31 to 24	MSA1[7:0]	All 0	R/W	IROP-Source Input α Value when 1-Bit α is 1 These bits specify the 8-bit α value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1. A value from 0 to 255 can be specified (**Figure 33.14**).
23 to 16	MSR1[7:0]	All 0	R/W	IROP-Source Input R/Cr Value when 1-Bit α is 1 These bits specify the R/Cr value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (**Figure 33.14**). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R component value. When YCbCr is specified, specify a Cr component value. A value from 0 to 255 can be specified.
15 to 8	MSG1[7:0]	All 0	R/W	IROP-Source Input G/Y Value when 1-Bit α is 1 These bits specify the G/Y value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (**Figure 33.14**). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G component value. When YCbCr is specified, specify a Y component value. A value from 0 to 255 can be specified.
7 to 0	MSB1[7:0]	All 0	R/W	IROP-Source Input B/Cb Value when 1-Bit α is 1 These bits specify the B/Cb value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (**Figure 33.14**). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B component value. When YCbCr is specified, specify a Cb component value. A value from 0 to 255 can be specified.

(11) RPFn Color Keying Control Registers (VI6_RPFn_CKEY_CTRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LTH	—	—	—	CV	—	—	SAPE1	SAPE0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	LTH	0	R/W	Transparent color-luma Threshold Mode Enable/Disable This bit enables or disables transparent color-luma threshold mode for the color keying module. In transparent color-luma threshold mode, color information 0 (GY0) specified in VI6_RPFn_CKEY_SET0 register is compared with the input luma values. When the input data is in YCbCr format, and if input Y value is equal to or smaller than specified color information (VI6_RPFn_CKEY_SET0.GY0), the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET0.AP0. This bit is available only when the input data is in YCbCr format. When the input data is in an RGB format, set this bit to 0. This bit setting is valid only when the CV bit is set to 0; it is ignored when the CV bit is set to 1. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0. 0: Luma threshold mode is disabled (Matched color mode) 1: Luma threshold mode is enabled
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	CV	0	R/W	Color Replacement Control This bit controls the color replacement function in the color keying module shown in **Figure 33.2**. When an RGB format is specified as the color space of the RPFn input data through VI6_RPFn_INFMT.RDFMT, and if all components of an input pixel match the color components specified in VI6_RPFn_CKEY_SET0, the color replacement function replaces the values of the input α and all RGB components with the α and color components specified in VI6_RPFn_CKEY_SET1. When a YCbCr format is specified as the color space of the RPFn input data through VI6_RPFn_INFMT.RDFMT, only the Y data is compared; if the luminance component of an input pixel matches the value specified in VI6_RPFn_CKEY_SET0.GY0, the color replacement function replaces the values of the input α and all YCbCr components with the α and color components specified in VI6_RPFn_CKEY_SET1. When the CV bit is set to 1, the color replacement function is enabled. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0. 0: Color replacement function is disabled (transparent color mode). 1: Color replacement function is enabled.
3, 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
1	SAPE1	0	R/W	Comparison Color Data Setting 1 Enable/Disable This bit enables or disables comparison color data setting 1 in the transparent color mode for the color keying module. This bit setting is valid only when the CV bit is set to 0; it is ignored when the CV bit is set to 1. In transparent color mode, color information 1 (VI6_RPFn_CKEY_SET1.R1/GY1/B1) specified in VI6_RPFn_CKEY_SET1 is compared with the input component values. When the input data is in an RGB format, and if all input values match the specified color information, the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET1.AP. When the input data is in YCbCr format, only the Y data is compared. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0. 0: Comparison color data setting 1 is disabled. 1: Comparison color data setting 1 is enabled.
0	SAPE0	0	R/W	Comparison Color Data Setting 0 Enable/Disable This bit enables or disables comparison color data setting 0 in the transparent color mode for the color keying module. This bit setting is valid only when the CV bit is set to 0; it is ignored when the CV bit is set to 1. In transparent color mode, color information 0 (VI6_RPFn_CKEY_SET0.R0/GY0/B0) specified in VI6_RPFn_CKEY_SET0 is compared with the input component values. When the input data is in an RGB format, and if all input values match the specified color information, the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET0.AP. When the input data is in YCbCr format, only the Y data is compared. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), clear this bit to 0. 0: Comparison color data setting 0 is disabled. 1: Comparison color data setting 0 is enabled.

(12) RPFn Color Keying Color Setting Registers m (VI6_RPFn_CKEY_SETm : m = 0, 1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	APm[7:0]								Rm[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GYm[7:0]								Bm[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	APm[7:0]	All 0	R/W	α Data in Color Keying Color Information-m ● In transparent color-matched color mode for color keying When the input data matches color setting-m (Rm, GYm, and Bm) for transparent color comparison in the color keying module, the input α value is replaced with the value specified in these bits. Specify the α value to replace the input value. ● In transparent color-luma threshold mode for color keying When the input data is in YCbCr format, and if input Y value is equal to or smaller than GY0, the input α value is replaced with the value specified in this bit field (AP0). Specify the α value in this bit field (AP0) to replace the input value. AP1 is not used in this mode. Set AP1 to 0 value. ● In color replacement mode for color keying These bits are not used in this mode. Clear them to 0. α value replacement through these bits in transparent color mode for color keying takes priority over the α value selected through the VI6_RPFn_ALPH_SEL.ASEL setting. A value from 0 to 255 can be specified.
23 to 16	Rm[7:0]	All 0	R/W	R*[1]/Cr Component Data in Color Keying Color Information-m ● In transparent color-matched color mode for color keying Specify the R component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting. When the RPFn input is in YCbCr format, the color keying module does not compare the Cr component, and the setting of these bits is ignored. ● In transparent color-luma threshold mode for color keying The color keying module does not refer this bit field, and the setting of these bits is ignored. ● In color replacement mode for color keying Specify the R component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.
15 to 8	GYm[7:0]	All 0	R/W	G*[1]/Y Component Data in Color Keying Color Information-m ● In transparent color-matched color mode for color keying Specify the G/Y component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting. ● In transparent color-luma threshold mode for color keying Specify the Y component value in the GY0 to be compared. ● In color replacement mode for color keying Specify the G/Y component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	Bm[7:0]	All 0	R/W	B*[1]/Cb Component Data in Color Keying Color Information-m ● In transparent color-matched color mode for color keying Specify the B component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting. When the RPFn input is in YCbCr format, the color keying module does not compare the Cb component, and the setting of these bits is ignored. ● In transparent color-luma threshold mode for color keying The color keying module does not refer this bit field, and the setting of these bits is ignored. ● In color replacement mode for color keying Specify the B component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.

Note 1. When comparison data is specified in an RGB format, if a packed format is selected for RGB input and each of the RGB components is not 8 bits, the lower-order bits of input data are extended as specified through VI6_RPFn_INFMT.CEXT before comparison. The RGB components to be compared with the input should also be extended in the same way and the extended values should be specified in this register.

(13) RPFn Source Picture Memory Stride Setting Registers (VI6_RPFn_SRCM_PSTRIDE)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PICT_STRD_C[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PICT_STRD_Y[15:0]	All 0	R/W	Memory Stride of Source Picture Y/RGB Plane These bits specify in 1-byte units the memory stride of the source picture Y/RGB plane read by the RPFn. A value from 0 to 65535 can be specified. Refer to **Figure 33.15** for settings.
15 to 0	PICT_STRD_C[15:0]	All 0	R/W	Memory Stride of Source Picture C Plane These bits specify in 1-byte units the memory stride of the source picture C plane read by the RPFn. When an RGB-format picture is read, these bits do not need to be set. A value from 0 to 65535 can be specified. Refer to **Figure 33.15** for settings. In the YCbCr planar format, this setting is used as the memory stride of the Cb and Cr planes.

This register specifies the memory stride of the picture planes in the source area as shown in **Figure 33.15**. The memory stride of the α plane should be specified through VI6_RPFn_SRCM_ASTRIDE.ALPH_STRD. When the RPF input is in an RGB format, only the RGB plane is read; when the input is in YCbCr format, the Y and C planes are read as shown in **Figure 33.15**. When the α plane is used, the α plane is also read. According to the image format and the necessity of the α plane, specify the necessary addresses where the source image is stored (VI6_RPFn_SRCM_ADDR_Y, VI6_RPFn_SRCM_ADDR_C, and VI6_RPFn_SRCM_ADDR_AI).

Whether the α plane needs to be read is determined according to the α plane selection method and IROP operation type. For details, refer to **Section 33.3.2.6(6)**.

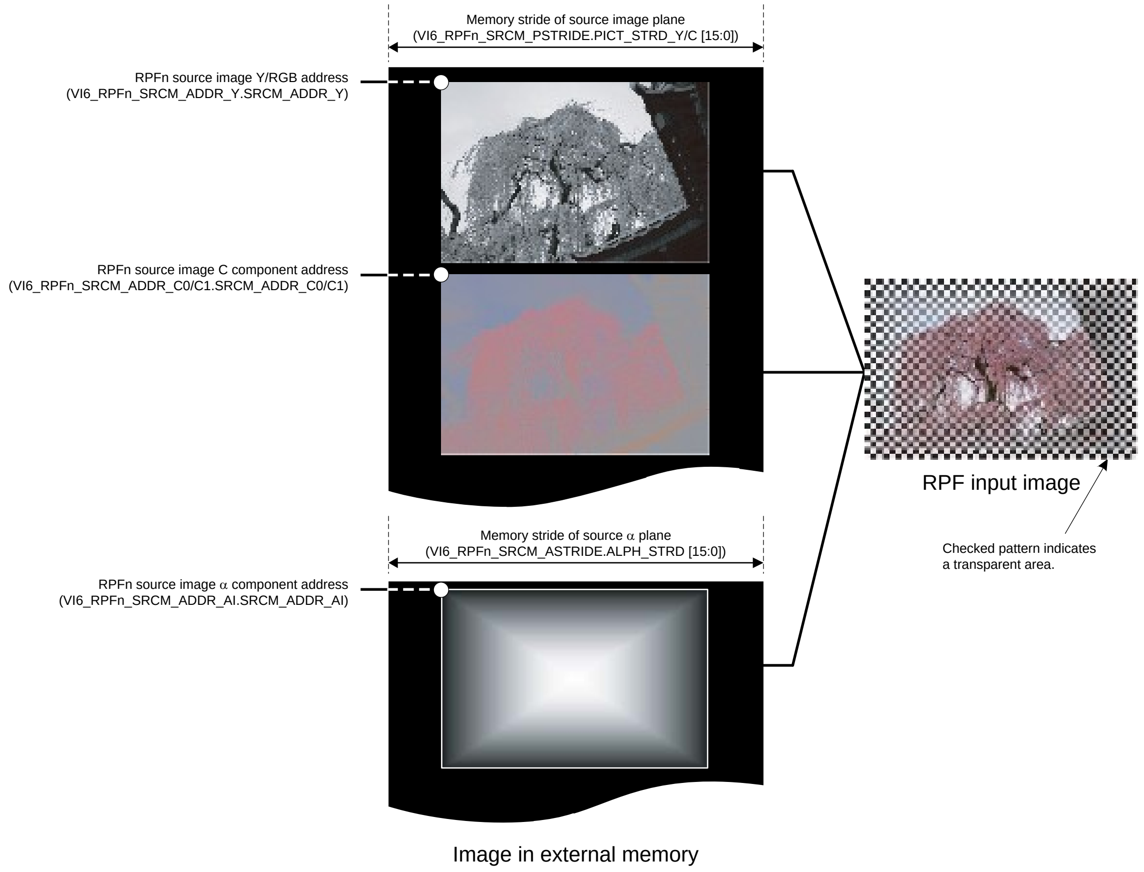

Figure 33.15 Reading an Image from RPFn Source Area

(14) RPFn Source α Memory Stride Setting Registers (VI6_RPFn_SRCM_ASTRIDE)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ADDR_C0[31:0]	All 0	R/W	Source Image C Plane Storing Address 0 These bits specify in 1-byte units the start address of the source image C plane read by the RPFn. Here, the C plane indicates the combined CbCr plane when a semi-planar format is selected from the packed YCbCr formats shown in **Figure 33.15** or the Cb plane when a planar format is selected. When an interleaved format is selected or the RPF input is in an RGB format, this setting is not used. A value from H’0000 0000 to H’FFFF FFFF can be specified. Refer to **Figure 33.15** in **Section 33.3.2.6(13)** for settings.

(17) RPFn Source Chroma Address Registers 1 (VI6_RPFn_SRCM_ADDR_C1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SRCM_ADDR_C1[31:0]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ADDR_C1[31:0]	All 0	R/W	Source Image C Plane Storing Address 1 These bits specify in 1-byte units the start address of the Cr plane when a planar YCbCr format shown in **Figure 33.15** is read by the RPFn. This setting is not used when the RPF input is in YCbCr format that is not a planar format or in an RGB format. A value from H’0000 0000 to H’FFFF FFFF can be specified. Refer to **Figure 33.15** in **Section 33.3.2.6(13)** for settings.

(18) RPFn Source α Address Registers (VI6_RPFn_SRCM_ADDR_AI)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SRCM_ADDR_AI[31:0]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ADDR_AI[31:0]	All 0	R/W	Source Image α Plane Storing Address These bits specify in 1-byte units the start address of the α plane of the source image read by the RPFn. Specify in the same way as the start address of the picture plane. When the α plane is not read from the source area, these bits do not need to be set. A value from H'0000 0000 to H'FFFF FFFF can be specified. Refer to **Figure 33.15** in **Section 33.3.2.6(13)** for settings.

