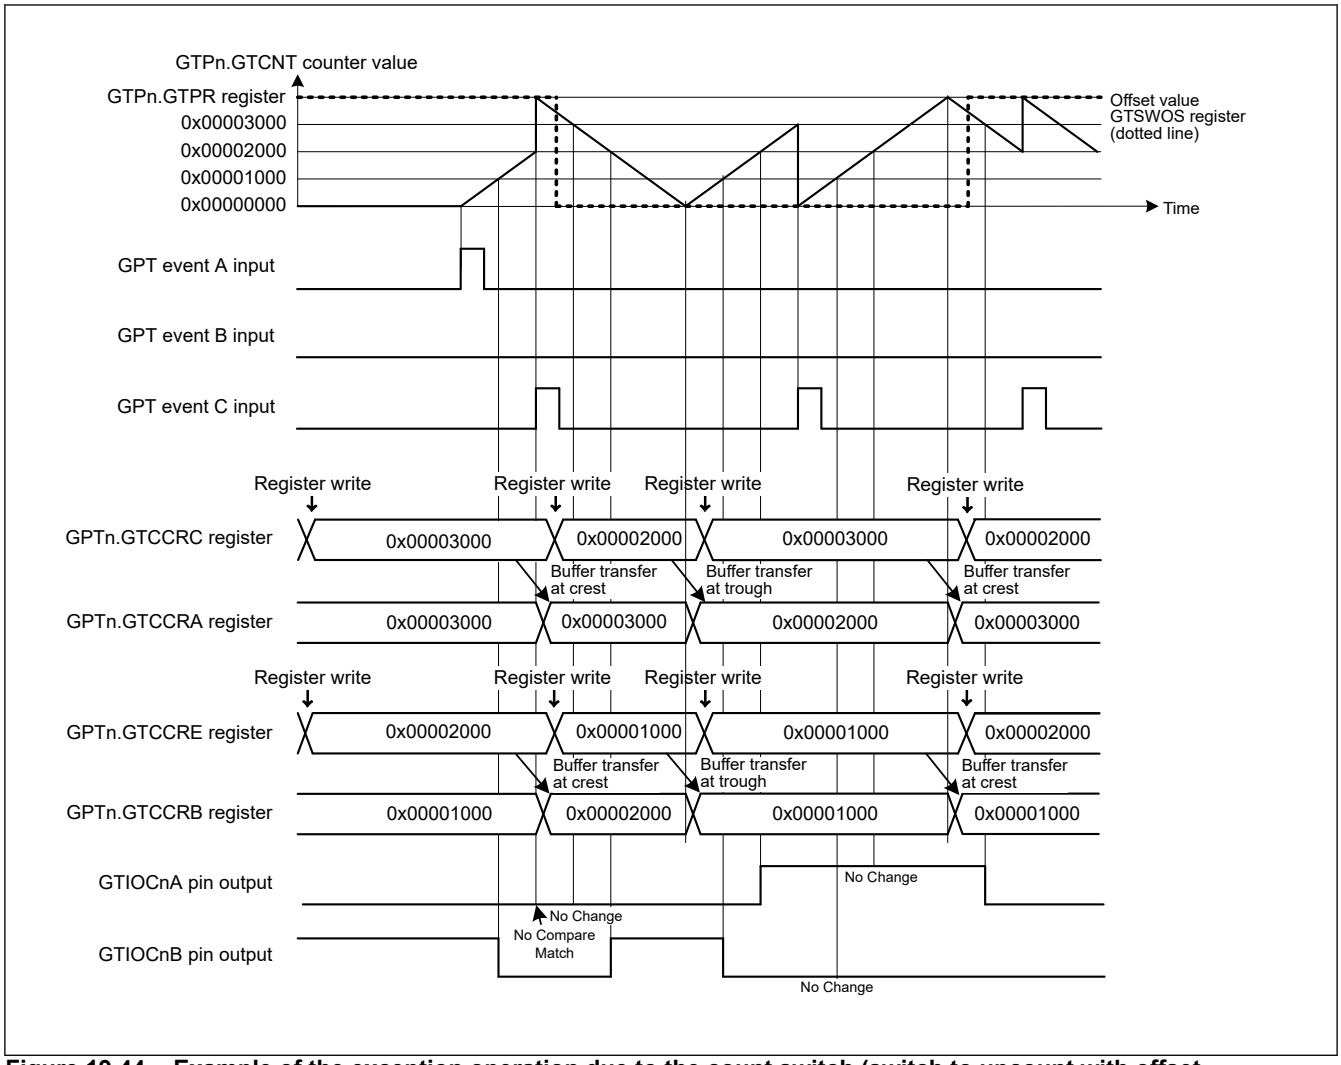

Figure 19.44 Example of the exception operation due to the count switch (switch to upcount with offset reload by GPT event C)

Figure 19.45 and Figure 19.46 show examples of the timing of operations to switch the counter in response to a rising edge of the input on the GTETRGA pin when a clock signal produced by frequency-dividing the Core clock signal is used as the counter clock for the GTCNT counter.

The GTCNT counter is switched when counting is in progress after the GPT has detected the internal switching signal.

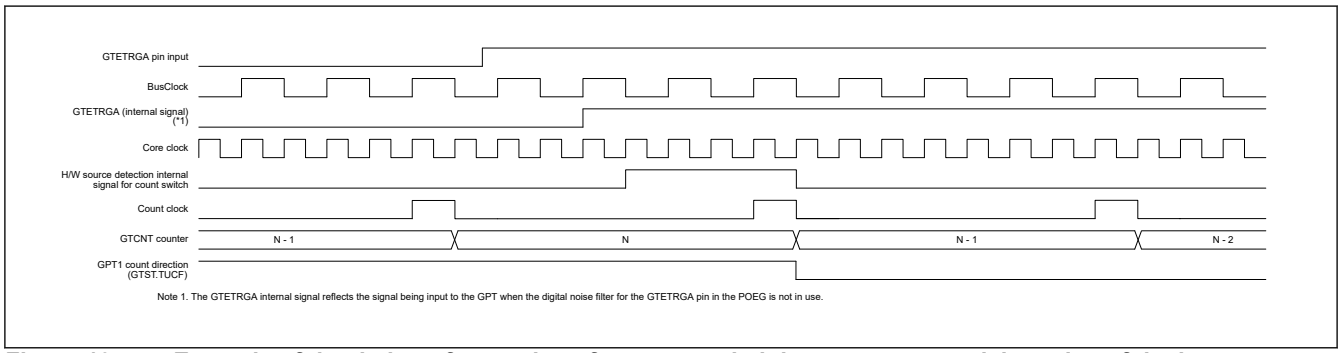

Figure 19.45 Example of the timing of operations for count switch in response to a rising edge of the input on the GTETRGA pin (switch to downcount without offset reload during the counting)

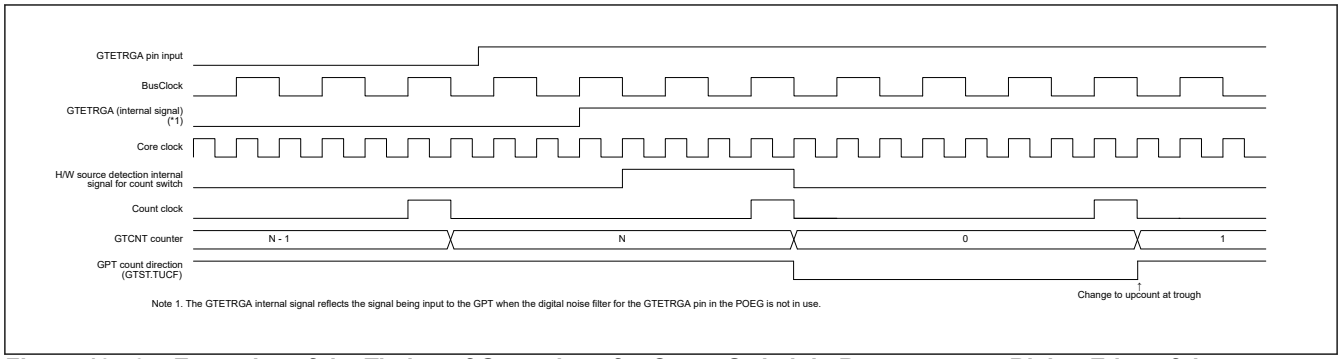

Figure 19.46 Examples of the Timing of Operations for Count Switch in Response to a Rising Edge of the Input on the GTETRGA Pin (switch to downcount with offset reload during the counting and offset value is 0)

Figure 19.47 and Figure 19.48 show examples of the timing of count switch operations in response to the input of an event signal from the GPT event A when counting is triggered by a hardware source.

This is an example of operations to switch the GPT1.GTCNT counter in response to a signal. An event signal is output to the ELC after matches in comparison with the GPT0.GTCCRA register. This is selected as a trigger for output to the GPT by the ELC as event source A.

The GPT0 compare match A signal is synchronized with Core clock. The ELC receives the signal in synchronization with BusClock, and outputs the GPT event source A signal after 1 cycle of BusClock has elapsed. The GTCNT counter is switched in synchronization with Core clock after the GPT has detected the internal switching signal.

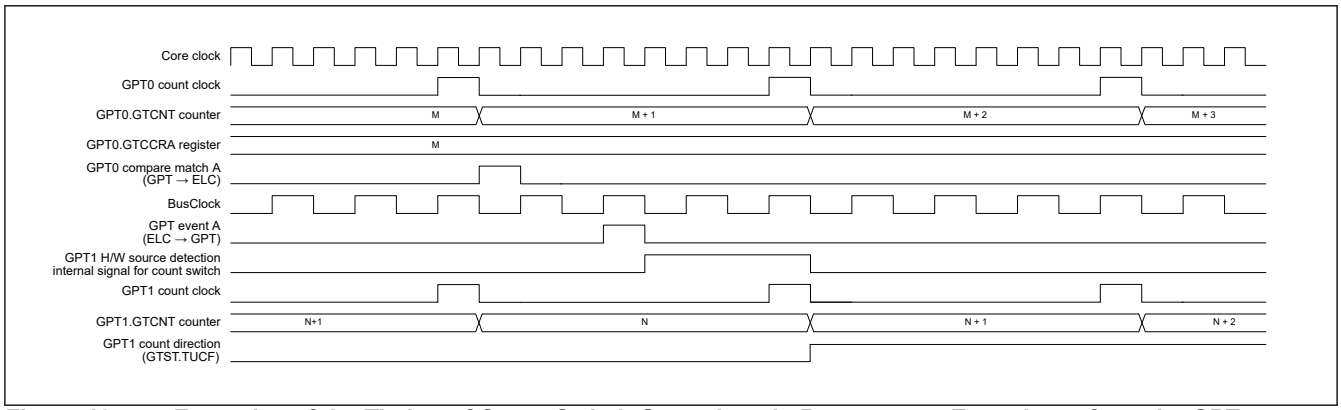

Figure 19.47 Examples of the Timing of Count Switch Operations in Response to Event Input from the GPT event A (switch to upcount without offset reload during the counting)

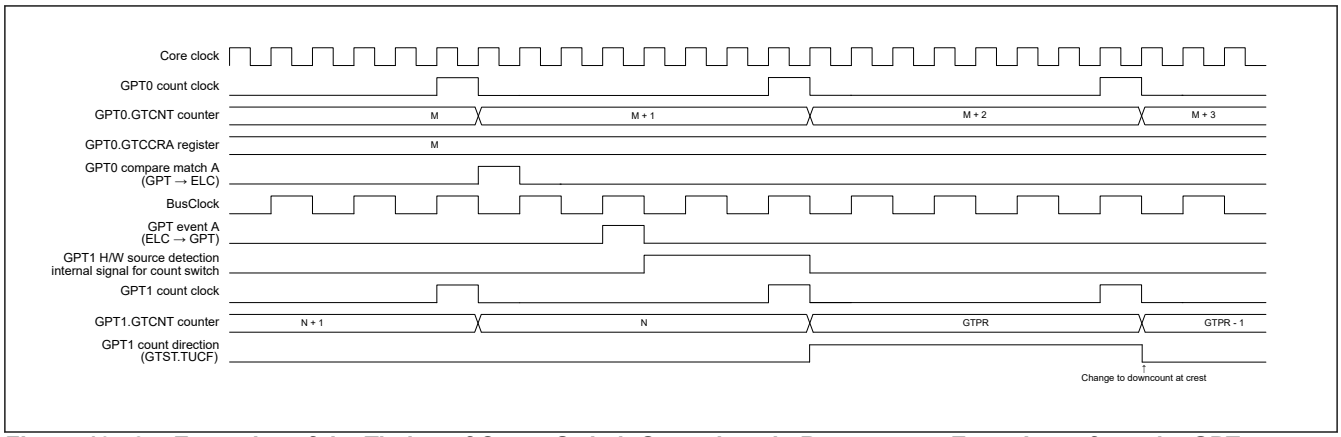

Figure 19.48 Examples of the Timing of Count Switch Operations in Response to Event Input from the GPT event A (switch to upcount with offset reload during the counting and offset value is GTPR)

19.3.9 Synchronous Operation

Synchronous operation on channels such as synchronous start/stop/clear/switch operation can be performed.

19.3.9.1 Synchronous Operation by Software

The count operations for respective channels can be started, stopped and cleared simultaneously by setting multiple bits of the GTSTR, GTSTP, and GTCLR registers to 1 at the same time.

Count start with phase differences among channels is possible by setting the GTCNT counter value before counting starts and then by setting simultaneously multiple bits in the GTSTR register to 1.

The Figure 19.49 shows an example of simultaneous start/stop/clear of four channels by software, and Figure 19.50 shows an example of phase shift start among four channels by software.

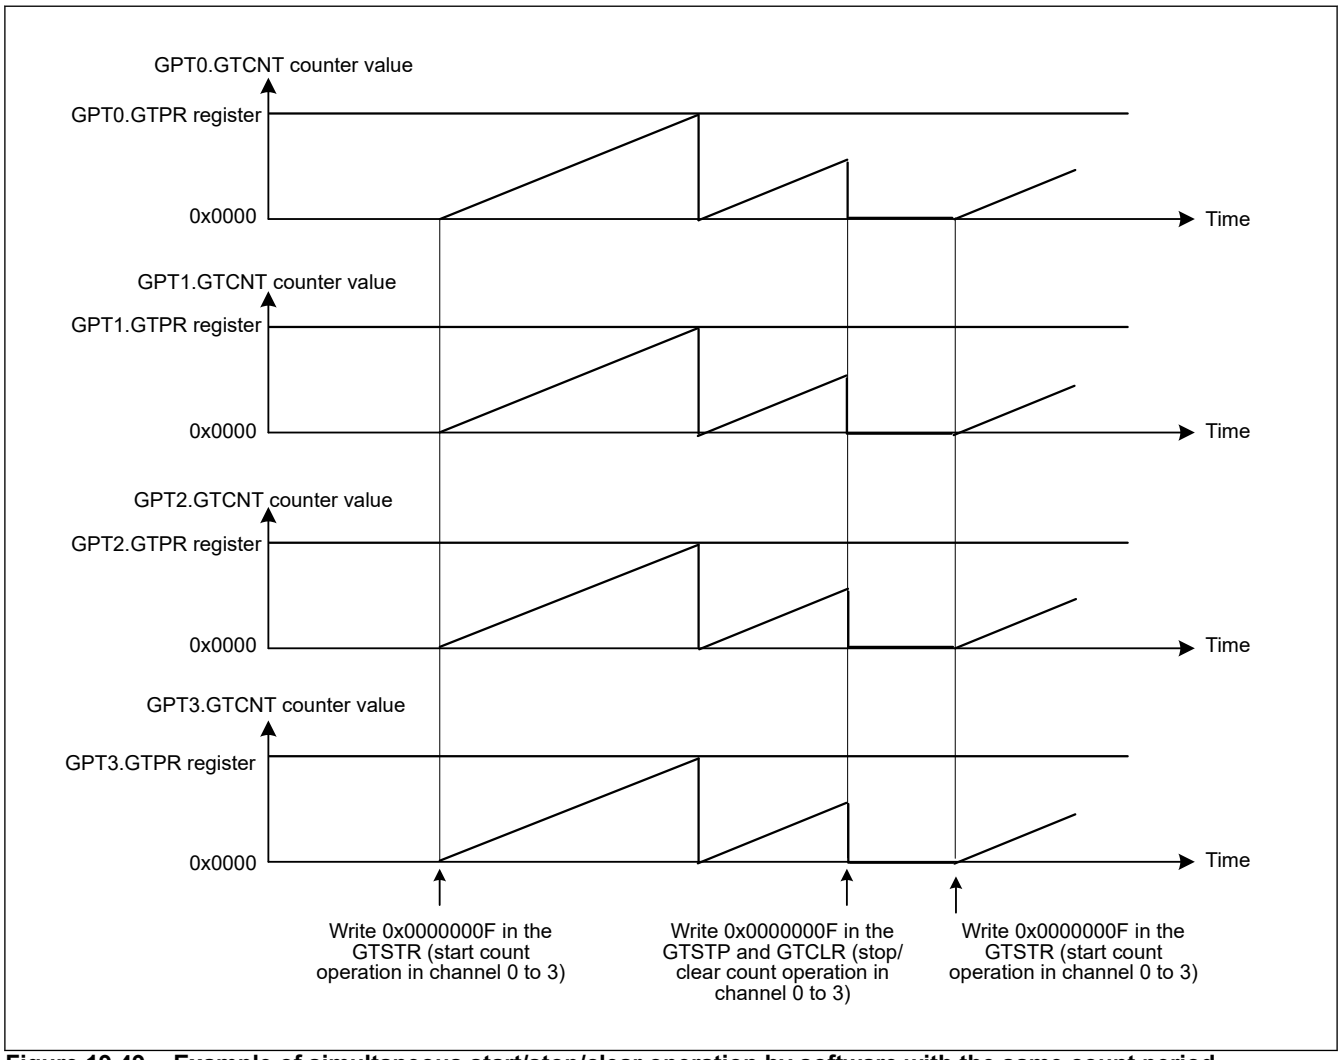

Figure 19.49 Example of simultaneous start/stop/clear operation by software with the same count period (GTPR register value)

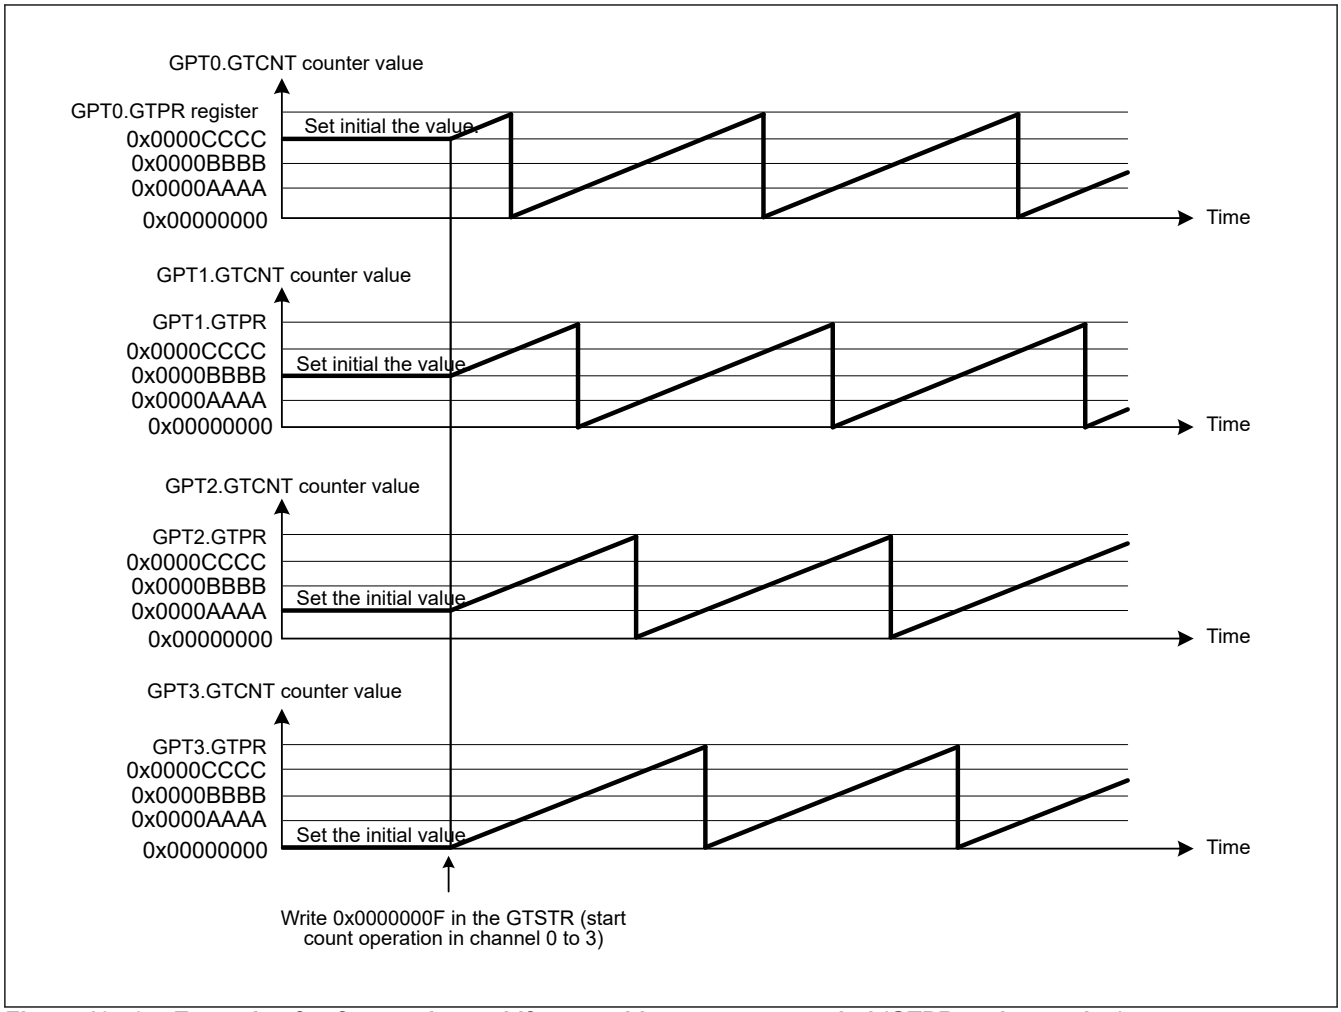

Figure 19.50 Example of software phase shift start with same count period (GTPR register value)

19.3.9.2 Synchronous Operation by Hardware Source

The count operations for respective channels can be started/stopped/cleared/switched simultaneously by hardware sources such as external trigger input and ELC event input.

Synchronous operation by the GTIOCnA and GTIOCnB pin inputs (n = 0 to 17) can be performed by setting the ELC event with input capture as a hardware source.

Figure 19.51 shows an example of simultaneous start/stop/clear/switch operation of four channels by hardware source.

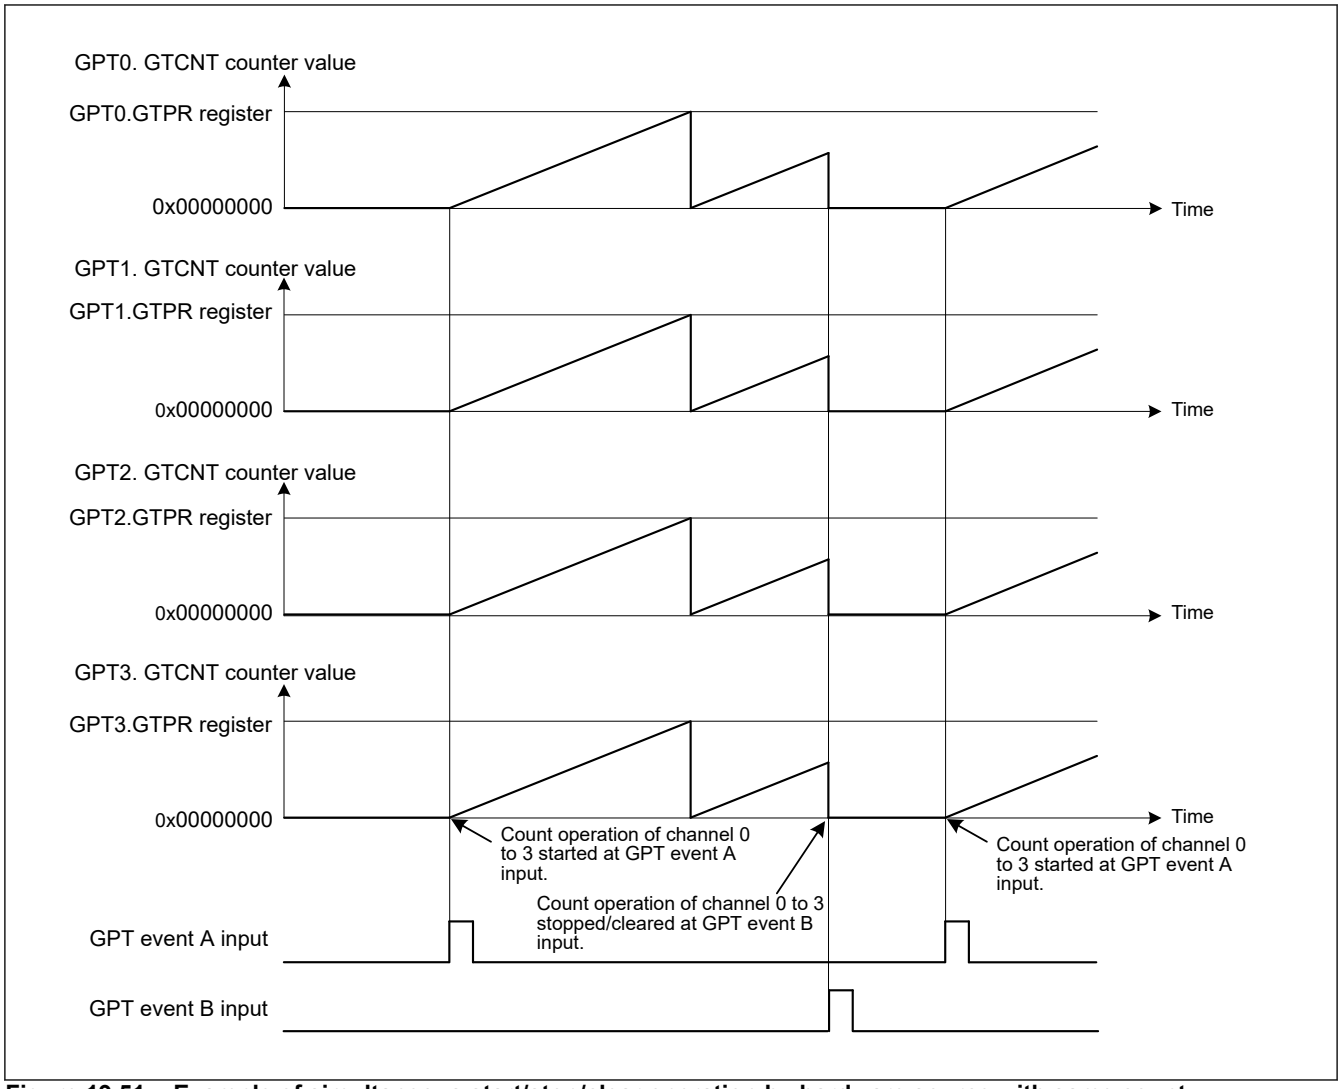

Figure 19.51 Example of simultaneous start/stop/clear operation by hardware source with same count period (GTPR register value)

The following example shows setting for simultaneous start by hardware source.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits of the corresponding channel.
   In Figure 19.51, 000b (sawtooth-wave PWM mode) is set.
2. Set count direction
   Select the count direction (up or down) with the GTUDDTYC register.
   In Figure 19.51, the lower 2 bits of the GTUDDTYC register is set to 11b and then to 01b for up-counting.
3. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits of the corresponding channel.
4. Period setting
   Set a period in the GTPR register of the corresponding channel.
5. Set initial value for counter
   Set the initial value in the GTCNT counter of the corresponding channel.
   In Figure 19.51, 0x00000000 is set.
6. Set hardware count start
   Select a hardware source to start the count operation with the GTSSR register and wait for count start by the hardware source.
   In Figure 19.51, GTSSR.SSELCA bit = 1.
7. Set hardware count stop

Select a hardware source to stop count operation with the GTPSR register and wait for count stop by the hardware source.
In Figure 19.51, GTPSR.PSELCB bit = 1.

8. Set hardware count clearing
Select a hardware source to clear the counter with the GTCSR register and wait for counter clear by the hardware source.
In Figure 19.51, GTCSR.CSELCB bit = 1.

9. Start hardware source operation
Set operation of the hardware source selected by the GTSSR, GTPSR, and GTCSR registers and start counting, stop counting, or clearing the counter.
In Figure 19.51, the GPT event A and B inputs are set.

19.3.10 PWM Output Operation Examples

(1) Synchronous PWM Output

The GPT can output two phases of linked PWM waveforms for one channel or 14 phases of linked PWM waveforms for a maximum of seven channels by one GPT or 36 phases of linked PWM waveforms for a maximum of 18 channels by plural GPT by synchronizing operation of the channels.

Figure 19.52 shows an example in which four channels perform synchronous operation in sawtooth-wave PWM mode and eight phases of PWM waveforms are output. The GTIOCnA pin (n = 0 to 3) is set so that it outputs low as the initial output, high at a GTCCRA register compare match, and low at the end of the cycle. The GTIOCnB pin is set so that it outputs low as the initial output, high at a GTCCRB register compare match, and low at the end of the cycle.

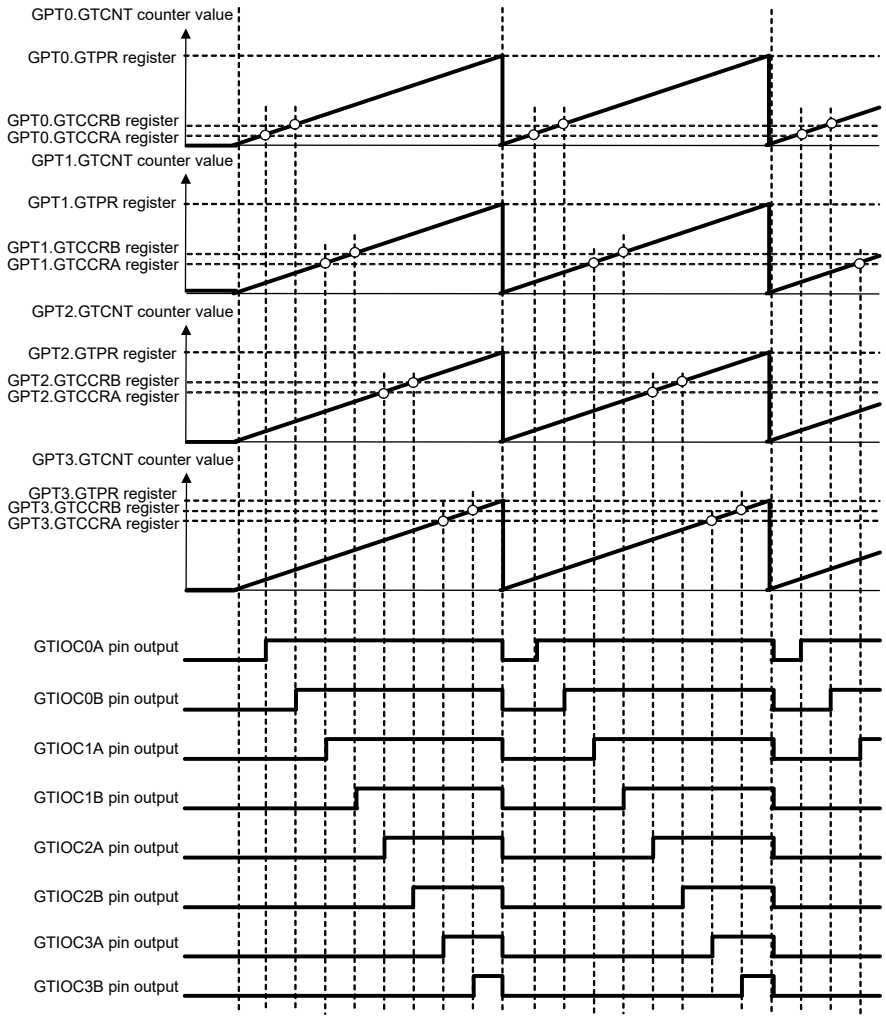

Figure 19.52 Example of synchronous PWM output

(2) 3-Phase Sawtooth-Wave Complementary PWM Output

Figure 19.53 shows an example in which three channels perform synchronous operation in sawtooth-wave PWM mode and 3-phase complementary PWM waveforms are output. The GTIOCnA pin (n = 0 to 2) is set so that it outputs low as the initial output, high at a GTCCRA register compare match, and low at the end of the cycle. The GTIOCnB pin is set so that it outputs high as the initial output, low at a GTCCRB register compare match, and high at the end of the cycle.

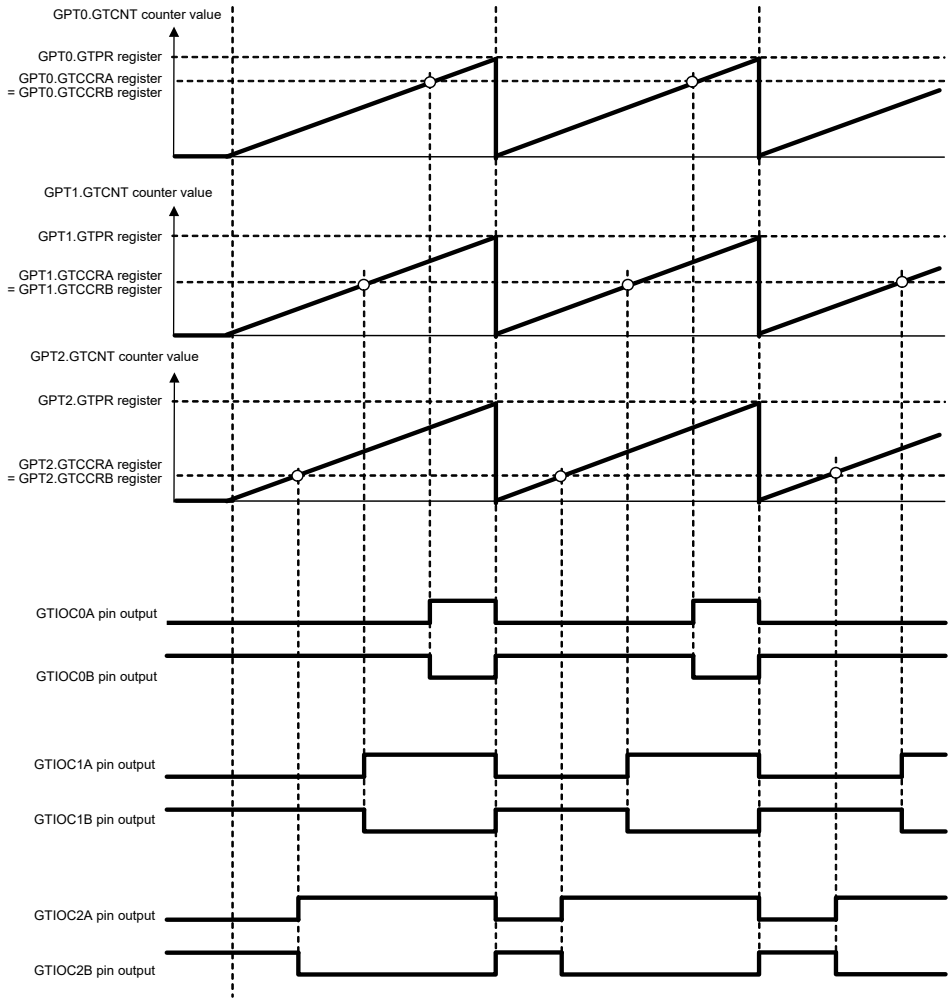

Figure 19.53 Example of 3-phase sawtooth-wave complementary PWM output

(3) 3-phase sawtooth-wave complementary PWM output with automatic dead time setting

Figure 19.54 shows an example in which three channels perform synchronous operation in sawtooth-wave one-shot pulse mode with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA pin (n = 0 to 2) is set so that it outputs low as the initial output, toggles the output at a GTCCRA register compare match, and retains the output at the end of the cycle. The GTIOCnB pin is set so that it outputs high as the initial output, toggles the output at a GTCCRB register compare match, and retains the output at the end of the cycle.

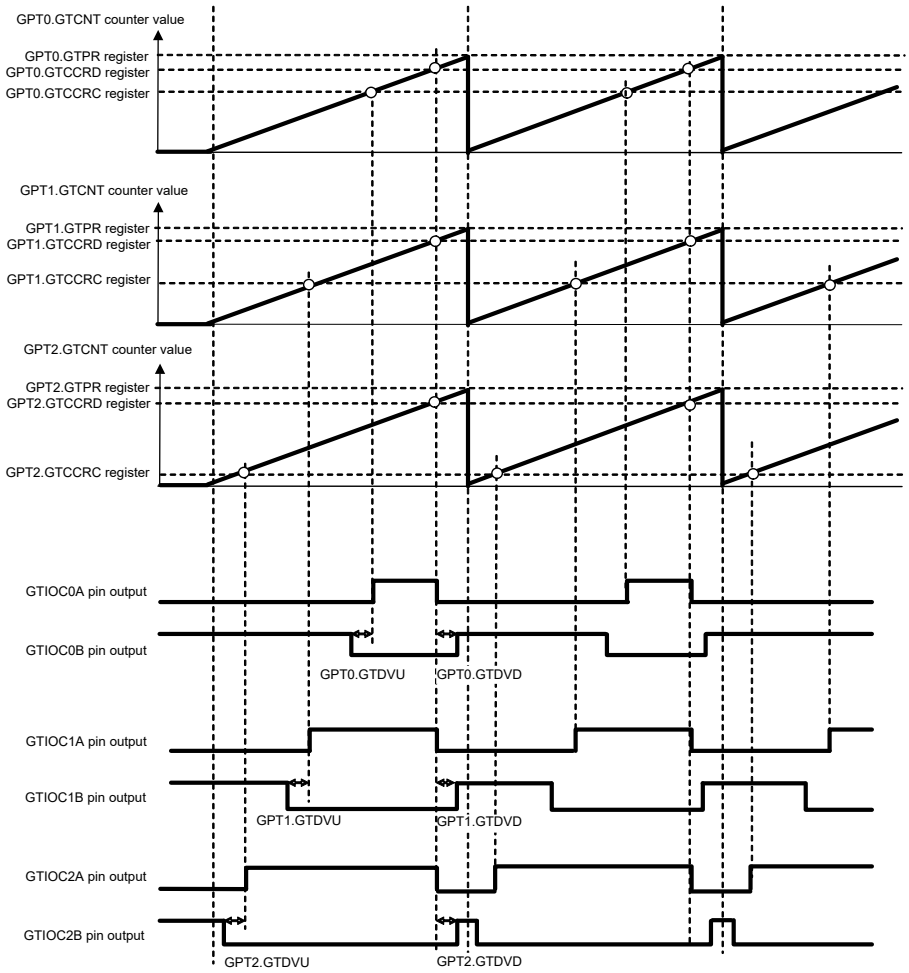

Figure 19.54 Example of 3-phase sawtooth-wave complementary PWM output with automatic dead time setting

(4) 3-Phase Triangle-Wave Complementary PWM Output

Figure 19.55 shows an example in which three channels perform synchronous operation in triangle-wave PWM mode 1 and 3-phase complementary PWM waveforms are output. The GTIOCnA pin (n = 0 to 2) is set so that it outputs low as the initial output, toggles the output at a GTCCRA register compare match, and retains the output at the end of the cycle. The GTIOCnB pin is set so that it outputs high as the initial output, toggles the output at a GTCCRB register compare match, and retains the output at the end of the cycle.

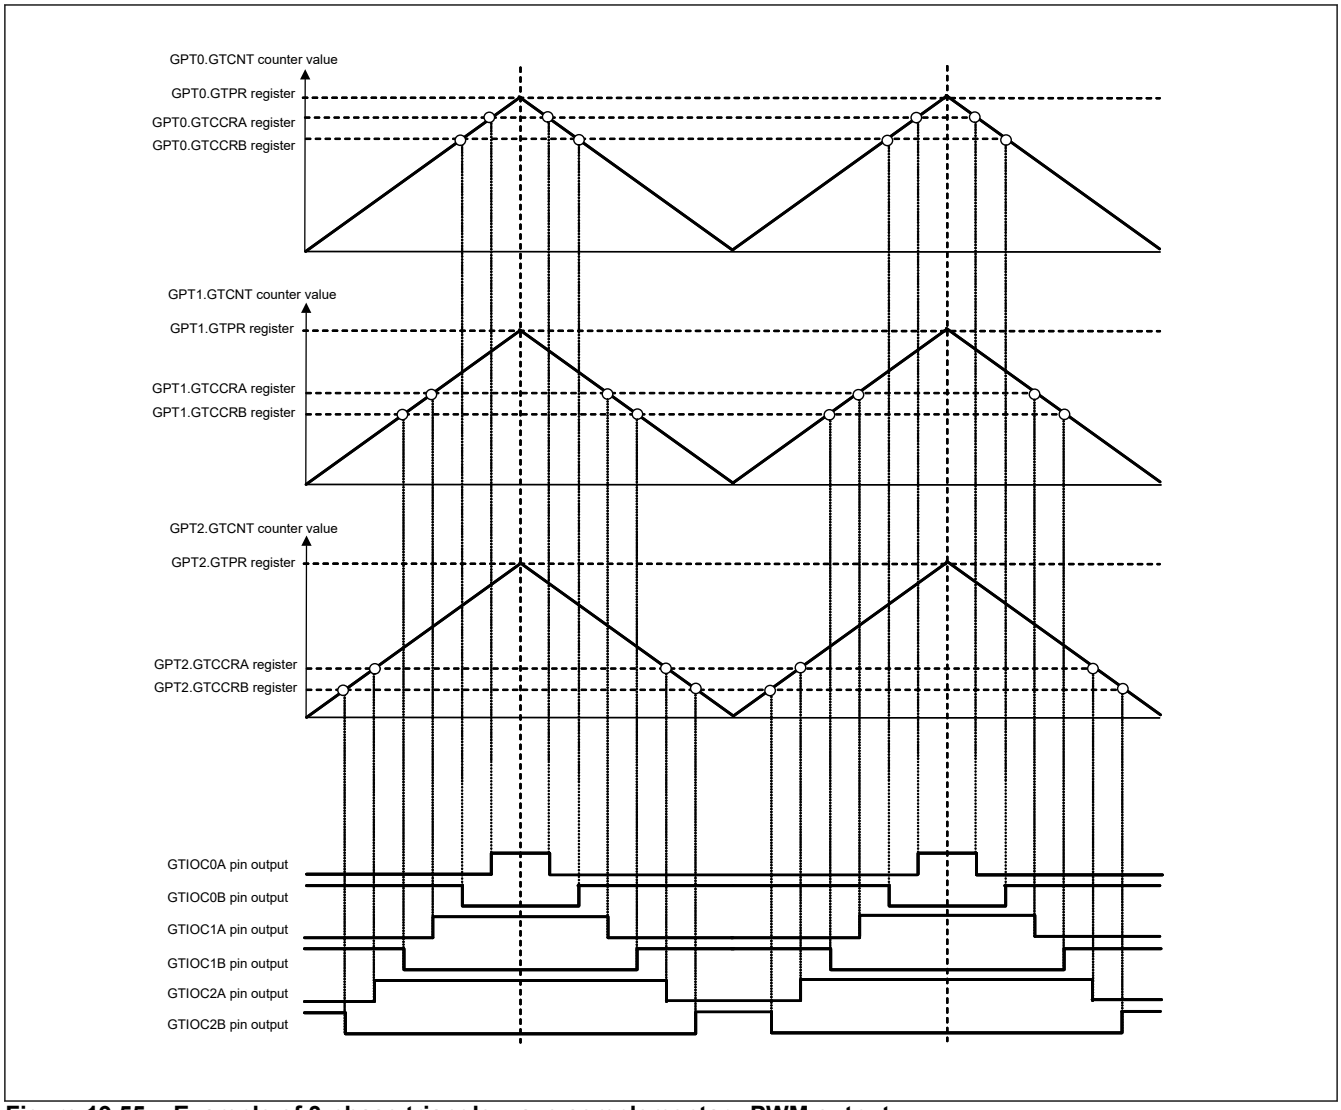

Figure 19.55 Example of 3-phase triangle-wave complementary PWM output

(5) 3-Phase Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 19.56 shows an example in which three channels perform synchronous operation in triangle-wave PWM mode 1 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA pin (n = 0 to 2) is set so that it outputs low as the initial output, toggles the output at a GTCCRA register compare match, and retains the output at the end of the cycle. The GTIOCnB pin is set so that it outputs high as the initial output, toggles the output at a GTCCRB register compare match, and retains the output at the end of the cycle.

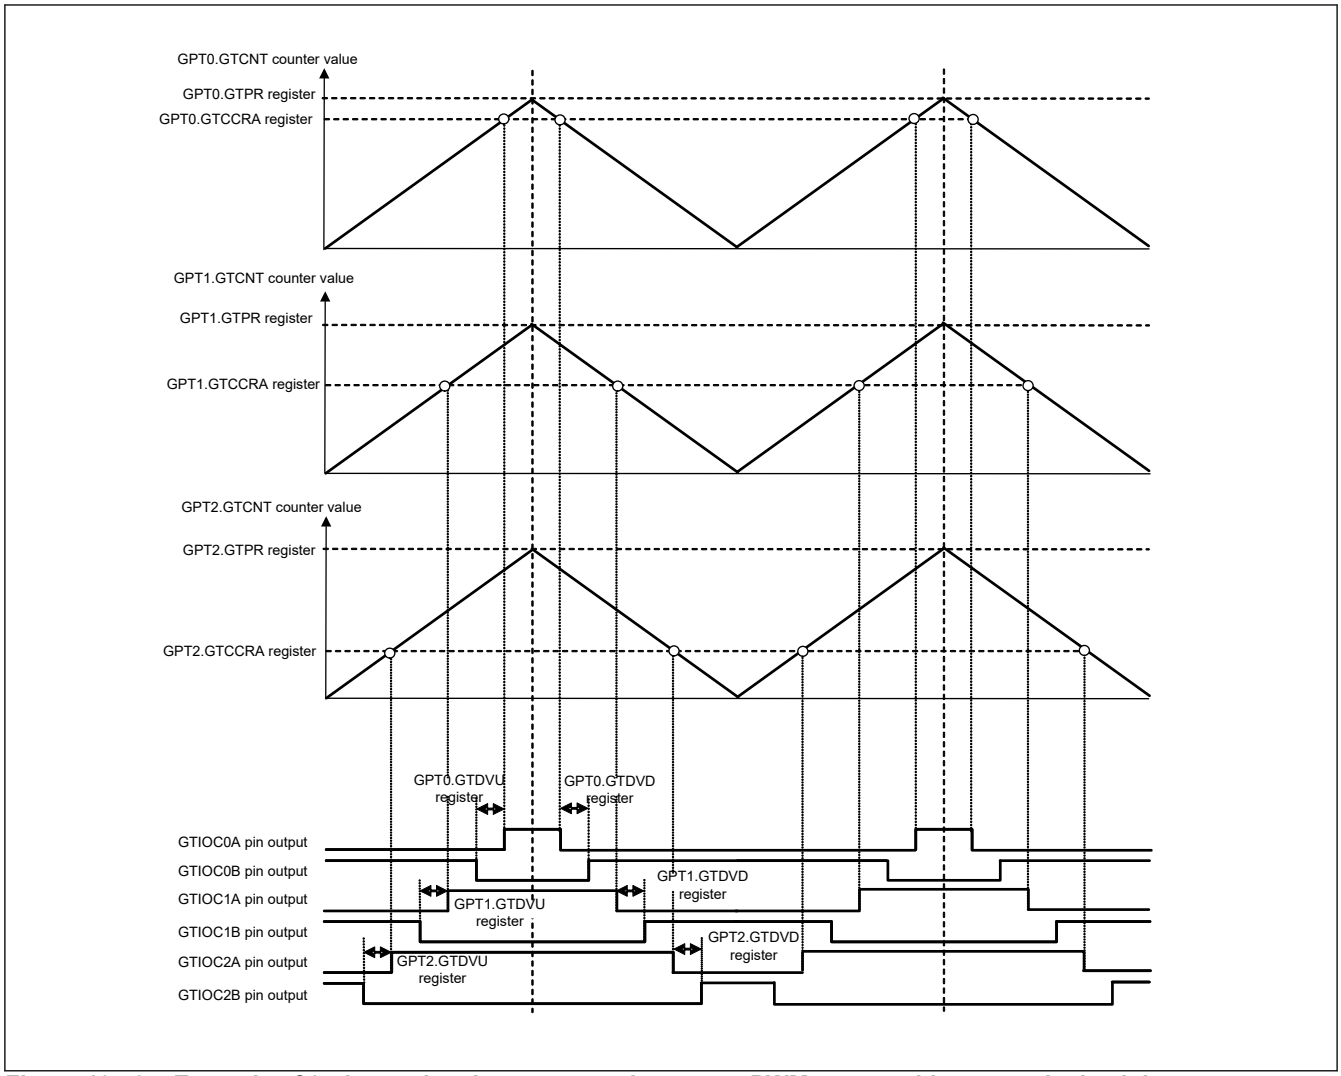

Figure 19.56 Example of 3-phase triangle-wave complementary PWM output with automatic dead time setting

(6) 3-Phase Asymmetric Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 19.57 shows an example in which three channels perform synchronous operation in triangle-wave PWM mode 3 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA pin (n = 0 to 2) is set so that it outputs low as the initial output, toggles the output at a GTCCRA register compare match, and retains the output at the end of the cycle. The GTIOCnB pin is set so that it outputs high as the initial output, toggles the output at a GTCCRB register compare match, and retains the output at the end of the cycle.

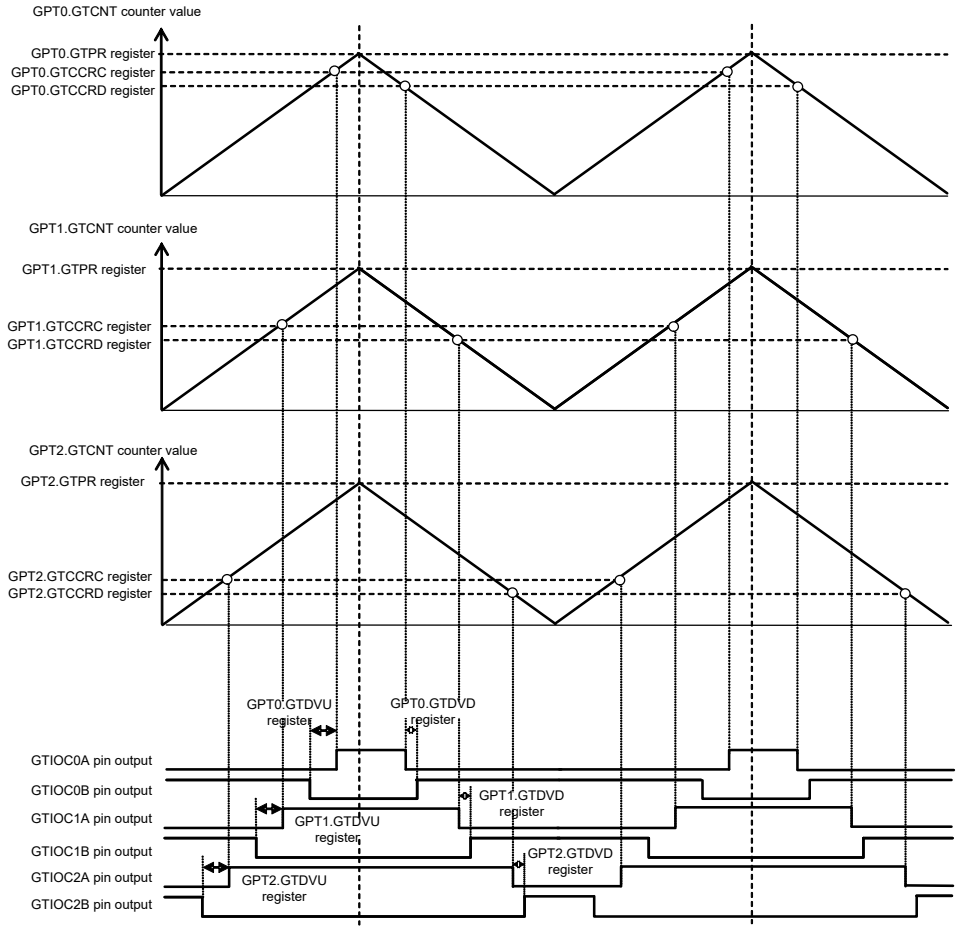

Figure 19.57 Example of 3-Phase Asymmetric Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

19.3.11 Phase Counting Mode

The GTCNT counter can be up-counting or down-counting by detecting the phase difference between the GTIOCnA pin input (n = 0 to 17) and the GTIOCnB pin input. Detection of the phase difference can be performed by setting the relationship between the edge and the level of the GTIOCnA pin input and the GTIOCnB pin input using the GTUPSR and GTDNSR registers for input combination. See section 19.3.1.1. Counter Operation.

Figure 19.58 to Figure 19.67 show the examples of setting procedure for the phase counting mode 1 to 5, and Table 19.11 to Table 19.20 show the setting of the GTUPSR and GTDNSR registers including up-counting and down-counting conditions.

19.4 Interrupt Sources

19.4.1 Interrupt Sources

There are four kinds of interrupt sources:

- GTCCRm register (m = A to F) input capture / compare match
- GTADTR register compare match (only used for ELC)
- GTCNT counter overflow (GTPR register compare match) / underflow
- Dead time error

Each interrupt source has its own status flag and control bit for generating interrupt request signals, where the generation of interrupt request signals can be enabled or disabled individually.

When an interrupt source condition is satisfied, the corresponding status flag in GTST is set to 1 and an interrupt request is generated if the corresponding interrupt request enable or disable bit in the GTINTAD register is 1.

The corresponding status flag in the GTST register is writable to clear. If flag set and flag clear occur at the same time, flag clear has priority over flag set. Both dead time error (DTEF flag) and those flags are automatically updated by internal state.

For details, see section 11, Interrupt Controller (ICU). Table 19.21 shows a list of the GPT interrupt sources.

Table 19.21 Interrupt sources

Channel	Name	Interrupt source	Interrupt flag
GPTn	GPTn_CCMPA	GPTn.GTCCRA register input capture / compare match	—
	GPTn_CCMPB	GPTn.GTCCRB register input capture / compare match	—
	GPTn_CMPC	GPTn.GTCCRC register compare match	—
	GPTn_CMPD	GPTn.GTCCRD register compare match	—
	GPTn_CMPE	GPTn.GTCCRE register compare match	—
	GPTn_CMPF	GPTn.GTCCRF register compare match	—
	GPTm_DTE	GPTm dead time error	GPTm.GTST.DTEF
	GPTm_ADTRGA	GPTm.GTADTRA register compare match	GPTm.GTST.ADTRAUF GPTm.GTST.ADTRADF
	GPTm_ADTRGB	GPTm.GTADTRB register compare match	GPTm.GTST.ADTRBUF GPTm.GTST.ADTRBDF
	GPTn_OVF	GPTn.GTCNT counter overflow (GPTn.GTPR register compare match)	—
	GPTn_UDF	GPTn.GTCNT counter underflow	—

Note: n = 0 to 17, m = 0 to 13

(1) GPTn_CCMPA Interrupt (n = 0 to 17)

When the GTINTAD.GTINTA bit is 1, an interrupt request is generated under the following conditions:

- When the GTCCRA register functions as a compare match register, the GTCNT counter value matches with the GTCCRA register
- When the GTCCRA register functions as an input capture register, the input capture signal causes transfer of the GTCNT counter value to the GTCCRA register

(2) GPTn_CCMPB Interrupt (n = 0 to 17)

When the GTINTAD.GTINTB bit is 1, an interrupt request is generated under the following conditions:

- When the GTCCRB register functions as a compare match register, the GTCNT counter value matches with the GTCCRB register

- When the GTCCRB register functions as an input capture register, the input capture signal causes transfer of the GTCNT counter value to the GTCCRB register

(3) GPTn_CMPC Interrupt (n = 0 to 17)

When the GTINTAD.GTINTC bit is 1, an interrupt request is generated under the following condition:

- When the GTCCRC register functions as a compare match register, the GTCNT counter value matches with the GTCCRC register

A compare match is not performed and thus interrupt is not requested under the following conditions:

- GTCR.MD[2:0] bits = 001b (sawtooth-wave one-shot pulse mode)
- GTCR.MD[2:0] bits = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] bits = 01b, 10b, 11b (buffer operation with the GTCCRC register)

(4) GPTn_CMPD Interrupt (n = 0 to 17)

When the GTINTAD.GTINTD bit is 1, an interrupt request is generated under the following condition:

- When the GTCCRD register functions as a compare match register, the GTCNT counter value matches with the GTCCRD register

A compare match is not performed and thus interrupt is not requested under the following conditions:

- GTCR.MD[2:0] bits = 001b (sawtooth-wave one-shot pulse mode)
- GTCR.MD[2:0] bits = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] bits = 10b, 11b (buffer operation with the GTCCRD register)

(5) GPTn_CMPE Interrupt (n = 0 to 17)

When the GTINTAD.GTINTE bit is 1, an interrupt request is generated under the following condition:

- When the GTCCRE register functions as a compare match register, the GTCNT counter value matches with the GTCCRE register.

A compare match is not performed and thus interrupt is not requested under the following conditions:

- GTCR.MD[2:0] bits = 001b (sawtooth-wave one-shot pulse mode)
- GTCR.MD[2:0] bits = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] bits = 01b, 10b, 11b (buffer operation with the GTCCRE register)

(6) GPTn_CMPF Interrupt (n = 0 to 17)

When the GTINTAD.GTINTF bit is 1, an interrupt request is generated under the following condition:

- When the GTCCRF register functions as a compare match register, the GTCNT counter value matches with the GTCCRF register.

A compare match is not performed and thus interrupt is not requested under the following conditions:

- GTCR.MD[2:0] bits = 001b (sawtooth-wave one-shot pulse mode)
- GTCR.MD[2:0] bits = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] bits = 10b, 11b (buffer operation with the GTCCRF register)

(7) GPTm_ADTRGA Interrupt (m = 0 to 13)

When the GTCNT counter value matches with the GTADTRA register, an interrupt request is generated under the following conditions:

- In up-counting, the interrupt enable bit (ADTRAUEN) in the GTINTAD register is 1
- In down-counting, the interrupt enable bit (ADTRADEN) in the GTINTAD register is 1

In event count operation, this interrupt request is not generated.

(8) GPTm_ADTRGB Interrupt (m = 0 to 13)

When the GTCNT counter value matches with the GTADTRB register, an interrupt request is generated under the following conditions:

- In up-counting, the interrupt enable bit (ADTRBUEN) in the GTINTAD register is 1
- In down-counting, the interrupt enable bit (ADTRBDEN) in the GTINTAD register is 1

In event count operation, this interrupt request is not generated.

(9) GPTn_OVF Interrupt (n = 0 to 17)

When the GTINTAD.GTINTPR[0] bit is 1, an interrupt request is generated under the following conditions:

- In sawtooth-wave mode, interrupt requests are enabled at overflows (GTCNT counter value changes from GTPR register value to 0 during up-counting)
- In triangle-wave mode, interrupt requests are enabled at crests (GTCNT counter value changes from GTPR register value to GTPR register value minus 1)
- In count operation by a hardware source, interrupt requests are enabled at overflows (GTCNT counter value changes from GTPR register value to 0 during up-counting)

(10) GPTn_UDF Interrupt (n = 0 to 17)

When the GTINTAD.GTINTPR[1] bit is 1, an interrupt request is generated under the following conditions:

- In sawtooth-wave mode, interrupt requests are enabled at underflows (GTCNT counter value changes from 0 to GTPR register value during down-counting)
- In triangle-wave mode, interrupt requests are enabled at troughs (GTCNT counter value changes from 0 to 1)
- In counting by a hardware source, interrupt requests are enabled at underflows (GTCNT counter value changes from 0 to GTPR register value during down-counting)

(11) GPTm_DTE Interrupt (m = 0 to 13)

When automatic dead time setting is made, the GTST.DTEF flag becomes 1 when the timer output toggle point with dead time added exceeds the count period. If GTINTAD.GRPDTE bit is 1 at this time, a dead time error interrupt request is generated.

In addition, when the timer output toggle point with dead time added is back within the count period, the GTST.DTEF flag changes from 1 to 0.

Table 19.22 Relationship between interrupt signals and interrupt enable bits (1 of 2)

Interrupt signal	Interrupt enable bit	Interrupt status flag
GPTn_CCMPA	GPTn.GTINTAD.GTINTA bit	—
GPTn_CCMPB	GPTn.GTINTAD.GTINTB bit	—

GPTn_UDF		—

Note: n = 0 to 17, m = 0 to 13

19.4.2 Interrupt and A/D Conversion Start Request Skipping Function

19.4.2.1 Interrupt Skipping Function by GTITC Register

By setting the GTITC register, the GTCNT counter overflow (GTPR register compare match) interrupt (GTPn_OVF) and underflow interrupt (GTPn_UDF) can be skipped. Other interrupts and A/D converter start request signals can be skipped in coordination with the GTPn_OVF/GTPn_UDF skipping function. However, the dead time error interrupts cannot be linked with the GTPn_OVF/GTPn_UDF skipping function.

The interrupt skipping function is related only to the GTITC register setting, and is not related to setting of the GTINTAD register interrupt enable bit.

When both troughs and crests are counted and skipped in triangle-wave mode, if the number of times of skipping is odd, GTPn_OVF/GTPn_UDF interrupt requests cannot be generated at troughs only or at crests only depending on the skipping counter start timing. Therefore, to count both troughs and crests and generate the GTPn_OVF/GTPn_UDF interrupts at troughs only or crests only in triangle-wave mode, the number of times of skipping should be even.

Similarly, in sawtooth-wave mode, when both overflows and underflows are counted and skipped with the count direction changed, GTPn_OVF/GTPn_UDF interrupt requests cannot be generated at overflows only or at underflows only.

Therefore, to count both overflows and underflows with the count direction changed and generate the GTPn_OVF/ GTPn_UDF interrupts at overflows only or underflows only in sawtooth-wave mode, the skipping state should be carefully checked before using.

When changing the skipping count, be sure to release the skipping count setting (GTITC.IVTC[1:0] bits = 00b).

Figure 19.68 to Figure 19.73 show examples of skipping function operation.

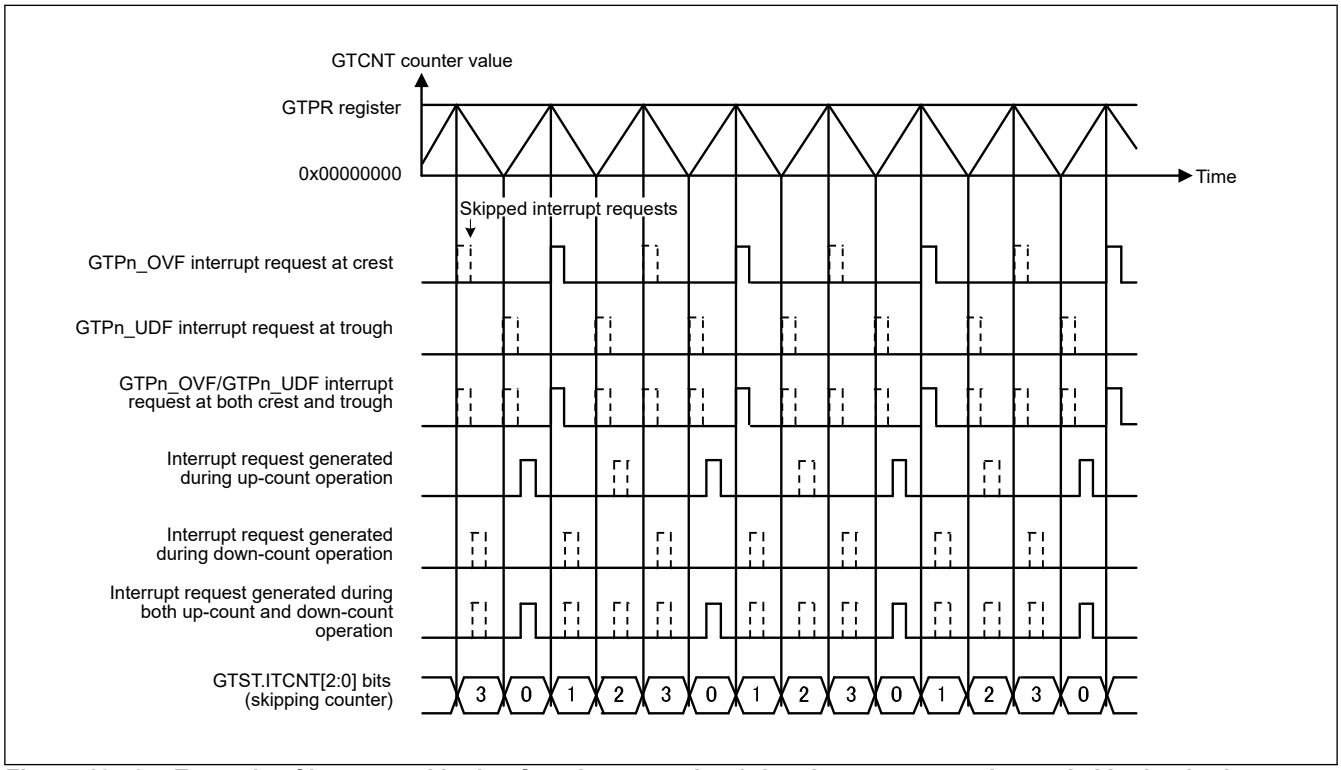

Figure 19.72 Example of interrupt skipping function operation (triangle waves, counting and skipping both troughs and crests, skipping count = 3, skipping started at down-counting)

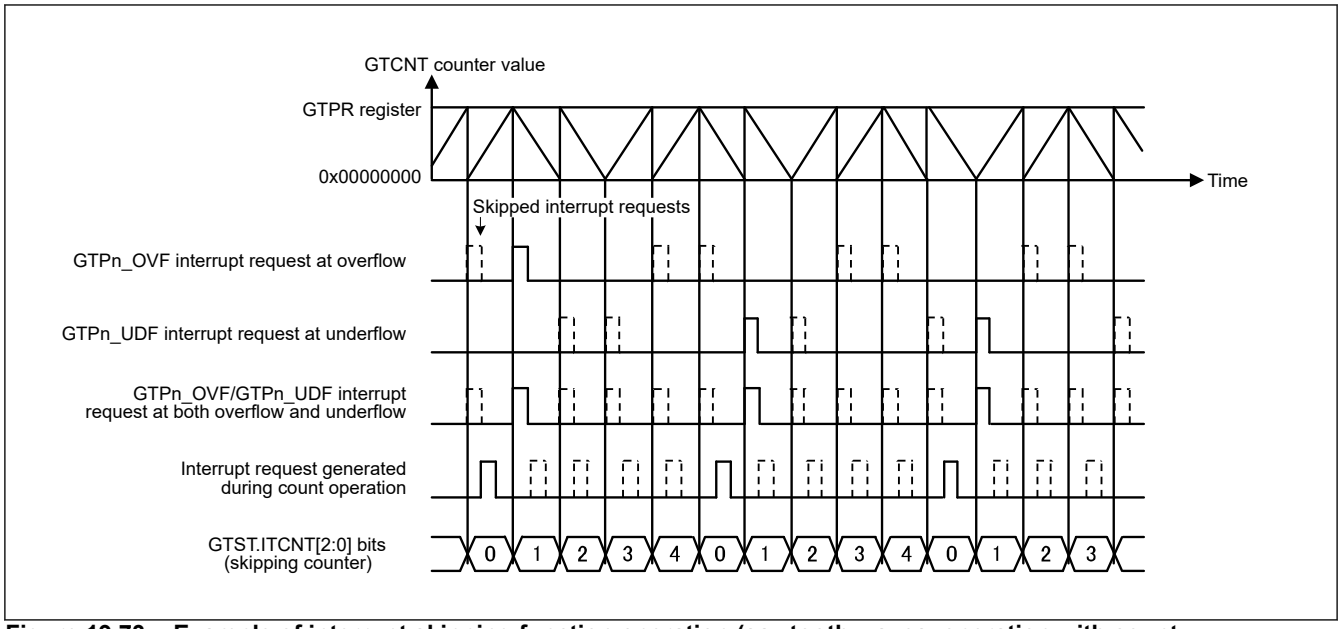

Figure 19.73 Example of interrupt skipping function operation (sawtooth waves, operation with count direction changed, counting and skipping both overflows and underflows, skipping count = 4)

19.4.2.2 Extended Interrupt Skipping Function

Overflow/underflow interrupt, compare match/input capture interrupt, A/D converter start request, and buffer transfer can be skipped by counting the GTCNT counter overflow or underflow based on settings of the GTEITC, GTEITLI1, GTEITLI2, and GTEITLB registers. A dead time error interrupt cannot be skipped.

Overflow/underflow interrupt, compare match/input capture interrupt, A/D converter start request, and buffer transfer can individually be set for skipping and the skipping period using the GTEITLI1, GTEITLI2, and GTEITLB registers.

The skipping period is set, related to the operation of the two independent extended interrupt skipping counters (EITCNT1[3:0] and EITCNT2[3:0] bits in the GTEITC registers), as a period that either of the counter value for such skipping counters is other than 0 or other than the skipping count. The skipping period can also be set as a period that both skipping counters are set as other than 0 or other than the skipping count for the counter value.

Figure 19.74 shows the counter operation for interrupt skipping by the GTITC register and extended interrupt skipping. The counter operation for extended interrupt skipping is set by the GTEITC register.

The EITCNT1[3:0] bits count the count source (in Figure 19.74, a crest is selected) selected by the extended interrupt counter 1 count source select bits (GTEITC.EIVTC1[1:0]) when the initial value is set for 0, and repeat the count operation which returns to 0 when the skipping count (in Figure 19.74, the count is 2) is set by the extended interrupt skipping 1 skipping count setting bits (EIVTT1[3:0]) is achieved.

The EITCNT2[3:0] bits can set the initial value, count the count source (in Figure 19.74, a trough is selected) selected by the extended interrupt counter 2 count source select bits (EIVTC2[1:0]), and repeat the count operation which returns to 0 when the skipping count (in Figure 19.74, the count is 2) is set by the EIVTT2[3:0] bits is achieved. The initial value is set when the GTEITC register is written by the access of upper 16 bits or 32 bits and when the written value to the EIVTC2[1:0] bits is other than 00b, while the setting for the extended interrupt skipping counter 2 is not in counting (EIVTC2[1:0] bits are 00b).

When the initial value is set, the written value to the extended interrupt skipping counter 2 initial value bits (EITCNT2IV[3:0]) is set as the initial value for the EITCNT2[3:0] bits.

The extended interrupt skipping counter starts up-counting at the first count clock after the setting is modified from not counting to counting.

The interrupt skipping count counter (GTST.ITCNT[2:0] bits) by the GTITC register is reset to 000b when the GTCNT counter operation is stopped: however, the EITCNT1[3:0] and EITCNT2[3:0] bits which are extended interrupt skipping functions retain the value even after the GTCNT counter operation is stopped, and the counting can be resumed from the value before the counter is stopped. When values for the EITCNT1[3:0] and EITCNT2[3:0] bits are to be reset (0000b), set the EIVTC1[1:0] and EIVTC2[1:0] bits to the setting for not counting (not skipping) (00b).

When the skipping count is to be changed, change the count after stopping the skipping counter operation (set either of the EIVTC1[1:0] bits or the EIVTC2[1:0] bits to 00b).

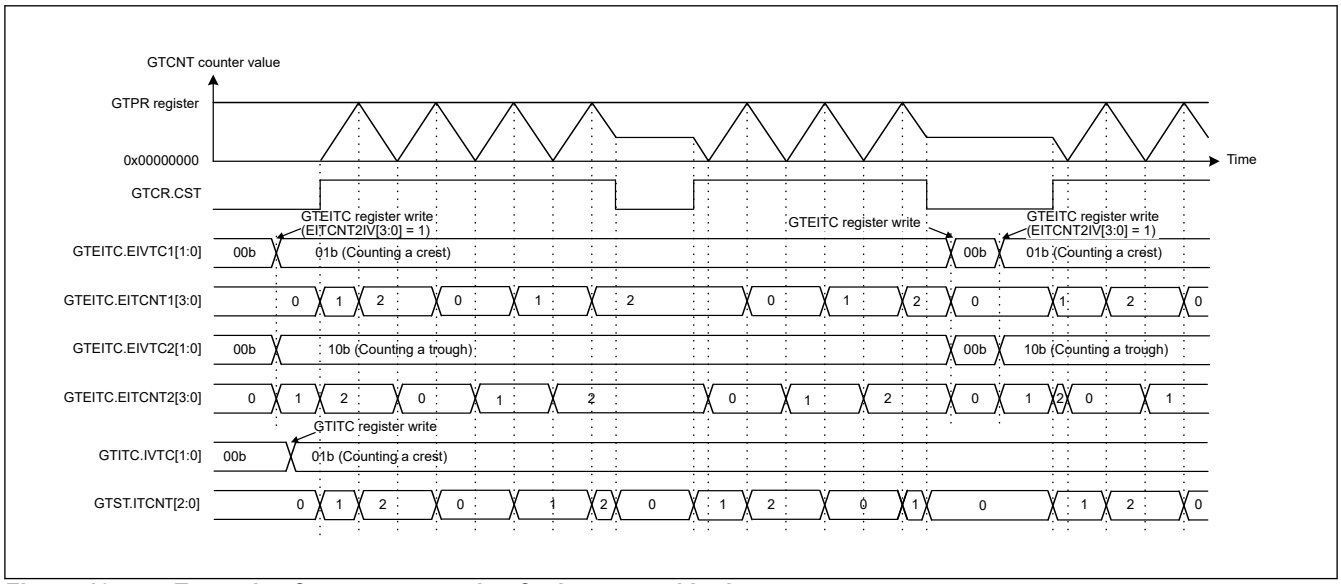

Figure 19.74 Example of counter operation for interrupt skipping

Interrupt skipping by the GTEITL1 register and A/D conversion start request skipping by the GTEITLI2 register can be performed simultaneously with interrupt skipping by the GTITC register. A skipping period at this time is represented by ORed skipping periods of respective registers.

Figure 19.75 shows corresponding interrupt skipping operations by different registers are performed simultaneously.

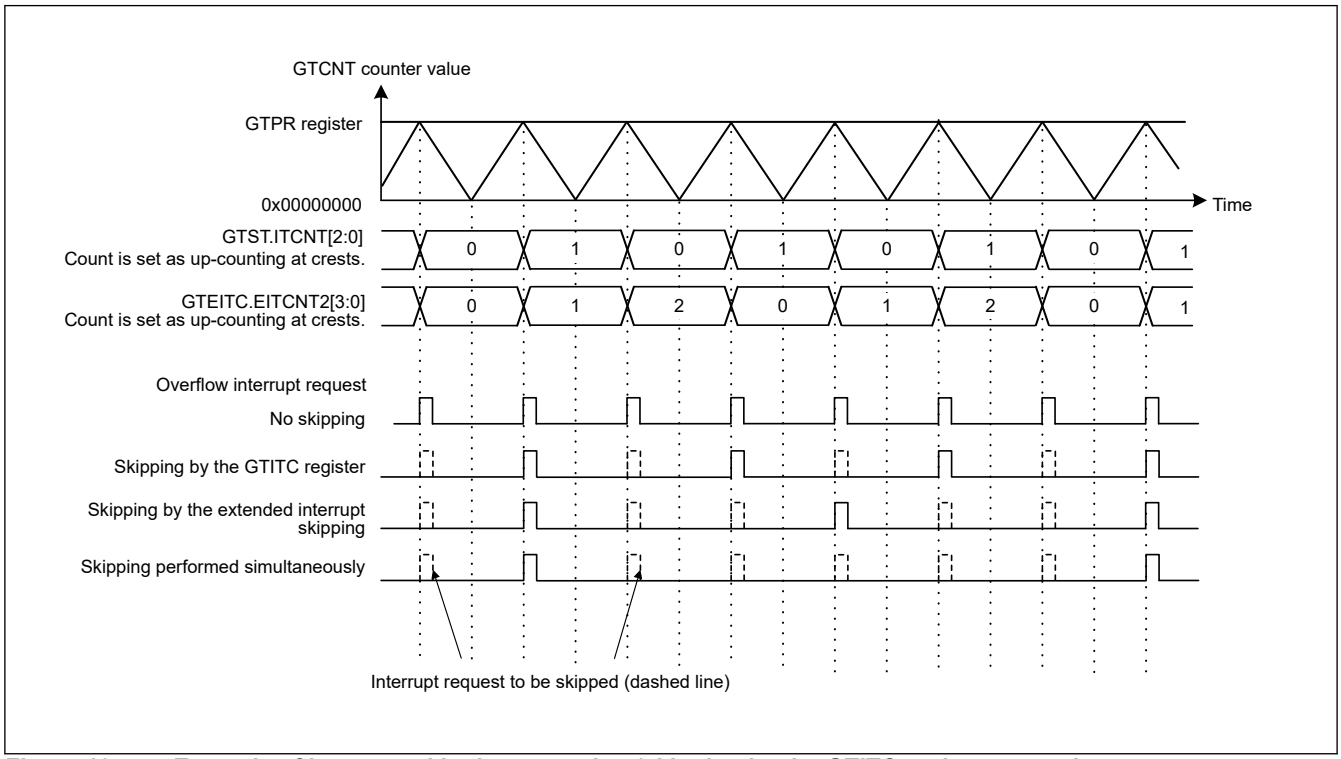

Figure 19.75 Example of interrupt skipping operation (skipping by the GTITC register: counting crests, extended interrupt skipping: EIVTC1[1:0] bits = 00b, EIVTC2[1:0] bits = 01b, EITLV[2:0] bits = 010b)

Skipping of ELC event source outputs corresponding to interrupts for which skipping can be set up in the GTEITLI1 register is only based on the settings of the GTITC register and the extended interrupt skipping register, and has no

connection with the setting of the interrupt enable bit in the GTINTAD register. The interrupt enable bit is used only for the interrupt signal output after skipping.

When A/D converter start request skipping which can be set by the GTEITLI2 register is performed, the ELC event output depend on the A/D converter start request enable bit in the GTINTAD register. All the operations by A/D converter start request which are set as disable by the GTINTAD register is not performed.

A buffer transfer skipping by the GTEITLB register is performed in all of buffer operation which is enabled in the GTBER and GTDTCR registers, or all buffer operations performed by sawtooth-wave one-shot pulse mode or triangle-wave PWM mode 3.

An interrupt skipping and a buffer transfer skipping are operated individually. An interrupt output without performing a buffer transferred performing a buffer transfer without an interrupt output can also be operated.

The following example shows the setting for the extended interrupt skipping.

The extended interrupt skipping counter 2 initial value is set by the written value to the ETICNT2IV[3:0] bits which is applied to change the setting from not counting the extended interrupt skipping counter 2 count source (GTEITC.EIVTC2[1:0] = 00b) to counting (EIVTC2[1:0] = other than 00b). Writing to the extended interrupt skipping counter 2 initial value bits (ETICNT2IV[3:0]) is performed only when the setting of the above-mentioned extended interrupt skipping counter 2 initial value is written.

1. Set GTCNT counter operation, set buffer operation, set compare match value
2. Set the extended interrupt skipping function
   Select the skipping counter used for skipping and the skipping period with the skipping function select bit for the interrupt, for the A/D converter start request, and for a buffer transfer, all of which are to be skipped, in the GTEITLI1, GTEITLI2, and GTEITLB registers, respectively.
3. Set the extended skipping counter
   With the GTEITC register, set a count source of the skipping counter used for skipping, skipping count, and the skipping counter 2 initial value as the following order.
   Set the EIVTCk[1:0] bits (k = 1, 2) as value other than 00b, and set the EIVTTk[3:0] bits as value other than 0000b.
   When the skipping counter 2 is used, change the EIVTC2[1:0] bits from 00b to a value other than 00b as well as set the EITCNT2IV[3:0] bits to the skipping counter 2 initial value.
4. Start count operation
   Set the GTCR.CST bit to 1 to start count operation.
5. Set buffer value by cycle

19.5 A/D Converter Start Request

An A/D converter start request can be issued at a compare match between the GTCNT counter and the GTADTRA or GTADTRB register, up-counting only, down-counting only, or both up-counting and down-counting can be specified by setting the GTINTAD register.

During event count operation, the A/D converter start request cannot be generated.

The A/D converter start request is not output directly to the A/D converter but output the event signal to the ELC.

The GTADTRA and GTADTRB registers each has two buffer registers. Buffer operation with the GTADTRA register used together with the GTADTBRA and GTADTDBRA registers, and buffer operation with the GTADTRB register used together with the GTADTBRB and GTADTDBRB registers can be performed.

Figure 19.76 shows an example of A/D converter start request operation.

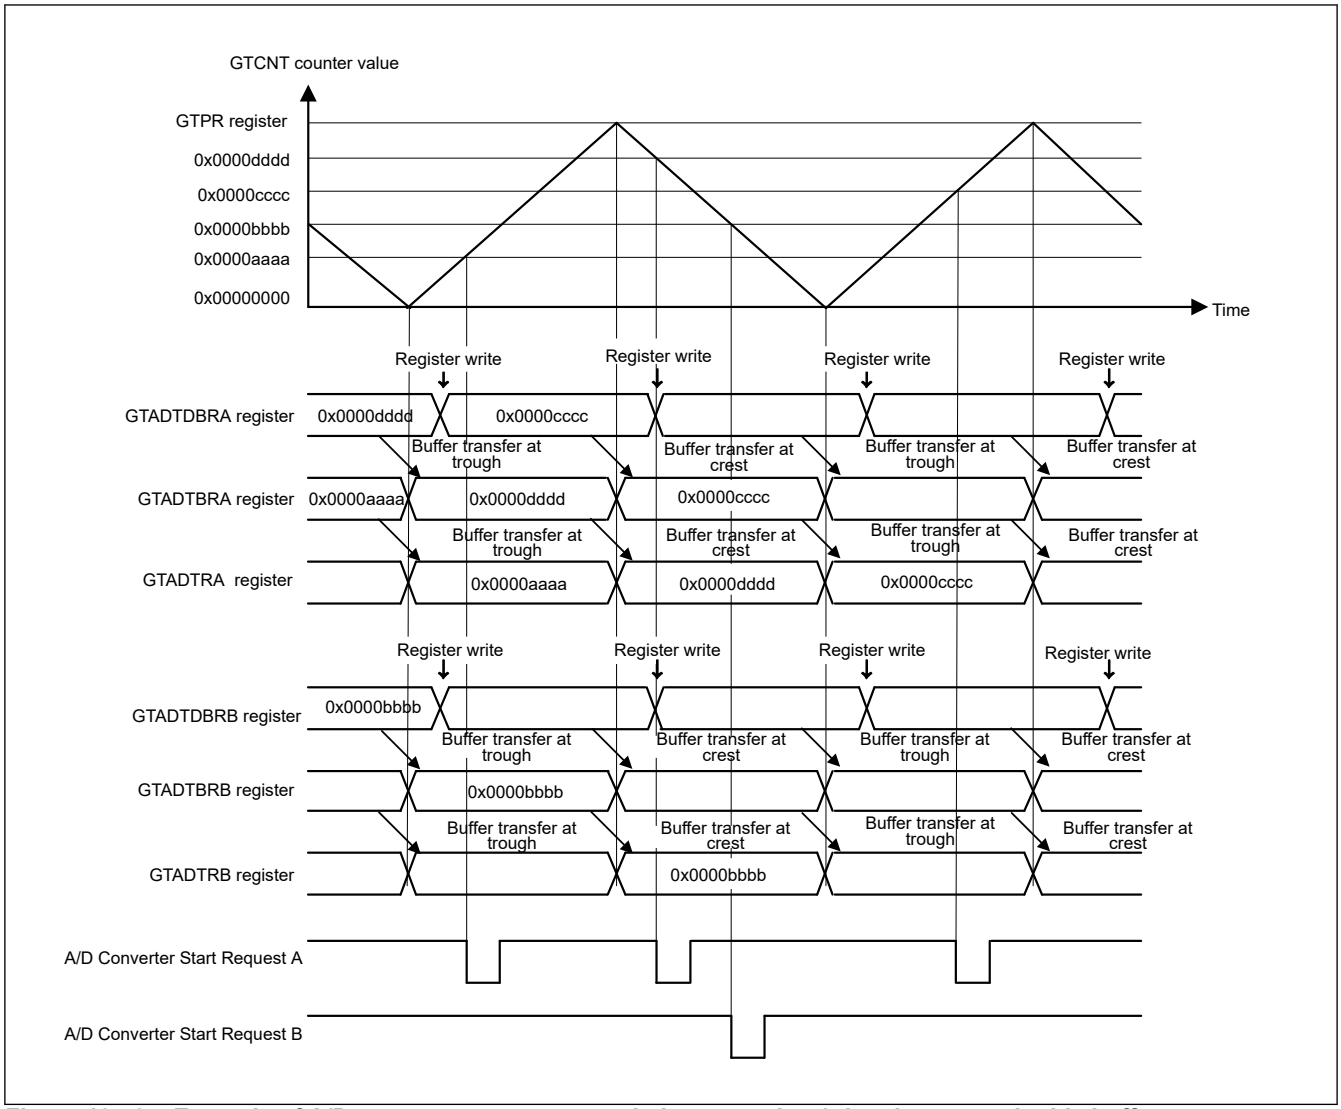

Figure 19.76 Example of A/D converter start request timing operation (triangle waves, double buffer operation, buffer transfer at both troughs and crests, A/D converter start request by GTADTRA register at both up-counting and down-counting, A/D converter start request by GTADTRB register at down-counting)

The following example shows setting for A/D converter start request operation.