(19) RPFn Bus Access Control Registers (VI6_RPFn_BAC)

33.3.2.7 WPF Control Registers

(1) WPFn-Source-RPF Registers (VI6_WPFn_SRCRPF)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	VIR_ACT2[1:0]		—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	RPF1_ACT[1:0]		RPF0_ACT[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25, 24	VIR_ACT2 [1:0]	All 0	R/W	Virtual RPF Start Enable in BRS These bits enable start of the virtual RPF in the BRS as the source RPF for the WPF0 when the WPF0 is started. For details of the virtual RPF, refer to the following. **Section 33.3.2.10(1) BRS Input Control Register (VI6_BRS_INCTRL)** **Section 33.3.2.10(2) Size Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_SIZE)** **Section 33.3.2.10(3) Display Location Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_LOC)** **Section 33.3.2.10(4) Color Information Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_COL)** Note that the virtual RPF is in the BRS as shown in **Figure 33.28** and there are no register bits for DPR setting related to the virtual RPF. 0: The virtual RPF in the BRS is not started. 1: The virtual RPF in the BRS is started as a sublayer source RPF for the WPFn. 2: The virtual RPF in the BRS is started as the master-layer source RPF for the WPFn. 3: Setting prohibited
23 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3, 2	RPF1_ACT [1:0]	All 0	R/W	RPFn Start Enable (RPFn_ACT, n = 0 to 1) These bits enable start of RPFn as the source RPF for the WPFn when the WPFn is started. When RPFn is not started by any of the WPFn (n = 0), set the VI6_DPR_RPFn_ROUTE.RT_RPFn bits to D'63. 0: RPFn is not started. 1: RPFn is started as a sublayer source RPF for the WPFn. 2: RPFn is started as the master-layer source RPF for the WPFn. 3: Setting prohibited
1, 0	RPF0_ACT [1:0]	All 0	R/W	

When the WPFn is started through the VSPD start register n (VI6_CMDn: n = 0), the RPF and virtual RPF in the BRS specified as the source RPF in this register are also started to supply data to the VSPD internal modules.

Note the following when specifying the source RPF.

(1) When blending or ROP operation is applied to multiple images through the BRS, multiple source RPFs are necessary for one WPF. When multiple source RPFs are used, images should be classified into a master layer and sublayers; assign one of the source RPFs as the master-layer source RPF and other RPFs as sublayer source RPFs.

Do not assign all RPFs as sublayer source RPFs (VI6_WPF1_SRCRPF = H’00000015) or two or more RPFs as the master-layer source RPF (VI6_WPF0_SRCRPF = H’0000025A) (such settings are prohibited).

(2) When the BRS is not used, there should be only one source RPF for one WPF. In this case, the source RPF should be assigned as the master-layer source RPF.

(2) WPFn Horizontal Input Size Clipping Registers (VI6_WPFn_HSZCLIP)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	HCEN	—	—	—	—	HCL_OFST[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	HCL_SIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	HCEN	0	R/W	Horizontal Size Clipping Enable/Disable Enables or disables clipping of the horizontal size of the WPFn input image. 0: Horizontal size clipping is disabled 1: Horizontal size clipping is enabled
27 to 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 16	HCL_OFST [7:0]	All 0	R/W	Horizontal Size Clipping Offset Value Setting These bits specify the offset size (pixels) from the left end of the image in horizontal size clipping when the HCEN bit is 1 (**Figure 33.16**). The left side of the image input to the WPF is cut off for the size specified in these bits. When the HCEN bit is 0, this setting is ignored. A value from 0 to 255 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in **Figure 33.16** is made, VSPD does not operate correctly.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	HCL_SIZE [12:0]	All 0	R/W	Horizontal Clipping Size Setting When the HCEN bit is 1, these bits specify the clipping size for horizontal clipping processing. Through this processing, the area of the horizontal size specified through the HCL_SIZE bits starting from the offset position specified through the HCL_OFST bits is determined as the valid image area. Accordingly, the right-side pixels beyond the (HCL_OFST + HCL_SIZE) size in the WPFn input image are discarded. When the HCEN bit is 0, this setting is ignored. A value from 1 to 1920 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in **Figure 33.16** is made, VSPD does not operate correctly. (Note) When the WPFn output format is YCbCr4:2:2 or YCbCr4:2:0, specify an even value in these bits.

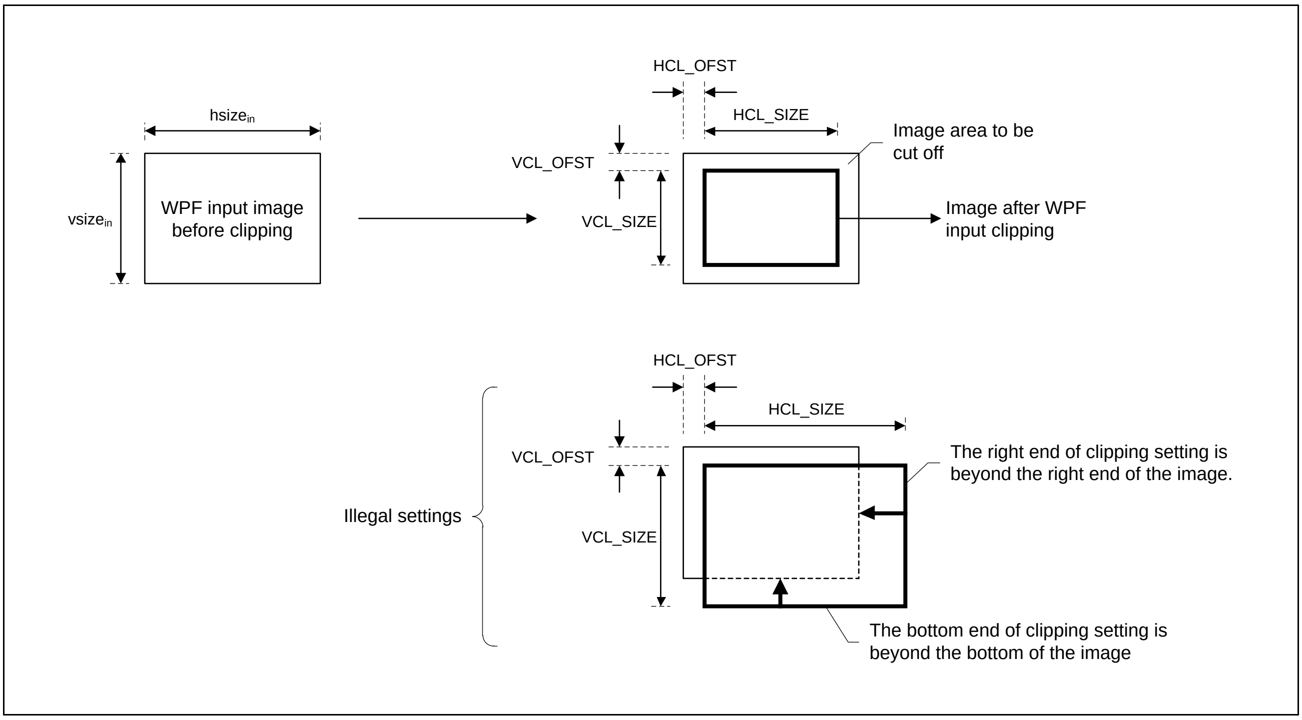

Figure 33.16 Image Clipping in WPF Input Section

(3) WPFn Vertical Input Size Clipping Registers (VI6_WPFn_VSZCLIP)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	VCEN	—	—	—	—	VCL_OFST[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	VCL_SIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	VCEN	0	R/W	Vertical Size Clipping Enable/Disable Enables or disables clipping of the vertical size of the WPFn input image. 0: Vertical size clipping is disabled 1: Vertical size clipping is enabled
27 to 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 16	VCL_OFST [7:0]	All 0	R/W	Vertical Size Clipping Offset Value Setting These bits specify the offset size (pixels) from the top end of the image in vertical size clipping when the VCEN bit is 1 (**Figure 33.16**). The top of the image input to the WPF is cut off for the size specified in these bits. When the VCEN bit is 0, this setting is ignored. A value from 0 to 255 can be specified. (VCL_OFST + VCL_SIZE) should not exceed the vertical size of the WPF input. If the setting shown in the bottom example in **Figure 33.16** is made, VSPD does not operate correctly.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	VCL_SIZE [12:0]	All 0	R/W	Vertical Clipping Size Setting When the VCEN bit is 1, these bits specify the clipping size for vertical clipping processing. Through this processing, the area of the vertical size specified through the VCL_SIZE bits starting from the offset position specified through the VCL_OFST bits is determined as the valid image area. Accordingly, the bottom pixels beyond the (VCL_OFST + VCL_SIZE) size in the WPFn input image are discarded. When the VCEN bit is 0, this setting is ignored. A value from 1 to 1080 can be specified. (VCL_OFST + VCL_SIZE) should not exceed the vertical size of the WPF input. If the setting shown in the bottom example in **Figure 33.16** is made, VSPD does not operate correctly. (Note) When the WPFn output format is YCbCr4:2:0, specify an even value in these bits.

(4) WPFn Output Format Registers (VI6_WPFn_OUTFMT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PDV [7:0]								PXA	ODE	—	—	—	ROT[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPYCS	SPUVS	DITH[1:0]		WRTM[2:0]			CSC	—	WRFMT[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	PDV [7:0]	All 0	R/W	PAD Value in Output Packed Data These bits specify the value to be stored in the bit field indicated as PAD or P in the output formats shown in **Table 33.20**. To store this value in PAD, specify 0 in the PXA bit. A value from 0 to 255 can be specified.
23	PXA	0	R/W	PAD Data Select Selects the value to be stored in the bit field indicated as PAD or P in the packed RGB output formats shown in **Table 33.21**. Both the value specified in the PDV bits and the α data input from the DPR to WPF are 8 bits, but some of the PAD and P bit fields shown in **Table 33.20** are four bits or one bit. When the target bit field is not 8 bits, the number of bits in the PDV value and the α data input from the DPR to WPF is reduced according to the VI6_WPFn_RNDCTRL.ABRM setting. For bit count reduction, refer to **Figure 33.17** and the description of VI6_WPFn_RNDCTRL.ABRM. 0: The value specified in the PDV bits is stored in the PAD shown in **Table 33.20**. 1: The α value output from DPR in pixel units is stored in the PAD shown in **Table 33.20**.
22	ODE	0	R/W	Ordered Dither (mode A) Enable/Disable 0: Ordered dither (mode A) is disabled. 1: Ordered dither (mode A) is enabled. When the output format specified through the WRFMT bits is YCbCr, specify 0 in this bit. And when VI6_WPFn_OUTFMT.CSC is set to 1, specify 0 in this bit even in the case that the output format specified through the WRFMT bits is RGB. Ordered dither is available only for 18bpp. So, when ODE bit is equal to 1, set WRFMT at 18bpp format. When ODE bit is equal to 0, WPF dither method is specified by DITH[1:0] in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
21 to 19	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18 to 16	ROT[2:0]	All 0	R/W	Rotation Processing Select These bits select the flipping processing to be applied to the WPFn output image. **Figure 33.18** shows the correspondence between the original image and the flipping result according to each setting. 0: No flipping 1: Vertical flipping Note that the destination address setting should be changed according to the setting of these bits. For details, refer to **Section 33.3.2.7(9)**. When the LIF module is used (VI6_LIF_CTRL.LIF_EN = 1), set 0 to ROT[2:0].

Bit	Bit Name	Initial Value	R/W	Description
15	SPYCS	0	R/W	WPF Output Mode Setting 1 When the output format is YUY2, set this bit to 1 and set the WRFMT bits to 71 (H’47). When the output format is YVYU, set this bit and the SPUVS bit to 1 and set the WRFMT bits to 71 (H’47). In other cases, set this bit to 0.
14	SPUVS	0	R/W	WPF Output Mode Setting 2 When the output format is NV61, set this bit to 1 and set the WRFMT bits to 65 (H’41). When the output format is NV21, set this bit to 1 and set the WRFMT bits to 66 (H’42). When the output format is YVYU, set this bit and the SPYCS bit to 1 and set the WRFMT bits to 71 (H’47). In other cases, set this bit to 0.
13, 12	DITH[1:0]	All 0	R/W	Ordered Dither (mode B) Enable/Disable When the output format specified through the WRFMT bits is RGB with 18 bpp (260000 colors) or less, the color reduction processing is applied to match the number of colors. The color reduction processing may generate the artifacts of pseudo gradation, which can be suppressed through dithering. The DITH bits enable or disable dithering during color reduction. When the output format specified through the WRFMT bits is YCbCr, specify 0 in these bits. And when VI6_WPFn_OUTFMT.CSC is set to 1, specify 0 in these bits even in the case that the output format specified through the WRFMT bits is RGB. 0: Dithering (mode B) is disabled 3: Dithering (mode B) is enabled 1, 2: Setting prohibited When ODE bit in the register is 1, set this bit to 0.
11 to 9	WRTM[2:0]	All 0	R/W	CSC Conversion Expression Setting These bits select the expression for color space conversion. The conversion direction is RGB to YCbCr when the format specified in the WRFMT bits is RGB, or YCbCr to RGB when the format is YCbCr. 0: BT.601 YCbCr [16,235/240] ↔ RGB [0,255] 1: BT.601 YCbCr [0,255] ↔ RGB [0,255] 2: BT.709 YCbCr [16,235/240] ↔ RGB [0,255] 3: BT.709 YCbCr [16,235/240] ↔ RGB [16,235] 4 to 7: Setting prohibited
8	CSC	0	R/W	Color Space Conversion Setting Enables or disables YCbCr ↔ RGB color space conversion to be executed in the WPFn. The characteristics of color space conversion are determined by the WRTM setting. There are some points to be noted about the relationship between the CSC setting and output format (WRFMT). For details refer to (*1) in **Section 33.3.2.6(3)**, RPFn Input Format Registers (VI6_RPFn_INFMT). 0: Color space is not converted. 1: Color space is converted.
7	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
6 to 0	WRFMT[6:0]	All 0	R/W	WPF Output Image Format Setting These bits select the format of the image output from the WPFn to the external memory from among those listed in **Table 33.20** and **Table 33.21**. [Note 1] Number of output pixels When YCbCr4:2:2 is specified through WRFMT, the horizontal size of the output image should be a multiple of 2 pixels. When YCbCr4:2:0 is specified, the vertical and horizontal sizes of the output image should be multiples of 2 pixels. Specify an appropriate data flow of the source RPF -> DPR -> target WPF so that the size of the image input to the target WPF satisfies the above restrictions. In particular, when the data flow includes a module or a function that modifies (up-scales, down-scales, or clips) the image size, take special care about the module or function settings. [Note 2] Output lines in YCbCr4:2:0 In the YCbCr4:2:0 output format, the number of chrominance lines in the vertical direction is one-half the number of luminance lines. For this reason, the WPF outputs only even-numbered chrominance lines (lines 0, 2, 4, 6, ...) (conversion from (A) to (B) in. When vertical flipping is also specified through the ROT bits, the flipping processing is executed last and the chrominance line locations are inverted (lines 1, 3, 5, 7, …) in the output image ((C) in **Figure 33.19**). [Note 3] Down sampling of CbCr in horizontal direction in YCbCr4:2:0 or YCbCr4:2:2 In the YCbCr4:2:2 or YCbCr4:2:0 output format, method of down sample of Cb/Cr in horizontal direction is average of neighbor two pixels.

Table 33.21 Packed YCbCr Formats for WPF Output

WRFMT[6:0]	Packed YCbCr Output Format	Reference
H'40	YCbCr4:4:4 semi-planar	**Figure 33.9***4
H'41	YCbCr4:2:2 semi-planar (NV16, NV61*1)	
H'42	YCbCr4:2:0 semi-planar (NV12, NV21*1)	
H'43 to H'45	Reserved	—
H'46	YCbCr4:4:4 interleaved	**Figure 33.10***4
H'47	YCbCr4:2:2 interleaved type 0 (UYVY, YUY2*2, YVYU*3)	
H'48	YCbCr4:2:2 interleaved type 1	
H'49	YCbCr4:2:0 interleaved *5	
H'4A	YCbCr4:4:4 planar	**Figure 33.11***4
H'4B	YCbCr4:2:2 planar (YV16)	
H'4C	YCbCr4:2:0 planar (YV12, I420)	
H'4D to H'7F	Reserved	—

Note 1. When the output format is NV61 or NV21, set SPUVS (bit 14) to 1.

Note 2. When the output format is YUY2, set SPYCS (bit 15) to 1.

Note 3. When the output format is YVYU, set SPUVS (bit 14) to 1 and SPYCS (bit 15) to 1.

Note 4. **Figure 33.12** shows the definition of memory address for each pixel in **Figure 33.9** to **Figure 33.11**.

Note 5. Each line of plane is written twice, so byte/pixel of YCbCr420ITL is 3 byte/pixel (same as YCbCr444ITL).

For details of each YCbCr format, refer to **Figure 33.9**, **Figure 33.10**, **Figure 33.11**, **Figure 33.12**. In these figures, registers for the RPF are indicated; read them as registers for the WPF as follows.

(RPF registers in the figures)	→	(Corresponding WPF registers)
VI6_RPFn_SRCM_ADDR_Y.SRCM_ADDR_Y	→	VI6_WPFn_DSTM_ADDR_Y.DSTM_ADDR_Y
VI6_RPFn_SRCM_ADDR_C0.SRCM_ADDR_C0	→	VI6_WPFn_DSTM_ADDR_C0.DSTM_ADDR_C0
VI6_RPFn_SRCM_ADDR_C1.SRCM_ADDR_C1	→	VI6_WPFn_DSTM_ADDR_C1.DSTM_ADDR_C1

(5) WPFn Data Swapping Registers (VI6_WPFn_DSWAP)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	P_LLS	P_LWS	P_WDS	P_BTS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	P_LLS	0	R/W	WPF Output Data Swapping in LONG LWORD Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 33.15**. 0: Data swapping in LONG LWORD (64-bit) units is disabled 1: Data swapping in LONG LWORD (64-bit) units is enabled
2	P_LWS	0	R/W	WPF Output Data Swapping in long word Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 33.15**. 0: Data swapping in long word (32-bit) units is disabled 1: Data swapping in long word (32-bit) units is enabled
1	P_WDS	0	R/W	WPF Output Data Swapping in Word Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 33.15**. 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled
0	P_BTS	0	R/W	WPF Output Data Swapping in Byte Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 33.15**. 0: Data swapping in byte (8-bit) units is disabled 1: Data swapping in byte (8-bit) units is enabled

Table 33.15 shows the data order before and after swapping according to the long long word, long word, word, and byte swapping settings.

When data order in memory for each format is the same as in **Table 33.20** for RGB format and **Figure 33.9** to **Figure 33.12** for YCbCr format, set 1111b to {*_LLS, *_LWS, *_WDS, *_BTS}. If data order is not the same as the definition, change data order within 16byte unit by these bits as shown in **Table 33.15**.

(6) WPFn Rounding Control Registers (VI6_WPFn_RNDCTRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	CBRM	—	—	ABRM[1:0]		ATHRESH[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	CLMD[1:0]		—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	CBRM	0	R/W	Bit Count Reduction Method Selection for Data Storage in Packed RGB This bit specifies the method for reducing the number of bits when data is stored in the bit fields indicated as R, G, and B in **Table 33.20** and the target bit fields are not 8 bits. 0: Bit count conversion: The lower-order bits are truncated 1: Bit count conversion: Rounding (rounding off)
27, 26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25, 24	ABRM[1:0]	All 0	R/W	Bit Count Reduction Method Selection for Data Storage in PAD These bits specify the method for reducing the number of bits when the data selected through VI6_WPFn_OUTFMT.PXA is stored in the bit fields indicated as PAD or P in **Table 33.20** and the target bit field is four bits or one bit. A value of 10b can be specified only when the packed RGB format specified through VI6_WPFn_OUTFMT.WRFMT includes a 1-bit P field. In this case, when the data selected through VI6_WPFn_OUTFMT.PXA is greater than the ATHRESH value, 1 is stored in the P field; when the selected data is not greater than the ATHRESH value, 0 is stored. 00b: Bit count conversion: The lower-order bits are truncated 01b: Bit count conversion: Rounding (rounding off) 10b: Bit count conversion: Comparison with the threshold value (this setting is allowed only when the storage field is one bit) 11b: Setting prohibited
23 to 16	ATHRESH [7:0]	All 0	R/W	Threshold for Conversion to 1-Bit α Data These bits specify the threshold value used for conversion from 8-bit α data to one bit when the ABRM bits are set to 10b. When the 8-bit α value before bit count reduction is equal to or smaller than the ATHRESH value, 0 is stored as the reduced 1-bit α data. In other cases, 1 is stored as the 1-bit α data. A value from 0 to 255 can be specified.
15, 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13, 12	CLMD[1:0]	All 0	R/W	Color Data Clipping These bits specify the method for clipping the YCbCr color data output from the WPF. When RGB color data is output from the WPF, specify 0 in these bits. 00b: Output value is not clipped (0-255) 01b: Output value is clipped: YCbCr mode 1 (16-235 (Y), 16-240 (Cb/Cr)) 10b: Output value is clipped: YCbCr mode 2 (Y/Cb/Cr = 1-254) 11b: Setting prohibited
11 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

(7) WPFn Destination Y Plane Memory Stride Registers (VI6_WPFn_DSTM_STRIDE_Y)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PICT_STRD_Y[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	PICT_STRD_Y[15:0]	All 0	R/W	Memory Stride of Destination Picture Y/RGB Plane These bits specify in 1-byte units the memory stride of the destination picture in the external memory to be written to by the WPFn as shown in **Figure 33.20**. A value from H'0000 to H'FFFF can be specified.

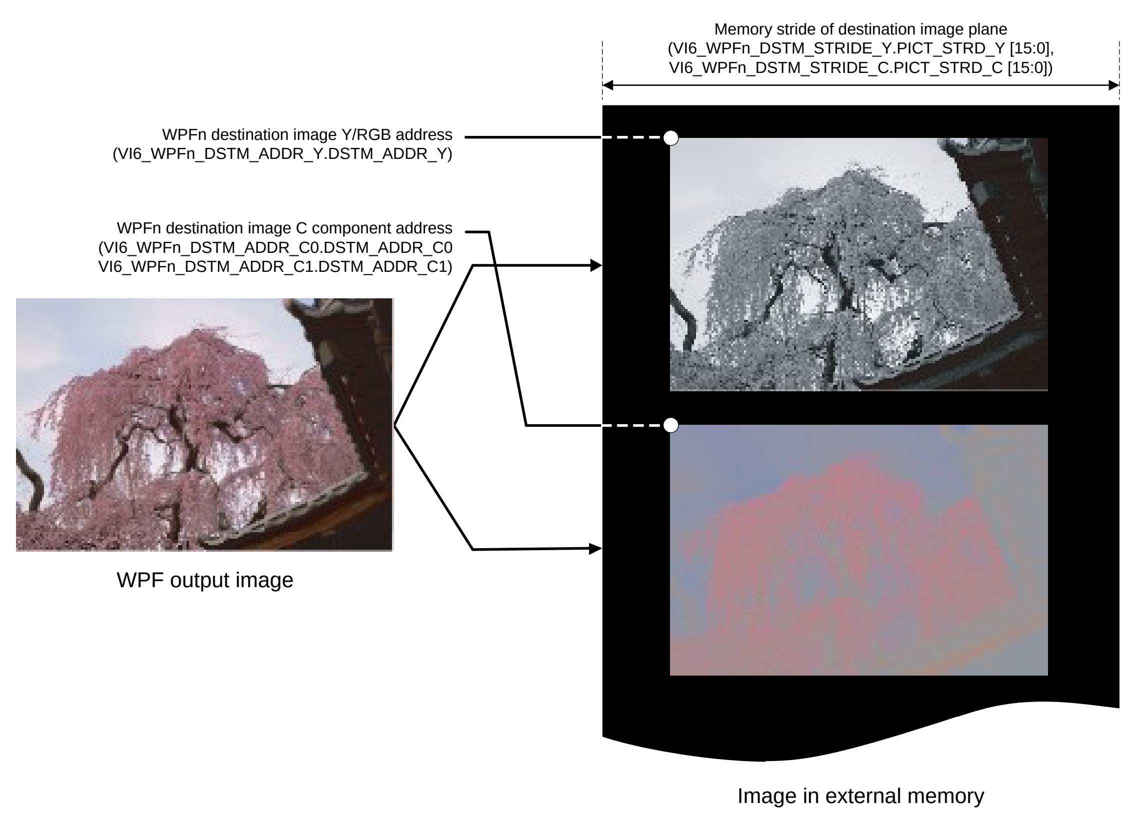

Figure 33.20 Writing Image Data to Destination Area in WPFn

(8) WPFn Destination C Plane Memory Stride Registers (VI6_WPFn_DSTM_STRIDE_C)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PICT_STRD_C[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	PICT_STRD_Y[15:0]	All 0	R/W	Memory Stride of Destination Picture C Plane These bits specify in 1-byte units the memory stride for the C plane of the destination picture in the external memory to be written to by the WPFn as shown in **Figure 33.20**. When the WPFn outputs images in an RGB format, this setting is not used. When the WPFn outputs images in YCbCr planar format, this setting is applied to both the Cb and Cr planes. A value from H'0000 to H'FFFF can be specified.

(9) WPFn Destination Y/RGB Address Registers (VI6_WPFn_DSTM_ADDR_Y)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSTM_ADDR_Y[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSTM_ADDR_Y[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ADDR_Y[31:0]	All 0	R/W	Destination Image Y/RGB Plane Storing Address These bits specify in 1-byte units the address for storing the destination-image Y plane or packed RGB plane to be written to by the WPFn in the method described later. A value from H'0000 0000 to H'FFFF FFFF can be specified.

[Destination Address Specification Method]

When flipping is not used, the start address of a frame (address FHA shown in **Figure 33.21**) should be specified as the destination address. When flipping is used, the destination address is not the frame start address (FHA); one of addresses A0 and A2 shown in **Figure 33.21** should be selected according to the combination of desired flipping (VI6_WPFn_OUTFMT.ROT setting).

To strictly define locations A0 and A2, let the horizontal size of the output image be H, the vertical size of the output image be V, and the memory stride (VI6_WPFn_DSTM_STRIDE_Y/C setting) be S as shown in **Figure 33.21**. Calculate the destination address (one of A0 and A2) using the formula shown in **Table 33.22** and specify it in the destination address storing register.