1. Set operating mode
   Set the operating mode with the GTCR.MD[2:0] bits of the corresponding channel.
   In Figure 19.76, 100b, 101b, or 110b (triangle-wave PWM mode) is set.
2. Select count clock
   Select the count clock with GTCR.TPCS[3:0] bits of corresponding channel.
3. Period setting
   Set a period in the GTPR register of corresponding channel.
4. Set initial value for counter
   Set the initial value in the GTCNT counter of the corresponding channel.
5. Set buffer operation
   Set buffer operation with the ADTTA[1:0], ADTTB[1:0], ADTDA, and ADTDB bits in the GTBER register.
   In Figure 19.76, ADTTA[1:0] bits = 11b, ADTTB[1:0] bits = 11b, ADTDA bit = 1, and ADTDB bit = 1.
6. Set compare match value
   Set the A/D converter start request point in the GTADTRA and GTADTRB registers.
7. Set buffer value

For buffer operation, set the A/D converter start request point in one cycle after the current cycle (in sawtooth-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers, respectively.
For double buffer operation, set the A/D converter start request point in two cycles after the current cycle (in sawtooth-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTDBRA and GTADTDBRB registers, respectively.

8. Set A/D converter start request for monitoring
   Select the A/D converter start request signal to be monitored with the ADSMS0[1:0] and ADSMS1[1:0] bits in the GTADSMR register from the GTADSM0 and GTADSM1 pins and enable output of the A/D converter start request signal being monitored to the ADSMEN0 and ADSMEN1 bits in the GTADSMR register.
9. Enable A/D converter start request
   Set to enable A/D converter start request with the ADTRAUEN, ADTRADEN, ADTRBUEN, and ADTRBDEN bits in the GTINTAD register.
   In Figure 19.76, ADTRAUEN bit = 1, ADTRADEN bit = 1, ADTRBUEN bit = 0, and ADTRBDEN bit = 1.
10. Start count operation
    Set the GTCR.CSR bit to 1 to start count operation.
11. Set buffer value by cycle
    For buffer operation, set the A/D converter start request point in one cycle after the current cycle (in sawtooth-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers, respectively.
    For double buffer operation, also set the A/D converter start request point in two cycles after the current cycle (in sawtooth-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTDBRA and GTADTDBRB registers, respectively.

19.6 Operations Linked by the ELC

19.6.1 Event Signal Output to the ELC

GPT is capable of operation linked with another module set in advance when its interrupt request signal is used as an event signal by the event link controller (ELC).

The event signal can be output regardless of the setting of the corresponding interrupt request enable bits except the A/D converter start request.

The A/D converter start request during up-counting/down-counting can be enabled/disabled individually with the A/D converter start request enable bit to output both interrupts and events output to ELC.

The corresponding channels in LLPP and NONSAFETY respectively have 10 event signals to the ELC in the GPT, and they are shown below. A dead time error interrupt does not have a corresponding event signal.

- Generation of compare match A interrupt
- Generation of compare match B interrupt
- Generation of compare match C interrupt
- Generation of compare match D interrupt
- Generation of compare match E interrupt
- Generation of compare match F interrupt
- Generation of overflow interrupt
- Generation of underflow interrupt
- Generation of A/D converter start request A (Only used for ELC)
- Generation of A/D converter start request B (Only used for ELC)

19.6.2 Operations in Response to Receiving Event Signals from the ELC

The GPT can perform the following operations by the signals for sources A to H which are output from the ELC. Each signal is provided to all channels. Select an event source for the desired operation by a relevant source select register in a channel:

- Operation of count start/count stop/counter clear
- Operation of switch and up-counting/down-counting
- Operation of input capture A and B

See operation by hardware sources in section 19.3. Operation for respective operations.

19.7 Noise Filter Function

Each pin for use in input capture to the GPT is equipped with a noise filter. The noise filter samples input signals at the sampling clock (Core clock) and removes the pulses of which length is less than 3 sampling cycles.

The noise filter functionality includes enabling and disabling of the noise filter for each pin and setting of the sampling clock for each channel.

Figure 19.77 shows the timing of noise filtering.

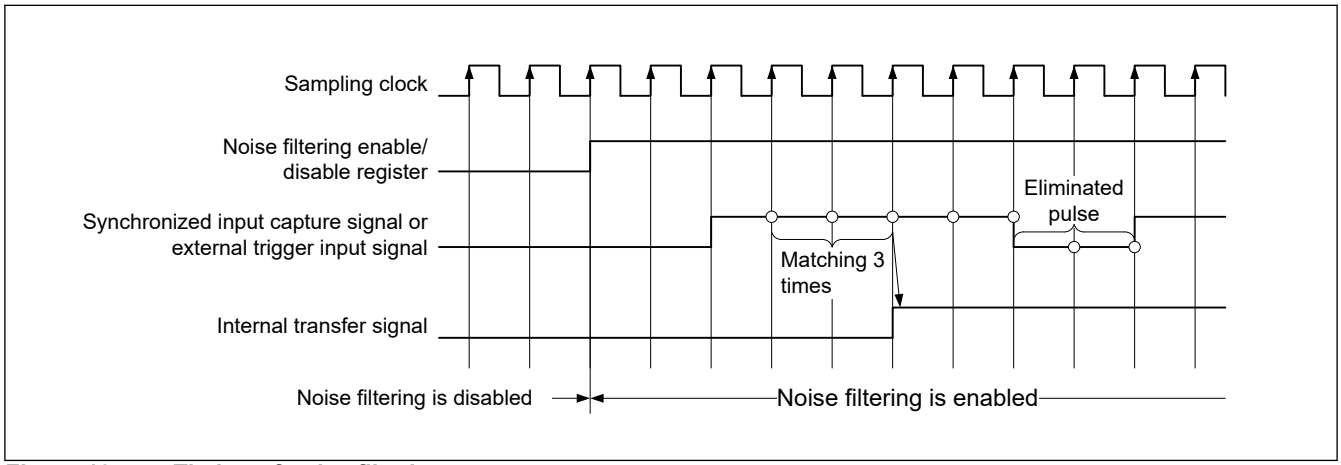

Figure 19.77 Timing of noise filtering

19.8 Protection Function

19.8.1 Write-Protection for Registers

To avoid incorrect writing to registers, write access to registers can be enabled or disabled per channel by setting the GTWP.WP bit for the given channel.

The WP bits enable or disable writing to the following registers:

GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTITC, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTPDBR, GTADTRA, GTADTBRA, GTADTDBRA, GTADTRB, GTADTBRB, GTADTDBRB, GTDTCR, GTDVU, GTDVD, GTDBU, GTDBD, GTSOS, GTSOTR, GTADSMR, GTEITC, GTEITLI1, GTEITLI2, GTEITLB, GTSWSR, GTSWOS.

Every bit in registers GTSTR, GTSTP, and GTCLR, which can update the corresponding registers in other channels and can be updated by any of the corresponding registers in other channels conversely, can be protected by setting the GTWP.STRWP, STPWP, and CLRWP bits, respectively, per channel.

Likewise, writing to the GTSECSR and GTSECR registers, which can control all channel in group by writing to the GTSECSR and GTSECR registers of a given channel, can be enabled or disabled by the setting of the GTWP.CMNWP bit.

Protection by the GTWP register only targets writing operation by the CPU. Update to the register generated in related to the CPU writing is not protected.

19.8.2 Disabling of Buffer Operation

If the timing of buffer register write is too late for the buffer transfer timing, buffer operation can be suspended by setting the BD0, BD1, BD2, and BD3 bits in the GTBER register.

Specifically, buffer transfer can be temporarily disabled, even though a buffer transfer condition is generated during buffer register write, by setting the BD0, BD1, BD2, and BD3 bits to 1 (buffer operation disabled) before buffer register write, and setting the bits to 0 (buffer operation enabled) after completion of writing to all the buffer registers.

The BD0, BD1, BD2, and BD3 bits can be set on channel basis by writing directly to the GTBER register or can be set simultaneously by setting the GTSECR register for multiple channels which were set by the GTSECSR register. Figure 19.78 shows an example of operation for disabling buffer operation by writing to the GTBER register.

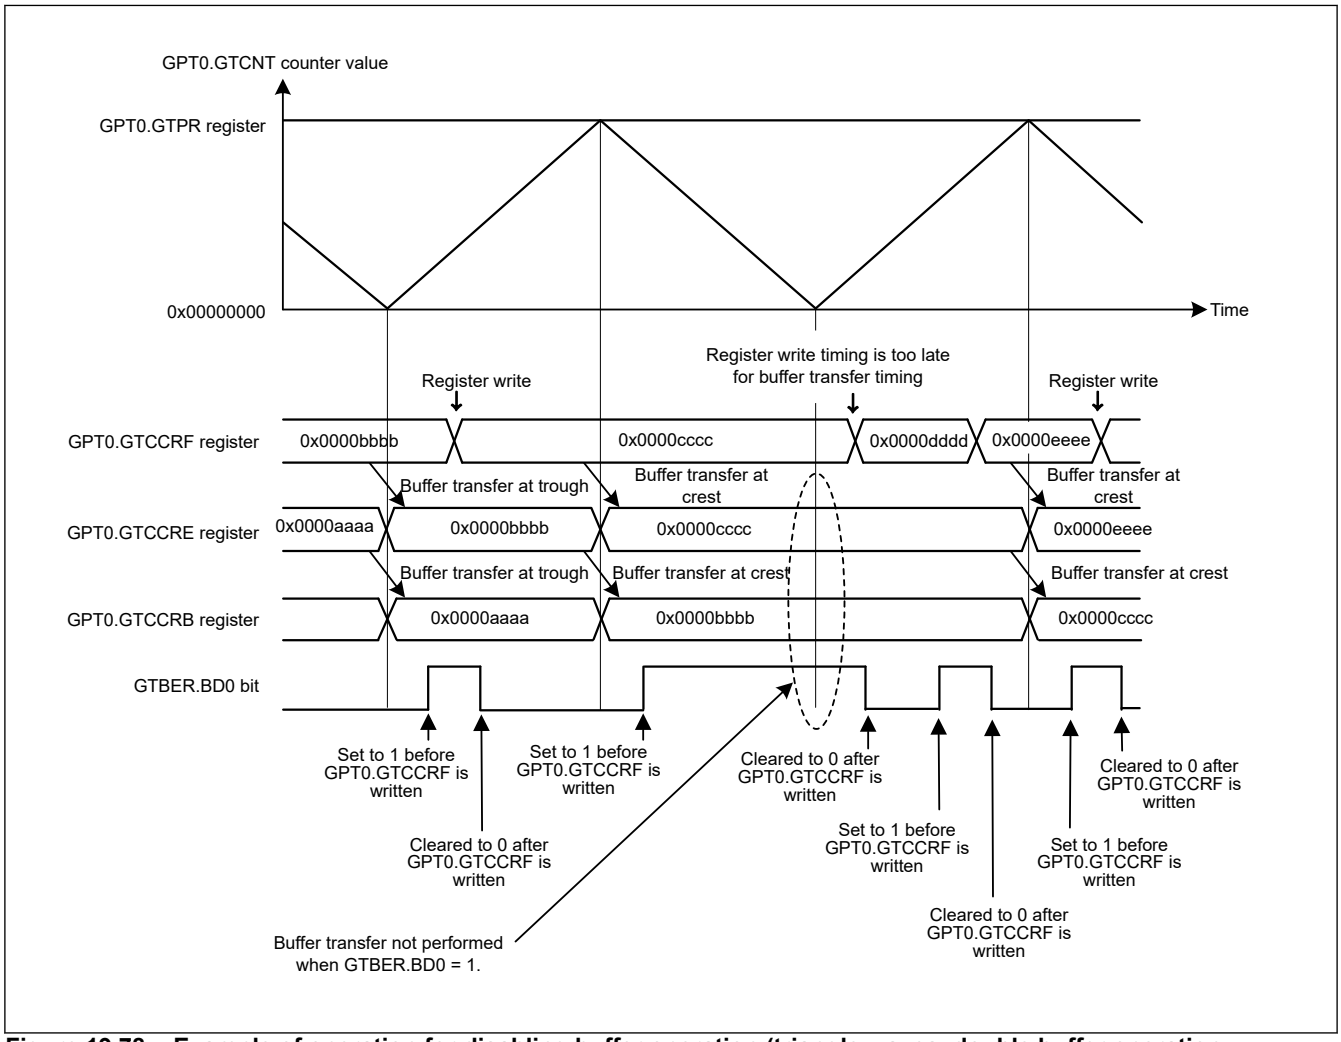

Figure 19.78 Example of operation for disabling buffer operation (triangle waves, double buffer operation, buffer transfer at both troughs and crests)

19.8.2.1 Simultaneous Control of Buffer Operations of Multiple Channels

The GTBER.BDn bit can be set by writing directly to the GTBER register per channel or by making settings in the GTSECR register for multiple channels that are already set in the GTSECSR register.

Use the following procedure to simultaneously set the GTBER.BDn bit of multiple channels.

1. Select the channels to simultaneously set the GTSECSR register
   Set the GTSECSR register so that the values at the bit positions for the corresponding channels for simultaneously setting of the GTBER.BDn bits become 1. All GTSECSR registers can be updated by writing to the GTSECSR register of any channel.
2. Simultaneously set the GTBER.BDn bits by updating the GTSECR register

In the GTSECR register, set the operation of the GTBER.BDn bit (enabling or disabling of buffer operation) that are to be simultaneously set. Writing to the GTSECR register from any channel updates the GTBER.BDn bit in all channels corresponding to the bits set as 1 in the GTSECSR register, in accordance with the value of the GTSECR register.

Figure 19.79 shows an example of simultaneously controlling the enabling or disabling of buffer operation for multiple channels.

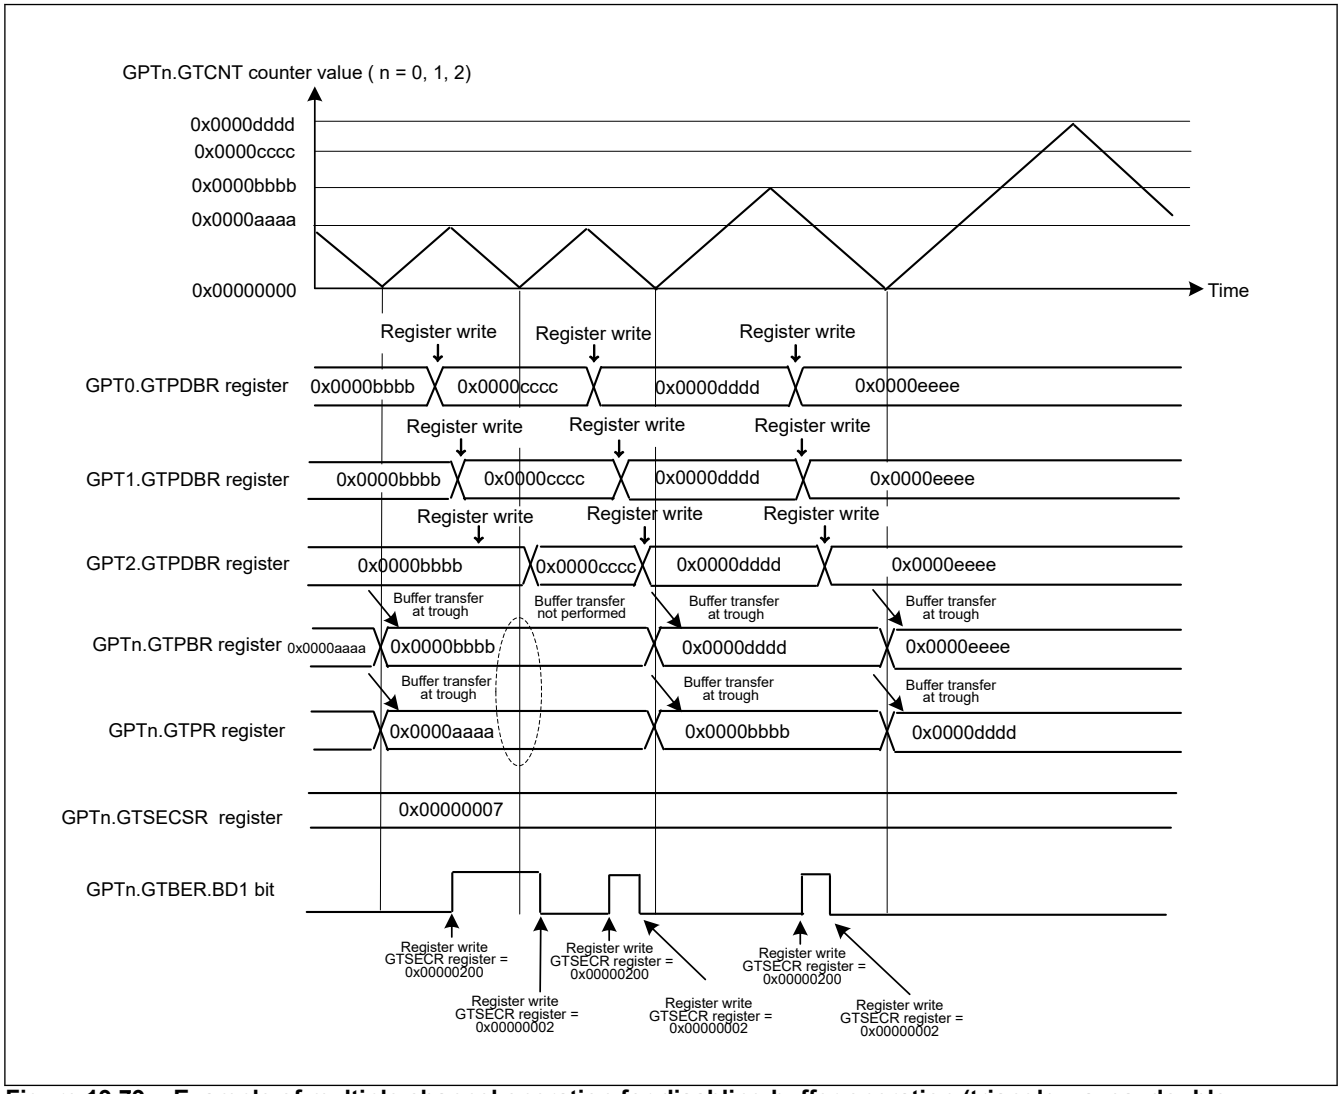

Figure 19.79 Example of multiple channel operation for disabling buffer operation (triangle waves, double buffer operation)

19.8.2.2 Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer

When a GTBER.DBRTECm (m = A, B) bit is set to 1 in sawtooth-wave one-shot pulse mode or triangle-wave PWM mode 3, transfer from the intermediate buffer to the GTCCRm (m = A, B) register is repeated on a cyclic basis even while buffer transfer is disabled by the setting of the GTBER.BD0 bit or by the buffer transfer extended skipping function.

(1) In Sawtooth-Wave One-Shot Pulse Mode

In sawtooth-wave one-shot pulse mode, the compare match value for the first half of a waveform is stored in temporary register x (x = C, E) as the intermediate buffer for the GTCCRx (x = C, E) register and the compare match value for the second half of a waveform is stored in temporary register m (m = A, B) as the intermediate buffer for the GTCCRy (y = D, F) register, respectively, for compare match values during repeated buffer operation, and the given values are alternately transferred to the GTCCRm (m = A, B) registers.

Table 19.23 lists the types of buffer transfer of the GTCCR register during counting in sawtooth-wave one-shot pulse mode.

While counting is stopped, the setting of the value in the temporary register is transferred through forcible buffer transfer.

In forcible buffer transfer, the values of the GTCCRy (y = D, F) registers are transferred to temporary registers m (m = A, B), and the values of the GTCCRx (x = C, E) are transferred to temporary registers x (x = C, E) when the setting of the corresponding GTBER.DBRTECm (m = A, B) bit is 1, respectively.

When the setting of the GTBER.DBRTECm (m = A, B) bit is 1, values written by the CPU to the GTCCRm (m = A, B) registers are reflected as the values of temporary registers x (x = C, E).

Table 19.23 GTCCR buffer transfer operation in sawtooth-wave one-shot pulse mode during GTCNT counting

GTBER.DBRTECm	Buffer transfer	Timing of transfer				
		GTCCRx ↓ GTCCRm	GTCCRx ↓ Temporary register x	Temporary register x ↓ GTCCRm	GTCCRy ↓ Temporary register m	Temporary register m ↓ GTCCRm
0	Transfer enabled period	Overflow or underflow	No transfer	No transfer	Overflow or underflow	GTCCRm compare match
	Transfer disabled period	No transfer	No transfer	No transfer	No transfer	No transfer
1	Transfer enabled period	Overflow or underflow	Overflow or underflow	Not Transferred	Overflow or underflow	GTCCRm compare match
	Transfer disabled period	No transfer	No transfer	Overflow or underflow	No transfer	GTCCRm compare match

Note: m = A, B; x = C, E; y = D, F

Figure 19.80 shows the operation of generating transfer-disabled period by extended buffer transfer skipping as an example of repeated double buffer operations when the GTCCR buffer transfer is disabled in sawtooth-wave one-shot pulse mode.

Figure 19.81 shows the operation of generating transfer-disabled period by updating the GTBER.BD0 bit as an example of repeated double-buffer operations when the GTCCR buffer transfer is disabled in sawtooth-wave one-shot pulse mode.

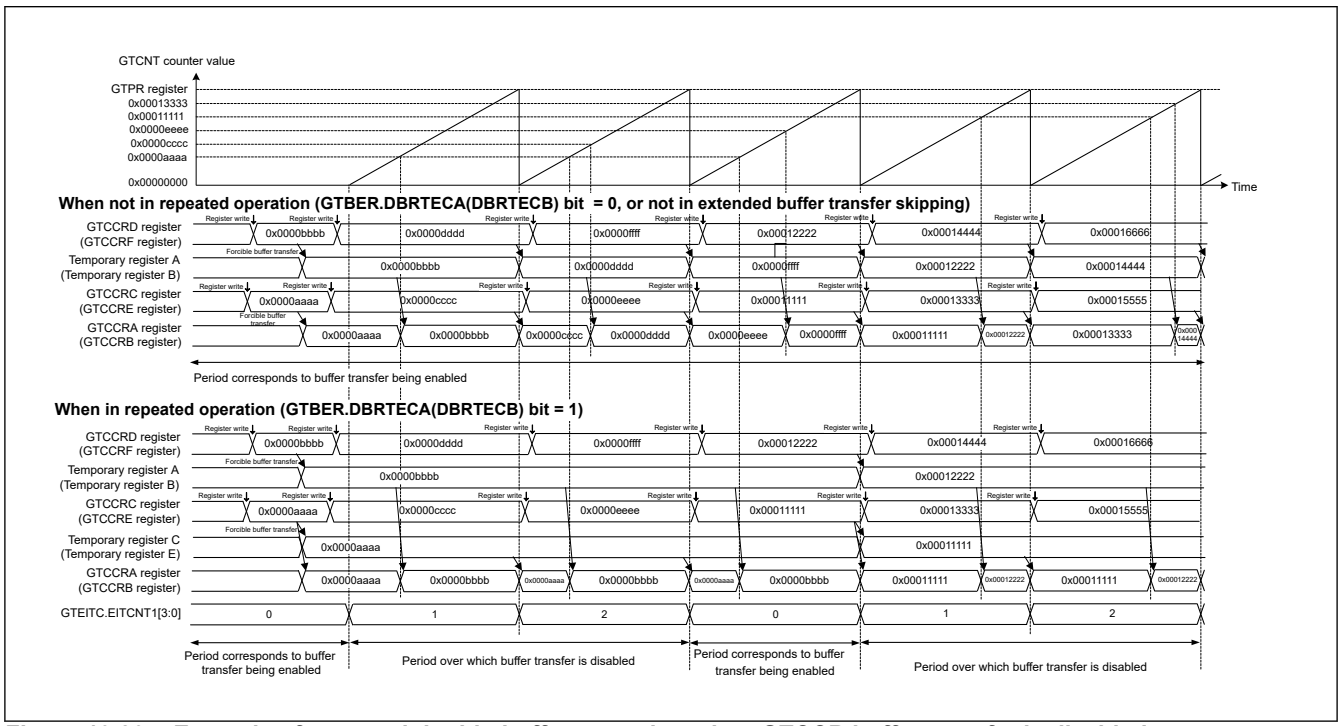

Figure 19.80 Example of repeated double-buffer operation when GTCCR buffer transfer is disabled (sawtooth-wave one-shot pulse mode, using extended buffer transfer skipping, GTBER.BD0 is constantly 0)

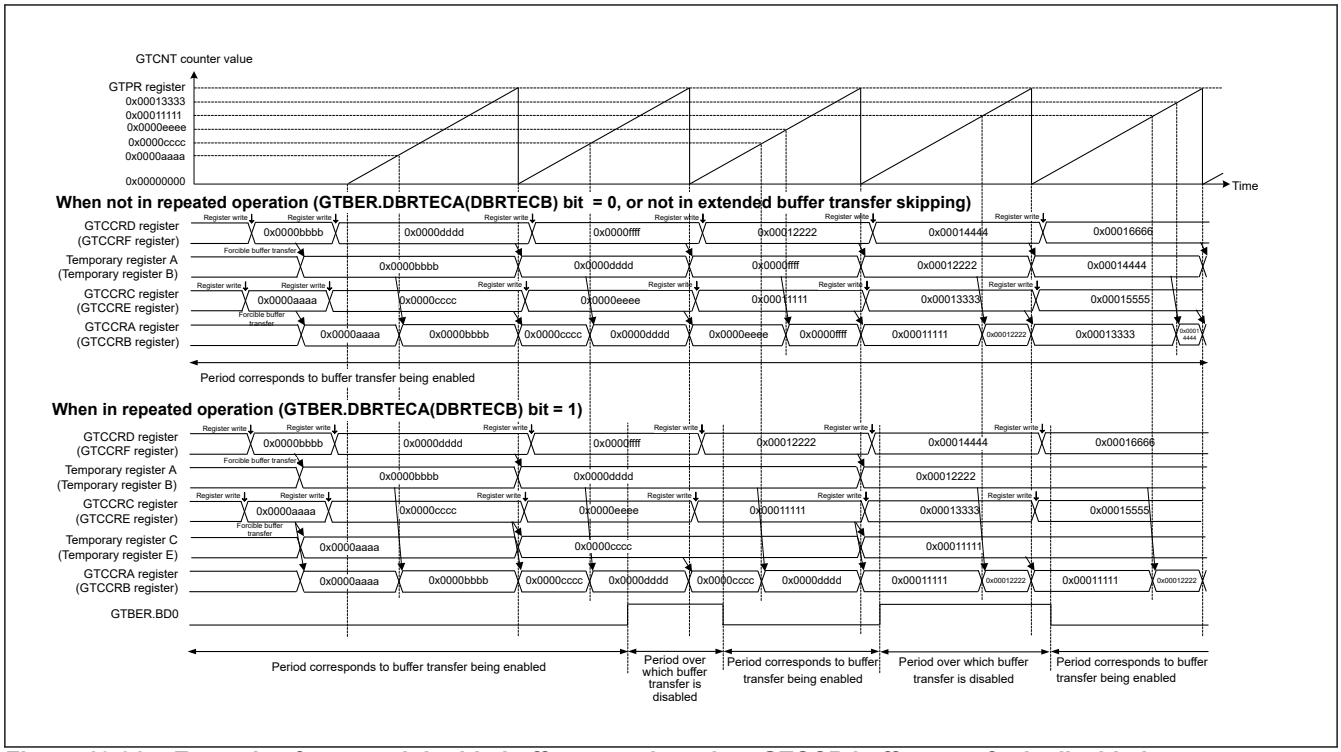

Figure 19.81 Example of repeated double-buffer operation when GTCCR buffer transfer is disabled (sawtooth-wave one-shot pulse mode, updating the GTBER.BD0 bit)

(2) In Triangle-Wave PWM Mode 3

In triangle-wave PWM mode 3, the compare match value for the first half of a waveform is stored in the temporary register x (x = C, E) as the intermediate buffer for the GTCCRx (x = C, E) register and the compare match value for the second half of a waveform is stored in temporary register m (m = A, B) as the intermediate buffer for the GTCCRy (y = D, F) register, respectively, for compare match values during repeated buffer operation, and the given values are alternately transferred to the GTCCRm (m = A, B) register.

Table 19.24 lists the types of buffer transfer of the GTCCR register during counting operation in triangle-wave PWM mode 3.

While counting is stopped, the setting of the value in the temporary register is transferred through forcible buffer transfer. In forcible buffer transfer, the values of the GTCCRy (y = D, F) registers are transferred to temporary registers m (m = A, B), and the values of the GTCCRx (x = C, E) are transferred to temporary registers x (x = C, E), when the setting of the corresponding GTBER.DBRTECm (m = A, B) bit is 1, respectively.

When the setting of the GTBER.DBRTECm (m = A, B) bit is set to 1, values written by the CPU to the GTCCRm (m = A, B) registers are reflected as the values of temporary registers x (x = C, E).

Table 19.24 GTCCR buffer transfer operation in triangle-wave PWM mode 3 during GTCNT counting

GTBER.DBRTECm	Buffer transfer	Timing of transfer				
		GTCCRx ↓ GTCCRm	GTCCRx ↓ temporary register x	temporary register x ↓ GTCCRm	GTCCRy ↓ temporary register m	temporary register m ↓ GTCCRm
0	Transfer enabled period	Trough	No transfer	No transfer	Trough	Crest
	Transfer disabled period	No transfer	No transfer	No transfer	No transfer	No transfer
1	Transfer enabled period	Trough	Trough	No transfer	Trough	Crest
	Transfer disabled period	No transfer	No transfer	Trough	No transfer	Crest

Note: m = A, B; x = C, E; y = D, F

Figure 19.82 shows the operation of generating transfer-disabled period by extended buffer transfer skipping as an example of repeated double buffer operations when the GTCCR buffer transfer is disabled in triangle-wave PWM mode 3.

Figure 19.83 shows the operation of generating transfer-disabled period by updating the GTBER.BD0 bit as an example of repeated double-buffer operations when the GTCCR buffer transfer is disabled in triangle-wave PWM mode 3.

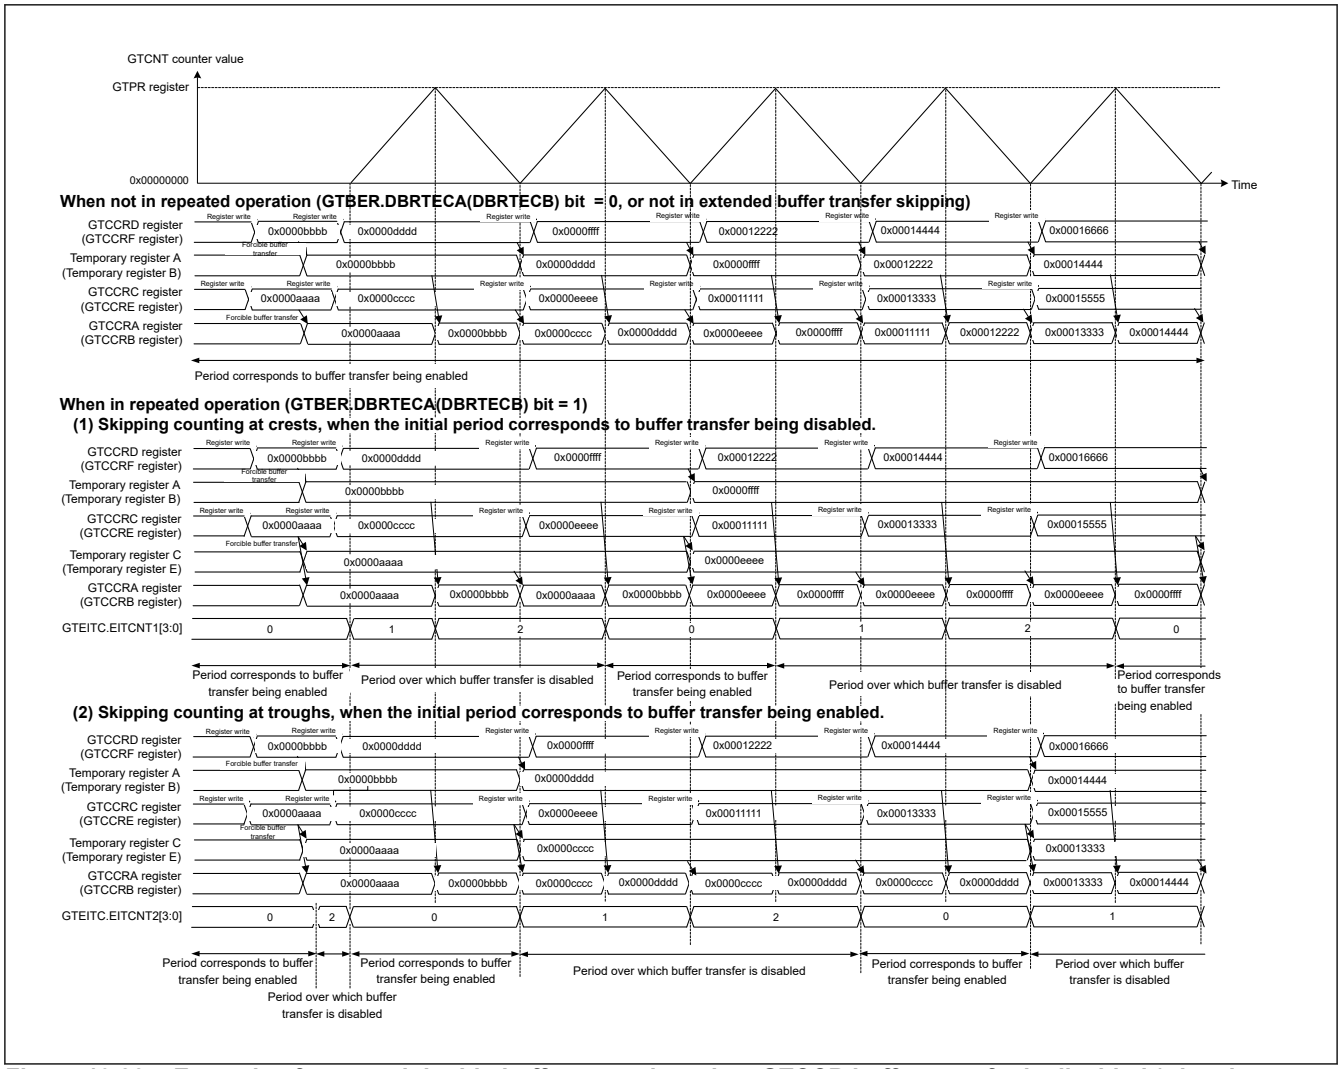

Figure 19.82 Example of repeated double-buffer operation when GTCCR buffer transfer is disabled (triangle-wave PWM mode 3, using extended buffer transfer skipping, GTBER.BD0 is constantly 0)

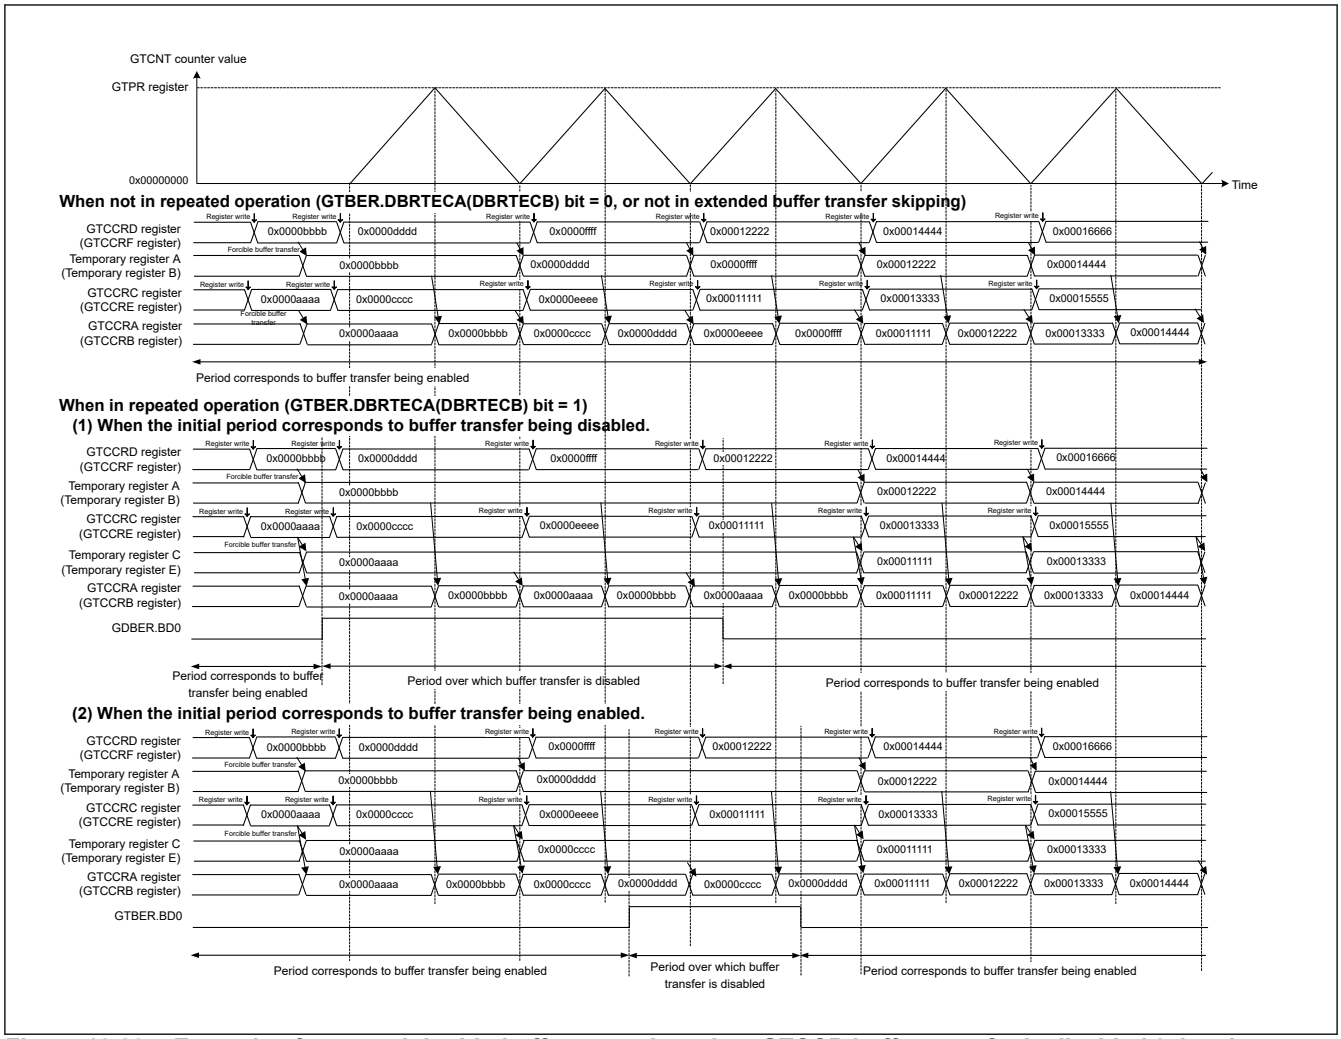

Figure 19.83 Example of repeated double-buffer operation when GTCCR buffer transfer is disabled (triangle-wave PWM mode 3, updating the GTBER.BD0 bit)

19.8.3 GTIOCnm Pin Output Negate Control (n = 0 to 17, m = A, B)

For protection from system failure, the output negate control that changes the GTIOCnm pin output forcibly by the output stop request from the POEG is provided.

Output protection is required when a dead-time error or the same output level on the GTIOCnA and GTIOCnB pins is detected. At that time, the detection of disabling of output is output to the group of the POEG set in the GTINTAD.GRP[1:0] bits based on the setting of the output disable detection enable bits, such as the GRPDTE, GRPABH, and GRPABL bits in the GTINTAD register. The POEG takes the logical OR of detection of the types as described and other forms of detection of the disabling of output, and outputs requests for the disabling of output to the GPT.

By setting the GTINTAD.GRP[1:0] bits, one output stop request can be selected out of four output stop requests which are input from the POEG as output stop request signal common in the GTIOCnA and GTIOCnB pins. Selected output stop request can be checked by reading the GTST.ODF flag.

The states of outputs at the time of control for their negation can be set with the GTIOR.OADF[1:0] bits for the GTIOCnA pin and with the GTIOR.OBDF[1:0] bits for the GTIOCnB pin.

Transition to the output negate condition by generating the output stop request from the POEG is performed asynchronously, while a release from the output negate condition by making the output stop request no longer satisfied is performed at the end of the cycle. It is after 3 PCLKGPTL (LLPP)/PCLKM (NONSAFETY, SAFETY) at shortest when the output negate condition is released after the output stop request is no longer satisfied. To reliably control output negation, clear the POEG flag for which the condition of the request to disable the output is no longer satisfied after 4 PCLKGPTL (LLPP)/PCLKM (NONSAFETY, SAFETY) cycles.

To release the output stop condition during event count operation or without waiting the end of the cycle, set the OADF[1:0] bits to 00b for the GTIOCnA pin, and set the OBDF[1:0] bits to 00b for the GTIOCnB pin. Figure 19.84 shows an example of the output negate control operation for the GTIOCnm pin output.

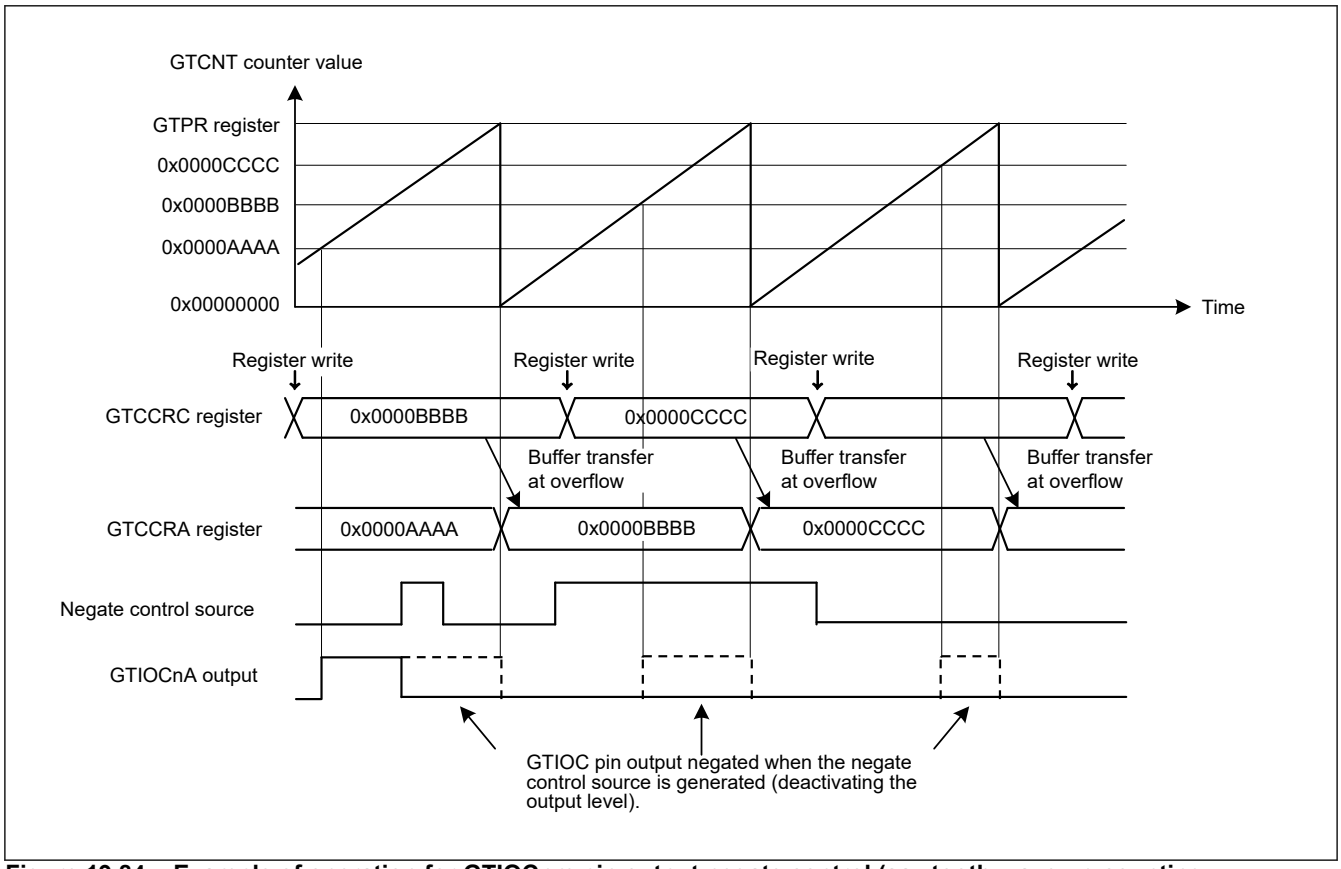

Figure 19.84 Example of operation for GTIOCnm pin output negate control (sawtooth-wave up-counting, buffer operation, active-level: high output at GTCCRA register compare match, low output at the end of the cycle, and low output at output negate) (n = 0 to 17, m = A, B)

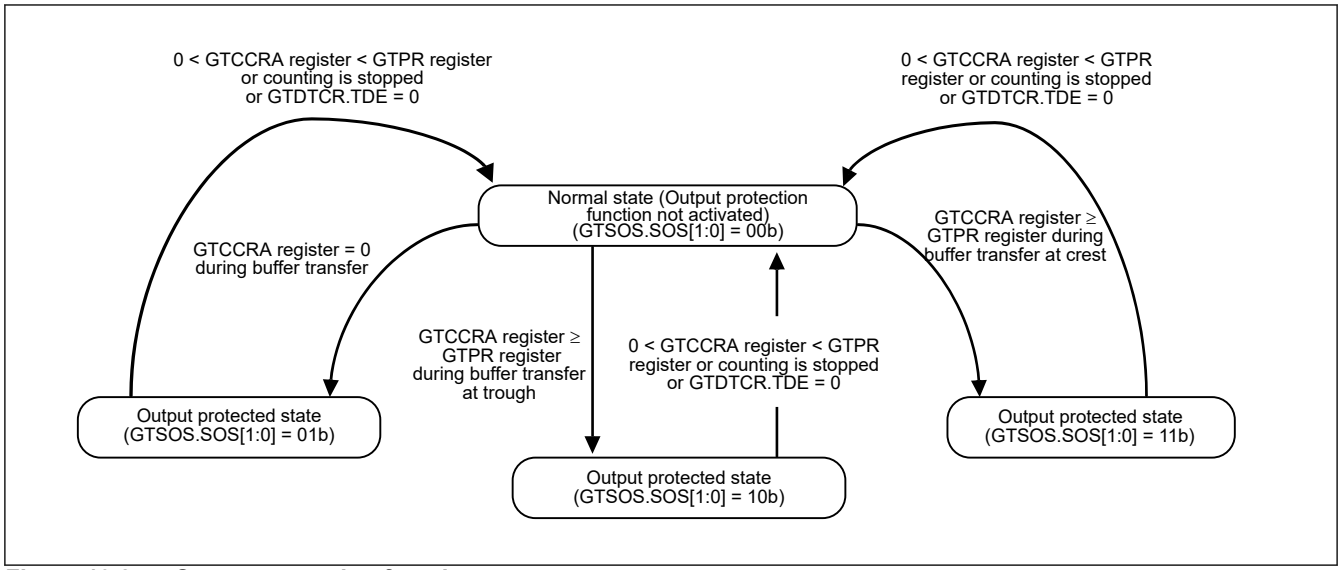
19.8.4 GTIOCnm Protection Function for GTIOCnm Pin Output (n = 0 to 17, m = A, B)

To prepare for a case when an incorrect value (0x00000000 or a value greater than or equal to the GTPR register value) is set in the GTCCRA register, the output protection function for the GTIOCnm pin output (disabling function) is activated when the automatic dead time is set (GTDTCR.TDE bit = 1) in triangle-wave PWM mode.

The status of the output protection function can be read from the GTSOS.SOS[1:0] bits.

Figure 19.85 shows the output protection function state transition.



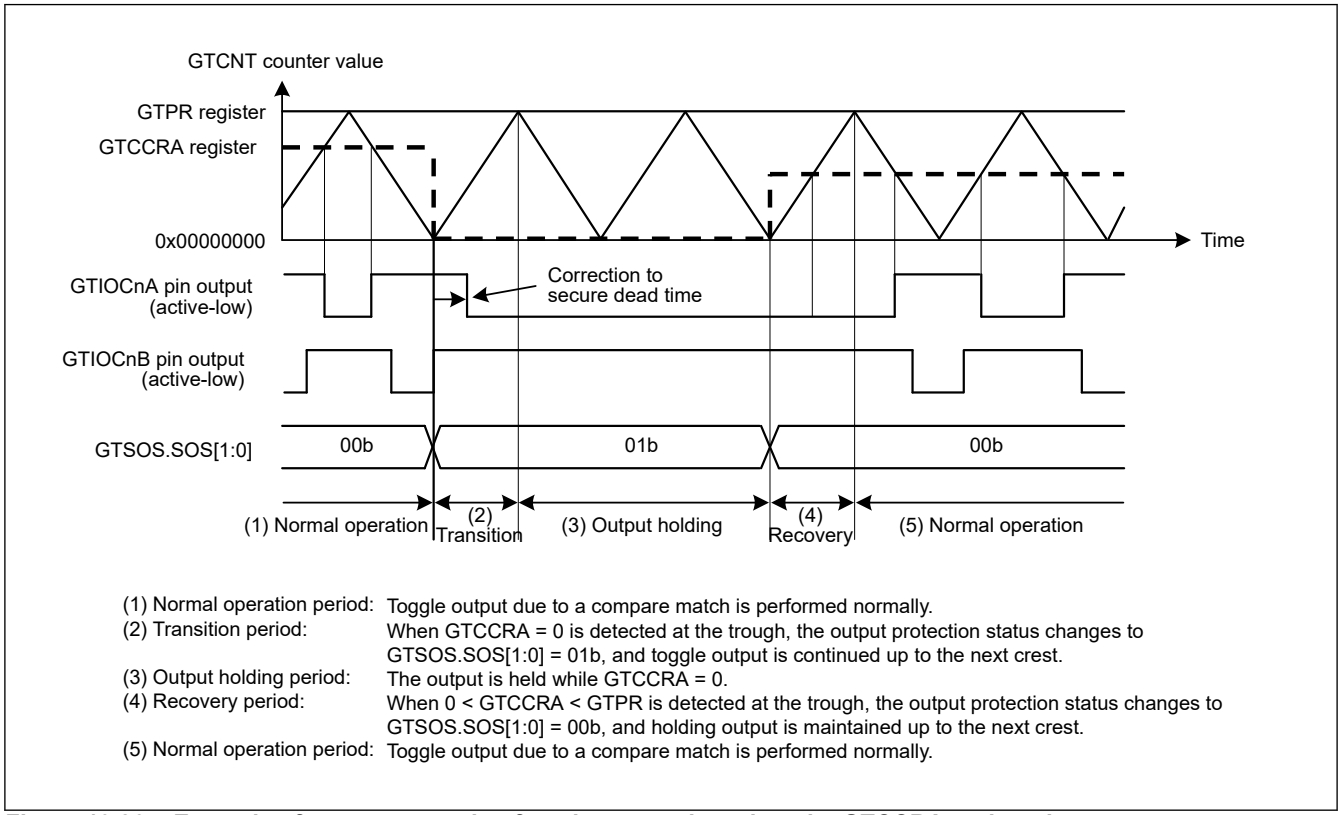


Figure 19.85 Output protection function

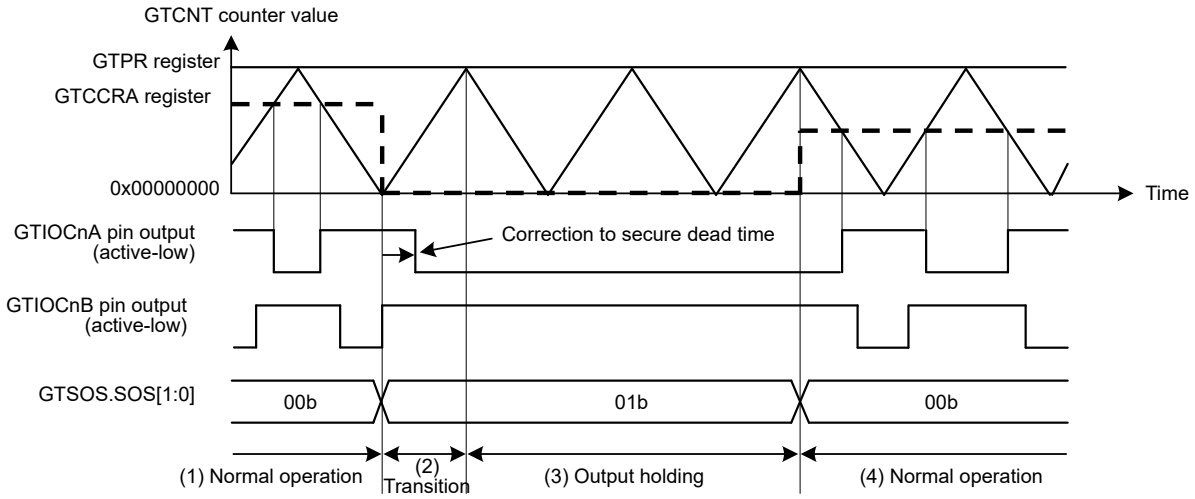
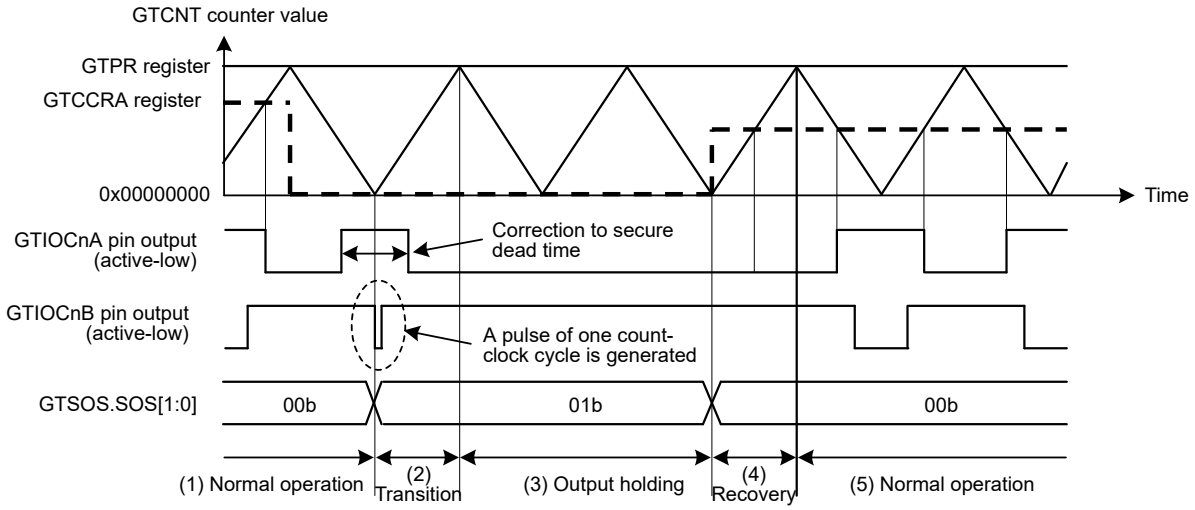


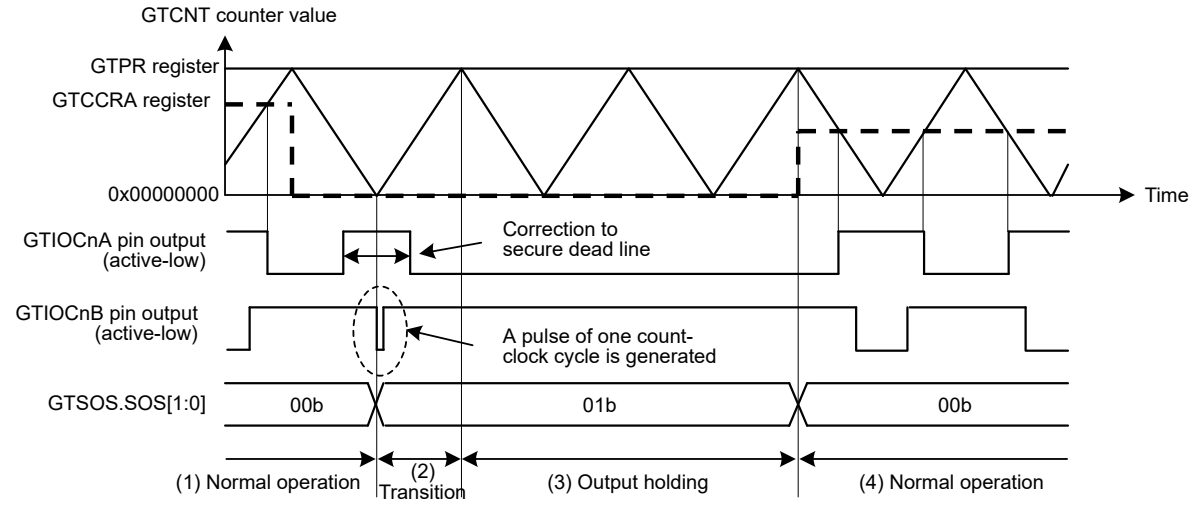
(1) Output Protection Function when the GTCCRA Register is Set to 0x00000000 during Buffer Transfer

Figure 19.86 and Figure 19.87 show examples of output protection function operation when the GTCCRA register is set to 0x00000000 during buffer transfer at troughs, and Figure 19.88 and Figure 19.89 show examples of output protection function operation when the GTCCRA register is set to 0x00000000 during buffer transfer at crests.



(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA = 0 is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA = 0.
(4) Recovery period: When 0 < GTCCRA < GTPR is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 00b, and holding output is maintained up to the next crest.
(5) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 19.86 Example of output protection function operation when the GTCCRA register is set to 0x00000000 during buffer transfer at troughs (restored to 0 < GTCCRA register < GTPR register during buffer transfer at troughs, active-level: low) (n = 0 to 17)

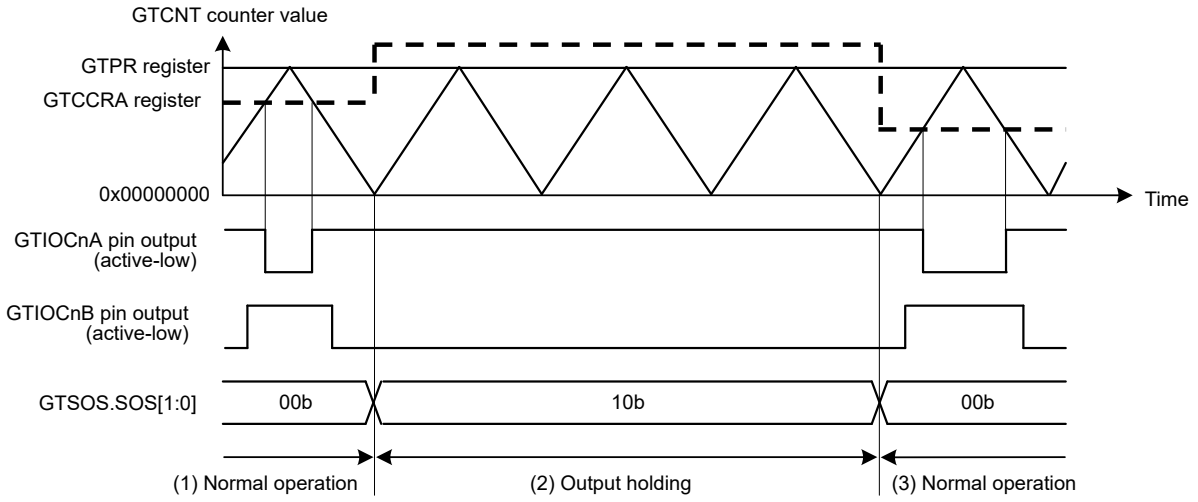


(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA = 0 is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA = 0.
(4) Normal operation period: When 0 < GTCCRA < GTPR is detected at the crest, the output protection status changes to GTSOS.SOS[1:0] = 00b, and toggle output due to a compare match is performed normally.

Figure 19.87 Example of output protection function operation when the GTCCRA register is set to 0x00000000 during buffer transfer at troughs (restored to 0 < GTCCRA register < GTPR register during buffer transfer at crests, active-level: low) (n = 0 to 17)

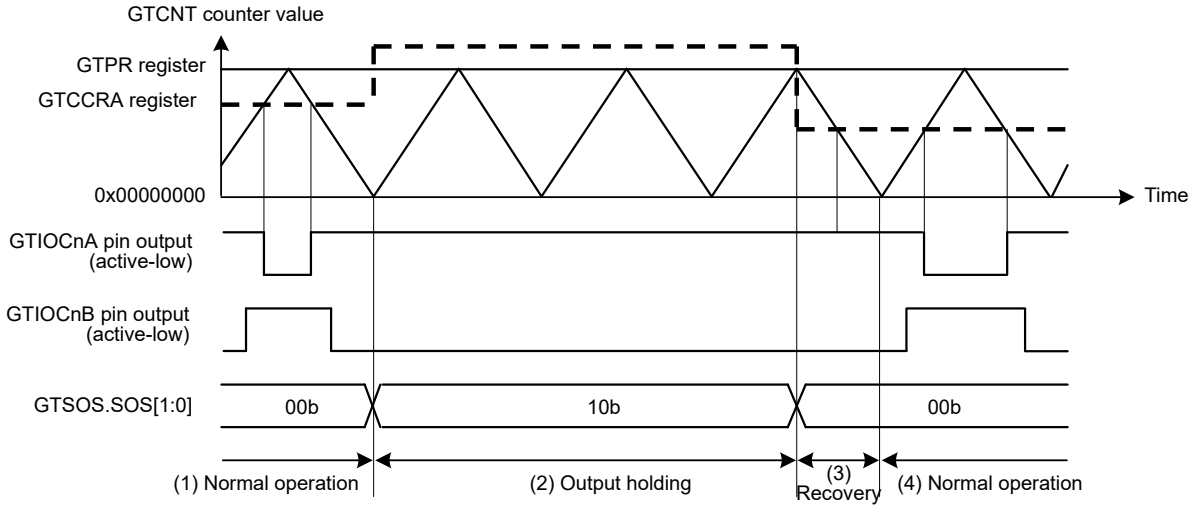
(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA = 0 is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA = 0.
(4) Recovery period: When 0 < GTCCRA < GTPR is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 00b, and holding output is maintained up to the next crest.
(5) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 19.88 Example of output protection function operation when the GTCCRA register is set to 0x00000000 during buffer transfer at crests (restored to 0 < GTCCRA register < GTPR register during buffer transfer at troughs, active-level: low) (n = 0 to 17)



(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA = 0 is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA = 0.
(4) Recovery period: When 0 < GTCCRA < GTPR is detected at the crest, the output protection status changes to GTSOS.SOS[1:0] = 00b, and toggle output due to a compare match is performed normally.

Figure 19.89 Example of output protection function operation when the GTCCRA register is set to 0x00000000 during buffer transfer at crests (restored to 0 < GTCCRA register < GTPR register during buffer transfer at crests, active-level: low) (n = 0 to 17)

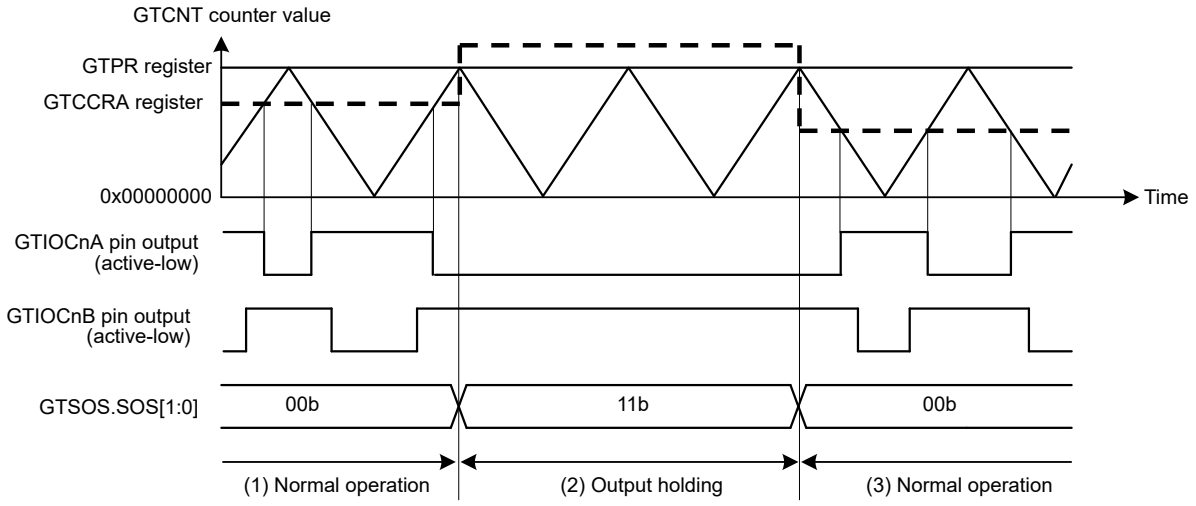


(2) Output Protection Function when GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Troughs

Figure 19.90 and Figure 19.91 show examples of output protection function operation when GTCCRA register ≥ GTPR register is set during buffer transfer at troughs.

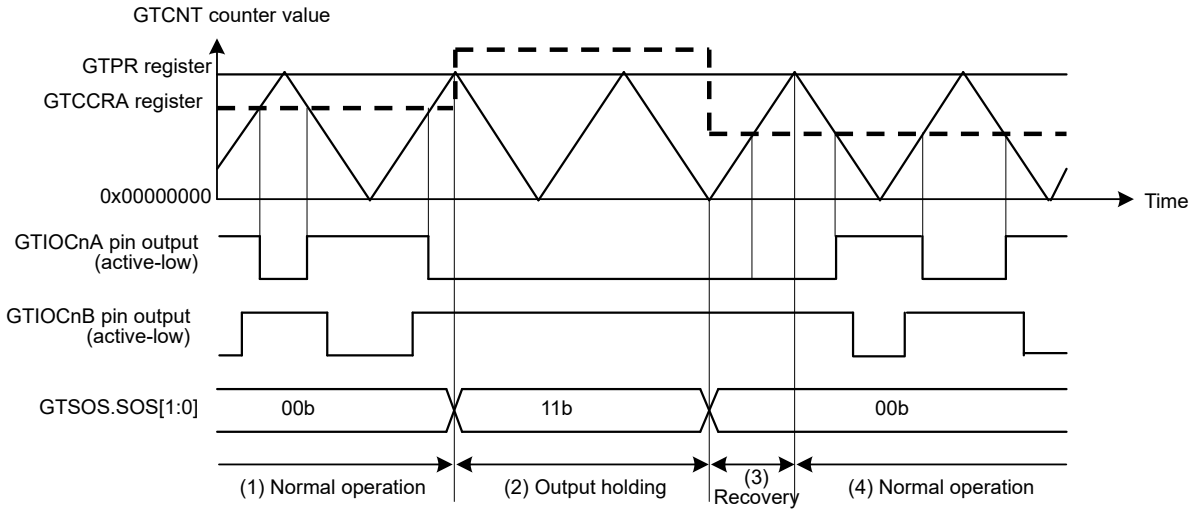
(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA ≥ GTPR is detected at the trough, the output protection status changes to GTSOS[1:0] = 10b, and the output is held while GTCCRA ≥ GTPR.
(3) Normal operation period: When 0 < GTCCRA < GTPR is detected at the trough, the output protection status changes to GTSOS[1:0] = 00b, ant toggle output due to a compare match is performed normally.

Figure 19.90 Example of output protection function operation when GTCCRA register ≥ GTPR register is set during buffer transfer at troughs (restored to 0 < GTCCRA register < GTPR register during buffer transfer at crests, active-level: low) (n = 0 to 17)



(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA ≥ GTPR is detected at the trough, the output protection status changes to GTSOS[1:0] = 10b, and the output is held while GTCCRA ≥ GTPR.
(3) Recovery period: When 0 < GTCCRA < GTPR is detected at the crest, the output protection status changes to GTSOS.SOS[1:0] = 00b, and holding output is maintained up to the next trough.
(4) Normal operation period: When 0 < GTCCRA register < GTPR register is detected in the crest, the output protection status changes to GTSOS[1:0] = 00b, and toggle output due to a compare match is performed normally.

Figure 19.91 Example of output protection function operation when GTCCRA register ≥ GTPR register is set during buffer transfer at troughs (restored to 0 < GTCCRA register < GTPR register during buffer transfer at troughs, active-level: low) (n = 0 to 17)



(3) Output Protection Function when GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Crests

Figure 19.92 and Figure 19.93 show examples of output protection function operation when GTCCRA register ≥ GTPR register is set during buffer transfer at crests.

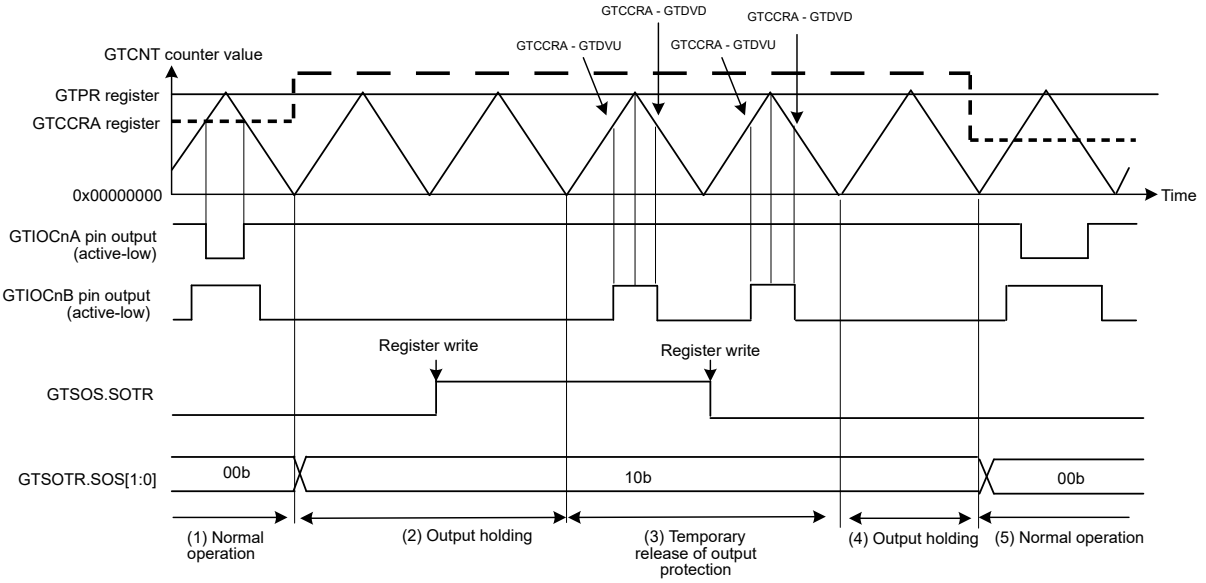
(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA ≥ GTPR is detected at the crest, the output protection status changes to GTSOS[1:0] = 11b, and the output is held while GTCCRA ≥ GTPR.
(3) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 19.92 Example of output protection function operation when GTCCRA register ≥ GTPR register is set during buffer transfer at crests (restored to 0 < GTCCRA register < GTPR register during buffer transfer at crests, active-level: low) (n = 0 to 17)

(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA ≥ GTPR Is detected at the crest, the output protection status changes to GTSOS[1:0] = 11b, and the output is held while GTCCRA ≥ GTPR.
(3) Recovery period: When 0 < GTCCRA < GTPR is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 00b, and holding output is maintained up to the next crest.
(4) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 19.93 Example of output protection function operation when GTCCRA register ≥ GTPR register is set during buffer transfer at crests (restored to 0 < GTCCRA register < GTPR register during buffer transfer at troughs, active-level: low) (n = 0 to 17)

(4) Restricted Specification of Output Protection Function



Even if an incorrect value (0x00000000 or a value greater than or equal to the GTPR register value) is set in the GTCCRA register during count operation, the output protection functions in a specific way such that one of the positive- and negative-phase outputs becomes non-active. However, the output protection does not operate normally when the GTCCRA register value at the start of count operation is greater than 0x00000000 and less than the setting value of the GTPR register.

(5) Temporary Release of Output Protection Function

When the GTSOS.SOS[1:0] bits = 10b (protected state in which GTCCRA register ≥ GTPR register occurred during transfer at trough), the protected state of the GTIOCnB pin output can be temporarily released by setting the GTSOTR.SOTR bit to 1. The SOS[1:0] bits retain 10b even if the output protection function is released.

When the SOTR bit is set to 0, the GTIOCnB pin output protection can be restarted.

Figure 19.94 shows an example of the operation of temporary release of output protection when the setting of the GTCCRA register ≥ GTPR register during buffer transfer at troughs.

(1) Normal operation period: Toggle output due to compare match is performed normally.

(2) Output holding period: When GTCCRA register ≥ GTPR register is detected in the trough, the output protection status changes to GTSOS[1:0] = 10b, and the output is held while GTCCRA register ≥ GTPR register. Even when the GTSOTR.SOTR bit is set to 1 during the output holding period, the GTIOCnB pin output is held until the first trough after the setting.

(3) Temporary release of output protection period: After GTSOTR.SOTR bit is set to 1, the GTIOCnB pin is performed normally from the first trough after the setting. Even when the GTSOTR.SOTR bit is set to 0 during the output protection releasing period, the GTIOCnB pin output is held until the first trough after the setting.

(4) Output holding period: The output is held until 0 < GTCCRA register < GTPR register is detected in the trough.

(5) Normal operation period: When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to GTSOS[1:0] = 00b, and toggle output due to a compare match is performed normally.

Figure 19.94 Example of the operation of temporary release of output protection when the setting of the GTCCRA register ≥ GTPR register during buffer transfer at troughs (restored to 0 < GTCCRA register < GTPR register during buffer transfer at troughs, active-level: low) (n = 0 to 17)

19.9 Initialization Method of Output Pins

19.9.1 Pin Settings after Reset

The GPT registers are initialized at a reset. Initialize the GPT for output to the external pins by making the port mode settings and setting the OAE and OBE bits in the GTIOR register, and then start the counter counting.

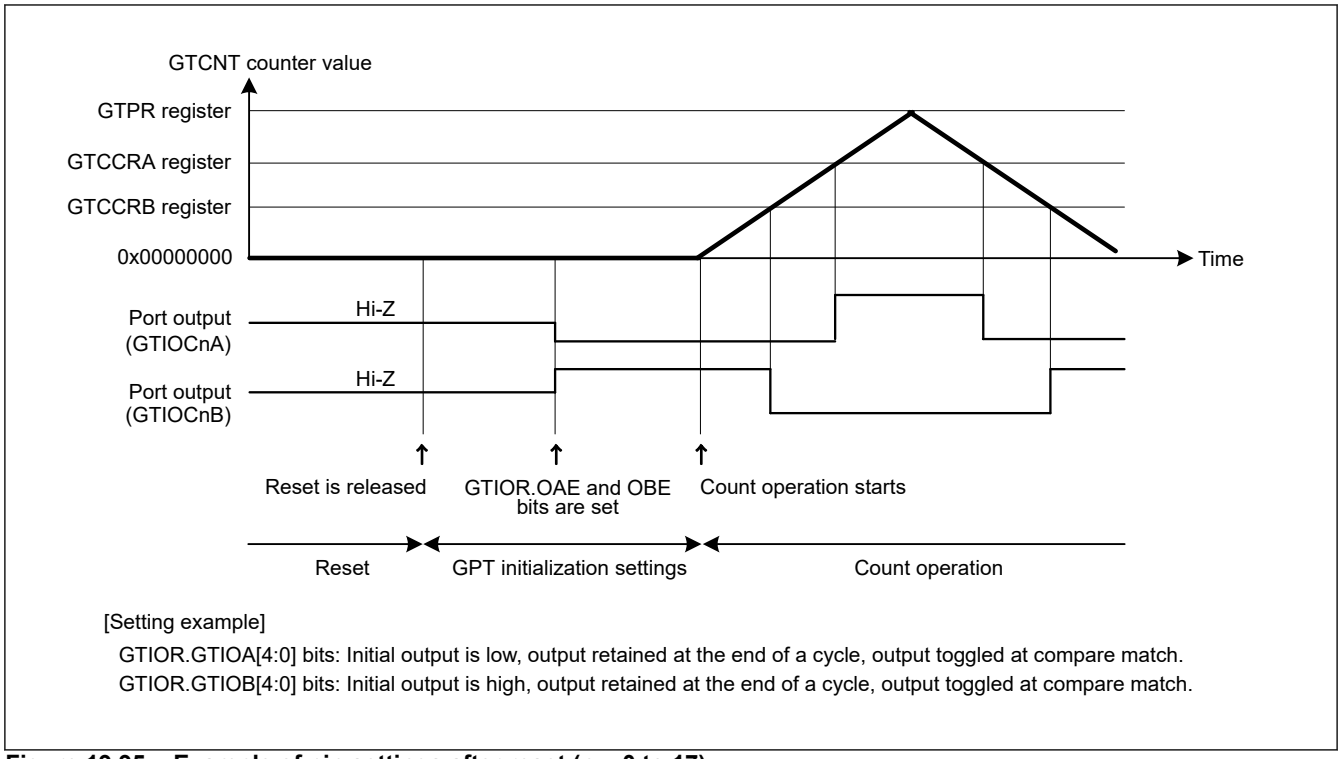


Figure 19.95 Example of pin settings after reset (n = 0 to 17)

19.9.2 Pin Initialization Due to Error during Operation

If an error occurs during GPT operation, the following four types of pin processing can be performed before pin initialization.

1. Set OAHLD and OBHLD bits in the GTIOR register to 1 and retain the outputs at count stop.
2. Set OAHLD and OBHLD bits to 0, specify arbitrary output values at OADFLT and OBDFLT bits in the GTIOR register, and output the arbitrary values at count stop.
3. Set the pin to output an arbitrary value as a general output port by setting the registers of the I/O port in advance. Set the OAE and OBE bits in the GTIOR register to 0 and the control bit in register that corresponds to the pin to allow the arbitrary values to be output from the pin set as a general output port when an error occurs.
4. Drive the output to a high impedance state using the POEG function.

When automatic dead time setting is made, set the GTDTCR.TDE bit to 0 once after counting is stopped. When counting is stopped, only the values of registers that are changed by a GPT external source change. If counting is resumed, operation carries on from where it was stopped.

If counting was stopped, registers should be initialized before counting is started.

19.10 Usage Notes

19.10.1 Module-Stop Function Setting

The Module Stop Control register can enable or disable operation of the GPT. The initial setting is to halt operation of the GPT. Register access is enabled by clearing the module-stop state. For details, see section 8, Low-Power Consumption Function.

19.10.2 Settings of the GTCCRn Register During Compare Match Operation (n = A to F)

(1) When Automatic Dead Time Setting is Made in Triangle-Wave PWM Mode

The GTCCRA register must satisfy the following conditions:

- GTCCRA register > GTDVU register

- GTCCRA register > GTDVD register
- GTCCRA register < GTPR register

When the GTCCRA register is set to 0x00000000 or a value greater than or equal to the GTPR register value during count operation, the output protection function is activated.

However, if the following conditions are not satisfied, the output protection does not operate normally.

- When the GTCCRA register value at the start of count operation is 0x00000001 or greater, and less than the setting value of the GTPR register

For details, see section 19.8.4. GTIOCnm Protection Function for GTIOCnm Pin Output (n = 0 to 17, m = A, B).

(2) When Automatic Dead Time Setting is not Made in Triangle-Wave PWM Mode

Set a value greater than 0x00000000 and less than the setting value of the GTPR register in the GTCCRA register. When 0x00000000 or the same value as that of the GTPR register is set in the GTCCRA register, compare match is generated in one cycle only when [GTCCRA register = 0x00000000] or [GTCCRA register = GTPR register] is met. Furthermore, a value exceeding the setting value of the GTPR register is set in the GTCCRA register, compare match does not occur.

Similarly, set a value greater than 0x00000000, and less than the setting value of the GTPR register in the GTCCRB register. When 0x00000000 or the same value as that of the GTPR register is set in the GTCCRB register, compare match is generated in one cycle only when [GTCCRB register = 0x00000000] or [GTCCRB register = GTPR register] is met.

Furthermore, a value exceeding the setting value of the GTPR register is set in the GTCCRB register, compare match does not occur.

(3) When Automatic Dead Time Setting is Made in Sawtooth-Wave One-Shot Pulse Mode

The GTCCRC and GTCCRD registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, correct output waveforms with secured dead time may not be obtained.

- In up-counting:

  GTCCRC register < GTCCRD register

  GTCCRC register > GTDVU register

  GTCCRD register < GTPR register − GTDVD register
- In down-counting:

  GTCCRC register > GTCCRD register

  GTCCRC register < GTPR register − GTDVU register

  GTCCRD register > GTDVD register

(4) When Automatic Dead Time Setting is not Made in Sawtooth-Wave One-Shot Pulse Mode

The GTCCRC and GTCCRD registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRC register < GTCCRD register < GTPR register
- In down-counting: GTPR register > GTCCRC register > GTCCRD register > 0

Similarly, GTCCRE and GTCCRF registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRE register < GTCCRF register < GTPR register
- In down-counting: GTPR register > GTCCRE register > GTCCRF register > 0

(5) In Sawtooth-Wave PWM Mode

The GTCCRA register must be set with the range of 0x00000000 < GTCCRA register < GTPR register. If GTCCRA register = 0x00000000 or GTCCRA register = GTPR register is set, a compare match occurs within the cycle only when GTCCRA register = 0x00000000 or GTCCRA register = GTPR register is satisfied. If GTCCRA register > GTPR register is set, no compare match occurs.

Similarly, GTCCRB register must be set with the range of 0x00000000 < GTCCRB register < GTPR register. If GTCCRB register = 0x00000000 or GTCCRB register = GTPR register is set, a compare match occurs within the cycle only when GTCCRB register = 0x00000000 or GTCCRB register = GTPR register is satisfied. If GTCCRB register > GTPR register is set, no compare match occurs.

19.10.3 Setting Range of the GTCNT Counter

Set the range of the GTCNT counter within the range of 0 ≤ GTCNT counter ≤ GTPR register.

19.10.4 The GTCNT Counter Start/Stop

The GTCNT counter start/stop control by the GTCR.CST bit is synchronized with the count clock selected by the GTCR.TPCS[3:0] bits. Since the GTCNT counter starts or stops after one count clock cycle selected by the GTCR.TPCS[3:0] bits following the CST bit updating, events until the GTCNT counter actually starts are ignored, where events may be accepted and the interrupt may be generated after the CST bit becomes 0.

19.10.5 Order of Priority in Events

(1) GTCNT Counter

Order of priority in events to update the GTCNT counter is shown below.

Table 19.25 Order of priority in updating GTCNT counter

The GTCNT counter updating source	Order of priority
CPU writing (GTCNT counter writing/GTCLR register writing)	High
Clearing by a hardware source set by the GTCSR register	↑
Up-counting/down-counting by a hardware source set by the GTUPSR and GTDNSR registers	↑
Count operation	Low

In case of contention between up-counting by the GTUPSR register and down-counting by the GTDNSR register, the counter value is not updated.

When updating of the GTCNT counter conflicts with reading by the CPU, the value before updating is reflected.

(2) GTCR.CST Bit

When start/stop by a hardware source set by the GTSSR and GTPSR registers conflicts with the CPU writing (GTCR register writing/GTSTR register writing/GTSTP register writing), the CPU writing takes priority.

When there is contention between start by a hardware source set by the GTSSR register and stop by a hardware source set by the GTPSR register, the state of the CST bit does not change.

When there is contention between the CST bit updating and the CPU reading (GTCR register reading/GTSTR register reading/GTSTP register reading), data before updating is read.

(3) GTCCRm Register (m = A to F)

When there is contention between the GTCCRm register writing and an input capture/buffer transfer, the GTCCRm register writing takes priority over an input capture/buffer transfer.

When an input capture conflicts with the CPU writing or the counter updating by a hardware source, the counter value before updating is captured.

When there is contention between the GTCCRm register updating and the CPU reading, data before updating is read.

(4) GTPR Register

When there is contention between a buffer transfer and the GTPR register writing, the GTPR register writing takes priority over a buffer transfer.

When there is contention between the GTPR register updating and the CPU reading, data before updating is read.

(5) GTADTRm Register (m = A, B)

When there is contention between a buffer transfer and the GTADTRm register writing, the GTADTRm register writing takes priority over a buffer transfer.

When there is contention between the GTADTRm register updating and the CPU reading, data before updating is read.

(6) GTDVm Register (m = U, D)

When there is contention between a buffer transfer and the GTDVm register writing, the GTDVm register writing takes priority over a buffer transfer.

When there is contention between the GTDVm register updating and the CPU reading, data before updating is read.

20. Port Output Enable for GPT (POEG)

20.1 Overview

The POEG issues requests to stop output from output pins of the general PWM timer (GPT). The combination of output pins of the POEG to be disabled can be specified from any channel of the GPT.

Select the method of detection for stopping the output from the list below.

- Input level detection of the GTETRGn pin (n = A to D)
- Detection from the GPT to stop output
- Detection of stopping of oscillation by the oscillation stop detection circuit for the main clock
- Register setting

The GTETRGn pin can be used for output to the external trigger input pins of the GPT.

Table 20.1 lists POEG specifications, Figure 20.1 shows a block diagram of POEG, Figure 20.4 shows POEG external trigger connections, Table 20.2 lists POEG I/O pins, and Table 20.3 lists POEG Interrupt Sources.

Table 20.1 POEG specifications

Item	Description
Number of units	Three units (LLPP (POEG0), NONSAFETY (POEG1), SAFETY (POEG2))
Number of groups	Four groups (A to D)
Output-disable control through input level detection	The GPT output pins can be disabled when a GTETRGA to GTETRGD rising edge or high level is sampled after polarity and filter selection.
Output-disable request from the GPT	• When the GTIOCA pin and the GTIOCB pin are driven to an active level simultaneously, the GPT generates an output-disable request to the POEG. Through reception of these requests, the POEG can control whether the GTIOCA and GTIOCB pins are output-disabled. • GPT output pins can be set to be disabled when the GPT output pins detect a dead time error.
Output-disable control through oscillation stop detection	The GPT output pins can be disabled when oscillation of the clock generation circuit stops.
Output-disable control by software (registers)	The GPT output pins can be disabled by modifying the register settings.
Output-disable control through DSMIF error detection	The GPT output pins can be disabled when DSMIF error 0 or 1 occurs (LLPP only).
Interrupt	• Allows output-disable control by the input level detection • Allows output-disable requests from the GPT
External trigger output to the GPT (count start, count stop, count clear, up-count, down-count, or input capture function)	The GTETRGA to GTETRGD signals can be output to the GPT after polarity and filter selection.
Noise filtering	• Three times sampling for every PCLK/1, PCLK/8, PCLK/32, or PCLK/128 can be set for any of the input pins GTETRGA to GTETRGD. (PCLK is PCLKH for LLPP and PCLKL for NONSAFETY and SAFETY). • Positive or negative polarity can be selected for any of the input pins, GTETRGA to GTETRGD. • Signal state after polarity and filter selection can be monitored.

Bit	Symbol	Function	R/W
0	PIDF	Port Input Detection Flag 0: The selected input level was not detected on the GTETRGn pin 1: The selected input level was detected on the GTETRGn pin	R/W*1
1	IOCF	GPT Output Stop Request Detection Flag 0: Stopping of GPT output was not detected 1: Stopping of GPT output was detected	R/W*1
2	OSTPF	Oscillation Stop Detection Flag 0: Stopping of oscillation was not detected 1: Stopping of oscillation was detected	R/W*1
3	SSF	Software Stop Flag 0: Software has not stopped output 1: Software has stopped output	R/W
4	PIDE	Port Input Detection Enable 0: Detection of input levels on the corresponding GTETRGn pin is disabled 1: Detection of input levels on the corresponding GTETRGn pin is enabled	R/W
5	IOCE	GPT Output Stop Request Enable 0: Detection of stopping of output from the GPT is disabled 1: Detection of stopping of output from the GPT is enabled	R/W
6	OSTPE	Enable Stopping Output on Stopping of Oscillation 0: Detection of stopping of oscillation is disabled 1: Detection of stopping of oscillation is enabled	R/W
15:7	—	These bits are read as 0. The write value should be 0.	R/W
16	ST	GTETRGn Input Status Flag 0: GTETRGn input after filtering was 0 1: GTETRGn input after filtering was 1	R
27:17	—	These bits are read as 0. The write value should be 0.	R/W
28	INV	GTETRGn Input Inverting 0: Input on the GTETRGn pin is not inverted 1: Input on the GTETRGn pin is inverted	R/W
29	NFEN	Noise filter Enable 0: Digital noise filter on the GTETRGn pin is disabled 1: Digital noise filter on the GTETRGn pin is enabled	R/W
31:30	NFCS[1:0]	Noise filter Clock Select 0 0: Samples the input level of GTETRGn pin three times per PCLKL clock 0 1: Samples the input level of GTETRGn pin three times per PCLKL/8 clock 1 0: Samples the input level of GTETRGn pin three times per PCLKL/32 clock 1 1: Samples the input level of GTETRGn pin three times per PCLKL/128 clock	R/W

Note 1. Only 0 to clear the flag can be written.

The POEGmGn register (m = 1, 2), (n = A to D) controls requests for stopping output and an external trigger for the GPT based in response to the detection of various signals.

20.3 Operation

20.3.1 Output-Disable Control Operation

If any of the following conditions is satisfied, the GTIOCxA, GTIOCxB, and the three-phase PWM output for motor control pins can be set to output-disable:

- Input level or edge detection of the GTETRGA to GTETRGD pins
  When POEGmGn.PIDE = 1 (m = 0 to 2, n = A to D), the POEGmGn.PIDF flag is set to 1.
- Output-disable request from the GPT
  When POEGmGn.IOCE = 1 (m = 0 to 2, n = A to D), the POEGmGn.IOCF flag is set to 1 if the output-disable request is enabled in GTINTAD. The GTINTAD.GRPDTE, GTINTAD.GRPABH, and GTINTAD.GRPABL settings apply to the group selected in GPT register GTINTAD.GRP[1:0] and OPSCR.GRP[1:0].
- Oscillation stop detection for the Clock Generation Circuit
  When POEGmGn.OSTPE = 1 (m = 0 to 2, n = A to D), the POEGmGn.OSTPF flag is set to 1.
- SSF bit setting
  When POEGmGn.SSF (m = 0 to 2, n = A to D) is set to 1.

The state of output-disable is controlled in the GPT module. The output-disable of the GTIOCxA and GTIOCxB pins are set in the GTINTAD.GRP[1:0] bits, GTIOR.OADF[1:0] bits, and GTIOR.OBDF[1:0] bits in GPTx. The output-disable of the PWM output for motor control pins are set in the OPSCR.GRP[1:0] bits and OPSCR.GODF bit in GPT_OPS.

20.3.1.1 Pin Input Level Detection Operation

If the input conditions set in POEGmGn.PIDE, POEGmGn.NFCS[1:0], POEGmGn.NFEN, and POEGmGn.INV (m = 0 to 2, n = A to D) occur on the GTETRGA to GTETRGD pins, the GPT output pins are output-disabled.

(1) Digital Noise Filter

Figure 20.5 shows high-level detection by the digital filter. When a high level associated with the POEGmGn.INV (m = 0 to 2, n = A to D) polarity setting is detected three times consecutively with the sampling clock selected in POEGmGn.NFCS[1:0] and POEGmGn.NFEN, the detected level is recognized as high, and the GPT output pins are output-disabled. If even one low level is detected during this interval, the detected level is not recognized as high. In addition, in an interval where the sampling clock is not being output, changes of the levels on the GTETRGA to GTETRGD pins are ignored.

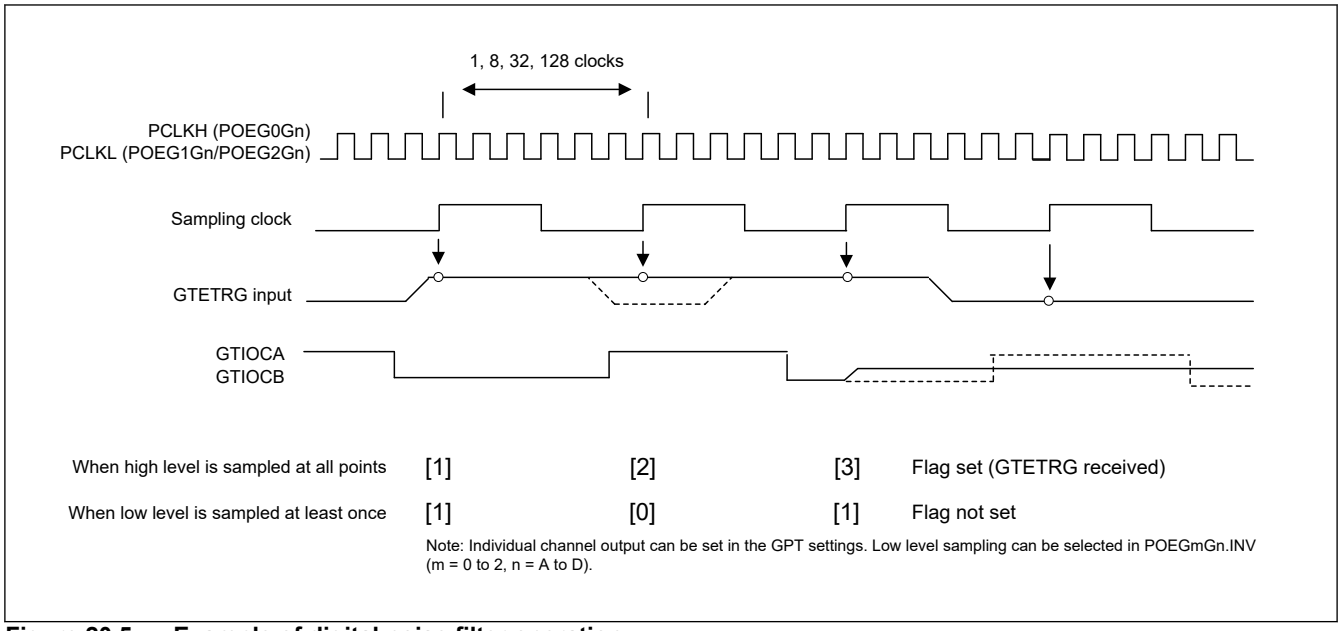

Figure 20.5 Example of digital noise filter operation

20.3.2 Output-Disable Requests from the GPT

For details on this operation, see the description of output-disable control for GTIOC pin outputs in section 19, General PWM Timer (GPT).

20.3.3 Output-Disable Control Using Detection of Stopped Oscillation

When the oscillation stop detection function in the Clock Generation Circuit detects stopped oscillation while POEGmGn.OSTPE = 1 (m = 0 to 2, n = A to D), the GPT output pins are output-disabled for each group.

20.3.4 Output-Disable Control Using DSMIF Error Detection

When the DSMIF detects error while POEG0Gn.DmERR0E =1 or POEG0Gn.DmERR1E = 1 (m = 0, 1), the GPT output pins in the LLPP region can be output-disabled.

20.3.5 Output-Disable Control Using Registers

The GPT output pins can be directly controlled by writing to the software stop flag, POEGmGn.SSF.

20.3.6 Release from Output-Disable

To release the GPT output pins placed in the output-disable state, either return them to their initial state with a reset or clear all of the following (n = A to D):

- POEG0Gn.PIDF flag
- POEG0Gn.IOCF flag
- POEG0Gn.OSTPF flag
- POEG0Gn.SSF flag

Writing 0 to the POEG0Gn.PIDF (n = A to D) flag is ignored (the flag is not cleared) if the external input pins, GTETRGA to GTETRGD, are not disabled and the POEG0Gn.ST bit is not set to 0.

Writing 0 to the POEG0Gn.IOCF (n = A to D) flag is valid (the flag is cleared) only if all of the GTST.DTEF, GTST.OABHF, and GTST.OABLF flags in the GPT are set to 0.

Figure 20.6 shows the release timing for output-disable. The output-disable is released at the beginning of the next count cycle of the GPT after the flag is cleared.

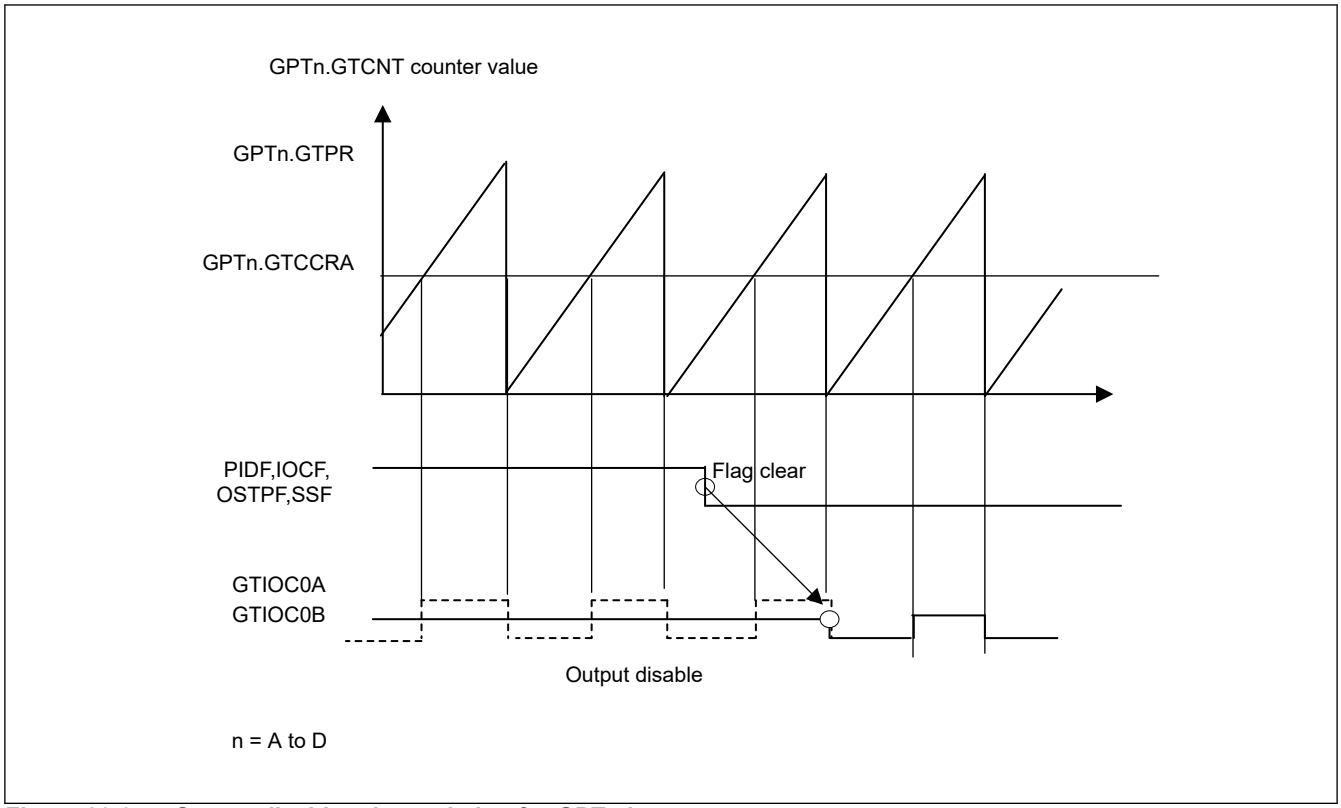

Figure 20.6 Output-disable release timing for GPT pin outputs

21. Trigonometric Function Unit (TFU)

21.1 Overview

A trigonometric Function Unit (TFU) handles the high-speed calculation for sinf, cosf, atan2f, and hypotf functions.

The PCLKH is used as the operating clock for the TFU.

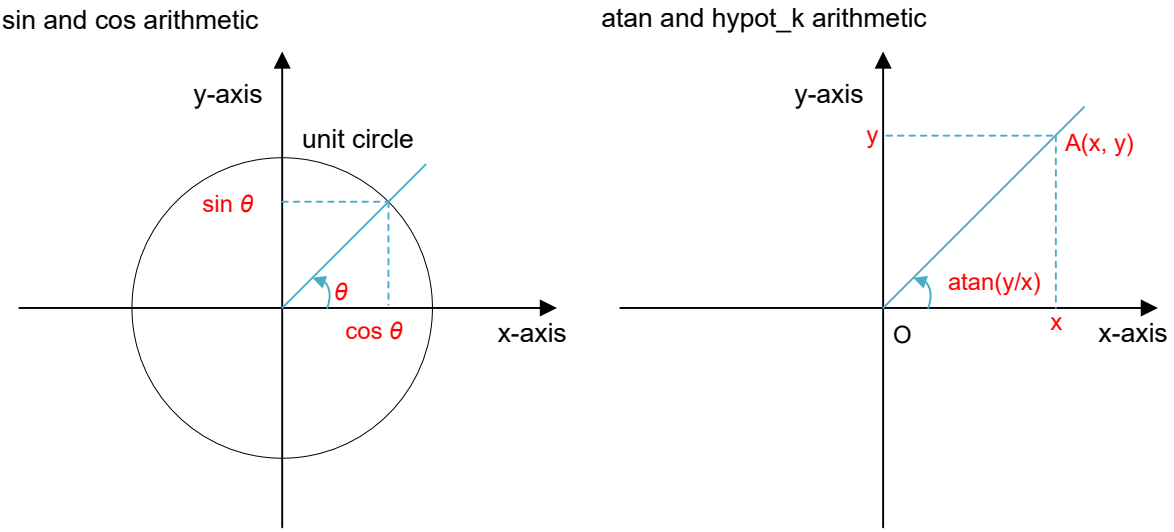

Table 21.1 lists the specifications of the TFU.

Table 21.1 TFU specifications

Note: k is a constant. See section 21.3.1. Arithmetic Processing.

Note 1. float_max is the maximum value that can be expressed as single-precision floating-point: $(2 - 2^{-23}) \times 2^{127}$.

Note: sin and cos arithmetic:
Operation to find $\sin\theta$ and $\cos\theta$, which are the triangular ratios of the input angle values θ.
atan arithmetic:
Operation to find the angle value between the vector OA (O is the origin and A is the point indicated by the input coordinates x and y) and the positive part of the x-axis.
hypot_k arithmetic:
Operation to find a value proportional to the distance from the point A indicated by the input coordinates x and y to the origin O.

Note: By multiplying the TFU output result hypot_k by the constant k, the distance between OA ($\sqrt{x^2+y^2}$) can be obtained. for details about k, see section 21.3.1. Arithmetic Processing.

Figure 21.1 Explanation for operations

21.1.1 Precautions on Use of the Trigonometric Function Unit

This section describes precautions on use of the trigonometric function unit.

21.1.1.1 General Precautions

If another operation is started after the operation is started and before the result is read, the result of the preceding operation will be discarded.

21.2 Register Descriptions

21.2.1 FXSCIOC : Fixed-point Sine Cosine Input/Output Setting Register

Base address: TFU = 0x9000_3000

Offset address: 0x04

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	OF[1:0]		—	—	—	IUF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IUF	Input unit and format setting Specify the unit and format for input value of fixed-point sincos operation 0: unit, format = turn, Q1.31 1: unit, format = radian, Q3.29	R/W

Bit	Symbol	Function	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
5:4	OF[1:0]	Output format setting 0 0: Q1.31 0 1: Q2.30 1 0: Q3.29 1 1: Setting prohibited	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

IUF bit (Input unit and format setting)

The IUF bit specifies the unit and format for input value of fixed-point sincos operation.

OF[1:0] bits (Output format setting)

The OF[1:0] bits specify the format for output value of fixed-point sincos operation.

When Q1.31 is selected, +1.0 cannot be expressed accurately. If $\sin\theta$ or $\cos\theta$ is +1.0 ordinally when Q1.31, +1.0 - 2^{-31} will be read out from the FXSCDT0 and FXSCDT1 registers.

This register should be set before the calculation start. If this register is changed during the calculation, the operation is not guaranteed.

21.2.2 FXATIOC : Fixed-point Arctangent hypot_k Input/Output Setting Register

Base address: TFU = 0x9000_3000

Offset address: 0x05

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	OUF	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	OUF	Output unit and format setting Specify the unit and format for output value of fixed-point arctangent operation 0: unit, format = turn, Q1.31 1: unit, format = radian, Q3.29	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

OUF bit (Output unit and format setting)

The OUF bit specifies the unit and format for output value when arctangent calculation is executed by fixed-point atanhypot_k operation. The output format of hypot_k calculation executed with arctangent calculation in parallel is Q3.29 regardless of this bit setting.

This register should be set before the calculation start. If this register is changed during the calculation, the operation is not guaranteed.

21.2.3 TRGSTS : Trigonometric Status Register

Base address: TFU = 0x9000_3000

Offset address: 0x08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	ERRF	BSYF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BSYF	Calculation in progress flag 0: No calculating 1: Calculating	R/W*1
1	ERRF	Input error flag 0: No input error occurred 1: Input error occurred	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Writing to this bit is invalid.

BSYF bit (Calculation in progress flag)

The BSYF bit specifies the calculation in progress flag. Writing to this bit is ignored.

[Setting condition]

- When calculation started

[Clearing condition]

- When calculation completed

ERRF bit (Input error flag)

The ERRF bit specifies the input error flag.

Do not write to this bit except error flag restoration procedure shown in section 21.3.8. Usage of Interrupt.

[Setting condition]

- When input error occurred or 1 wrote to this bit. For details on input error, see Table 21.8.

[Clearing condition]

- When the next calculation started or 0 wrote to this bit

21.2.4 FPSCDT0 : Floating-point Sine Cosine Data Register 0

Base address: TFU = 0x9000_3000

Offset address: 0x10

Bit position:	31																												0
Bit field:	FPSCDT0[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	FPSCDT0[31:0]	Floating-point Sine Cosine Data Register 0	R/W

For the floating-point sincos operation, the FPSCDT0 register is dedicated for the output value $\cos\theta$ of the trigonometric function unit. See Table 21.2 for detail. In terms of usage of this register, see section 21.3.7. Procedure for Trigonometric Function Operation.

Writing to this register is prohibited even during any operations.

If read access is made to this register during the calculation, the result is read after the calculation is completed. At this time, the bus access is forced to wait until the operation is completed.

For calculations except the floating-point sincos operation, do not access this register. If other data register 0 such as FPATDT0, FXSCDT0, and FXATDT0 registers is written, this register value will be uncertainty.

When the DTSR0 register is written, this register value will be the same as DTSR0 register writing value.

21.2.5 FPSCDT1 : Floating-point Sine Cosine Data Register 1

Base address: TFU = 0x9000_3000

Offset address: 0x14

Bit position:	31																												0
Bit field:	FPSCDT1[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	FPSCDT1[31:0]	Floating-point Sine Cosine Data Register 1	R/W

For the floating-point sincos operation, the FPSCDT1 register is shared for the input angle value θ and the output value $\sin\theta$ of the trigonometric function unit. See Table 21.2 for detail. Writing to this register starts the floating-point sincos operation. In terms of usage of this register, see section 21.3.7. Procedure for Trigonometric Function Operation.

Writing to this register is prohibited even during any operations.

If read access is made to this register during the calculation, the result is read after the calculation is completed. At this time, the bus access is forced to wait until the operation is completed.

For calculations except the floating-point sincos operation, do not access this register. If other data register 1 such as FPATDT1, FXSCDT1, and FXATDT1 registers is written, this register value will be uncertainty.

When the DTSR1 register is written, this register value will be the same as DTSR1 register writing value.

Table 21.2 Input/Output value of FPSCDT0 and FPSCDT1

Register	Input value	Output value
FPSCDT0	—	$\cos\theta$
FPSCDT1	Angle θ	$\sin\theta$

21.2.6 FPATDT0 : Floating-point Arctangent hypot_k Data Register 0

Base address: TFU = 0x9000_3000

Offset address: 0x18

Bit position:	31																												0
Bit field:	FPATDT0[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	FPATDT0[31:0]	Floating-point Arctangent hypot_k Data Register 0	R/W

For the floating-point atanhypot_k operation, the FPATDT0 register is shared for the input coordinate value x and the output value $\sqrt{x^2+y^2}/k$ of the trigonometric function unit. See Table 21.3 for detail. In terms of usage of this register, see section 21.3.7. Procedure for Trigonometric Function Operation.

Writing to this register is prohibited even during any operations.

If read access is made to this register during the calculation, the result is read after the calculation is completed. At this time, the bus access is forced to wait until the operation is completed.

For calculations except the floating-point atanhypot_k operation, do not access this register. If other data register 0 such as FPSCDT0, FXSCDT0, and FXATDT0 registers is written, this register value will be uncertainty.

When the DTSR0 register is written, this register value will be the same as DTSR0 register writing value.

21.2.7 FPATDT1 : Floating-point Arctangent hypot_k Data Register 1

Base address: TFU = 0x9000_3000

Offset address: 0x1C

Bit position:	31																												0
Bit field:	FPATDT1[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	FPATDT1[31:0]	Floating-point Arctangent hypot_k Data Register 1	R/W

For the floating-point atanhypot_k operation, the FPATDT1 register is shared for the input coordinate value y and the output value atan(y/x) of the trigonometric function unit. See Table 21.3 for detail. Writing to this register starts the floating-point atanhypot_k operation. In terms of usage of this register, see section 21.3.7. Procedure for Trigonometric Function Operation.

Writing to this register is prohibited even during any operations.

If read access is made to this register during the calculation, the result is read after the calculation is completed. At this time, the bus access is forced to wait until the operation is completed.

For calculations except the floating-point atanhypot_k operation, do not access this register. If other data register 1 such as FPSCDT1, FXSCDT1, and FXATDT1 registers is written, this register value will be uncertainty.

When the DTSR1 register is written, this register value will be the same as DTSR1 register writing value.

Table 21.3 Input/Output value of FPATDT0 and FPATDT1

Register	Input value	Output value
FPATDT0	Coordinates x	hypot_k
FPATDT1	Coordinates y	atan(y/x)

21.2.8 FXSCDT0 : Fixed-point Sine Cosine Data Register 0

Base address: TFU = 0x9000_3000

Offset address: 0x20

Bit position:	31																												0
Bit field:	FXSCDT0[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	FXSCDT0[31:0]	Fixed-point Sine Cosine Data Register 0	R/W

For the fixed-point sincos operation, the FXSCDT0 register is dedicated for the output value $\cos\theta$ of the trigonometric function unit. See Table 21.4 for detail. In terms of usage of this register, see section 21.3.7. Procedure for Trigonometric Function Operation.

Writing to this register is prohibited even during any operations.

If read access is made to this register during the calculation, the result is read after the calculation is completed. At this time, the bus access is forced to wait until the operation is completed.

For calculations except the fixed-point sincos operation, do not access this register. If other data register 0 such as FPSCDT0, FPATDT0, and FXATDT0 registers is written, this register value will be uncertainty.

When the DTSR0 register is written, this register value will be the same as DTSR0 register writing value.

21.2.9 FXSCDT1 : Fixed-point Sine Cosine Data Register 1

Base address: TFU = 0x9000_3000

Offset address: 0x24

Bit position:	31																												0
Bit field:	FXSCDT1[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	FXSCDT1[31:0]	Fixed-point Sine Cosine Data Register 1	R/W

For the fixed-point sincos operation, the FXSCDT1 register is shared for the input angle value θ and the output value $\sin\theta$ of the trigonometric function unit. See Table 21.4 for detail. Writing to this register starts the fixed-point sincos operation. In terms of usage of this register, see section 21.3.7. Procedure for Trigonometric Function Operation.

Writing to this register is prohibited even during any operations.

If read access is made to this register during the calculation, the result is read after the calculation is completed. At this time, the bus access is forced to wait until the operation is completed.

For calculations except the fixed-point sincos operation, do not access this register. If other data register 1 such as FPSCDT1, FPATDT1, and FXATDT1 registers is written, this register value will be uncertainty.

When the DTSR1 register is written, this register value will be the same as DTSR1 register writing value.

Table 21.4 Input/Output value of FXSCDT0 and FXSCDT1

Register	Input value	Input unit and format	Output value	Output format
FXSCDT0	Unused	—	$\cos\theta$	Depends on FXSCIOC.OF[1:0] setting: Q1.31, Q2.30, or Q3.29
FXSCDT1	Angle θ	When FXSCIOC.IUF = 0: [turn], Q1.31 When FXSCIOC.IUF = 1: [radian], Q3.29	$\sin\theta$	Same as $\cos\theta$

When Q1.31 is selected, +1.0 cannot be expressed accurately. If $\sin\theta$ or $\cos\theta$ is +1.0 ordinally when Q1.31, $+1.0 - 2^{-31}$ will be read out from the FXSCDT0 and FXSCDT1 registers.

21.2.10 FXATDT0 : Fixed-point Arctangent hypot_k Data Register 0

Base address: TFU = 0x9000_3000

Offset address: 0x28

Bit position:	31																												0
Bit field:	FXATDT0[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	FXATDT0[31:0]	Fixed-point Arctangent hypot_k Data Register 0	R/W

For the fixed-point atanhypot_k operation, the FXATDT0 register is shared for the input coordinate value x and the output value $\sqrt{x^2 + y^2}/k$ of the trigonometric function unit. See Table 21.5 for detail. In terms of usage of this register, see section 21.3.7. Procedure for Trigonometric Function Operation.

Writing to this register is prohibited even during any operations.

If read access is made to this register during the calculation, the result is read after the calculation is completed. At this time, the bus access is forced to wait until the operation is completed.

For calculations except the fixed-point atanhypot_k operation, do not access this register. If other data register 0 such as FPSCDT0, FPATDT0, and FXSCDT0 registers is written, this register value will be uncertainty.

When the DTSR0 register is written, this register value will be the same as DTSR0 register writing value.

21.2.11 FXATDT1 : Fixed-point Arctangent hypot_k Data Register 1

Base address: TFU = 0x9000_3000

Offset address: 0x2C

Bit position:	31																												0
Bit field:	FXATDT1[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	FXATDT1[31:0]	Fixed-point Arctangent hypot_k Data Register 1	R/W

For the fixed-point atanhypot_k operation, the FXATDT1 register is shared for the input coordinate value y and the output value atan(y/x) of the trigonometric function unit. See Table 21.5 for detail. Writing to this register starts the fixed-point atanhypot_k operation. In terms of usage of this register, see section 21.3.7. Procedure for Trigonometric Function Operation.

Writing to this register is prohibited even during any operations.

If read access is made to this register during the calculation, the result is read after the calculation is completed. At this time, the bus access is forced to wait until the operation is completed.

For calculations except the fixed-point atanhypot_k operation, do not access this register. If other data register 1 such as FPSCDT1, FPATDT1, and FXSCDT1 registers is written, this register value will be uncertainty.

When the DTSR1 register is written, this register value will be the same as DTSR1 register writing value.

Table 21.5 Input/Output value of FXATDT0 and FXATDT1

Register	Input value	Input format	Output value	Output unit and format
FXATDT0	Coordinates x	Q1.31	hypot_k	[—], Q3.29
FXATDT1	Coordinates y	Q1.31	atan(y/x)	When FXATIOC.OUF = 0: [turn], Q1.31 When FXATIOC.OUF = 1: [radian], Q3.29

21.2.12 DTSR0 : Data Save Restore Register 0

Base address: TFU = 0x9000_3000

Offset address: 0x30

Bit position:	31																												0
Bit field:	DTSR0[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	DTSR0[31:0]	Data Save Restore Register 0	R/W

The DTSR0 register is used to save and restore data in the data register 0 such as FPSCDT0, FPATDT0, FXSCDT0, and FXATDT0.

When read this register, the last written value into data register 0 or the result of the last arithmetic operation for data register 0 will be read.

When write to this register, the value for all data register 0 will be set to the written data of this register.

Writing to this register is prohibited during the operation.

If read access is made to this register during the calculation, the result is read after the calculation is completed. At this time, the bus access is forced to wait until the operation is completed.

In terms of usage of this register, see section 21.3.8. Usage of Interrupt.

21.2.13 DTSR1 : Data Save Restore Register 1

Base address: TFU = 0x9000_3000

Offset address: 0x34

Bit position:	31																												0
Bit field:	DTSR1[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	DTSR1[31:0]	Data Save Restore Register 1	R/W

The DTSR1 register is used to save and restore data in the data register 1 such as FPSCDT1, FPATDT1, FXSCDT1, and FXATDT1.

When read this register, the last written value into data register 1 or the result of the last arithmetic operation for data register 1 will be read.

When write to this register, the value for all data register 1 will be set to the written data of this register.

Writing to this register is prohibited during the operation.

If read access is made to this register during the calculation, the result is read after the calculation is completed. At this time, the bus access is forced to wait until the operation is completed.

In terms of usage of this register, see section 21.3.8. Usage of Interrupt.

21.3 Operation

21.3.1 Arithmetic Processing

The trigonometric function unit has two arithmetic operations, the sincos operation and the atanhypot_k operation. See Table 21.6 for detail.

Table 21.6 Arithmetic processing

Operation	Input value	Output value
sincos	Angle value θ	$\cos\theta$ and $\sin\theta$
atanhypot_k	Coordinates x and y	atan(y/x) and hypot_k

The value of scaling factor k is:

$$k = \prod_{i=0}^{\infty} \frac{1}{\sqrt{1 + 2^{-2i}}} \approx 0.607252935008881256169 4$$

21.3.2 Input and Output Value Formats

The input/output value of the TFU supports single-precision floating-point and fixed-point. For the single-precision floating-point in detail, see Table 21.2 and Table 21.7. For the fixed-point in detail, see Table 21.3. As a side of note, fixed-point input/output data is in 32-bit format, but it is performed with less than 32 bits of precision.

- Floating-point
  Support single-precision floating-point specified by the IEEE754 standard.
  - Single-precision floating-point

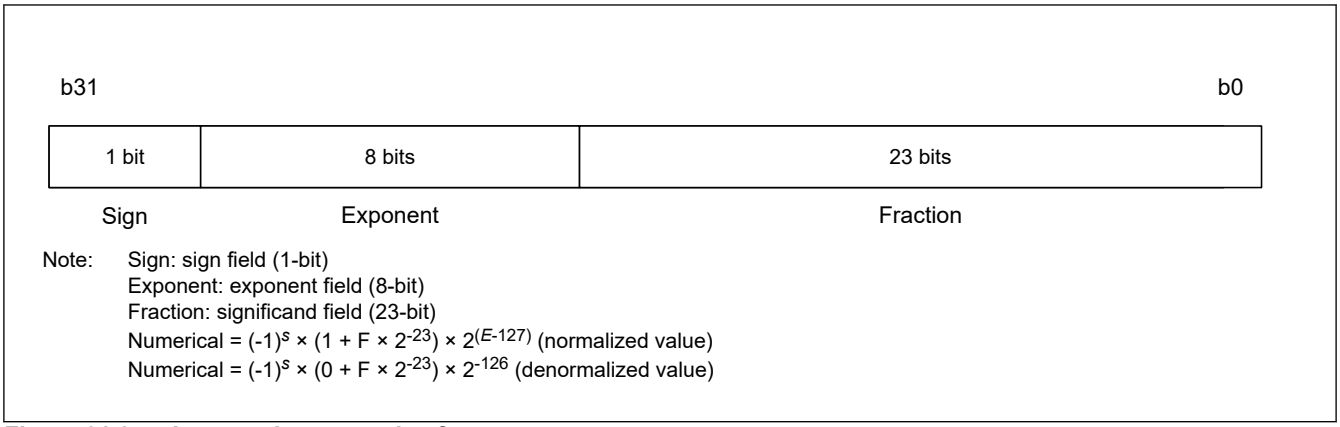

Figure 21.2 Input and output value formats

Table 21.7 Support single-precision floating-point

S	E	F	Numerical
Any value	0 < E < 255	Any value	$(-1)^s \times 1.F \times 2^{(E-127)}$ (normalized value — Normal Numbers)
Any value	E = 0	F > 0	$(-1)^s \times 0.F \times 2^{-126}$ (denormalized value — Subnormal Numbers)
S = 0	E = 0	F = 0	$(-1)^0 \times 0.0$ (positive zero — +0)
S = 1	E = 0	F = 0	$(-1)^{-1} \times 0.0$ (negative zero — -0)
S = 0	E = 255	F = 0	(positive infinity — +∞)
S = 1	E = 255	F = 0	(negative infinity — -∞)
Any value	E = 255	$2^{22} > F > 0$	(non-number — SNaN: Signaling Not a Number)
Any value	E = 255	$F \geq 2^{22}$	(non-number — QNaN: Quiet Not a Number)

- Fixed-point
  Format of two's complement representation shown in Figure 21.3 is used.

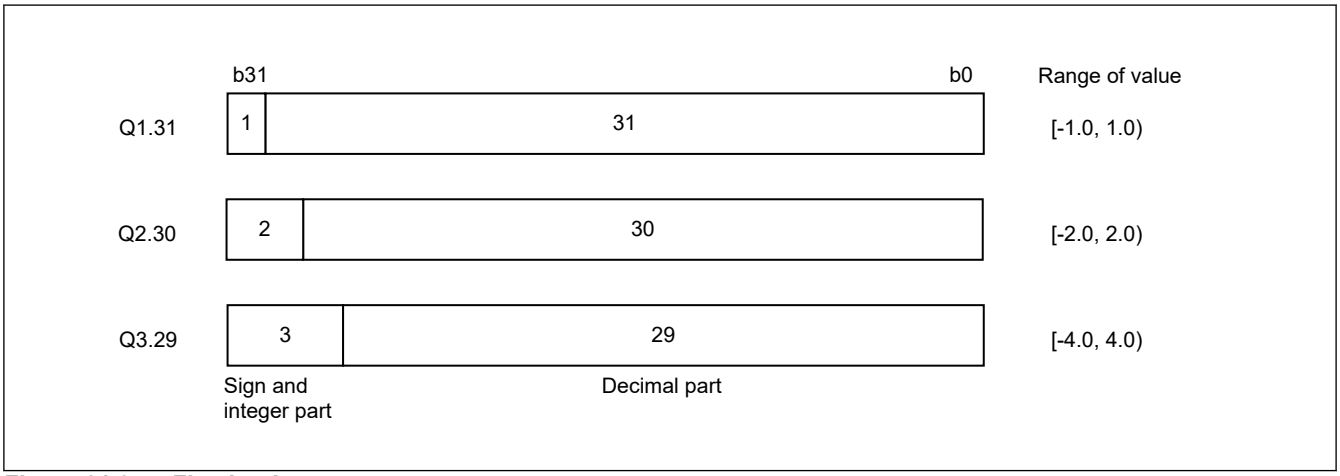

Figure 21.3 Fixed-point

21.3.3 Angle Unit

The units of angle used in the TFU are radian and turn. The radian is one rotation expressed as 0 to 2π. The turn is one rotation expressed as 0 to 1.

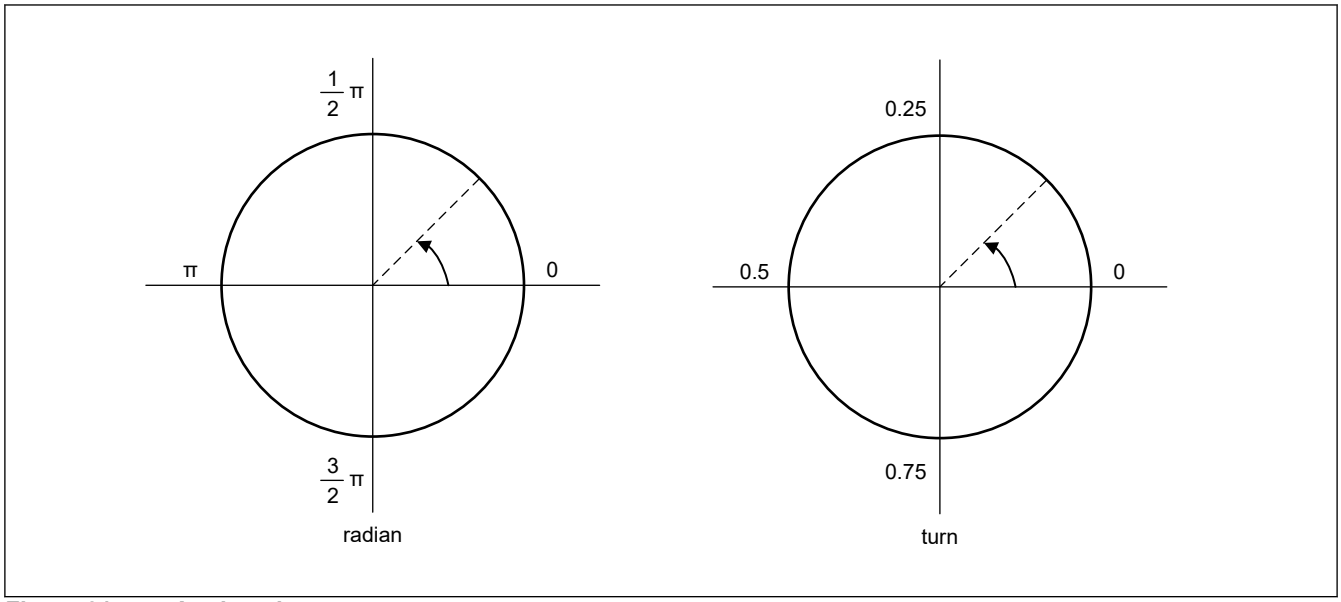

Figure 21.4 Angle unit

21.3.4 Relationship Between Input and Output Values for Sincos Operation

When the input values in the floating-point sincos operation are ±0, ±∞, SNaN (Signaling Not a Number), and QNaN (Quiet Not a Number), a fixed value is output as shown in Table 21.8.

Table 21.8 Relationship between special input value and its output value (for floating-point sincos operation)

Input (θ)	Output ($\cos\theta$)	Output ($\sin\theta$)
-∞	QNaN	QNaN
-0	+1	-0
+0	+1	+0
+∞	QNaN	QNaN
SNaN/QNaN	QNaN	QNaN

Note: The output value of QNaN is 0xFFC0_0000.

21.3.5 Relationship Between Input and Output Values for Atan Operation

When either the input values x or y in the floating-point atan operation are ±0, ±∞, SNaN (Signaling Not a Number), and QNaN (Quiet Not a Number), a fixed value is output as shown in Table 21.9.

If both input values are ±0, it is determined as an input error.

Table 21.9 Relationship between special input value and its output value (for floating-point atan operation)

		x						
		-∞	**Negative value**	**-0**	**+0**	**Positive value**	**+∞**	**SNaN/QNaN**
y	**-∞**	QNaN	QNaN	QNaN	QNaN	QNaN	QNaN	QNaN
	Negative value	QNaN	—	-π/2	-π/2	—	QNaN	QNaN
	-0	QNaN	-π	QNaN[*1]	QNaN[*1]	-0	QNaN	QNaN
	+0	QNaN	+π	QNaN[*1]	QNaN[*1]	+0	QNaN	QNaN
	Positive value	QNaN	—	+π/2	+π/2	—	QNaN	QNaN
	+∞	QNaN	QNaN	QNaN	QNaN	QNaN	QNaN	QNaN
	SNaN/QNaN	QNaN	QNaN	QNaN	QNaN	QNaN	QNaN	QNaN

Note 1. An input error occurs for the special input value, and the input error flag (TRGSTS.ERRF) is set.

For fixed-point atan operation, when both x and y input values are 0, it is determined as an input error. When an input error happens, output value of atan operation is 0.

21.3.6 Relationship Between Input and Output Values for hypot_k Operation

When either the input values x or y in the floating-point hypot_k operation are ±0, ±∞, SNaN (Signaling Not a Number), and QNaN (Quiet Not a Number), or when both x and y are ± 0, a fixed value is output as shown in Table 21.10.

If both input values are ±0, it is determined as an input error.

Table 21.10 Relationship between special input value and its output value (for floating-point hypot_k operation)

		x						
		-∞	**Negative value**	**-0**	**+0**	**Positive value**	**+∞**	**SNaN/QNaN**
y	**-∞**	QNaN	QNaN	QNaN	QNaN	QNaN	QNaN	QNaN
	Negative value	QNaN	—	—	—	—	QNaN	QNaN
	-0	QNaN	—	+0*1	+0*1	—	QNaN	QNaN
	+0	QNaN	—	+0*1	+0*1	—	QNaN	QNaN
	Positive value	QNaN	—	—	—	—	QNaN	QNaN
	+∞	QNaN	QNaN	QNaN	QNaN	QNaN	QNaN	QNaN
	SNaN/QNaN	QNaN	QNaN	QNaN	QNaN	QNaN	QNaN	QNaN

Note 1. An input error occurs for the special input value, and the input error flag (TRGSTS.ERRF) is set.

For fixed-point hypot_k operation, when both x and y input values are 0, it is determined as an input error. Because atan operation becomes error, although it is no problem for hypot_k operation. When an input error happens, output value of hypot_k is 0.

21.3.7 Procedure for Trigonometric Function Operation

Figure 21.5 shows the procedure for sincos operation. There are two procedures. The advantages and disadvantages of each are shown in Table 21.11. For floating-point sincos operation, replace SCDTn in the figure with FPSCDTn. And for fixed-point sincos operation, replace with FXSCDTn. (n = 0 or 1)

Figure 21.6 shows the procedure for atanhypot_k operation. There are two procedures. The advantages and disadvantages of each are shown in Table 21.11. For floating-point atanhypot_k operation, replace ATDTn in the figure with FPATDTn. And for fixed-point atanhypot_k operation, replace with FXATDTn. (n = 0 or 1)

Table 21.11 Advantages and disadvantages of sincos and atanhypot_k operations

Method	Advantages	Disadvantages
Procedure 1	Not occupy the bus.	Operation end determination is required by checking TRGSTS.BSYF.
Procedure 2	Operation end determination is not required by checking TRGSTS.BSYF. (reduced number of execution cycles)	Occupy the bus while waiting for the number of execution cycles when the result of the operation is read.

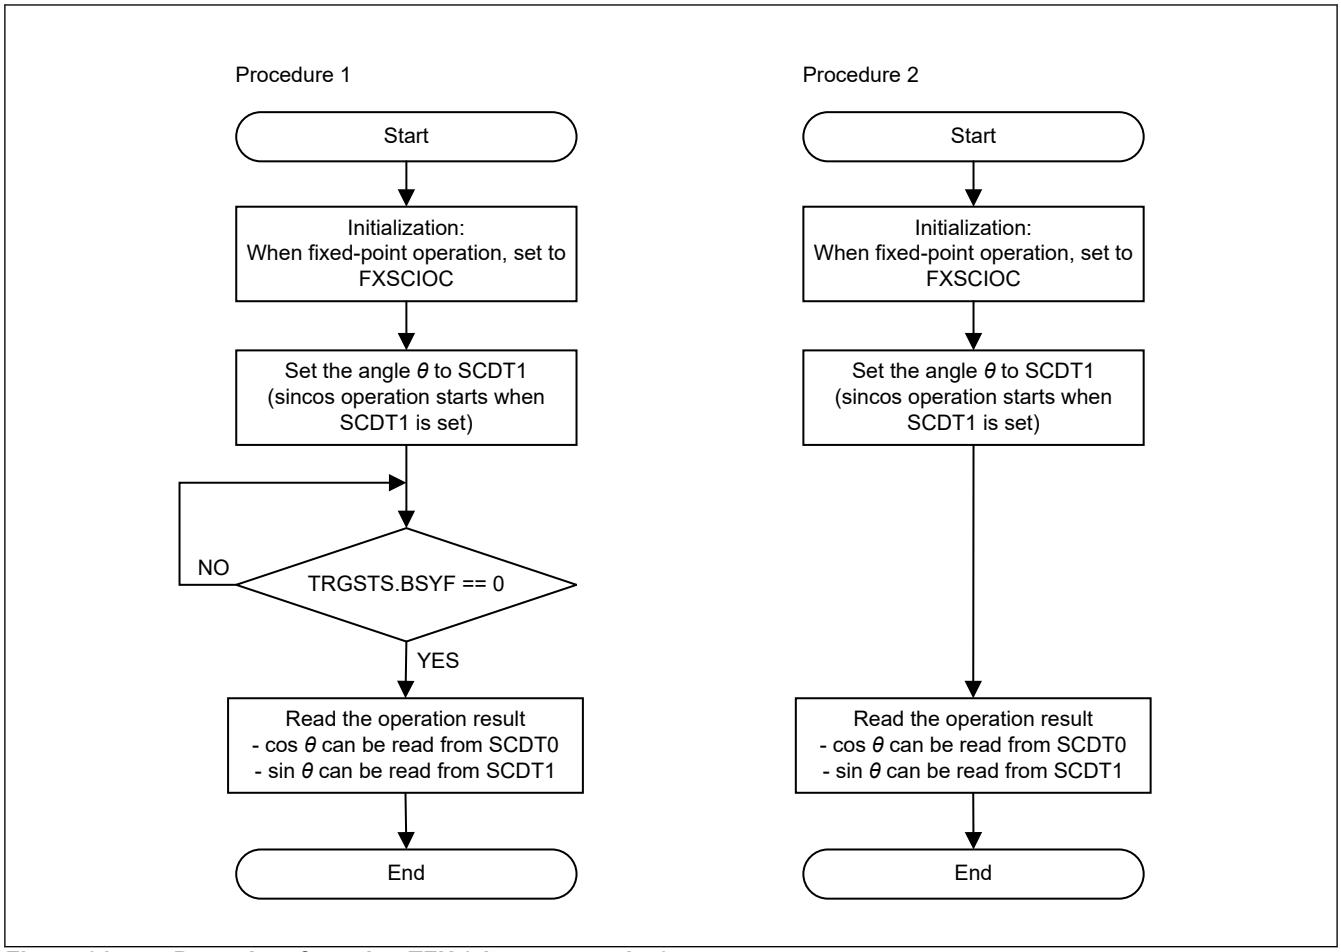

Figure 21.5 Procedure for using TFU (sincos operation)

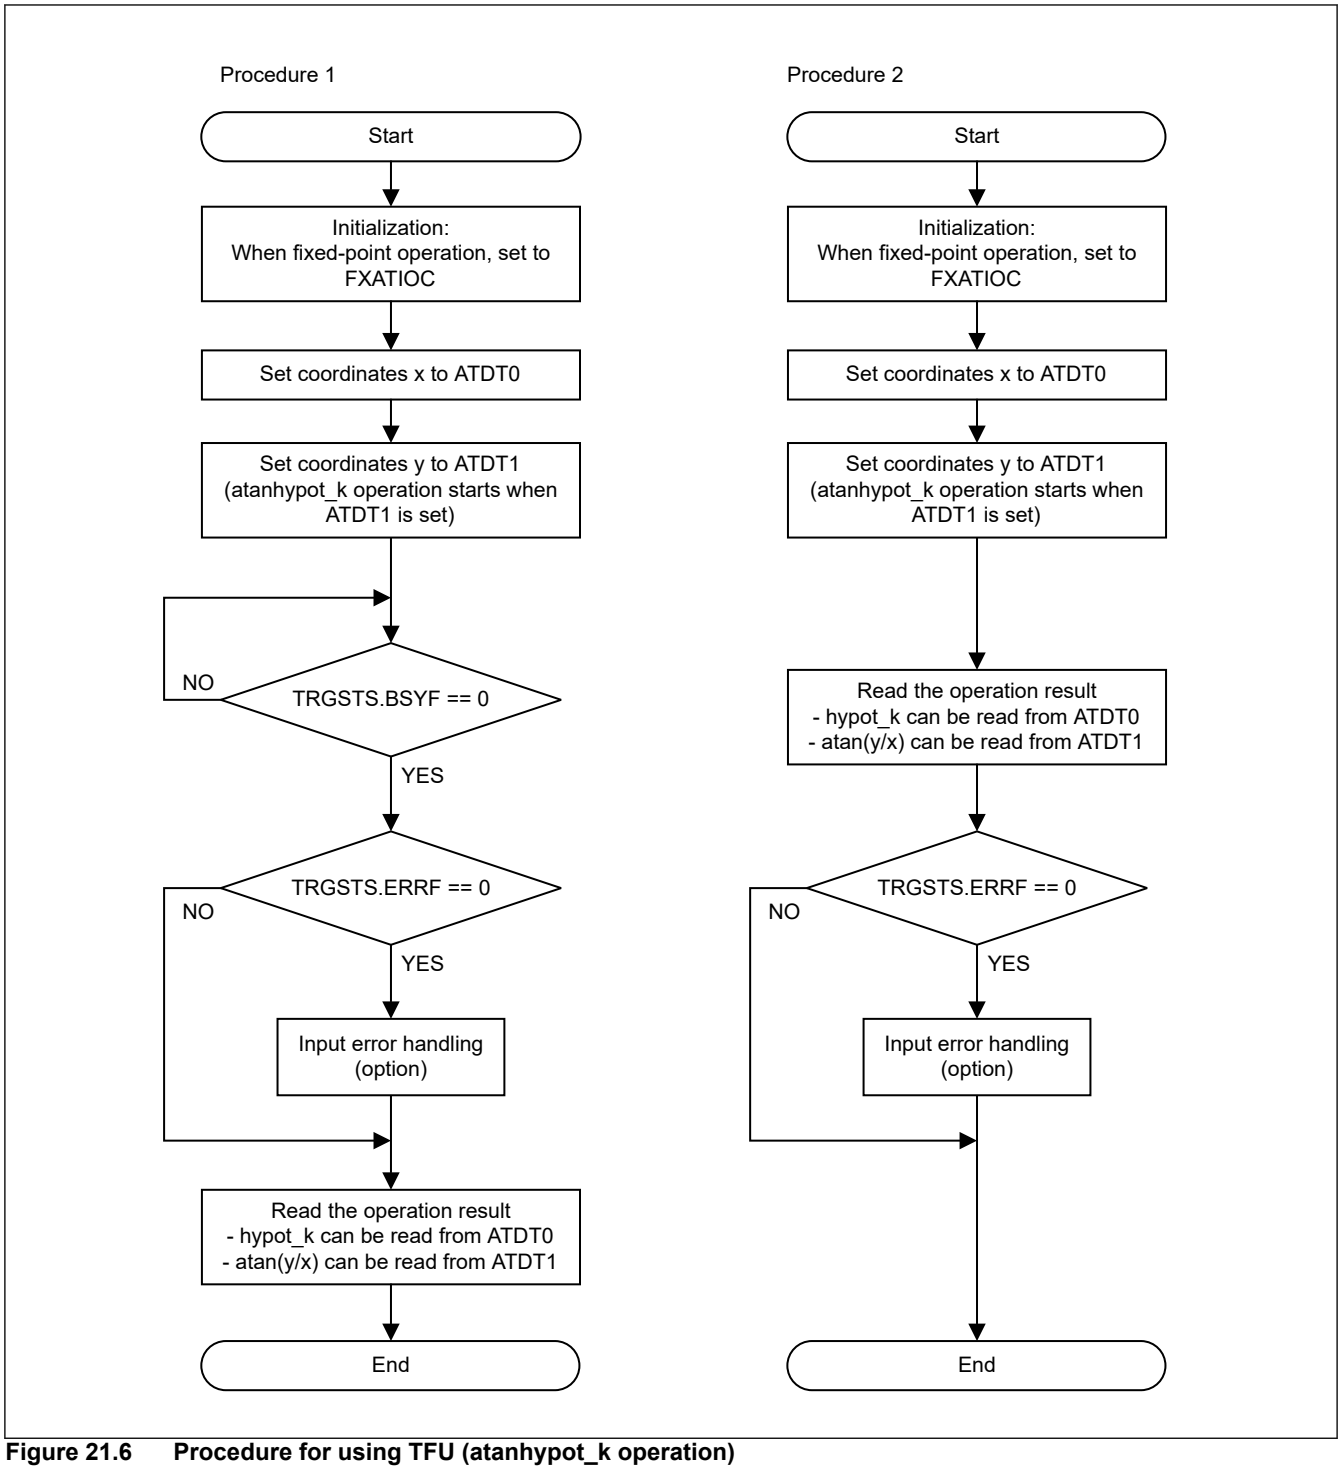

Figure 21.6 Procedure for using TFU (atanhypot_k operation)

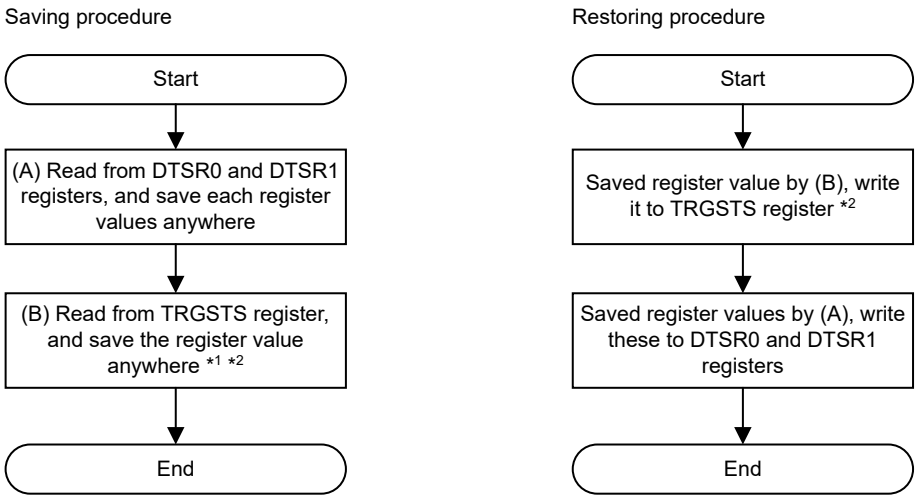
21.3.8 Usage of Interrupt



In the middle of procedure for trigonometric function operation, when an interrupt occurs between a data register write and an error flag/data register read and trigonometric function operation is executed in the interrupt handler, malfunction occurs after returning from the interrupt handler.

Therefore, the following measures are required so that malfunction does not occur when multiple interrupts are used, and multiple interrupt handlers use TFU module.

1. Disable interrupts on the process from a data register write to an error flag and data register read
2. Save and restore an error flag and data registers in an interrupt handler

The latter measure is described as below.

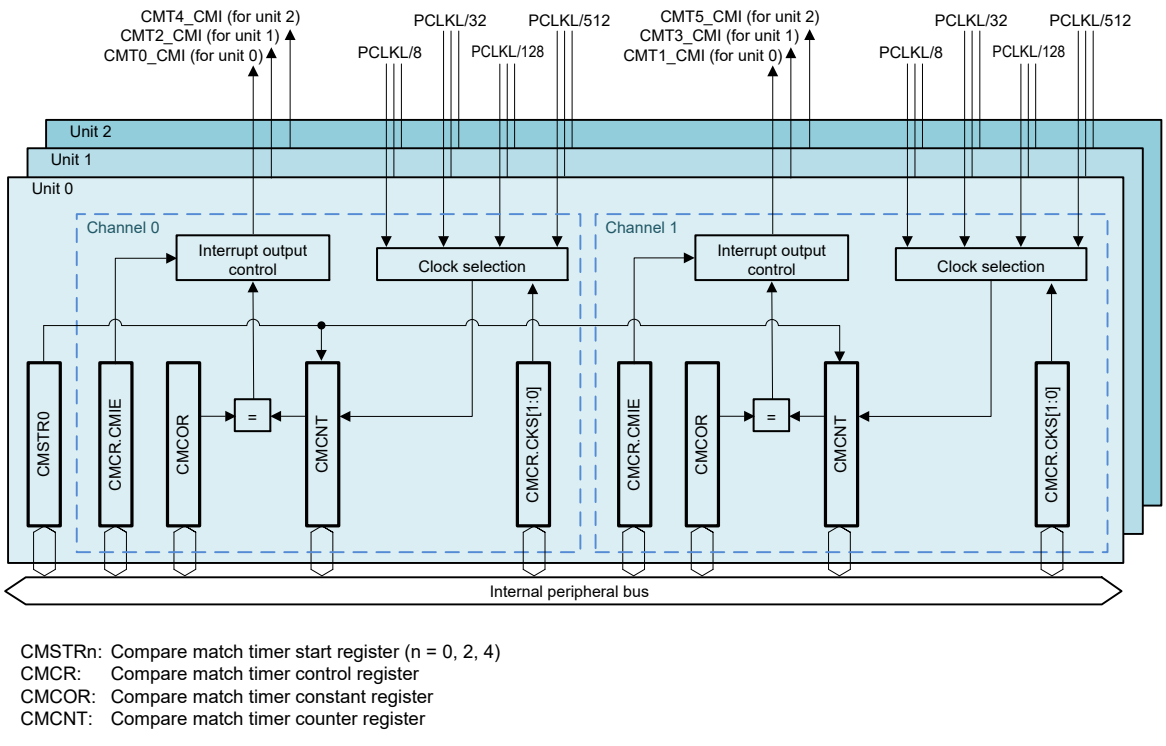
Regardless of a kind of an operation in the interrupt handler and an operation being performed before the interrupt is received, data registers and error flag should be saved/restored by using DTSR0, DTSR1, and TRGSTS registers. Figure 21.7 shows the data save/restore procedure. By following this procedure, the operation before the interrupt is received can be continued without malfunction after returning from the interrupt handler.

Note 1. (B) has to be executed after (A).
Note 2. Can be omitted if the error flag is not used in any arithmetic process.

Figure 21.7 Data save/restore procedure in exception handler

When a setting will be changed in the interrupt handler and an arithmetic processing will be performed, in addition to the data registers and error flag, setting registers such as FXSCIOC and FXATIOC need to be saved and restored as well. Save and restore the setting registers as necessary. When saving the setting registers, be sure to do so after saving (A).

22. Compare Match Timer (CMT)



22.1 Overview

The LSI has three on-chip compare match timer (CMT) units, each consisting of a 2-channel 16-bit timer, for a total of six channels. The CMT has a 16-bit counter and can generate interrupts at set intervals.

Table 22.1 lists the specifications for the CMT and Figure 22.1 shows a block diagram of the CMT.

Table 22.1 CMT specifications

Item	Description
Number of internal channels	6 channels (2 channels × 3 units)
Timer counter (per channel)	16-bit up counter (counted according to the count enable signal output by the prescaler.) Returned to 0x0000 after compare match.
Prescaler (per channel)	9-bit counter (linked with enabling/disabling of timer counter operation.) ● Outputs four types of count clocks. The type can be selected from PCLKL/8, PCLKL/32, PCLKL/128, and PCLKL/512.
Interrupt	A compare match interrupt can be requested for each channel.
Module-stop function	Module-stop state can be set to reduce power consumption

CMSTRn: Compare match timer start register (n = 0, 2, 4)
CMCR: Compare match timer control register
CMCOR: Compare match timer constant register
CMCNT: Compare match timer counter register

Figure 22.1 CMT block diagram

22.2 Register Descriptions

22.2.1 CMSTRn : Compare Match Timer Start Register (n = 0, 2, 4)

Base address: CMTC = 0x8004_0000

Offset address: 0x000 + 0x200 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STR1	STR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	STR0	CMT Channel n Count Start This bit selects starting or stopping of the CMTn.CMCNT counter operation. The corresponding prescaler starts or stops according to the setting of this bit. 0: The CMTn.CMCNT counter is stopped. 1: The CMTn.CMCNT counter is started.	R/W
1	STR1	CMT Channel n+1 Count Start This bit selects starting or stopping of the CMTn+1.CMCNT counter operation. The corresponding prescaler starts or stops according to the setting of this bit. 0: The CMTn+1.CMCNT counter is stopped. 1: The CMTn+1.CMCNT counter is started.	R/W
15:2	—	These bits are read as 0. The write value should be 0.	R/W

The CMSTR0 register sets starting or stopping of the CMT0.CMCNT and CMT1.CMCNT counters of unit 0.

The CMSTR2 register sets starting or stopping of the CMT2.CMCNT and CMT3.CMCNT counters of unit 1.

The CMSTR4 register sets starting or stopping of the CMT4.CMCNT and CMT5.CMCNT counters of unit 2.

22.2.2 CMCR : Compare Match Timer Control Register

Base address: CMT0 = 0x8004_0002, CMT2 = 0x8004_0402, CMT4 = 0x8004_0802
CMT1 = 0x8004_0008, CMT3 = 0x8004_0408, CMT5 = 0x8004_0808

Offset address: 0x000

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	CMIE	—	—	—	—	CKS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	x	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	CKS[1:0]	Clock Select 0 0: PCLKL/8 0 1: PCLKL/32 1 0: PCLKL/128 1 1: PCLKL/512	R/W
5:2	—	These bits are read as 0. The write value should be 0.	R/W
6	CMIE	Compare Match Interrupt Enable 0: Compare match interrupt (CMTn_CMI) disabled 1: Compare match interrupt (CMTn_CMI) enabled	R/W
7	—	The read value is undefined. The write value should be 0.	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W

The CMCR register specifies a clock used for count-up operation.

CKS[1:0] bits (Clock Select)

These bits select a clock to be input to the CMTn.CMCNT counter from the internal clocks obtained by dividing the frequency of the low-speed peripheral module clock (PCLKL) (n = 0 to 5). Setting the CMSTRm.STRn bit to 1 starts count-up operation of the corresponding CMCNT counter by using the clock selected in the CKS[1:0] bits (m = 0, 2, 4; n = 0, 1).

CMIE bit (Compare Match Interrupt Enable)

This bit selects whether to enable or disable generation of a compare match interrupt (CMTn_CMI) when the values in the CMCNT counter and in the CMCOR register match (n = 0 to 5).

22.2.3 CMCNT : Compare Match Timer Counter Register

Base address: CMT0 = 0x8004_0002, CMT2 = 0x8004_0402, CMT4 = 0x8004_0802
CMT1 = 0x8004_0008, CMT3 = 0x8004_0408, CMT5 = 0x8004_0808

Offset address: 0x002

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The CMCNT counter (the main unit of the compare match timer) is a readable/writable up-counter. When an internal clock is selected by the CMCR.CKS[1:0] bits and the CMSTRm.STRn (m = 0, 2, 4; n = 0, 1) bit is set to 1, the CMCNT counter starts counting up using the selected clock.

When the value in the CMCNT counter and the value in the CMCOR register match, the CMCNT counter is cleared to 0x0000. At the same time, a compare match interrupt (CMTn_CMI) is generated (n = 0 to 5).

22.2.4 CMCOR : Compare Match Timer Constant Register

Base address: CMT0 = 0x8004_0002, CMT2 = 0x8004_0402, CMT4 = 0x8004_0802
CMT1 = 0x8004_0008, CMT3 = 0x8004_0408, CMT5 = 0x8004_0808

Offset address: 0x004

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The CMCOR register is a readable/writable register to set a cycle for compare match with the CMCNT counter. The cycle for compare matches is as follows:

Compare-match cycle = (setting of the CMCOR register + 1) × counter-clock cycle[*1]

Note 1. This is a clock cycle set by the CMCR.CKS[1:0] bits.

22.3 Operation

22.3.1 Periodic Count Operation

When an internal clock is selected by the CMCR.CKS[1:0] bits and the CMSTRm.STRn (m = 0, 2, 4; n = 0, 1) bit is set to 1, the CMCNT counter starts counting up using the selected clock.

When the value in the CMCNT counter and the value in the CMCOR register match, the CMCNT counter is cleared to 0x0000, and then a compare match interrupt (CMTn_CMI) is generated (n = 0 to 5). The CMCNT counter then starts counting up again from 0x0000. Figure 22.2 shows the operation of the CMCNT counter.

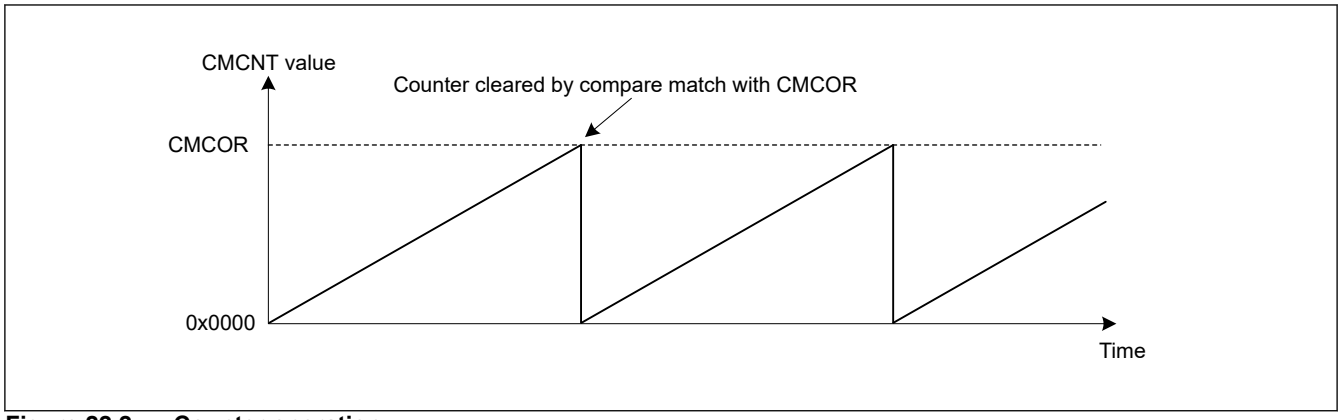


Figure 22.2 Counter operation

22.3.2 CMCNT Count Timing

As the count clock, one of four internal clocks (PCLKL/8, PCLKL/32, PCLKL/128, and PCLKL/512) obtained by dividing the low-speed peripheral module clock (PCLKL) can be selected with the CMCR.CKS[1:0] bits. Figure 22.3 shows the timing of the CMCNT counter.

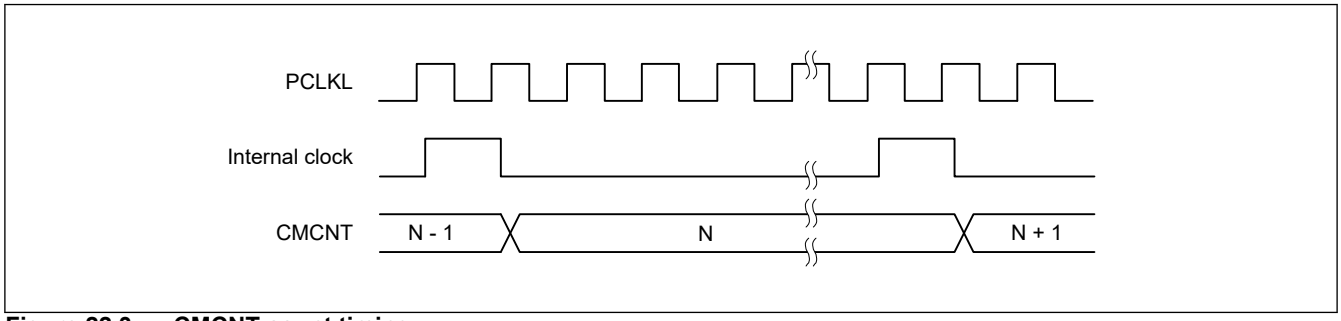

Figure 22.3 CMCNT count timing

22.4 Interrupts

22.4.1 Interrupt Sources

For each CMT channel, a compare-match interrupt (CMTn_CMI) is allocated and has a different event number. The priority of channels can be changed by the interrupt controller settings.

Table 22.2 CMT interrupt sources

Name	Interrupt Sources	CPU0 GIC request	DMAC activation
CMT0_CMI	Compare match between the CMT0.CMCNT counter and CMT0.CMCOR register	Possible	Possible
CMT1_CMI	Compare match between the CMT1.CMCNT counter and CMT1.CMCOR register	Possible	Possible
CMT2_CMI	Compare match between the CMT2.CMCNT counter and CMT2.CMCOR register	Possible	Possible
CMT3_CMI	Compare match between the CMT3.CMCNT counter and CMT3.CMCOR register	Possible	Possible
CMT4_CMI	Compare match between the CMT4.CMCNT counter and CMT4.CMCOR register	Possible	Possible
CMT5_CMI	Compare match between the CMT5.CMCNT counter and CMT5.CMCOR register	Possible	Possible

22.4.2 Timing of Compare Match Interrupt Generation

When the CMCNT counter and the CMCOR register match, a compare match interrupt (CMTn_CMI) is generated.

A compare match signal is generated at the last state in which the values match (the timing when the CMCNT counter updates the matched count value). That is, after a match between the CMCOR register and the CMCNT counter, the compare match signal is not generated until the CMCNT counter input clock is generated (n = 0 to 5).

Figure 22.4 shows the timing of a compare match interrupt.

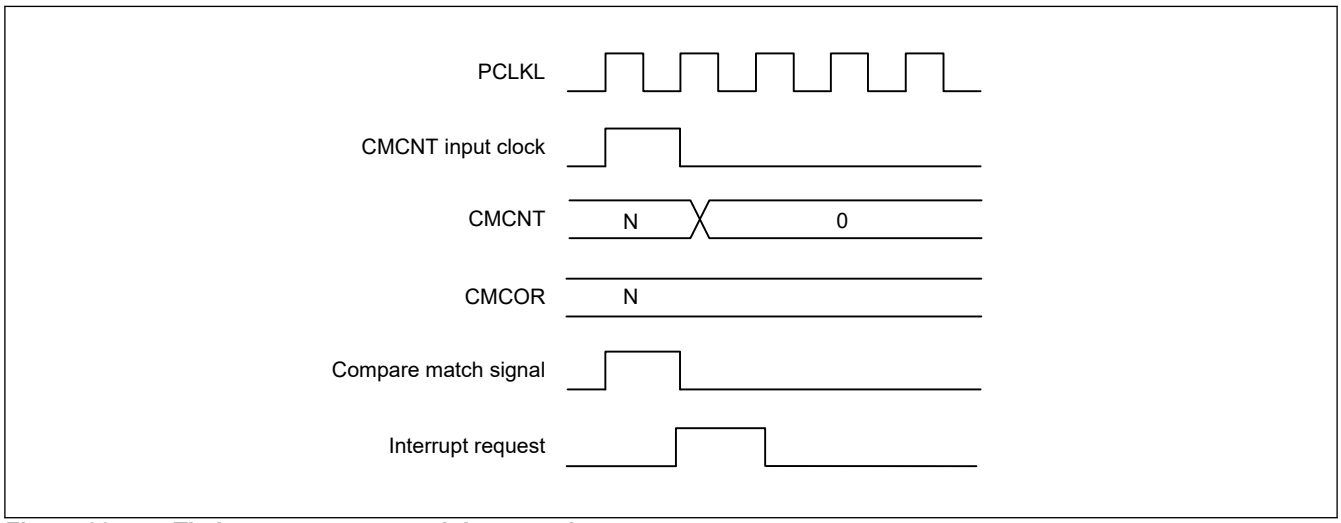

Figure 22.4 Timing a compare match interrupt is set

22.5 Usage Notes

22.5.1 Setting the Module Stop Function

The CMT can be enabled or disabled using the Module Stop Control register. After a reset, the CMT is in the module-stop state. The registers can be accessed by canceling the module-stop state. For details, see section 8, Low-Power Consumption Function.

22.5.2 Conflict between Write and Compare-Match Processes of CMCNT

When the compare match signal is generated while writing to the CMCNT counter, clearing the CMCNT counter is given priority over the writing to it. In this case, the CMCNT counter is not written to. Figure 22.5 shows the timing to clear the CMCNT counter.

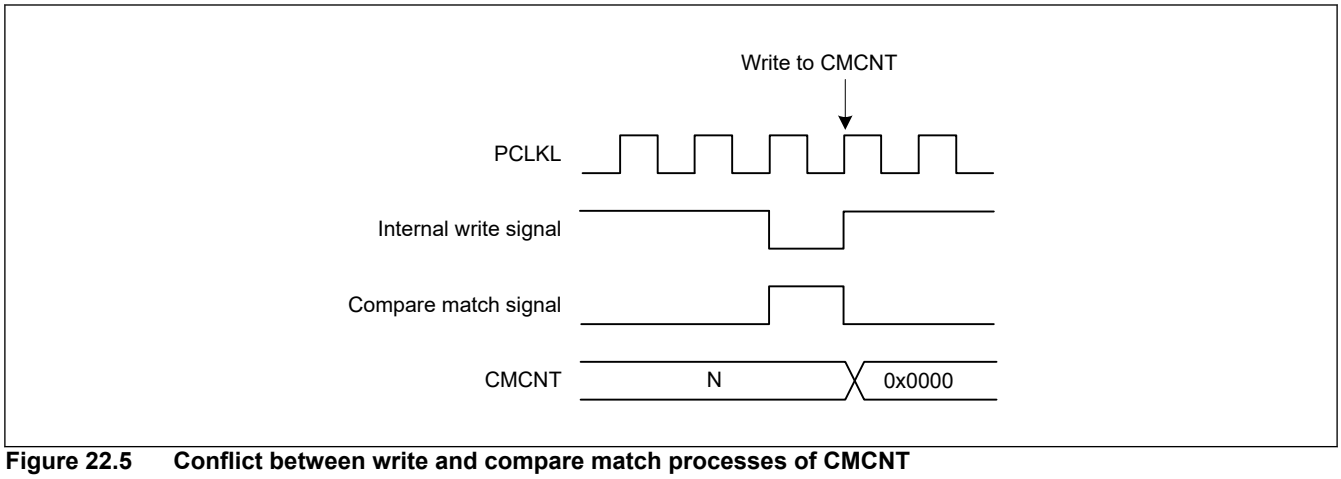

Figure 22.5 Conflict between write and compare match processes of CMCNT

22.5.3 Conflict between Write and Count-Up Processes of CMCNT

If count-up occurs during the write access to the CMCNT counter, that writing has priority over the count-up. Figure 22.6 shows the timing to write the CMCNT counter.

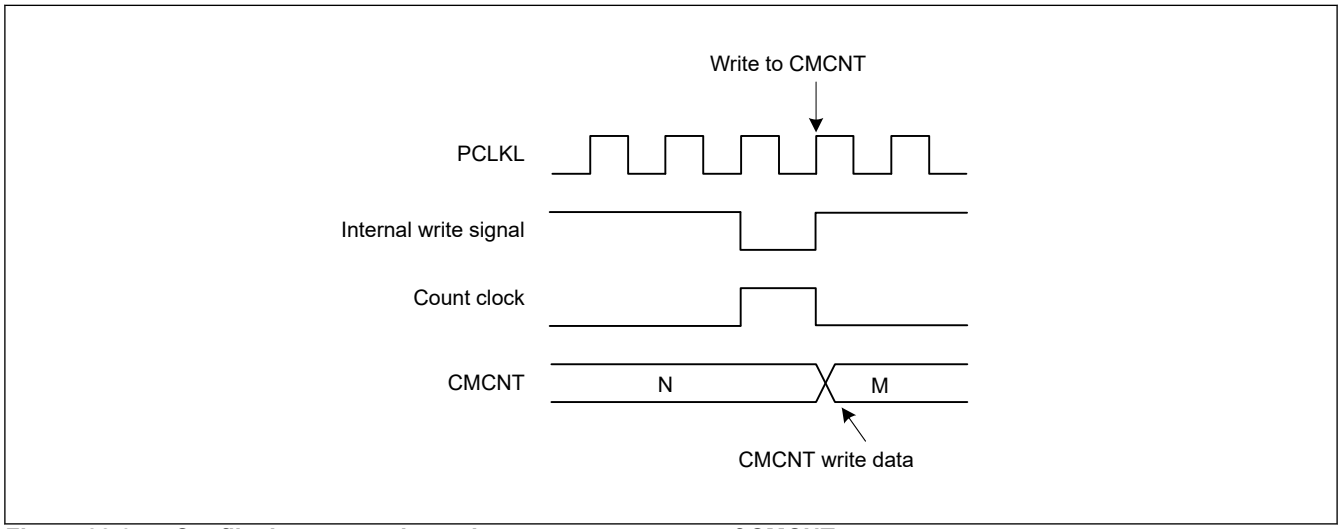

Figure 22.6 Conflict between write and count-up processes of CMCNT

23. Compare Match Timer W (CMTW)

23.1 Overview

The LSI has two channels (1 channel × 2 units) of 32-bit compare match timer W (CMTW). CMTW has a 32-bit counter and can generate interrupts each time a set period elapses.

Table 23.1 shows the specifications of the CMTW and Figure 23.1 shows a block diagram of the CMTW.