The values of variables L in **Table 33.22** depend on the other register settings and luminance and chrominance components. These values should be obtained by referring to **Table 33.23** when calculating the address to be specified in VI6_WPFn_DSTM_ADDR_Y, or **Table 33.24** when calculating the address to be specified in VI6_WPFn_DSTM_ADDR_C0 or VI6_WPFn_DSTM_ADDR_C1.

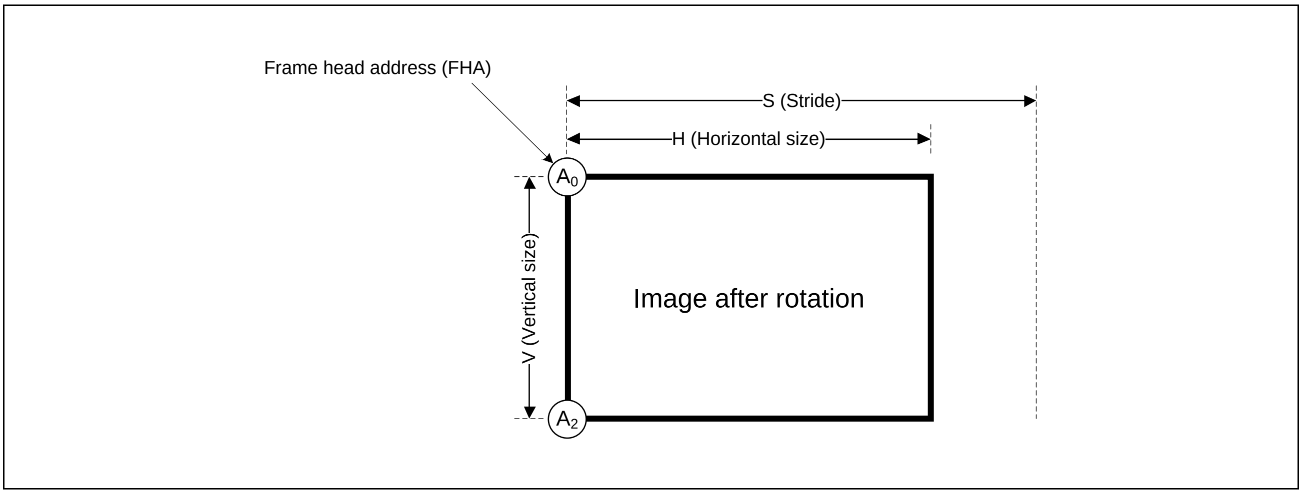

Figure 33.21 Location of Destination Address to be Specified for Flipping

Table 33.22 Destination Address A_0, A_1, A_2, and A3 Calculation Formulas

VI6_WPFn_OUTFMT.ROT Setting	Formula for Calculating Address to be Set in VI6_WPFn_DSTM_ADDR_Y, VI6_WPFn_DSTM_ADDR_C0, and VI6_WPFn_DSTM_ADDR_C1
0	A_0 = FHA
1	A_2 = FHA + (V×L – 1) × S

Table 33.23 Value of L according to VI6_WPFn_OUTFMT.WRFMT Setting (for RGB and Luminance Y Address Calculation)

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ADDR_C0[31:0]	All 0	R/W	Destination Image C Plane Storing Address 0 These bits specify in 1-byte units the address for storing the destination-image C plane to be written to by the WPFn. Refer to the description of VI6_WPFn_DSTM_ADDR_Y for settings. Here, the C plane indicates the combined CbCr plane when a semi-planar format is selected from the packed YCbCr formats shown in **Table 33.21** or the Cb plane when a planar format is selected. When an interleaved format is selected or the output is in an RGB format, this setting is not used. A value from H’0000 0000 to H’FFFF FFFF can be specified. Refer to **Figure 33.21** in **Section 33.3.2.7(10)** for settings.

(11) WPFn Destination Chroma Address Registers 1 (VI6_WPFn_DSTM_ADDR_C1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	WBMD[1:0]	All 0	R/W	Display Data Write Back Control This bit is used for selecting the write back mode when the value of VI6_LIFn_CTRL.LIF_EN bit is set to 1. 0: Write Back Disabled 1: Write Back Enabled

33.3.2.8 DPR Control Registers

(1) Concept of DPR Settings

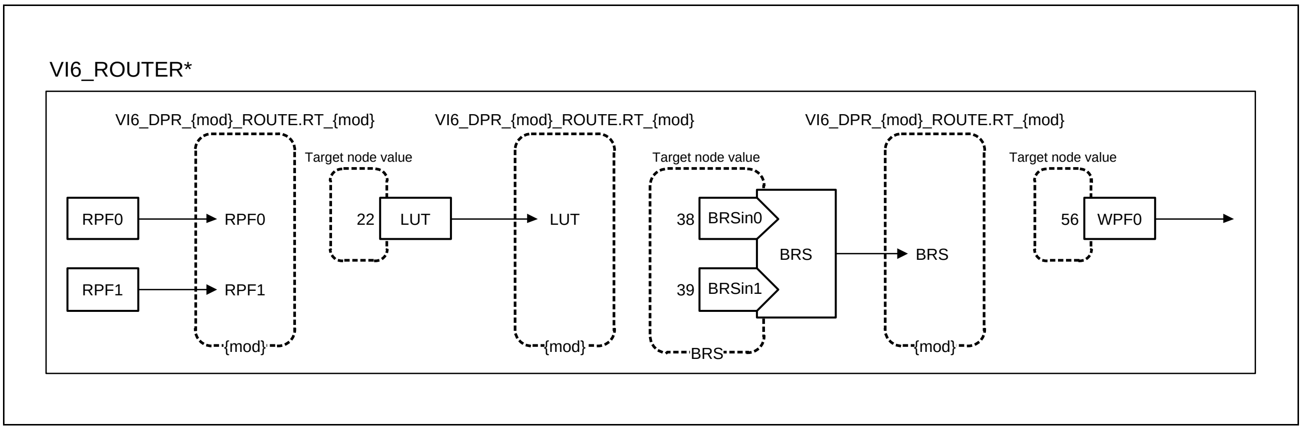

Figure 33.22 Node Register Names and Target Node Values on Data Path Router

In the VSPD internal data path, the order of processes can be specified as desired. The module for performing each process has a unique node value. Set each bit field in VI6_DPR_*_ROUTE to an appropriate node value shown in **Figure 33.22** to specify the target node to be connected behind each module.

For DPR settings, all of the following restrictions should be observed. If any of them is violated, even the WPF paths operating correctly at that time will be affected as well as the WPF paths connected through the DPR, and correct operation will not be guaranteed.

1. Specify 63 for the output node values of all RPFs and processing modules that are not used in the DPR. Here, make sure that no module is connected to a module for which 63 is specified as the node value. Note: VI6_DPR_{mod}_ROUTE.RT are not implemented in VSPD which doesn't have {mod}. See **Figure 33.1** whether VSPD has {mod} or not.
2. When specifying a value other than 63 for an output node value in the DPR, make sure that valid inputs (RPF0 to RPF1 or virtual RPF) and a target WPF are determined.
3. Only one module can be connected to each module; specifying the same target node value for two or more modules is prohibited.
4. Desired modules can be connected between each RPF and BRS input port, but all RPFs specified as the sources for a BRS input port should have the same target WPF.
5. Make appropriate routing or RPF register settings so that the color space formats (RGB/YCbCr) for all BRS input ports are the same.
6. Do not connect the output of any module as the input to the same module (in the BRS case, any input port) even when there is another module between the output and input (creating a loop is prohibited).
7. Each node can be used only once throughout all paths from RPFn to WPFn. When a module shown in **Figure 33.22** is assigned in one RPF to WPF path, it cannot be used in another RPF to WPF path.
8. While a WPF is operating, modifying the DPR connection settings in VI6_DPR_*_ROUTE is prohibited for modules used by the WPF but allowed for modules not used by the WPF. Be careful not to accidentally modify the settings of the modules included in the WPF path that is operating.
9. Be careful to do the following setting when BRS is used.
   VI6_DPR_ILV_BRS_ROUTE.BRSSEL = 1

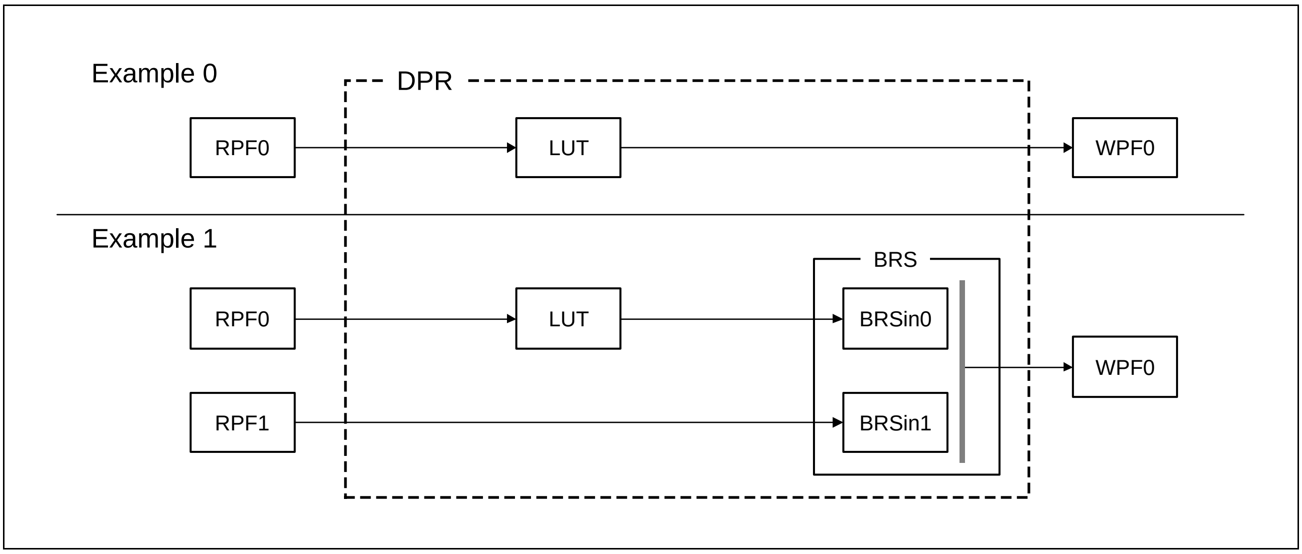

Figure 33.23 Examples of Internal Data Path Routing

Figure 33.23 shows examples of internal data path routing. Example 0 is WPF0 processing (RPF0 is the source RPF), and example 1 is also WPF0 (RPF0 to RPF1 are the source RPFs). Each example has the configuration shown in **Figure 33.23**. Example 0 performs LUT (e.g. γ correction) processing. Example 1 performs LUT processing (e.g. γ correction), for input 0 (RPF0) and then applies blending or raster operation between the resultant data and input data 1 (RPF1). The VI6_ DPR_*_ROUTE settings for these examples are shown in **Table 33.25**. The bit fields for the modules that are not used in the examples should be set to 63.

Table 33.25 VI6_DPR_*_ROUTE Register Settings in Connection Examples Shown in **Figure 33.23**. Although both examples show in **Figure 33.23** include operation in image processing modules, connect the RPF to the WPF directly when only image format conversion or packed format conversion is required.

Table 33.25 Examples of Internal Data Path Routing

	Register Name	Setting	
Example 0	VI6_DPR_RPF0_ROUTE.RT_RPF0	22	(To LUT)
	VI6_DPR_RPF1_ROUTE.RT_RPF1	63	(UNUSED)
	VI6_DPR_LUT_ROUTE.RT	56	(To WPF0)
	VI6_DPR_ILV_BRS_ROUTE.RT	63	(UNUSED)
Example 1	VI6_DPR_RPF0_ROUTE.RT_RPF0	22	(To LUT)
	VI6_DPR_RPF1_ROUTE.RT_RPF1	39	(To BRSin1)
	VI6_DPR_LUT_ROUTE.RT	38	(To BRSin0)
	VI6_DPR_ILV_BRS_ROUTE.RT	56	(To WPF0)

(2) RPFn Routing Register (VI6_DPR_RPFn_ROUTE : n = 0, 1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	RT_RPFn[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5 to 0	RT_RPFn [5:0]	All 0	R/W	RPFn Target Node Value These bits specify the target node value for RPFn. When using RPFn, refer to **Figure 33.22** for settings. When RPFn is not started through the VI6_WPFn_SRCRPF setting, specify 63.

(3) WPFn Timing Control Register (VI6_DPR_WPFn_FPORCH : n = 0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	FP_WPFn[5:0]						—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 8	FP_WPFn [5:0]	All 0	R/W	WPFn Internal Operation Timing Setting Specify 5.
7 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

(4) {mod} Routing Register (VI6_DPR_{mod}_ROUTE : {mod}=ILV_BRS, LUT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	BRSSEL	—	—	—	—	FXA[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	FP[5:0]						—	—	RT[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	BRSSEL	0	R/W	This bit is valid only for VI6_DPR_ILV_BRS_ROUTE. Always specify 1.
27 to 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 16	FXA[7:0]	All 0	R/W	Fixed α Output Value for {mod} The {mod} does not support input/output of the α value. The α value input to the {LUT} is discarded, and the fixed α value specified in these bits is always output from the {LUT}. A value from 0 to 255 can be specified. These bits are valid for LUT module. For BRS module, these bits are reserved.
15, 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 8	FP[5:0]	All 0	R/W	{mod} Internal Operation Timing Setting Specify 0.
7, 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5 to 0	RT[5:0]	All 0	R/W	{mod}Target Node Value These bits specify the target node value for the {mod}. When using the {mod}, refer to **Figure 33.22** for settings. When not using the {mod}, specify 63.