Table 23.1 CMTW specifications

Item	Description
Number of channel	Two channels (1 channel × 2 units)
Timer counter	16-bit/32-bit selectable up-counter. The counter returns to 0x00000000 after a compare match.
Prescaler	Four dividing clocks are output. Selectable from any of PCLKL/8, PCLKL/32, PCLKL/128, or PCLKL/512.
Input capture	Up to two input capture input signals available per unit
Output compare	Up to two output compare output signals available per unit
Compare match	One compare match available (no output compare output pin used)
Interrupt	Compare match interrupt Input capture 0 and 1 interrupts per unit Output compare 0 and 1 interrupts per unit
Module-stop function	Module-stop state can be set to reduce power consumption

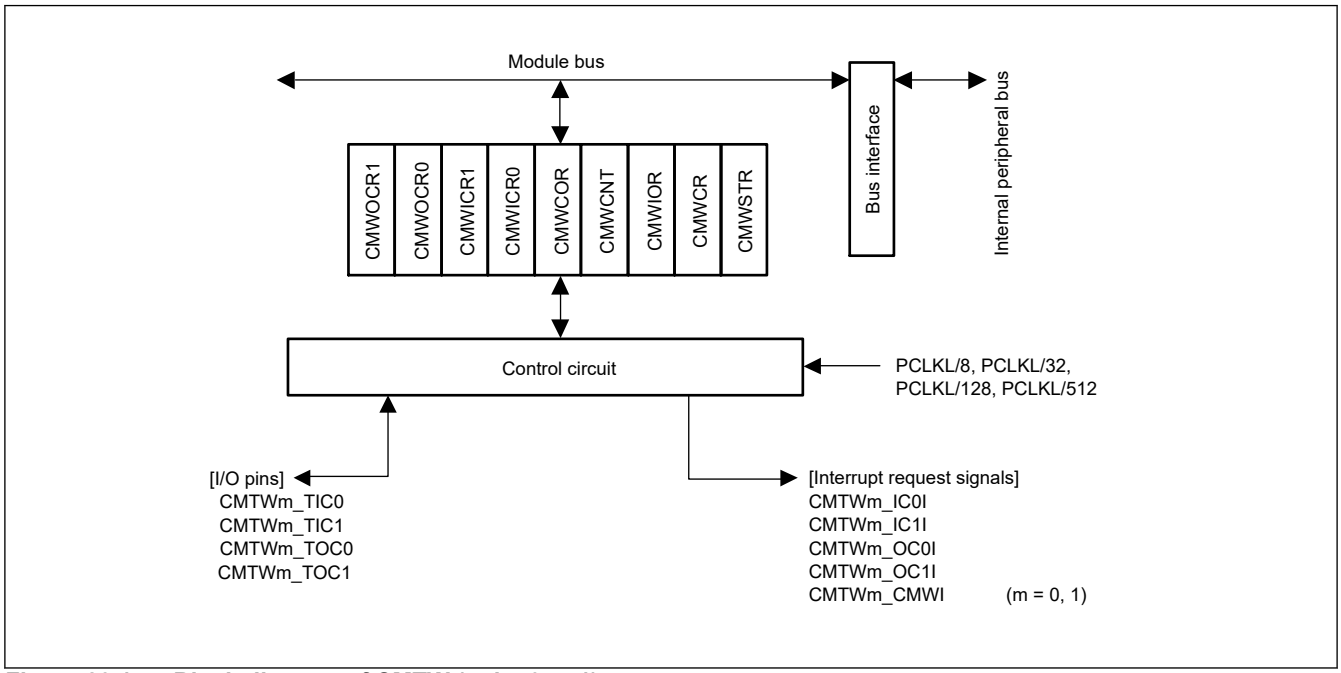

Figure 23.1 Block diagram of CMTW (units 0 to 1)

Table 23.2 shows the CMTW pin configuration.

Table 23.2 Input/Output pins of CMTW

Unit	Pin name	I/O	Description
CMTWm (m = 0, 1)	CMTWm_TIC0	Input	CMTWm input capture input 0
	CMTWm_TIC1	Input	CMTWm input capture input 1
	CMTWm_TOC0	Output	CMTWm output compare output 0
	CMTWm_TOC1	Output	CMTWm output compare output 1

Note: For convention, pin names within this chapter are written without "CMTWm_" (m = 0, 1) notation except this table and the block diagram.

23.2 Register Descriptions

23.2.1 CMWSTR : Timer Start Register

Base address: CMTWm = 0x8004_1000 + 0x0400 × m (m = 0, 1)

Offset address: 0x000

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	STR	Counter Start 0: The CMWCNT counter stops counting. The value immediately before a stop of counting is retained and counting is stopped. 1: The CMWCNT counter starts counting.	R/W
15:1	—	These bits are read as 0. The write value should be 0.	R/W

The CMWSTR register is used to start or stop the CMWCNT counter.

STR bit (Counter Start)

Specifies whether the timer counter operates or is stopped. The relevant prescaler operates or is stopped according to the settings of STR bit.

23.2.2 CMWCR : Timer Control Register

Base address: CMTWm = 0x8004_1000 + 0x0400 × m (m = 0, 1)

Offset address: 0x004

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CCLR[2:0]			—	—	—	CMS	—	OC1IE	OC0IE	IC1IE	IC0IE	CMWIE	—	CKS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	CKS[1:0]	Clock Select 0 0: PCLKL/8 0 1: PCLKL/32 1 0: PCLKL/128 1 1: PCLKL/512	R/W
2	—	This bit is read as 0. The write value should be 0.	R/W
3	CMWIE	Compare Match Interrupt Enable 0: Disables a compare match interrupt request (CMTWm_CMWI). 1: Enables a compare match interrupt request (CMTWm_CMWI).	R/W
4	IC0IE	Input Capture 0 Interrupt Enable 0: Disables an interrupt request by the input capture 0 (CMTWm_IC0I). 1: Enables an interrupt request by the input capture 0 (CMTWm_IC0I).	R/W
5	IC1IE	Input Capture 1 Interrupt Enable 0: Disables an interrupt request by the input capture 1 (CMTWm_IC1I). 1: Enables an interrupt request by the input capture 1 (CMTWm_IC1I).	R/W

Bit	Symbol	Function	R/W
6	OC0IE	Output Compare 0 Interrupt Enable 0: Disables an interrupt request by the output compare 0 (CMTWm_OC0I). 1: Enables an interrupt request by the output compare 0 (CMTWm_OC0I).	R/W
7	OC1IE	Output Compare 1 Interrupt Enable 0: Disables an interrupt request by the output compare 1 (CMTWm_OC1I). 1: Enables an interrupt request by the output compare 1 (CMTWm_OC1I).	R/W
8	—	This bit is read as 0. The write value should be 0.	R/W
9	CMS	Timer Counter Size 0: 32 bits 1: 16 bits	R/W
12:10	—	These bits are read as 0. The write value should be 0.	R/W
15:13	CCLR[2:0]	Counter Clear 0 0 0: The CMWCNT counter is cleared by CMWCOR register compare match. 0 0 1: The CMWCNT counter is not cleared. 0 1 0: The CMWCNT counter is not cleared. 0 1 1: The CMWCNT counter is not cleared. 1 0 0: The CMWCNT counter is cleared by CMWICR0 register input capture. 1 0 1: The CMWCNT counter is cleared by CMWICR1 register input capture. 1 1 0: The CMWCNT counter is cleared by CMWOCR0 register compare match. 1 1 1: The CMWCNT counter is cleared by CMWOCR1 register compare match.	R/W

The CMWCR register selects the counter clearing source and the counter input clock, and enables or disables interrupts.

The CMWCR register should be set while the timer counter (CMWCNT) operation is stopped.

CKS[1:0] bits (Clock Select)

Select the clock to be input to the CMWCNT counter among four internal clocks obtained by dividing the peripheral clock (PCLKL). When the CMWSTR.STR bit is set to 1, the CMWCNT counter starts counting up based on the clock selected with the CMWCR.CKS[1:0] bits.

CMWIE bit (Compare Match Interrupt Enable)

Enables or disables compare match interrupt (CMTWm_CMWI) request generation when the CMWCNT counter and CMWCOR register values match.

IC0IE bit (Input Capture 0 Interrupt Enable)

Enables or disables input capture interrupt 0 (CMWm_IC0I) request generation when input capture is generated in the CMWICR0 register.

IC1IE bit (Input Capture 1 Interrupt Enable)

Enables or disables input capture interrupt 1 (CMWm_IC1I) request generation when input capture is generated in the CMWICR1 register.

OC0IE bit (Output Compare 0 Interrupt Enable)

Enables or disables compare match interrupt 0 (CMWm_OC0I) request generation when the CMWCNT counter and CMWOCR0 register values match.

OC1IE bit (Output Compare 1 Interrupt Enable)

Enables or disables compare match interrupt 1 (CMWm_OC1I) request generation when the CMWCNT counter and CMWOCR1 register values match.

CMS bit (Timer Counter Size)

Selects either 16 or 32 bits as the size of the timer counter (CMWCNT). The size selected with the CMS bit is valid in the compare match constant register (CMWCOR), input capture registers (CMWICR0 and CMWICR1), and output compare registers (CMWOCR0 and CMWOCR1).

CCLR[2:0] bits (Counter Clear)

Selects the CMWCNT counter clearing source.

23.2.3 CMWIOR : Timer I/O Control Register

Base address: CMTWm = 0x8004_1000 + 0x0400 × m (m = 0, 1)

Offset address: 0x008

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CMWE	—	OC1E	OC0E	OC1[1:0]		OC0[1:0]		—	—	IC1E	IC0E	IC1[1:0]		IC0[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	IC0[1:0]	Input Capture Control 0 0 0: Input capture at the rising edge on the TIC0 pin. 0 1: Input capture at the falling edge on the TIC0 pin. 1 0: Input capture at both edges on the TIC0 pin. 1 1: Setting prohibited	R/W
3:2	IC1[1:0]	Input Capture Control 1 0 0: Input capture at the rising edge on the TIC1 pin. 0 1: Input capture at the falling edge on the TIC1 pin. 1 0: Input capture at both edges on the TIC1 pin. 1 1: Setting prohibited	R/W
4	IC0E	Input Capture Enable 0 0: Disables the input capture operation of the CMWICR0 register. 1: Enables the input capture operation of the CMWICR0 register.	R/W
5	IC1E	Input Capture Enable 1 0: Disables the input capture operation of the CMWICR1 register. 1: Enables the input capture operation of the CMWICR1 register.	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
9:8	OC0[1:0]	Output Compare Control 0 0 0: Retains the output value.*1 0 1: Initially outputs 0 and toggles the output value upon compare match. 1 0: Initially outputs 1 and toggles the output value upon compare match. 1 1: Setting prohibited	R/W
11:10	OC1[1:0]	Output Compare Control 1 0 0: Retains the output value.*1 0 1: Initially outputs 0 and toggles the output value upon compare match. 1 0: Initially outputs 1 and toggles the output value upon compare match. 1 1: Setting prohibited	R/W
12	OC0E	Compare Match Enable 0 0: Disables the compare match operation using the CMWOCR0 register. 1: Enables the compare match operation using the CMWOCR0 register.	R/W
13	OC1E	Compare Match Enable 1 0: Disables the compare match operation using the CMWOCR1 register. 1: Enables the compare match operation using the CMWOCR1 register.	R/W
14	—	This bit is read as 0. The write value should be 0.	R/W
15	CMWE	Compare Match Enable 0: Disables the compare match operation using the CMWCOR register. 1: Enables the compare match operation using the CMWCOR register.	R/W

Note 1. After reset, 0 is output until the CMWIOR register is set.

The CMWIOR register controls the CMWCOR, CMWICR0, CMWICR1, CMWOCR0, and CMWOCR1 registers.

CMWIOR should be set while the timer counter (CMWCNT) operation is stopped.

IC0[1:0] bits (Input Capture Control 0)

Selects the input capture operation of the CMWICR0 register.

IC1[1:0] bits (Input Capture Control 1)

Selects the input capture operation of the CMWICR1 register.

IC0E bit (Input Capture Enable 0)

Enables or disables the input capture operation of the CMWICR0 register.

IC1E bit (Input Capture Enable 1)

Enables or disables the input capture operation of the CMWICR1 register.

OC0[1:0] bits (Output Compare Control 0)

Sets the output compare operation using the CMWOCR0 register.

OC1[1:0] bits (Output Compare Control 1)

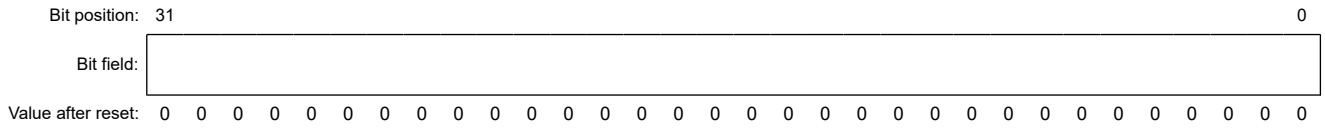
Sets the output compare operation using the CMWOCR1 register.

OC0E bit (Compare Match Enable 0)

Enables or disables the compare match operation using the CMWOCR0 register.

OC1E bit (Compare Match Enable 1)

Enables or disables the compare match operation using the CMWOCR1 register.



CMWE bit (Compare Match Enable)

Enables or disables the compare match operation using the CMWCOR register.

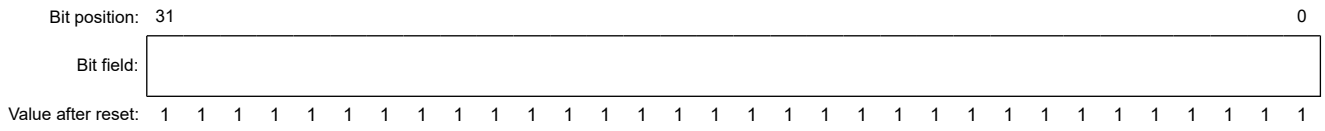
23.2.4 CMWCNT : Timer Counter

Base address: CMTWm = 0x8004_1000 + 0x0400 × m (m = 0, 1)

Offset address: 0x010

Bit	Symbol	Function	R/W
31:0	n/a	Timer Counter	R/W

The CMWCNT counter is used as a readable/writable up-counter.



Before starting counter operation, the timer control register (CMWCR) should be set. When the 16-bit counter size is selected with the CMS bit in the timer control register (CMWCR), bits 15 to 0 in the CMWCNT counter are valid. Since access to this register is in 32-bit units, when writing, write 32-bit values to it with 0x0000 in the higher-order bits. If a value other than 0x0000 is set in the higher-order bits, a value greater than 0x0000FFFF may be read when this register is read.

When the STR bit is set to 1, the CMWCNT counter starts counting. When the STR bit is set to 0, the CMWCNT counter retains the value immediately before a stop of counting and stops counting.

23.2.5 CMWCOR : Compare Match Constant Register

Base address: CMTWm = 0x8004_1000 + 0x0400 × m (m = 0, 1)

Offset address: 0x014

Bit	Symbol	Function	R/W
31:0	n/a	The CMWCOR register is a readable/writable register that specifies the time up to a compare match between the timer counter (CMWCNT) value and CMWCOR value. When the 16-bit counter size is selected with the CMS bit in the timer control register (CMWCR), bit 15 to bit 0 in this register are valid. Since access to this register is in 32-bit units, when writing, write 32-bit values to it with 0x0000 in the higher-order bits.	R/W

The cycle for compare matches is as follows:

Compare-match cycle = (setting of the CMWCOR register + 1) × counter-clock cycle[*1]

Note 1. This is a clock cycle set by the CMWCR.CKS[1:0] bits.

23.2.6 CMWICRn : Input Capture Registers (n = 0, 1)

Base address: CMTWm = 0x8004_1000 + 0x0400 × m (m = 0, 1)

Offset address: 0x018 + 0x004 × n

Bit position:	31																												0
Bit field:																													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	The CMWICR0 and CMWICR1 registers are read-only registers in which the CMWCNT counter value is stored when an input capture is generated. When the 16-bit counter size is selected with the CMS bit in the timer control register (CMWCR), bits 15 to 0 in these registers are valid. Writing to these registers is invalid.	R

23.2.7 CMWOCRn : Output Compare Registers (n = 0, 1)

Base address: CMTWm = 0x8004_1000 + 0x0400 × m (m = 0, 1)

Offset address: 0x020 + 0x004 × (n - 1)

Bit position:	31																												0
Bit field:																													
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	The CMWOCR0 and CMWOCR1 registers are readable/writable registers that set the value to be compared when an output compare is generated. When the 16-bit counter size is selected with the CMS bit in the timer control register (CMWCR), bits 15 to 0 of these registers become valid. Since access to this register is in 32-bit units, when writing, write 32-bit values to it with 0x0000 in the higher-order bits.	R/W

23.3 Operation

When the CMWCR register is set and then the STR bit in CMWCR is set to 1, the CMTW starts counter operation.

Setting the CMWSTR.STR bit to 0 enables the CMWCNT counter to retain the value immediately before a stop of counting and stop counting. Setting CMWIOR register enables using the compare match function, input capture input function, and output compare output function.

23.3.1 Period Counting Operation

When the internal clock is selected by using the CMWCNT.CKS[1:0] bits and the CMWSTR.STR bit is set to 1, the CMWCNT counter starts counting up cycles of the selected clock. When the CCLR[2:0] bits in CMWCR are set so that CMWCNT should be cleared by a specific counter clearing source and the counter clearing source is generated, the

CMWCNT counter is cleared to 0x00000000 and continues incrementing. When the CCLR[2:0] bits are set so that CMWCNT should not be cleared by any specific counter clearing source, the CMWCNT counter is cleared to 0x00000000 only when an overflow is generated (0xFFFFFFFF → 0x00000000 (when the counter size is 32 bits) or 0x0000FFFF → 0x00000000 (when the counter size is 16 bits)) and continues incrementing.

23.3.2 Compare Match Function

When the values of the CMWCNT counter and CMWCOR register match, a compare match interrupt (CMTWm_CMWI) is generated. The CMWCNT counter operates as follows according to the setting of CMWCR.CCLR[1:0].

1. When CMWCR.CCLR[2:0] = 000b
   When the values of the CMWCNT counter and CMWCOR register match, the CMWCNT counter is cleared to 0x00000000. The CMWCNT counter then restarts counting up from 0x00000000.
2. When CMWCR.CCLR[2:0] ≠ 000b
   Even when the values of the CMWCNT counter and CMWCOR register match, the CMWCNT counter is not cleared to 0x00000000 but continues counting up until the clearing condition set in CMWCR.CCLR[1:0] is satisfied or the value of the counter reaches 0xFFFFFFFF (when the size of the counter is 32 bits) or 0x0000FFFF (when the size of the counter is 16 bits).
   The CMWCNT counter is then cleared to 0x00000000 and restarts counting up from 0x00000000.

Figure 23.2 shows an example of procedure for setting compare match operation.

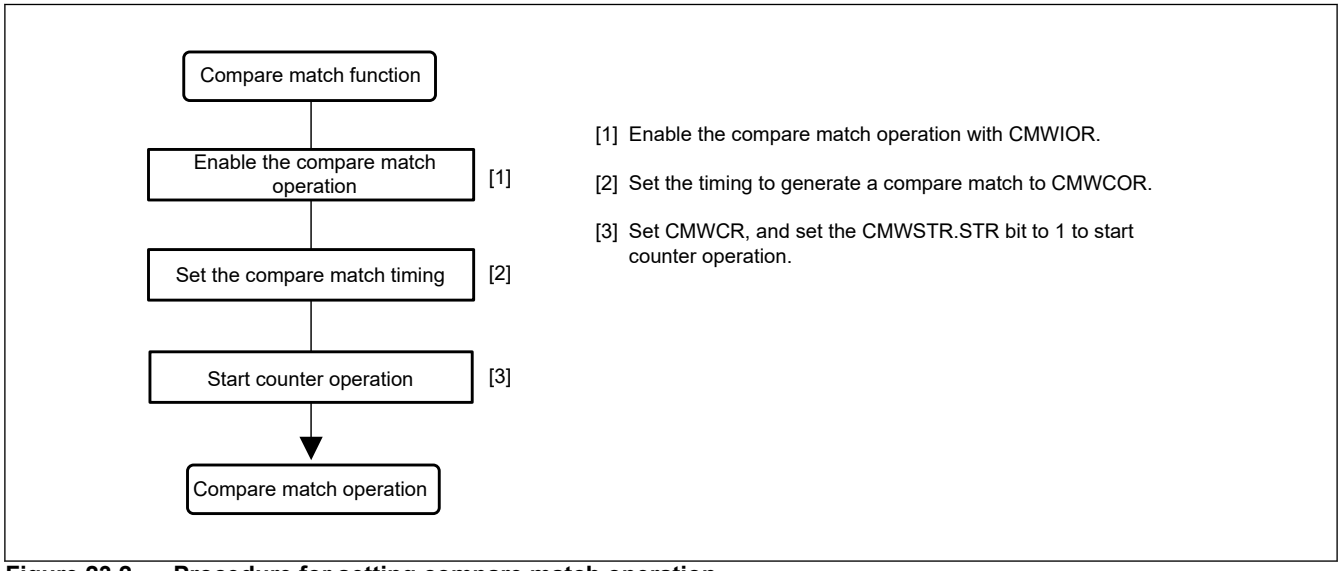


Figure 23.2 Procedure for setting compare match operation

Figure 23.3 shows an example when compare match with CMWCOR is set as a counter clearing source.

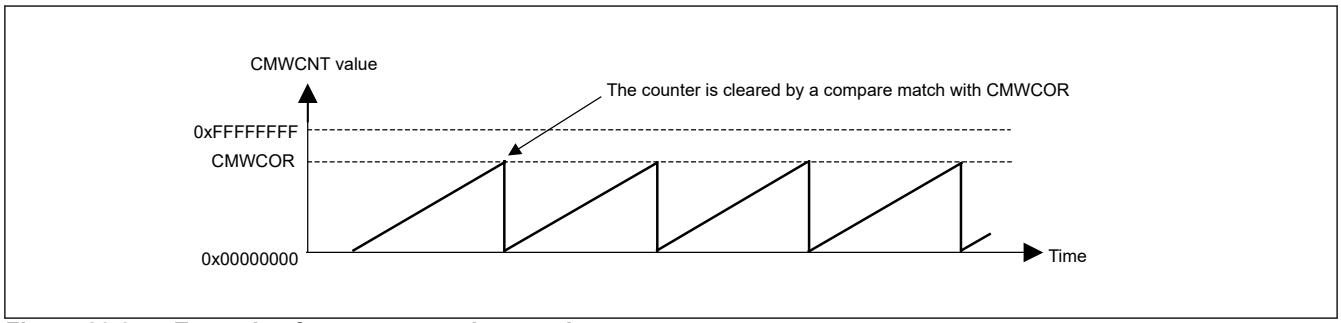

Figure 23.3 Example of compare match operation

Figure 23.4 shows an example when CMWCOR is set to 0xFFFFFFFF and detected as overflow.

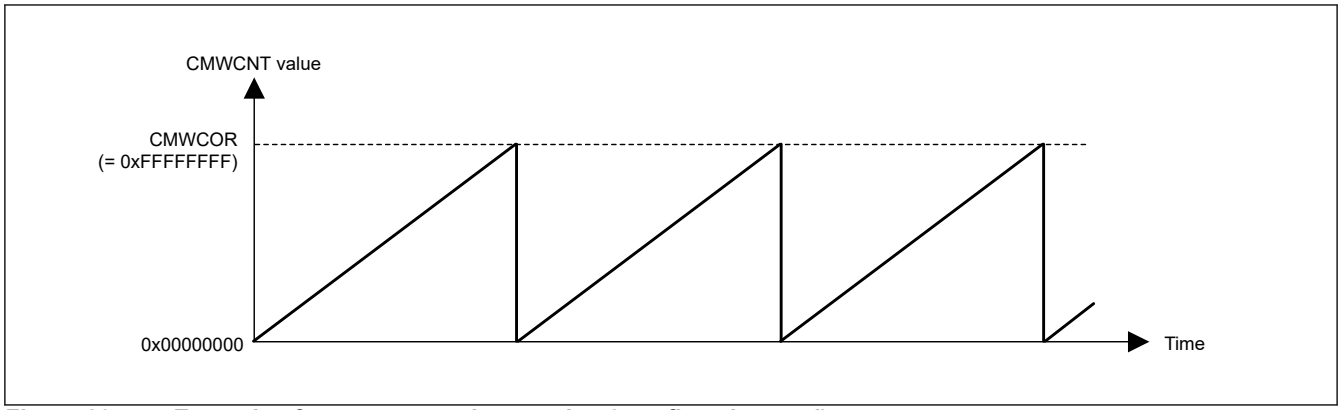

Figure 23.4 Example of compare match operation (overflow detected)

23.3.3 Output Compare Function

Using the output compare function, toggle output from the relevant output pins can be provided. When the CMWCNT counter value matches either of the values of CMWOCR0 or CMWOCR1 register, the output compare interrupt (CMTWm_OC0I or CMTWm_OC1I (m = 0, 1)) is generated. The CMWCNT counter operates as follows according to the setting of CMWCR.CCLR[2:0].

1. When CMWCR.CCLR[2:0] = 110b
   When the values of the CMWCNT counter and CMWOCR0 register match, the CMWCNT counter is cleared to 0x00000000. The CMWCNT counter then restarts counting up from 0x00000000.
2. When CMWCR.CCLR[2:0] = 111b
   When the values of the CMWCNT counter and CMWOCR1 register match, the CMWCNT counter is cleared to 0x00000000. The CMWCNT counter then restarts counting up from 0x00000000.
3. When CMWCR.CCLR[2:0] = others except 110b and 111b
   Even when the values of the CMWCNT counter and CMWOCR0 or CMWOCR1 register match, the CMWCNT counter is not cleared to 0x00000000 but continues counting up until the clearing condition set in CMWCR.CCLR[2:0] is satisfied or the value of the counter reaches 0xFFFFFFFF (when the size of the counter is 32 bits) or 0x0000FFFF (when the size of the counter is 16 bits). The CMWCNT counter is then cleared to 0x00000000 and restarts counting up from 0x00000000.

Figure 23.5 shows an example of procedure for setting output compare operation.

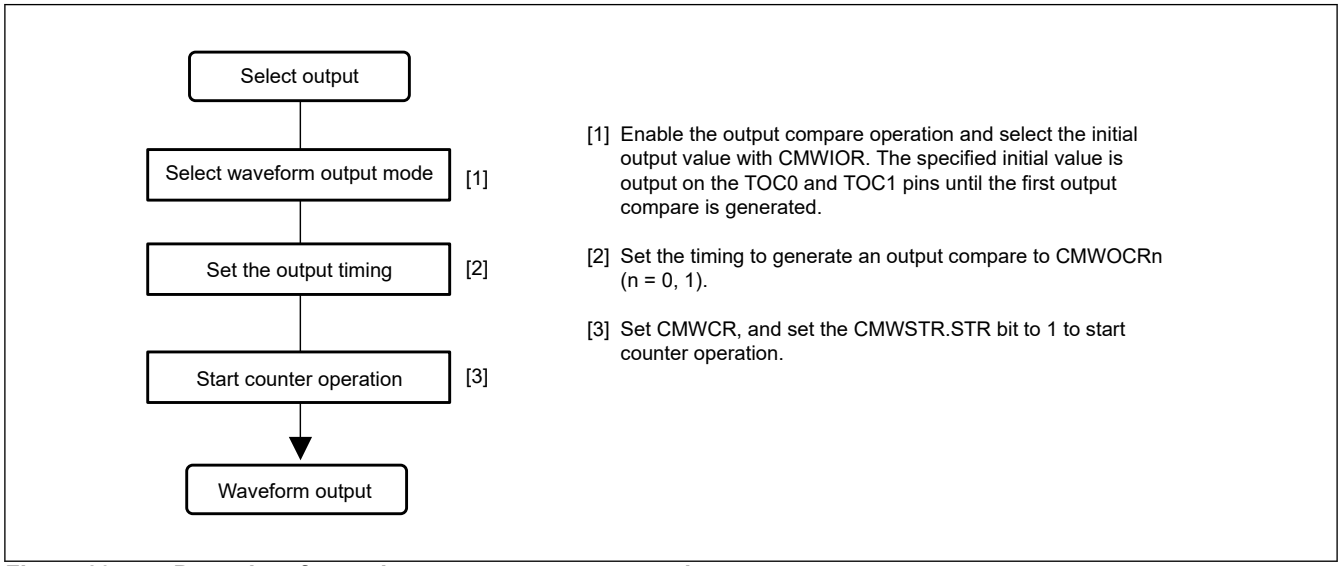

Figure 23.5 Procedure for setting output compare operation

Figure 23.6 shows an example when the counter is cleared upon compare match with CMWOCR1 register and toggle outputs are provided from the TOC0 and TOC1 pins.

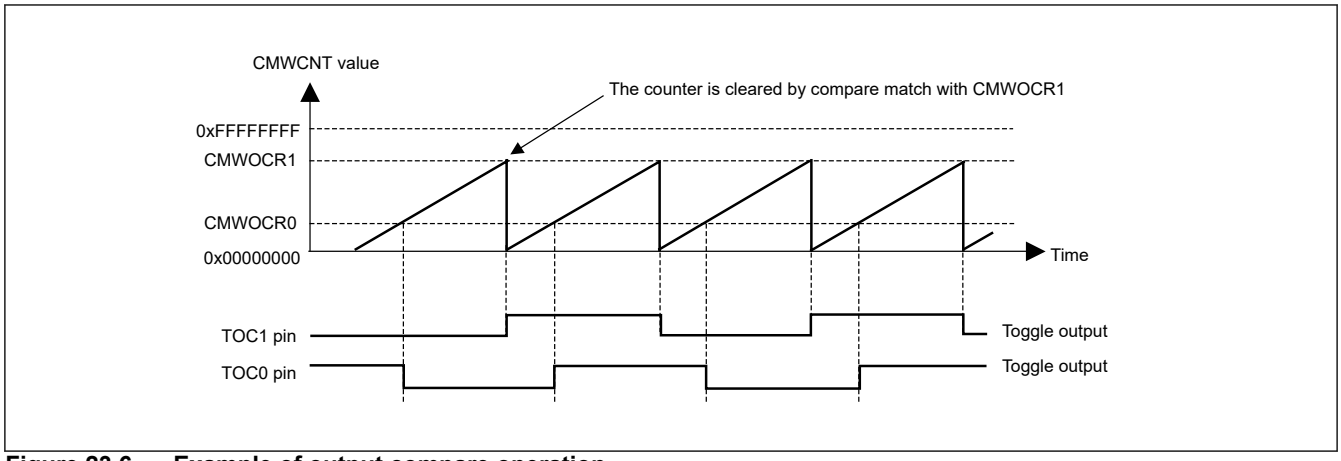

Figure 23.6 Example of output compare operation

23.3.4 Input Capture Function

Through detecting the edge on the TIC0 and TIC1 pin input, the CMWCNT counter value can be transferred to CMWICR0 and CMWICR1 registers, respectively. The edges to be detected can be selected from among the rising edge alone, falling edge alone, and both the rising and falling edges. When the CMWCNT counter value is transferred to CMWICR0 or CMWICR1 register using the input capture function, an input capture interrupt (CMTWm_IC0I or CMTWm_IC1I (m = 0, 1)) is generated. The CMWCNT counter operates as follows according to the setting of CMWCR.CCLR[2:0].

1. When CMWCR.CCLR[2:0] = 100b
   When the CMWCNT counter value is transferred to CMWICR0 using the input capture operation, the CMWCNT counter is cleared to 0x00000000.
   The CMWCNT counter then restarts counting up from 0x00000000.
2. When CMWCR.CCLR[2:0] = 101b
   When the CMWCNT counter value is transferred to CMWICR1 using the input capture operation, the CMWCNT counter is cleared to 0x00000000.
   The CMWCNT counter then restarts counting up from 0x0000000.
3. When CMWCR.CCLR[2:0] = others except 110b and 111b
   Even when the CMWCNT counter value is transferred to CMWICR0 or CMWICR1 using the input capture operation, the CMWCNT counter is not cleared to 0x00000000 but continues counting up until the clearing condition set in CMWCR.CCLR[2:0] is satisfied or the value of the counter reaches 0xFFFFFFFF (when the size of the counter is 32 bits) or 0x0000FFFF (when the size of the counter is 16 bits). The CMWCNT counter is then cleared to 0x00000000 and restarts counting up from 0x00000000.

Figure 23.7 shows an example of procedure for setting input capture operation.

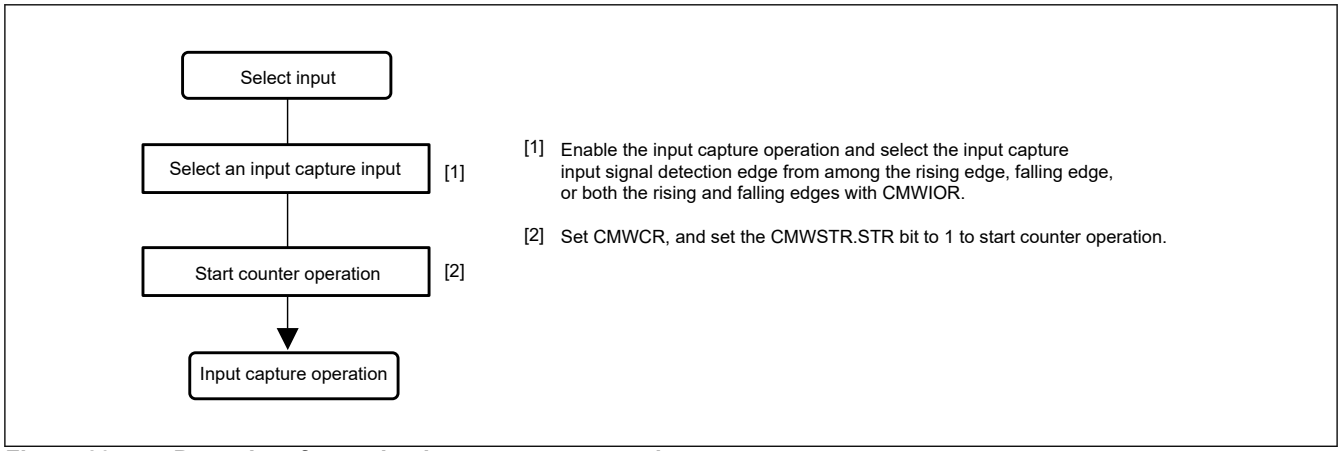

Figure 23.7 Procedure for setting input capture operation

Figure 23.8 shows an example in which both the rising and falling edges are selected for the TIC0 pin input capture input edge and the falling edge for the TIC1 pin, and the CMWCNT counter is cleared by a CMWICR1 register input capture.

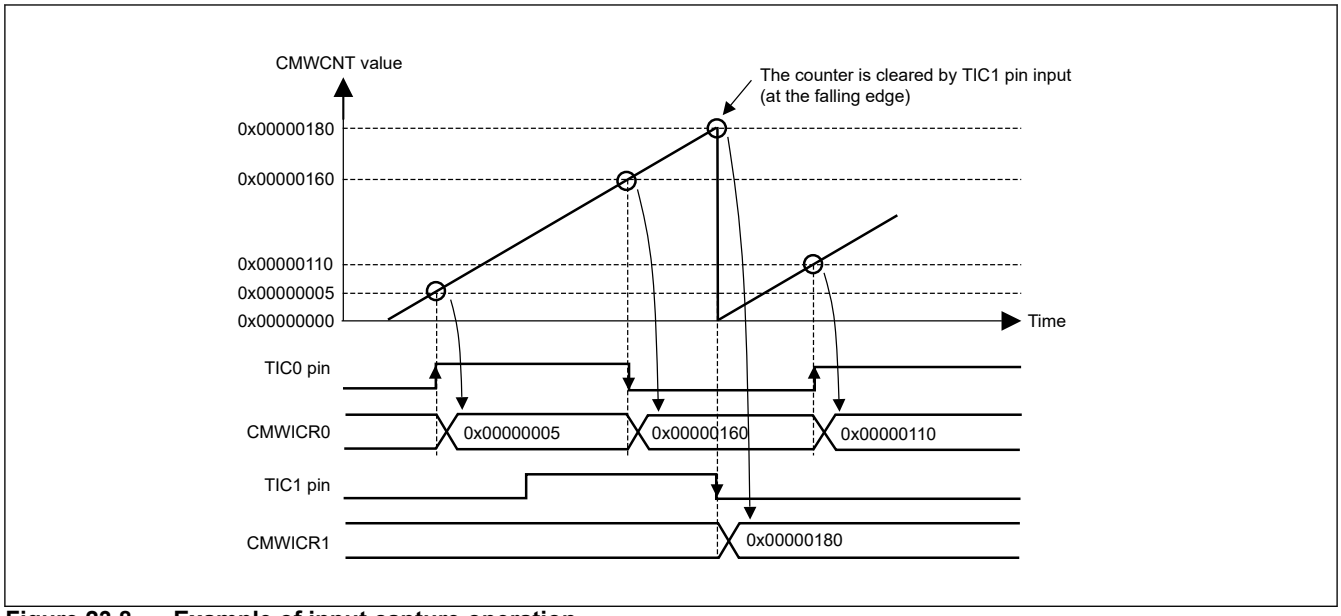

Figure 23.8 Example of input capture operation

23.3.5 Counter Size

With the CMTW, either 16 or 32 bits can be selected as the counter size by using the CMWCR.CMS bit. When the counter is used as a 32-bit counter, set the CMWCOR, CMWOCR0, or CMWOCR1 register to the desired values in 32-bit units. In reading, all 32 bits of CMWICR0 and CMWICR1 are valid. When the counter is used as a 16-bit counter, a 32-bit value should be set to the CMWCOR register with 0x0000 in the higher-order bits. Similarly, a 32-bit value should be set to CMWOCR0 and CMWOCR1 registers with 0x0000 in the higher-order bits.

A 32-bit value with 0x0000 in the higher-order bits is read from CMWICR0 and CMWICR1 registers.

23.3.6 Count Timing Based on CMWCNT

One of four clocks (PCLKL/8, PCLKL/32, PCLKL/128, and PCLKL/512) obtained by dividing the peripheral clock (PCLKL) can be selected with the CMWCR.CKS[1:0] bits. Figure 23.9 shows the timing.

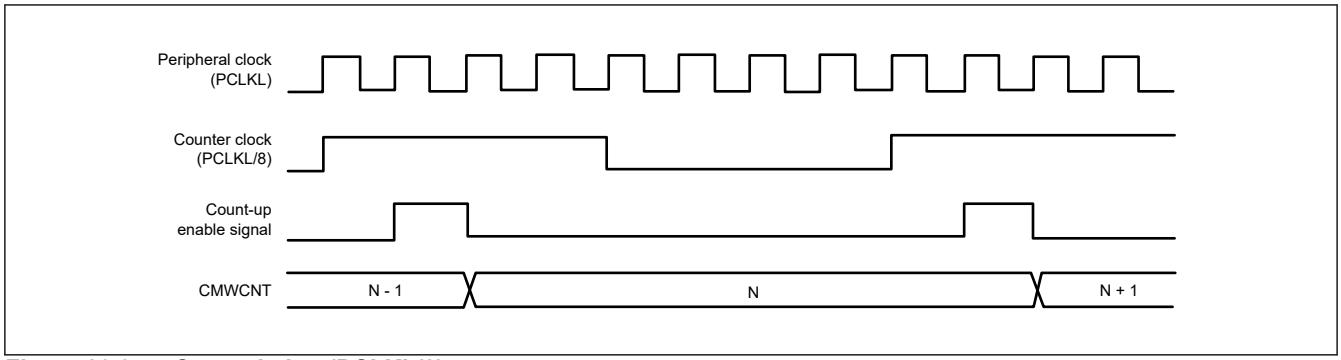

Figure 23.9 Count timing (PCLKL/8)

23.3.7 Output Compare Output Timing

A compare match signal is generated in the last state in which the CMWOCRn (n = 0, 1) register and CMWCNT counter values match (the CMWCNT counter value is updated immediately after the state). That is, the compare match signal is not generated if the CMWCNT counter clock is not input after a match between the CMWOCRn register and CMWCNT counter values. When a compare match signal is generated, the output compare output pin (TOC) changes in accord with the setting of the OC0[1:0] or OC1[1:0] bits in the CMWIOR register. Figure 23.10 shows output compare output timing.

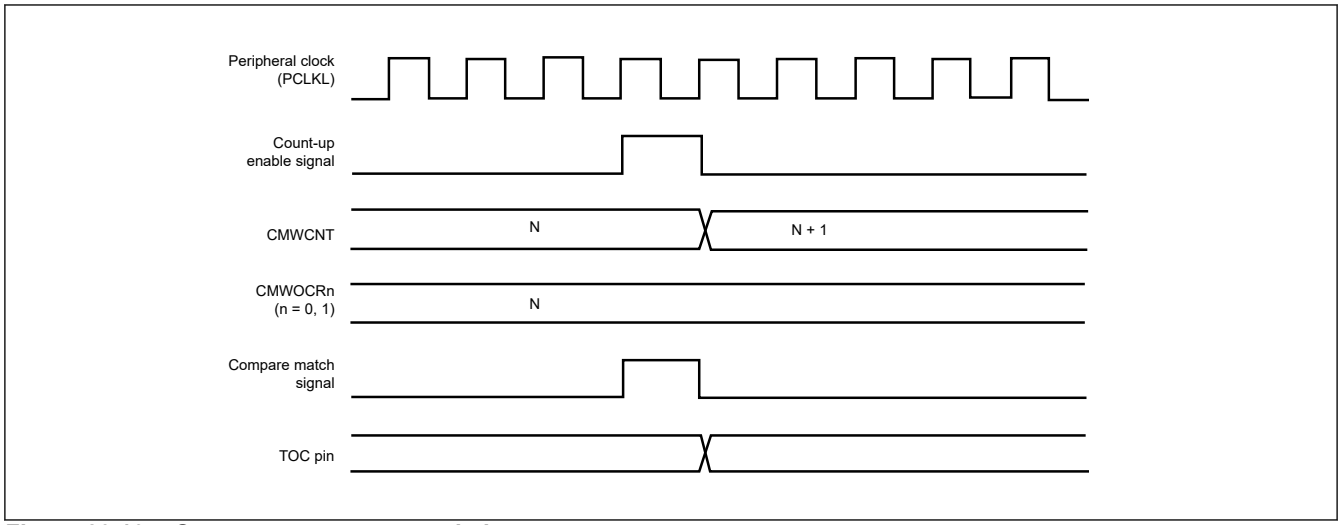

Figure 23.10 Output compare output timing

23.3.8 Input Capture Signal Timing

Figure 23.11 shows the input capture timing.

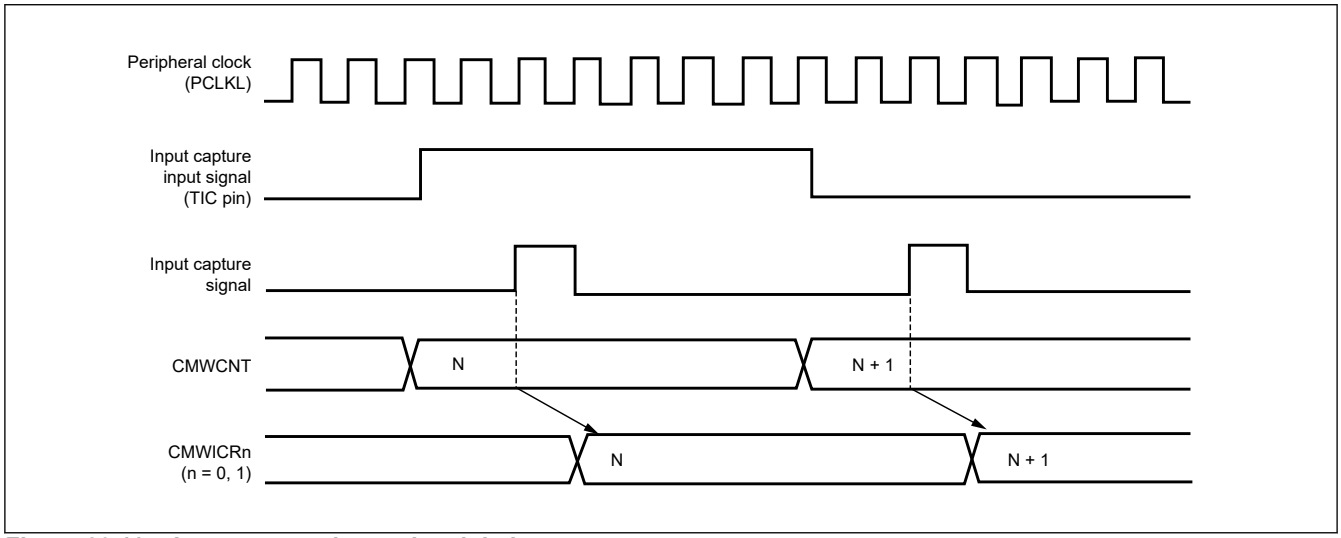

Figure 23.11 Input capture input signal timing

23.4 Interrupts

23.4.1 CMTW Interrupt Sources and DMAC Transfer Requests

The CMTW has five interrupt sources: two input capture interrupt requests (CMTWm_IC0I and CMTWm_IC1I), two output compare interrupt requests (CMTWm_OC0I and CMTWm_OC1I), and a compare match interrupt request (CMTWm_CMWI) (m = 0, 1).

Table 23.3 shows the interrupt sources and priority. The interrupt sources can be enabled or disabled using the IC0IE, IC1IE, OC0IE, OC1IE, and CMWIE bits in CMWCR and are separately issued to the interrupt controller.

Table 23.3 CMTW interrupt sources

Interrupt source	Interrupt	Interrupt enable bit	CPU0 GIC request	DMAC activation	Priority
CMTWm_CMWI	Interrupt caused by compare match	CMWIE	Possible	Possible	High
CMTWm_IC0I	Interrupt caused by input capture 0	IC0IE	Possible	Possible	↑
CMTWm_IC1I	Interrupt caused by input capture 1	IC1IE	Possible	Possible	↑
CMTWm_OC0I	Interrupt caused by output compare 0	OC0IE	Possible	Possible	↑
CMTWm_OC1I	Interrupt caused by output compare 1	OC1IE	Possible	Possible	Low

23.4.2 Timing of Compare Match Interrupt Generation

When the values of the CMWCNT counter and CMWCOR register match, a compare match interrupt (CMTWm_CMWI (m = 0, 1)) is generated. The compare match signal is generated at the end of the cycle where the values matched (i.e. when the CMWCNT counter is updated from the matching counter value). The compare match signal, therefore, is not generated until a further cycle of the input clock (PCLKL/8, PCLKL/32, PCLKL/128, or PCLKL/512) for the CMWCNT counter arrives after the values of the CMWCNT counter and CMWCOR register have matched. Figure 23.12 shows the timing of compare match interrupt generation.

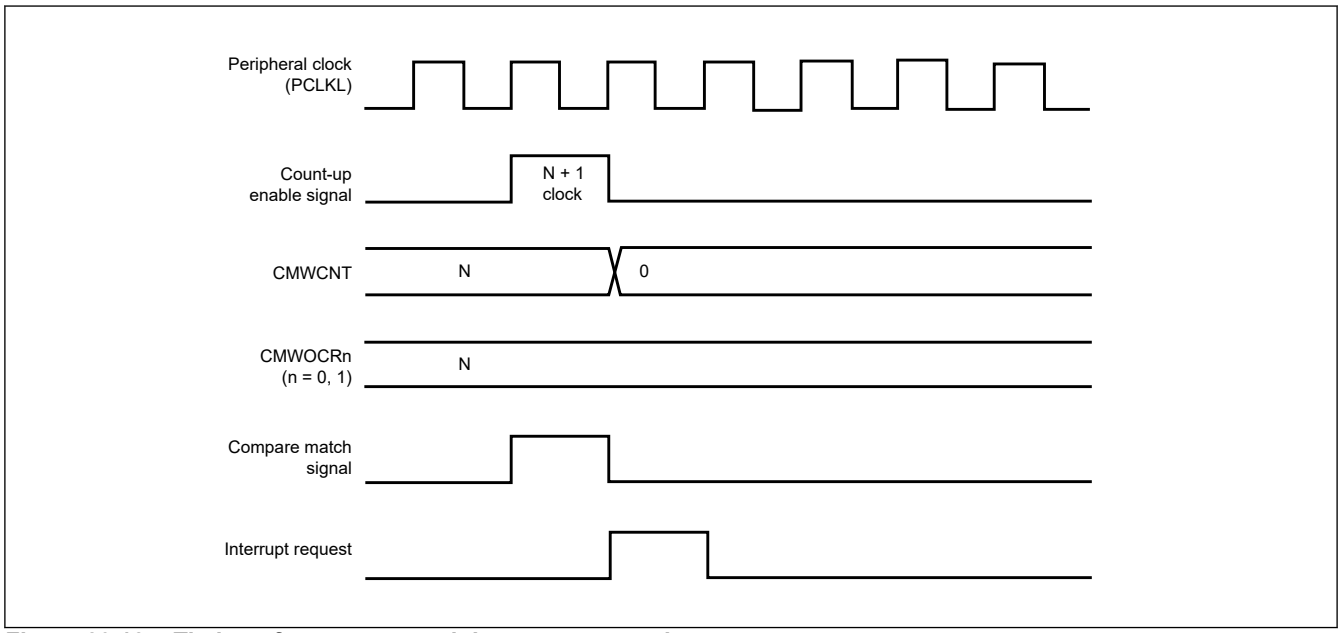

Figure 23.12 Timing of compare match interrupt generation

23.4.3 Timing of Output Compare Interrupt Generation

Figure 23.13 shows the timing of output compare interrupt generation.

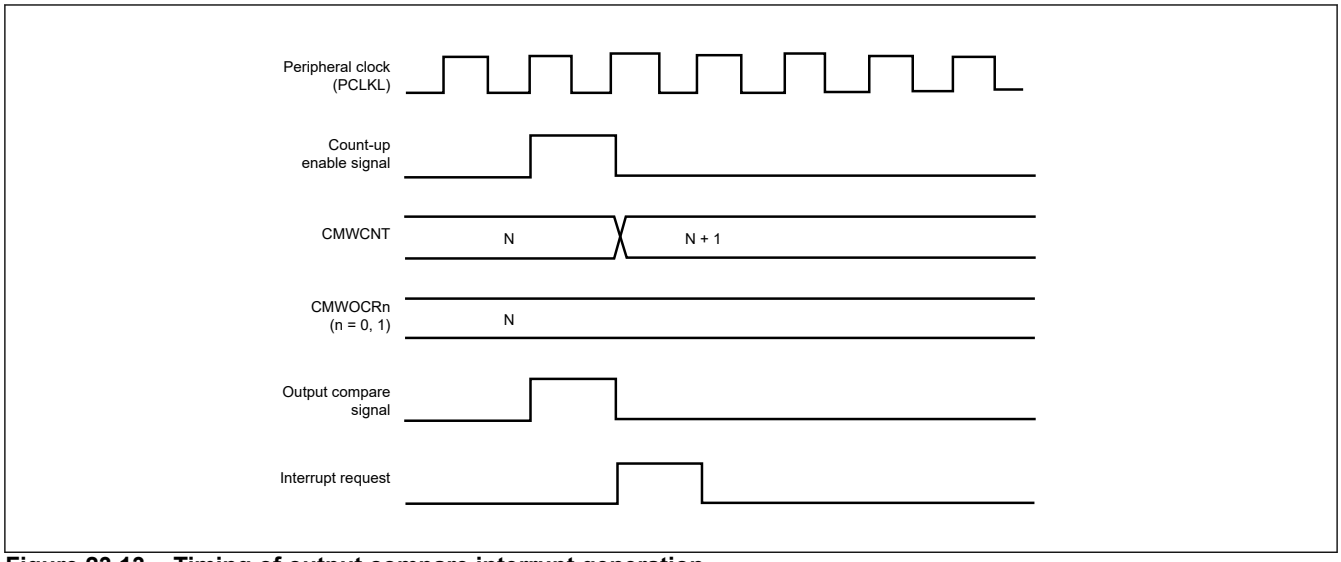

Figure 23.13 Timing of output compare interrupt generation

23.4.4 Timing of Input Capture Interrupt Generation

Figure 23.14 shows the timing of input capture interrupt generation.

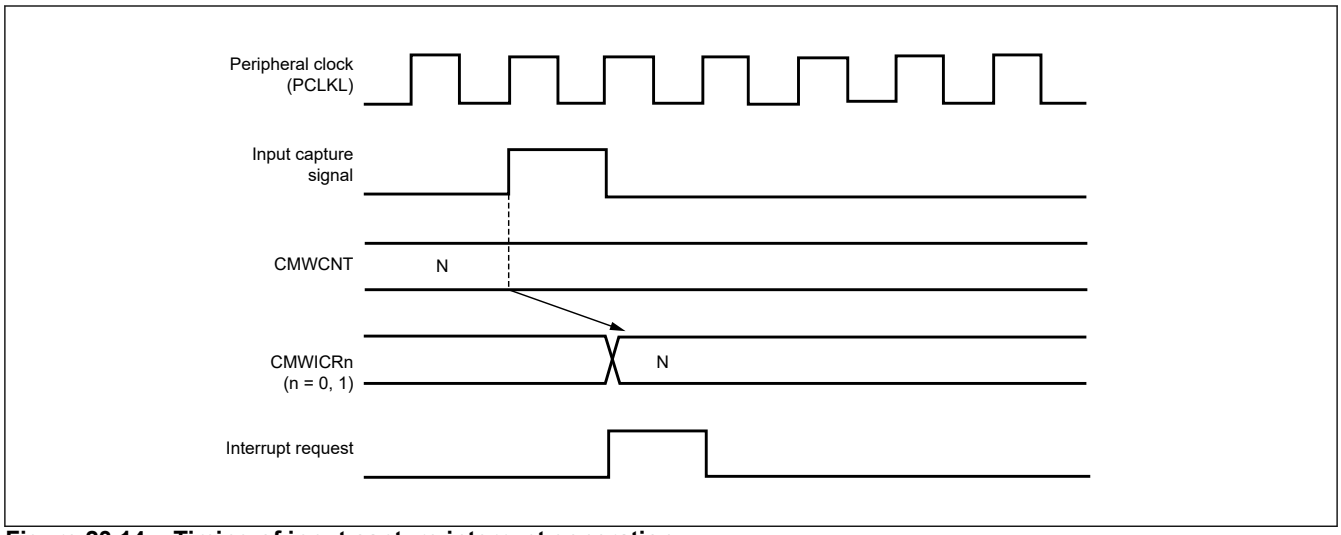

Figure 23.14 Timing of input capture interrupt generation

23.5 Usage Notes

23.5.1 Module-Stop Function

The CMTW operation can be enabled and disabled using the Module-Stop Control Register (MSTPCRD). With the initial value, the CMTW is in module-stop state. Register access is enabled by release from the module-stop state. For details, see section 8, Low-Power Consumption Function.

23.5.2 Contention Between CMWCNT Counter Writing and Compare Match

If the compare match signal is generated during CPU writing to the CMWCNT counter, the compare match interrupt request is output but the counter is not cleared since the CPU writing to the counter is given priority.

Figure 23.15 shows the timing of contention between CMWCNT counter writing and compare match.

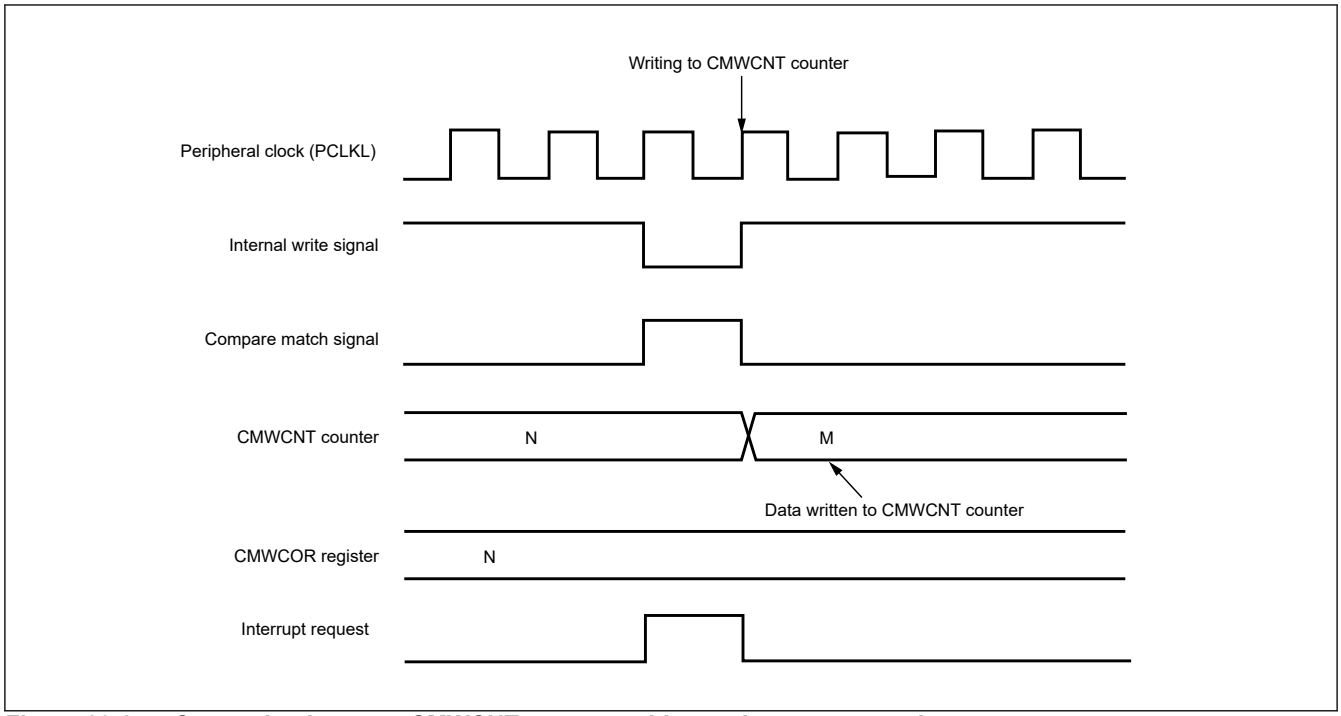

Figure 23.15 Contention between CMWCNT counter writing and compare match

23.5.3 Contention Between CMWCNT Counter Writing and Incrementing or Clearing

In case of contention between incrementation or clearing of the CMWCNT counter and CPU writing to the counter, the counter is not actually incremented or cleared since the CPU writing to the CMWCNT counter is given priority.

Figure 23.16 shows the timing in the case of contention between writing to the CMWCNT counter and incrementation or clearing.

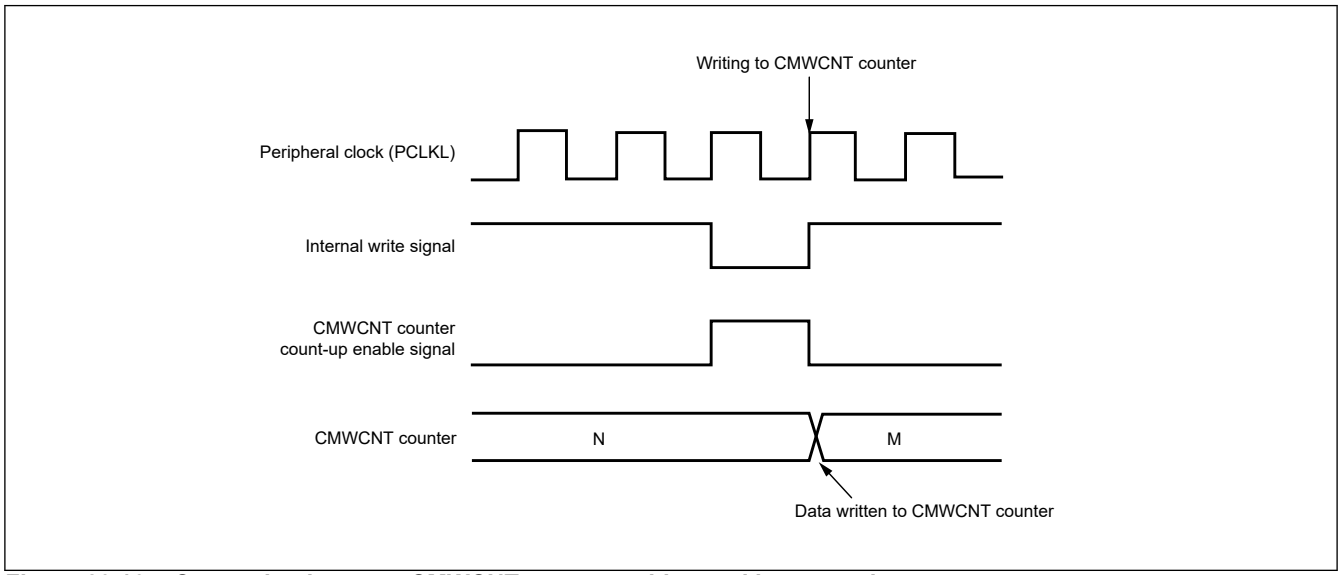

Figure 23.16 Contention between CMWCNT counter writing and incrementing

23.5.4 Contention Between CMWCOR Register Writing and Compare Match

If the compare match is generated during CPU writing to the CMWCOR register, the CPU writing to the CMWCOR register proceeds and also the compare match signal is output.

Figure 23.17 shows the timing of contention between CMWCOR register writing and compare match.

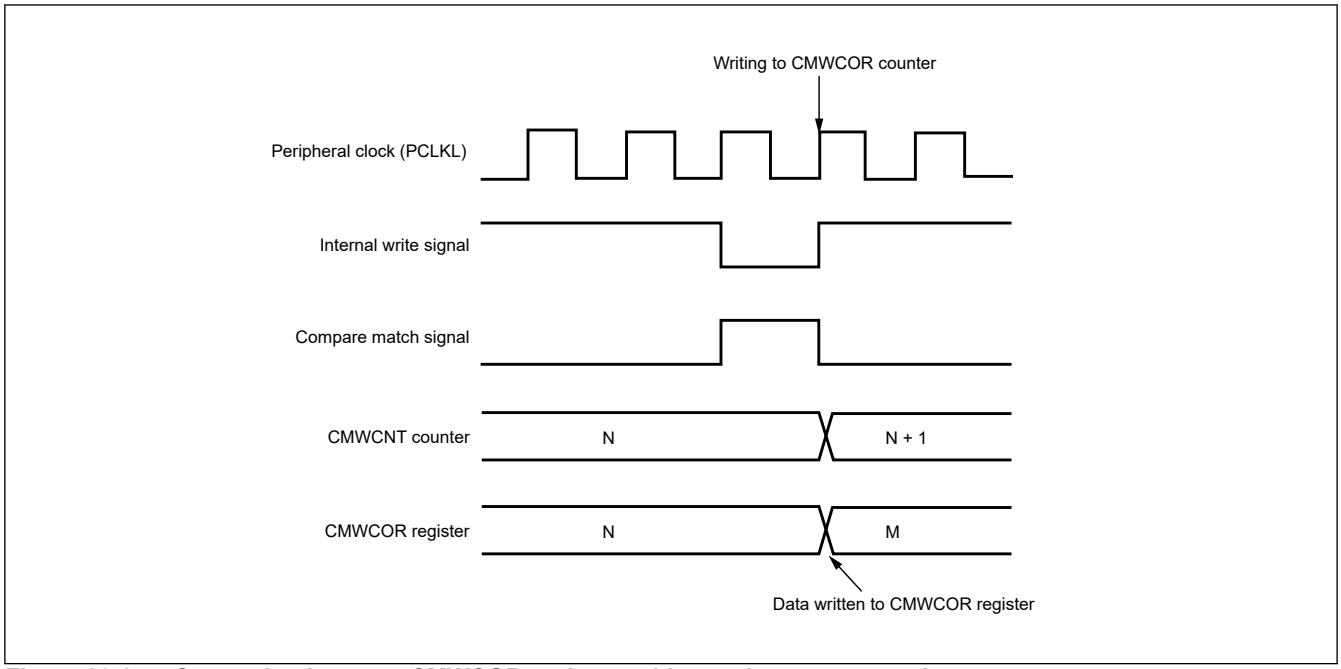

Figure 23.17 Contention between CMWCOR register writing and compare match

23.5.5 Contention Between CMWOCRn Register Writing and Compare Match

If the compare match is generated during CPU writing to the CMWOCRn register, the CPU writing to the CMWOCRn register proceeds and also the compare match signal is output (n = 0, 1).

Figure 23.18 shows the timing of contention between CMWOCRn register writing and compare match.

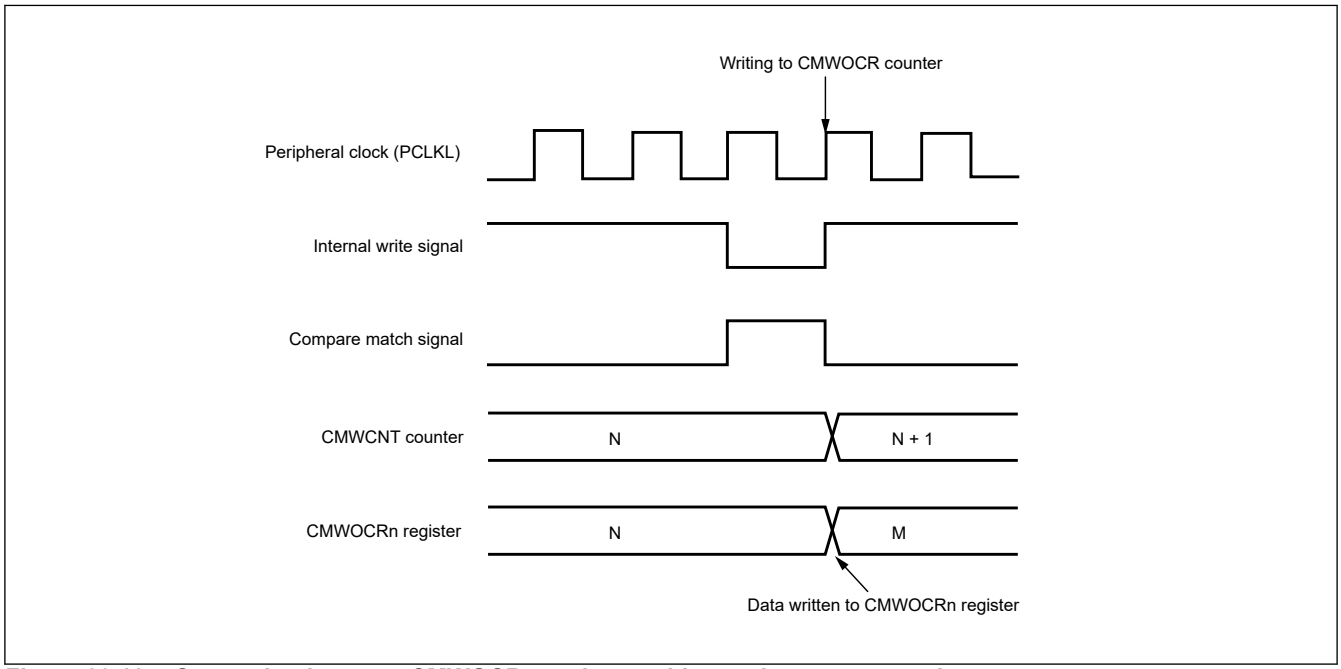

Figure 23.18 Contention between CMWOCRn register writing and compare match

23.5.6 Contention Between CMWCNT Counter Reading and Incrementing or Clearing

If the CMWCNT counter incrementing or clearing process occurs at the same time that the data of the CMWCNT counter is read, the value having been in the CMWCNT counter before incremented or cleared is read.

Figure 23.19 shows the timing of contention between the CMWCNT counter reading and incrementing.

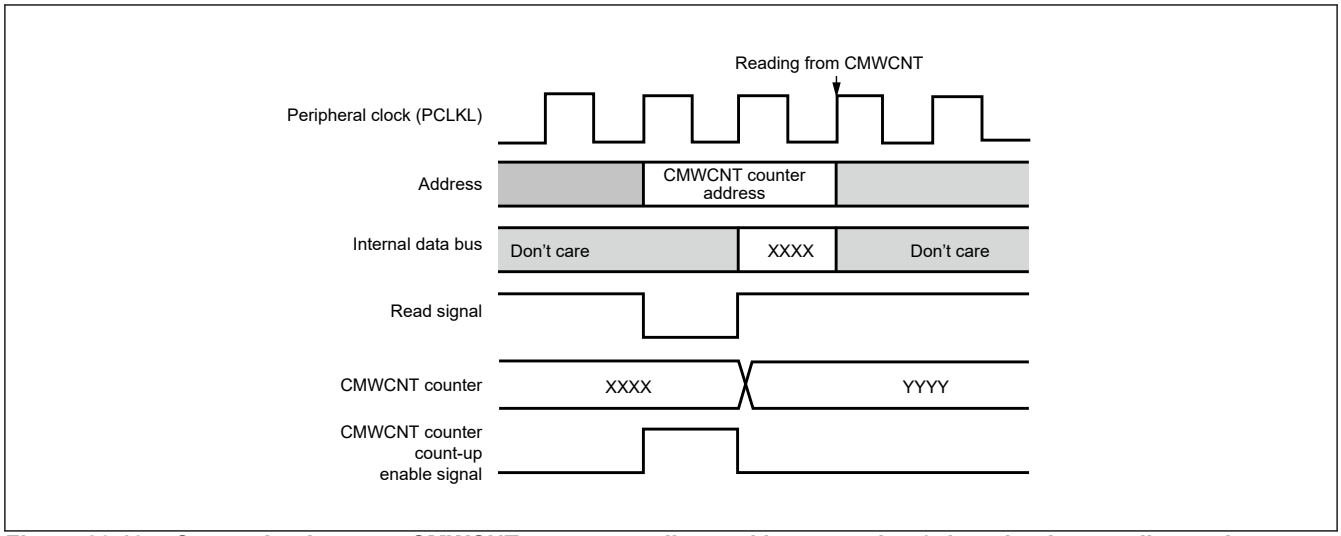

Figure 23.19 Contention between CMWCNT counter reading and incrementing (when the data reading and incrementing process occur simultaneously)

23.5.7 Contention Between CMWICRn Register Reading and Input Capture

If the input capture signal is generated at the same time that the data of CMWICRn register is read, the value having been in CMWICRn register before updated by input capture transfer is read (n = 0, 1).

Figure 23.20 shows the timing of contention between CMWICRn register reading and input capture.

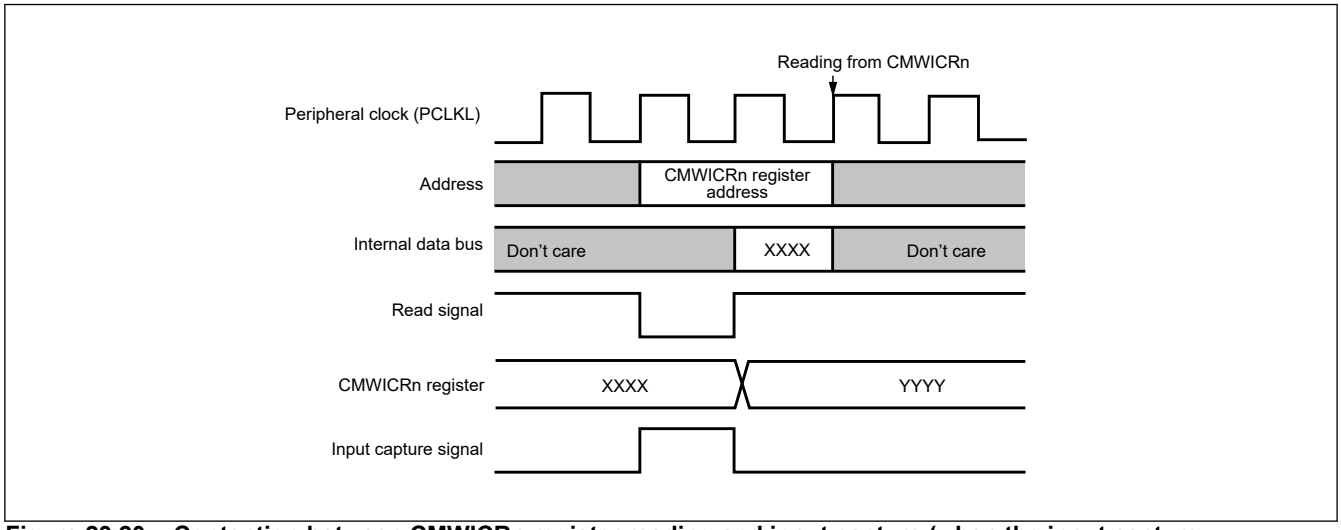

Figure 23.20 Contention between CMWICRn register reading and input capture (when the input capture signal and read signal are generated simultaneously)

Table 23.4 Summary of contention between operations due to the access to registers and changes to the counter's state (1 of 2)

Register access	CMWCNT state	CMWICR0/1 state	Operation to be performed
Writing to CMWCNT	Compare match	—	Output of compare match interrupt request / Writing to CMWCNT
	Counting up	—	Writing to CMWCNT
Writing to CMWCOR	Compare match	—	Compare match
Writing to CMWOCR0	Output compare 0	—	Output compare 0
Writing to CMWOCR1	Output compare 1	—	Output compare 1
Reading from CMWCNT	Counting up	—	Counting up and reading of the previous value

Table 23.4 Summary of contention between operations due to the access to registers and changes to the counter's state (2 of 2)

Register access	CMWCNT state	CMWICR0/1 state	Operation to be performed
Reading from CMWICR0	—	Input capture 0	Input capture 0 and reading of the value before transfer
Reading from CMWICR1	—	Input capture 1	Input capture 1 and reading of the value before transfer

24. Watchdog Timer (WDT)

24.1 Overview

The watchdog timer (WDT) is a 14-bit down-counter and can be used to inform error events to ICU when the counter underflows because the system has run out of control and is unable to refresh the WDT. The refresh-permitted period can be set to refresh the counter and to detect when the system runs out of control.

Table 24.1 lists the specifications of the WDT and Figure 24.1 shows a block diagram of the WDT.

Table 24.1 WDT specifications

Parameter	Specifications
Number of channels	One channel
Count source	Peripheral clock (PCLKL)
Clock division ratio	Divide by 4, 64, 128, 512, 2048, or 8192
Counter operation	Counting down using a 14-bit down-counter
Conditions for starting the counter	Register start mode: Counting is started by refresh on a write to the WDTRR register
Conditions for stopping the counter	• Reset (the down-counter and other registers return to their initial values) • A counter underflows or a refresh error occurs • Cortex®-R52 debug state
Window function	Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods)
WDT error events	• Down-counter underflows • Refreshing outside the refresh-permitted period (refresh error)
Reading the counter value	The down-counter value can be read by the WDTSR register.
Output signal (internal signal)	Interrupt request output

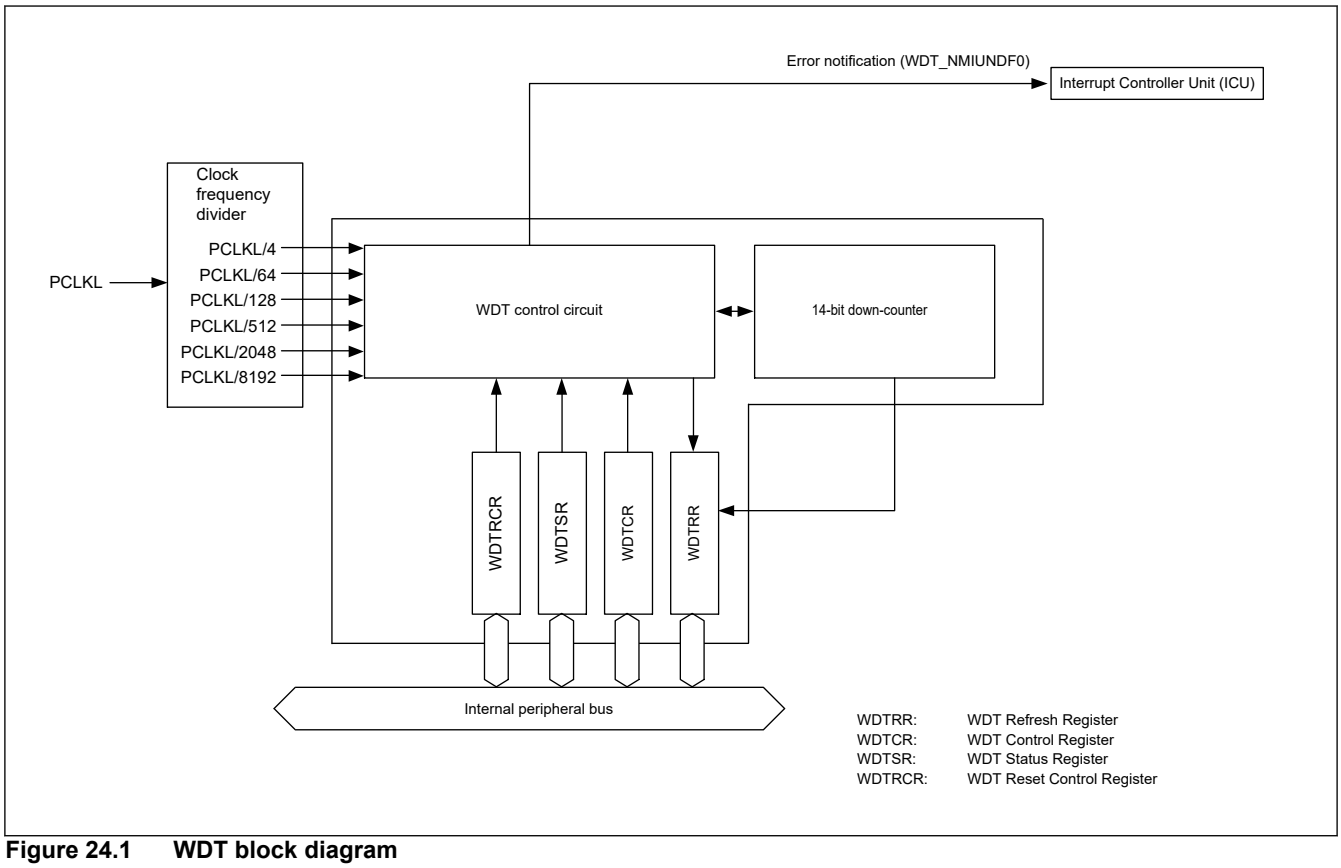

Figure 24.1 WDT block diagram

Table 24.2 WDT interrupt sources

Name	Interrupt sources	CPU0 GIC request	DMAC activation
WDT_NMIUNDF0	Down-counter underflow/Refresh error for CPU0	Possible*1	Not possible

Note 1. Some errors from other peripherals are ORed and connected to the GIC. See section 11, Interrupt Controller (ICU) for detail of error events.

24.2 Register Descriptions

24.2.1 WDTRR : WDT Refresh Register

Base address: WDT0 = 0x8004_2000

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:								
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
7:0	n/a	The down-counter is refreshed by writing 0x00 and then 0xFF to this register.	R/W

WDTRR register refreshes the down-counter of the WDT.

The down-counter of the WDT is refreshed by writing 0x00 and then 0xFF to WDTRR (refresh operation) within the refresh-permitted period. After being refreshed, the down-counter starts counting down from the value specified with the WDTCR.TOPS[1:0] bits.

When 0x00 is written, the read value is 0x00, when a value other than 0x00 is written, the read value is 0xFF. For details of the refresh operation, see section 24.3.3. Refresh Operation.

24.2.2 WDTCR : WDT Control Register

Base address: WDT0 = 0x8004_2000

Offset address: 0x02

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	RPSS[1:0]		—	—	RPES[1:0]		CKS[3:0]				—	—	TOPS[1:0]	
Value after reset:	0	0	1	1	0	0	1	1	1	1	1	1	0	0	1	1

Bit	Symbol	Function	R/W
1:0	TOPS[1:0]	Timeout Period Selection 0 0: 1024 cycles (0x03FF) 0 1: 4096 cycles (0x0FFF) 1 0: 8192 cycles (0x1FFF) 1 1: 16384 cycles (0x3FFF)	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
7:4	CKS[3:0]	Clock Division Ratio Selection 0x1: PCLKL/4 0x4: PCLKL/64 0xF: PCLKL/128 0x6: PCLKL/512 0x7: PCLKL/2048 0x8: PCLKL/8192 Others: Setting prohibited.	R/W

Bit	Symbol	Function	R/W
9:8	RPES[1:0]	Window End Position Selection 0 0: 75% 0 1: 50% 1 0: 25% 1 1: 0% (window end position is not specified.)	R/W
11:10	—	These bits are read as 0. The write value should be 0.	R/W
13:12	RPSS[1:0]	Window Start Position Selection 0 0: 25% 0 1: 50% 1 0: 75% 1 1: 100% (window start position is not specified.)	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W

The WDTCR register allows the selecting of a timeout period before the down-counter underflows, a clock division ratio, and a window start/end position for refreshing. There are some restrictions for writing to this register. For details, see section 24.3.2. Control over Writing to the WDTCR and WDTRCR Registers.

TOPS[1:0] bits (Timeout Period Selection)

These bits select a timeout period (period before the down-counter underflows) from among 1024, 4096, 8192, and 16384 cycles, taking the divided clock specified by the CKS[3:0] bits as one cycle.

After the down-counter is refreshed, the combination of the CKS[3:0] and TOPS[1:0] bits determines the time (number of PCLKL cycles) before the counter underflows.

Table 24.3 lists the relationship between the CKS[3:0] and TOPS[1:0] bit settings, the timeout period, and the number of PCLKL cycles.

CKS[3:0] bits (Clock Division Ratio Selection)

These bits specify the division ratio of the clock used for the down-counter. The division ratio can be selected from among the peripheral module clock (PCLKL) divided by 4, 64, 128, 512, 2048, and 8192. Combined with the TOPS[1:0] bit setting, a count period between 4,096 and 134,217,728 cycles of the PCLKL clock can be selected for the WDT.

RPES[1:0] bits (Window End Position Selection)

These bits allow selection of the window end position of the down counter from among 75%, 50%, 25%, and 0% of the counting period. The selected window end position should be a value smaller than the window start position (window start position > window end position). If the window end position is greater than the window start position, only the window start position setting is valid.

The counter values of the window start and end positions specified by the RPES[1:0] and RPSS[1:0] bit settings vary according to the TOPS[1:0] bit setting.

Table 24.4 lists the counter values of the window start and end positions corresponding to the TOPS[1:0] bit setting.

RPSS[1:0] bits (Window Start Position Selection)

These bits allow the selection of the window start position of the down counter from among 100%, 75%, 50%, and 25% of the counting period (assuming that the count start position as 100% and underflow occurrence as 0%). The period from the window start position to the window end position is the refresh-permitted period, any other periods are the refresh-prohibited periods.

Table 24.4 lists the counter values for the window start and end positions and Figure 24.2 shows the relationship between the settings of the RPSS[1:0] and RPES[1:0] bits, including the refresh-permitted and refresh-prohibited periods.

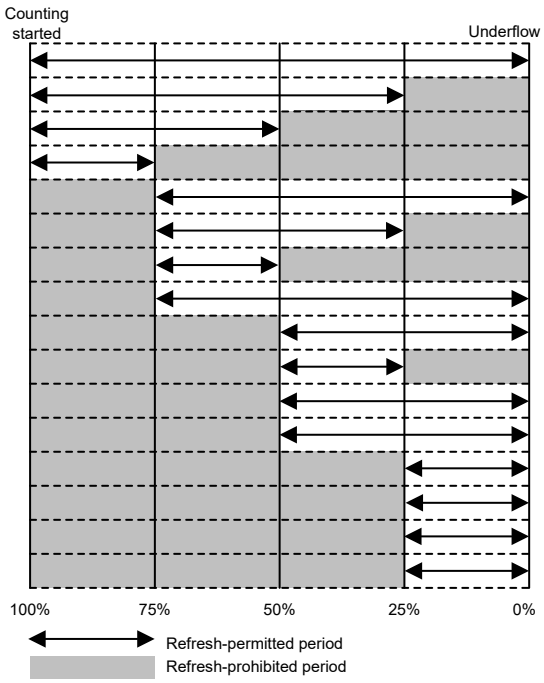

Table 24.3 Timeout period settings

CKS[3:0] bits				TOPS[1:0] bits		Clock division ratio	Timeout period (number of cycles)	No. of Peripheral clock (PCLKL) cycles @Count clock = PCLKL

		0	0		75

Note: If window end setting ≥ window start setting, the window end setting is set to 0%.

Figure 24.2 RPSS[1:0] and RPES[1:0] bit settings and the refresh-permitted period

24.2.3 WDTSR : WDT Status Register

Base address: WDT0 = 0x8004_2000

Offset address: 0x04

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	REFEF	UNDF	CNTVAL[13:0]													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
13:0	CNTVAL[13:0]	Down-Counter Value Value counted by the down-counter	R
14	UNDFF	Underflow Flag 0: No underflow occurred 1: Underflow occurred	R/W*1
15	REFEF	Refresh Error Flag 0: No refresh error occurred 1: Refresh error occurred	R/W*1

Note 1. Only 0 can be written to clear the flag.

The WDTSR register displays the counter value of the down-counter and the states of underflow and refresh error occurrences.

CNTVAL[13:0] bits (Down-Counter Value)

Read these bits to confirm the value of the down-counter, but note that the read value may differ from the actual count by a value of one count.

UNDFF flag (Underflow Flag)

Read this flag to confirm whether an underflow has occurred in the down-counter.

The value 1 indicates that the down-counter has underflowed. The value 0 indicates that the down-counter has not underflowed.

Write 0 to the UNDFF flag to set the value to 0. Writing 1 has no effect.

Clearing of the UNDFF flag takes (N + 1) PCLKL cycles. In addition, clearing of the flag is ignored for (N + 1) PCLKL cycles after an underflow. N is specified in the WDTCR.CKS[3:0] bits as follows:

- When WDTCR.CKS[3:0] = 0x1, N = 4
- When WDTCR.CKS[3:0] = 0x4, N = 64
- When WDTCR.CKS[3:0] = 0xF, N = 128
- When WDTCR.CKS[3:0] = 0x7, N = 2048
- When WDTCR.CKS[3:0] = 0x8, N = 8192

REFEF flag (Refresh Error Flag)

Read this flag to confirm whether a refresh error (performing a refresh operation during a refresh-prohibited period) has occurred.

The value 1 indicates that a refresh error has occurred. The value 0 indicates that no refresh error has occurred.

Write 0 to the REFEF flag to set the value to 0. Writing 1 has no effect.

Clearing of the REFEF flag takes (N + 1) PCLKL cycles. In addition, clearing of the flag is ignored for (N + 1) PCLKL cycles after a refresh error. N is specified in the WDTCR.CKS[3:0] bits as follows:

- When WDTCR.CKS[3:0] = 0x1, N = 4
- When WDTCR.CKS[3:0] = 0x4, N = 64
- When WDTCR.CKS[3:0] = 0xF, N = 128
- When WDTCR.CKS[3:0] = 0x6, N = 512
- When WDTCR.CKS[3:0] = 0x7, N = 2048
- When WDTCR.CKS[3:0] = 0x8, N = 8192

24.2.4 WDTRCR : WDT Reset Control Register

Base address: WDT0 = 0x8004_2000

Offset address: 0x06

Bit position:	7	6	5	4	3	2	1	0
Bit field:	RSTIRQS	—						
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	—	These bits are read as 0. The write value should be 0.	R/W
7	RSTIRQS	Reset Interrupt Request Selection 0: Error notification to ICU is permitted 1: Error notification to ICU is not performed	R/W

The WDTRCR register controls whether to send an error notification when underflow occurs in the down-counter of WDT.

There are some restrictions for writing to the WDTRCR register. For details, see section 24.3.2. Control over Writing to the WDTCR and WDTRCR Registers.

RSTIRQS bit (Reset Interrupt Request Selection)

The RSTIRQS bit specifies whether an error notification should be sent to the ICU module when an underflow or refresh error occurs in the down-counter. Set this bit to 0 to enable error notification from the WDT module.

24.3 Operation

24.3.1 Count Operation in Start Mode

Counting starts by a refresh operation of the WDT Refresh Register (WDTRR) when the WDT Control Register (WDTCR) and WDT Reset Control Register (WDTRCR) are set.

24.3.1.1 Register Setting

After the reset state is released, set the clock division ratio, window start and end positions, and timeout period in the WDTCR register. The value specified by the WDTCR.TOPS[1:0] bits is then set in the down-counter by a refresh operation to start counting down.

Thereafter, the value in the counter is reset at each refresh operation and count-down continues if the program runs normally and the counter is refreshed in the refresh-permitted period.

Figure 24.3 shows an example of operation under the following conditions:

- Reset Interrupt Request bit (RSTIRQS): 0b (error notification to ICU is permitted)
- Window Start Position Selection bits (RPSS[1:0]): 10b (75%)
- Window End Position Selection bits (RPES[1:0]): 10b (25%)

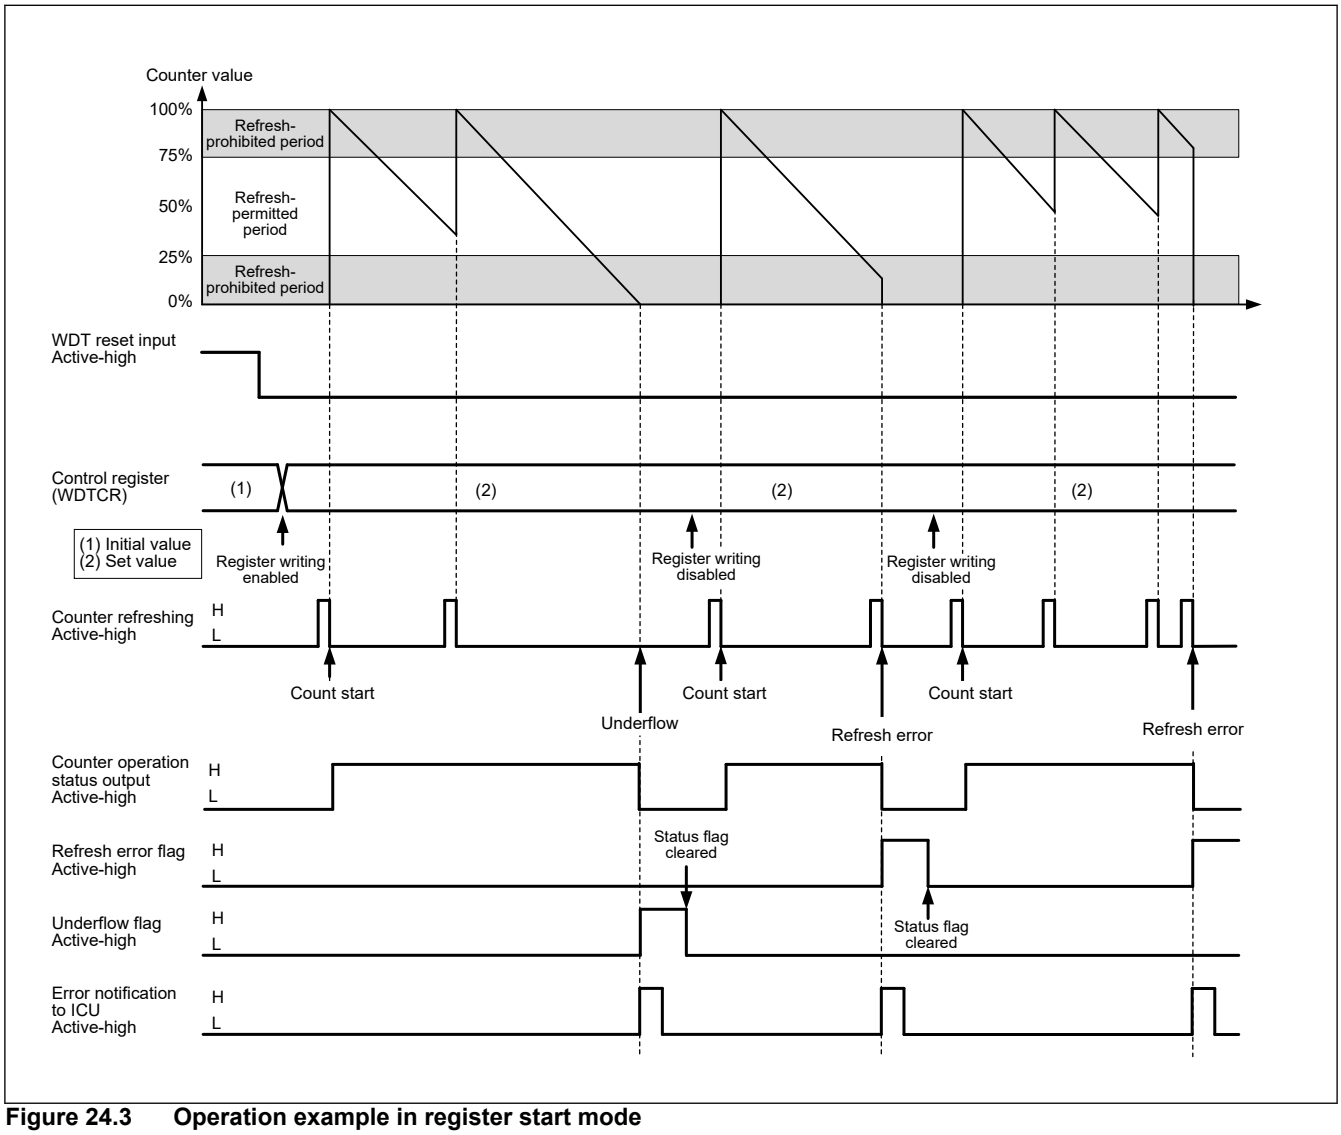

Figure 24.3 Operation example in register start mode

24.3.2 Control over Writing to the WDTCR and WDTRCR Registers

Writing to the WDT Control Register (WDTCR) is only possible once between the release from the reset state and the first refresh operation.

After a refresh operation (counting starts) or by writing to the WDTCR register, the protection signal in the WDT becomes 1 to protect the WDTCR register against subsequent attempts at writing.

Writing to the WDT Reset Control Register (WDTRCR) is also controlled similarly.

This protection is released by the reset source of the WDT. Any other reset sources cannot release the protection. Figure 24.4 shows control waveforms produced in response to writing to the WDTCR register.

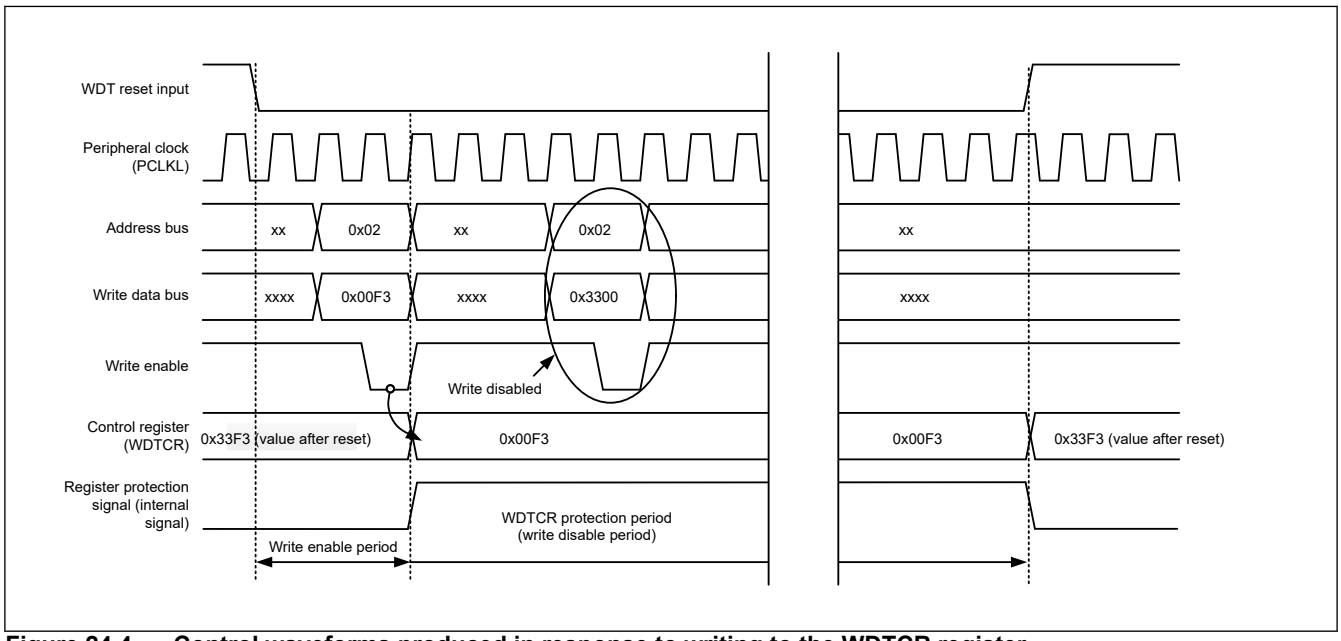

Figure 24.4 Control waveforms produced in response to writing to the WDTCR register

24.3.3 Refresh Operation

To refresh the down-counter and to start the down-counter operation (count start due to refreshing), write the values 0x00 and then 0xFF to the WDT Refresh Register (WDTRR). If a value other than 0xFF is written after 0x00, the down-counter is not refreshed. To perform refreshing after an invalid write, write 0x00 and then 0xFF again to the WDTRR register.

If 0x00 is written twice in succession, writing 0xFF after the second 0x00 refreshes the down-counter because the 0x00 → 0xFF condition is satisfied. The write sequence of 0x00 (n-1th) → 0x00 (nth) → 0xFF also satisfies the refreshing condition and thus refreshes the down-counter.

Even if a register other than WDTRR is accessed or WDTRR is read between writing 0x00 and writing 0xFF to WDTRR, correct refreshing will be done.

[Sample sequences of writing that are valid for refreshing the counter]

- 0x00 → 0xFF
- 0x00 (n - 1th time) → 0x00 (nth time) → 0xFF
- 0x00 → access to another register or read from the WDTRR register → 0xFF

[Sample sequences of writing that are not valid for refreshing the counter]

- 0x23 (a value other than 0x00) → 0xFF
- 0x00 → 0x54 (a value other than 0xFF)
- 0x00→ 0xAA (0x00 and a value other than 0xFF) → 0xFF

If 0xFF is written to the WDTRR register during the refresh-permitted period after 0x00 is written outside of the period, write operation is acknowledged and down-counter is refreshed. Whether writing is made within the refresh-permitted period is determined by when 0xFF is written.

After 0xFF is written to the WDT Refresh Register (WDTRR), refreshing the down-counter requires up to 4 counting cycles. The number of peripheral clock (PCLKL) cycles in a single counting cycle differs depending on the setting of the Clock Division Ratio Selection bits (WDTCR.CKS[3:0]).

Therefore, writing 0xFF to the WDTRR register should be completed within 4 count cycles before the refresh-permitted period end position or before the down-counter underflows. Confirm the down-counter value with the down-counter value bits (WDTSR.CNTVAL[13:0]).

[Sample of refresh operation timing]

- When the window start position is 0x1FFF, if 0x00 is written to the WDTRR register before 0x1FFF (for example, 0x2002), the down-counter can be refreshed by writing 0xFF to the WDTRR register after the value of WDTSR.CNTVAL[13:0] becomes 0x1FFF.
- When the window end position is 0x1FFF, if the value of WDTSR.CNTVAL[13:0] is 0x2003 (4 counts before 0x1FFF) or more immediately after 0x00 and 0xFF are written to the WDTRR register, the down-counter will be refreshed.
- If the refresh-permitted period goes down to 0x0000, refreshing is possible until just before underflow. In this case, if the value of WDTSR.CNTVAL[13:0] is 0x0003 (4 count cycles before underflow) or more immediately after 0x00 and 0xFF are written to the WDTRR register, underflow does not occur and the down-counter is refreshed.

Figure 24.5 shows WDT refresh-operation waveforms when the clock division ratio is PCLKL/64.

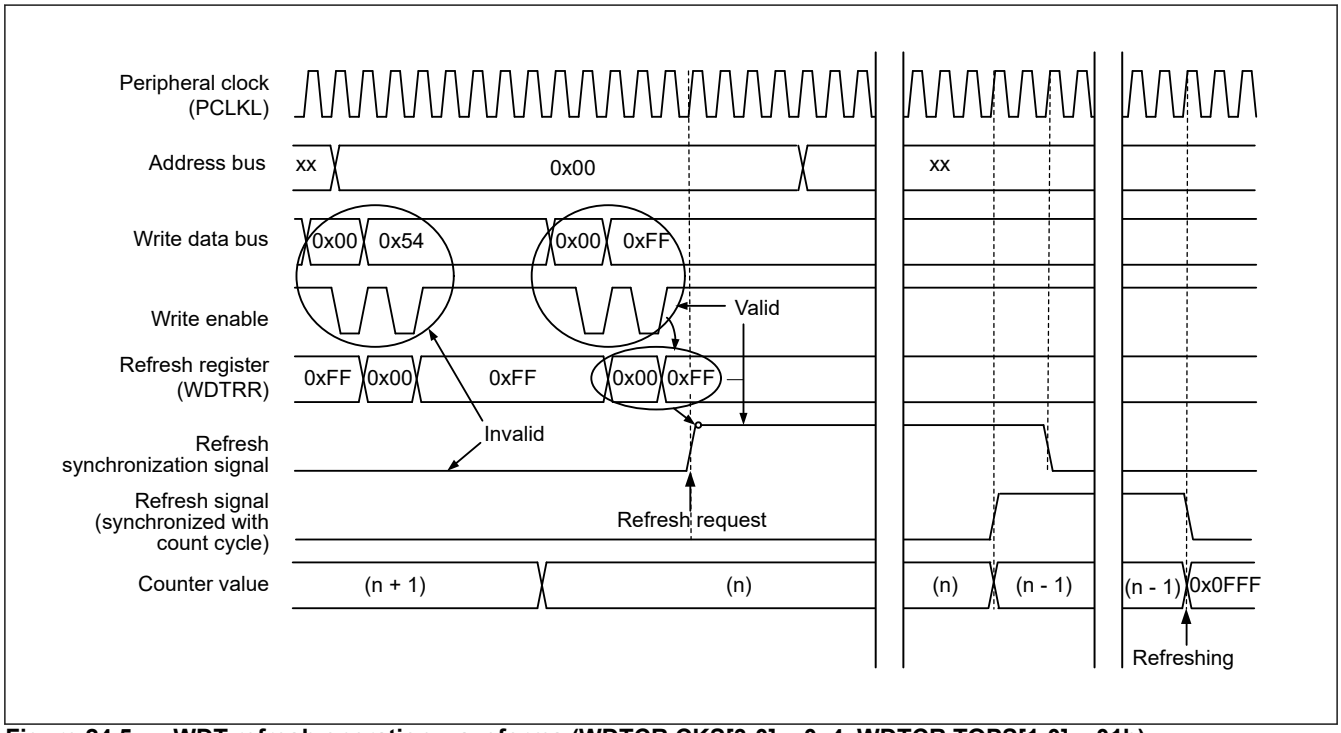

Figure 24.5 WDT refresh operation waveforms (WDTCR.CKS[3:0] = 0x4, WDTCR.TOPS[1:0] = 01b)

24.3.4 Status Flag

The Refresh Error flag (WDTSR.REFEF) and the Underflow flag (WDTSR.UNDFF) retain the error causes after error notifications are output to the Interrupt Controller (ICU).

Occurrence state of error notifications to ICU can be confirmed by reading the WDTSR.REFEF flag or the WDTSR.UNDFF flag after reset is released or on occurrence of an error notification to ICU.

To clear these flags, write 0. Writing 1 is ignored.

If these flags are not cleared, there is no effect on the operation. On occurrence of the next error notification to ICU, the previous error notification is automatically cleared and a new notification to ICU is written.

25. Real Time Clock (RTC)

25.1 Overview

The RTC module can count a 100-year calendar from 2000 to 2099 and automatically adjust dates for leap years. The RTC uses an internal clock acquired by dividing the main clock oscillator or PLL output by a prescaler. Year, month, date, day-of-week, a.m./p.m. (in 12-hour mode), hour, minute, second is counted. No external oscillator is required but battery backup is not supported.

Table 25.1 lists the RTC specifications and Figure 25.1 shows a block diagram. Table 25.2 lists the RTC I/O pin and Table 25.3 lists the interrupt sources.

Table 25.1 RTC specifications

Parameter	Specifications
Number of units	1 unit
Count mode	Calendar count mode
Count source	Main clock oscillator divided by 128 (195.3125 kHz)
Clock and calendar functions	• Year, month, day of the week, day, hour, minute, second counters and sub-counters, counting up to 99 years are supported • Year, month, day of the week, day, hour, minute, and second counters: BCD code display • 12 hours/24 hours mode switching function • Automatic adjustment function for leap years • Start/stop function • 1 Hz pulse output
Interrupts	• Alarm interrupt (RTC_ALM) As an alarm interrupt condition, day-of-week, hour and minute can be selected • 1 second interrupt (RTC_1S) Interrupt can be generated every 1 second • Fixed interval interrupt (RTC_PRD) 0.25 second, 0.5 second, 1 second, 1 minute, 1 hour, 1 day, or 1 month can be selected as an interrupt period
Module-stop function	Module-stop state can be set to reduce power consumption.

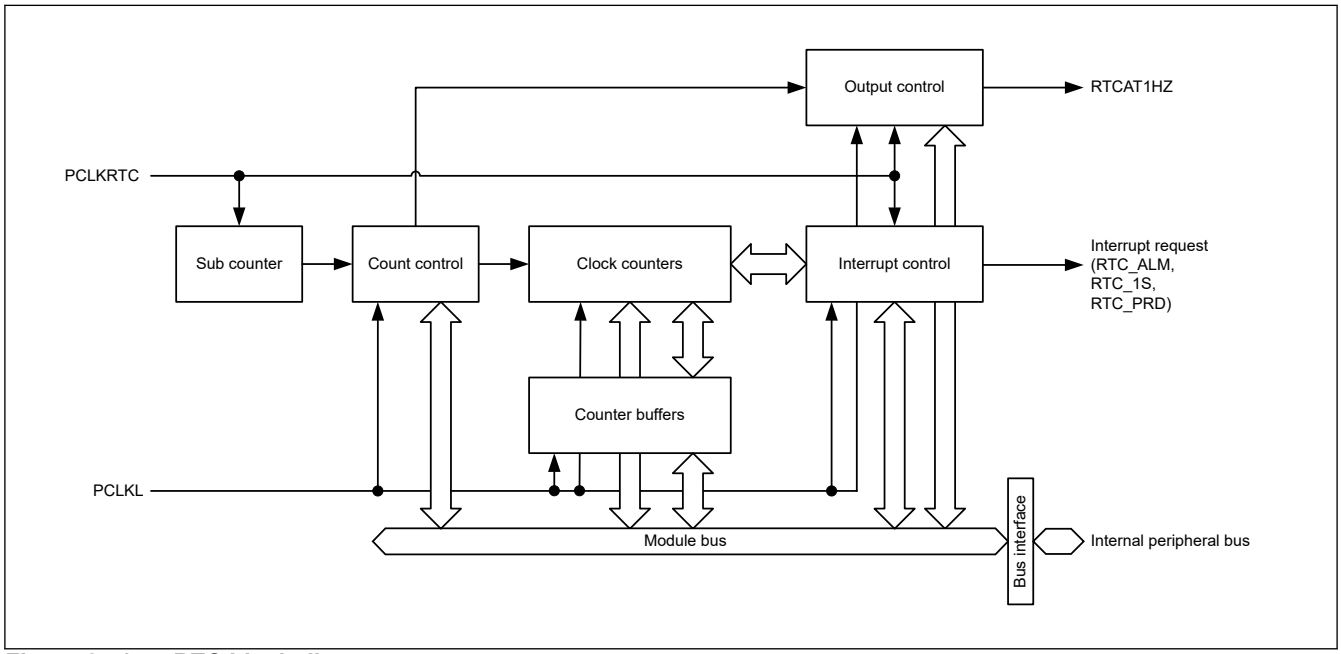

Figure 25.1 RTC block diagram

Table 25.2 RTC I/O pins

Pin name	I/O	Function
RTCAT1HZ	Output	RTC 1 Hz output

Table 25.3 RTC interrupt sources

Name	Interrupt sources	CPU0 GIC request	DMAC activation
RTC_ALM	Alarm interrupt	Possible	Not possible
RTC_1S	1 second interrupt	Possible	Not possible
RTC_PRD	Fixed interval interrupt	Possible	Not possible

25.2 Register Descriptions

25.2.1 RTCA0CTL0 : RTC Control Register 0

Base address: RTC = 0x8100_9000

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	RTCA0CE	RTCA0CEST	RTCA0AMPM	RTCA0SLSB	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	RTCA0SLSB	RTCA0SCMP enable/disable setting Set this bit to 1, see the RTCA0SCMP register description. When setting this bit, be sure to follow the flow described in section 25.3.1.1. Initial Setting. It is prohibited to change the setting of this bit while the clock counter operation is enabled (RTCA0CE = 1). If the setting of this bit is changed during clock counter operation, the operation of RTC Controller cannot be guaranteed. When changing the setting of this bit, first perform initialization according to section 25.3.1.5. Initialization of RTC While Clock Counter Operation is Enabled, and then perform the setting of this bit again according to the flow described in section 25.3.1.1. Initial Setting.	R/W
5	RTCA0AMPM	RTCA0HOUR, RTCA0ALH display format selection bit 0: 12-hour display 1: 24-hour display	R/W
6	RTCA0CEST	RTC Controller Enable Status 0: Clock counter operation stopped status 1: Clock counter operation enabled status (the clock counter counts up)	R
7	RTCA0CE	RTC Controller Enable Bit Setting this bit to 0 initializes the internal circuit of RTC Controller other than the control registers*1. Moreover, interrupts (RTC_ALM, RTC_1S, RTC_PRD) are cleared. 0: Clock counter operation stopped 1: Clock counter operation enabled (the clock counter counts up)	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Status flags RTCA0WST, RTCA0RSST, and RTCA0WSST, which cannot be written by the user, are cleared.

25.2.2 RTCA0CTL1 : RTC Control Register 1

Base address: RTC = 0x8100_9000

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	RTCA01HZE	RTCA0ALME	RTCA01SE	RTCA0CT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	RTCA0CT[2:0]	Fixed interval interrupt (RTC_PRD) output setting bit See section 25.3.1.7. Changing the Setting of Fixed Interval Interrupt During Clock Counter Operation for changing the setting of this field. RTCA0CT[2]/RTCA0CT[1]/RTCA0CT[0] 0 0 0: Fixed interval interrupt output stop 0 0 1: Interrupt once every 0.25 seconds (in synchronization with second count-up) 0 1 0: Interrupt once every 0.5 seconds (in synchronization with second count-up) 0 1 1: Interrupt once every 1 second (in synchronization with second count-up) 1 0 0: Interrupt once every 1 minute (every 1 minute 00 seconds) 1 0 1: Interrupt once every 1 hour (every 1 hour 00 minutes 00 seconds) 1 1 0: Interrupt once every 1 day (every 1 day 00 hours 00 minutes 00 seconds) 1 1 1: Interrupt once every 1 month (every 1 month first day 00 hours 00 minutes 00 seconds a.m.)	R/W
3	RTCA01SE	1 second interrupt (RTC_1S) output enable bit 0: Stop interrupt output at every 1 second 1: Enable interrupt output at every 1 second	R/W
4	RTCA0ALME	Alarm interrupt (RTC_ALM) output enable bit 0: Disable 1: Enable	R/W
5	RTCA01HZE	This bit enables/disables 1 Hz pulse output (RTCAT1HZ). 0: Disable 1 Hz pulse output (RTCAT1HZ fixed to 0) 1: Enable 1 Hz pulse output	R/W
31:6	—	These bits are read as 0. The write value should be 0.	R/W

25.2.3 RTCA0CTL2 : RTC Control Register 2

Base address: RTC = 0x8100_9000

Offset address: 0x08

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	RTCA0WSST	RTCA0RSST	RTCA0RSUB	RTCA0WST	RTCA0WAIT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RTCA0WAIT	RTC Controller Counter Wait Control This bit controls the count-up operation of the counters. Be sure to write 1 to this bit when reading and writing counter values while the clock counter operation is enabled (RTCA0CE = 1). When this bit is 1, on occurrence of RTCA0SUBC overflow, the overflow information is held internally, and after 0 is written to this bit, RTCA0SEC is counted up. However, when the value of the second counter is written while RTCA0WAIT = 1, the overflow information that was held is discarded. 0: Counter operation 1: Count-up operation of RTCA0SEC, RTCA0MIN, RTCA0HOUR, RTCA0WEEK, RTCA0DAY, RTCA0MONTH, RTCA0YEAR is stopped (count-up operation of second, minute, hour, week, day, month, and year count registers is stopped)	R/W
1	RTCA0WST	RTC Controller Counter Wait Status When 1 is written to RTCA0WAIT, the value of this bit becomes 1 when the count-up operation of RTCA0SEC, RTCA0MIN, RTCA0HOUR, RTCA0WEEK, RTCA0DAY, RTCA0MONTH, RTCA0YEAR has stopped completely. Before reading and writing clock counters (RTCA0SEC, RTCA0MIN, RTCA0HOUR, RTCA0WEEK, RTCA0DAY, RTCA0MONTH, RTCA0YEAR) during clock counter operation (RTCA0CE = 1), check that the value of this register is 1. Also, when write to a clock counter (RTCA0SEC, RTCA0MIN, RTCA0HOUR, RTCA0WEEK, RTCA0DAY, RTCA0MONTH, RTCA0YEAR) occurred, the value written to RTCA0WAIT is reflected only when the write operation has completed (status hold). 0: Count-up status of RTCA0SECC, RTCA0MINC, RTCA0HOURC, RTCA0WEEKC, RTCA0DAYC, RTCA0MONC, RTCA0YEARC 1: Count-up stopped status of RTCA0SECC, RTCA0MINC, RTCA0HOURC, RTCA0WEEKC, RTCA0DAYC, RTCA0MONC, RTCA0YEARC (count-up operation of second, minute, hour, week, day, month, and year count registers is stopped)	R
2	RTCA0RSUB	RTCA0SUBC Data Transfer Control This is a control bit for transferring the value of RTCA0SUBC of RTCA0SRBU. Use it when reading the value of RTCA0SRBU while the clock counter operation is enabled (RTCA0CE = 1). When 1 is written to this bit, the value of RTCA0SUBC is loaded to RTCA0SRBU in synchronization with PCLKRTC. For the usage method, see section 25.3.1.4. Reading RTCA0SRBU While Clock Counter Operation is Enabled. 0: RTCA0SRBU data hold 1: Transfer of value of RTCA0SUBC to RTCA0SRBU	R/W
3	RTCA0RSST	RTCA0SRBU Transfer Status When 1 is written to RTCA0RSUB, the value of this bit becomes 1 when the value of RTCA0SUBC is loaded to RTCA0SRBU. Before reading RTCA0SRBU during clock counter operation (RTCA0CE = 1), check that the value of this register is 1. 0: RTCA0SRBU data hold status 1: Transfer of the value of RTCA0SUBC to RTCA0SRBU completed	R
4	RTCA0WSST	RTCA0SCMP Write Status This bit is set to 1 when RTCA0SCMP is written to while the clock counter operation is enabled (RTCA0CE = 1). It is then cleared to 0 on completion of RTCA0SCMP write (RTCA0SUBC overflow). Do not write to RTCA0SCMP while the value of this bit is 1 because write to RTCA0SCMP is in progress. 0: RTCA0SCMP write completed 1: RTCA0SCMP write in progress	R
31:5	—	These bits are read as 0. The write value should be 0.	R/W

25.2.4 RTCA0SUBC : RTC Sub Count Register

Base address: RTC = 0x8100_9000

Offset address: 0x0C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	RTCA0SUBC[21:0]																					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
21:0	RTCA0SUBC[21:0]	Register that counts the 1 second reference time This register is cleared on reset or on write to the RTCA0SEC (RTC Sec Count Buffer register) or RTCA0TIME (RTC Time Set register), and arbitrary values cannot be written to this register. Count-up occurs on clock input when the clock counter operation is enabled (RTCA0CE = 1). When this register is read while the clock counter operation is enabled (RTCA0CE = 1), the register value, which changes in synchronization with PCLKRTC, is read asynchronously, so that the read value is not guaranteed. To check the value of this register while the clock counter operation is enabled (RTCA0CE = 1), use the RTCA0SRBU register. The count-up operation starts from 0x0, and on matching the value set to RTCA0SCMP, an overflow signal is output to RTCA0SEC (Second Count Buffer register), and this register is cleared. [Example] Operation using 195.3 kHz clock 195312 - 1 = 195311 (decimal code) = 0x2FAEF is set to RTCA0SCMP. Counting up is performed each time a 195.3 kHz clock is input, taking on values from 0x0 to 0x2FAEF. 1 second is counted when the value changes from 0x2FAEF to 0x0.	R
31:22	—	These bits are read as 0.	R

25.2.5 RTCA0SRBU : RTC Sub Count Register Read Buffer

Base address: RTC = 0x8100_9000

Offset address: 0x10

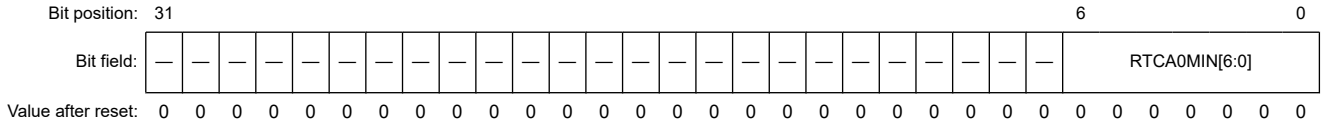
Bit position:	31										21																				0
Bit field:	—	—	—	—	—	—	—	—	—	—	RTCA0SRBU[21:0]																					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
21:0	RTCA0SRBU[21:0]	Read buffer register of RTCA0SUBC This register is cleared when reset, at which time arbitrary values cannot be written. When 1 is written to the RTCA0RSUB bit while the clock counter operation is enabled (RTCA0CE = 1), the value of RTCA0SUBC is loaded to this register in synchronization with PCLKRTC clock. Be sure to perform RTCA0SRBU read according to the flow described in section 25.3.1.4. Reading RTCA0SRBU While Clock Counter Operation is Enabled.	R
31:22	—	These bits are read as 0.	R

25.2.6 RTCA0SEC : RTC Sec Count Buffer Register

Base address: RTC = 0x8100_9000

Offset address: 0x14



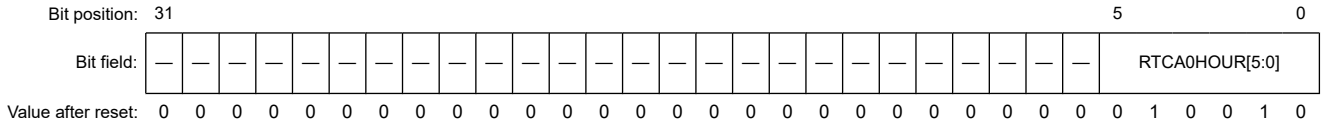
Bit position:	31																								6						0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RTCA0SEC[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	RTCA0SEC[6:0]	Buffer register to read/write RTC Second Count register (RTCA0SECC). This register is used when Second Count register is read and written. When setting this register, a decimal value of 00 to 59 must be set in BCD code.	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

25.2.7 RTCA0MIN : RTC Min Count Buffer Register

Base address: RTC = 0x8100_9000

Offset address: 0x18

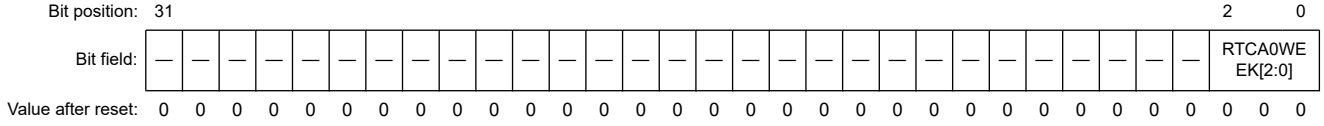


Bit	Symbol	Function	R/W
6:0	RTCA0MIN[6:0]	Buffer register to read/write RTC Minute Count register (RTCA0MINC). This register is used when Minute Count register is read and written. When setting this register, a decimal value of 00 to 59 must be set in BCD code.	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

25.2.8 RTCA0HOUR : RTC Hour Count Buffer Register

Base address: RTC = 0x8100_9000

Offset address: 0x1C



Bit	Symbol	Function	R/W
5:0	RTCA0HOUR[5:0]	Buffer register to read/write RTC Hour Count register (RTCA0HOURC). This register is used when Hour Count register is read and written. When setting this register, a decimal value of 01 to 12 or 21 to 32 must be set when RTCA0AMPM = 0, or a decimal value of 0 to 23 when RTCA0AMPM = 1, in BCD code in both cases. Display of RTCA0HOUR is 12-hour display when the RTCA0AMPM bit is set to 0, and 24-hour display when it is 1. In the case of 12-hour display, am/pm is indicated by the 5th bit of RTCA0HOUR. During am, RTCA0HOUR[5] = 0, and during pm, RTCA0HOUR[5] = 1.	R/W
31:6	—	These bits are read as 0. The write value should be 0.	R/W

12-hour display		24-hour display	
Time	RTCA0HOUR display	Time	RTCA0HOUR display

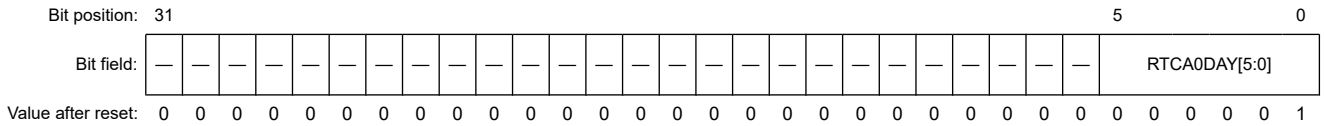
11 pm	0x31	23	0x23

25.2.9 RTCA0WEEK : RTC Week Count Buffer Register

Base address: RTC = 0x8100_9000

Offset address: 0x20

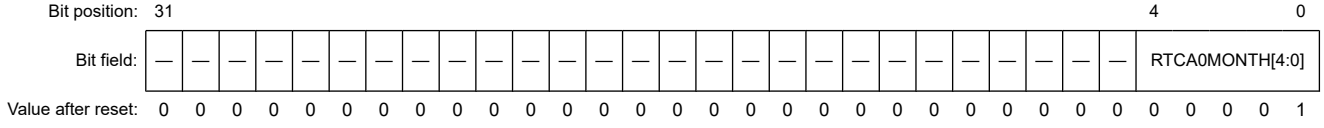


Bit	Symbol	Function	R/W
2:0	RTCA0WEEK[2:0]	Buffer register to read/write RTC Week Count register (RTCA0WEEKC). This register is used when Week Count register is read and written. When setting this register, a decimal value of 00 to 06 must be set in BCD code. There is no particular correspondence between the value of RTCA0WEEK and the day of the week. Set the correspondence according to the application to be used. [Example] 0 → Sunday, 1 → Monday, …, 6 → Saturday	R/W
31:3	—	These bits are read as 0. The write value should be 0.	R/W

25.2.10 RTCA0DAY : RTC Day Count Buffer Register

Base address: RTC = 0x8100_9000

Offset address: 0x24

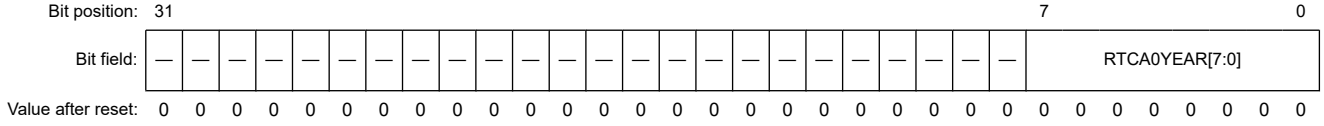


Bit	Symbol	Function	R/W
5:0	RTCA0DAY[5:0]	Buffer register to read/write RTC Day Count register (RTCA0DAYC). This register is used when Day Count register is read and written. When setting this register, a decimal value of 01 to 31 must be set in BCD code. ● 01 to 31 (January, March, May, July, August, October, December) ● 01 to 30 (April, June, September, November) ● 01 to 29 (February, leap year) ● 01 to 28 (February, non-leap year)	R/W
31:6	—	These bits are read as 0. The write value should be 0.	R/W

25.2.11 RTCA0MONTH : RTC Month Count Buffer Register

Base address: RTC = 0x8100_9000

Offset address: 0x28

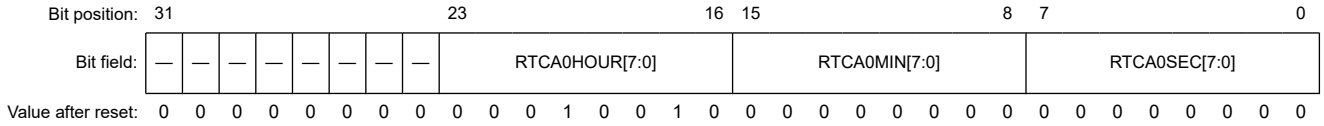


Bit	Symbol	Function	R/W
4:0	RTCA0MONTH[4:0]	Buffer register to read/write RTC Month Count register (RTCA0MONC). This register is used when Month Count register is read and written. When setting this register, a decimal value of 01 to 12 must be set in BCD code.	R/W
31:5	—	These bits are read as 0. The write value should be 0.	R/W

25.2.12 RTCA0YEAR : RTC Year Count Buffer Register

Base address: RTC = 0x8100_9000

Offset address: 0x2C

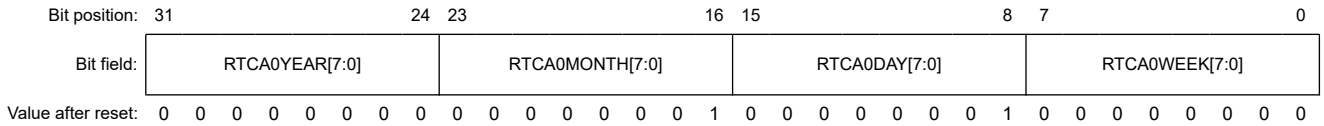


Bit	Symbol	Function	R/W
7:0	RTCA0YEAR[7:0]	Buffer register to read/write RTC Year Count register (RTCA0YEARC). This register is used when Year Count register is read and written. When setting this register, a decimal value of 00 to 99 must be set in BCD code.	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

25.2.13 RTCA0TIME : RTC Time Set Register

Base address: RTC = 0x8100_9000

Offset address: 0x30



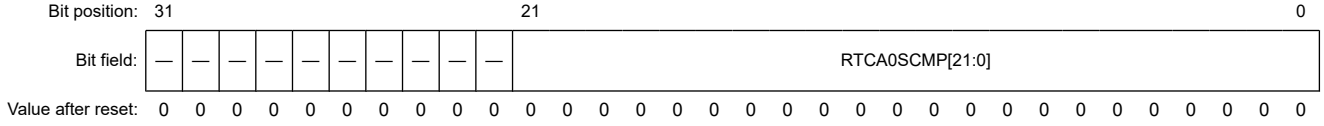
Bit	Symbol	Function	R/W
7:0	RTCA0SEC[7:0]	See RTCA0SEC register	R/W
15:8	RTCA0MIN[7:0]	See RTCA0MIN register	R/W
23:16	RTCA0HOUR[7:0]	See RTCA0HOUR register	R/W
31:24	—	These bits are read as 0. The write value should be 0.	R/W

The RTCA0TIME register is a register for accessing the RTCA0HOUR, RTCA0MIN, and RTCA0SEC registers simultaneously. By using this register, the RTCA0HOUR, RTCA0MIN, and RTCA0SEC registers can be read or written simultaneously.

25.2.14 RTCA0CAL : RTC Calendar Set Register

Base address: RTC = 0x8100_9000

Offset address: 0x34



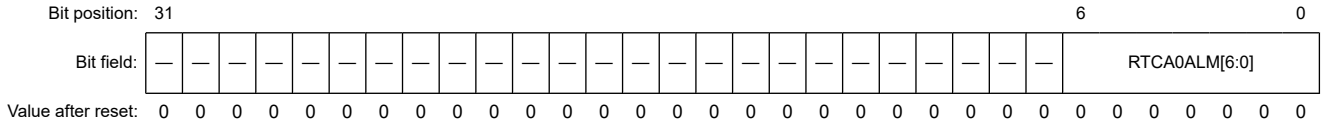
Bit	Symbol	Function	R/W
7:0	RTCA0WEEK[7:0]	See RTCA0WEEK register	R/W
15:8	RTCA0DAY[7:0]	See RTCA0DAY register	R/W
23:16	RTCA0MONTH[7:0]	See RTCA0MONTH register	R/W
31:24	RTCA0YEAR[7:0]	See RTCA0YEAR register	R/W

The RTCA0CAL register is a register for accessing the RTCA0YEAR, RTCA0MONTH, RTCA0DAY, and RTCA0WEEK registers simultaneously. By using this register, the RTCA0YEAR, RTCA0MONTH, RTCA0DAY, and RTCA0WEEK registers can be read or written simultaneously.

25.2.15 RTCA0SCMP : RTC Sub Count Compare Register

Base address: RTC = 0x8100_9000

Offset address: 0x3C



Bit	Symbol	Function	R/W
21:0	RTCA0SCMP[21:0]	Register that sets the compare value of RTCA0SUBC (sub-counter). The setting of this register is valid when RTCA0SLSB = 1. When RTCA0SLSB = 1 is set, RTCA0SUBC starts counting up from 0, and when the value set to this register is matched, an overflow signal is output to RTCA0SEC (Second Count Buffer register), and the register is cleared. Set the value for this register according to the frequency of the selected input clock. Accurate one second counting can be performed to PCLKRTC through the value set to this register. [Example] Setting of 195,312 (decimal) - 1 = 195,311 (decimal) = 0x2FAEF to RTCA0SCMP When performing write to this register during clock counter operation (RTCA0CE = 1), be sure to check that RTCA0WSST = 0. When writing to this register during clock counter operation (RTCA0CE = 1), write ends at the timing of RTCA0SUBC overflow. Be sure to perform RTCA0SCMP write according to the flows described in section 25.3.1.1. Initial Setting and section 25.3.1.6. Writing to RTCA0SCMP During Clock Counter Operation.	R/W
31:22	—	These bits are read as 0. The write value should be 0.	R/W

25.2.16 RTCA0ALM : RTC Alarm Min Set Register

Base address: RTC = 0x8100_9000

Offset address: 0x40

Bit	Symbol	Function	R/W
6:0	RTCA0ALM[6:0]	RTCA0ALM is a register that performs the minute setting for the alarm interrupt. Set a decimal value of 00 to 59 in BCD code (alarm detection is not performed if an out-of-range value is set.)	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

25.2.17 RTCA0ALH : RTC Alarm Hour Set Register

Base address: RTC = 0x8100_9000

Offset address: 0x44

Bit position:	31																							5	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RTCA0ALH[5:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0

Bit	Symbol	Function	R/W
5:0	RTCA0ALH[5:0]	RTCA0ALH is a register that performs the hour setting for the alarm interrupt. When RTCA0AMPM = 0, set a decimal value of 01 to 12 or 21 to 32, and when RTCA0AMPM = 1, set a decimal value of 00 to 23, in BCD code in both cases (alarm detection is not performed if an out-of-range value is set.)	R/W
31:6	—	These bits are read as 0. The write value should be 0.	R/W

25.2.18 RTCA0ALW : RTC Alarm Week Set Register

Base address: RTC = 0x8100_9000

Offset address: 0x48

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	RTCA0ALW6	RTCA0ALW5	RTCA0ALW4	RTCA0ALW3	RTCA0ALW2	RTCA0ALW1	RTCA0ALW0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RTCA0ALW0	Alarm interrupt day of the week setting bit 0 0: Disable alarm 1: Enable alarm	R/W
1	RTCA0ALW1	Alarm interrupt day of the week setting bit 1 0: Disable alarm 1: Enable alarm	R/W
2	RTCA0ALW2	Alarm interrupt day of the week setting bit 2 0: Disable alarm 1: Enable alarm	R/W
3	RTCA0ALW3	Alarm interrupt day of the week setting bit 3 0: Disable alarm 1: Enable alarm	R/W
4	RTCA0ALW4	Alarm interrupt day of the week setting bit 4 0: Disable alarm 1: Enable alarm	R/W
5	RTCA0ALW5	Alarm interrupt day of the week setting bit 5 0: Disable alarm 1: Enable alarm	R/W
6	RTCA0ALW6	Alarm interrupt day of the week setting bit 6 0: Disable alarm 1: Enable alarm	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

The RTCA0ALW register enables the alarm corresponding to RTCA0WEEK value. For example, if RTCA0WEEK = 0 is Sunday, RTCA0ALW0 bit functions as Sunday alarm. If RTCA0WEEK = 6 is Saturday, RTCA0ALW6 bit functions as Saturday alarm.

25.2.19 RTCA0SECC : RTC Second Count Register

Base address: RTC = 0x8100_9000

Offset address: 0x4C

Bit position:	31																								6						0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RTCA0SECC[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	RTCA0SECC[6:0]	Counts up the seconds This register counts from 00 to 59, and when its value changes from 59 to 00 in BCD code, an overflow signal is output to RTCA0MINC.	R
31:7	—	These bits are read as 0.	R

25.2.20 RTCA0MINC : RTC Minute Count Register

Base address: RTC = 0x8100_9000

Offset address: 0x50

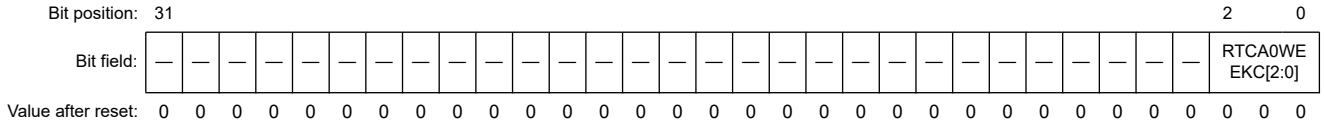
Bit position:	31																								6						0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RTCA0MINC[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	RTCA0MINC[6:0]	Counts up the minutes This register counts from 00 to 59, and when its value changes from 59 to 00 in BCD code, an overflow signal is output to RTCA0HOURC.	R
31:7	—	These bits are read as 0.	R

25.2.21 RTCA0HOURC : RTC Hour Count Register

Base address: RTC = 0x8100_9000

Offset address: 0x54



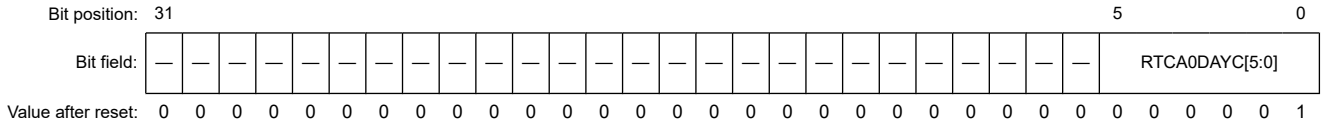
Bit position:	31																									5					0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RTCA0HOURC[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0

Bit	Symbol	Function	R/W
5:0	RTCA0HOURC[5:0]	Counts up the hours This register counts from 00 to 23, or 01 to 12, or 21 to 32 in BCD code depending on the setting of RTCA0AMPM, and when its value changes from 23 to 00 or from 32 to 01, an overflow signal is output to RTCA0DAY and RTCA0WEEK.	R
31:6	—	These bits are read as 0.	R

25.2.22 RTCA0WEEKC : RTC Week Count Register

Base address: RTC = 0x8100_9000

Offset address: 0x58

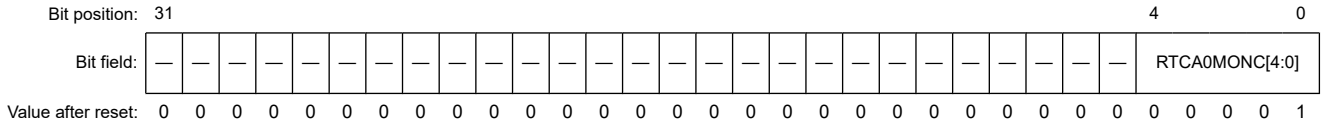


Bit	Symbol	Function	R/W
2:0	RTCA0WEEKC[2:0]	Counts up the weeks This register counts up on occurrence of RTCA0HOURC overflow when the clock counter operation is enabled (RTCA0CE = 1).	R
31:3	—	These bits are read as 0.	R

25.2.23 RTCA0DAYC : RTC Day Count Register

Base address: RTC = 0x8100_9000

Offset address: 0x5C



Bit	Symbol	Function	R/W
5:0	RTCA0DAYC[5:0]	Counts up the days This register counts up on occurrence of RTCA0HOURC overflow when the clock counter operation is enabled (RTCA0CE = 1). This register counts according to the value of RTCA0MONC, and on occurrence of an overflow, an overflow signal is output to RTCA0MONC.	R
31:6	—	These bits are read as 0.	R

25.2.24 RTCA0MONC : RTC Month Count Register

Base address: RTC = 0x8100_9000

Offset address: 0x60

Bit	Symbol	Function	R/W
4:0	RTCA0MONC[4:0]	Counts up the months This register counts up on occurrence of RTCA0DAYC overflow while the clock counter operation is enabled (RTCA0CE = 1). This register counts from 01 to 12 in BCD code, and when its value changes from 12 to 01, an overflow signal is output to RTCA0YEARC.	R
31:5	—	These bits are read as 0.	R

25.2.25 RTCA0YEARC : RTC Year Count Register

Base address: RTC = 0x8100_9000

Offset address: 0x64

Bit position:	31																						7							0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RTCA0YEARC[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	RTCA0YEARC[7:0]	Counts up the years This register counts up on occurrence of RTCA0MONC overflow while the clock counter operation is enabled (RTCA0CE = 1). This register counts from 00 to 99 in BCD code.	R
31:8	—	These bits are read as 0.	R

25.2.26 RTCA0TIMEC : RTC Time Count Register

Base address: RTC = 0x8100_9000

Offset address: 0x68

Bit position:	31								23							16	15							8	7						0
Bit field:	—	—	—	—	—	—	—	—	RTCA0HOURC[7:0]								RTCA0MINC[7:0]								RTCA0SECC[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	RTCA0SECC[7:0]	See RTCA0SECC register	R
15:8	RTCA0MINC[7:0]	See RTCA0MINC register	R
23:16	RTCA0HOURC[7:0]	See RTCA0HOURC register	R
31:24	—	These bits are read as 0.	R

This register is for reading the RTCA0HOURC, RTCA0MINC, and RTCA0SECC simultaneously.

25.2.27 RTCA0CALC : RTC Calendar Count Register

Base address: RTC = 0x8100_9000

Offset address: 0x6C

Bit position:	31							24	23							16	15							8	7						0
Bit field:	RTCA0YEARC[7:0]								RTCA0MONC[7:0]								RTCA0DAYC[7:0]								RTCA0WEEKC[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	RTCA0WEEKC[7:0]	See RTCA0WEEKC register	R
15:8	RTCA0DAYC[7:0]	See RTCA0DAYC register	R
23:16	RTCA0MONC[7:0]	See RTCA0MONC register	R
31:24	RTCA0YEARC[7:0]	See RTCA0YEARC register	R

The RTCA0CALC register is for reading the RTCA0YEARC, RTCA0MONC, RTCA0DAYC, and RTCA0WEEKC simultaneously.

25.3 Operation

25.3.1 Programming RTC

25.3.1.1 Initial Setting

Perform initial setting of RTC according to the flow in Figure 25.2.

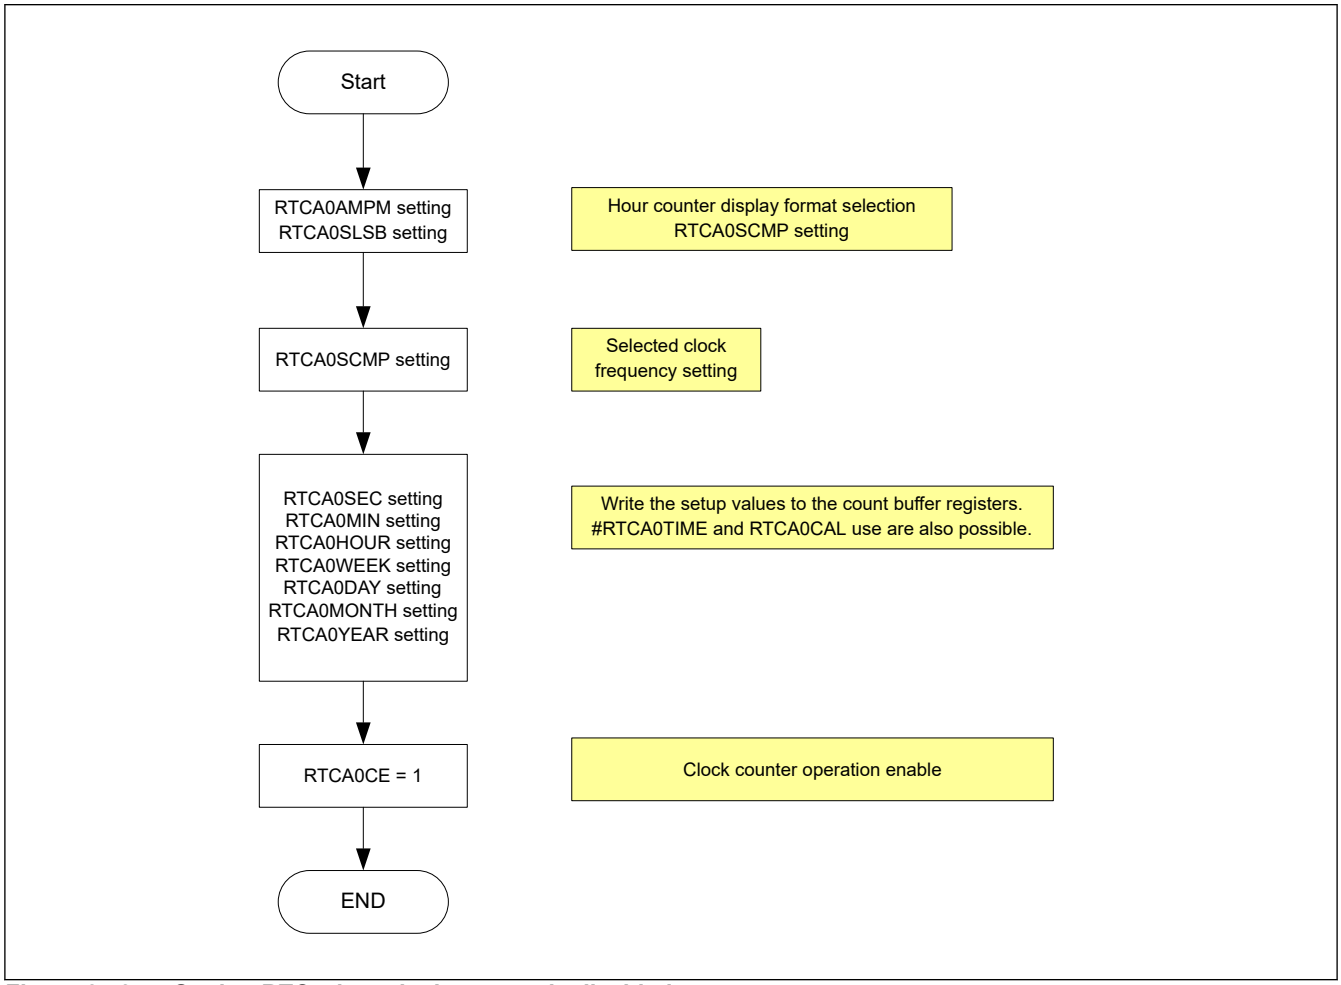


Figure 25.2 Setting RTC when clock counter is disabled

The internal clock counter operates in synchronization with PCLKRTC, and two PCLKRTC cycles are required until completion of the initial value setting procedure described in Figure 25.2. Therefore, PCLKL must be continuously supplied until completion of the initial value setting procedure. To stop PCLKL supply after the initial value setting procedure, check first that RTCA0CEST = 1 (clock counter operation enabled status).

25.3.1.2 Writing to Clock Counters While Clock Counter Operation is Enabled

Be sure to write to the RTCA0SEC, RTCA0MIN, RTCA0HOUR, RTCA0WEEK, RTCA0DAY, RTCA0MONTH, and RTCA0YEAR counters while the clock counter operation is enabled (RTCA0CE = 1) according to the flow in Figure 25.3.

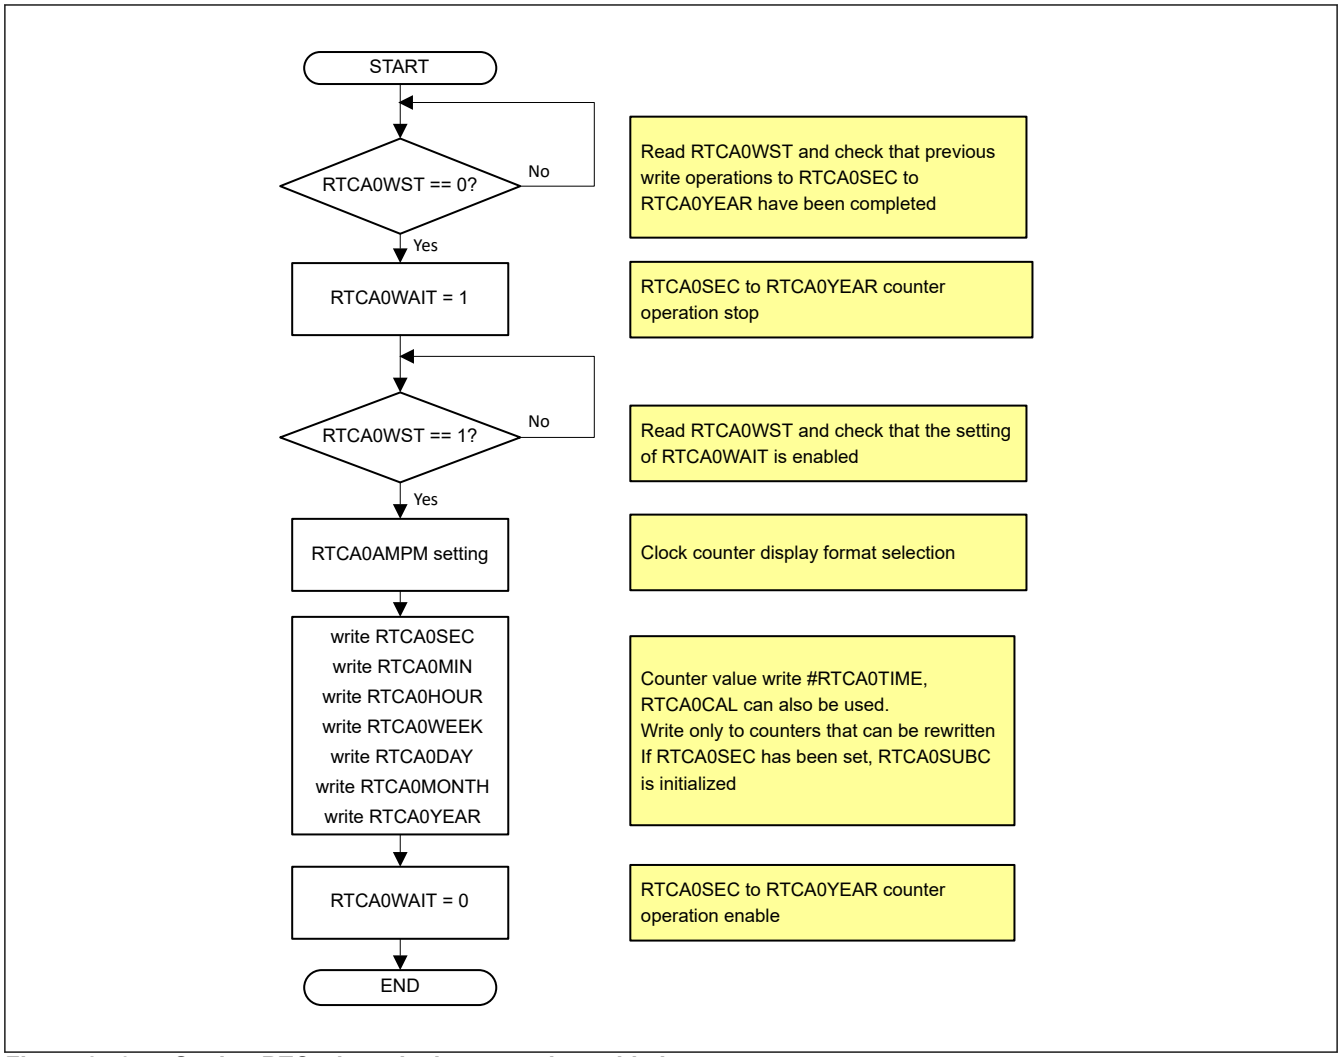

Figure 25.3 Setting RTC when clock counter is enabled

It is prohibited to write two or more times to the same register in the flow described in Figure 25.3. For example, it is prohibited to write twice to the second counter. End the programming flow within 1 second.

When RTCA0WAIT = 1 is set, the operation of RTCA0SEC (second counter buffer) stops. If RTCA0SUBC overflow occurs while RTCA0WAIT = 1, one overflow is held internally. However, if overflow occurs two or more times, the overflow count cannot be held.

The internal clock counter operates in synchronization with PCLKRTC. Two PCLKRTC cycles are required until completion of the above-described initial value setting procedure. Therefore, PCLKL must be continuously supplied until completion of the initial value setting procedure.

To stop PCLKL supply after the initial value setting procedure, check first that RTCA0WST = 0 (clock counter count-up status).

25.3.1.3 Reading Clock Counters While Clock Counter Operation is Enabled

There are two methods to read clock counters while clock counter operation is enabled (RTCA0CE = 1):

- Using Count Buffer Registers
- Reading Count Registers

The advantages and disadvantages of the two methods are mentioned in the next table.

Method	Advantage	Disadvantage
(1) Using count buffer registers	It is unnecessary to read clock counter several times such as in method (2), because clock counters are read synchronously.	Program wait*1 occurs from setting RTCA0WAIT = 1 to completion of data transfer.
(2) Reading count registers	Program wait does not occur.	When the reading of counter and overflow of RTCA0SUBC competed with each other, the clock counters are read several times again*2.

Note 1. The maximum of program wait is 3 clock cycles of PCLKL + 2 clock cycles of PCLKRTC.
Note 2. When reading of counter and overflow of sub-counter competed with each other, unknown value might be read.

(1) Using Count Buffer Registers

This is how to read clock counter value by using buffer registers. The value of clock count registers are transferred to count buffer registers by writing 1 in RTCA0WAIT. The count buffer registers are read after that. In this method, program wait occurs from setting RTCA0WAIT = 1 to completion of data transfer.

Reading clock counters while clock counter operation is enabled (RTCA0CE = 1)

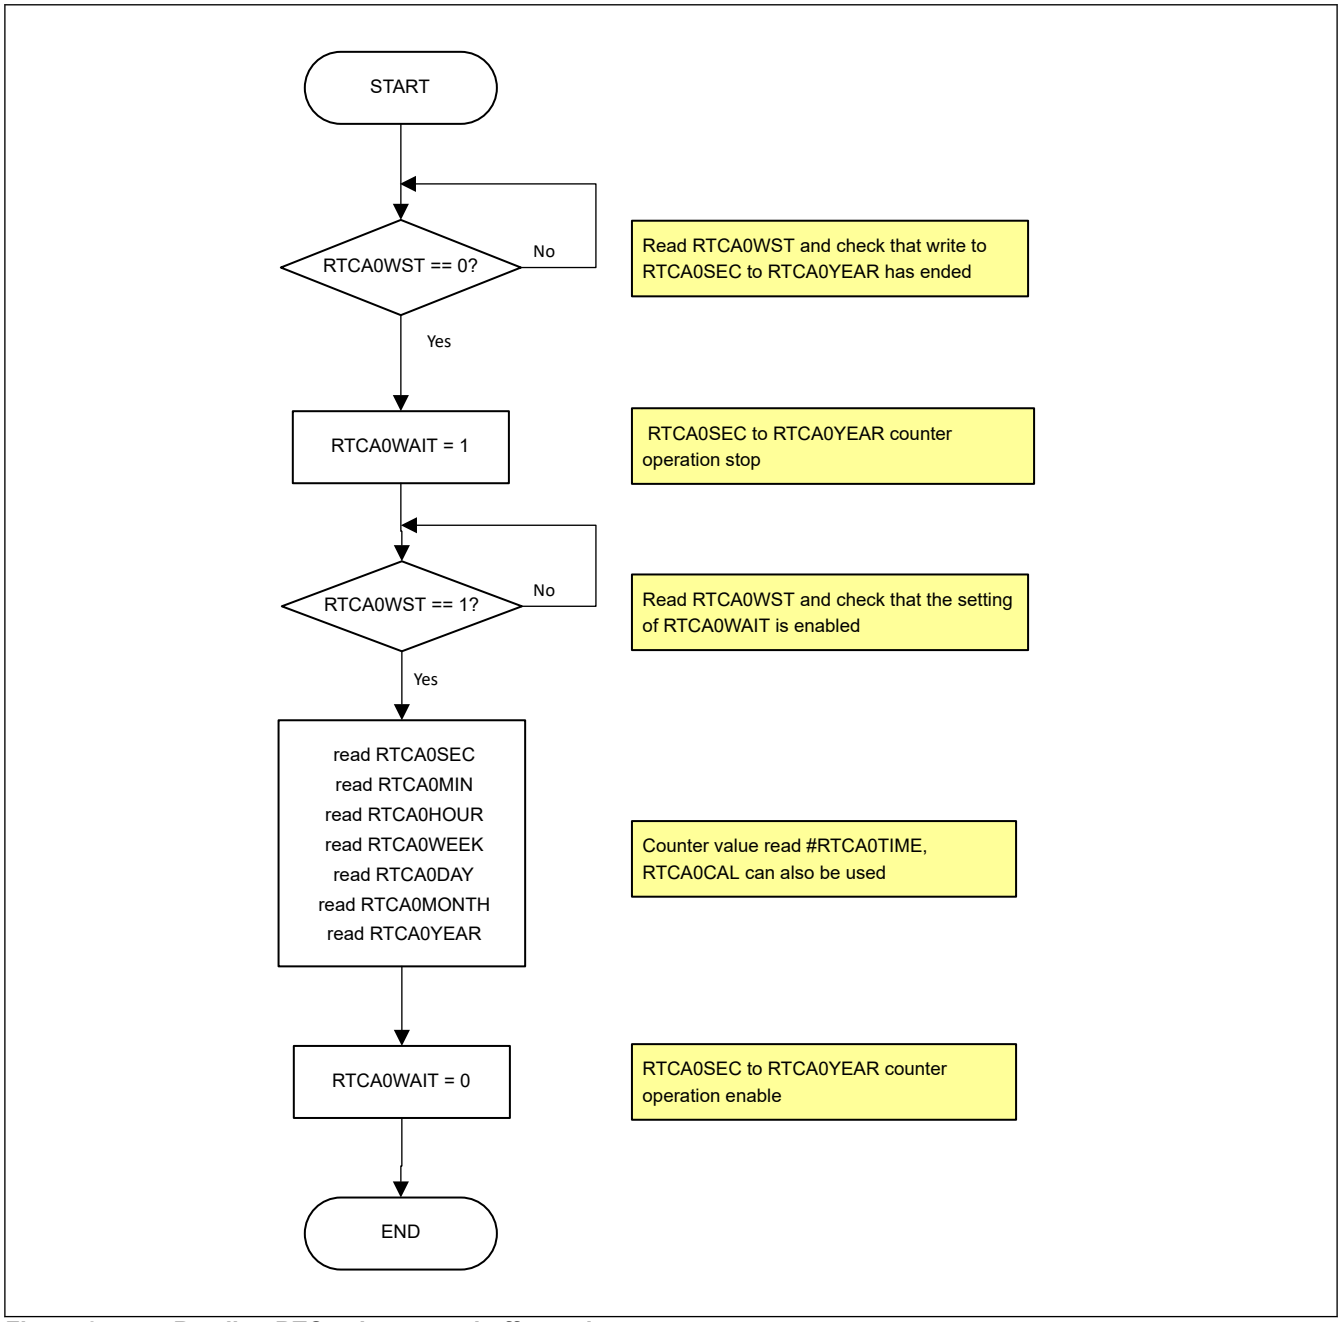

Figure 25.4 Reading RTC using count buffer registers

End this flow within 1 second.

When RTCA0WAIT = 1 is set, the operation of RTCA0SEC (second counter buffer) stops. If RTCA0SUBC overflow occurs while RTCA0WAIT = 1, one overflow is held internally. However, if overflow occurs two or more times, the overflow count cannot be held.

(2) Reading Count Registers

This is how to read clock counter immediately. RTCA0SECC (RTC Second Count Register) is read twice in the beginning and in the end. This is because it confirms whether overflow of sub-counter does not occur while counter is read. After that, the first read value is compared with the second read value. If the first read value is the same as the second read value, it is determined that overflow of sub-counter did not occur during counter read flow. If the first read value is not the same as the second read value, it is determined that overflow of sub-counter occurred during counter read flow, and it begins to read the clock counter again.

Reading clock counters while clock counter operation is enabled (RTCA0CE = 1)

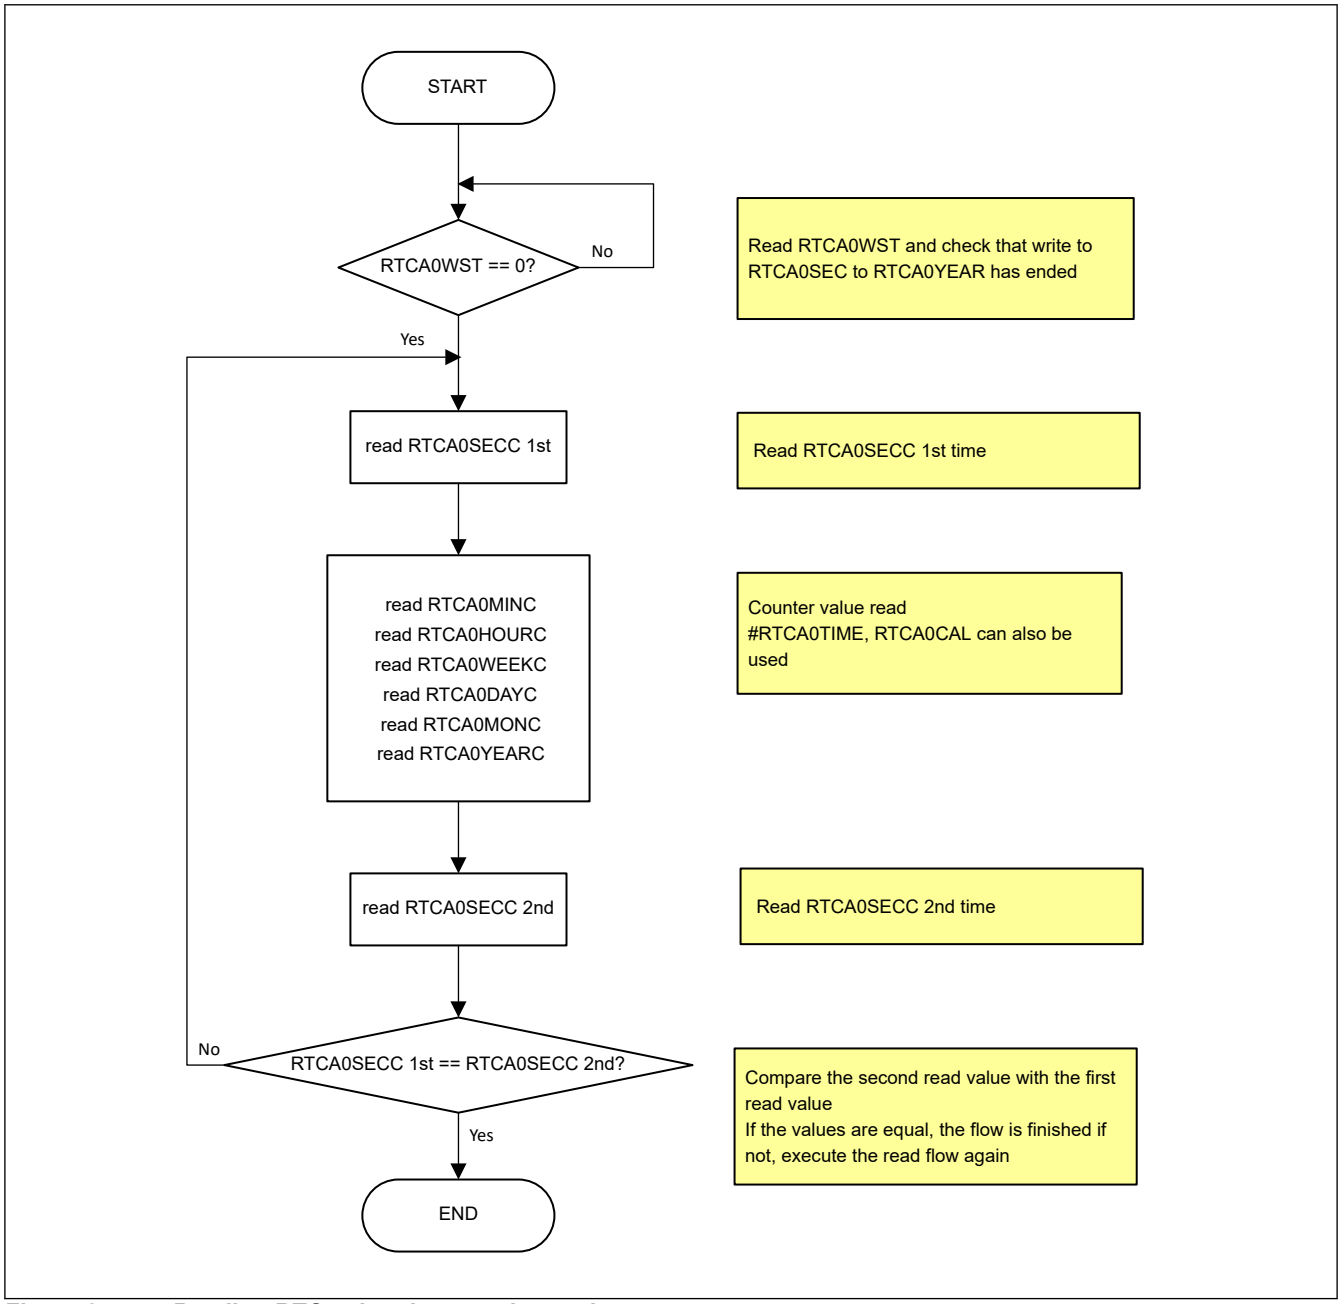

Figure 25.5 Reading RTC using the counting registers

End this flow within 1 second.

When it is not finished within one second, read clock counter value cannot be assured.

25.3.1.4 Reading RTCA0SRBU While Clock Counter Operation is Enabled

Be sure to read RTCA0SRBU while the clock counter operation is enabled (RTCA0CE = 1) according to the flow in Figure 25.6.

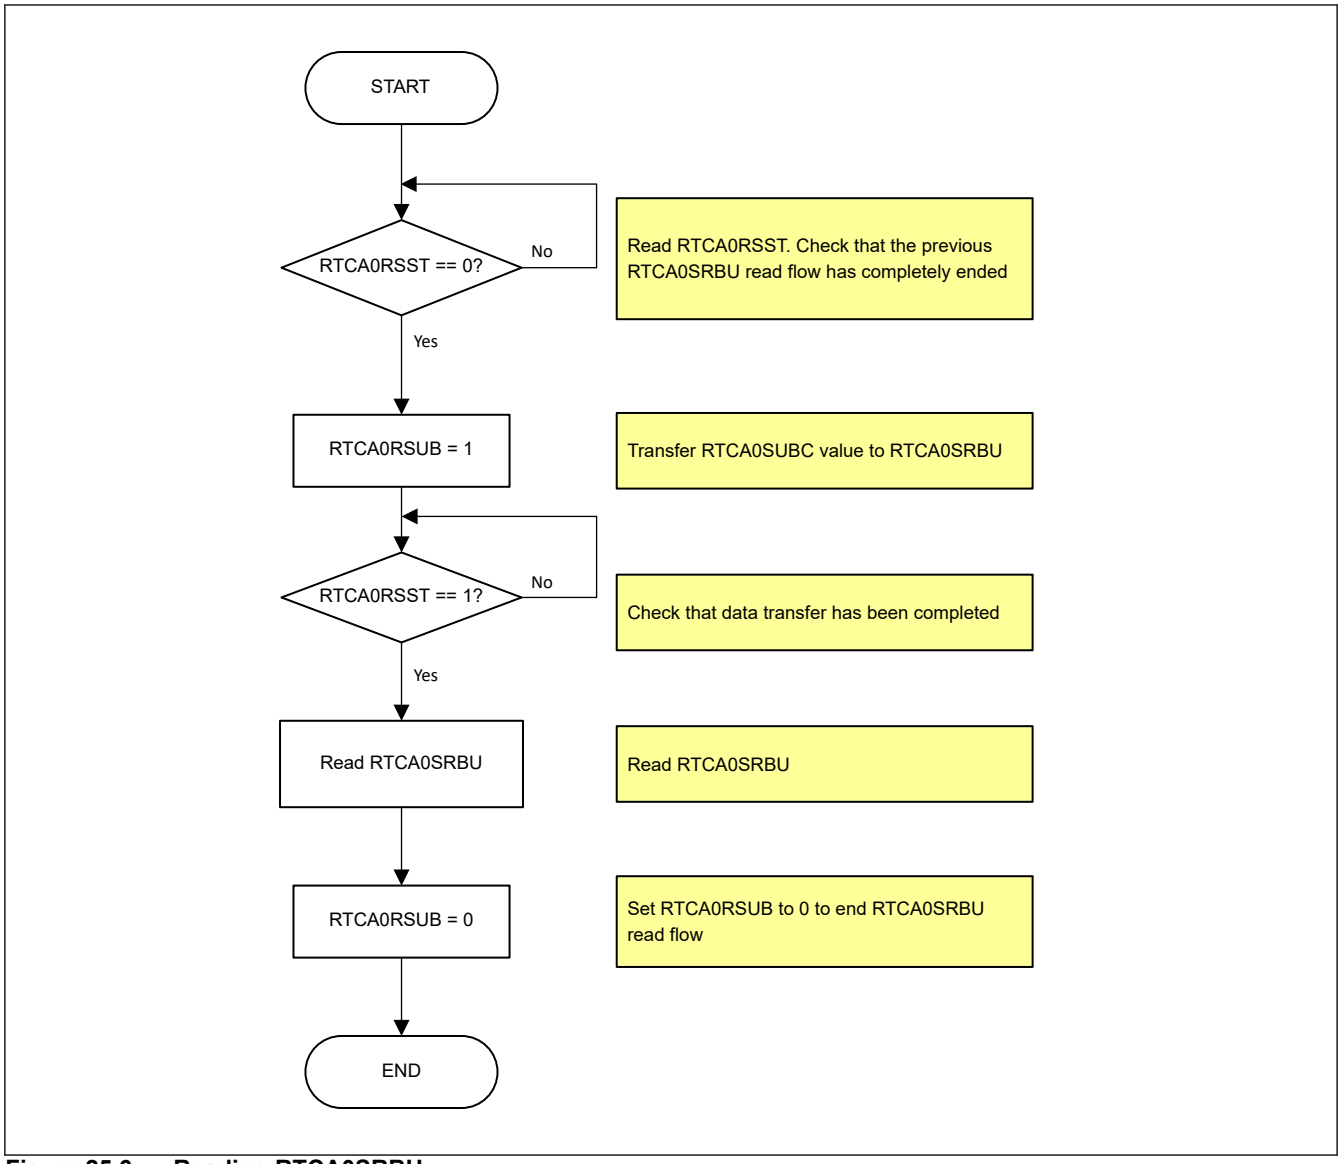

Figure 25.6 Reading RTCA0SRBU

25.3.1.5 Initialization of RTC While Clock Counter Operation is Enabled

Be sure to perform initialization of the RTC controller while the clock counter operation is enabled (RTCA0CE = 1) according to the flow in Figure 25.7. To restart the RTC controller operation at the end of the flow, implement the flow as described in section 25.3.1.1. Initial Setting.