33.3.2.9 LUT Control Register

(1) LUT Control Register (VI6_LUT_CTRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LUT_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	LUT_EN	0	R/W	1D-LUT Enable/Disable Enables or disables the 1D-LUT function by the LUT. When the 1D-LUT is used, the color component curve information needs to be set separately in the LUT table. For the LUT table settings, refer to **Section 33.4.7.1**. 0: 1D-LUT function is disabled 1: 1D-LUT function is enabled

In the LUT, various image processing, such as curves with high operation load (e.g., γ correction), negative-positive conversion, and gain adjustment of images, can be achieved by the data replacement processing by the 1D-LUT. As shown in **Figure 33.24**, the LUT replaces each component of the input pixel data using the set replacement table of 256 entries. For example, if the LUT is set as in **Figure 33.25**, when there is an input of 150, the data stored in address 150 of the 1D-LUT is read and output as the LUT output. **Figure 33.25** shows a case in which the input and output become equal for convenience in explaining.

In the LUT settings shown in **Figure 33.26**, the input bits are reversed. This has the effect of negative-positive flipping. In **Figure 33.27**, γ correction (γ = 1.8 is shown as an example) is possible. As described above, information to be set in the LUT indicates LUT processing characteristics. If the same value is set for each component in the LUT, an equal effect can be obtained for each component of the input image when it is processed. If the LUT is set with different characteristics for each component, the processing characteristics can be changed for each component.

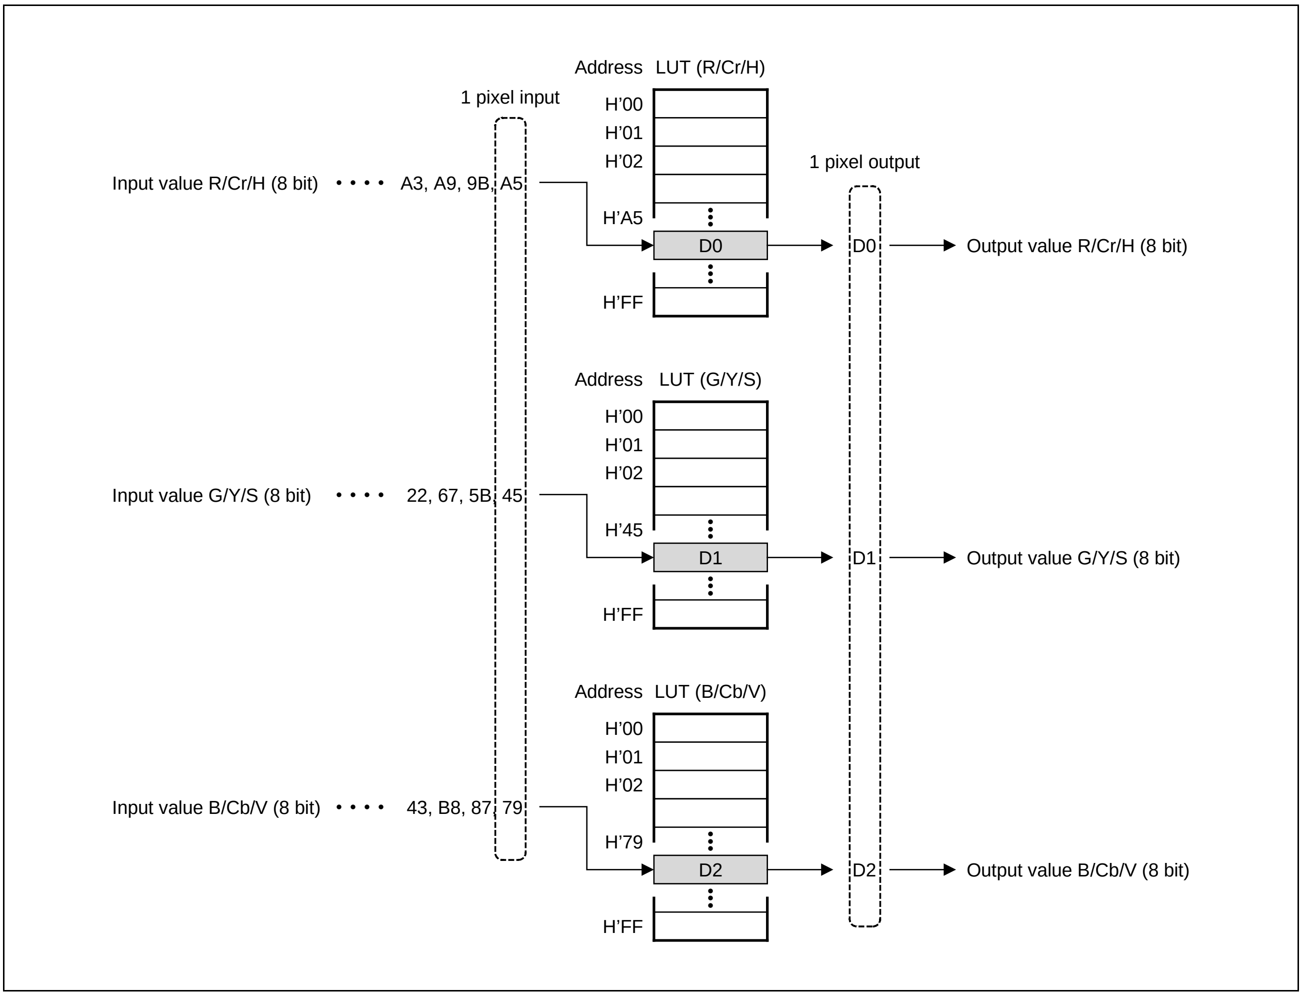

Figure 33.24 Relationship between Input and Output for 1D-LUT Table

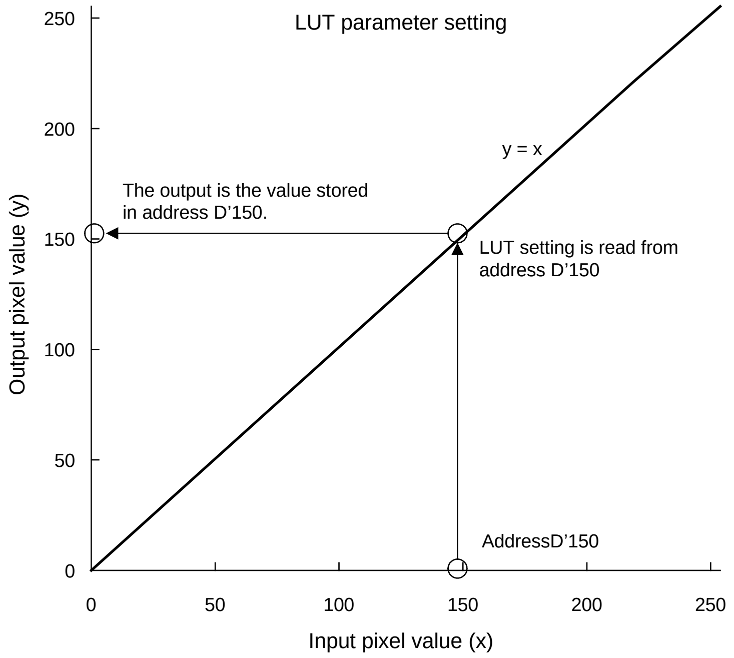

Figure 33.25 Setting Example in Which Output Becomes Equal to Input

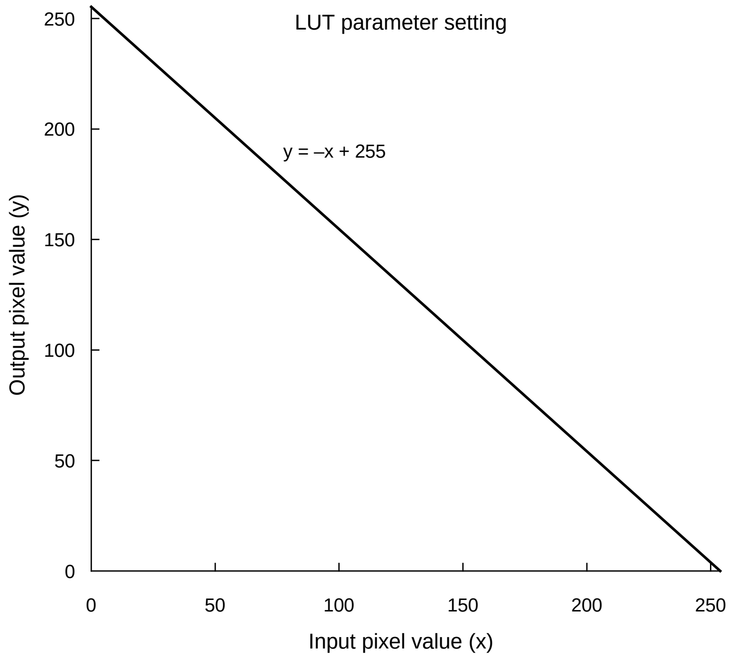

Figure 33.26 Setting Example of Negative-Positive Conversion

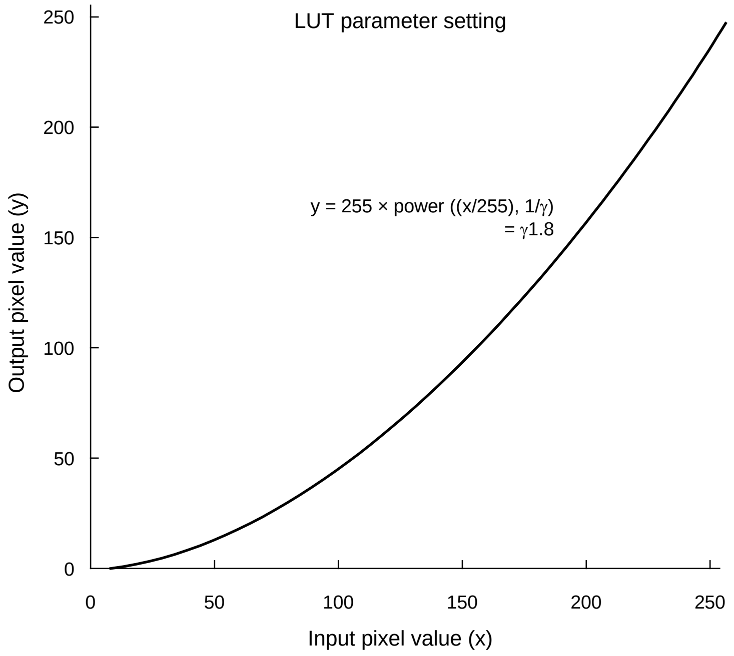

Figure 33.27 Setting Example of γ Correction

33.3.2.10 BRS Control Registers

(1) BRS Input Control Register (VI6_BRS_INCTRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	NRM	—	—	—	—	—	—	—	—	—	—	D1ON	D0ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ODE1	DITH1[2:0]			ODE0	DITH0 [2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	NRM	0	R/W	Color Data Normalization Enables or disables division by the α value of the color data in BRS blending operation. This is used when converting the RGB color data format to which the α value is multiplied (pre-multiplied color) into the RGB color data format to which the α value is not multiplied (non pre-multiplied color). Do not use this for the YCbCr format. 0: Divider (DIV unit in **Figure 33.28**) does not divide the color value by α 1: Divider (DIV unit in **Figure 33.28**) divides the color value by α
27 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	D1ON	0	R/W	Ordered dither (mode B) Enable of BRS Input 1 Enables or disables dithering (color reduction) of BRS input 1 (BRSin1 in **Figure 33.28**). 0: Dithering (mode B) of BRSin1 is disabled 1: Dithering (mode B) of BRSin1 is enabled When ODE1 in this bit is set to 1, set 0 to this bit.
16	D0ON	0	R/W	Ordered dither (mode B) Enable of BRS Input 0 Enables or disables dithering (color reduction) of BRS input 0 (BRSin0 in **Figure 33.28**). 0: Dithering (mode B) of BRSin0 is disabled 1: Dithering (mode B) of BRSin0 is enabled When ODE0 in this bit is set to 1, set 0 to this bit.
15 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	ODE1	0	R/W	Ordered Dither (mode A) of CH1 Input to BRS Enable/Disable 0: Ordered dither (mode A) of BRSin1 is disabled. 1: Ordered dither (mode A) of BRSin1 is enabled. Ordered dither is available only for 18bpp. So, when ODE1 bit is equal to 1, set DITH1 = 1. When ODE1 bit is equal to 0, BRSin1 dither method is specified by D1ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.

Bit	Bit Name	Initial Value	R/W	Description
6 to 4	DITH1[2:0]	All 0	R/W	Dithering of CH1 Input to BRS These bits specify the number of colors for pixels after dithering (color reduction) when dithering (color reduction) for pixel information is enabled through the D1ON bit. When dithering (color reduction) for pixel information is disabled, specify 0 in these bits. 0: Dithering of BRSin1 input image is disabled 1: Dithering of BRSin1 input image at 18 bpp (RGB666: 260000 colors) 2: Dithering of BRSin1 input image at 16 bpp (RGB565: 65535 colors) 3: Dithering of BRSin1 input image at 15 bpp (RGB555: 32768 colors) 4: Dithering of BRSin1 input image at 12 bpp (RGB444: 4096 colors) 5: Dithering of BRSin1 input image at 8 bpp (RGB332: 256 colors) 6, 7: Setting prohibited
3	ODE0	0	R/W	Ordered Dither (mode A) of CH0 Input to BRS Enable/Disable 0: Ordered dither (mode A) of BRSin0 is disabled. 1: Ordered dither (mode A) of BRSin0 is enabled. Ordered dither is available only for 18bpp. So, when ODE0 bit is equal to 1, set DITH0 = 1. When ODE0 bit is equal to 0, BRSin0 dither method is specified by D0ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
2 to 0	DITH0 [2:0]	All 0	R/W	Dithering of CH0 Input to BRS These bits specify how to perform dithering of the CH0 input to the BRS. The setting method is the same as that for the DITH1 bits. Read the description of the DITH1 bits with BRSin0 and D0ON replacing BRSin1 and D1ON, respectively.