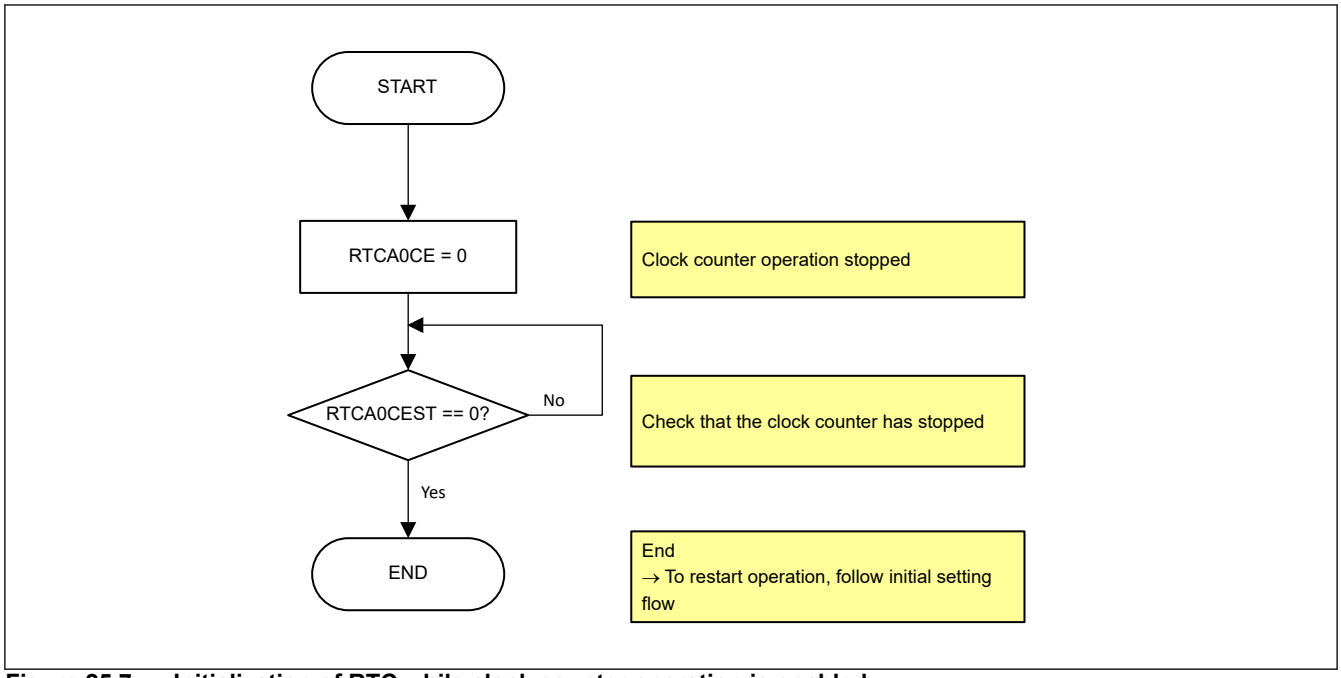

Figure 25.7 Initialization of RTC while clock counter operation is enabled

25.3.1.6 Writing to RTCA0SCMP During Clock Counter Operation

Be sure to write to RTCA0SCMP while the clock counter operation is enabled (RTCA0CE = 1) according to the flow in Figure 25.8.

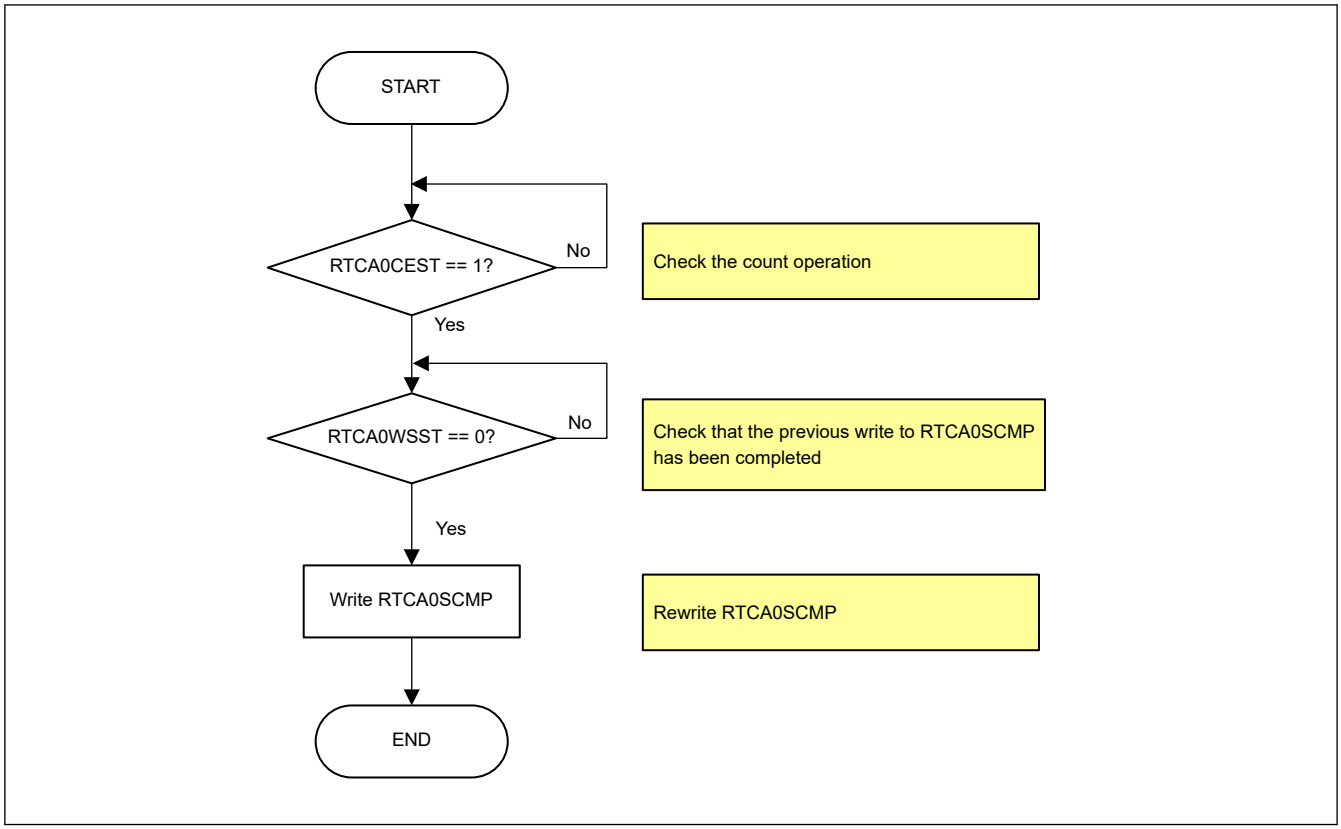

Figure 25.8 Writing to RTCA0SCMP

RTCA0WSST is set to 1 when RTCA0SCMP is written to while the clock counter operation is enabled (RTCA0CE = 1), and on completion of RTCA0SCMP write (RTCA0SUBC overflow), RTCA0WSST is cleared to 0. Because RTCA0WSST displays 1 for up to 1 second for this reason, caution is required when polling RTCA0WSST.

25.3.1.7 Changing the Setting of Fixed Interval Interrupt During Clock Counter Operation

Be sure to change the fixed interval interrupt setting while the clock counter operation is enabled (RTCA0CE = 1) according to the flow in Figure 25.9.

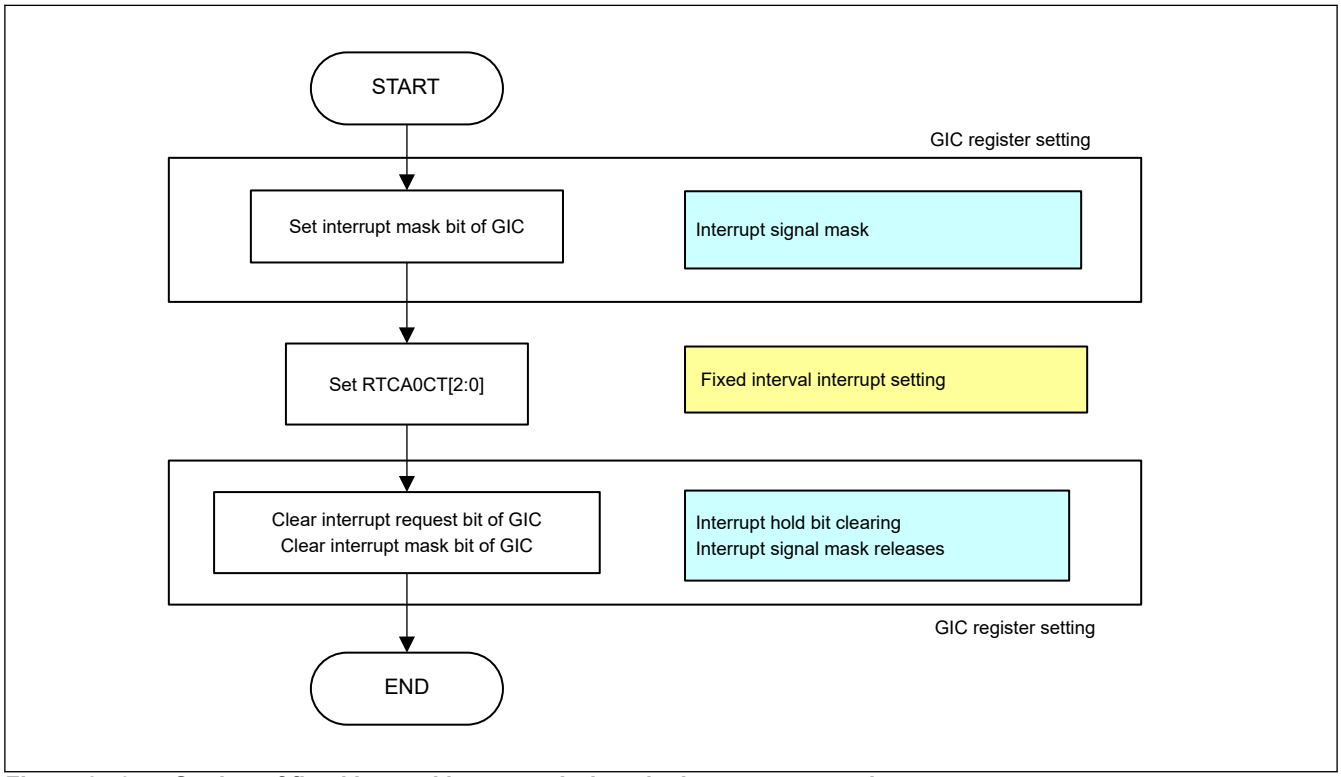

Figure 25.9 Setting of fixed interval interrupt during clock counter operation

25.3.1.8 Changing Alarm Setting During Clock Counter Operation

Be sure to change the alarm interrupt setting while the clock counter operation is enabled (RTCA0CE = 1) according to the flow in Figure 25.10.

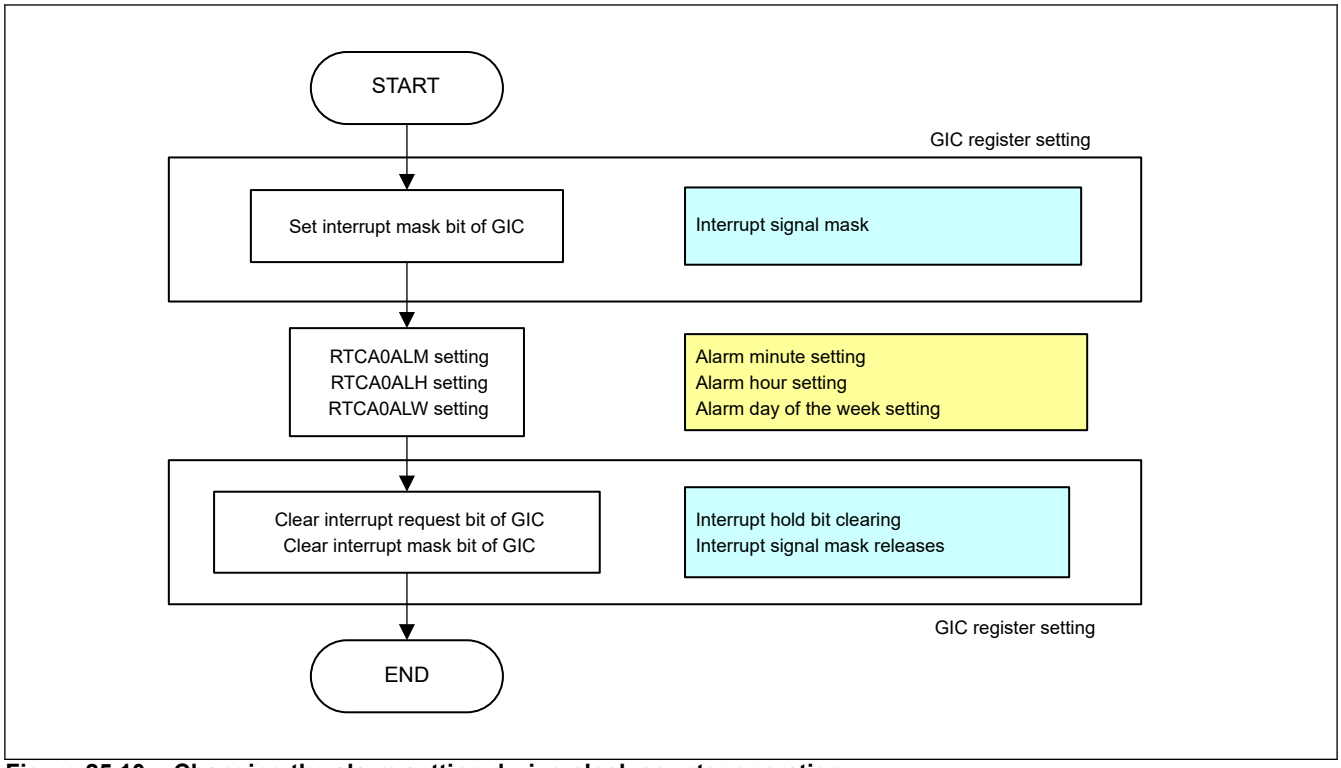

Figure 25.10 Changing the alarm setting during clock counter operation

26. Ethernet Subsystem

26.1 Overview

Ethernet Subsystem (Ethernet_SS) consists of Ethernet MAC (GMAC), EtherCAT Slave Controller (ESC), and RGMII/RMII converters. Three MAC-PHY interfaces supporting RGMII (port 2 only), MII, and RMII are shared with these functions.

Table 26.1 lists the specification of the Ethernet Subsystem and Figure 26.1 shows a block diagram of the Ethernet Subsystem.

Table 26.1 Ethernet Subsystem specifications

Item	Description
Ethernet function	• Gigabit Ethernet MAC (GMAC) • EtherCAT Slave Controller (ESC)
MAC-PHY interface	Supported interface by RGMII/RMII converter • RGMII (2.5 MHz/25 MHz/125 MHz) (port 2 only) • RMII (50 MHz) • MII (2.5 MHz/25 MHz)
Clock output for PHY	• 25 MHz reference clock output for each PHY • 50 MHz reference clock output for RMII
Event link (input)	• GMAC PTP Timer capture • EtherCAT DC capture (LATCH0/1)
Event link (output)	• PTP Timer pulse output • EtherCAT DC event (SYNC0/1)
Module-stop function	Module-stop state can be set to reduce power consumption each module

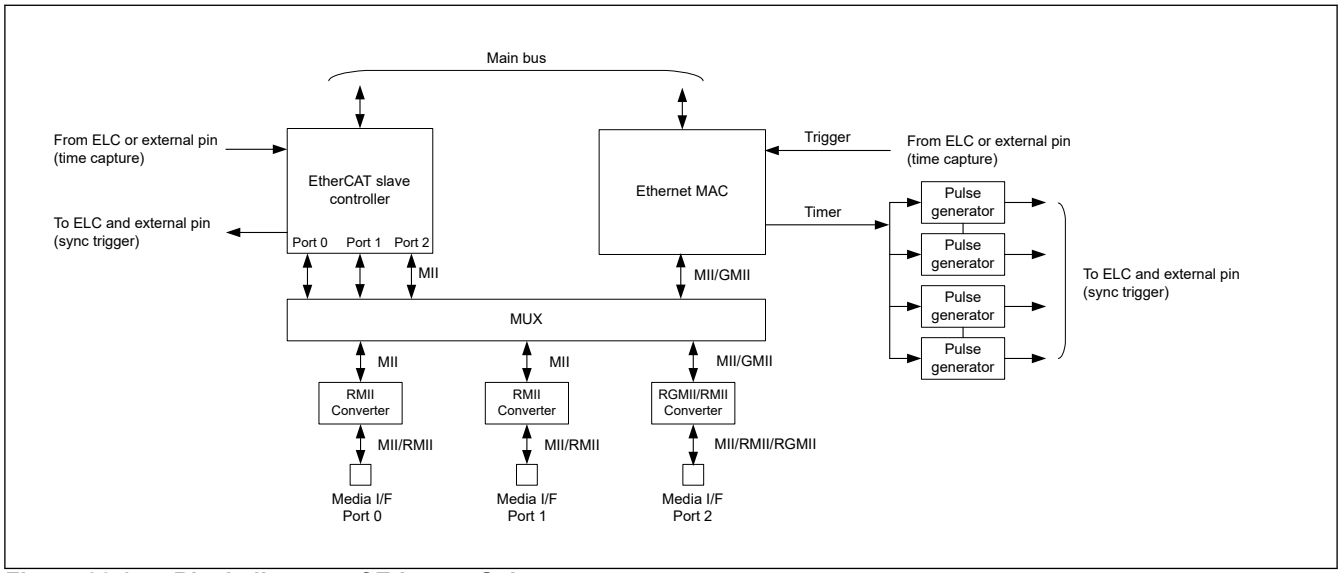

Figure 26.1 Block diagram of Ethernet Subsystem

Table 26.2 Ethernet Subsystem I/O pins (common PHY interface only)

Channel	Pin Name	I/O	Function
ETHn	ETHn_TXCLK	I/O	TX clock input pin (MII mode)/TX clock output pin (RGMII mode)
	ETHn_TXD0	Output	TX data 0 output pin (RGMII, RMII, and MII modes)
	ETHn_TXD1	Output	TX data 1 output pin (RGMII, RMII, and MII modes)
	ETHn_TXD2	Output	TX data 2 output pin (RGMII and MII modes)
	ETHn_TXD3	Output	TX data 3 output pin (RGMII and MII modes)
	ETHn_TXEN	Output	TX data enable pins (RMII and MII modes) TX data enable/TX data error (TX_CTL) pin (RGMII mode)
	ETH2_TXER	Output	TX data error output pin (MII mode)
	ETHn_RXCLK	Input	RX clock input pin (RGMII, RMII, and MII modes)
	ETHn_RXD0	Input	RX data 0 input pin (RGMII, RMII, and MII modes)
	ETHn_RXD1	Input	RX data 1 input pin (RGMII, RMII, and MII modes)
	ETHn_RXD2	Input	RX data 2 input pin (RGMII and MII modes)
	ETHn_RXD3	Input	RX data 3 input pin (RGMII and MII modes)
	ETHn_RXDV	Input	RX data valid pins (MII mode) Carrier sense/RX data valid (CRS_DV) pin (RMII mode) RX data valid/RX error (RX_CTL) pin (RGMII mode)
	ETHn_RXER	Input	RX data error pins (RMII and MII modes)
	ETH2_CRS	Input	Carrier sense pins (MII mode)
	ETH2_COL	Input	Collision detection pins (MII mode)

Note: n = 0 to 2

Table 26.3 Combination of MAC-PHY interface

Pin name	I/O	Normal mode*1			
		MII mode	RMII mode (REF_CLK input)	RMII mode (REF_CLK output)	RGMII mode*2
ETHn_TXCLK	I/O	TX_CLK (Input)	—	—	TXC (Output)
ETHn_TXD0	Output	TXD0	TXD0	TXD0	TXD0
ETHn_TXD1	Output	TXD1	TXD1	TXD1	TXD1

Note 1. n = 0 to 2
Note 2. n = 2 only

Table 26.4 MAC-PHY interface mode

Combination*1	ETH0	ETH1	ETH2
No.0	EtherCAT Slave Controller Port 0	EtherCAT Slave Controller Port 1	Ethernet MAC
No.1	EtherCAT Slave Controller Port 0	EtherCAT Slave Controller Port 1	EtherCAT Slave Controller Port 2

Note 1. This is the pin connection inside the Ethernet Subsystem. For example, if Ethernet MAC in ETH2 is not required for No.0, pins which are assigned to ETH2 can be used as another peripheral by pin mux. EtherMAC can be put to the module-stop state (clock is stopped).

26.2 Register Descriptions

26.2.1 PRCMD : Ethernet Protect Register

Base address: ETHSS = 0x8011_0000
Offset address: 0x000

Bit position:	31																												0
Bit field:	PRCMD[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	PRCMD[31:0]	Permit write access to protected registers For detail, see Figure 26.2. 0x0000 00A5: DLE to STATE1 at IDLE 0x0000 0001: STATE1 to STATE2 at STATE1 0x0000 FFFE: STATE2 to STATE3 at STATE2 0x0000 0001: STATE3 to Release Protect at STATE3 0x0000 0000: Clear at Release Protect	R/W

The PRCMD register is used to permit write access to protected registers. The PRCMD register mitigates the risk when application system carries out unusual operations by software runaways.

Before setting the PRCMD register to 0x00000001, protected registers are denied write access (no error occurs and the registers are not updated by write data).

[Setting procedure]

1. Writing 0x000000A5 to PRCMD register
2. Writing 0x00000001 to PRCMD register
3. Writing 0x0000FFFE to PRCMD register
4. Writing 0x00000001 to PRCMD register

[Clearing condition]

- Writing 0x00000000 to PRCMD register

Figure 26.2 shows an ethernet protect command sequence.

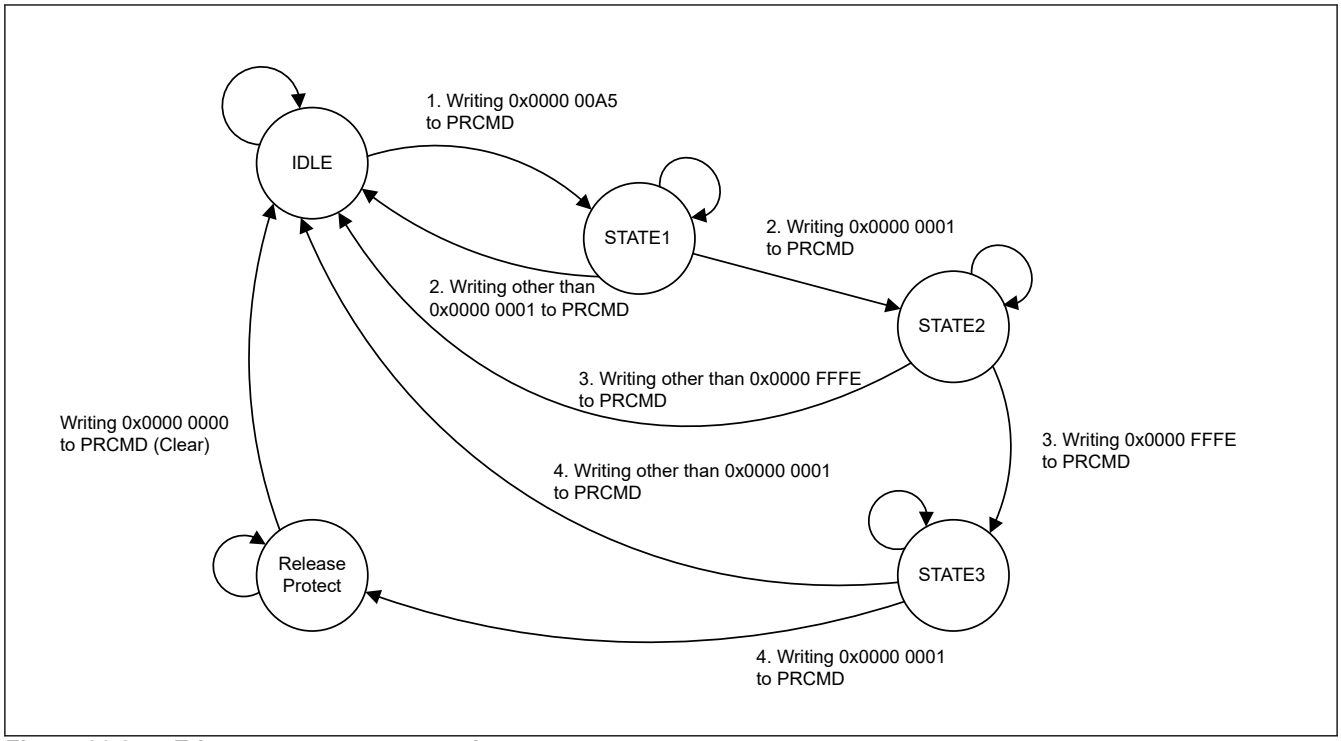

Figure 26.2 Ethernet protect command sequence

26.2.2 MODCTRL : Mode Control Register

Base address: ETHSS = 0x8011_0000

Offset address: 0x008

The MODCTRL register is used to switch the operation control of Switch mode. See Figure 26.1.

26.2.3 PTPMCTRL : PTP Mode Control Register

Base address: ETHSS = 0x8011_0000

Offset address: 0x00C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PTP_PLS_RSTn
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	—	These bits are read as 0. The write value should be 0.	R/W
16	PTP_PLS_RSTn	Reset control for Pulse Generator (unit 0 - 3) 0: Assert RESET 1: Release RESET	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

The PTPMCTRL register is used to select the unit number of PTP timer.

26.2.4 PHYLNK : Ethernet PHY Link Mode Register

Base address: ETHSS = 0x8011_0000

Offset address: 0x014

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	CATLNK[2:0]			—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	1	1	1	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
6:4	CATLNK[2:0]	Specify the active level of the ESC_PHYLINKn signal using the EtherCAT interface CATLNK[n] control ESC_PHYLINKn signal (n = 0 to 2) If not used, set the initial value. 0: Active-Low PHYLINK signal 1: Active-High PHYLINK signal	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

The PHYLNK register is used to switch the polarity of the Ethernet Switch and EtherCAT Link.

26.2.5 CONVCTRLn : RGMII/RMII Converter n Control Register (n = 0 to 2)

Base address: ETHSS = 0x8011_0000

Offset address: 0x100 + 0x004 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	RGMII_SPEED[1:0]		RGMII_DUPLEX	RGMII_LINK	—	RMII_CRS_MODE	RMII_RX_ER_EN	FULLD	—	—	—	CONV_MODE[4:0]				
Value after reset:	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
4:0	CONV_MODE[4:0]	Converter operation mode **CONV_MODE[4:0] / Description** x0000b: MII mode (through mode) 00100b: RMII mode 10 Mbps REF_CLK input 00101b: RMII mode 100 Mbps REF_CLK input 10100b: RMII mode 10 Mbps REF_CLK output 10101b: RMII mode 100 Mbps REF_CLK output x1000b*1: RGMII mode 10 Mbps x1001b*1: RGMII mode 100 Mbps x1010b*1: RGMII mode 1000 Mbps Others: Setting prohibited	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
8	FULLD	Duplex mode (for RMII/RGMII mode) 0: Half-duplex 1: Full-duplex	R/W
9	RMII_RX_ER_EN	ETHn_RXER pin input control (only for RMII mode) 0: RX_ER is always 0 1: RX_ER signal	R/W
10	RMII_CRS_MODE	CRS detection mode (only for RMII mode) 0: CRS | TX_EN 1: CRS | TX_EN | RX_DV	R/W
11	—	This bit is read as 0. The write value should be 0.	R/W
12	RGMII_LINK	Indicates link status (only for RGMII mode)*1 0: Down 1: Up	R
13	RGMII_DUPLEX	Indicates duplex status (only for RGMII mode)*1 0: Half-duplex 1: Full-duplex	R
15:14	RGMII_SPEED[1:0]	Indicates link speed (only for RGMII mode)*1 0 0: 2.5 MHz 0 1: 25 MHz 1 0: 125 MHz 1 1: Reserved	R
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. RGMII mode can be supported for CONVCTRL2 register only.

The CONVCTRLn register is used to select the mode for RGMII/RMII.

Table 26.5 Ethernet interface support mode

Ethernet interface mode	Module	
	GMAC (Port 2)	EtherCAT (Port 0 / 1 / 2)
MII mode, 10 Mbps, Half-duplex	Supported	Not supported
MII mode, 10 Mbps, Full-duplex	Supported	Not supported
MII mode, 100 Mbps, Half-duplex	Supported	Not supported
MII mode, 100 Mbps, Full-duplex	Supported	Supported
RMII mode, 10 Mbps, Half-duplex, Reference clock input	Supported	Not supported
RMII mode, 10 Mbps, Full-duplex, Reference clock input	Supported	Not supported
RMII mode, 100 Mbps, Half-duplex, Reference clock input	Supported	Not supported
RMII mode, 100 Mbps, Full-duplex, Reference clock input	Supported	Supported
RMII mode, 10 Mbps, Half-duplex, Reference clock output	Supported	Not supported
RMII mode, 10 Mbps, Full-duplex, Reference clock output	Supported	Not supported
RMII mode, 100 Mbps, Half-duplex, Reference clock output	Supported	Not supported
RMII mode, 100 Mbps, Full-duplex, Reference clock output	Supported	Supported
RGMII mode, 10 Mbps, Half-duplex	Supported	Not supported
RGMII mode, 10 Mbps, Full-duplex	Supported	Not supported
RGMII mode, 100 Mbps, Half-duplex	Supported	Not supported
RGMII mode, 100 Mbps, Full-duplex	Supported	Not supported
RGMII mode, 1000 Mbps, Half-duplex	Supported	Not supported
RGMII mode, 1000 Mbps, Full-duplex	Supported	Not supported

26.2.6 CONVRST : RGMII/RMII Converter Reset Control Register

Base address: ETHSS = 0x8011_0000

Offset address: 0x114

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	PHYIR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	PHYIR[2:0]	Release reset of RGMII/RMII Converter. Bit 0 = port 0, bit 1= port 1, bit 2 = port 2. 0: Reset RGMII/RMII Converter 1: Activate RGMII/RMII Converter	R/W
31:3	—	These bits are read as 0. The write value should be 0.	R/W

The CONVRST register is used to control the reset for PHY I/F.

26.3 Operation

26.3.1 Ethernet Initializing Operation

For initializing operation, complete the following flowchart.

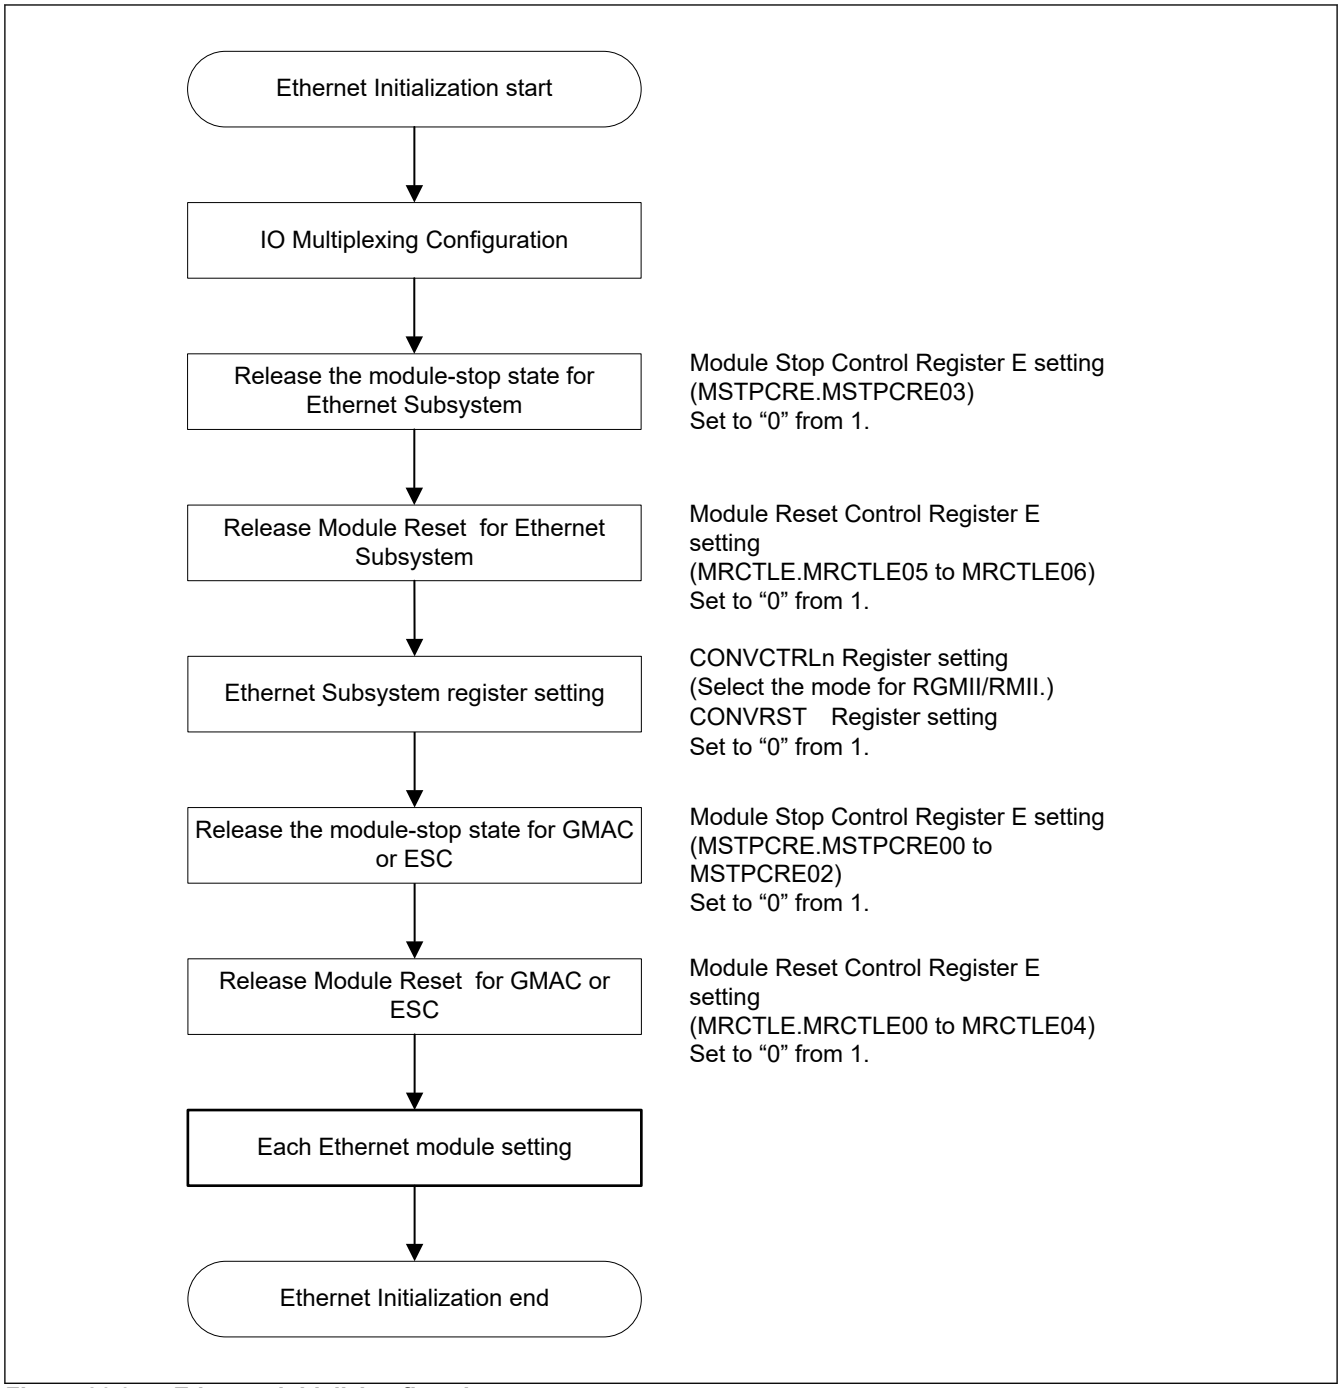

Figure 26.3 Ethernet initializing flowchart

Note: Setting EtherCAT Slave Controller (ESC) to module stop state and module reset release state is prohibited. (MSTPCRE.MSTPCRE02 = 1 and (MRCTLE.MRCTLE03 = 0 and/or MRCTLE.MRCTLE04 = 0))

27. Ethernet MAC (GMAC)

Portions Copyright © 2013, 2020 Synopsys, Inc. Used with permission. All rights reserved. Synopsys & DesignWare are registered trademarks of Synopsys, Inc.

27.1 Overview

The LSI includes an Ethernet MAC (GMAC) that:

- Is compliant with the following standards:
  - IEEE 802.3-2008 for Ethernet MAC, Gigabit Media Independent Interface (GMII), and Media Independent Interface (MII)
  - IEEE 1588-2008 v2 standard for precision networked clock synchronization, IEEE 1588-2008 v2 is compliant with Power IEEE-C37.238 profile
  - IEEE 802.3-az, version D2.0 for Energy Efficient Ethernet (EEE).
- Supports 10/100/1000 Mbps data transfer rates
- Supports both half-duplex and full-duplex operation
- Has programmable frame length to support both standard and jumbo ethernet frames of size up to 16 KB (16 KB - 1):
  - Jumbo mode support in cut-through mode only (not implemented in store and forward due to TX and RX FIFO size).
- Contains 17 MAC Address registers for the Address Filter block
- Supports variety of flexible addresses filtering modes:
  - Perfect (DA) address filters with masks for each byte
  - SA address comparison check with masks for each byte
  - 256-bit Hash filter for multicast and unicast (DA) addresses
  - Option to pass all multicast addressed frames
  - Promiscuous mode support to pass all frames without any filtering for network monitoring
  - Passes all incoming packets (as per filter) with a status report.
- Supports native DMA with simple independent channels transmit and receive engines:
  - 1 RX channel of 4 KB FIFO size for receive channel
  - 1 TX channel of 2 KB FIFO size for transmit channel
  - DMA implements dual buffer (ring) or linked list (chained) descriptor chaining.
- Supports advanced IEEE 1588-2002 & 2008 ethernet frame time stamping:
  - Timer module implemented
  - IEEE1588 time base information, with reference clock of 125 MHz
  - IEEE1588 external snapshot.
- Supports programmable CRC generation and checking
- Supports RMON statistics (L2 layer only)
- Supports Station Management Block and MDIO interface
- Is Ethernet Energy Efficiency compliant with IEEE 802.3az-2010:
  - Supports wakeup on LAN on magic packet and packet filtering
  - Supports energy efficiency feature (LPI mode)
  - Wakeup capability.
- Has interface for:
  - Native mode GMII (used for internal only), MII
  - No Native RMII and RGMII, managed by RMII/RGMII converter (connected on external pins).

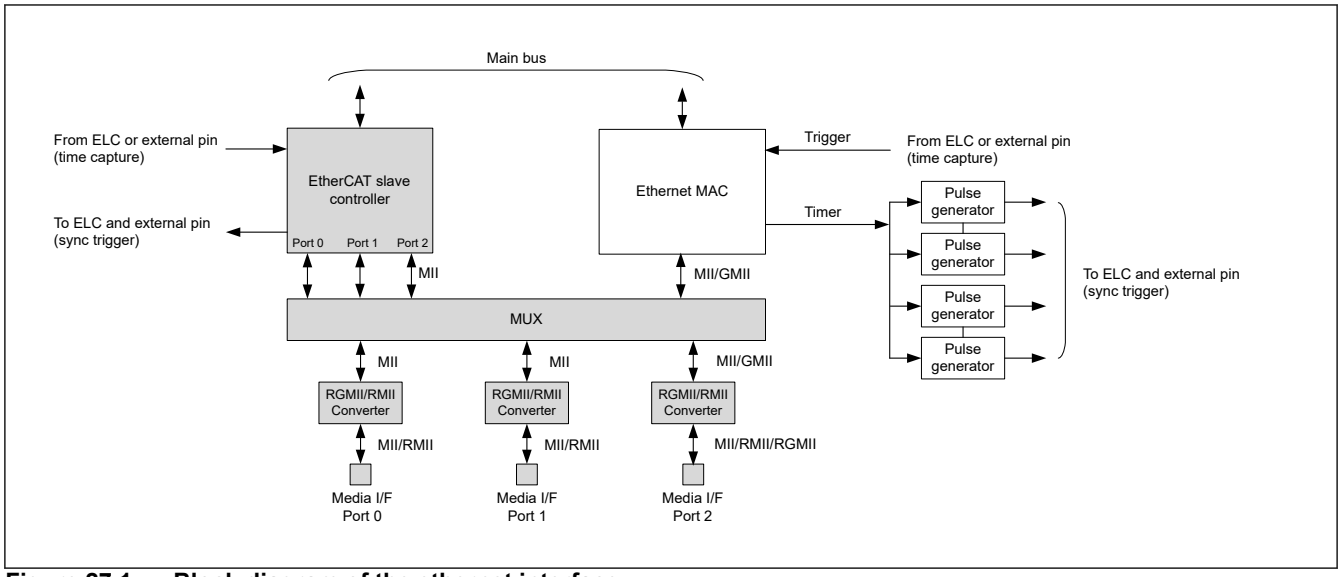

Figure 27.1 Block diagram of the ethernet interface

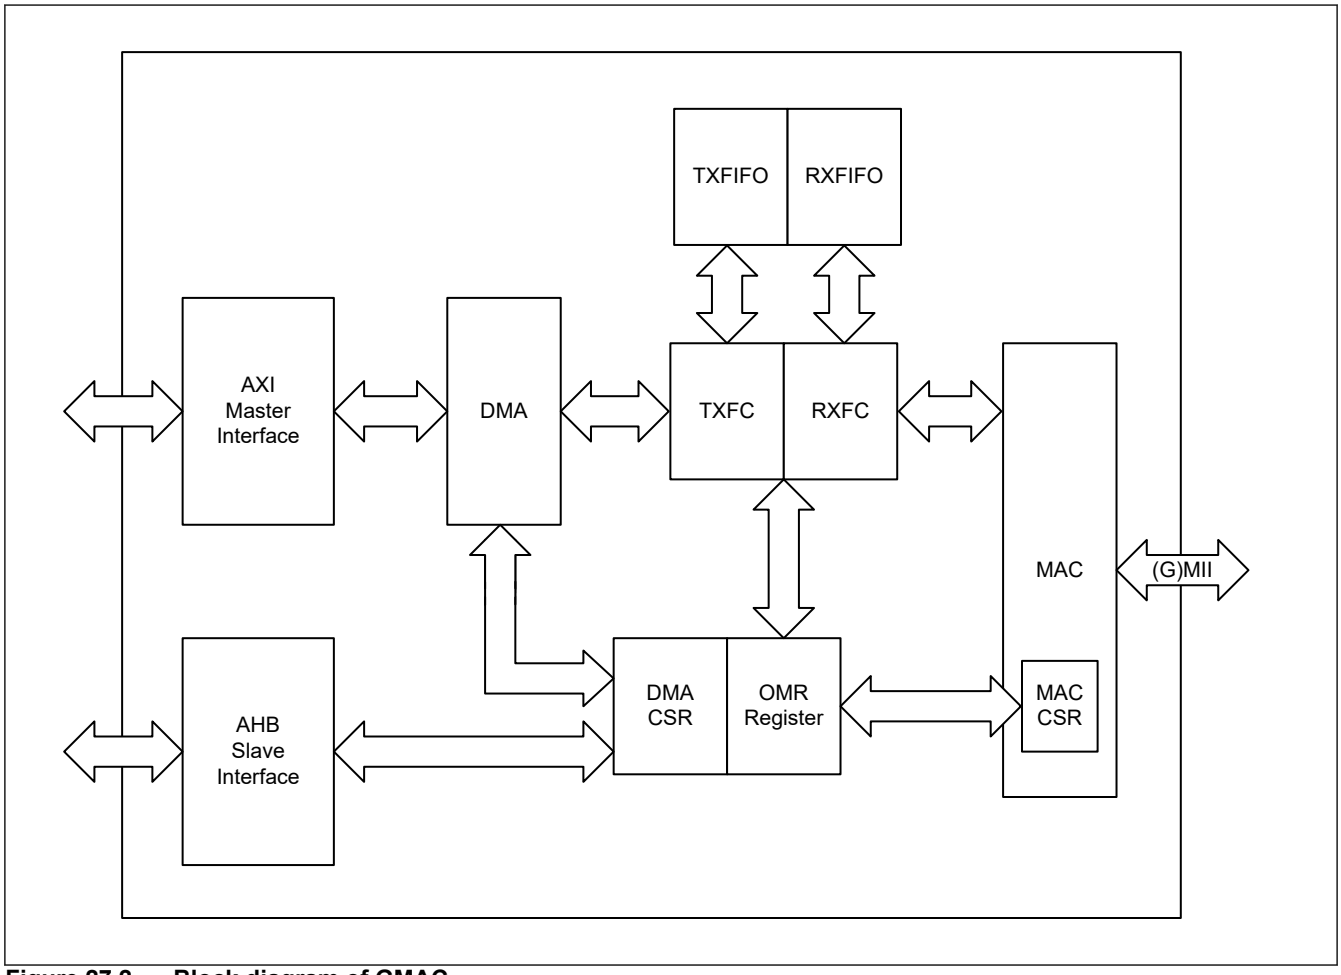

Figure 27.2 Block diagram of GMAC

Table 27.1 Input/output pins of the GMAC (1 of 2)

Pin name	I/O	Description
GMAC_PTPTRG0, GMAC_PTPTRG1	Input	PTP timer trigger signal input pin
GMAC_PTPOUT0, GMAC_PTPOUT1, GMAC_PTPOUT2, GMAC_PTPOUT3	Output	PTP timer pulse output pin

Table 27.1 Input/output pins of the GMAC (2 of 2)

Pin name	I/O	Description
GMAC_MDC	Output	Management data clock output pin
GMAC_MDIO	I/O	Management data I/O pin

27.2 Register Map

27.2.1 GMAC register map

Address	Register symbol	Register name
0x8010_0000	MAC_Configuration	MAC Configuration Register
0x8010_0004	MAC_Frame_Filter	MAC Frame Filter Register
0x8010_0010	GMII_Address	GMII Address Register
0x8010_0014	GMII_Data	GMII Data Register
0x8010_0018	Flow_Control	Flow Control Register
0x8010_001C	VLAN_Tag	VLAN Tag Register
0x8010_0020	Version	Version Register
0x8010_0024	Debug	Debug Register
0x8010_0028	Remote_Wake_Up_Frame_Filter	Remote Wake-Up Frame Filter Register
0x8010_002C	PMT_Control_Status	PMT Control and Status Register
0x8010_0030	LPI_Control_Status	LPI Control and Status Register
0x8010_0034	LPI_Timers_Control	LPI Timers Control Register
0x8010_0038	Interrupt_Status	Interrupt Status Register
0x8010_003C	Interrupt_Mask	Interrupt Mask Register
0x8010_0040 + 0x8 × n	MARn_H (n = 0 to 15)	MAC Address n High Register
0x8010_0044 + 0x8 × n	MARn_L (n = 0 to 15)	MAC Address n Low Register
0x8010_00DC	WDog_Timeout	Watchdog Timeout Register
0x8010_0100	MMC_Control	MMC Control Register
0x8010_0104	MMC_Receive_Interrupt	MMC Receive Interrupt Register
0x8010_0108	MMC_Transmit_Interrupt	MMC Transmit Interrupt Register
0x8010_010C	MMC_Receive_Interrupt_Mask	MMC Receive Interrupt Mask Register
0x8010_0110	MMC_Transmit_Interrupt_Mask	MMC Transmit Interrupt Mask Register
0x8010_0114	Tx_Octet_Count_Good_Bad	Transmit Octet Count for Good and Bad Frames
0x8010_0118	Tx_Frame_Count_Good_Bad	Transmit Frame Count for Good and Bad Frames
0x8010_011C	Tx_Broadcast_Frames_Good	Transmit Frame Count for Good Broadcast Frames
0x8010_0120	Tx_Multicast_Frames_Good	Transmit Frame Count for Good Multicast Frames
0x8010_0124	Tx_64Octets_Frames_Good_Bad	Transmit Octet Count for Good and Bad 64 Byte Frames
0x8010_0128	Tx_65To127Octets_Frames_Good_Bad	Transmit Octet Count for Good and Bad 65 to 127 Bytes Frames
0x8010_012C	Tx_128To255Octets_Frames_Good_Bad	Transmit Octet Count for Good and Bad 128 to 255 Bytes Frames
0x8010_0130	Tx_256To511Octets_Frames_Good_Bad	Transmit Octet Count for Good and Bad 256 to 511 Bytes Frames
0x8010_0134	Tx_512To1023Octets_Frames_Good_Bad	Transmit Octet Count for Good and Bad 512 to 1023 Bytes Frames

Address	Register symbol	Register name
0x8010_0138	Tx_1024ToMaxOctets_Frames_Good_Bad	Transmit Octet Count for Good and Bad 1024 to Maxsize Bytes Frames
0x8010_013C	Tx_Unicast_Frames_Good_Bad	Transmit Frame Count for Good and Bad Unicast Frames
0x8010_0140	Tx_Multicast_Frames_Good_Bad	Transmit Frame Count for Good and Bad Multicast Frames
0x8010_0144	Tx_Broadcast_Frames_Good_Bad	Transmit Frame Count for Good and Bad Broadcast Frames
0x8010_0148	Tx_Underflow_Error_Frames	Transmit Frame Count for Underflow Error Frames
0x8010_014C	Tx_Single_Collision_Good_Frames	Transmit Frame Count for Frames Transmitted after Single Collision
0x8010_0150	Tx_Multiple_Collision_Good_Frames	Transmit Frame Count for Frames Transmitted after Multiple Collision
0x8010_0154	Tx_Deferred_Frames	Transmit Frame Count for Deferred Frames
0x8010_0158	Tx_Late_Collision_Frames	Transmit Frame Count for Late Collision Error Frames
0x8010_015C	Tx_Excessive_Collision_Frames	Transmit Frame Count for Excessive Collision Error Frames
0x8010_0160	Tx_Carrier_Error_Frames	Transmit Frame Count for Carrier Sense Error Frames
0x8010_0164	Tx_Octet_Count_Good	Transmit Octet Count for Good Frames
0x8010_0168	Tx_Frame_Count_Good	Transmit Frame Count for Good Frames
0x8010_016C	Tx_Excessive_Deferral_Error	Transmit Frame Count for Excessive Deferral Error Frames
0x8010_0170	Tx_Pause_Frames	Transmit Frame Count for Good PAUSE Frames
0x8010_0174	Tx_VLAN_Frames_Good	Transmit Frame Count for Good VLAN Frames
0x8010_0178	Tx_OSize_Frames_Good	Transmit Frame Count for Good Oversize Frames
0x8010_0180	Rx_Frames_Count_Good_Bad	Receive Frame Count for Good and Bad Frames
0x8010_0184	Rx_Octet_Count_Good_Bad	Receive Octet Count for Good and Bad Frames
0x8010_0188	Rx_Octet_Count_Good	Receive Octet Count for Good Frames
0x8010_018C	Rx_Broadcast_Frames_Good	Receive Frame Count for Good Broadcast Frames
0x8010_0190	Rx_Multicast_Frames_Good	Receive Frame Count for Good Multicast Frames
0x8010_0194	Rx_CRC_Error_Frames	Receive Frame Count for CRC Error Frames
0x8010_0198	Rx_Alignment_Error_Frames	Receive Frame Count for Alignment Error Frames
0x8010_019C	Rx_Runt_Error_Frames	Receive Frame Count for Runt Error Frames
0x8010_01A0	Rx_Jabber_Error_Frames	Receive Frame Count for Jabber Error Frames
0x8010_01A4	Rx_Undersize_Frames_Good	Receive Frame Count for Undersize Frames
0x8010_01A8	Rx_Oversize_Frames_Good	Receive Frame Count for Oversize Frames
0x8010_01AC	Rx_64Octets_Frames_Good_Bad	Receive Frame Count for Good and Bad 64 Byte Frames
0x8010_01B0	Rx_65To127Octets_Frames_Good_Bad	Receive Frame Count for Good and Bad 65 to 127 Bytes Frames
0x8010_01B4	Rx_128To255Octets_Frames_Good_Bad	Receive Frame Count for Good and Bad 128 to 255 Bytes Frames
0x8010_01B8	Rx_256To511Octets_Frames_Good_Bad	Receive Frame Count for Good and Bad 256 to 511 Bytes Frames
0x8010_01BC	Rx_512To1023Octets_Frames_Good_Bad	Receive Frame Count for Good and Bad 512 to 1,023 Bytes Frames
0x8010_01C0	Rx_1024ToMaxOctets_Frames_Good_Bad	Receive Frame Count for Good and Bad 1,024 to Maxsize Bytes Frames

Address	Register symbol	Register name
0x8010_01C4	Rx_Unicast_Frames_Good	Receive Frame Count for Good Unicast Frames
0x8010_01C8	Rx_Length_Error_Frames	Receive Frame Count for Length Error Frames
0x8010_01CC	Rx_Out_Of_Range_Type_Frames	Receive Frame Count for Out of Range Frames
0x8010_01D0	Rx_Pause_Frames	Receive Frame Count for PAUSE Frames
0x8010_01D4	Rx_FIFO_Overflow_Frames	Receive Frame Count for FIFO Overflow Frames
0x8010_01D8	Rx_VLAN_Frames_Good_Bad	Receive Frame Count for Good and Bad VLAN Frames
0x8010_01DC	Rx_Watchdog_Error_Frames	Receive Frame Count for Watchdog Error Frames
0x8010_01E0	Rx_Receive_Error_Frames	Receive Frame Count for Receive Error Frames
0x8010_01E4	Rx_Control_Frames_Good	Receive Frame Count for Good Control Frames
0x8010_0500 + 0x4 × n	HASH_TABLE_REGn (n = 0 to 7)	Hash Table Register n
0x8010_0588	VLAN_Hash_Table_Reg	VLAN Hash Table Register
0x8010_0700	Timestamp_Control	Timestamp Control Register
0x8010_0704	Sub_Second_Increment	Sub-Second Increment Register
0x8010_0708	System_Time_Seconds	System Time - Seconds Register
0x8010_070C	System_Time_Nanoseconds	System Time - Nanoseconds Register
0x8010_0710	System_Time_Seconds_Update	System Time - Seconds Update Register
0x8010_0714	System_Time_Nanoseconds_Update	System Time - Nanoseconds Update Register
0x8010_0718	Timestamp_Addend	Timestamp Addend Register
0x8010_071C	Target_Time_Seconds	Target Time Seconds Register
0x8010_0720	Target_Time_Nanoseconds	Target Time Nanoseconds Register
0x8010_0728	Timestamp_Status	Timestamp Status Register
0x8010_0730	Auxiliary_Timestamp_Nanoseconds	Auxiliary Timestamp - Nanoseconds Register
0x8010_0734	Auxiliary_Timestamp_Seconds	Auxiliary Timestamp - Seconds Register
0x8010_0800	MAR16_H	MAC Address16 High Register
0x8010_0804	MAR16_L	MAC Address16 Low Register
0x8010_0808	MAR17_H	MAC Address17 High Register
0x8010_080C	MAR17_L	MAC Address17 Low Register
0x8010_1000	Bus_Mode	Bus Mode Register
0x8010_1004	Transmit_Poll_Demand	Transmit Poll Demand Register
0x8010_1008	Receive_Poll_Demand	Receive Poll Demand Register
0x8010_100C	Receive_Descriptor_List_Address	Receive Descriptor List Address Register
0x8010_1010	Transmit_Descriptor_List_Address	Transmit Descriptor List Address Register
0x8010_1014	Status	Status Register
0x8010_1018	Operation_Mode	Operation Mode Register
0x8010_101C	Interrupt_Enable	Interrupt Enable Register
0x8010_1020	Missed_Frame_And_Buffer_Overflow_Counter	Missed Frame and Buffer Overflow Counter Register
0x8010_1024	Receive_Interrupt_Watchdog_Timer	Receive Interrupt Watchdog Timer Register
0x8010_1028	AXI_Bus_Mode	AXI Bus Mode Register
0x8010_102C	AXI_Status	AXI Status Register
0x8010_1048	Current_Host_Transmit_Descriptor	Current Host Transmit Descriptor Register
0x8010_104C	Current_Host_Receive_Descriptor	Current Host Receive Descriptor Register
0x8010_1050	Current_Host_Transmit_Buffer_Address	Current Host Transmit Buffer Address Register

Address	Register symbol	Register name
0x8010_1054	Current_Host_Receive_Buffer_Address	Current Host Receive Buffer Address Register
0x8010_1058	HW_Feature	HW Feature Register
0x8011_0400	GMACTRGSEL	GMAC PTP Trigger Select Register
0x8011_0800 + 0x100 × n	SWTMENn (n = 0 to 3)	PTP Timer Pulse Output Enable n Register
0x8011_0804 + 0x100 × n	SWTMSTSECn (n = 0 to 3)	PTP Timer Pulse Start Second n Register
0x8011_0808 + 0x100 × n	SWTMSTNSn (n = 0 to 3)	PTP Timer Pulse Start Nanosecond n Register
0x8011_080C + 0x100 × n	SWTMPSECn (n = 0 to 3)	PTP Timer Pulse Period Second n Register
0x8011_0810 + 0x100 × n	SWTMPNSn (n = 0 to 3)	PTP Timer Pulse Period Nanosecond n Register
0x8011_0814 + 0x100 × n	SWTMWTHn (n = 0 to 3)	PTP Timer Pulse Width n Register
0x8011_0818 + 0x100 × n	SWTMMAXPn (n = 0 to 3)	PTP Timer Pulse Max Second n Register
0x8011_081C + 0x100 × n	SWTMLATSECn (n = 0 to 3)	PTP Timer Pulse Latch Second n Register
0x8011_0820 + 0x100 × n	SWTMLATNSn (n = 0 to 3)	PTP Timer Pulse Latch Nanosecond n Register

27.3 Register Description

27.3.1 MAC_Configuration : MAC Configuration Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	TWOKPE	—	CST	—	WD	JD	BE	JE	IFG[2:0]			DCRS
Value after reset:	x	x	x	x	0	x	0	x	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PS	FES	DO	LM	DM	IPC	DR	—	ACS	BL[1:0]		DC	TE	RE	PRELEN[1:0]	
Value after reset:	0	0	0	0	0	0	0	x	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	PRELEN[1:0]	Preamble Length for Transmit Frames These bits control the number of preamble bytes that are added to the beginning of every transmit frame. The preamble reduction occurs only when the GMAC is operating in the full-duplex mode. 0 0: 7 bytes of preamble 0 1: 5 bytes of preamble 1 0: 3 bytes of preamble 1 1: Reserved	R/W
2	RE	Receiver Enable When this bit is set, the receive state machine of the GMAC is enabled for receiving frames from the GMII or MII. When this bit is reset, the GMAC receive state machine is disabled after completion of the reception of the current frame, and does not receive any additional frames from the GMII or MII.	R/W
3	TE	Transmitter Enable When this bit is set, the transmit state machine of the GMAC is enabled for transmission on the GMII or MII. When this bit is reset, the GMAC transmit state machine is disabled after completion of the transmission of the current frame, and does not transmit any additional frames.	R/W

Bit	Symbol	Function	R/W
4	DC	Deferral Check When this bit is set, the deferral check function is enabled in the GMAC. The GMAC issues a Frame Abort status, along with the excessive deferral error bit set in the transmit frame status, when the transmit state machine is deferred for more than 24,288-bit times in the 10 or 100 Mbps mode. If the GMAC is configured for 1000 Mbps operation or if the Jumbo frame mode is enabled in the 10 or 100 Mbps mode, the threshold for deferral is 155,680 bits times. Deferral begins when the transmitter is ready to transmit but is prevented because of an active carrier sense signal (CRS) on GMII or MII. The defer time is not cumulative. For example, if the transmitter defers for 10,000 bit times because the CRS signal is active and then the CRS signal becomes inactive, the transmitter transmits and collision occurs. Because of collision, the transmitter needs to back off and then defer again after back off is complete. In such a scenario, the deferral timer is reset to 0 and it is restarted. When this bit is reset, the deferral check function is disabled and the GMAC defers until the CRS signal goes inactive. This bit is applicable only in the half-duplex mode.	R/W
6:5	BL[1:0]	Back-Off Limit The Back-Off limit determines the random integer number (r) of slot time delays (4,096-bit times for 1000 Mbps and 512-bit times for 10/100 Mbps) for which the GMAC waits before rescheduling a transmission attempt during retries after a collision. This bit is applicable only in the half-duplex mode. where n = retransmission attempt. The random integer r takes the value in the range 0 ≤ r < kth power of 2 0 0: k = min (n, 10) 0 1: k = min (n, 8) 1 0: k = min (n, 4) 1 1: k = min (n, 1)	R/W
7	ACS	Automatic Pad or CRC Stripping When this bit is set, the GMAC strips the Pad or FCS field on the incoming frames only if the value of the length field is less than 1,536 bytes. All received frames with length field greater than or equal to 1,536 bytes are passed to the application without stripping the Pad or FCS field. When this bit is reset, the GMAC passes all incoming frames, without modifying them, to the host.	R/W
8	—	This bit is read as 0. The write value should be 0.	R/W
9	DR	Disable Retry When this bit is set, the GMAC attempts only one transmission. When a collision occurs on the GMII or MII interface, the GMAC ignores the current frame transmission and reports a Frame Abort with excessive collision error in the transmit frame status. When this bit is reset, the GMAC attempts retries based on the settings of the BL field (bits [6:5]). This bit is applicable only in the half-duplex mode.	R/W
10	IPC	Checksum Offload When this bit is set, the GMAC calculates the 16-bit 1's complement of the 1's complement sum of all received Ethernet frame payloads. It also checks whether the IPv4 Header checksum (assumed to be bytes 25-26 or 29-30 (VLAN-tagged) of the received Ethernet frame) is correct for the received frame and gives the status in the receive status word. When this bit is reset, this function is disabled. When this bit is set, enables the IPv4 header checksum checking and IPv4 or IPv6 TCP, UDP, or ICMP payload checksum checking. When this bit is reset, the COE function in the receiver is disabled and the corresponding Payload Checksum Error and IP Header Checksum Error status bits are cleared.	R/W
11	DM	Duplex Mode When this bit is set, the GMAC operates in the full-duplex mode where it can transmit and receive simultaneously.	R/W
12	LM	Loopback Mode When this bit is set, the GMAC operates in the loopback mode at GMII or MII. The receive clock is required for the loopback to work properly, because the transmit clock is not looped back internally.	R/W
13	DO	Disable Receive Own When this bit is set, the GMAC disables the reception of frames when the Transmit Data Enable is asserted in the half-duplex mode. When this bit is reset, the GMAC receives all packets that are given by the PHY while transmitting. This bit is not applicable if the GMAC is operating in the full-duplex mode.	R/W

Bit	Symbol	Function	R/W
14	FES	Speed This bit selects the speed in the MII interface. 0: 10 Mbps 1: 100 Mbps	R/W
15	PS	Port Select This bit selects the Ethernet line speed. In 10 or 100 Mbps operations, this bit, along with FES bit, selects the exact line speed. 0: For 1000 Mbps operations 1: For 10 or 100 Mbps operations	R/W
16	DCRS	Disable Carrier Sense During Transmission When set high, this bit makes the GMAC transmitter ignore the (G)MII CRS signal during frame transmission in the half-duplex mode. This request results in no errors generated because of Loss of Carrier or No Carrier during such transmission. When this bit is low, the GMAC transmitter generates such errors because of Carrier Sense and can even abort the transmissions.	R/W
19:17	IFG[2:0]	Inter-Frame Gap These bits control the minimum IFG between frames during transmission. In the half-duplex mode, the minimum IFG can be configured only for 64-bit times (IFG = 100b). Lower values are not considered. In the 1000-Mbps mode, the minimum IFG supported is 80-bit times and above. When a JAM pattern is being transmitted because of backpressure activation, the GMAC does not consider the minimum IFG. 0 0 0: 96-bit times 0 0 1: 88-bit times 0 1 0: 80-bit times ⋮ 1 1 1: 40-bit times	R/W
20	JE	Jumbo Frame Enable When this bit is set, the GMAC allows Jumbo frames of 9,018 bytes (9,022 bytes for VLAN tagged frames) without reporting a giant frame error in the receive frame status.	R/W
21	BE	Frame Burst Enable When this bit is set, the GMAC allows frame bursting during transmission in the GMII half-duplex mode.	R/W
22	JD	Jabber Disable When this bit is set, the GMAC disables the jabber timer on the transmitter. The GMAC can transfer frames of up to 16,384 bytes. When this bit is reset, the GMAC cuts off the transmitter if the application sends out more than 2,048 bytes of data (10,240 if JE is set high) during transmission.	R/W
23	WD	Watchdog Disable When this bit is set, the GMAC disables the watchdog timer on the receiver. The GMAC can receive frames of up to 16,384 bytes. When this bit is reset, the GMAC does not allow a receive frame which more than 2,048 bytes (10,240 if JE is set high) or the value programmed in Watchdog Timeout Register (WDog_Timeout). The GMAC cuts off any bytes received after the watchdog limit number of bytes.	R/W
24	—	This bit is read as 0. The write value should be 0.	R/W
25	CST	CRC Stripping for Type Frames When this bit is set, the last 4 bytes (FCS) of all frames of Ether type (Length/Type field greater than or equal to 1,536) are stripped and dropped before forwarding the frame to the application.	R/W
26	—	This bit is read as 0. The write value should be 0.	R/W
27	TWOKPE	IEEE 802.3 as Support for 2 K Packets When set, the GMAC considers all frames, with up to 2,000 bytes length, as normal packets. When bit JE[20] is not set, the GMAC considers all received frames of size more than 2 KB as Giant frames. When this bit is reset and bit JE[20] is not set, the GMAC considers all received frames of size more than 1,518 bytes (1,522 bytes for tagged) as Giant frames. When bit [20] is set, setting this bit has no effect on Giant Frame status.	R/W
31:28	—	These bits are read as 0. The write value should be 0.	R/W

27.3.2 MAC_Frame_Filter : MAC Frame Filter Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0004

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	RA	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VTFE
Value after reset:	0	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	HPF	SAF	SAIF	PCF[1:0]		DBF	PM	DAIF	HMC	HUC	PR
Value after reset:	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PR	Promiscuous Mode When this bit is set, the Address Filter module passes all incoming frames regardless of its destination or source address. The SA or DA Filter Fails status bits of the Receive Status Word are cleared when PR is set.	R/W
1	HUC	Hash Unicast When set, GMAC performs destination address filtering of unicast frames according to the hash table. When reset, the GMAC performs a perfect destination address filtering for unicast frames, that is, it compares the DA field with the values programmed in DA registers.	R/W
2	HMC	Hash Multicast When set, GMAC performs destination address filtering of received multicast frames according to the hash table. When reset, the GMAC performs a perfect destination address filtering for multicast frames, that is, it compares the DA field with the values programmed in DA registers.	R/W
3	DAIF	DA Inverse Filtering When this bit is set, the Address Check block operates in inverse filtering mode for the DA address comparison for both unicast and multicast frames. When reset, normal filtering of frames is performed.	R/W
4	PM	Pass All Multicast When set, this bit indicates that all received frames with a multicast destination address (first bit in the destination address field is 1) are passed. When reset, filtering of multicast frame depends on HMC bit.	R/W
5	DBF	Disable Broadcast Frames When this bit is set, the AFM module filters all incoming broadcast frames. In addition, it overrides all other filter settings. When this bit is reset, the AFM module passes all received broadcast frames.	R/W

Bit	Symbol	Function	R/W
7:6	PCF[1:0]	Pass Control Frames These bits control the forwarding of all control frames (including unicast and multicast PAUSE frames). 0 0: GMAC filters all control frames from reaching the application. 0 1: GMAC forwards all control frames except PAUSE control frames to application even if they fail the Address filter. 1 0: GMAC forwards all control frames to application even if they fail the Address Filter. 1 1: GMAC forwards control frames that pass the Address Filter. The following conditions should be true for the PAUSE control frames processing: ● Condition 1: The GMAC is in the full-duplex mode and flow control is enabled by setting bit RFE[2] of Flow Control Register (Flow_Control) to 1. ● Condition 2: The destination address (DA) of the received frame matches the special multicast address or the MAC Address 0 when bit [3] (UP) of the Flow Control Register (Flow_Control) is set. ● Condition 3: The Type field of the received frame is 0x8808 and the OPCODE field is 0x0001. This field should be set to 01b only when the Condition 1 is true, that is, the GMAC is programmed to operate in the full-duplex mode and the RFE bit is enabled. Otherwise, the PAUSE frame filtering may be inconsistent. When Condition 1 is false, the PAUSE frames are considered as generic control frames. Therefore, to pass all control frames (including PAUSE control frames) when the full-duplex mode and flow control is not enabled, set the PCF field to 10b or 11b (as required by the application).	R/W
8	SAIF	SA Inverse Filtering When this bit is set, the Address Check block operates in inverse filtering mode for the SA address comparison. The frames whose SA matches the SA registers are marked as failing the SA Address filter. When this bit is reset, frames whose SA does not match the SA registers are marked as failing the SA Address filter.	R/W
9	SAF	Source Address Filter Enable When this bit is set, the GMAC compares the SA field of the received frames with the values programmed in the enabled SA registers. If the comparison fails, the GMAC drops the frame. When this bit is reset, the GMAC forwards the received frame to the application with updated SAF bit of the RX status depending on the SA address comparison. According to the IEEE specification, bit [47] of the SA is reserved and set to 0. However, the GMAC compares all 48 bits. The software driver should take this into consideration while programming the MAC address registers for SA.	R/W
10	HPF	Hash or Perfect Filter When this bit is set, it configures the address filter to pass a frame if it matches either the perfect filtering or the hash filtering as set by the HMC or HUC bits. When this bit is low and the HUC or HMC bit is set, the frame is passed only if it matches the Hash filter.	R/W
15:11	—	These bits are read as 0. The write value should be 0.	R/W
16	VTFE	VLAN Tag Filter Enable When set, this bit enables the GMAC to drop VLAN tagged frames that do not match the VLAN Tag comparison. When reset, the GMAC forwards all frames irrespective of the match status of the VLAN Tag.	R/W
30:17	—	These bits are read as 0. The write value should be 0.	R/W
31	RA	Receive All When this bit is set, the GMAC Receiver module passes all received frames, irrespective of whether they pass the address filter or not, to the application. The result of the SA or DA filtering is updated (pass or fail) in the corresponding bits in the Receive Status Word. When this bit is reset, the Receiver module passes only those frames to the application that pass the SA or DA address filter.	R/W

27.3.3 GMII_Address : GMII Address Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0010

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PA[4:0]					GR[4:0]					CR[3:0]				GW	GB
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	GB	GMII Busy This bit reads logic 0 before writing to GMII Address Register (GMII_Address) and GMII Data Register (GMII_Data). During a PHY register access, the software sets this bit to 1 to indicate that a read or write access is in progress. GMII Data Register (GMII_Data) is invalid until this bit is cleared by the GMAC. Therefore, GMII Data Register (GMII_Data) should be kept valid until the GMAC clears this bit during a PHY Write operation. Similarly, for a read operation, the contents of GMII Data Register (GMII_Data) are not valid until this bit is cleared. The subsequent read or write operation occurs only after the previous operation is complete. Because there is no acknowledgment from the PHY to GMAC after a read or write operation is completed, there is no change in the functionality of this bit even when the PHY is not present.	R/W
1	GW	GMII Write When set, this bit indicates to the PHY that this is a write operation using the GMII Data register. If this bit is not set, it indicates that this is a read operation, placing the data in the GMII Data register.	R/W

Bit	Symbol	Function	R/W
5:2	CR[3:0]	CSR Clock Range The CSR Clock (PCLKM) Range selection determines the frequency of the MDC clock according to the CSR clock frequency. The suggested range of CSR clock frequency applicable for each value (when bit [5] = 0) ensures that the MDC clock is approximately between the frequency range 1.0 MHz to 2.5 MHz. 0x0: The frequency of the CSR clock is 60-100 MHz, and the MDC clock is CSR clock/42. 0x1: The frequency of the CSR clock is 100-150 MHz, and the MDC clock is CSR clock/62. 0x2: The frequency of the CSR clock is 20-35 MHz, and the MDC clock is CSR clock/16. 0x3: The frequency of the CSR clock is 35-60 MHz, and the MDC clock is CSR clock/26. 0x4: The frequency of the CSR clock is 150-250 MHz, and the MDC clock is CSR clock/102. 0x5: The frequency of the CSR clock is 250-300 MHz, and the MDC clock is CSR clock/124. 0x6: Reserved 0x7: Reserved When bit [5] is set, you can achieve higher frequency of the MDC clock than the frequency limit of 2.5 MHz (specified in the IEEE Std 802.3) and program a clock divider of lower value. For example, when CSR clock is of 100 MHz frequency and you program these bits as 0xA, then the resultant MDC clock is of 12.5 MHz which is outside the limit of IEEE 802.3 specified range. Program the following values only if the interfacing chips support faster MDC clocks: 0x8: CSR clock/4 0x9: CSR clock/6 0xA: CSR clock/8 0xB: CSR clock/10 0xC: CSR clock/12 0xD: CSR clock/14 0xE: CSR clock/16 0xF: CSR clock/18	R/W
10:6	GR[4:0]	GMII Register These bits select the desired GMII register in the selected PHY device.	R/W
15:11	PA[4:0]	Physical Layer Address This field indicates which of the 32 possible PHY devices are being accessed.	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

27.3.4 GMII_Data : GMII Data Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0014

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	GD[15:0]															
Value after reset:	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
15:0	GD[15:0]	GMII Data This field contains the 16-bit data value read from the PHY after a Management Read operation or the 16-bit data value to be written to the PHY before a Management Write operation.	R/W

Bit	Symbol	Function	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

27.3.5 Flow_Control : Flow Control Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0018

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	PT[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	DZPQ	—	PLT[1:0]		UP	RFE	TFE	FCA_ BPA
Value after reset:	x	x	x	x	x	x	x	x	0	x	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FCA_BPA	Flow Control Busy or Backpressure Activate This bit initiates a Pause Control frame in the full-duplex mode and activates the backpressure function in the half-duplex mode if the TFE bit is set. In the full-duplex mode, this bit should be read as 0b before writing to the Flow Control register. To initiate a Pause control frame, the application must set this bit to 1b. During a transfer of the Control Frame, this bit continues to be set to signify that a frame transmission is in progress. After the completion of Pause control frame transmission, the GMAC resets this bit to 0b. The Flow Control register should not be written to until this bit is cleared. In the half-duplex mode, when this bit is set (and TFE is set), then backpressure is asserted by the GMAC. During backpressure, when the GMAC receives a new frame, the transmitter starts sending a JAM pattern resulting in a collision. This control register bit is logically ORed with the flow control input signal for the backpressure function. When the GMAC is configured for the full-duplex mode, backpressure is automatically disabled.	R/W
1	TFE	Transmit Flow Control Enable In the full-duplex mode, when this bit is set, the GMAC enables the flow control operation to transmit Pause frames. When this bit is reset, the flow control operation in the GMAC is disabled, and the GMAC does not transmit any Pause frames. In half-duplex mode, when this bit is set, the GMAC enables the backpressure operation. When this bit is reset, the backpressure feature is disabled.	R/W
2	RFE	Receive Flow Control Enable When this bit is set, the GMAC decodes the received Pause frame and disables its transmitter for a specified (Pause) time. When this bit is reset, the decode function of the Pause frame is disabled.	R/W
3	UP	Unicast Pause Frame Detect A Pause frame is processed when it has the unique multicast address specified in the IEEE Std 802.3. When this bit is set, the GMAC can also detect Pause frames with unicast address of the station. This unicast address should be as specified in the MAC Address0 High Register and MAC Address0 Low Register. When this bit is reset, the GMAC only detects Pause frames with unique multicast address. The GMAC does not process a Pause frame if the multicast address of received frame is different from the unique multicast address.	R/W

Bit	Symbol	Function	R/W
5:4	PLT[1:0]	Pause Low Threshold This field configures the threshold of the Pause timer at which the input flow control signal is checked for automatic retransmission of Pause frame. The threshold values should always be less than the Pause Time configured in bits [31:16]. For example, if PT = 0x100 (256 slot-times), and PLT = 01b, then a second Pause frame is automatically transmitted if the flow control signal is asserted at 228 (256 - 28) slot times after the first Pause frame is transmitted. The following list provides the threshold values for different values: 0 0: The threshold is Pause time minus 4 slot times (PT - 4 slot times). 0 1: The threshold is Pause time minus 28 slot times (PT - 28 slot times). 1 0: The threshold is Pause time minus 144 slot times (PT - 144 slot times). 1 1: The threshold is Pause time minus 256 slot times (PT - 256 slot times). The slot time is defined as the time taken to transmit 512 bits (64 bytes) on the GMII or MII interface.	R/W
6	—	This bit is read as 0. The write value should be 0.	R/W
7	DZPQ	Disable Zero-Quanta Pause When this bit is set, it disables the automatic generation of the Zero-Quanta Pause Control frames on the deassertion of the flow control signal from the FIFO layer. When this bit is reset, normal operation with automatic Zero-Quanta Pause Control frame generation is enabled.	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W
31:16	PT[15:0]	Pause Time This field holds the value to be used in the Pause Time field in the transmit control frame. Consecutive writes to this register should be performed only after at least 4 clock cycles in the destination clock domain.	R/W

27.3.6 VLAN_Tag : VLAN Tag Register

Base address: GMAC = 0x8010_0000

Offset address: 0x001C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	VTHM	ESVL	VTIM	ETV
Value after reset:	0	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	VL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	VL[15:0]	VLAN Tag Identifier for Receive Frames This field contains the 802.1Q VLAN tag to identify the VLAN frames and is compared to the 15th and 16th bytes of the frames being received for VLAN frames. The following list describes the bits of this field: Bits [15:13]: User Priority Bit [12]: Canonical Format Indicator (CFI) or Drop Eligibility Indicator (DEI) Bits [11:0]: VLAN Identifier (VID) field of VLAN tag When the ETV bit is set, only bits VID[11:0] are used for comparison. If VL (VL[11:0] if ETV is set) is all 0s, the GMAC does not check the 15th and 16th bytes for VLAN tag comparison, and declares all frames with a Type field value of 0x8100 or 0x88A8 as VLAN frames.	R/W
16	ETV	Enable 12-Bit VLAN Tag Comparison When this bit is set, a 12-bit VLAN identifier is used for comparing and filtering instead of the complete 16-bit VLAN tag. Bits [11:0] of VLAN tag are compared with the corresponding field in the received VLAN-tagged frame. Similarly, when enabled, only 12 bits of the VLAN tag in the received frame are used for hash-based VLAN filtering. When this bit is reset, all 16 bits of the 15th and 16th bytes of the received VLAN frame are used for comparison and VLAN hash filtering.	R/W

Bit	Symbol	Function	R/W
17	VTIM	VLAN Tag Inverse Match Enable When set, this bit enables the VLAN Tag inverse matching. The frames that do not have matching VLAN Tag are marked as matched. When reset, this bit enables the VLAN Tag perfect matching. The frames with matched VLAN Tag are marked as matched.	R/W
18	ESVL	Enable S-VLAN When this bit is set, the GMAC transmitter and receiver also consider the S-VLAN (Type = 0x88A8) frames as valid VLAN tagged frames.	R/W
19	VTHM	VLAN Tag Hash Table Match Enable When set, the most significant 4 bits of the CRC of VLAN tag are used to index the content of VLAN Hash Table Register (VLAN_Hash_Table_Reg). A value of 1 in the VLAN Hash Table register, corresponding to the index, indicates that the frame matched the VLAN hash table. When bit ETV[16] is set, the CRC of the 12-bit VLAN Identifier (VID) is used for comparison whereas when ETV is reset, the CRC of the 16-bit VLAN tag is used for comparison. When reset, the VLAN Hash Match operation is not performed.	R/W
31:20	—	These bits are read as 0. The write value should be 0.	R/W

27.3.7 Version : Version Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0020

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VER[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	1	1	0	0	0	1	0	0	1	1	0	1	1	1

Bit	Symbol	Function	R/W
15:0	VER[15:0]	Version (GMAC: 0x3137)	R
31:16	—	These bits are read as 0.	R

27.3.8 Debug : Debug Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0024

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	TXSTSFSTS	TXFSTS	—	TWCSTS	TRCSTS[1:0]		TXPAUSED	TFCSTS[1:0]		TPESTS
Value after reset:	x	x	x	x	x	x	0	0	x	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	RXFSTS[1:0]		—	RRCSTS[1:0]		RWCSTS	—	RFCFCSTS[1:0]		RPESTS
Value after reset:	x	x	x	x	x	x	0	0	x	0	0	0	x	0	0	0

Bit	Symbol	Function	R/W
0	RPESTS	GMAC GMII or MII Receive Protocol Engine Status When high, this bit indicates that the GMAC GMII or MII receive protocol engine is actively receiving data and not in IDLE state.	R
2:1	RFCFCSTS[1:0]	GMAC Receive Frame Controller FIFO Status When high, this field indicates the active state of the small FIFO read and write controllers of the GMAC Receive Frame Controller Module.	R
3	—	This bit is read as 0.	R

Bit	Symbol	Function	R/W
4	RWCSTS	MTL RX FIFO Write Controller Active Status When high, this bit indicates that the MTL RX FIFO write controller is active and is transferring a received frame to the FIFO.	R
6:5	RRCSTS[1:0]	MTL RX FIFO Read Controller State This field gives the state of the RX FIFO read controller: 0 0: IDLE state 0 1: Reading frame data 1 0: Reading frame status (or timestamp) 1 1: Flushing the frame data and status	R
7	—	This bit is read as 0.	R
9:8	RXFSTS[1:0]	MTL RX FIFO Fill-level Status This field gives the status of the fill level of the RX FIFO: 0 0: RX FIFO Empty 0 1: RX FIFO fill level is below the flow-control deactivate threshold 1 0: RX FIFO fill level is above the flow-control activate threshold 1 1: RX FIFO Full	R
15:10	—	These bits are read as 0.	R
16	TPESTS	GMAC GMII or MII Transmit Protocol Engine Status When high, this bit indicates that the GMAC GMII or MII transmit protocol engine is actively transmitting data and is not in the IDLE state.	R
18:17	TFCSTS[1:0]	GMAC Transmit Frame Controller Status This field indicates the state of the GMAC Transmit Frame Controller module: 0 0: IDLE state 0 1: Waiting for status of previous frame, or IFG, or backoff period to be over 1 0: Generating and transmitting a Pause control frame (in the full-duplex mode) 1 1: Transferring input frame for transmission	R
19	TXPAUSED	GMAC transmitter in PAUSE When high, this bit indicates that the GMAC transmitter is in the PAUSE condition (in the full-duplex only mode) and hence does not schedule any frame for transmission.	R
21:20	TRCSTS[1:0]	MTL TX FIFO Read Controller Status This field indicates the state of the TX FIFO read controller: 0 0: IDLE state 0 1: READ state (transferring data to GMAC transmitter) 1 0: Waiting for TX status from GMAC transmitter 1 1: Writing the received TX status or flushing the TX FIFO	R
22	TWCSTS	MTL TX FIFO Write Controller Active Status When high, this bit indicates that the MTL TX FIFO write controller is active and transferring data to the TX FIFO.	R
23	—	This bit is read as 0.	R
24	TXFSTS	MTL TX FIFO Not Empty Status When high, this bit indicates that the MTL TX FIFO is not empty and some data is left for transmission.	R
25	TXSTSFSTS	MTL TX Status FIFO Full Status When high, this bit indicates that the MTL (MAC Transaction Layer) TX status FIFO is full. Therefore, the MTL cannot accept any more frames for transmission.	R
31:26	—	These bits are read as 0.	R

27.3.9 Remote_Wake_Up_Frame_Filter : Remote Wake-Up Frame Filter Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0028

Bit position:	31																												0
Bit field:	WKUPFRMFTR[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	WKUPFRMFTR[31:0]	Remote Wake-Up Frame Filter	R/W

27.3.10 PMT_Control_Status : PMT Control and Status Register

Base address: GMAC = 0x8010_0000

Offset address: 0x002C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	RWKFILTRST	—	—	—	—	RWKPTR[2:0]			—	—	—	—	—	—	—	—
Value after reset:	0	x	x	x	x	0	0	0	x	x	x	x	x	x	x	x

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	GLBLUCAST	—	—	RWKPRCVD	MGKPRCVD	—	—	RWKPKTEN	MGKPKTEN	PWRDWN
Value after reset:	x	x	x	x	x	0	0	x	x	0	0	x	x	0	0	0

Bit	Symbol	Function	R/W
0	PWRDWN	Power Down When set, the GMAC receiver drops all received frames until it receives the expected magic packet or wakeup frame. This bit is then self-cleared and the power-down mode is disabled. The Software can also clear this bit before the expected magic packet or wakeup frame is received. The frames, received by the GMAC after this bit is cleared, are forwarded to the application. This bit must only be set when the Magic Packet Enable, Global Unicast, or Wake-Up Frame Enable bit is set high. You can gate-off the CSR clock (PCLKM) during the power-down mode. However, when the CSR clock is gated-off, you cannot perform any read or write operations on this register. Therefore, software cannot clear this bit.	R/W
1	MGKPKTEN	Magic Packet Enable When set, enables generation of a power management event because of magic packet reception.	R/W
2	RWKPKTEN	Wake-Up Frame Enable When set, enables generation of a power management event because of wake-up frame reception.	R/W
4:3	—	These bits are read as 0. The write value should be 0.	R/W
5	MGKPRCVD	Magic Packet Received When set, this bit indicates that the power management event is generated because of the reception of a magic packet. This bit is cleared by a read into this register.	R
6	RWKPRCVD	Wake-Up Frame Received When set, this bit indicates the power management event is generated because of the reception of a wakeup frame. This bit is cleared by a read into this register.	R
8:7	—	These bits are read as 0. The write value should be 0.	R/W
9	GLBLUCAST	Global Unicast When set, enables any unicast packet filtered by the MAC address recognition (DA filter) to be a wakeup frame.	R/W
10	—	This bit is read as 0. The write value should be 0.	R/W
23:11	—	These bits are read as 0. The write value should be 0.	R/W
26:24	RWKPTR[2:0]	Remote Wake-Up FIFO Pointer This gives the current value (0 to 7) of the Remote Wake-up Frame Filter Register pointer. The contents of the Remote Wake-up Frame Filter Register are transferred to the receive clock domain when a write occurs to that register while this pointer value equals 7.	R
30:27	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
31	RWKFILTRST	Wake-Up Frame Filter Register Pointer Reset When this bit is set, it resets the remote Wake-Up Frame Filter Register pointer to 000b. It is automatically cleared after 1 clock cycle.	R/W

27.3.11 LPI_Control_Status : LPI Control and Status Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0030

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	LPITXA	—	PLS	LPIEN
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	0	x	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	RLPIST	TLPIST	—	—	—	—	RLPIEX	RLPIEN	TLPIEX	TLPIEN
Value after reset:	x	x	x	x	x	x	0	0	x	x	x	x	0	0	0	0

Bit	Symbol	Function	R/W
0	TLPIEN	Transmit LPI Entry When set, this bit indicates that the GMAC transmitter has entered the LPI state because of the setting of the LPIEN bit. This bit is cleared by a read into this register.	R
1	TLPIEX	Transmit LPI Exit When set, this bit indicates that the GMAC transmitter has exited the LPI state after the LPIEN bit is cleared and the LPI TW Timer has expired. This bit is cleared by a read into this register.	R
2	RLPIEN	Receive LPI Entry When set, this bit indicates that the GMAC receiver has received an LPI pattern and entered the LPI state. This bit is cleared by a read into this register. This bit may not get set if the GMAC stops receiving the LPI pattern for a very short duration, such as, less than 3 clock cycles of CSR clock.	R
3	RLPIEX	Receive LPI Exit When set, this bit indicates that the GMAC receiver has stopped receiving the LPI pattern on the GMII or MII interface, exited the LPI state, and resumed the normal reception. This bit is cleared by a read into this register. This bit may not get set if the GMAC stops receiving the LPI pattern for a very short duration, such as, less than 3 clock cycles of CSR clock.	R
7:4	—	These bits are read as 0. The write value should be 0.	R/W
8	TLPIST	Transmit LPI State When set, this bit indicates that the GMAC is transmitting the LPI pattern on the GMII or MII interface.	R
9	RLPIST	Receive LPI State When set, this bit indicates that the GMAC is receiving the LPI pattern on the GMII or MII interface.	R
15:10	—	These bits are read as 0. The write value should be 0.	R/W
16	LPIEN	LPI Enable When set, this bit instructs the GMAC transmitter to enter the LPI state. When reset, this bit instructs the GMAC to exit the LPI state and resume normal transmission. This bit is cleared when the LPITXA bit is set and the GMAC exits the LPI state because of the arrival of a new packet for transmission.	R/W
17	PLS	PHY Link Status This bit indicates the link status of the PHY. The GMAC transmitter asserts the LPI pattern only when the link status is up (okay) at least for the time indicated by the LPI LS timer. When set, the link is considered to be up (okay) and when reset, the link is considered to be down.	R/W
18	—	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
19	LPITXA	LPI TX Automate This bit controls the behavior of the GMAC when it is entering or coming out of the LPI mode on the transmit side. If the LPITXA and LPIEN bits are set to 1, the GMAC enters the LPI mode only after all outstanding frames (in the core) and pending frames (in the application interface) have been transmitted. The GMAC comes out of the LPI mode when the application sends any frame for transmission or the application issues a TX FIFO Flush command. In addition, the GMAC automatically clears the LPIEN bit when it exits the LPI state. If TX FIFO Flush bit [20] of Operation Mode Register (Operation_Mode) is set when the GMAC is in the LPI mode, the GMAC exits the LPI mode. When this bit is 0, the LPIEN bit directly controls the behavior of GMAC when it is entering or coming out of the LPI mode.	R/W
31:20	—	These bits are read as 0. The write value should be 0.	R/W

27.3.12 LPI_Timers_Control : LPI Timers Control Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0034

Bit position:	31						25									16	15														0
Bit field:	—	—	—	—	—	—	LST[9:0]										TWT[15:0]														
Value after reset:	x	x	x	x	x	x	1	1	1	1	1	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	TWT[15:0]	LPI TW Timer This field specifies the minimum time (in microseconds) for which the GMAC waits after it stops transmitting the LPI pattern to the PHY and before it resumes the normal transmission. The TLPIEX status bit is set after the expiry of this timer.	R/W
25:16	LST[9:0]	LPI LS Timer This field specifies the minimum time (in milliseconds) for which the link status from the PHY should be up (okay) before the LPI pattern can be transmitted to the PHY. The GMAC does not transmit the LPI pattern even when the LPIEN bit is set unless the LPI LS Timer reaches the programmed terminal count. The default value of the LPI LS Timer is 1000 (1 sec.) as defined in the IEEE standard.	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

27.3.13 Interrupt_Status : Interrupt Status Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0038

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	LPIIS	TSIS	—	MMCRXIPIS	MMCTXIS	MMCRXIS	MMCIS	PMTIS	—	—	—
Value after reset:	x	x	x	x	x	0	0	x	0	0	0	0	0	x	x	x

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0.	R

Bit	Symbol	Function	R/W
3	PMTIS	PMT Interrupt Status This bit is set when a Magic packet or Wake-on-LAN frame is received in the power-down mode (see bits [5] and [6] in the PMT Control and Status Register). This bit is cleared when both bits [5] and [6] are cleared because of a read operation to the PMT Control and Status register.	R
4	MMCIS	MMC Interrupt Status This bit is set high when any of the bits [7:5] is set high and cleared only when all of these bits are low.	R
5	MMCRXIS	MMC Receive Interrupt Status This bit is set high when an interrupt is generated in the MMC Receive Interrupt Register. This bit is cleared when all the bits in this register are cleared.	R
6	MMCTXIS	MMC Transmit Interrupt Status This bit is set high when an interrupt is generated in the MMC Transmit Interrupt Register. This bit is cleared when all the bits in this register are cleared.	R
7	MMCRXIPIS	MMC Receive Checksum Offload Interrupt Status This bit is set high when an interrupt is generated in the MMC Receive Checksum Offload Interrupt Register. This bit is cleared when all the bits in this register are cleared.	R
8	—	This bit is read as 0.	R
9	TSIS	Timestamp Interrupt Status This bit is set when any of the following conditions is true: ● The system time value equals or exceeds the value specified in the Target Time High and Low registers. ● There is an overflow in the seconds register. ● The Auxiliary snapshot trigger is asserted. This bit is cleared on reading bit [0] of the Timestamp Status Register (Timestamp_Status). If default Timestamping is enabled, when set, this bit indicates that the system time value is equal to or exceeds the value specified in the Target Time registers. In this mode, this bit is cleared after a read completion of this bit.	R
10	LPIIS	LPI Interrupt Status This bit is set for any LPI state entry or exit in the GMAC transmitter or receiver. This bit is cleared on reading bit [0] of LPI Control and Status Register (LPI_Control_Status).	R
31:11	—	These bits are read as 0.	R

27.3.14 Interrupt_Mask : Interrupt Mask Register

Base address: GMAC = 0x8010_0000

Offset address: 0x003C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	LPIIM	TSIM	—	—	—	—	—	PMTIM	—	—	—
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
3	PMTIM	PMT Interrupt Mask When set, this bit disables the assertion of the interrupt signal because of the setting of PMT Interrupt Status bit in Interrupt Status Register (Interrupt_Status).	R/W
8:4	—	These bits are read as 0. The write value should be 0.	R/W
9	TSIM	Timestamp Interrupt Mask When set, this bit disables the assertion of the interrupt signal because of the setting of Timestamp Interrupt Status bit in Interrupt Status Register (Interrupt_Status).	R/W

Bit	Symbol	Function	R/W
10	LPIIM	LPI Interrupt Mask When set, this bit disables the assertion of the interrupt signal because of the setting of the LPI Interrupt Status bit in Interrupt Status Register (Interrupt_Status).	R/W
31:11	—	These bits are read as 0. The write value should be 0.	R/W

27.3.15 MAR0_H : MAC Address 0 High Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0040

Bit position:	31															15														0
Bit field:	AE	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADDRHI[15:0]														
Value after reset:	1	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	ADDRHI[15:0]	MAC Address0[47:32] This field contains the upper 16 bits [47:32] of the first 6-byte MAC address. The GMAC uses this field for filtering the received frames and inserting the MAC address in the Transmit Flow Control (Pause) Frames.	R/W
30:16	—	These bits are read as 0. The write value should be 0.	R/W
31	AE	Address Enable This bit is always set to 1.	R

27.3.16 MAR0_L : MAC Address 0 Low Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0044 + 0x8 × n

Bit position:	31																													0
Bit field:	ADDRLO[31:0]																													
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	ADDRLO[31:0]	MAC Address0[31:0] This field contains the lower 32 bits [31:0] of the first 6-byte MAC address. This is used by the GMAC for filtering the received frames and inserting the MAC address in the Transmit Flow Control (Pause) Frames.	R/W

27.3.17 MARn_H : MAC ADDRESS High Register (n = 1 to 17)

Base address: GMAC = 0x8010_0000

Offset address: 0x0040 + 0x8 × n (n = 1 to 15)
0x0800 (n = 16), 0x0808 (n = 17)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	AE	SA	MBC[5:0]						—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ADDRHI[15:0]															
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	ADDRHI[15:0]	MAC Address n[47:32] This field contains the upper 16 bits [47:32] of the nth 6-byte MAC address.	R/W
23:16	—	These bits are read as 0. The write value should be 0.	R/W
29:24	MBC[5:0]	Mask Byte Control These bits are mask control bits for comparison of each of the MAC Address bytes. When set high, the GMAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: MBC[5]: MARn_H.ADDRHI[15:8] MBC[4]: MARn_H.ADDRHI[7:0] MBC[3]: MADRn_L.ADDRLO[31:24] MBC[2]: MADRn_L.ADDRLO[23:16] MBC[1]: MADRn_L.ADDRLO[15:8] MBC[0]: MADRn_L.ADDRLO[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.	R/W
30	SA	Source Address When this bit is set, the MAC Address n[47:0] is used to compare with the SA fields of the received frame. When this bit is reset, the MAC Address n[47:0] is used to compare with the DA fields of the received frame.	R/W
31	AE	Address Enable When this bit is set, the address filter module uses the nth MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering.	R/W

27.3.18 MARn_L : MAC ADDRESS Low Register (n = 1 to 17)

Base address: GMAC = 0x8010_0000

Offset address: 0x0044 + 0x8 × n (n = 1 to 15)
0x0804 (n = 16), 0x080C (n = 17)

Bit position:	31																													0
Bit field:	ADDRLO[31:0]																													
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	ADDRLO[31:0]	MAC Address n[31:0] This field contains the lower 32 bits [31:0] of the nth 6-byte MAC address. The content of this field is undefined until loaded by the application after the initialization process.	R/W

27.3.19 WDog_Timeout : Watchdog Timeout Register

Base address: GMAC = 0x8010_0000

Offset address: 0x00DC

Bit position:	31															16		13												0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PWE	—	—	WTO[13:0]												
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
13:0	WTO[13:0]	Watchdog Timeout When bit PWE[16] is set and bit WD[23] of MAC Configuration Register (MAC_Configuration) is reset, this field is used as watchdog timeout for a received frame. If the length of a received frame exceeds the value of this field, such frame is terminated and declared as an error frame. When bit PWE[16] is set, the value in this field should be more than 1,522 (0x05F2). Otherwise, the IEEE Std 802.3-specified valid tagged frames are declared as error frames and are dropped.	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W
16	PWE	Programmable Watchdog Enable When this bit is set and bit WD[23] of MAC Configuration Register (MAC_Configuration) is reset, the WTO field (bits [13:0]) is used as watchdog timeout for a received frame. When this bit is cleared, the watchdog timeout for a received frame is controlled by the setting of bit WD[23] and bit JE[20] in MAC Configuration Register (MAC_Configuration).	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

27.3.20 MMC_Control : MMC Control Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0100

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	UCDBC	—	—	CNTPRSTLVL	CNTPRST	CNTFREEZ	RSTONRD	CNTSTOPRO	CNTRST
Value after reset:	x	x	x	x	x	x	x	0	x	x	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CNTRST	Counters Reset When this bit is set, all counters are reset. This bit is cleared automatically after 1 clock cycle.	R/W
1	CNTSTOPRO	Counters Stop Rollover When this bit is set, after reaching maximum value, the counter does not roll over to 0.	R/W
2	RSTONRD	Reset on Read When this bit is set, the MMC counters are reset to 0 after a read (self-clearing after reset). The counters are cleared when the least significant byte lane (bits [7:0]) is read.	R/W
3	CNTFREEZ	MMC Counter Freeze When this bit is set, it freezes all MMC counters to their current value. Until this bit is reset to 0, no MMC counter is updated because of any transmitted or received frame. If any MMC counter is read with the Reset on Read bit set, then that counter is also cleared in this mode.	R/W
4	CNTPRST	Counters Preset When this bit is set, all counters are initialized or preset to almost full or almost half according to bit [5]. This bit is cleared automatically after 1 clock cycle. This bit, along with bit [5], is useful for debugging and testing the assertion of interrupts because of MMC counter becoming half-full or full.	R/W

Bit	Symbol	Function	R/W
5	CNTPRSTLVL	Full-Half Preset When low and bit [4] is set, all MMC counters get preset to almost-half value. All octet counters get preset to 0x7FFF_F800 (half - 2 KB) and all frame-counters gets preset to 0x7FFF_FFF0 (half - 16). When this bit is high and bit [4] is set, all MMC counters get preset to almost-full value. All octet counters get preset to 0xFFFF_F800 (full - 2 KB) and all frame-counters gets preset to 0xFFFF_FFF0 (full - 16). For 16-bit counters, the almost-half preset values are 0x7800 and 0x7FF0 for the respective octet and frame counters. Similarly, the almost-full preset values for the 16-bit counters are 0xF800 and 0xFFF0.	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
8	UCDBC	Update MMC Counters for Dropped Broadcast Frames When set, this bit enables GMAC to update all the related MMC counters for Broadcast frames dropped due to setting of DBF bit (Disable Broadcast Frames) of MAC Frame Filter Register at offset 0x0004. When reset, MMC counters are not updated for dropped Broadcast frames.	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

27.3.21 MMC_Receive_Interrupt : MMC Receive Interrupt Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0104

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	RXCTRLFIS	RXRCVERRFIS	RXWDOGFIS	RXVLANGBFIS	RXFOVFIS	RXPAUSFIS	RXORANGEFIS	RXLENERFIS	RXUCGFIS	RX1024TMAXOCTGBFIS
Value after reset:	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	RX512T1023OCTGBFIS	RX256T511OCTGBFIS	RX128T255OCTGBFIS	RX65T127OCTGBFIS	RX64OCTGBFIS	RXOSIZEGFIS	RXUSIZEGFIS	RXJABERFIS	RXRUNTFIS	RXALGNERFIS	RXCRCERFIS	RXMCGFIS	RXBCGFIS	RXGOCTIS	RXGBOCTIS	RXGBFRMIS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RXGBFRMIS	MMC Receive Good Bad Frame Counter Interrupt Status This bit is set when the Rx_Frames_Count_Good_Bad counter reaches half of the maximum value or the maximum value.	R
1	RXGBOCTIS	MMC Receive Good Bad Octet Counter Interrupt Status This bit is set when the Rx_Octet_Count_Good_Bad counter reaches half of the maximum value or the maximum value.	R
2	RXGOCTIS	MMC Receive Good Octet Counter Interrupt Status This bit is set when the Rx_Octet_Count_Good counter reaches half of the maximum value or the maximum value.	R
3	RXBCGFIS	MMC Receive Broadcast Good Frame Counter Interrupt Status This bit is set when the Rx_Broadcast_Frames_Good counter reaches half of the maximum value or the maximum value.	R
4	RXMCGFIS	MMC Receive Multicast Good Frame Counter Interrupt Status This bit is set when the Rx_Multicast_Frames_Good counter reaches half of the maximum value or the maximum value.	R
5	RXCRCERFIS	MMC Receive CRC Error Frame Counter Interrupt Status This bit is set when the Rx_CRC_Error_Frames counter reaches half of the maximum value or the maximum value.	R
6	RXALGNERFIS	MMC Receive Alignment Error Frame Counter Interrupt Status This bit is set when the Rx_Alignment_Error_Frames counter reaches half of the maximum value or the maximum value.	R

Bit	Symbol	Function	R/W
7	RXRUNTFIS	MMC Receive Runt Frame Counter Interrupt Status This bit is set when the Rx_Runt_Error_Frames counter reaches half of the maximum value or the maximum value.	R
8	RXJABERFIS	MMC Receive Jabber Error Frame Counter Interrupt Status This bit is set when the Rx_Jabber_Error_Frames counter reaches half of the maximum value or the maximum value.	R
9	RXUSIZEGFIS	MMC Receive Undersize Good Frame Counter Interrupt Status This bit is set when the Rx_Undersize_Frames_Good counter reaches half of the maximum value or the maximum value.	R
10	RXOSIZEGFIS	MMC Receive Oversize Good Frame Counter Interrupt Status This bit is set when the Rx_Oversize_Frames_Good counter reaches half of the maximum value or the maximum value.	R
11	RX64OCTGBFIS	MMC Receive 64 Octet Good Bad Frame Counter Interrupt Status This bit is set when the Rx_64Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R
12	RX65T127OCTGBFIS	MMC Receive 65 to 127 Octet Good Bad Frame Counter Interrupt Status This is set when the Rx_65To127Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R
13	RX128T255OCTGBFIS	MMC Receive 128 to 255 Octet Good Bad Frame Counter Interrupt Status This bit is set when the Rx_128To255Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R
14	RX256T511OCTGBFIS	MMC Receive 256 to 511 Octet Good Bad Frame Counter Interrupt Status This bit is set when the Rx_256To511Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R
15	RX512T1023OCTGBFIS	MMC Receive 512 to 1023 Octet Good Bad Frame Counter Interrupt Status This bit is set when the Rx_512To1023Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R
16	RX1024TMAXOCTGBFIS	MMC Receive 1024 to Maximum Octet Good Bad Frame Counter Interrupt Status This bit is set when the Rx_1024ToMaxOctets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R
17	RXUCGFIS	MMC Receive Unicast Good Frame Counter Interrupt Status This bit is set when the Rx_Unicast_Frames_Good counter reaches half of the maximum value or the maximum value.	R
18	RXLENERFIS	MMC Receive Length Error Frame Counter Interrupt Status This bit is set when the Rx_Length_Error_Frames counter reaches half of the maximum value or the maximum value.	R
19	RXORANGEFIS	MMC Receive Out Of Range Error Frame Counter Interrupt Status This bit is set when the Rx_Out_Of_Range_Type_Frames counter reaches half of the maximum value or the maximum value.	R
20	RXPAUSFIS	MMC Receive Pause Frame Counter Interrupt Status This bit is set when the Rx_Pause_Frames counter reaches half of the maximum value or the maximum value.	R
21	RXFOVFIS	MMC Receive FIFO Overflow Frame Counter Interrupt Status This bit is set when the Rx_FIFO_Overflow_Frames counter reaches half of the maximum value or the maximum value.	R
22	RXVLANGBFIS	MMC Receive VLAN Good Bad Frame Counter Interrupt Status This bit is set when the Rx_VLAN_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R
23	RXWDOGFIS	MMC Receive Watchdog Error Frame Counter Interrupt Status This bit is set when the Rx_Watchdog_Error_Frames counter reaches half of the maximum value or the maximum value.	R
24	RXRCVERRFIS	MMC Receive Error Frame Counter Interrupt Status This bit is set when the Rx_Receive_Error_Frames counter reaches half of the maximum value or the maximum value.	R
25	RXCTRLFIS	MMC Receive Control Frame Counter Interrupt Status This bit is set when the Rx_Control_Frames_Good counter reaches half of the maximum value or the maximum value.	R

Bit	Symbol	Function	R/W
31:26	—	These bits are read as 0.	R

27.3.22 MMC_Transmit_Interrupt : MMC Transmit Interrupt Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0108

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	TXOSIZEGFIS	TXVLANGFIS	TXPAUSFIS	TXEXDEFFIS	TXGFRMIS	TXGOCTIS	TXCARERFIS	TXEXCOLFIS	TXLATCOLFIS	TXDEFFIS
Value after reset:	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	TXMCOLGFIS	TXSCOLGFIS	TXUFLOWERFIS	TXBCGBFIS	TXMCGBFIS	TXUCGBFIS	TX1024TMAXOCTGBFIS	TX512T1023OCTGBFIS	TX256T511OCTGBFIS	TX128T255OCTGBFIS	TX65T127OCTGBFIS	TX64OCTGBFIS	TXMCGFIS	TXBCGFIS	TXGBFRMIS	TXGBOCTIS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TXGBOCTIS	MMC Transmit Good Bad Octet Counter Interrupt Status This bit is set when the Tx_Octet_Count_Good_Bad counter reaches half of the maximum value or the maximum value.	R
1	TXGBFRMIS	MMC Transmit Good Bad Frame Counter Interrupt Status This bit is set when the Tx_Frame_Count_Good_Bad counter reaches half of the maximum value or the maximum value.	R
2	TXBCGFIS	MMC Transmit Broadcast Good Frame Counter Interrupt Status This bit is set when the Tx_Broadcast_Frames_Good counter reaches half of the maximum value or the maximum value.	R
3	TXMCGFIS	MMC Transmit Multicast Good Frame Counter Interrupt Status This bit is set when the Tx_Multicast_Frames_Good counter reaches half of the maximum value or the maximum value.	R
4	TX64OCTGBFIS	MMC Transmit 64 Octet Good Bad Frame Counter Interrupt Status This bit is set when the Tx_64Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R
5	TX65T127OCTGBFIS	MMC Transmit 65 to 127 Octet Good Bad Frame Counter Interrupt Status This bit is set when the Tx_65To127Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R
6	TX128T255OCTGBFIS	MMC Transmit 128 to 255 Octet Good Bad Frame Counter Interrupt Status This bit is set when the Tx_128To255Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R
7	TX256T511OCTGBFIS	MMC Transmit 256 to 511 Octet Good Bad Frame Counter Interrupt Status This bit is set when the Tx_256To511Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R
8	TX512T1023OCTGBFIS	MMC Transmit 512 to 1023 Octet Good Bad Frame Counter Interrupt Status This bit is set when the Tx_512To1023Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R
9	TX1024TMAXOCTGBFIS	MMC Transmit 1024 to Maximum Octet Good Bad Frame Counter Interrupt Status This bit is set when the Tx_1024ToMaxOctets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R
10	TXUCGBFIS	MMC Transmit Unicast Good Bad Frame Counter Interrupt Status This bit is set when the Tx_Unicast_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R
11	TXMCGBFIS	MMC Transmit Multicast Good Bad Frame Counter Interrupt Status This bit is set when the Tx_Multicast_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R

Bit	Symbol	Function	R/W
12	TXBCGBFIS	MMC Transmit Broadcast Good Bad Frame Counter Interrupt Status This bit is set when the Tx_Broadcast_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R
13	TXUFLOWERFIS	MMC Transmit Underflow Error Frame Counter Interrupt Status This bit is set when the Tx_Underflow_Error_Frames counter reaches half of the maximum value or the maximum value.	R
14	TXSCOLGFIS	MMC Transmit Single Collision Good Frame Counter Interrupt Status This bit is set when the Tx_Single_Collision_Good_Frames counter reaches half of the maximum value or the maximum value.	R
15	TXMCOLGFIS	MMC Transmit Multiple Collision Good Frame Counter Interrupt Status This bit is set when the Tx_Multiple_Collision_Good_Frames counter reaches half of the maximum value or the maximum value.	R
16	TXDEFFIS	MMC Transmit Deferred Frame Counter Interrupt Status This bit is set when the Tx_Deferred_Frames counter reaches half of the maximum value or the maximum value.	R
17	TXLATCOLFIS	MMC Transmit Late Collision Frame Counter Interrupt Status This bit is set when the Tx_Late_Collision_Frames counter reaches half of the maximum value or the maximum value.	R
18	TXEXCOLFIS	MMC Transmit Excessive Collision Frame Counter Interrupt Status This bit is set when the Tx_Excessive_Collision_Frames counter reaches half of the maximum value or the maximum value.	R
19	TXCARERFIS	MMC Transmit Carrier Error Frame Counter Interrupt Status This bit is set when the Tx_Carrier_Error_Frames counter reaches half of the maximum value or the maximum value.	R
20	TXGOCTIS	MMC Transmit Good Octet Counter Interrupt Status This bit is set when the Tx_Octet_Count_Good counter reaches half of the maximum value or the maximum value.	R
21	TXGFRMIS	MMC Transmit Good Frame Counter Interrupt Status This bit is set when the Tx_Frame_Count_Good counter reaches half of the maximum value or the maximum value.	R
22	TXEXDEFFIS	MMC Transmit Excessive Deferral Frame Counter Interrupt Status This bit is set when the Tx_Excessive_Deferral_Error counter reaches half of the maximum value or the maximum value.	R
23	TXPAUSFIS	MMC Transmit Pause Frame Counter Interrupt Status This bit is set when the Tx_Pause_Frames counter reaches half of the maximum value or the maximum value.	R
24	TXVLANGFIS	MMC Transmit VLAN Good Frame Counter Interrupt Status This bit is set when the Tx_VLAN_Frames_Good counter reaches half of the maximum value or the maximum value.	R
25	TXOSIZEGFIS	MMC Transmit Oversize Good Frame Counter Interrupt Status This bit is set when the Tx_OSize_Frames_Good counter reaches half of the maximum value or the maximum value.	R
31:26	—	These bits are read as 0.	R

27.3.23 MMC_Receive_Interrupt_Mask : MMC Receive Interrupt Mask Register

Base address: GMAC = 0x8010_0000

Offset address: 0x010C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	RXCTRLFIM	RXRCVERRFIM	RXWDOGFIM	RXVLANGBFIM	RXFOVFIM	RXPAUSFIM	RXORANGEFIM	RXLENERFIM	RXUCGFIM	RX1024TMAXOCTGBFIM
Value after reset:	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	RX512T1023OCTGBFIM	RX256T511OCTGBFIM	RX128T255OCTGBFIM	RX65T127OCTGBFIM	RX64OCTGBFIM	RXOSIZEGFIM	RXUSIZEGFIM	RXJABERFIM	RXRUNTFIM	RXALGNERFIM	RXCRCERFIM	RXMCGFIM	RXBCGFIM	RXGOCTIM	RXGBOCTIM	RXGBFRMIM
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RXGBFRMIM	MMC Receive Good Bad Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_Frames_Count_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W
1	RXGBOCTIM	MMC Receive Good Bad Octet Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_Octet_Count_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W
2	RXGOCTIM	MMC Receive Good Octet Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_Octet_Count_Good counter reaches half of the maximum value or the maximum value.	R/W
3	RXBCGFIM	MMC Receive Broadcast Good Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_Broadcast_Frames_Good counter reaches half of the maximum value or the maximum value.	R/W
4	RXMCGFIM	MMC Receive Multicast Good Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_Multicast_Frames_Good counter reaches half of the maximum value or the maximum value.	R/W
5	RXCRCERFIM	MMC Receive CRC Error Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_CRC_Error_Frames counter reaches half of the maximum value or the maximum value.	R/W
6	RXALGNERFIM	MMC Receive Alignment Error Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_Alignment_Error_Frames counter reaches half of the maximum value or the maximum value.	R/W
7	RXRUNTFIM	MMC Receive Runt Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_Runt_Error_Frames counter reaches half of the maximum value or the maximum value.	R/W
8	RXJABERFIM	MMC Receive Jabber Error Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_Jabber_Error_Frames counter reaches half of the maximum value or the maximum value.	R/W
9	RXUSIZEGFIM	MMC Receive Undersize Good Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_Undersize_Frames_Good counter reaches half of the maximum value or the maximum value.	R/W
10	RXOSIZEGFIM	MMC Receive Oversize Good Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_Oversize_Frames_Good counter reaches half of the maximum value or the maximum value.	R/W
11	RX64OCTGBFIM	MMC Receive 64 Octet Good Bad Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_64Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W
12	RX65T127OCTGBFIM	MMC Receive 65 to 127 Octet Good Bad Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_65To127Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W

Bit	Symbol	Function	R/W
13	RX128T255OCTGBFIM	MMC Receive 128 to 255 Octet Good Bad Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_128To255Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W
14	RX256T511OCTGBFIM	MMC Receive 256 to 511 Octet Good Bad Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_256To511Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W
15	RX512T1023OCTGBFIM	MMC Receive 512 to 1023 Octet Good Bad Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_512To1023Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W
16	RX1024TMAXOCTGBFIM	MMC Receive 1024 to Maximum Octet Good Bad Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_1024ToMaxOctets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W
17	RXUCGFIM	MMC Receive Unicast Good Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_Unicast_Frames_Good counter reaches half of the maximum value or the maximum value.	R/W
18	RXLENERFIM	MMC Receive Length Error Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_Length_Error_Frames counter reaches half of the maximum value or the maximum value.	R/W
19	RXORANGEFIM	MMC Receive Out Of Range Error Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_Out_Of_Range_Type_Frames counter reaches half of the maximum value or the maximum value.	R/W
20	RXPAUSFIM	MMC Receive Pause Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_Pause_Frames counter reaches half of the maximum value or the maximum value.	R/W
21	RXFOVFIM	MMC Receive FIFO Overflow Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_FIFO_Overflow_Frames counter reaches half of the maximum value or the maximum value.	R/W
22	RXVLANGBFIM	MMC Receive VLAN Good Bad Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_VLAN_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W
23	RXWDOGFIM	MMC Receive Watchdog Error Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_Watchdog_Error_Frames counter reaches half of the maximum value or the maximum value.	R/W
24	RXRCVERRFIM	MMC Receive Error Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_Receive_Error_Frames error counter reaches half the maximum value, and also when it reaches the maximum value.	R/W
25	RXCTRLFIM	MMC Receive Control Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Rx_Control_Frames_Good counter reaches half the maximum value, and also when it reaches the maximum value.	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

27.3.24 MMC_Transmit_Interrupt_Mask : MMC Transmit Interrupt Mask Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0110

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset:	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	TXMCOLGFIM	TXSCOLGFIM	TXUFLOWERFIM	TXBCGBFIM	TXMCGBFIM	TXUCGBFIM	TX1024TMAXOCTGBFIM	TX512T1023OCTGBFIM	TX256T511OCTGBFIM	TX128T255OCTGBFIM	TX65T127OCTGBFIM	TX64OCTGBFIM	TXMCGFIM	TXBCGFIM	TXGBFRMIM	TXGBOCTIM
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TXGBOCTIM	MMC Transmit Good Bad Octet Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_Octet_Count_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W
1	TXGBFRMIM	MMC Transmit Good Bad Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_Frame_Count_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W
2	TXBCGFIM	MMC Transmit Broadcast Good Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_Broadcast_Frames_Good counter reaches half of the maximum value or the maximum value.	R/W
3	TXMCGFIM	MMC Transmit Multicast Good Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_Multicast_Frames_Good counter reaches half of the maximum value or the maximum value.	R/W
4	TX64OCTGBFIM	MMC Transmit 64 Octet Good Bad Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_64Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W
5	TX65T127OCTGBFIM	MMC Transmit 65 to 127 Octet Good Bad Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_65To127Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W
6	TX128T255OCTGBFIM	MMC Transmit 128 to 255 Octet Good Bad Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_128To255Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W
7	TX256T511OCTGBFIM	MMC Transmit 256 to 511 Octet Good Bad Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_256To511Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W
8	TX512T1023OCTGBFIM	MMC Transmit 512 to 1023 Octet Good Bad Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_512To1023Octets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W
9	TX1024TMAXOCTGBFIM	MMC Transmit 1024 to Maximum Octet Good Bad Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_1024ToMaxOctets_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W
10	TXUCGBFIM	MMC Transmit Unicast Good Bad Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_Unicast_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W
11	TXMCGBFIM	MMC Transmit Multicast Good Bad Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_Multicast_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W

Bit	Symbol	Function	R/W
12	TXBCGBFIM	MMC Transmit Broadcast Good Bad Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_Broadcast_Frames_Good_Bad counter reaches half of the maximum value or the maximum value.	R/W
13	TXUFLOWERFIM	MMC Transmit Underflow Error Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_Underflow_Error_Frames counter reaches half of the maximum value or the maximum value.	R/W
14	TXSCOLGFIM	MMC Transmit Single Collision Good Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_Single_Collision_Good_Frames counter reaches half of the maximum value or the maximum value.	R/W
15	TXMCOLGFIM	MMC Transmit Multiple Collision Good Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_Multiple_Collision_Good_Frames counter reaches half of the maximum value or the maximum value.	R/W
16	TXDEFFIM	MMC Transmit Deferred Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_Deferred_Frames counter reaches half of the maximum value or the maximum value.	R/W
17	TXLATCOLFIM	MMC Transmit Late Collision Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_Late_Collision_Frames counter reaches half of the maximum value or the maximum value.	R/W
18	TXEXCOLFIM	MMC Transmit Excessive Collision Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_Excessive_Collision_Frames counter reaches half of the maximum value or the maximum value.	R/W
19	TXCARERFIM	MMC Transmit Carrier Error Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_Carrier_Error_Frames counter reaches half of the maximum value or the maximum value.	R/W
20	TXGOCTIM	MMC Transmit Good Octet Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_Octet_Count_Good counter reaches half of the maximum value or the maximum value.	R/W
21	TXGFRMIM	MMC Transmit Good Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_Frame_Count_Good counter reaches half of the maximum value or the maximum value.	R/W
22	TXEXDEFFIM	MMC Transmit Excessive Deferral Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_Excessive_Deferral_Error counter reaches half of the maximum value or the maximum value.	R/W
23	TXPAUSFIM	MMC Transmit Pause Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_Pause_Frames counter reaches half of the maximum value or the maximum value.	R/W
24	TXVLANGFIM	MMC Transmit VLAN Good Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_VLAN_Frames_Good counter reaches half of the maximum value or the maximum value.	R/W
25	TXOSIZEGFIM	MMC Transmit Oversize Good Frame Counter Interrupt Mask Setting this bit masks the interrupt generated when the Tx_OSize_Frames_Good counter reaches half of the maximum value or the maximum value.	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

27.3.25 Tx_Octet_Count_Good_Bad : Transmit Octet Count for Good and Bad Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0114

Bit position:	31																												0
Bit field:	TXOCTGB[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	TXOCTGB[31:0]	This field indicates the number of bytes transmitted in good and bad frames exclusive of preamble and retried bytes.	R

27.3.26 Tx_Frame_Count_Good_Bad : Transmit Frame Count for Good and Bad Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0118

Bit position:	31																												0
Bit field:	TXFRMGB[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	TXFRMGB[31:0]	This field indicates the number of good and bad frames transmitted, exclusive of retried frames.	R

27.3.27 Tx_Broadcast_Frames_Good : Transmit Frame Count for Good Broadcast Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x011C

Bit position:	31																												0
Bit field:	TXBCASTG[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	TXBCASTG[31:0]	This field indicates the number of transmitted good broadcast frames.	R

27.3.28 Tx_Multicast_Frames_Good : Transmit Frame Count for Good Multicast Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0120

Bit position:	31																												0
Bit field:	TXMCASTG[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	TXMCASTG[31:0]	This field indicates the number of transmitted good multicast frames.	R

27.3.29 Tx_64Octets_Frames_Good_Bad : Transmit Octet Count for Good and Bad 64 Byte Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0124

Bit position:	31																												0
Bit field:	TX64OCTGB[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	TX64OCTGB[31:0]	This field indicates the number of transmitted good and bad frames with length of 64 bytes, exclusive of preamble and retried frames.	R

27.3.30 Tx_65To127Octets_Frames_Good_Bad : Transmit Octet Count for Good and Bad 65 to 127 Bytes Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0128

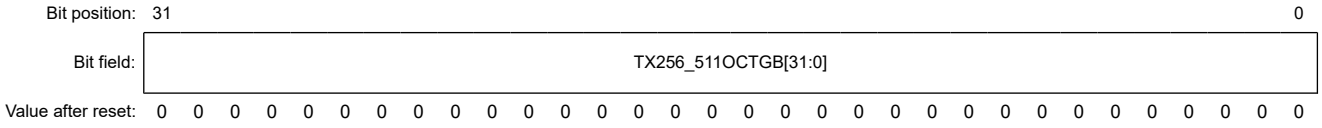
Bit position:	31																												0
Bit field:	TX65_127OCTGB[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	TX65_127OCTGB[31:0]	This field indicates the number of transmitted good and bad frames with length between 65 and 127 (inclusive) bytes, exclusive of preamble and retried frames.	R

27.3.31 Tx_128To255Octets_Frames_Good_Bad : Transmit Octet Count for Good and Bad 128 to 255 Bytes Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x012C



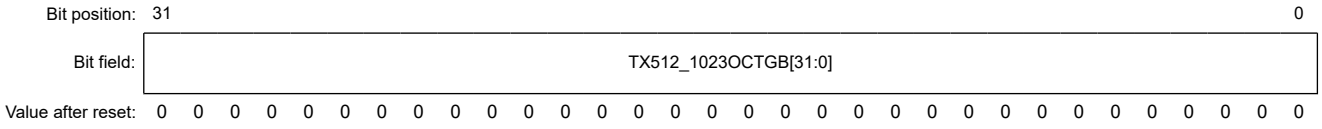
Bit position:	31																												0
Bit field:	TX128_255OCTGB[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	TX128_255OCTGB[31:0]	This field indicates the number of transmitted good and bad frames with length between 128 and 255 (inclusive) bytes, exclusive of preamble and retried frames.	R

27.3.32 Tx_256To511Octets_Frames_Good_Bad : Transmit Octet Count for Good and Bad 256 to 511 Bytes Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0130

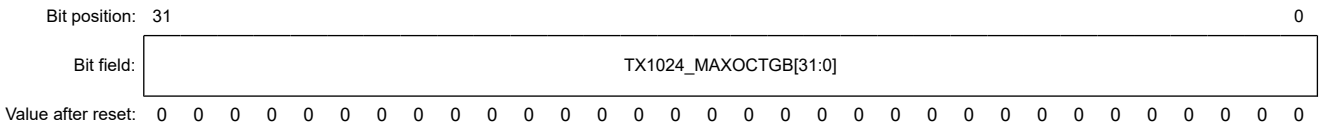


Bit	Symbol	Function	R/W
31:0	TX256_511OCTGB[31:0]	This field indicates the number of transmitted good and bad frames with length between 256 and 511 (inclusive) bytes, exclusive of preamble and retried frames.	R

27.3.33 Tx_512To1023Octets_Frames_Good_Bad : Transmit Octet Count for Good and Bad 512 to 1023 Bytes Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0134

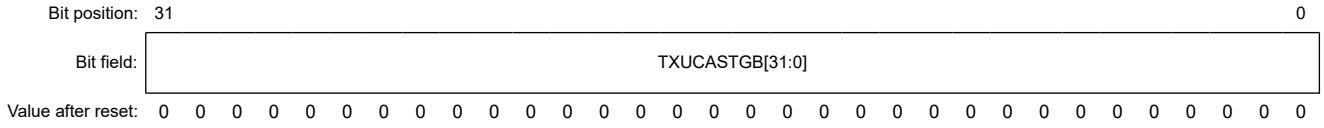


Bit	Symbol	Function	R/W
31:0	TX512_1023OCTGB[31:0]	This field indicates the number of transmitted good and bad frames with length between 512 and 1,023 (inclusive) bytes, exclusive of preamble and retried frames.	R

27.3.34 Tx_1024ToMaxOctets_Frames_Good_Bad : Transmit Octet Count for Good and Bad 1024 to Maxsize Bytes Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0138

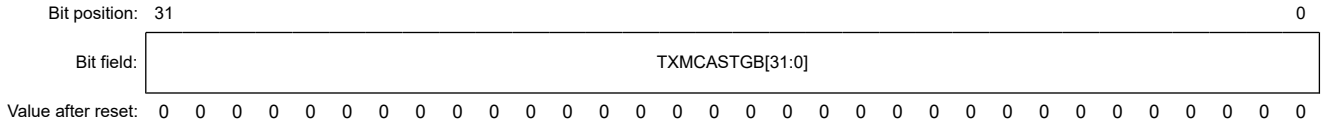


Bit	Symbol	Function	R/W
31:0	TX1024_MAXOCTGB[31:0]	This field indicates the number of good and bad frames transmitted with length between 1,024 and maxsize (inclusive) bytes, exclusive of preamble and retried frames.	R

27.3.35 Tx_Unicast_Frames_Good_Bad : Transmit Frame Count for Good and Bad Unicast Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x013C

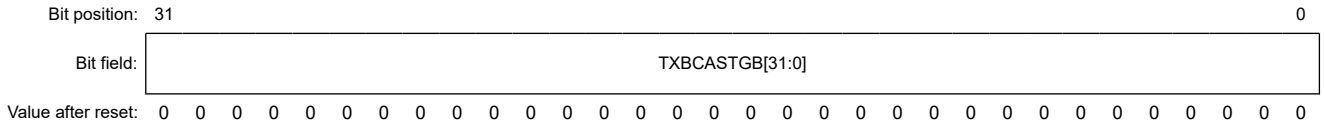


Bit	Symbol	Function	R/W
31:0	TXUCASTGB[31:0]	This field indicates the number of transmitted good and bad unicast frames.	R

27.3.36 Tx_Multicast_Frames_Good_Bad : Transmit Frame Count for Good and Bad Multicast Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0140

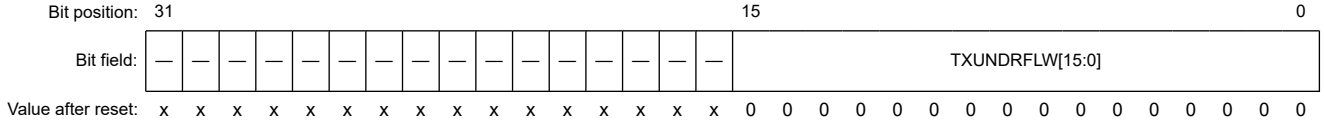


Bit	Symbol	Function	R/W
31:0	TXMCASTGB[31:0]	This field indicates the number of transmitted good and bad multicast frames.	R

27.3.37 Tx_Broadcast_Frames_Good_Bad : Transmit Frame Count for Good and Bad Broadcast Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0144



Bit	Symbol	Function	R/W
31:0	TXBCASTGB[31:0]	This field indicates the number of transmitted good and bad broadcast frames.	R

27.3.38 Tx_Underflow_Error_Frames : Transmit Frame Count for Underflow Error Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0148

Bit	Symbol	Function	R/W
15:0	TXUNDRFLW[15:0]	This field indicates the number of frames aborted because of frame underflow error.	R
31:16	—	These bits are read as 0.	R

27.3.39 Tx_Single_Collision_Good_Frames : Transmit Frame Count for Frames Transmitted after Single Collision

Base address: GMAC = 0x8010_0000

Offset address: 0x014C

Bit position:	31															15														0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TXSNGLCOLG[15:0]														
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	TXSNGLCOLG[15:0]	This field indicates the number of successfully transmitted frames after a single collision in the half-duplex mode.	R
31:16	—	These bits are read as 0.	R

27.3.40 Tx_Multiple_Collision_Good_Frames : Transmit Frame Count for Frames Transmitted after Multiple Collision

Base address: GMAC = 0x8010_0000

Offset address: 0x0150

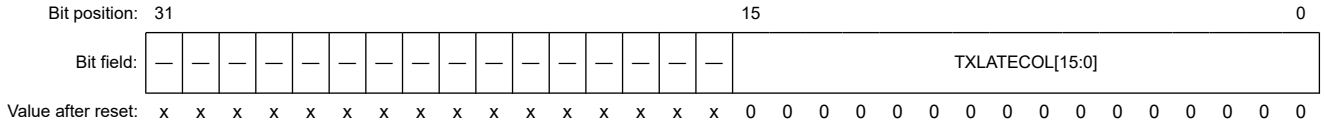
Bit position:	31															15														0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TXMULTCOLG[15:0]														
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	TXMULTCOLG[15:0]	This field indicates the number of successfully transmitted frames after multiple collisions in the half-duplex mode.	R
31:16	—	These bits are read as 0.	R

27.3.41 Tx_Deferred_Frames : Transmit Frame Count for Deferred Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0154



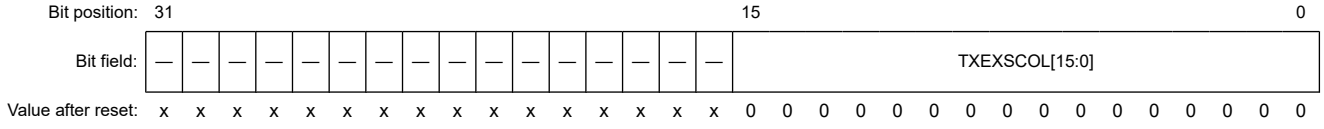
Bit position:	31															15														0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TXDEFRD[15:0]														
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	TXDEFRD[15:0]	This field indicates the number of successfully transmitted frames after a deferral in the half-duplex mode.	R
31:16	—	These bits are read as 0.	R

27.3.42 Tx_Late_Collision_Frames : Transmit Frame Count for Late Collision Error Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0158

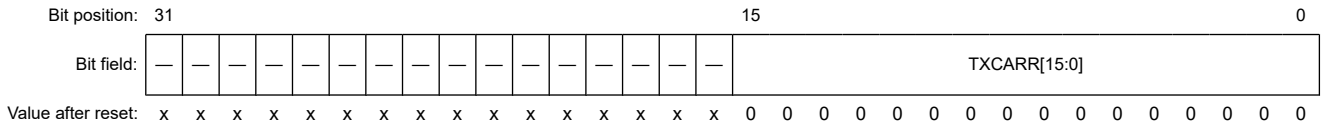


Bit	Symbol	Function	R/W
15:0	TXLATECOL[15:0]	This field indicates the number of frames aborted because of late collision error.	R
31:16	—	These bits are read as 0.	R

27.3.43 Tx_Excessive_Collision_Frames : Transmit Frame Count for Excessive Collision Error Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x015C

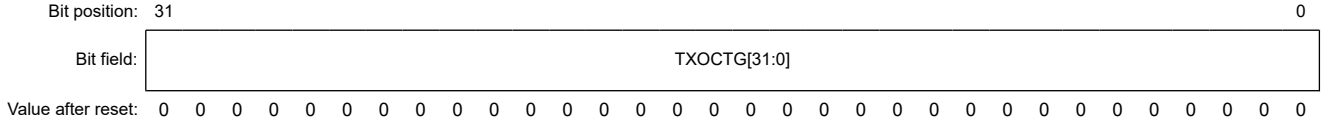


Bit	Symbol	Function	R/W
15:0	TXEXSCOL[15:0]	This field indicates the number of frames aborted because of excessive (16) collision error.	R
31:16	—	These bits are read as 0.	R

27.3.44 Tx_Carrier_Error_Frames : Transmit Frame Count for Carrier Sense Error Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0160

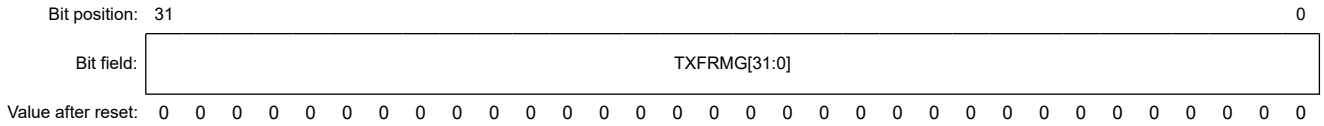


Bit	Symbol	Function	R/W
15:0	TXCARR[15:0]	This field indicates the number of frames aborted because of carrier sense error (no carrier or loss of carrier).	R
31:16	—	These bits are read as 0.	R

27.3.45 Tx_Octet_Count_Good : Transmit Octet Count for Good Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0164

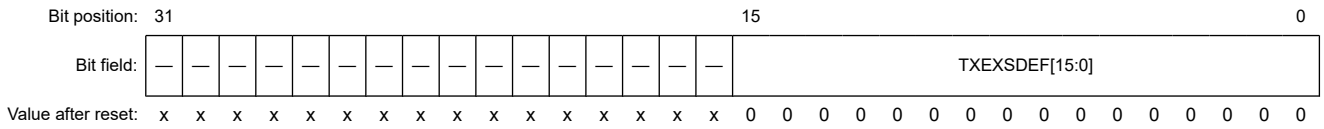


Bit	Symbol	Function	R/W
31:0	TXOCTG[31:0]	This field indicates the number of bytes transmitted, exclusive of preamble, in good frames.	R

27.3.46 Tx_Frame_Count_Good : Transmit Frame Count for Good Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0168

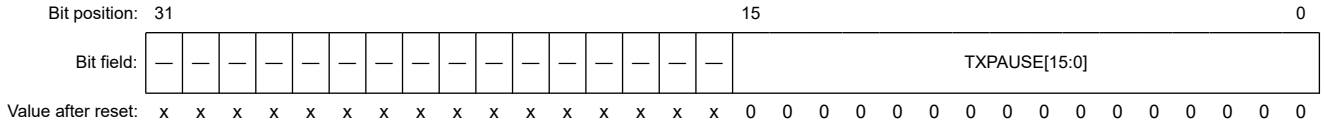


Bit	Symbol	Function	R/W
31:0	TXFRMG[31:0]	This field indicates the number of transmitted good frames, exclusive of preamble.	R

27.3.47 Tx_Excessive_Deferral_Error : Transmit Frame Count for Excessive Deferral Error Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x016C



Bit	Symbol	Function	R/W
15:0	TXEXSDEF[15:0]	This field indicates the number of frames aborted because of excessive deferral error, that is, frames deferred for more than two max sized frame times.	R
31:16	—	These bits are read as 0.	R

27.3.48 Tx_Pause_Frames : Transmit Frame Count for Good PAUSE Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0170

Bit	Symbol	Function	R/W
15:0	TXPAUSE[15:0]	This field indicates the number of transmitted good PAUSE frames.	R
31:16	—	These bits are read as 0.	R

27.3.49 Tx_VLAN_Frames_Good : Transmit Frame Count for Good VLAN Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0174

Bit position:	31																												0
Bit field:	TXVLANG[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	TXVLANG[31:0]	This register maintains the number of transmitted good VLAN frames, exclusive of retried frames.	R

27.3.50 Tx_OSize_Frames_Good : Transmit Frame Count for Good Oversize Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0178

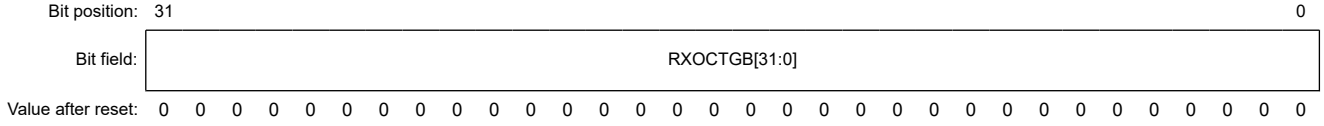
Bit position:	31															15													0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TXOSIZG[15:0]													
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	TXOSIZG[15:0]	This field indicates the number of frames transmitted without errors and with length greater than the maxsize (1,518 or 1,522 bytes for VLAN tagged frames; 2000 bytes if enabled in bit [27] of MAC Configuration Register (MAC_Configuration)).	R
31:16	—	These bits are read as 0.	R

27.3.51 Rx_Frames_Count_Good_Bad : Receive Frame Count for Good and Bad Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0180



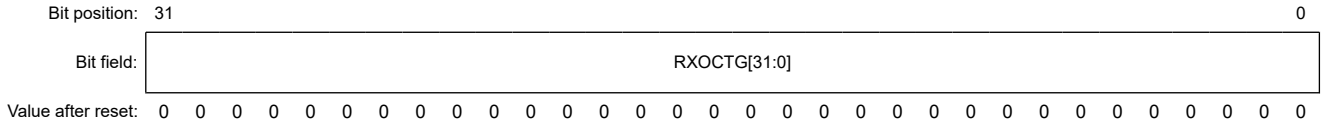
Bit position:	31																												0
Bit field:	RXFRMGB[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	RXFRMGB[31:0]	This field indicates the number of received good and bad frames.	R

27.3.52 Rx_Octet_Count_Good_Bad : Receive Octet Count for Good and Bad Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0184

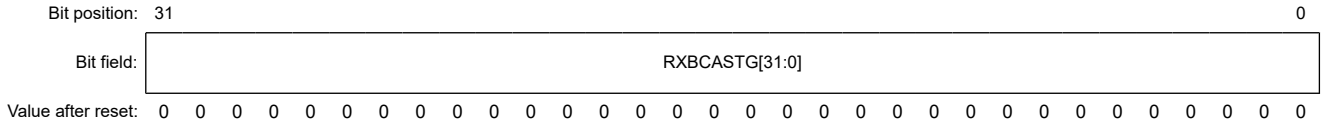


Bit	Symbol	Function	R/W
31:0	RXOCTGB[31:0]	This field indicates the number of bytes received, exclusive of preamble, in good and bad frames.	R

27.3.53 Rx_Octet_Count_Good : Receive Octet Count for Good Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0188

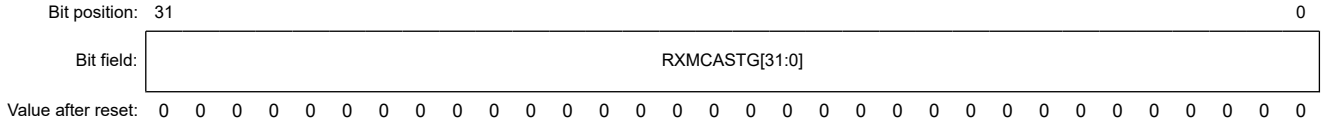


Bit	Symbol	Function	R/W
31:0	RXOCTG[31:0]	This field indicates the number of bytes received, exclusive of preamble, only in good frames.	R

27.3.54 Rx_Broadcast_Frames_Good : Receive Frame Count for Good Broadcast Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x018C



Bit	Symbol	Function	R/W
31:0	RXBCASTG[31:0]	This field indicates the number of received good broadcast frames.	R

27.3.55 Rx_Multicast_Frames_Good : Receive Frame Count for Good Multicast Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0190

Bit	Symbol	Function	R/W
31:0	RXMCASTG[31:0]	This field indicates the number of received good multicast frames.	R

27.3.56 Rx_CRC_Error_Frames : Receive Frame Count for CRC Error Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0194

Bit position:	31																15														0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RXCRCERR[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	RXCRCERR[15:0]	This field indicates the number of frames received with CRC error.	R
31:16	—	These bits are read as 0.	R

27.3.57 Rx_Alignment_Error_Frames : Receive Frame Count for Alignment Error Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x0198

Bit position:	31																15														0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RXALGNERR[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	RXALGNERR[15:0]	This field indicates the number of frames received with alignment (dribble) error. This field is valid only in the 10 or 100 Mbps mode.	R
31:16	—	These bits are read as 0.	R

27.3.58 Rx_Runt_Error_Frames : Receive Frame Count for Runt Error Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x019C

Bit position:	31																15														0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RXRUNTERR[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	RXRUNTERR[15:0]	This field indicates the number of frames received with runt error (< 64 bytes and CRC error).	R
31:16	—	These bits are read as 0.	R

27.3.59 Rx_Jabber_Error_Frames : Receive Frame Count for Jabber Error Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x01A0

Bit position:	31																15														0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RXJABERR[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	RXJABERR[15:0]	This field indicates the number of giant frames received with length (including CRC) greater than 1,518 bytes (1,522 bytes for VLAN tagged) and with CRC error. If Jumbo Frame mode is enabled, then frames of length greater than 9,018 bytes (9,022 for VLAN tagged) are considered as giant frames.	R
31:16	—	These bits are read as 0.	R

27.3.60 Rx_Undersize_Frames_Good : Receive Frame Count for Undersize Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x01A4

Bit position:	31																15														0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RXUNDERSZG[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	RXUNDERSZG[15:0]	This field indicates the number of frames received with length less than 64 bytes and without errors.	R
31:16	—	These bits are read as 0.	R

27.3.61 Rx_Oversize_Frames_Good : Receive Frame Count for Oversize Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x01A8

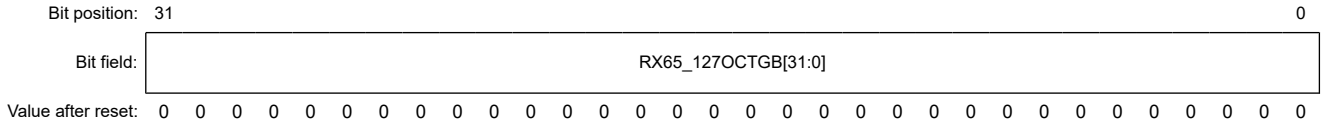
Bit position:	31																15														0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RXOVERSZG[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	RXOVERSZG[15:0]	This field indicates the number of frames received without errors, with length greater than the maxsize (1,518 or 1,522 for VLAN tagged frames; 2,000 bytes if enabled in bit [27] of MAC Configuration Register (MAC_Configuration)).	R
31:16	—	These bits are read as 0.	R

27.3.62 Rx_64Octets_Frames_Good_Bad : Receive Frame Count for Good and Bad 64 Byte Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x01AC



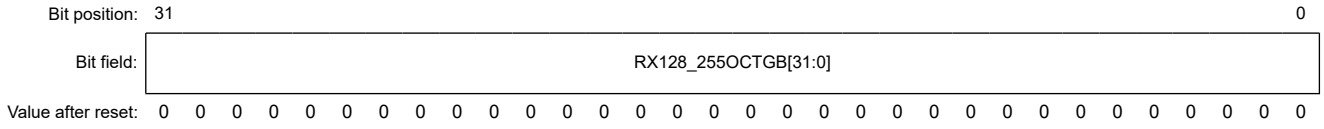
Bit position:	31																														0
Bit field:	RX64OCTGB[31:0]																														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	RX64OCTGB[31:0]	This field indicates the number of received good and bad frames with length 64 bytes, exclusive of preamble.	R

27.3.63 Rx_65To127Octets_Frames_Good_Bad : Receive Frame Count for Good and Bad 65 to 127 Bytes Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x01B0

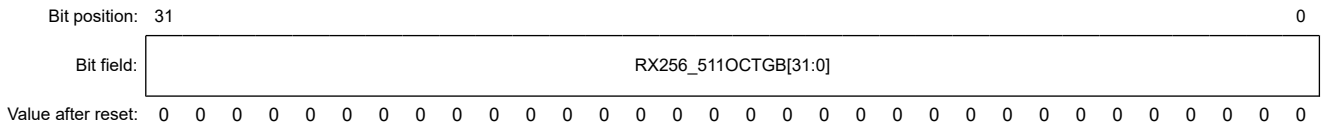


Bit	Symbol	Function	R/W
31:0	RX65_127OCTGB[31:0]	This field indicates the number of received good and bad frames received with length between 65 and 127 (inclusive) bytes, exclusive of preamble.	R

27.3.64 Rx_128To255Octets_Frames_Good_Bad : Receive Frame Count for Good and Bad 128 to 255 Bytes Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x01B4

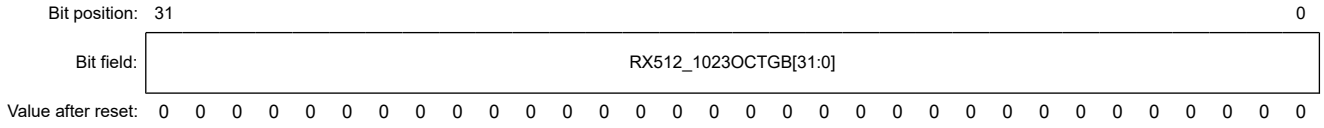


Bit	Symbol	Function	R/W
31:0	RX128_255OCTGB[31:0]	This field indicates the number of received good and bad frames with length between 128 and 255 (inclusive) bytes, exclusive of preamble.	R

27.3.65 Rx_256To511Octets_Frames_Good_Bad : Receive Frame Count for Good and Bad 256 to 511 Bytes Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x01B8

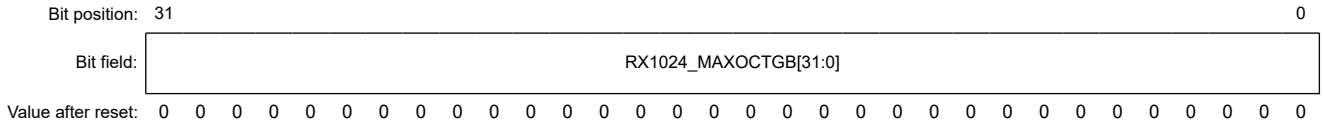


Bit	Symbol	Function	R/W
31:0	RX256_511OCTGB[31:0]	This field indicates the number of received good and bad frames with length between 256 and 511 (inclusive) bytes, exclusive of preamble.	R

27.3.66 Rx_512To1023Octets_Frames_Good_Bad : Receive Frame Count for Good and Bad 512 to 1,023 Bytes Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x01BC

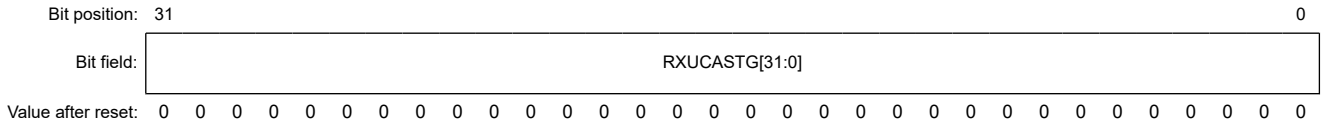


Bit	Symbol	Function	R/W
31:0	RX512_1023OCTGB[31:0]	This field indicates the number of received good and bad frames with length between 512 and 1,023 (inclusive) bytes, exclusive of preamble.	R

27.3.67 Rx_1024ToMaxOctets_Frames_Good_Bad : Receive Frame Count for Good and Bad 1,024 to Maxsize Bytes Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x01C0

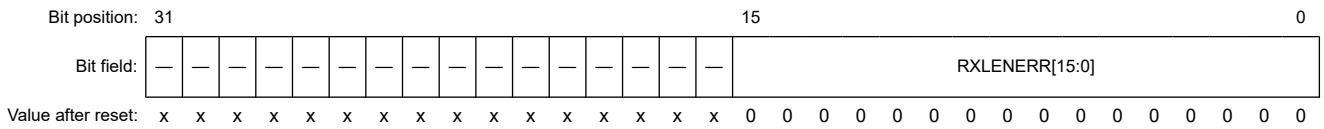


Bit	Symbol	Function	R/W
31:0	RX1024_MAXOCTGB[31:0]	This field indicates the number of received good and bad frames with length between 1,024 and maxsize (inclusive) bytes, exclusive of preamble and retried frames.	R

27.3.68 Rx_Unicast_Frames_Good : Receive Frame Count for Good Unicast Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x01C4



Bit	Symbol	Function	R/W
31:0	RXUCASTG[31:0]	This field indicates the number of received good unicast frames.	R

27.3.69 Rx_Length_Error_Frames : Receive Frame Count for Length Error Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x01C8

Bit	Symbol	Function	R/W
15:0	RXLENERR[15:0]	This field indicates the number of frames received with length error (Length type field not equal to frame size) for all frames with valid length field.	R
31:16	—	These bits are read as 0.	R

27.3.70 Rx_Out_Of_Range_Type_Frames : Receive Frame Count for Out of Range Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x01CC

Bit position:	31															15														0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RXOUTOFRNG[15:0]														
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	RXOUTOFRNG[15:0]	This field indicates the number of received frames with length field not equal to the valid frame size (greater than 1,500 but less than 1,536).	R
31:16	—	These bits are read as 0.	R

27.3.71 Rx_Pause_Frames : Receive Frame Count for PAUSE Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x01D0

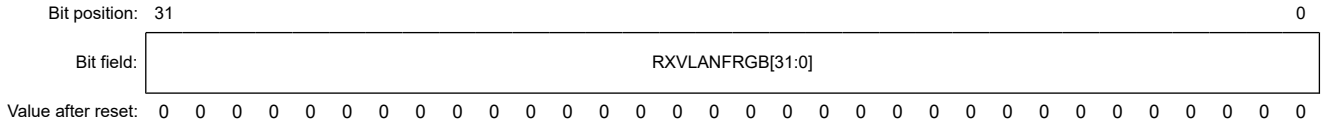
Bit position:	31															15														0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RXPAUSEFRM[15:0]														
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	RXPAUSEFRM[15:0]	This field indicates the number of received good and valid PAUSE frames.	R
31:16	—	These bits are read as 0.	R

27.3.72 Rx_FIFO_Overflow_Frames : Receive Frame Count for FIFO Overflow Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x01D4



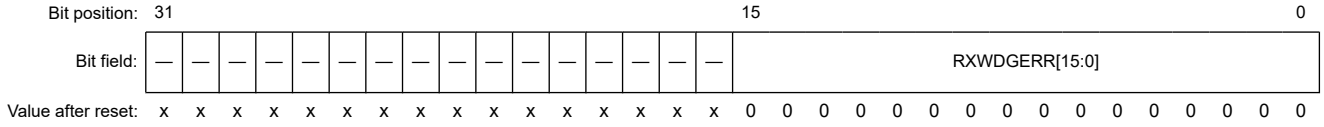
Bit position:	31															15														0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RXFIFOOVFL[15:0]														
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	RXFIFOOVFL[15:0]	This field indicates the number of received frames missed because of FIFO overflow.	R
31:16	—	These bits are read as 0.	R

27.3.73 Rx_VLAN_Frames_Good_Bad : Receive Frame Count for Good and Bad VLAN Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x01D8

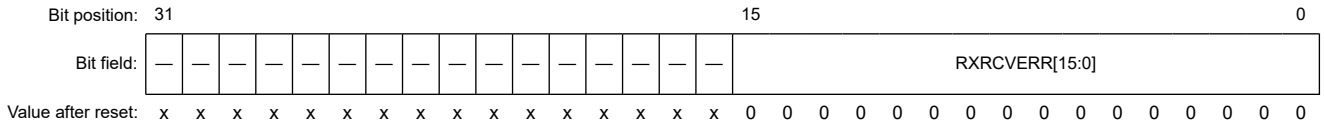


Bit	Symbol	Function	R/W
31:0	RXVLANFRGB[31:0]	This field indicates the number of received good and bad VLAN frames.	R

27.3.74 Rx_Watchdog_Error_Frames : Receive Frame Count for Watchdog Error Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x01DC

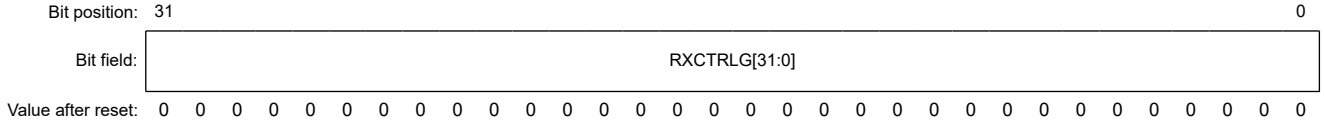


Bit	Symbol	Function	R/W
15:0	RXWDGERR[15:0]	This field indicates the number of frames received with error because of the watchdog timeout error (frames with more than 2,048 bytes or value programmed in Watchdog Timeout Register (WDog_Timeout)).	R
31:16	—	These bits are read as 0.	R

27.3.75 Rx_Receive_Error_Frames : Receive Frame Count for Receive Error Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x01E0



Bit	Symbol	Function	R/W
15:0	RXRCVERR[15:0]	This field indicates the number of frames received with error because of the GMII/MII RXER error or Frame Extension error on GMII.	R
31:16	—	These bits are read as 0.	R

27.3.76 Rx_Control_Frames_Good : Receive Frame Count for Good Control Frames

Base address: GMAC = 0x8010_0000

Offset address: 0x01E4

Bit	Symbol	Function	R/W
31:0	RXCTRLG[31:0]	This field indicates the number of good control frames received.	R

27.3.77 HASH_TABLE_REGn : Hash Table Register n (n = 0 to 7)

Base address: GMAC = 0x8010_0000

Offset address: 0x0500 + 0x4 × n

Bit position:	31																													0
Bit field:	HT[31:0]																													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	HT[31:0]	This field contains the nth 32 bits [31:0] of the Hash table.	R/W

27.3.78 VLAN_Hash_Table_Reg : VLAN Hash Table Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0588

Bit position:	31																15													0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VLHT[15:0]													
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	VLHT[15:0]	VLAN Hash Table This field contains the 16-bit VLAN Hash Table.	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

27.3.79 Timestamp_Control : Timestamp Control Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0700

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	ATSEN1	ATSEN0	ATSFC	—	—	—	—	—	TSENMACADDR	SNAPTYPSEL	
Value after reset:	x	x	x	x	x	0	0	0	x	x	x	x	x	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	TSMSTRENA	TSEVNTENA	TSIPV4ENA	TSIPV6ENA	TSIPENA	TSVER2ENA	TSCTRLSSR	TSENALL	—	—	TSADDREG	TSTRIG	TSUPDT	TSINIT	TSCFUPDT	TSENA
Value after reset:	0	0	1	0	0	0	0	0	x	x	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TSENA	Timestamp Enable When set, the timestamp is added for the transmit and receive frames. When disabled, timestamp is not added for the transmit and receive frames and the Timestamp Generator is also suspended. You need to initialize the Timestamp (system time) after enabling this mode. On the receive side, the GMAC processes the IEEE 1588 frames only if this bit is set.	R/W

Bit	Symbol	Function	R/W
1	TSCFUPDT	Timestamp Fine or Coarse Update When set, this bit indicates that the system times update should be done using the fine update method. When reset, it indicates the system timestamp update should be done using the Coarse method.	R/W
2	TSINIT	Timestamp Initialize When set, the system time is initialized (overwritten) with the value specified in the System Time – Seconds Update Register (System_Time_Seconds_Update) and System Time – Nanoseconds Update Register (System_time_Nanoseconds_Update). This bit should be read zero before updating it. This bit is reset when the initialization is complete.	R/W
3	TSUPDT	Timestamp Update When set, the system time is updated (added or subtracted) with the value specified in System Time – Seconds Update Register (System_Time_Seconds) and System Time – Nanoseconds Update Register (System_Time_Nanoseconds). This bit should be read zero before updating it. This bit is reset when the update is completed in hardware.	R/W
4	TSTRIG	Timestamp Interrupt Trigger Enable When set, the timestamp interrupt is generated when the System Time becomes greater than the value written in the Target Time register. This bit is reset after the generation of the Timestamp Trigger Interrupt.	R/W
5	TSADDREG	Addend Reg Update When set, the content of the Timestamp Addend register is updated in the PTP block for fine correction. This is cleared when the update is completed. This register bit should be zero before setting it.	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
8	TSENALL	Enable Timestamp for all Frames When set, the timestamp snapshot is enabled for all frames received by the GMAC.	R/W
9	TSCTRLSSR	Timestamp Digital or Binary Rollover Control When set, the Timestamp Low register rolls over after 0x3B9A_C9FF value (that is, 1 nanosecond accuracy) and increments the timestamp (high) seconds. When reset, the rollover value of sub second register is 0x7FFF_FFFF. The sub second increment must be programmed correctly depending on the PTP reference clock frequency and the value of this bit.	R/W
10	TSVER2ENA	Enable PTP packet Processing for Version 2 Format When set, the PTP packets are processed using the IEEE 1588 version 2 format. Otherwise, the PTP packets are processed using the version 1 format.	R/W
11	TSIPENA	Enable Processing of PTP over Ethernet Frames When set, the GMAC receiver processes the PTP packets encapsulated directly in the Ethernet frames. When this bit is clear, the GMAC ignores the PTP over Ethernet packets.	R/W
12	TSIPV6ENA	Enable Processing of PTP Frames Sent Over IPv6 UDP When set, the GMAC receiver processes PTP packets encapsulated in UDP over IPv6 packets. When this bit is clear, the GMAC ignores the PTP transported over UDP IPv6 packets.	R/W
13	TSIPV4ENA	Enable Processing of PTP Frames Sent over IPv4 UDP When set, the GMAC receiver processes the PTP packets encapsulated in UDP over IPv4 packets. When this bit is clear, the GMAC ignores the PTP transported over UDP IPv4 packets. This bit is set by default.	R/W
14	TSEVNTENA	Enable Timestamp Snapshot for Event Messages When set, the timestamp snapshot is taken only for event messages (SYNC, Delay_Req, Pdelay_Req, or Pdelay_Resp). When reset, the snapshot is taken for all messages except Announce, Management, and Signaling.	R/W
15	TSMSTRENA	Enable Snapshot for Messages Relevant to Master When set, the snapshot is taken only for the messages relevant to the master node. Otherwise, the snapshot is taken for the messages relevant to the slave node.	R/W
17:16	SNAPTYPSEL	Select PTP packets for Taking Snapshots These bits along with bits [15] and [14] determine the set of PTP packet types for which snapshot must be taken.	R/W

Bit	Symbol	Function	R/W
18	TSENMACADDR	Enable MAC address for PTP Frame Filtering When set, the DA MAC address (that matches any MAC Address register) is used to filter the PTP frames when PTP is directly sent over Ethernet.	R/W
23:19	—	These bits are read as 0. The write value should be 0.	R/W
24	ATSFC	Auxiliary Snapshot FIFO Clear When set, it resets the pointers of the Auxiliary Snapshot FIFO. This bit is cleared when the pointers are reset and the FIFO is empty. When this bit is high, auxiliary snapshots get stored in the FIFO.	R/W
25	ATSEN0	Auxiliary Snapshot 0 Enable This field controls capturing the Auxiliary Snapshot Trigger 0. When this bit is set, the Auxiliary snapshot of event on GMAC_PTPTRG0 input is enabled. When this bit is reset, the events on this input are ignored.	R/W
26	ATSEN1	Auxiliary Snapshot 1 Enable This field controls capturing the Auxiliary Snapshot Trigger 1. When this bit is set, the Auxiliary snapshot of event on GMAC_PTPTRG1 input is enabled. When this bit is reset, the events on this input are ignored.	R/W
31:27	—	These bits are read as 0. The write value should be 0.	R/W

27.3.80 Sub_Second_Increment : Sub-Second Increment Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0704

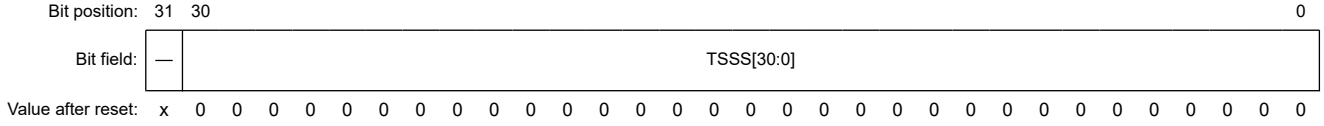
Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SSINC[7:0]							
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	SSINC[7:0]	Sub-second Increment Value The value programmed in this field is accumulated every clock cycle (of GMAC_PTP_REFCLK_I) with the contents of the sub-second register. For example, when PTP clock is 50 MHz (period is 20 ns), you should program 20 (0x14) when the System Time-Nanoseconds register has an accuracy of 1 ns (TSCTRLSSR bit is set). When TSCTRLSSR is clear, the Nanoseconds register has a resolution of ~0.465 ns. In this case, you should program a value of 43 (0x2B) that is derived by 20 ns/0.465 ns.	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

27.3.81 System_Time_Seconds : System Time - Seconds Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0708



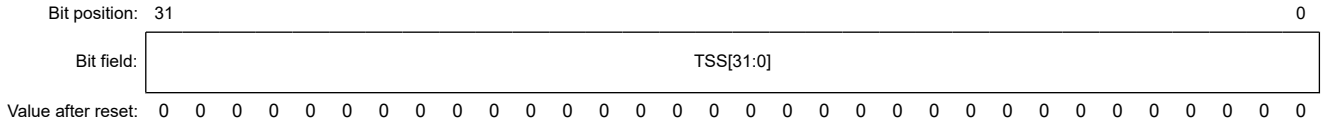
Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	TSS[31:0]																															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	TSS[31:0]	Timestamp Second The value in this field indicates the current value in seconds of the System Time maintained by the GMAC.	R

27.3.82 System_Time_Nanoseconds : System Time - Nanoseconds Register

Base address: GMAC = 0x8010_0000

Offset address: 0x070C

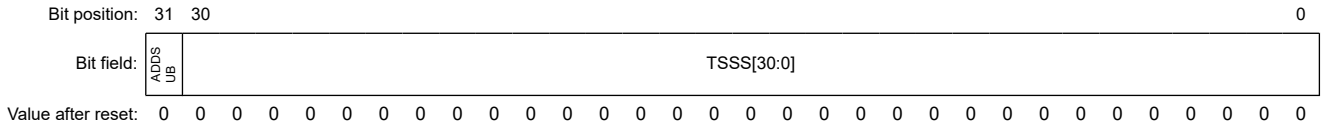


Bit	Symbol	Function	R/W
30:0	TSSS[30:0]	Timestamp Sub Seconds The value in this field has the sub-second representation of time, with an accuracy of 0.46 ns. When bit 9 (TSCTRLSSR) is set in Timestamp Control Register (Timestamp_Control), each bit represents 1 ns and the maximum value is 0x3B9A_C9FF, after which it rolls over to zero.	R
31	—	This bit is read as 0.	R

27.3.83 System_Time_Seconds_Update : System Time - Seconds Update Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0710

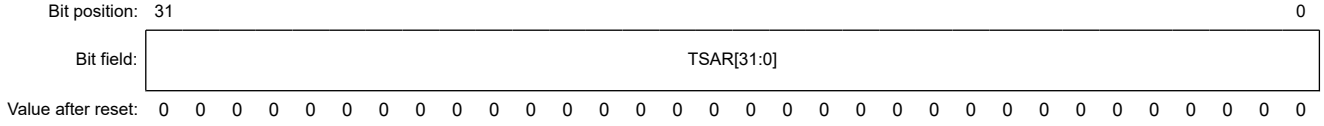


Bit	Symbol	Function	R/W
31:0	TSS[31:0]	Timestamp Second The value in this field indicates the time in seconds to be initialized or added to the system time.	R/W

27.3.84 System_Time_Nanoseconds_Update : System Time - Nanoseconds Update Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0714

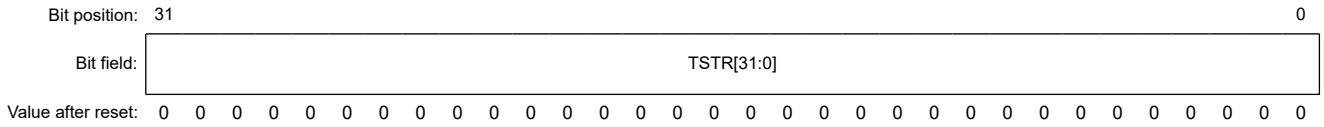


Bit	Symbol	Function	R/W
30:0	TSSS[30:0]	Timestamp Sub Seconds The value in this field has the sub-second representation of time, with an accuracy of 0.46 ns. When bit 9 (TSCTRLSSR) is set in Timestamp Control Register (Timestamp_Control), each bit represents 1 ns and the programmed value should not exceed 0x3B9A_C9FF.	R/W
31	ADDSUB	Add or subtract time When this bit is set, the time value is subtracted with the contents of the update register. When this bit is reset, the time value is added with the contents of the update register.	R/W

27.3.85 Timestamp_Addend : Timestamp Addend Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0718

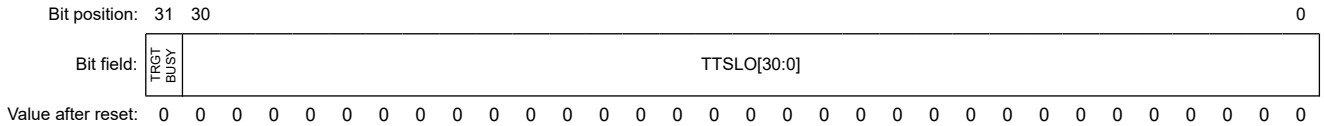


Bit	Symbol	Function	R/W
31:0	TSAR[31:0]	Timestamp Addend This field indicates the 32-bit time value to be added to the Accumulator to achieve time synchronization.	R/W

27.3.86 Target_Time_Seconds : Target Time Seconds Register

Base address: GMAC = 0x8010_0000

Offset address: 0x071C



Bit	Symbol	Function	R/W
31:0	TSTR[31:0]	Target Time Seconds This register stores the time in seconds. When the timestamp value matches or exceeds both Target Timestamp registers, then based on bits [6:5] of PPS Control Register (PPS_Control), the GMAC starts or stops the PPS signal output and generates an interrupt (if enabled).	R/W

27.3.87 Target_Time_Nanoseconds : Target Time Nanoseconds Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0720

Bit	Symbol	Function	R/W
30:0	TTSLO[30:0]	Target Timestamp Low Register This register stores the time in (signed) nanoseconds. When the value of the timestamp matches both Target Timestamp registers, then based on the TRGTMODSEL0 field (bits [6:5]) in PPS Control Register (PPS_Control), the GMAC starts or stops the PPS signal output and generates an interrupt (if enabled). This value should not exceed 0x3B9A_C9FF when TSCTRLSSR is set in the Timestamp control register. The actual start or stop time of the PPS signal output may have an error margin up to one unit of sub-second increment value.	R/W

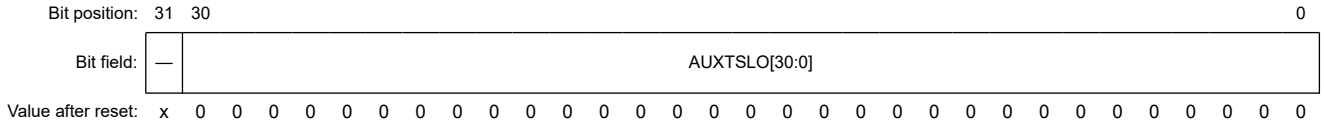
Bit	Symbol	Function	R/W
31	TRGTBUSY	Target Time Register Busy The GMAC sets this bit when the PPSCMD field (bits [2:0]) in PPS Control Register (PPS_Control) is programmed to 010b or 011b. Programming the PPSCMD field to 010b or 011b, instructs the GMAC to synchronize the Target Time Registers to the PTP clock domain. The GMAC clears this bit after synchronizing the Target Time Registers to the PTP clock domain. The application must not update the Target Time Registers when this bit is read as 1. Otherwise, the synchronization of the previously programmed time gets corrupted.	R