Figure 33.28 shows the configuration of the BRS. For the BRS inputs, there are two inputs from the DPR and one internal input as a virtual RPF. BRSin0 to BRSin1 are input ports that have the target node values shown in **Figure 33.22**, and they can be connected to any module on the DPR. The same color space (YCbCr or RGB) has to be used for the two inputs from the DPR to the BRS.

The virtual RPF inside the BRS is an input unit not connected to the DPR. It is called the “virtual RPF” because it outputs images internally created by the BRS. Starting of the virtual RPF is controlled by VI6_WPFn_SRCRPF.VIR_ACT2, and the single-color data created at the virtual RPF can be used for blending or raster operation (ROP) with data from the other input units BRSin0 to BRSin1. The color space for the single color to be set for the virtual RPF needs to match the color space of the two inputs from the DPR to the BRS. For this setting method, see **Section 33.3.2.10(4)**.

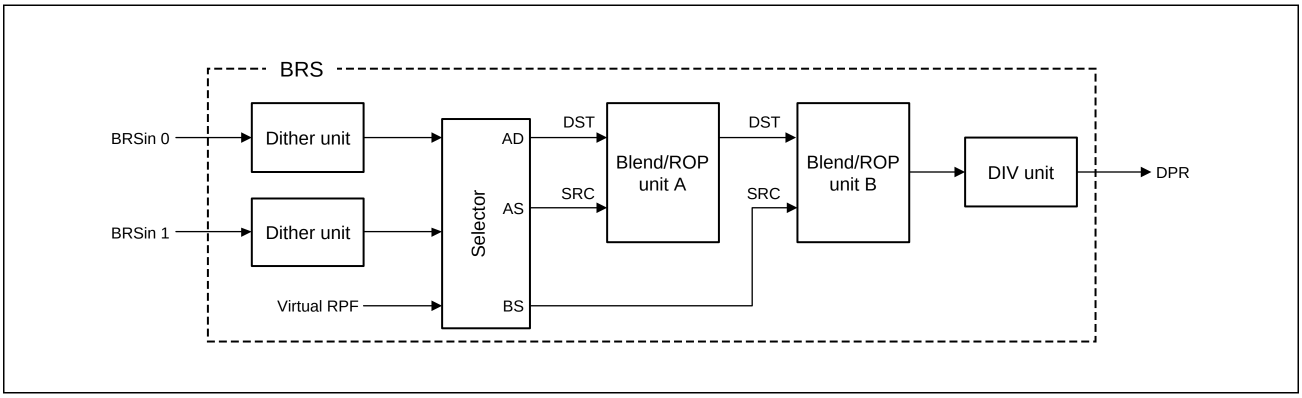

Figure 33.28 BRS Configuration

The selector in **Figure 33.28** is used to select the SRC and DST inputs to blending/ROP units A to B from BRSin0 to BRSin1 which are inputs from the DPR and the virtual RPF. The SRC and DST input sources for blending/ROP units A to B are either uniquely determined based on the configuration shown in **Figure 33.28** or selected as desired by registers. The input sources that can be arbitrarily selected by registers are AD, AS and BS, which correspond to the registers shown in **Table 33.26**.

Table 33.26 Correspondence between Selector Output Destinations and Register Bits for BRS

Selector Output	Output Destination	Register Bits
AD	Blending/ROP unit A - DST	VI6_BRSA_CTRL.DSTSEL
AS	Blending/ROP unit A - SRC	VI6_BRSA_CTRL.SRCSEL
BS	Blending/ROP unit B - SRC	VI6_BRSB_CTRL.SRCSEL

(2) Size Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_SIZE)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	VIR_HSIZE [12:0]	All 0	R/W	Virtual RPF Horizontal Size These bits set the horizontal size of an image from the virtual RPF shown in **Figure 33.28**. A value from 1 to 1920 can be specified.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	VIR_VSIZE [12:0]	All 0	R/W	Virtual RPF Vertical Size These bits set the vertical size of an image from the virtual RPF shown in **Figure 33.28**. A value from 1 to 1080 can be specified.

The virtual RPF has only a function to output a fixed α value and a fixed pixel value. The virtual RPF can internally create a single-color image without accessing external memory via the MAU. Same as images from the other BRS input ports, a sublayer can be blended on an image created in this manner with the image used as the background (master layer). In turn, when using the image as a sublayer, it can be drawn on the master layer as a window.

(3) Display Location Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_LOC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	HCOORD [12:0]	All 0	R/W	Horizontal Coordinate of Virtual RPF Location on Master Layer These bits specify the horizontal coordinate of where to locate the left-edge pixel of the virtual RPF's layer, with the left-edge pixel of the master layer set at coordinate 0. This setting should be made in pixel units. A value from 0 to 1919 can be specified. When the virtual RPF is specified as the master layer by VI6_WPFn_SRCRPF.VIR_ACT2, set these bits to 0.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	VCOORD [12:0]	All 0	R/W	Vertical Coordinate of Virtual RPF Location on Master Layer These bits specify the vertical coordinate of where to locate the top-edge pixel of the virtual RPF's layer, with the top-edge pixel of the master layer set at coordinate 0. This setting should be made in pixel units. A value from 0 to 1079 can be specified. When the virtual RPF is specified as the master layer by VI6_WPFn_SRCRPF.VIR_ACT2, set these bits to 0.

(4) Color Information Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_COL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	COL_A[7:0]								COL_RCR[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	COL_GY[7:0]								COL_BCB[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	COL_A[7:0]	All 0	R/W	Fixed α of Virtual RPF These bits set the fixed α value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
23 to 16	COL_RCR [7:0]	All 0	R/W	Fixed R/Cr of Virtual RPF These bits set the fixed R/Cr value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
15 to 8	COL_GY[7:0]	All 0	R/W	Fixed G/Y of Virtual RPF These bits set the fixed G/Y value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
7 to 0	COL_BCB [7:0]	All 0	R/W	Fixed B/Cb of Virtual RPF These bits set the fixed B/Cb value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.

The transparency information and color information of the single color that is created by the virtual RPF are set in the bits of this register. As described earlier, the color information is set for the YCbCr or RGB color space. The color space to be set in this register depends on the register settings of the environment and other modules to which the BRS is connected by the DPR. Two cases can be considered. Since the α value (COL_A) is transparency information and irrelevant to the concept of color space, the same setting is made for either the YCbCr or RGB color space.

[Case 1: When an input other than the virtual RPF is used]

When the source RPF is connected to any one of the BRS input ports (BRSin0 to BRSin1) other than the virtual RPF and valid data is being supplied, the same color space data as the color space for the BRS inputs should be set in this register as the color space for the virtual RPF's color information. This is based on the restriction of “all BRS inputs must have the same color space”, as described in **Section 33.3.2.8(1)** or **Section 33.3.2.10(1)**.

[Case 2: When only the virtual RPF is used]

When only the virtual RPF is used as the source RPF of WPFn, RPFn is not connected to the BRS, as shown in **Figure 33.29**. Thus, there is no color space for another input that the color space for the virtual RPF has to follow, as in case 1. This means that the color space of the data output by the BRS is determined by the WPF setting.

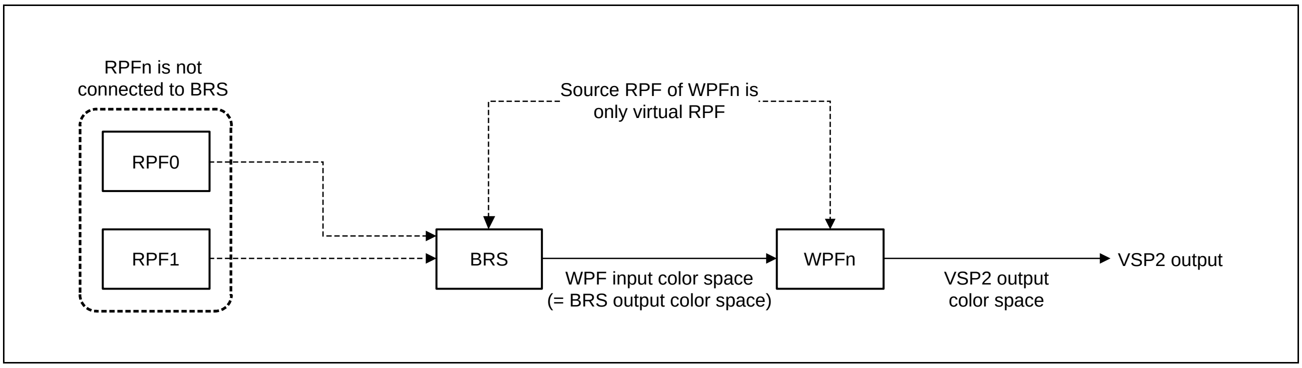

Figure 33.29 Relationship between DPR Connection and Color Space When Only Virtual RPF is Used

Figure 33.29, the output color space of the VSPD (= output color space of WPFn) is determined by VI6_WPFn_OUTFMT.WRFMT. When bit 6 in VI6_WPFn_OUTFMT.WRFMT (WRFMT [6]) is 0, the color space is RGB, while when it is 1, the color space is YCbCr. Next, the WPF input color space (= BRS output color space) is determined by the relationship between the WPF output color space and VI6_WPFn_OUTFMT.CSC. When VI6_WPFn_OUTFMT.CSC is 0, the WPF output color space and WPF input color space (= BRS output color space) are the same. When VI6_WPFn_OUTFMT.CSC is 1, the WPF output color space and WPF input color space (= BRS output color space) are the opposite. This relationship is summarized in **Table 33.27**.

The color space for the virtual RPF's color information should be set in this register according to the “BRS output color space” shown in **Table 33.27**.

Table 33.27 Relationship between WPF Output Color Space and BRS Output Color Space

VI6_WPFn_OUTFMT Register Bit Settings				BRS Output Color Space (= WPF Input Color Space)
Bit 6 in WRFMT		CSC		
0	(WPF output is RGB)	0	(YCbCr to RGB conversion is disabled)	RGB
0	(WPF output is RGB)	1	(YCbCr to RGB conversion is enabled)	YCbCr
1	(WPF output is YCbCr)	0	(RGB to YCbCr conversion is disabled)	YCbCr
1	(WPF output is YCbCr)	1	(RGB to YCbCr conversion is enabled)	RGB

(5) BRS Control Registers (VI6_BRSm_CTRL: m = A, B)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RBC	—	—	—	—	—	—	—	—	DSTSEL[2:0]			—	SRCSEL[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	LBA2[11:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	RBC	0	R/W	Operation Type of Blending/ROP Unit m (m = A, B) Specifies the operation type for blending/ROP unit m (m = A, B) shown in **Figure 33.28**. 0: ROP (raster operation) 1: Blending operation
30 to 23	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22 to 20	DSTSEL[2:0]	All 0	R/W	Input Selection for DST Side of Blending/ROP Unit A These bits select the input for the DST side of blending/ROP unit A shown in **Figure 33.28**. These bits specify the connection between the BRS input port and the DST separately from the setting of connections between other modules and the BRS input port through the DPR. 000b: BRS input 0 (BRSin0) is input to DST 001b: BRS input 1 (BRSin1) is input to DST 100b: Virtual RPF is input to DST 010b, 011b, 101b to 111b: Setting prohibited [Note] The DSTSEL bits for blending/ROP unit B is reserved. The write value should always be 0.
19	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18 to 16	SRCSEL[2:0]	All 0	R/W	Input Selection for SRC Side of Blending/ROP Unit m (m = A, B) These bits select the input for the SRC side of blending/ROP unit m (m = A, B) shown in **Figure 33.28**.These bits specify the connection between the BRS input port and the SRC separately from the setting of connections between other modules and the BRS input port through the DPR. 000b: BRS input 0 (BRSin0) is input to SRC 001b: BRS input 1 (BRSin1) is input to SRC 100b: Virtual RPF is input to SRC 010b, 011b, 101b to 111b: Setting prohibited [Note] The SRCSEL bits for blending/ROP unit B are reserved. The write value should always be 0.
15 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 4	CROP[3:0]	All 0	R/W	Color Data ROP Operator These bits select the ROP operator of the color data in blending/ROP unit m (m = A, B). Select the opcode for ROP operation from **Table 33.28**.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	AROP[3:0]	All 0	R/W	α Data ROP Operator These bits select the ROP operator of the α data in blending/ROP unit m (m = A, B). Select the opcode for ROP operation from **Table 33.28**.