27.3.88 Timestamp_Status : Timestamp Status Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0728

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	ATSNS[4:0]					ATSSTM	—	—	—	—	ATSSTN[3:0]			
Value after reset:	x	x	0	0	0	0	0	0	x	x	x	x	0	0	0	0



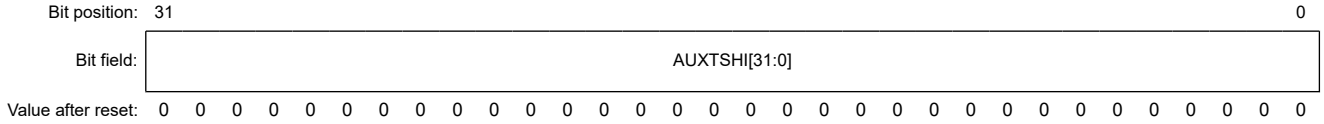
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	AUXTSTRIG	—	—
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	0	x	x

Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0.	R
2	AUXTSTRIG	Auxiliary Timestamp Trigger Snapshot This bit is set high when the auxiliary snapshot is written to the FIFO.	R
15:3	—	These bits are read as 0.	R
19:16	ATSSTN[3:0]	Auxiliary Timestamp Snapshot Trigger Identifier These bits identify the Auxiliary trigger inputs for which the timestamp available in the Auxiliary Snapshot Register is applicable. When more than one bit is set at the same time, it means that corresponding auxiliary triggers were sampled at the same clock. These bits are applicable only if the number of Auxiliary snapshots is more than one. One bit is assigned for each trigger as shown in the following list: Bit [16]: Auxiliary trigger 0 Bit [17]: Auxiliary trigger 1 Bit [18]: Auxiliary trigger 2 (not used) Bit [19]: Auxiliary trigger 3 (not used) The software can read this register to find the triggers that are set when the timestamp is taken.	R
23:20	—	These bits are read as 0.	R
24	ATSSTM	Auxiliary Timestamp Snapshot Trigger Missed This bit is set when the Auxiliary timestamp snapshot FIFO is full and external trigger was set. This indicates that the latest snapshot is not stored in the FIFO.	R
29:25	ATSNS[4:0]	Number of Auxiliary Timestamp Snapshots This field indicates the number of snapshots available in the FIFO. A value equal to the selected depth of FIFO (4) indicates that the Auxiliary Snapshot FIFO is full. These bits are cleared (to 00000b) when the Auxiliary snapshot FIFO clear bit is set.	R
31:30	—	These bits are read as 0.	R

27.3.89 Auxiliary_Timestamp_Nanoseconds : Auxiliary Timestamp – Nanoseconds Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0730

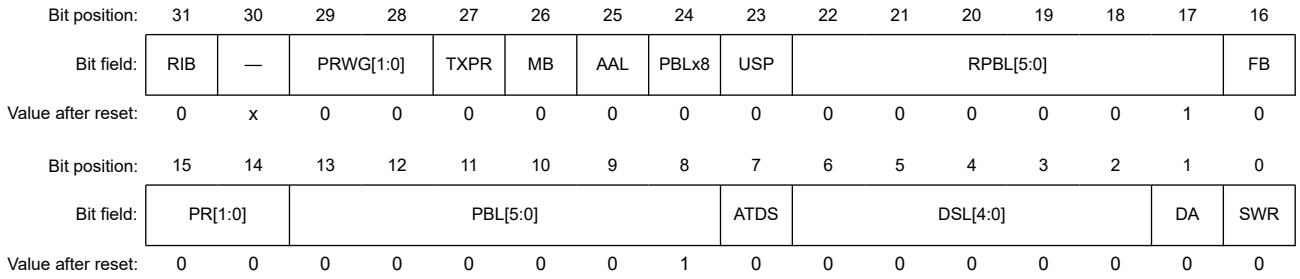


Bit	Symbol	Function	R/W
30:0	AUXTSLO[30:0]	Contains the lower 32 bits (nanoseconds field) of the auxiliary timestamp.	R
31	—	This bit is read as 0.	R

27.3.90 Auxiliary_Timestamp_Seconds : Auxiliary Timestamp - Seconds Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0734

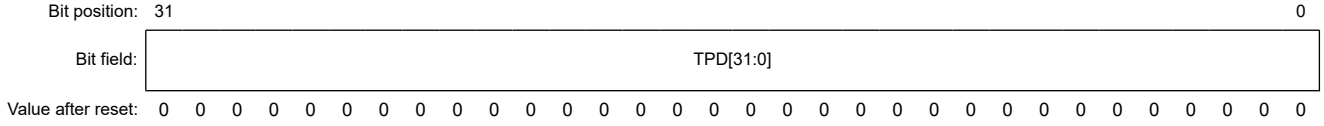


Bit	Symbol	Function	R/W
31:0	AUXTSHI[31:0]	Contains the upper 32 bits (Seconds field) of the auxiliary timestamp.	R

27.3.91 Bus_Mode : Bus Mode Register

Base address: GMAC = 0x8010_0000

Offset address: 0x1000



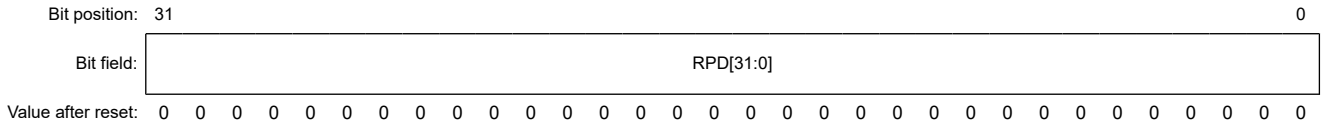
Bit	Symbol	Function	R/W
0	SWR	Software Reset When this bit is set, the MAC DMA Controller resets the logic and all internal registers of the GMAC. It is cleared automatically after the reset operation has completed in all of the GMAC clock domains. Before reprogramming any register of the GMAC, read a 0 value in this bit. The Software reset function is driven only by this bit. The reset operation is completed only when all resets in all active clock domains are deasserted. Therefore, it is essential that all the PHY inputs clocks (applicable for the selected PHY interface) are present for the software reset completion. The time to complete the software reset operation depends on the frequency of the slowest active clock.	R/W

Bit	Symbol	Function	R/W
1	DA	DMA Arbitration Scheme This bit is reserved and read-only (RO).	R
6:2	DSL[4:0]	Descriptor Skip Length This bit specifies the number of word to skip between two unchained descriptors. The address skipping starts from the end of current descriptor to the start of next descriptor. When the DSL value is equal to 0, the descriptor table is taken as contiguous by the DMA in Ring mode.	R/W
7	ATDS	Enhanced Descriptor Size When set, the size of the enhanced descriptor increases to 32 bytes (8 DWORDS). When reset, the descriptor size reverts back to 4 DWORDs (16 bytes).	R/W
13:8	PBL[5:0]	Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA transaction. This is the maximum value that is used in a single block read or write. The DMA always attempts to burst as specified in PBL each time it starts a burst transfer on the host bus. PBL can be programmed with permissible values of 1, 2, 4, 8, and 16. Any other value results in undefined behavior. When USP is set high, this PBL value is applicable only for TX DMA transactions.	R/W
15:14	PR[1:0]	Priority Ratio These bits are reserved and read-only (RO).	R
16	FB	Fixed Burst This bit controls whether the AXI Master interface performs fixed burst transfers or not. When set, the AXI interface uses only SINGLE, INCR4, INCR8, or INCR16 during start of the normal burst transfers. When reset, the AXI interface uses SINGLE and INCR burst transfer operations. For more information, see bit UNDEF[0] of the AXI Bus Mode register.	R/W
22:17	RPBL[5:0]	RX DMA PBL This field indicates the maximum number of beats to be transferred in one RX DMA transaction. This is the maximum value that is used in a single block read or write. The RX DMA always attempts to burst as specified in the RPBL bit each time it starts a burst transfer on the host bus. You can program RPBL with values of 1, 2, 4, 8, and 16. Any other value results in undefined behavior. This field is valid and applicable only when USP is set high.	R/W
23	USP	Use Separate PBL When set high, this bit configures the RX DMA to use the value configured in bits [22:17] as PBL. The PBL value in bits [13:8] is applicable only to the TX DMA operations. When reset to low, the PBL value in bits [13:8] is applicable for both DMA engines.	R/W
24	PBLx8	PBLx8 Mode When set high, this bit multiplies the programmed PBL value (bits [22:17] and bits [13:8]) eight times. Therefore, the DMA transfers the data in 8, 16 beats depending on the PBL value. The maximum number of beats to be transferred in one DMA transaction is 16 beats.	R/W
25	AAL	Address Aligned Beats When this bit is set high and the FB bit is equal to 1, the AXI interface generates all bursts aligned to the start address LS bits. If the FB bit is equal to 0, the first burst (accessing the start address of the data buffer) is not aligned, but subsequent bursts are aligned to the address.	R/W
26	MB	Mixed Burst This bit is reserved and read-only (RO).	R
27	TXPR	Transmit Priority This bit is reserved and read-only (RO).	R
29:28	PRWG[1:0]	Channel Priority Weights This field is reserved and read-only (RO).	R
30	—	This bit is read as 0. The write value should be 0.	R/W
31	RIB	Rebuild INCRx Burst This bit is reserved and read-only (RO).	R

27.3.92 Transmit_Poll_Demand : Transmit Poll Demand Register

Base address: GMAC = 0x8010_0000

Offset address: 0x1004

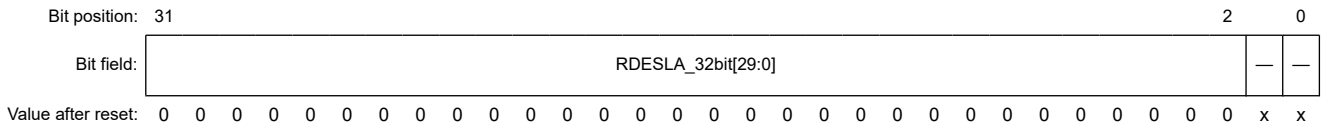


Bit	Symbol	Function	R/W
31:0	TPD[31:0]	Transmit Poll Demand When these bits are written with any value, the DMA reads the current descriptor pointed to by Current Host Transmit Descriptor Register (Current_Host_Transmit_Descriptor). If that descriptor is not available (owned by the host), the transmission returns to the Suspend state and bit TU[2] of Status Register (Status) is asserted. If the descriptor is available, the transmission resumes.	R/W

27.3.93 Receive_Poll_Demand : Receive Poll Demand Register

Base address: GMAC = 0x8010_0000

Offset address: 0x1008



Bit	Symbol	Function	R/W
31:0	RPD[31:0]	Receive Poll Demand When these bits are written with any value, the DMA reads the current descriptor pointed to by Current Host Receive Descriptor Register (Current_Host_Receive_Descriptor). If that descriptor is not available (owned by the host), the reception returns to the Suspended state and bit RU[7] of Status Register (Status) is not asserted. If the descriptor is available, the RX DMA returns to the active state.	R/W

27.3.94 Receive_Descriptor_List_Address : Receive Descriptor List Address Register

Base address: GMAC = 0x8010_0000

Offset address: 0x100C

Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0. The write value should be 0.	R/W
31:2	RDESLA_32bit[29:0]	Start of Receive List This field contains the base address of the first descriptor in the receive descriptor list. The LSB bits [1:0] for 32-bit bus width are ignored and internally taken as all 0s by the DMA. Therefore, these LSB bits are read-only (RO).	R/W

27.3.95 Transmit_Descriptor_List_Address : Transmit Descriptor List Address Register

Base address: GMAC = 0x8010_0000

Offset address: 0x1010

Bit position:	31																										2	0
Bit field:	TDESLA_32bit[29:0]																										—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x	x

Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0. The write value should be 0.	R/W
31:2	TDESLA_32bit[29:0]	Start of Transmit List This field contains the base address of the first descriptor in the transmit descriptor list. The LSB bits [1:0] for 32-bit bus width are ignored and are internally taken as all 0s by the DMA. Therefore, these LSB bits are read-only (RO).	R/W

27.3.96 Status : Status Register

Base address: GMAC = 0x8010_0000

Offset address: 0x1014

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	GLPII	TTI	GPI	GMI	—	EB[2:0]			TS[2:0]			RS[2:0]			NIS
Value after reset:	x	0	0	0	0	x	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	AIS	ERI	FBI	—	—	ETI	RWT	RPS	RU	RI	UNF	OVF	TJT	TU	TPS	TI
Value after reset:	0	0	0	x	x	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TI	Transmit Interrupt This bit indicates that the frame transmission is complete. When transmission is complete, bit OWN[31] of TDES0 is reset, and the specific frame status information is updated in the descriptor.	R/W
1	TPS	Transmit Process Stopped This bit is set when the transmission is stopped.	R/W
2	TU	Transmit Buffer Unavailable This bit indicates that the host owns the next descriptor in the transmit list and the DMA cannot acquire it. Transmission is suspended. Bits [22:20] specify the transmit process state transitions. To resume processing transmit descriptors, the host should change the ownership of the descriptor by setting TDES0[31] and then issue a Transmit Poll Demand command.	R/W
3	TJT	Transmit Jabber Timeout This bit indicates that the Transmit Jabber Timer expired, which happens when the frame size exceeds 2,048 (10,240 bytes when the Jumbo frame is enabled). When the Jabber Timeout occurs, the transmission process is aborted and placed in the Stopped state. This causes the Transmit Jabber Timeout TDES0[14] flag to assert.	R/W
4	OVF	Receive Overflow This bit indicates that the receive buffer had an overflow during frame reception. If the partial frame is transferred to the application, the overflow status is set in RDES0[11].	R/W
5	UNF	Transmit Underflow This bit indicates that the transmit buffer had an underflow during frame transmission. Transmission is suspended and an Underflow error TDES0[1] is set.	R/W

Bit	Symbol	Function	R/W
6	RI	Receive Interrupt This bit indicates that the frame reception is complete. When reception is complete, bit RDES1[31] (Disable Interrupt on Completion) is reset in the last descriptor, and the specific frame status information is updated in the descriptor. The reception remains in the Running state.	R/W
7	RU	Receive Buffer Unavailable This bit indicates that the host owns the next descriptor in the receive list and the DMA cannot acquire it. The receive process is suspended. To resume processing receive descriptors, the host should change the ownership of the descriptor and issue a Receive Poll Demand command. If no Receive Poll Demand is issued, the receive process resumes when the next recognized incoming frame is received. This bit is set only when the previous receive descriptor is owned by the DMA.	R/W
8	RPS	Receive Process Stopped This bit is asserted when the receive process enters the Stopped state.	R/W
9	RWT	Receive Watchdog Timeout When set, this bit indicates that the receive watchdog timer expired while receiving the current frame and the current frame is truncated after the watchdog timeout.	R/W
10	ETI	Early Transmit Interrupt This bit indicates that the frame to be transmitted is fully transferred to the MTL Transmit FIFO.	R/W
12:11	—	These bits are read as 0. The write value should be 0.	R/W
13	FBI	Fatal Bus Error Interrupt This bit indicates that a bus error occurred, as described in bits [25:23]. When this bit is set, the corresponding DMA engine disables all of its bus accesses.	R/W
14	ERI	Early Receive Interrupt This bit indicates that the DMA filled the first data buffer of the packet. This bit is cleared when the software writes 1 to this bit or bit RI[6] of this register is set (whichever occurs earlier).	R/W
15	AIS	Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in Interrupt Enable Register (Interrupt_Enable): ● Interrupt_Enable [1]: Transmit Process Stopped ● Interrupt_Enable [3]: Transmit Jabber Timeout ● Interrupt_Enable [4]: Receive FIFO Overflow ● Interrupt_Enable [5]: Transmit Underflow ● Interrupt_Enable [7]: Receive Buffer Unavailable ● Interrupt_Enable [8]: Receive Process Stopped ● Interrupt_Enable [9]: Receive Watchdog Timeout ● Interrupt_Enable [10]: Early Transmit Interrupt ● Interrupt_Enable [13]: Fatal Bus Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit and must be cleared each time a corresponding bit, which causes AIS to be set, is cleared.	R/W
16	NIS	Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in Interrupt Enable Register (Interrupt_Enable): ● Interrupt_Enable [0]: Transmit Interrupt ● Interrupt_Enable [2]: Transmit Buffer Unavailable ● Interrupt_Enable [6]: Receive Interrupt ● Interrupt_Enable [14]: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in Interrupt Enable Register (Interrupt_Enable)) affect the Normal Interrupt Summary bit. This is a sticky bit and must be cleared (by writing 1 to this bit) each time a corresponding bit, which causes NIS to be set, is cleared.	R/W

Bit	Symbol	Function	R/W
19:17	RS[2:0]	Received Process State This field indicates the Receive DMA FSM state. This field does not generate an interrupt. 0 0 0: Stopped: Reset or Stop Receive Command issued 0 0 1: Running: Fetching Receive Transfer Descriptor 0 1 0: Reserved for future use 0 1 1: Running: Waiting for receive packet 1 0 0: Suspended: Receive Descriptor Unavailable 1 0 1: Running: Closing Receive Descriptor 1 1 0: TIME_STAMP write state 1 1 1: Running: Transferring the receive packet data from receive buffer to host memory	R
22:20	TS[2:0]	Transmit Process State This field indicates the Transmit DMA FSM state. This field does not generate an interrupt. 0 0 0: Stopped: Reset or Stop Transmit Command issued 0 0 1: Running: Fetching Transmit Transfer Descriptor 0 1 0: Running: Waiting for status 0 1 1: Running: Reading Data from host memory buffer and queuing it to transmit buffer (Tx FIFO) 1 0 0: TIME_STAMP write state 1 0 1: Reserved for future use 1 1 0: Suspended: Transmit Descriptor Unavailable or Transmit Buffer Underflow 1 1 1: Running: Closing Transmit Descriptor	R
25:23	EB[2:0]	Error Bits This field indicates the type of error that caused a bus error, for example, error response on the AXI interface. This field is valid only when bit FBI[13] is set. This field does not generate an interrupt. 0 0 0: Error during RX DMA Write Data Transfer 0 0 1: Reserved 0 1 0: Reserved 0 1 1: Error during TX DMA Read Data Transfer 1 0 0: Error during RX DMA Descriptor Write Access 1 0 1: Error during TX DMA Descriptor Write Access 1 1 0: Error during RX DMA Descriptor Read Access 1 1 1: Error during TX DMA Descriptor Read Access	R
26	—	This bit is read as 0. The write value should be 0.	R/W
27	GMI	GMAC MMC Interrupt This bit reflects an interrupt event in the MMC module of the GMAC. The software must read the corresponding registers in the GMAC to get the exact cause of interrupt and clear the source of interrupt to make this bit as 0b. The interrupt signal from the GMAC subsystem (GMAC_SBD) is high when this bit is high.	R
28	GPI	GMAC PMT Interrupt This bit indicates an interrupt event in the PMT module of the GMAC. The software must read the PMT Control and Status Register in the GMAC to get the exact cause of interrupt and clear its source to reset this bit to 0b. The interrupt signal from the GMAC subsystem (GMAC_SBD) is high when this bit is high. The GPI and GMAC_PMT interrupts are generated in different clock domains.	R
29	TTI	Timestamp Trigger Interrupt This bit indicates an interrupt event in the Timestamp Generator block of GMAC. Software must read the corresponding registers in the GMAC to get the exact cause of interrupt and clear its source to reset this bit to 0b. When this bit is high, the interrupt signal from the GMAC subsystem (GMAC_SBD) is high.	R
30	GLPII	GMAC LPI Interrupt This bit indicates an interrupt event in the LPI logic of the GMAC. To reset this bit to 0b, software must read the corresponding registers in the GMAC to get the exact cause of the interrupt and clear its source. When this bit is high, the interrupt signal from the GMAC (GMAC_SBD) is high.	R
31	—	This bit is read as 0. The write value should be 0.	R/W

27.3.97 Operation_Mode : Operation Mode Register

Base address: GMAC = 0x8010_0000

Offset address: 0x1018

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	DT	RSF	—	—	—	TSF	FTF	—	—	—	TTC[2:0]
Value after reset:	x	x	x	x	x	0	0	x	x	0	0	0	x	x	x	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	TTC[2:0]		ST	RFD[1:0]		RFA[1:0]		EFC	FEF	FUF	DGF	RTC[1:0]		OSF	SR	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
1	SR	Start or Stop Receive When this bit is set, the Receive process is placed in the Running state. The DMA attempts to acquire the descriptor from the Receive list and processes the incoming frames. The descriptor acquisition is attempted from the current position in the list, which is the address set by Receive Descriptor List Address Register (Receive_Descriptor_List_Address) or the position retained when the Receive process was previously stopped. If the DMA does not own the descriptor, reception is suspended and bit [7] (Receive Buffer Unavailable) of Status Register (Status) is set. The Start Receive command is effective only when the reception has stopped. If the command is issued before setting Receive Descriptor List Address Register (Receive_Descriptor_List_Address), the DMA behavior is unpredictable. When this bit is cleared, the RX DMA operation is stopped after the transfer of the current frame. The next descriptor position in the receive list is saved and becomes the current position after the receive process is restarted. The Stop Receive command is effective only when the receive process is in either the Running (waiting for receive packet) or in the Suspended state.	R/W
2	OSF	Operate on Second Frame When this bit is set, it instructs the DMA to process the second frame of the transmit data even before the status for the first frame is obtained.	R/W
4:3	RTC[1:0]	Receive Threshold Control These two bits control the threshold level of the MTL Receive FIFO. Transfer (request) to DMA starts when the frame size within the MTL Receive FIFO is larger than the threshold. In addition, full frames with length less than the threshold are transferred automatically. These bits are valid only when the RSF bit is 0, and are ignored when the RSF bit is set to 1. 0 0: 64 0 1: 32 1 0: 96 1 1: 128	R/W
5	DGF	Drop Giant Frames When set, the GMAC drops the received giant frames in the RX FIFO, that is, frames that are larger than the computed giant frame limit. When reset, the GMAC does not drop the giant frames in the RX FIFO.	R/W
6	FUF	Forward Undersized Good Frames When set, the RX FIFO forwards Undersized frames (frames with no error and length less than 64 bytes) including pad-bytes and CRC. When reset, the RX FIFO drops all frames of less than 64 bytes, unless a frame is already transferred because of the lower value of receive threshold, for example, RTC = 01b.	R/W

Bit	Symbol	Function	R/W
7	FEF	Forward Error Frames When this bit is reset, the RX FIFO drops frames with error status (CRC error, collision error, GMII_ER, giant frame, watchdog timeout, or overflow). However, if the start byte (write) pointer of a frame is already transferred to the read controller side (in Threshold mode), then the frame is not dropped. When the FEF bit is set, all frames except runt error frames are forwarded to the DMA. If bit RSF[25] is set and the RX FIFO overflows when a partial frame is written, then the frame is dropped irrespective of the FEF bit setting. However, if the bit RSF[25] is reset and the RX FIFO overflows when a partial frame is written, then a partial frame may be forwarded to the DMA.	R/W
8	EFC	Enable HW Flow Control When this bit is set, the flow control signal operation based on the fill-level of RX FIFO is enabled. When reset, the flow control operation is disabled.	R/W
10:9	RFA[1:0]	Threshold for Activating Flow Control (in half-duplex and full-duplex) These bits control the threshold (fill level of RX FIFO) at which the flow control is activated. 0 0: Full minus 1 KB, that is, FULL - 1 KB 0 1: Full minus 2 KB, that is, FULL - 2 KB 1 0: Full minus 3 KB, that is, FULL - 3 KB 1 1: Reserved These values are applicable only when bit EFC[8] is set high.	R/W
12:11	RFD[1:0]	Threshold for Deactivating Flow Control (in half-duplex and full-duplex) These bits control the threshold (fill-level of RX FIFO) at which the flow control is deasserted after activation. The deassertion is effective only after flow control is asserted. For proper flow control, the value programmed in the RFD field should be equal to or more than the value programmed in the RFA field. 0 0: Full minus 1 KB, that is, FULL - 1 KB 0 1: Full minus 2 KB, that is, FULL - 2 KB 1 0: Full minus 3 KB, that is, FULL - 3 KB 1 1: Full minus 4 KB, that is, FULL - 4 KB	R/W
13	ST	Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state, and the DMA checks the Transmit List at the current position for a frame to be transmitted. Descriptor acquisition is attempted either from the current position in the list, which is the Transmit List Base Address set by Transmit Descriptor List Address Register (Transmit_Descriptor_List_Address), or from the position retained when transmission was stopped previously. If the DMA does not own the current descriptor, transmission enters the Suspended state and bit [2] (Transmit Buffer Unavailable) of Status Register (Status) is set. The Start Transmission command is effective only when transmission is stopped. If the command is issued before setting Transmit Descriptor List Address Register (Transmit_Descriptor_List_Address), then the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current frame. The next descriptor position in the transmit list is saved, and it becomes the current position when transmission is restarted. To change the list address, program the Transmit Descriptor List Address Register (Transmit_Descriptor_List_Address) with a new value when this bit is reset. The new value is considered when this bit is set again. The Stop Transmission command is effective only when the transmission of the current frame is complete or the transmission is in the Suspended state.	R/W
16:14	TTC[2:0]	Transmit Threshold Control These bits control the threshold level of the MTL Transmit FIFO. Transmission starts when the frame size within the MTL transmit FIFO is larger than the threshold. In addition, full frames with a length less than the threshold are also transmitted. These bits are used only when bit TSF[21] is reset. 0 0 0: 64 0 0 1: 128 0 1 0: 192 0 1 1: 256 1 0 0: 40 1 0 1: 32 1 1 0: 24 1 1 1: 16	R/W
19:17	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
20	FTF	Flush Transmit FIFO When this bit is set, the transmit FIFO controller logic is reset to its default values and thus all data in the TX FIFO is lost or flushed. This bit is cleared internally when the flushing operation is completed. The Operation Mode register should not be written to until this bit is cleared. The data which is already accepted by the GMAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt frame transmission. The flush operation is complete only when the TX FIFO is emptied of its contents and all the pending Transmit status of the transmitted frames are accepted by the host. To complete this flush operation, the PHY transmit clock is required to be active.	R/W
21	TSF	Transmit Store and Forward When this bit is set, transmission starts when a full frame resides in the MTL Transmit FIFO. When this bit is set, the TTC values specified in bits [16:14] are ignored. This bit should be changed only when the transmission is stopped.	R/W
24:22	—	These bits are read as 0. The write value should be 0.	R/W
25	RSF	Receive Store and Forward When this bit is set, the MTL reads a frame from the RX FIFO only after the complete frame has been written to it, ignoring the RTC bits. When this bit is reset, the RX FIFO operates in the cut-through mode, subject to the threshold specified by the RTC bits.	R/W
26	DT	Disable Dropping of TCP/IP Checksum Error Frames When this bit is set, the GMAC does not drop the frames which only have errors detected by the Receive Checksum Offload engine. Such frames do not have any errors (including FCS error) in the Ethernet frame received by the GMAC but have errors only in the encapsulated payload. When this bit is reset, all error frames are dropped if the FEF bit is reset.	R/W
31:27	—	These bits are read as 0. The write value should be 0.	R/W

27.3.98 Interrupt_Enable : Interrupt Enable Register

Base address: GMAC = 0x8010_0000

Offset address: 0x101C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NIE
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	AIE	ERE	FBE	—	—	ETE	RWE	RSE	RUE	RIE	UNE	OVE	TJE	TUE	TSE	TIE
Value after reset:	0	0	0	x	x	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TIE	Transmit Interrupt Enable When this bit is set with Normal Interrupt Summary Enable (bit [16]), the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled.	R/W
1	TSE	Transmit Stopped Enable When this bit is set with Abnormal Interrupt Summary Enable (bit [15]), the Transmission Stopped Interrupt is enabled. When this bit is reset, the Transmission Stopped Interrupt is disabled.	R/W
2	TUE	Transmit Buffer Unavailable Enable When this bit is set with Normal Interrupt Summary Enable (bit [16]), the Transmit Buffer Unavailable Interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable Interrupt is disabled.	R/W
3	TJE	Transmit Jabber Timeout Enable When this bit is set with Abnormal Interrupt Summary Enable (bit [15]), the Transmit Jabber Timeout Interrupt is enabled. When this bit is reset, the Transmit Jabber Timeout Interrupt is disabled.	R/W

Bit	Symbol	Function	R/W
4	OVE	Overflow Interrupt Enable When this bit is set with Abnormal Interrupt Summary Enable (bit [15]), the Receive Overflow Interrupt is enabled. When this bit is reset, the Overflow Interrupt is disabled.	R/W
5	UNE	Underflow Interrupt Enable When this bit is set with Abnormal Interrupt Summary Enable (bit [15]), the Transmit Underflow Interrupt is enabled. When this bit is reset, the Underflow Interrupt is disabled.	R/W
6	RIE	Receive Interrupt Enable When this bit is set with Normal Interrupt Summary Enable (bit [16]), the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled.	R/W
7	RUE	Receive Buffer Unavailable Enable When this bit is set with Abnormal Interrupt Summary Enable (bit [15]), the Receive Buffer Unavailable Interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable Interrupt is disabled.	R/W
8	RSE	Receive Stopped Enable When this bit is set with Abnormal Interrupt Summary Enable (bit [15]), the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped Interrupt is disabled.	R/W
9	RWE	Receive Watchdog Timeout Enable When this bit is set with Abnormal Interrupt Summary Enable (bit [15]), the Receive Watchdog Timeout Interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout Interrupt is disabled.	R/W
10	ETE	Early Transmit Interrupt Enable When this bit is set with an Abnormal Interrupt Summary Enable (bit [15]), the Early Transmit Interrupt is enabled. When this bit is reset, the Early Transmit Interrupt is disabled.	R/W
12:11	—	These bits are read as 0. The write value should be 0.	R/W
13	FBE	Fatal Bus Error Enable When this bit is set with Abnormal Interrupt Summary Enable (bit [15]), the Fatal Bus Error Interrupt is enabled. When this bit is reset, the Fatal Bus Error Enable Interrupt is disabled.	R/W
14	ERE	Early Receive Interrupt Enable When this bit is set with Normal Interrupt Summary Enable (bit [16]), the Early Receive Interrupt is enabled. When this bit is reset, the Early Receive Interrupt is disabled.	R/W
15	AIE	Abnormal Interrupt Summary Enable When this bit is set, abnormal interrupt summary is enabled. When this bit is reset, the abnormal interrupt summary is disabled. This bit enables the following interrupts in Status Register: ● Status [1]: Transmit Process Stopped ● Status [3]: Transmit Jabber Timeout ● Status [4]: Receive Overflow ● Status [5]: Transmit Underflow ● Status [7]: Receive Buffer Unavailable ● Status [8]: Receive Process Stopped ● Status [9]: Receive Watchdog Timeout ● Status [10]: Early Transmit Interrupt ● Status [13]: Fatal Bus Error	R/W
16	NIE	Normal Interrupt Summary Enable When this bit is set, normal interrupt summary is enabled. When this bit is reset, normal interrupt summary is disabled. This bit enables the following interrupts in Status Register): ● Status [0]: Transmit Interrupt ● Status [2]: Transmit Buffer Unavailable ● Status [6]: Receive Interrupt ● Status [14]: Early Receive Interrupt	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

27.3.99 Missed_Frame_And_Buffer_Overflow_Counter : Missed Frame and Buffer Overflow Counter Register

Base address: GMAC = 0x8010_0000

Offset address: 0x1020

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	OVFCNTOVF	OVFFRMCNT[10:0]											MISCNTOVF
Value after reset:	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MISFRMCNT[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	MISFRMCNT[15:0]	Missed Frame Counter This field indicates the number of frames missed by the controller because of the host receive buffer being unavailable. This counter is incremented each time the DMA discards an incoming frame. The counter is cleared when this bit is read.	R
16	MISCNTOVF	Overflow Bit for Missed Frame Counter This bit is set every time Missed Frame Counter (bits [15:0]) overflows, that is, the DMA discards an incoming frame because of the Host Receive Buffer being unavailable with the missed frame counter at maximum value. In such a scenario, the missed frame counter is reset to all 0s and this bit indicates that the rollover occurred.	R
27:17	OVFFRMCNT[10:0]	Overflow Frame Counter This field indicates the number of frames missed by the application. This counter is incremented each time the MTL FIFO overflows. The counter is cleared when this bit is read.	R
28	OVFCNTOVF	Overflow Bit for FIFO Overflow Counter This bit is set every time the Overflow Frame Counter (bits [27:17]) overflows, that is, the RX FIFO overflows with the overflow frame counter at maximum value. In such a scenario, the overflow frame counter is reset to all 0s and this bit indicates that the rollover occurred.	R
31:29	—	These bits are read as 0.	R

27.3.100 Receive_Interrupt_Watchdog_Timer : Receive Interrupt Watchdog Timer Register

Base address: GMAC = 0x8010_0000

Offset address: 0x1024

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RIWT[7:0]							
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	RIWT[7:0]	RI Watchdog Timer Count This bit indicates the number of system clock cycles multiplied by 256 for which the watchdog timer is set. The watchdog timer gets triggered with the programmed value after the RX DMA completes the transfer of a frame for which the RI status bit is not set because of the setting in the corresponding descriptor RDES1[31]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per RDES1[31] of any received frame.	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

27.3.101 AXI_Bus_Mode : AXI Bus Mode Register

Base address: GMAC = 0x8010_0000

Offset address: 0x1028

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	EN_LPI	LPI_XIT_FRM	—	—	—	—	—	—	—	—	WR_OSR_LMT[1:0]		—	—	RD_OSR_LMT[1:0]	
Value after reset:	0	0	x	x	x	x	x	x	x	x	0	1	x	x	0	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	ONEKBBE	AXI_AAL	—	—	—	—	—	—	—	—	BLEN16	BLEN8	BLEN4	UNDEF
Value after reset:	x	x	0	0	x	x	x	x	x	x	x	x	0	0	0	1

Bit	Symbol	Function	R/W
0	UNDEF	AXI Undefined Burst Length This bit is read-only bit and indicates the complement (invert) value of bit FB[16] in Bus Mode Register (Bus_Mode[16]). ● When this bit is set to 1, the GMAC-AXI is allowed to perform any burst length equal to or below the maximum allowed burst length programmed in bits [3]. ● When this bit is set to 0, the GMAC-AXI is allowed to perform only fixed burst lengths as indicated by BLEN16, BLEN8, or BLEN4, or a burst length of 1.	R
1	BLEN4	AXI Burst Length 4 When this bit is set to 1, the GMAC-AXI is allowed to select a burst length of 4 on the AXI Master interface. Setting this bit has no effect when UNDEF is set to 1.	R/W
2	BLEN8	AXI Burst Length 8 When this bit is set to 1, the GMAC-AXI is allowed to select a burst length of 8 on the AXI Master interface. Setting this bit has no effect when UNDEF is set to 1.	R/W
3	BLEN16	AXI Burst Length 16 When this bit is set to 1 or UNDEF is set to 1, the GMAC-AXI is allowed to select a burst length of 16 on the AXI Master interface.	R/W
11:4	—	These bits are read as 0. The write value should be 0.	R/W
12	AXI_AAL	Address-Aligned Beats This bit is read-only bit and reflects bit AAL[25] of Bus Mode Register (Bus_Mode). When this bit is set to 1, the GMAC-AXI performs address-aligned burst transfers on both read and write channels.	R
13	ONEKBBE	1 KB Boundary Crossing Enable for the GMAC-AXI Master When set, the GMAC-AXI Master performs burst transfers that do not cross 1 KB boundary. When reset, the GMAC-AXI Master performs burst transfers that do not cross 4 KB boundary.	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W
17:16	RD_OSR_LMT[1:0]	AXI Maximum Read OutStanding Request Limit This value limits the maximum outstanding request on the AXI read interface. Maximum outstanding requests = RD_OSR_LMT + 1	R/W
19:18	—	These bits are read as 0. The write value should be 0.	R/W
21:20	WR_OSR_LMT[1:0]	AXI Maximum Write OutStanding Request Limit This value limits the maximum outstanding request on the AXI write interface. Maximum outstanding requests = WR_OSR_LMT + 1	R/W
29:22	—	These bits are read as 0. The write value should be 0.	R/W
30	LPI_XIT_FRM	Unlock on Magic Packet or Remote Wake-Up Frame When set to 1, this bit enables the GMAC-AXI to come out of the LPI mode only when the Magic Packet or Remote Wake-Up Packet is received. When set to 0, this bit enables the GMAC-AXI to come out of LPI mode when any frame is received.	R/W

Bit	Symbol	Function	R/W
31	EN_LPI	Enable Low Power Interface (LPI) When set to 1, this bit enables the LPI mode and accepts the LPI request from the AXI System Clock controller. When set to 0, this bit disables the LPI mode and always denies the LPI request from the AXI System Clock controller.	R/W

27.3.102 AXI_Status : AXI Status Register

Base address: GMAC = 0x8010_0000

Offset address: 0x102C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AXIRDSTS	AXWHSTS
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0

Bit	Symbol	Function	R/W
0	AXWHSTS	AXI Master Write Channel When high, it indicates that the write channel of the AXI master is active and transferring data.	R
1	AXIRDSTS	AXI Master Read Channel Status When high, it indicates that the read channel of the AXI master is active and transferring data.	R
31:2	—	These bits are read as 0.	R

27.3.103 Current_Host_Transmit_Descriptor : Current Host Transmit Descriptor Register

Base address: GMAC = 0x8010_0000

Offset address: 0x1048

Bit position:	31	0
Bit field:	CURTDESAPTR[31:0]	
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	

Bit	Symbol	Function	R/W
31:0	CURTDESAPTR[31:0]	Host Transmit Descriptor Address Pointer Cleared on reset. Pointer updated by the DMA during operation.	R

27.3.104 Current_Host_Receive_Descriptor : Current Host Receive Descriptor Register

Base address: GMAC = 0x8010_0000

Offset address: 0x104C

Bit position:	31	0
Bit field:	CURRDESAPTR[31:0]	
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	

Bit	Symbol	Function	R/W
31:0	CURRDESAPTR[31:0]	Host Receive Descriptor Address Pointer Cleared on reset. Pointer updated by the DMA during operation.	R

27.3.105 Current_Host_Transmit_Buffer_Address : Current Host Transmit Buffer Address Register

Base address: GMAC = 0x8010_0000

Offset address: 0x1050

Bit position:	31																												0
Bit field:	CURTBUFAPTR[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	CURTBUFAPTR[31:0]	Host Transmit Buffer Address Pointer Cleared on reset. Pointer updated by the DMA during operation.	R

27.3.106 Current_Host_Receive_Buffer_Address : Current Host Receive Buffer Address Register

Base address: GMAC = 0x8010_0000

Offset address: 0x1054

Bit position:	31																												0
Bit field:	CURRBUFAPTR[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	CURRBUFAPTR[31:0]	Host Receive Buffer Address Pointer Cleared on reset. Pointer updated by the DMA during operation.	R

27.3.107 HW_Feature : HW Feature Register

Base address: GMAC = 0x8010_0000

Offset address: 0x1058

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	ACTPHYIF[2:0]			SAVLANINS	FLEXIPPSEN	INTTSEN	ENHDESSEL	TXCHCNT[1:0]		RXCHCNT[1:0]		RXFIFOSIZE	RXTYP2COE	RXTYP1COE	TXCOESEL
Value after reset:	x	0	0	0	0	0	1	1	0	0	0	0	1	1	0	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

13	TSVER2SEL	IEEE 1588-2008 Advanced Timestamp	R
14	EEESEL	Energy Efficient Ethernet	R
15	AVSEL	AV Feature	R
16	TXCOESEL	Checksum Offload in TX	R
17	RXTYP1COE	IP Checksum Offload (Type 1) in RX	R
18	RXTYP2COE	IP Checksum Offload (Type 2) in RX	R
19	RXFIFOSIZE	RX FIFO > 2,048 Bytes	R
21:20	RXCHCNT[1:0]	Number of additional RX channels	R
23:22	TXCHCNT[1:0]	Number of additional TX channels	R
24	ENHDESSEL	Enhanced Descriptor	R
25	INTTSEN	Timestamping with Internal System Time	R
26	FLEXIPPSEN	Flexible Pulse-Per-Second Output (GMAC: 0)	R
27	SAVLANINS	Source Address or VLAN Insertion	R
30:28	ACTPHYIF[2:0]	Active or Selected PHY interface 0 0 0: GMII or MII Others: Reserved	R
31	—	This bit is read as 0.	R

27.3.108 GMACTRGSEL : GMAC PTP Trigger Select Register

Base address: GMAC = 0x8010_0000

Offset address: 0x0400

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TRGSEL	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	TRGSEL	Select PTP Timestamp Trigger for GMAC IP 0: Select GMAC_PTPTRGn (n = 0, 1) trigger from ELC 1: Select external GMAC_PTPTRGn (n = 0, 1) trigger input pin	R/W
31:2	—	These bits are read as 0.	R

Note: This register can only be written when protection is unlocked by a specific sequence using the Ethernet Protect Register (PRCMD). For the protection unlock procedure, see section 26.2.1. PRCMD : Ethernet Protect Register. The special sequence is not necessary when reading the value of this register.

27.3.109 PTP Timer Pulse Control Registers

The registers control the PTP pulse generator. The PTP pulse generator operates based on the current time of the PTP timer and the register values and generates a pulse signal of any cycle from any start time. The pulse width can be set arbitrarily.

The register controls the pulse signal of GMAC_PTPOUTn (n = 0 to 3) for interrupt signals or external output pins.

27.3.109.1 SWTMENn : PTP Timer Pulse Output Enable n Register (n = 0 to 3)

Base address: GMAC_PTP = 0x8011_0400

Offset address: 0x400 + 0x100 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OUTEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OUTEN	Enable GMAC_PTPOUTn Signal Output 0: Disabled 1: Enabled	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: This register should be set after setting completion of SWTMSTSEC, SWTMSTNS, SWTMPSEC, SWTMPNS, SWTMWTH, and SWTMMAXP registers. When this register is set to 1, changing SWTMSTSEC, SWTMSTNS, SWTMPSEC, SWTMPNS, SWTMWTH, and SWTMMAXP has no effect.

27.3.109.2 SWTMSTSECn : PTP Timer Pulse Start Second n Register (n = 0 to 3)

Base address: GMAC_PTP = 0x8011_0400

Offset address: 0x404 + 0x100 × n

Bit position:	31	0
Bit field:	STSEC[31:0]	
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	

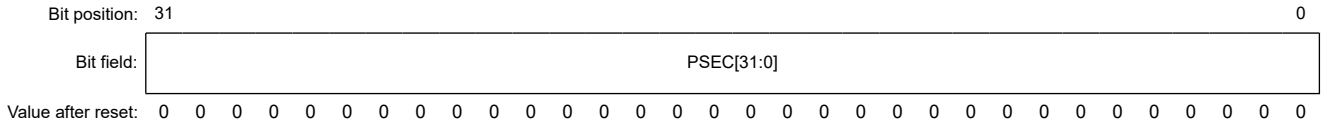
Bit	Symbol	Function	R/W
31:0	STSEC[31:0]	Start Time by Second	R/W

27.3.109.3 SWTMSTNSn : PTP Timer Pulse Start Nanosecond n Register (n = 0 to 3)

Base address: GMAC_PTP = 0x8011_0400

Offset address: 0x408 + 0x100 × n

Bit position:	31	0
Bit field:	STNS[31:0]	
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	



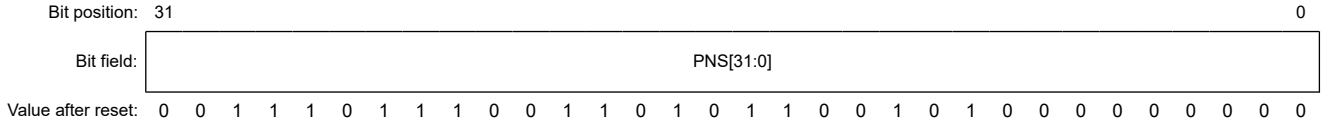
Bit	Symbol	Function	R/W
31:0	STNS[31:0]	Start Time by Nanosecond	R/W

Note: When SWTMMAXP is not 0, the value set in this register must be less than the value set in SWTMMAXP (SWTMSTNS < SWTMMAXP). When SWTMMAXP is 0, this register can be set to any value.

27.3.109.4 SWTMPSECn : PTP Timer Pulse Period Second n Register (n = 0 to 3)

Base address: GMAC_PTP = 0x8011_0400

Offset address: 0x40C + 0x100 × n



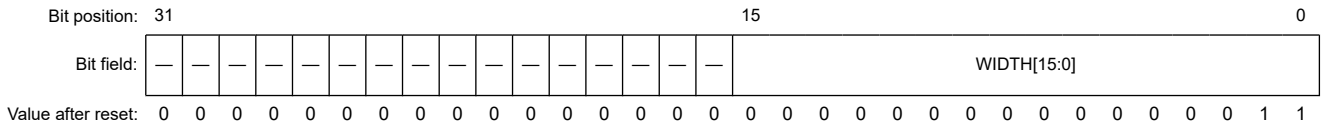
Bit	Symbol	Function	R/W
31:0	PSEC[31:0]	Period by Second	R/W

27.3.109.5 SWTMPNSn : PTP Timer Pulse Period Nanosecond n Register (n = 0 to 3)

Base address: GMAC_PTP = 0x8011_0400

Offset address: 0x410 + 0x100 × n

Bit	Symbol	Function	R/W
31:0	PNS[31:0]	Period by Nanosecond	R/W



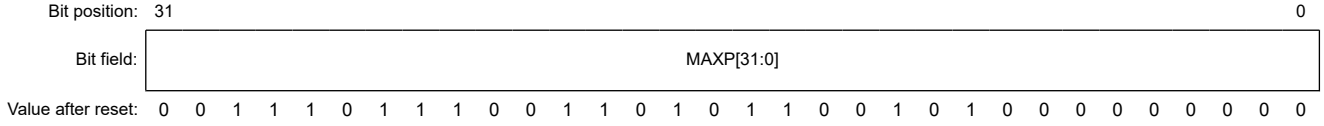
Note: The value set in this register must be larger than the value below.
In case PCLKM = 100 MHz, 18 × SSINC[7:0] bits in Sub_Second_Increment Register (144 ns when SSINC[7:0] = 8).
In case PCLKM = 75 MHz, 20 × SSINC[7:0] bits in Sub_Second_Increment Register (160 ns when SSINC[7:0] = 8).

Note: When SWTMMAXP is not 0, the value set in this register must be less than or equal to the value set in SWTMMAXP (SWTMPNS ≤ SWTMMAXP).

27.3.109.6 SWTMWTHn : PTP Timer Pulse Width n Register (n = 0 to 3)

Base address: GMAC_PTP = 0x8011_0400

Offset address: 0x414 + 0x100 × n



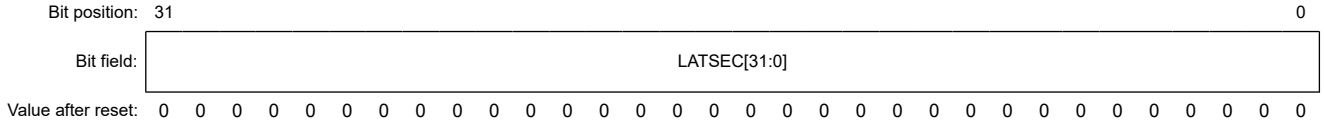
Bit	Symbol	Function	R/W
15:0	WIDTH[15:0]	Set the Pulse Width of GMAC_PTPOUTn in the cycle number of GMAC_PTP_REFCLK_I (8 ns). Output pulse width is the set value × 8 (ns). The GMAC_PTPOUTn is set to 0 when this register is 0x0000.	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note: If GMAC_PTPOUT is used as pulse event, do not change the value of this register (use the initial value). When it is used as external signal, appropriate width must be specified.

27.3.109.7 SWTMMAXPn : PTP Timer Pulse Max Nanosecond n Register (n = 0 to 3)

Base address: GMAC_PTP = 0x8011_0400

Offset address: 0x418 + 0x100 × n



Bit	Symbol	Function	R/W
31:0	MAXP[31:0]	Sets the boundary value in nanoseconds to carry from the nanosecond field to the second field. This register must be set to 0x3B9ACA00 (= 10^9) when TSCTRLSSR bit in Timestamp_Control register is set to 1. This register must be set to 0x80000000 (= 2^{31}) when TSCTRLSSR bit in Timestamp_Control register is reset to 0.	R/W

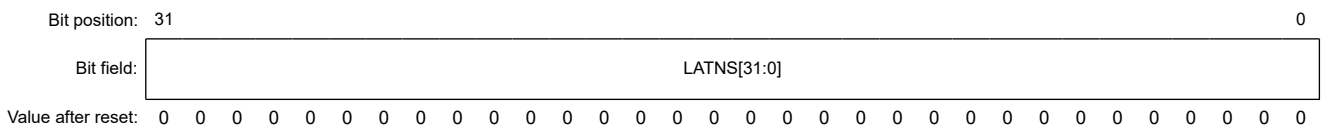
Note: This register sets the boundary value in nanoseconds to carry from the nanosecond field to the second field. When the nanosecond field reaches the set value of this register, the second field is carried up. This register is normally used with the initial value of 0x3B9ACA00 (= 10^9) and TSCTRLSSR bit in Timestamp_Control register is set to 1. In this case, the nanosecond field counts from 0x0 to 0x3B9AC9FF (= 10^9 - 1) and then carries to the second field. If 0x80000000 (= 2^{31}) is set in this register and TSCTRLSSR bit in Timestamp_Control register is reset to 0, the boundary value for carrying to the second field is interpreted as 0x80000000 (= 2^{31}). In this case, the nanosecond field is fully counted from 0x0 to 0x7FFFFFFF (= 2^{31} - 1) and then carries to the second field.

27.3.109.8 SWTMLATSECn : PTP Timer Pulse Latch Second n Register (n = 0 to 3)

Base address: GMAC_PTP = 0x8011_0400

Offset address: 0x41C + 0x100 × n

Bit	Symbol	Function	R/W
31:0	LATSEC[31:0]	Latch the time of second count at the GMAC_PTPOUTn rising edge.	R/W



Note: This register is updated when the PTPOUT signal rises, and the updated value is expressed in the formula t_{START} + t_{PERIOD} × n (n = 0, 1, 2, …) in seconds of the rise target time. t_{START} = {SWTMSTSEC, SWTMSTNS}, t_{PERIOD} = {SWTMPSEC, SWTMPNS}

Note: Since SWTMLATSEC is a 32-bit register, it will be 0x00000000 when incremented in the state of 0xFFFFFFFF.

27.3.109.9 SWTMLATNSn : PTP Timer Pulse Latch Nanosecond n Register (n = 0 to 3)

Base address: GMAC_PTP = 0x8011_0400

Offset address: 0x420 + 0x100 × n

Bit	Symbol	Function	R/W
31:0	LATNS[31:0]	Latch the time of nanosecond count at the GMAC_PTPOUTn rising edge.	R/W

Note: This register is updated when the PTPOUT signal rises, and the updated value is expressed in the formula t_{START} + t_{PERIOD} × n (n = 0, 1, 2, …) in nanoseconds of the rise target time. t_{START} = {SWTMSTSEC, SWTMSTNS}, t_{PERIOD} = {SWTMPSEC, SWTMPNS}

27.4 Operation

This section provides the instructions for initializing the DMA or MAC registers in the proper sequence.

27.4.1 Initializing

The initializing sequence in this section is an example for preparation of system environments using GMAC under the configuration below.

GMAC configuration of this example:

GMAC is connected to external port1 through RGMII/RMII Converter.

The sequence for section 27.4.2. Initializing DMA and section 27.4.3. Initializing GMAC is followed after the sequence of this section.

27.4.2 Initializing DMA

The initialization sequence in this section is used for GMAC configurations.

Complete the following steps to initialize the DMA:

1. Provide a software reset. This resets all of the GMAC internal registers and logic. (Bus Mode Register (Bus_Mode) - bit 0).
2. Wait for the completion of the reset process (poll bit 0 of the Bus Mode Register (Bus_Mode), which is only cleared after the reset operation is completed).
3. Poll the bits of AXI Status Register (AXI_Status) to confirm that all previously initiated (before soft reset) or ongoing AXI transactions are complete.

   Note: If the application cannot poll the AXI Status Register (AXI_Status) after a soft reset (because of performance reasons), then it is recommended that you continue with the next steps and check this register again (as mentioned in Step 11) before triggering the DMA operations.
4. Program the following fields to initialize the Bus Mode Register by setting values in Bus Mode Register:
   - AAL
   - Fixed burst or undefined burst
   - Burst length values and burst mode values.
   - Descriptor length
5. Program the AXI Interface options in AXI Bus Mode Register (AXI_Bus_Mode).
6. Create a proper descriptor chain for transmit and receive. In addition, ensure that the receive descriptors are owned by DMA (bit [31] of descriptor should be set). When OSF mode is used, at least two descriptors are required.
7. Make sure that your software creates three or more different transmit or receive descriptors in the chain before reusing any of the descriptors.
8. Initialize receive and transmit descriptor list address with the base address of the transmit and receive descriptor (Receive Descriptor List Address Register (Receive_Descriptor_List_Address) and Transmit Descriptor List Address Register (Transmit_Descriptor_List_Address) respectively).
9. Program the following fields to initialize the mode of operation in Operation Mode Register (Operation_Mode)
   - Receive and Transmit Store and Forward
   - Receive and Transmit Threshold Control (RTC and TTC)
   - Hardware Flow Control enable
   - Flow Control Activation and Deactivation thresholds for MTL Receive and Transmit FIFO (RFA and RFD)
   - Error frame and undersized good frame forwarding enable

- OSF mode

10. Enable the interrupts by programming Interrupt Enable Register (Interrupt_Enable).

Note: Perform Step 11 only if you did not perform Step 3.

11. Read AXI Status Register (AXI_Status) to confirm that all previous AXI transactions are complete.

Note: If any previous transaction is still in progress when you read the AXI Status Register, it is strongly recommended to check the slave components addressed by the AXI master interface of GMAC.

12. Start the Receive and Transmit DMA by setting SR (bit 1) and ST (bit 13) of the Operation Mode Register (Operation_Mode).

27.4.3 Initializing GMAC

The following GMAC Initialization operations can be performed after DMA initialization. If the GMAC initialization is done before the DMA is set up, then enable the GMAC receiver (last step in following sequence) only after the DMA is active. Otherwise, received frames fills the RX FIFO and overflow.

1. Program the GMII Address Register (GMII_Address) for controlling the management cycles for external PHY. For example, Physical Layer Address PA (bits [15:11]). In addition, set bit [0] (GMII Busy) for writing into PHY and reading from PHY.
2. Read the 16-bit data of GMII Data Register (GMII_Data) from the PHY for link up, speed of operation, and mode of operation, by specifying the appropriate address value in bits [15:11] of GMII Address Register (GMII_Address).
3. Provide the MAC address; MAC Address0 High Register (MAR0_H) and MAC Address0 Low Register (MAR0_L).
4. Program the following fields to set the appropriate filters for the incoming frames in MAC Frame Filter Register:
   - Receive All
   - Promiscuous mode
   - Hash or Perfect Filter
   - Unicast, multicast, broadcast, and control frames filter settings
5. Program the following fields for proper flow control in Flow Control Register (Flow_Control):
   - Pause time and other Pause frame control bits
   - Receive and Transmit Flow control bits
   - Flow Control Busy/Backpressure Activate
6. Program the Interrupt Mask register bits, as required.
7. Program the appropriate fields in MAC Configuration Register (MAC_Configuration). For example, Inter frame gap while transmission and jabber disable. Based on the Auto negotiation you can set the Duplex mode (bit [11]) or port select (bit [15]).
8. Set bit [3] (TE) and bit [2] (RE) in MAC Configuration Register (MAC_Configuration).

Note: Do not change the configuration (such as duplex mode, speed, port, or loopback) when the GMAC is actively transmitting or receiving. Software should change these parameters only when the GMAC transmitter and receiver are not active.

27.4.4 Performing Normal Receive and Transmit Operation

For normal operation, complete the following steps:

1. For normal transmit and receive interrupts, read the interrupt status. Then, poll the descriptors, reading the status of the descriptor owned by the Host (either transmit or receive).
2. Set appropriate values for the descriptors, ensuring that transmit and receive descriptors are owned by the DMA to resume the transmission and reception of data.
3. If the descriptors are not owned by the DMA (or no descriptor is available), the DMA goes into SUSPEND state. The transmission or reception can be resumed by freeing the descriptors and issuing a poll demand by writing 0 into the Transmit Poll Demand Register (Transmit_Poll_Demand) and Receive Poll Demand Register (Receive_Poll_Demand).

4. The values of the current host transmitter or receiver descriptor address pointer can be read for the debug process (Current Host Transmit Descriptor Register (Current_Host_transmit_Descriptor) and Current Host Receive Descriptor Register (Current_Host_Receive_Descriptor)).
5. The values of the current host transmit buffer address pointer and receive buffer address pointer can be read for the debug process (Current Host Transmit Buffer Address Register (Current_Host_Transmit_Buffer_Address) and Current Host Receive Buffer Address Register (Current_Host_Receive_Buffer_Address)).

27.4.5 Stopping and Starting Transmission

Complete the following steps to pause the transmission for some time:

1. Disable the Transmit DMA (if applicable) by clearing bit [13] (ST) of Operation Mode Register (Operation_Mode).
2. Wait for any previous frame transmissions to complete. You can check this by reading the appropriate bits of Debug Register (Debug).
3. Disable the GMAC transmitter and GMAC receiver by clearing bit [3] (TE) and bit [2] (RE) in MAC Configuration Register (MAC_Configuration).
4. Disable the Receive DMA (if applicable), after making sure that the data in the RX FIFO is transferred to the system memory (by reading Debug Register (Debug)).
5. Make sure that both TX FIFO and RX FIFO are empty.
6. To restart the operation, first start the DMAs, and then enable the GMAC transmitter and receiver.

27.4.6 Programming Guidelines for GMII Link Transitions

27.4.6.1 Transmit and Receive Clocks are Running when the Link is Down

Complete the following steps when the link is down but the transmit and receive clocks are running:

1. Disable the Transmit DMA (if applicable), by clearing bit [13] (ST) of Operation Mode Register (Operation_Mode).
2. Disable the GMAC receiver by clearing bit [2] (RE) of MAC Configuration Register (MAC_Configuration).
3. Wait for any previous frame transmissions to complete from the TX FIFO. You can do this by reading the appropriate bits of Debug Register (Debug).
   -or-
   Flush the TXFIFO for faster empty operation.
4. Disable the GMAC transmitter by clearing bit [3] (TE) in MAC Configuration Register (MAC_Configuration).
5. After the link is up, read the PHY registers for the latest configuration and program the GMAC registers accordingly.
6. Restart the operation by starting the TX DMA, and then enabling the GMAC transmitter and receiver.

You do not need to disable the RX DMA. When the receiver is disabled, the FIFO does not get any data in the RX FIFO.

27.4.6.2 Transmit and Receive Clocks are Stopped when the Link is Down

Complete the following steps when the link is down and the transmit and receive clocks are stopped:

1. Wait until the link is up and the transmit and receive clocks are active.
   When the transmit and receive clocks are stopped, disabling the transmit or receive operations does not have any effect. Therefore, the software must wait until the link is up again.
2. Disable the Transmit DMA (if applicable), by clearing bit [13] (ST) of the Operation Mode Register (Operation_Mode)
3. Disable the GMAC receiver by clearing bit [2] (RE) of MAC Configuration Register (MAC_Configuration).
4. Wait for any previous frame transmissions to complete from the TX FIFO. You can do this by reading the appropriate bits of Debug Register (Debug).
   -or-
   Flush the TX FIFO for faster empty operation.
5. Disable the GMAC transmitter by clearing bit [3] (TE) in MAC Configuration (MAC_Configuration).
6. After the link is up, read the PHY registers for the latest configuration and program the GMAC registers accordingly.

7. Restart the operation by starting the TX DMA, and then enabling the GMAC transmitter and receiver.

27.4.7 Programming Guidelines for IEEE 1588 Timestamping

27.4.7.1 Initialization Guideline for System Time Generation

You can enable the timestamp feature by setting bit 0 of the Timestamp control register. However, it is essential that the timestamp counter should be initialized after this bit is set. Complete the following steps during GMAC initialization:

1. Mask the Timestamp Trigger interrupt by setting bit 9 of Interrupt Mask Register (Interrupt_Mask).
2. Program bit 0 in Timestamp Control Register (Timestamp_Control) to enable timestamping.
3. Program Sub Second Increment Register (Sub_Second_Increment) based on the PTP clock frequency.
4. If you are using the Fine Correction approach, program Timestamp Addend Register (Timestamp_Addend) and set bit 5 of Timestamp Control Register (Timestamp_Control).
5. Poll the Timestamp Control register until bit 5 is cleared.
6. Program bit 1 of Timestamp Control Register (Timestamp_Control) to select the Fine Update method (if required).
7. Program System Time – Seconds Update Register (System_Time_Seconds_Update) and System Time – Nanoseconds Update Register (System_Time_Nanoseconds_Update) with the appropriate time value.
8. Set bit 2 in Timestamp Control Register (Timestamp_Control). The timestamp counter starts operation as soon as it is initialized with the value written in the Timestamp Update registers.
9. Enable the GMAC receiver and transmitter for proper timestamping.

Note: If timestamp operation is disabled by clearing bit 0 of Timestamp Control Register (Timestamp_Control), you need to repeat all these steps to restart the timestamp operation.

27.4.7.2 System Time Correction

To synchronize or update the system time in one process (coarse correction method), complete the following steps:

1. Set the offset (positive or negative) in the Timestamp Update registers (System Time – Seconds Update Register (System_Time_Seconds_Update) and System Time – Nanoseconds Update Register (System_Time_Nanoseconds_Update)).
2. Set bit 3 (TSUPDT) of Timestamp Control Register (Timestamp_Control). The value in the Timestamp Update registers is added to or subtracted from the system time when the TSUPDT bit is cleared.

To synchronize or update the system time to reduce system time jitter (fine correction method), complete the following steps:

1. With the help of the algorithm explained in section 27.4.8. System Time Register Module, calculate the rate by which you want to make the system time increments slower or faster.
2. Update Timestamp Addend Register (Timestamp_Addend) with the new value and set bit 5 of Timestamp Control Register (Timestamp_Control).
3. Wait for the time for which you want the new value of the Addend register to be active. You can do this by enabling the Timestamp Trigger interrupt after the system time reaches the target value.
4. Program the required target time in Target Time Seconds Register (Target_Time_Seconds) and Target Time Nanoseconds Register (Target_Time_Nanoseconds).
5. Unmask the Timestamp interrupt by clearing bit 9 of Interrupt Mask Register (Interrupt_Mask).
6. Set bit 4 in Timestamp Control Register (Timestamp_Control).
7. When this trigger causes an interrupt, read Interrupt Status Register (Interrupt_Status).
8. Reprogram Timestamp Addend Register (Timestamp_Addend) with the old value and set bit 5 again.

27.4.8 System Time Register Module

The 64-bit time is maintained in this module and updated using the input reference clock (GMAC_PTP_REFCLK_I). This time is the source for taking snapshots (timestamps) of Ethernet frames being transmitted or received at the GMII.

The System Time counter can be initialized or corrected using the coarse correction method. In this method, the initial value or the offset value is written to the Timestamp Update register (see section 27.5.8. IEEE 1588 Timestamp Registers). For initialization, the System Time counter is written with the value in the Timestamp Update registers, while for system time correction, the offset value is added to or subtracted from the system time.

In the fine correction method, a slave clock's (GMAC_PTP_REFCLK_I) frequency drift with respect to the master clock (as defined in IEEE 1588) is corrected over a period of time instead of in one clock, as in coarse correction. This helps maintain linear time and does not introduce drastic changes (or a large jitter) in the reference time between PTP Sync message intervals. In this method, an accumulator sums up the contents of the Addend register. The arithmetic carry that the accumulator generates is used as a pulse to increment the system time counter. The accumulator and the addend are 32-bit registers. Here, the accumulator acts as a high precision frequency multiplier or divider.

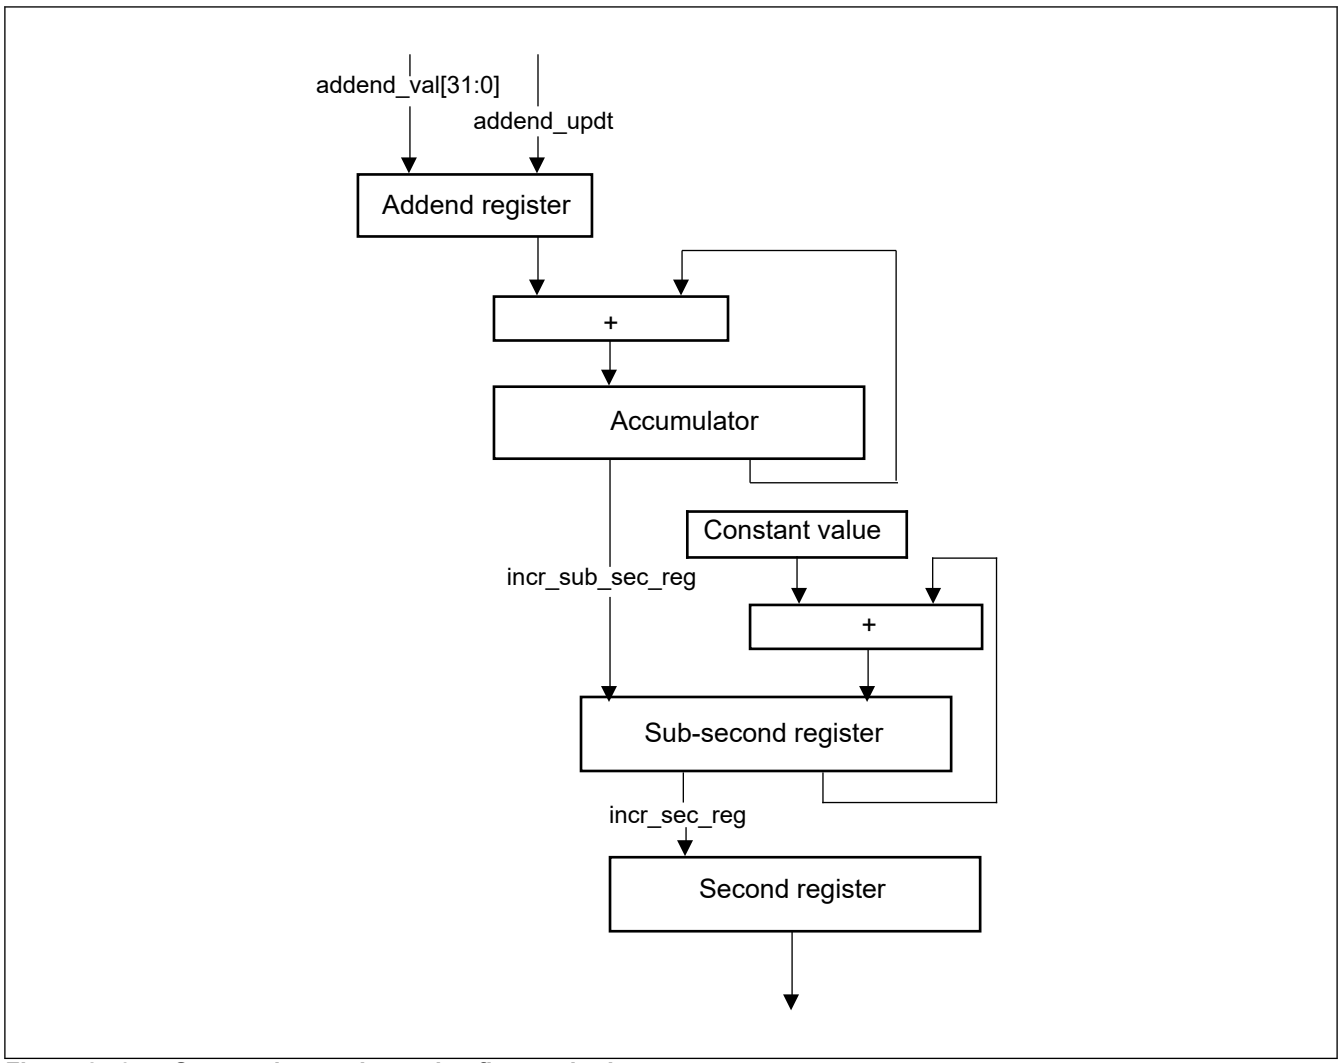


Figure 27.3 System time update using fine method

The System Time Update logic requires a 50 MHz clock frequency to achieve 20 ns accuracy. The frequency division is the ratio of the reference clock frequency to the required clock frequency. Hence, if the reference clock (GMAC_PTP_REFCLK_I) is, for example, 66 MHz, this ratio is calculated as 66 MHz / 50 MHz = 1.32. Hence, the default addend value to be set in the register is 232 / 1.32, 0xC1F07C1F.

If the reference clock drifts lower, to 65 MHz for example, the ratio is 65 / 50, or 1.3 and the value to set in the addend register is 232 / 1.30, or 0xC4EC4EC4. If the clock drifts higher, to 67 MHz for example, the addend register must be set to 0xBF0B7672. When the clock drift is nil, the default addend value of 0xC1F07C1F (232 / 1.32) must be programmed.

In Figure 27.3, the constant value used to accumulate the sub-second register is decimal 43, which achieves an accuracy of 20 ns in the system time (in other words, it is incremented in 20 ns steps). The optional System Time module is unavailable when External Time Update is enabled. Two different methods are used to update the System Time register, depending on which configuration you choose.

The software must calculate the drift in frequency based on the Sync messages and update the Addend register accordingly.

Initially, the slave clock is set with FreqCompensationValue0 in the Addend register. This value is as follows:

$$\mathrm{FreqCompensationValue0} = \frac{2^{32}}{\mathrm{FreqDivisionRatio}}$$

If MasterToSlaveDelay is initially assumed to be the same for consecutive Sync messages, the algorithm described below must be applied. After a few Sync cycles, frequency lock occurs. The slave clock can then determine a precise MasterToSlaveDelay value and re-synchronize with the master using the new value.

The algorithm is as follows:

- At time MasterSyncTime(n), the master sends the slave clock a Sync message. The slave receives this message when its local clock is SlaveClockTime(n) and computes MasterClockTime(n) as:
  $\mathrm{MasterClockTime(n)} = \mathrm{MasterSyncTime(n)} + \mathrm{MasterToSlaveDelay(n)}$
- The master clock count for current Sync cycle, MasterClockCount(n) is given by:
  $\mathrm{MasterClockCount(n)} = \mathrm{MasterClockTime(n)} - \mathrm{MasterClockTime(n-1)}$
  $(\mathrm{assumingthatMasterToSlaveDelayisthesameforSynccyclesnandn-1})$
- The slave clock count for current Sync cycle, SlaveClockCount(n) is given by:
  $\mathrm{SlaveClockCount(n)} = \mathrm{SlaveClockTime(n)} - \mathrm{SlaveClockTime(n-1)}$
- The difference between master and slave clock counts for current Sync cycle, ClockDiffCount(n) is given by:
  $\mathrm{ClockDiffCount(n)} = \mathrm{MasterClockCount(n)} - \mathrm{SlaveClockCount(n)}$
- The frequency scaling factor for slave clock, FreqScaleFactor(n) is given by:
  $\mathrm{FreqScaleFactor}\left(\mathrm{n}\right) = \frac{\mathrm{MasterClockCount(n)} + \mathrm{ClockDiffCount(n)}}{\mathrm{SlaveClockCount(n)}}$
- The frequency compensation value for Addend register, FreqCompensationValue(n) is given by:
  $\mathrm{FreqCompensationValue(n)} = \mathrm{FreqScaleFactor(n)} \times \mathrm{FreqCompensationValue(n-1)}$

In theory, this algorithm achieves lock in one Sync cycle; however, it may take several cycles, because of changing network propagation delays and operating conditions.

This algorithm is self-correcting: If for any reason the slave clock is initially set to a value from the master that is incorrect, the algorithm corrects it at the cost of more Sync cycles.

27.4.9 Programming Guidelines for Energy Efficient Ethernet

27.4.9.1 Entering and Exiting the TX LPI Mode

Complete the following steps during GMAC initialization:

1. Read the PHY register through the MDIO interface, check if the remote end has the EEE capability, and then negotiate the timer values.
2. Program the PHY registers through the MDIO interface (including the RX_CLK_stoppable bit that indicates to the PHY whether to stop RX clock in LPI mode.)
3. Program bits [26:16] and bits [15:0] in LPI Timers Control Register (LPI_Timers_Control).
4. Read the link status of the PHY chip by using the MDIO interface and update bit [17] of LPI Control and Status Register (LPI_Control_Status) accordingly. This update should be done whenever the link status in the PHY chip changes.
5. Set bit [16] of LPI Control and Status Register (LPI_Control_Status) to make the GMAC enter the LPI state. The GMAC enters the LPI mode after completing the transmission in progress and sets bit [0].

Note:
- To make the GMAC enter the LPI state only after it completes the transmission of all queued frames in the TX FIFO, set bit [19] in LPI Control and Status Register (LPI_Control_Status).
- To switch off the CSR clock (PCLKM) or power to the rest of the system during the LPI state, wait for the TLPIEN interrupt of LPI Control and Status Register (LPI_Control_Status) to be generated. Restore the clocks before performing step 6 to come out of the LPI state.

6. Reset bit [16] of LPI Control and Status Register (LPI_Control_Status) to bring the GMAC out of the LPI state. The GMAC waits for the time programmed in bits [15:0] before setting the TLPIEX interrupt status bit and resuming the transmission.

27.4.9.2 Gating Off the CSR Clock in the LPI Mode

You can gate off the CSR clock (PCLKM) to save the power when the GMAC is in the Low Power Idle (LPI) mode.

(1) Gating Off the CSR Clock in the RX LPI Mode

The following operations are performed when the GMAC receives the LPI pattern from the PHY.

1. The MAC RX enters the LPI mode and the RX LPI entry interrupt status [RLPIEN interrupt of LPI Control and Status Register (LPI_Control_Status)] is set.
2. The interrupt signal (GMAC_SBD) is asserted. The GMAC_SBD interrupt is cleared when the host reads the LPI Control and Status Register (LPI_Control_Status).

After the GMAC_SBD interrupt is asserted and the MAC TX is also in the LPI mode, you can gate off the CSR clock. If the MAC TX is not in the LPI mode when you gate off the CSR clock, the events on the GMAC transmitter do not get reported or updated in the CSR.

For restoring the CSR clock, wait for the LPI exit indication from the PHY after which the GMAC asserts the LPI exit interrupt on GMAC_LPI (synchronous to Receive Clock). The GMAC_LPI interrupt is cleared when LPI_Control_Status is read.

(2) Gating Off the CSR Clock in the TX LPI Mode

The following operations are performed when bit [16] (LPIEN) of LPI Control and Status Register (LPI_Control_Status) is set:

1. The Transmit LPI Entry interrupt (TLPIEN bit of register LPI_Control_Status) is set.
2. The interrupt signal (GMAC_SBD) is asserted. The GMAC_SBD interrupt is cleared when the host reads the register LPI_Control_Status.

After the GMAC_SBD interrupt is asserted and the MAC RX is also in the LPI mode, you can gate off the CSR clock. If the MAC RX is not in the LPI mode when you gate off the CSR clock, the events on the GMAC receiver do not get reported or updated in the CSR.

For restoring the CSR clock, switch on the CSR clock when the GMAC must come out of the TX LPI mode. After the CSR clock is resumed, reset bit [16] (LPIEN) of LPI Control and Status Register (LPI_Control_Status) to bring the GMAC out of the LPI mode.

27.4.10 Enhanced Descriptors

The integrated DMA transfers data based on a linked list of descriptors. The descriptors are created in the system memory. Descriptor contains two buffers, two byte-count buffers, and two address pointers, which enable the adapter port to be compatible with various types of memory management schemes.

Note: There is no limit for the number of descriptors that can be used for a single frame.

The enhanced descriptor structure can have 8 DWORDS (32 bytes). The features of the enhanced descriptor structure are:

- The enhanced descriptor structure is implemented to support buffers of up to 8 KB (useful for Jumbo frames).
- There is an assignment of control and status bits in TDES0, TDES1, RDES0, and RDES1.
- The transmit descriptor stores the timestamp in TDES6 and TDES7.
- This receive descriptor structure is also used for storing the extended status (RDES4) and timestamp (RDES6 and RDES7).
- One of the following options for descriptor structure can be selected:
  - If timestamping is enabled in Timestamp Control Register (Timestamp_Control) or Checksum Offload is enabled in MAC Configuration Register (MAC_Configuration), software must allocate 32 bytes (8 DWORDS) of memory for every descriptor. For this, software must set bit [7] (Enhanced Descriptor Size) of Bus Mode Register (Bus_Mode).
  - If timestamping and Checksum Offload is not enabled, the extended descriptors (DES4 to DES7) are not required. Therefore, software can use enhanced descriptors with the default size of 16 bytes (4 DWORDS). For this, software must reset bit [7] (Enhanced Descriptor Size) of Bus Mode Register (Bus_Mode) to 0.

27.4.10.1 Transmit Descriptor

The transmit descriptor structure is shown in Table 27.2. The application software must program the control bits TDES0[31:18] during descriptor initialization. When the DMA updates the descriptor, it write backs all the control bits except the OWN bit (which it clears) and updates the status bits [7:0]. The contents of the transmitter descriptor word 0 (TDES0) through word 3 (TDES3) are given in Table 27.4 through Table 27.7, respectively.

With the advance timestamp support, the snapshot of the timestamp to be taken can be enabled for a given frame by setting bit [25] (TTSE) of TDES0. When the descriptor is closed (that is, when the OWN bit is cleared), the timestamp is written into TDES6 and TDES7. This is indicated by the status bit [17] (TTSS) of TDES0 shown in Table 27.2. The contents of TDES6 and TDES7 are mentioned in Table 27.8 and Table 27.9.

Note: When Advanced Timestamp feature is enabled, software must set bit [7] of Bus Mode Register (Bus_Mode), so that the DMA operates with extended descriptor size. When this control bit is reset, the TDES4 to TDES7 descriptor space is not valid.

Table 27.2 Transmit descriptor fields - enhanced format

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TDES0	OWN	Ctrl [30:26]					TTSE	Ctrl [24:18]							TTSS	Status [16:7]										Ctrl/Status [6:3]				Status [2:0]		
TDES1	Reserved						Buffer 2 Byte Count [28:16]										Reserved									Buffer 1 Byte Count [12:0]						
TDES2	Buffer 1 Address [31:0]																															
TDES3	Buffer 2 Address [31:0] or Next Descriptor Address [31:0]																															
TDES4	Reserved																															
TDES5	Reserved																															
TDES6	Transmit Timestamp Low [31:0]																															
TDES7	Transmit Timestamp High [31:0]																															

The DMA always reads or fetches 4 DWORDS of the descriptor from system memory to obtain the buffer and control information as shown in Table 27.3.

Table 27.3 Transmit descriptor fetch (read) for enhanced format

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TDES0	OWN	Ctrl [30:26]					TTSE	Ctrl [24:18]							Reserved for Status [17:7]											Reserved				Reserved for Status [2:0]		
TDES1	Reserved						Buffer 2 Byte Count [28:16]										Reserved									Buffer 1 Byte Count [12:0]						
TDES2	Buffer 1 Address [31:0]																															
TDES3	Buffer 2 Address [31:0] or Next Descriptor Address [31:0]																															

Table 27.4 Transmit descriptor word 0 (TDES0) (1 of 3)

Bit position	Bit name	Description
0	DB	Deferred Bit When set, this bit indicates that the GMAC defers before transmission because of the presence of carrier. This bit is valid only in the half-duplex mode.
1	UF	Underflow Error When set, this bit indicates that the GMAC aborted the frame because the data arrived late from the Host memory. Underflow error indicates that the DMA encountered an empty transmit buffer while transmitting the frame. The transmission process enters the Suspended state and sets both bit [5] (Transmit Underflow bit) in Status Register (Status) and bit [0] (Transmit Interrupt bit) in Status Register (Status).
2	ED	Excessive Deferral When set, this bit indicates that the transmission has ended because of excessive deferral of over 24,288-bit times (155,680-bit times in 1000 Mbps mode or if Jumbo Frame is enabled) if bit [4] (Deferral Check bit) in MAC Configuration Register (MAC_Configuration) is set high.

Table 27.4 Transmit descriptor word 0 (TDES0) (2 of 3)

Bit position	Bit name	Description
6:3	CC[3:0]	Collision Count (Status field) These status bits indicate the number of collisions that occurred before the frame was transmitted. This count is not valid when the Excessive Collisions bit (TDES0[8]) is set. The core updates this status field only in the half-duplex mode.
7	VF	VLAN Frame When set, this bit indicates that the transmitted frame is a VLAN-type frame.
8	EC	Excessive Collision When set, this bit indicates that the transmission was aborted after 16 successive collisions while attempting to transmit the current frame. If bit [9] (Disable Retry bit) in the MAC Configuration Register (MAC_Configuration) is set, this bit is set after the first collision, and the transmission of the frame is aborted.
9	LC	Late Collision When set, this bit indicates that frame transmission is aborted because of a collision occurring after the collision window (64 byte-times, including preamble, in MII mode and 512 byte-times, including preamble and carrier extension, in GMII mode). This bit is not valid if the Underflow Error bit is set.
10	NC	No Carrier When set, this bit indicates that the Carrier Sense signal from the PHY was not asserted during transmission.
11	LOC	Loss of Carrier When set, this bit indicates that a loss of carrier occurred during frame transmission (that is, the CRS signal was inactive for one or more transmit clock periods during frame transmission). This is valid only for the frames transmitted without collision when the GMAC operates in the half-duplex mode.
12	IPE	IP Payload Error When set, this bit indicates that GMAC transmitter detected an error in the TCP, UDP, or ICMP IP datagram payload. The transmitter checks the payload length received in the IPv4 or IPv6 header against the actual number of TCP, UDP, or ICMP packet bytes received from the application and issues an error status in case of a mismatch.
13	FF	Frame Flushed When set, this bit indicates that the DMA or MTL flushed the frame because of a software Flush command given by the CPU.
14	JT	Jabber Timeout When set, this bit indicates the GMAC transmitter has experienced a jabber timeout. This bit is only set when bit [22] (Jabber Disable) of MAC Configuration Register (MAC_Configuration) is not set.
15	ES	Error Summary Indicates the logical OR of the following bits: TDES0[14]: Jabber Timeout TDES0[13]: Frame Flush TDES0[11]: Loss of Carrier TDES0[10]: No Carrier TDES0[9]: Late Collision TDES0[8]: Excessive Collision TDES0[2]: Excessive Deferral TDES0[1]: Underflow Error TDES0[16]: IP Header Error TDES0[12]: IP Payload Error
16	IHE	IP Header Error When set, this bit indicates that the GMAC transmitter detected an error in the IP datagram header. The transmitter checks the header length in the IPv4 packet against the number of header bytes received from the application and indicates an error status if there is a mismatch. For IPv6 frames, a header error is reported if the main header length is not 40 bytes. Furthermore, the Ethernet Length/Type field value for an IPv4 or IPv6 frame must match the IP header version received with the packet. For IPv4 frames, an error status is also indicated if the Header Length field has a value less than 0x5. If COE detects an IP header error, it still inserts an IPv4 header checksum if the Ethernet Type field indicates an IPv4 payload.
17	TTSS	Transmit Timestamp Status This field is used as a status bit to indicate that a timestamp was captured for the described transmit frame. When this bit is set, TDES2 and TDES3 have a timestamp value captured for the transmit frame. This field is only valid when the Last Segment Control bit (TDES0[29]) of the descriptor is set.

Table 27.4 Transmit descriptor word 0 (TDES0) (3 of 3)

Bit position	Bit name	Description
19:18	—	These bits are read as 0. The write value should be 0.