Table 33.28 ROP Operator of Blending/ROP Unit m (m = A, B)

Opcode	Operator
0000b	NOP(D)
0001b	AND(S & D)
0010b	AND_REVERSE(S & ~D)
0011b	COPY(S)
0100b	AND_INVERTED(~S & D)
0101b	CLEAR(0)
0110b	XOR(S ^ D)
0111b	OR(S | D)
1000b	NOR(~(S | D))
1001b	EQUIV(~(S ^ D))
1010b	INVERT(~D)
1011b	OR_REVERSE(S | ~D)
1100b	COPY_INVERTED(~S)
1101b	OR_INVERTED(~S | D)
1110b	NAND(~(S & D))
1111b	SET(all1)

(6) BRS Blend Control Registers (VI6_BRSm_BLD: m = A, B)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CBES	CCMDX[2:0]			—	CCMDY[2:0]			ABES	ACMDX[2:0]			—	ACMDY[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	COEFX[7:0]								COEFY[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	CBES	0	R/W	Blending Expression Selection Selects the blending expression of the color data in the BRS (VI6_BRSm_CTRL.RBC = 1). Blending coefficients are specified by the CCMDX and CCMDY bits. 0: CCMDX * (DST color data) + CCMDY * (SRC color data) 1: CCMDX * (DST color data) - CCMDY * (SRC color data)
30 to 28	CCMDX[2:0]	All 0	R/W	Blending Coefficient X Selection These bits specify coefficient X used in the blending expression determined by the CBES bit. 000b: DST α data is used as blending coefficient X 001b: 255 - (DST α data) is used as blending coefficient X 010b: SRC α data is used as blending coefficient X 011b: 255 - (SRC α data) is used as blending coefficient X 100b: Fixed α value 0 (COEFX setting)
27	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
26 to 24	CCMDY[2:0]	All 0	R/W	Blending Coefficient Y Selection These bits specify coefficient Y used in the blending expression determined by the CBES bit. 000b: DST α data is used as blending coefficient Y 001b: 255 - (DST α data) is used as blending coefficient Y 010b: SRC α data is used as blending coefficient Y 011b: 255 - (SRC α data) is used as blending coefficient Y 100b: Fixed α value 1 (COEFY setting) When the virtual RPF is specified as the master layer by VI6_WPFn_SRCRPF.VIR_ACT2, set these bits to 0.
23	ABES	0	R/W	Blending α Creation Expression Specifies the expression for creating α data after blending by blending/ROP unit m (m = A, B, C, D, E). α creation coefficients are specified by the ACMDX and ACMDY bits. 0: ACMDX * (DST α data) + ACMDY * (SRC α data) 1: ACMDX * (DST α data) - ACMDY * (SRC α data)
22 to 20	ACMDX[2:0]	All 0	R/W	α Creation Coefficient X These bits specify α creation coefficient X used in the α creation expression determined by the ABES bit. 000b: (α creation coefficient X) = (DST α data) 001b: (α creation coefficient X) = 255 - (DST α data) 010b: (α creation coefficient X) = (SRC α data) 011b: (α creation coefficient X) = 255 - (SRC α data) 100b: (α creation coefficient X) = Fixed α value 0 (COEFX setting) 101b to 111b: Setting prohibited
19	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
18 to 16	ACMDY[2:0]	All 0	R/W	α Creation Coefficient Y These bits specify α creation coefficient Y used in the α creation expression determined by the ABES bit. 000b: (α creation coefficient Y) = (DST α data) 001b: (α creation coefficient Y) = 255 - (DST α data) 010b: (α creation coefficient Y) = (SRC α data) 011b: (α creation coefficient Y) = 255 - (SRC α data) 100b: (α creation coefficient Y) = Fixed α value 1 (COEFY setting) 101b to 111b: Setting prohibited
15 to 8	COEFX[7:0]	All 0	R/W	Fixed α Value 0 These bits specify fixed α value 0 used when the CCMDX or ACMDX bits are set to 100b. A value from H’00 to H’FF can be specified.
7 to 0	COEFY[7:0]	All 0	R/W	Fixed α Value 1 These bits specify fixed α value 1 used when the CCMDY or ACMDY bits are set to 100b. A value from H’00 to H’FF can be specified.

33.3.2.11 LIF Control Registers

(1) LIF0 Control Register (VI6_LIF0_CTRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	OBTH [11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PADL	—	—	—	CFMT	—	—	REQSEL	LIF_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 16	OBTH [11:0]	0	R/W	Buffer Threshold for Start Ready Notification to Display Module Always specify 1500, when LIF_EN is set to 1.
15 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	PADL	0	R/W	Enable/Disable of padding with dummy lines to output-image to the DU. [LIF0 only] Enables or disables of padding with dummy lines to output-image to the DU. 0: Padding with dummy lines to output image to DU is disabled. 1: Padding with dummy lines to output image to DU is enabled.
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	CFMT	0	R/W	Chroma Format This bit selects the output format from the LIF module to the display module. When RGB format is used, this bit shall be set to 0. 0: YCbCr444 or RGB Format 1: YCbCr422 Format [Note] The DU cannot receive YCbCr422 format. Therefore, when CFMT is 1, YCbCr444 data which information contents is equal to YCbCr422 is output to DU as shown in **Figure 33.30**.
3, 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	REQSEL	0	R/W	External Display Module Selection 0: This value is setting prohibited when 1 is set to LIF_EN 1: DU is selected as the destination external display module.
0	LIF_EN	0	R/W	Enable/Disable of Data Output to External Display Module Enables or disables data output from the LIF to the external display module (DU). 0: Data output to the external display module is disabled. 1: Data output to the external display module is enabled.

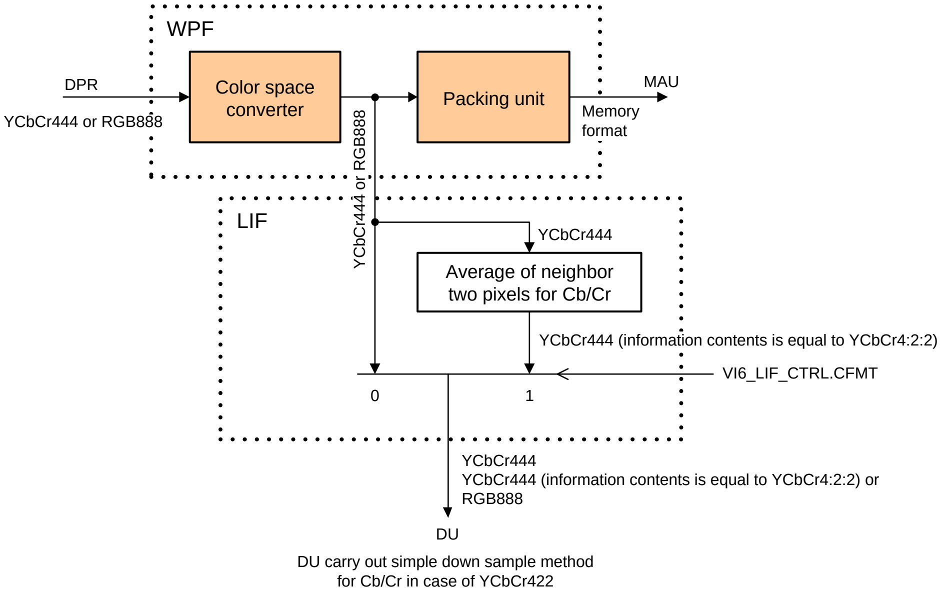

Figure 33.30 Data flow between LIF and DU

(2) LIF0 Clock Stop Buffer Control Register (VI6_LIF0_CSBTH)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	HBTH[11:0]

R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	LBTH[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 16	HBTH[11:0]	0	R/W	Buffer Threshold for Start Ready Notification to Display Module Always specify 1500, when LIF_EN is set to 1.
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	LBTH[11:0]	0	R/W	Buffer Threshold for Clock Start in Dynamic Clock Control Set LBTH[11:0] = 0 (fixed value)

(3) LIF0 Buffer Attribute Register (VI6_LIF0_LBA)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LBA0	—	—	—	LBA1[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	LBA2[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	LBA0	0	R/W	LIF Buffer Attribute Register0 Always specify 1, when LIF_EN is set to 1
30 to 28	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 16	LBA1[11:0]	0	R/W	LIF Buffer Attribute Register1 Always specify 1536, when LIF_EN is set to 1
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	LBA2[11:0]	0	R	LIF Buffer Attribute Register2 These bits are internal status for purpose of h/w debugging.

(4) LIF0 Padding Line Cycle Register (VI6_LIF0_PADLN_CYC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	PADLN_CYC[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5 to 0	PADLN_CYC [5:0]	0	R/W	Cycle of padding pattern. These bits specify the minimum number of cycles of the padding pattern of valid lines and dummy lines. For example, if PADLN_CYC[5:0] is 4, lower 4 bits of PADLN_PATTERN[3:0] indicates padding pattern. A value from 1 to 32 can be specified.

(5) LIF0 Padding Line Pattern Register (VI6_LIF0_PADLN_PT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PADLN_PAT TERN[31:0]	0	R/W	Pattern of padding with dummy lines These bits specify the padding pattern of valid lines and dummy lines. In each bit, 0b indicates an active line, 1b indicates a dummy line. It starts from the lower bit (Bit 0). First line should be valid line (Always set 0 to PADLN_PATTERN[0]).

(6) LIF0 Padding Line Value Register (VI6_LIF0_PADLN_VAL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PADA[7:0]								PADR[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PADG[7:0]								PADB[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	PADA[7:0]	0	R/W	Padding data of EDC code for dummy line.
23 to 16	PADR[7:0]	0	R/W	Padding data of R/Cr for dummy line.
15 to 8	PADG[7:0]	0	R/W	Padding data of G/Y for dummy line.
7 to 0	PADB[7:0]	0	R/W	Padding data of B/Cb for dummy line.

Note: Set H’24FFFFFF to the register, when output format is YUV422. Set H'2EFFFFFF to the register in other case.

(7) LIF0 Padding Line Size Register (VI6_LIF0_PADLN_SIZE)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	PADLN_VSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	PADLN_VSIZE[12:0]	0	R/W	Vertical Size of LIF output in case of enabling Padding line When VI6_LIF0_CTRL.PADL is 1, dummy lines are included in the output data from LIF, so set the LIF output VSIZE including dummy lines to these bits. If the number of output lines does not reach the value of PADLN_VSIZE [12:0] even if all valid lines are output according to padding pattern, dummy lines are inserted until the number of output lines reaches PADLN_VSIZE [12:0]. ● Output vsize of LIF is same with input vsize to LIF when VI6_LIF0_CTRL.PADL is 0 ● Output vsize of LIF is PADLN_VSIZE [12:0] when VI6_LIF0_CTRL.PADL is 1

33.3.3 DU Registers

33.3.3.1 DU Module Control Register 0 (DU_MCR0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PB_CLR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DI_EN	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	PB_CLR	0	R/W	Clear PBUF pointers. This parameter must be changed while VSPD is not running and DU_MSR0.ST_DIF_BSY is “0”. Writing “1”. to this parameter starts clearing the PBUF pointers. After clearing the PBUF pointers is completed, DU_MSR0.ST_PB_WINIT and DU_MSR0.ST_PB_RINIT are read as “1”, this parameter must be written back to “0”.
15 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	DI_EN	0	R/W	Display enable. 1: Enable 0: Disable
7 to 1	—	All 0	R	Reserved
0	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

33.3.3.2 DU Module Status Register 0 (DU_MSR0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	ST_PB_RINIT	ST_PB_RUF	ST_PB_REMPTY	—	ST_PB_WINIT	—	ST_PB_WFULL
Initial Value	0	0	0	0	0	0	0	0	0	1	0	1	0	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ST_DI_BSY	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	ST_PB_RINIT	1	R	PBUF FIFO read pointer cleared status. 1: Cleared (initial value) 0: Not cleared
21	ST_PB_RUF	0	R	PBUF read underflow status. This parameter clears when PBUF pointers are cleared. 1: Occur PBUF underflow 0: Not occur PBUF underflow
20	ST_PB_REMPTY	1	R	PBUF read empty status. 1: Empty 0: Not empty
19	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	ST_PB_WINIT	1	R	PBUF FIFO write pointer cleared status. 1: Cleared (initial value) 0: Not cleared
17	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	ST_PB_WFULL	0	R	PBUF write full status. 1: Full 0: Not full
15 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	ST_DI_BSY	0	R	Display I/F status. 1: Busy 0: Idle
7 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

33.3.3.3 DU Module Status Register 1 (DU_MSR1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	UF_VACT												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	UF_HACT												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	UF_VACT	H’0000	R	Vactive counter when the PBUF underflow occurs. This parameter is value latched the down counter starting from VACTIVE. This parameter is cleared when DU_MSR0.ST_PB_RUF is cleared.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	UF_HACT	H’0000	R	Hactive counter when the PBUF underflow occurs. This parameter is value latched the down counter starting from HACTIVE. This parameter is cleared when DU_MSR0.ST_PB_RUF is cleared.

33.3.3.4 DU Interrupt Mask Register 0 (DU_IMR0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IM_PB_RUF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	IM_PB_RUF	0	R/W	Mask PBUF read underflow interrupt. 1: Mask interrupt 0: Not mask interrupt

33.3.3.5 DU Display I/F Timing Register 0 (DU_DITR0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HSPOL	VSPOL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DEMD		—	—	—	—	—	—	—	DPI_CLKMD
Initial Value	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	HSPOL	1	R/W	hsync polarity. 1: High active 0: Low active
16	VSPOL	1	R/W	vsync polarity. 1: High active 0: Low active
15 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9, 8	DEMD	11b	R/W	de output mode. 00: Fixed to Low 01: Reserved 10: Reserved 11: Data enable (High active)
7 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	DPI_CLKMD	0	R/W	Display parallel interface clock mode. 0: Through output 1: Inversion output

33.3.3.6 DU Display I/F Timing Register 1 (DU_DITR1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	VACTIVE												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	VSA											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	VACTIVE	H’0000	R/W	The number of lines in the Vactive period. This parameter should be more than 0.
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	VSA	H’000	R/W	The number of lines in the Vsync period. This parameter should be 0 or more, and DU_DITR1.VSA + DU_DITR2.VBP should be more than 0. If set 0, Vsync is not asserted to DU_DITR0.VSPOL.

Figure 33.31 shows the relationship between the parameters and the video output timings.

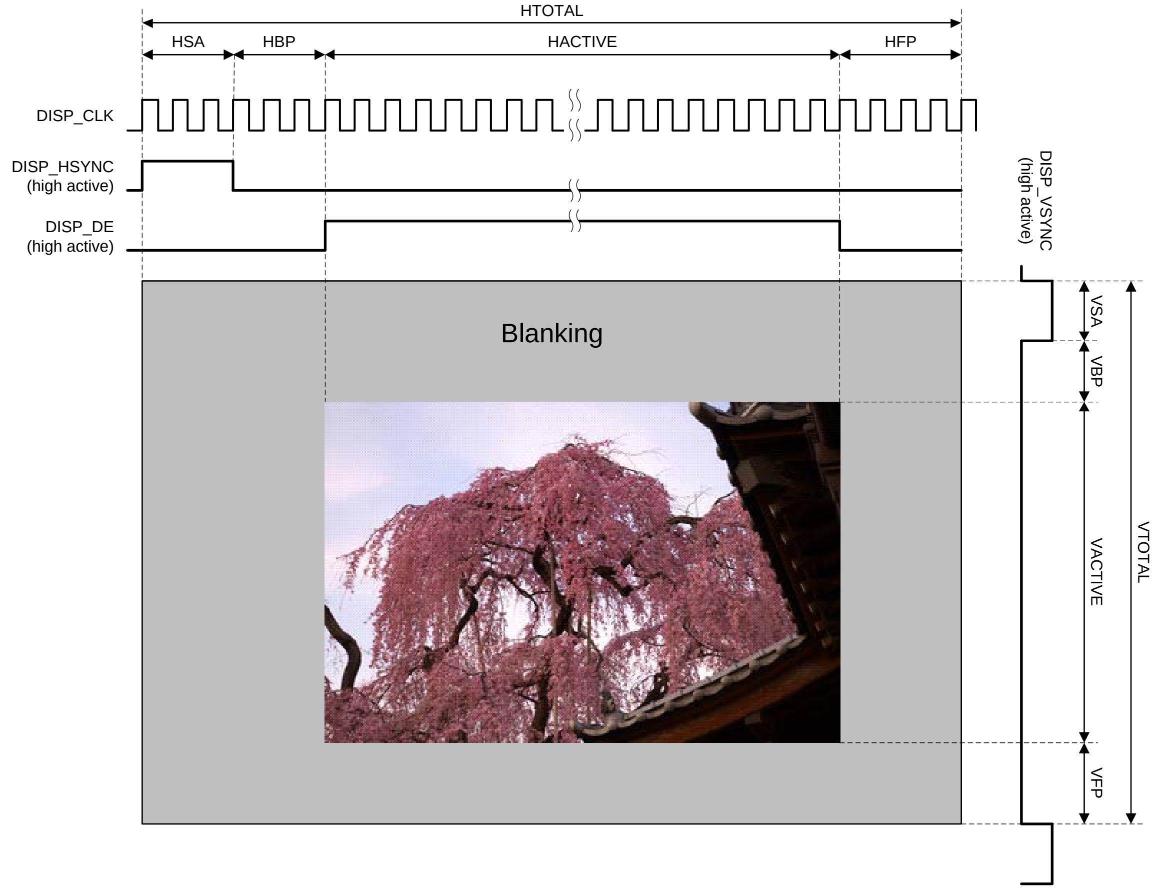

Figure 33.31 Video output timings

33.3.3.7 DU Display I/F Timing Register 2 (DU_DITR2)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	VFP												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	VBP												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	VFP	H’0000	R/W	The number of lines in the Vfront period. This parameter should be 0 or more.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	VBP	H’0000	R/W	The number of lines in the Vback period. This parameter should be 0 or more, and DU_DITR1.VSA + DU_DITR2.VBP should be more than 0.

33.3.3.8 DU Display I/F Timing Register 3 (DU_DITR3)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	HACTIVE												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	HSA											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	HACTIVE	H’0000	R/W	The number of cycles (pixels) in the Hactive period. This parameter should be more than 0.
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	HSA	H’000	R/W	The number of cycles in the Hsync period. This parameter should be 0 or more, and DU_DITR3.HSA + DU_DITR4.HBP + DU_DITR4.HFP (=Hblank) should be 3 or more. If set 0, Hsync is not asserted to DU_DITR0.HSPOL.

33.3.3.9 DU Display I/F Timing Register 4 (DU_DITR4)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	HFP												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	HBP												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	HFP	H’0000	R/W	The number of cycles in the Hfront period. This parameter should be 1 or more, and DU_DITR3.HSA + DU_DITR4.HBP + DU_DITR4.HFP (=Hblank) should be 3 or more.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	HBP	H’0000	R/W	The number of cycles in the Hback period. This parameter should be 0 or more, and DU_DITR3.HSA + DU_DITR4.HBP + DU_DITR4.HFP (=Hblank) should be 3 or more.

33.3.3.10 DU Module Control Register 1 (DU_MCR1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PB_AUTOCLR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OPMD	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	H'0000	R	Reserved When read, the initial value is read. The written value will be ignored.
16	PB_AUTOCLR	0	R/W	PBUF pointers auto clear enable. Specify timing to clear the PBUF pointers. 0: Not clear until DU_MCR0.PB_CLR is asserted. 1: Clear during blanking (according DU_MCR1.OPMD).
15 to 9	—	H'00	R	Reserved When read, the initial value is read. The written value will be ignored.
8	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
7 to 2	—	H'00	R	Reserved When read, the initial value is read. The written value will be ignored.
1, 0	OPMD	All 0	R/W	Operation mode Specify behavior of LIFC and PBUF during Vfront and Hfront period. This parameter must be changed while VSPD is not running. 00: After frame end, LIFC wait, and PBUF pointers are cleared if DU_MCR1.PB_AUTOCLR is set to "1". 01: After line end, LIFC wait, and PBUF pointers are cleared if DU_MCR1.PB_AUTOCLR is set to "1". 10: Reserved 11: LIFC always request to VSPD.PBUF pointers are not cleared until DU_MCR0.PB_CLR is set to "1".

33.3.3.11 DU PBUF Control Register 0 (DU_PBCR0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

33.4 Operation

33.4.1 Operation Control Setting

(a) To start image process

FCPVD registers do not need to be set when starting an image process. Therefore, refer the **Section 33.4.4** for the guidance of starting an image process.

33.4.2 Reset Operation

FCPVD reset can be conducted by power on reset. Power on reset initializes the whole FCPVD logic immediately.

33.4.2.1 Power-on Reset, Hardware reset

The power-on reset is controlled by an externally input signal called hardware reset. This reset initializes the whole internal logic of LCDC.

33.4.3 Registers to set fixed value

Set fixed value to following registers in any case.

[1] Always set H’0000 0808 to VI6_CLK_DCSWT

[2] Always set D’256 to VI6_DL_CTRL.AR_WAIT [7:0] in case of using display list.

[3] Always set D’2 to VI6_DL_EXT_CTRLn.POLINT [5:0] in case of using extended display list of WPFn.

[4] Always set D’1 to VI6_DL_EXT_CTRLn.DLPRI in case of using extended display list of WPFn.

[5] Always set D’0 to VI6_DL_EXT_CTRLn.EXPRI in case of using extended display list of WPFn.

[6] Always set H’0000 0500 toVI6_DPR_WPFn_FPORCH (n = 0, 1) in case of using WPFn.

[7] Always set D’1500 to VI6_LIF0_CTRL.OBTH [11:0] in case of using LIF (VI6_LIF0_CTRL.LIF_EN = 1).

[8] Always set H’8600 0000 to VI6_LIF0_LBA in case of using LIF0 (VI6_LIF0_CTRL.LIF_EN = 1).

[9] Always set D’1 to VI6_LIFn_CTRL.REQSEL in case of using LIFn (VI6_LIFn_CTRL.LIF_EN = 1).

[10] Always set D’0 to VI6_LIFn_CSBTH in case of using LIFn (VI6_LIFn_CTRL.LIF_EN = 1).

[11] Always set H'1F to DU_PBCR0 in case of using DU (DU_MCR0.DI_EN = 1).

33.4.4 Concept of VSPD Operation Starting and Stopping

The VSPD provides one channel of image processing. Each channel is started by setting the corresponding start register. Here, starting a processing channel means starting one of WPF0, which are output modules of the VSPD. Use the start registers shown in **Table 33.29** to start WPF modules.

After a WPF module is started and specified processing is completed, the corresponding channel stops operation and notifies the end of processing through an end interrupt. End interrupts are generated through the end interrupt source registers shown in **Table 33.29**; clearing a source register cancels the corresponding interrupt signal. Each of the operating status registers shown in the table indicates the busy state after the corresponding channel is started through the start register until processing is completed and operation stops. **Figure 33.32** shows these operation timings.

Table 33.29 Target Module and Corresponding Registers for Starting and Stopping Operation

Target Module	Start Register	End Interrupt Source Register	Operating Status Register
WPF0	VI6_CMD0.STRCMD	VI6_WPF0_IRQ_STA. FRE	VI6_STATUS.SYS0_ACT

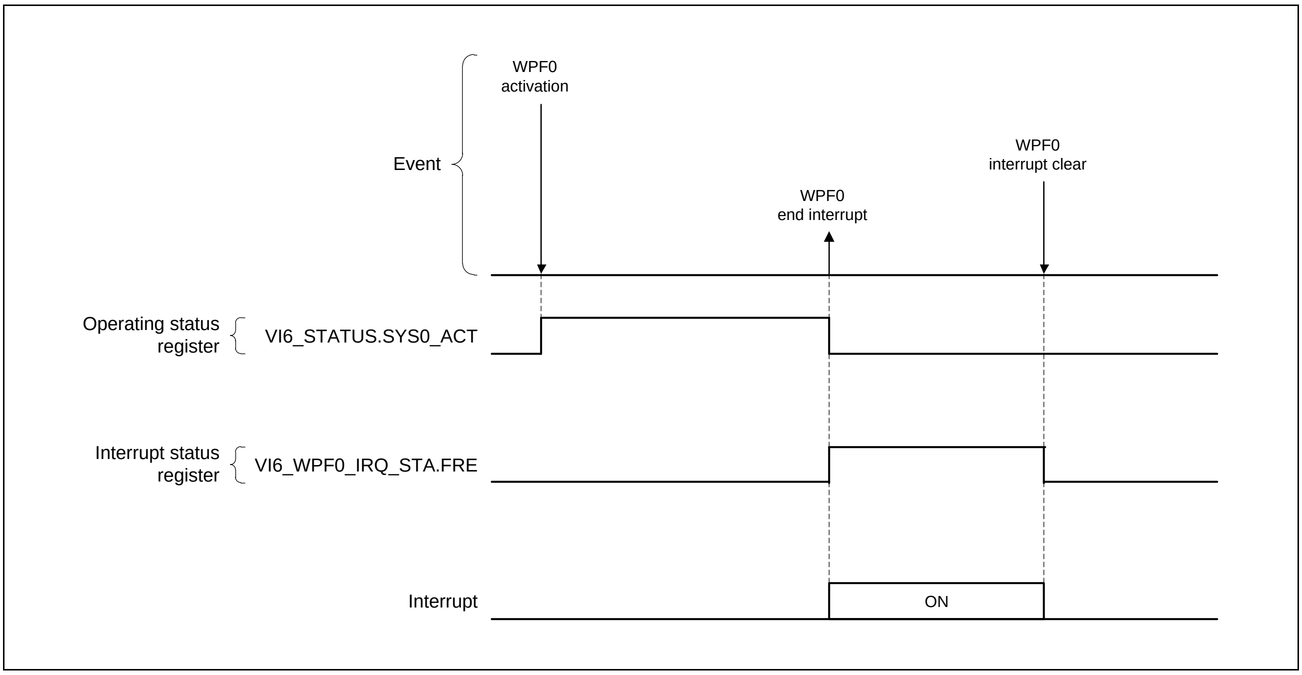

Figure 33.32 VSPD Startup and Status of Each Register and Interrupt

The following describes the operating states (operating or stopped) of VSPD internal modules. As described in **Section 33.3.2**, the VSPD has several image processing modules and the connections between modules are determined by the DPR. Accordingly, the operating state of a module is the same as that of the target WPF for that module. For example, when the target WPF for the BRS is WPF0, the BRS operating state is the same as that of WPF0; that is, the BRS operating state is indicated by the VI6_STATUS.SYS0_ACT as shown in **Table 33.29** and the status change timing is shown as VI6_STATUS. SYS0_ACT in **Figure 33.32**. Likewise, the operating states of all modules connected to WPF0 is indicated by VI6_STATUS. SYS0_ACT.

Connections should be changed through the DPR-related registers (described later) while all modules to be affected by any change in connections are stopped. If connections through the DPR are changed during operation, the VSPD will hang.

Figure 33.33 shows relation between start reservation and operating status. When start is reserved while VSPD is operating, the reservation is accepted after VSPD status is moved from “operating” into “idle” as shown in **Figure 33.33**.

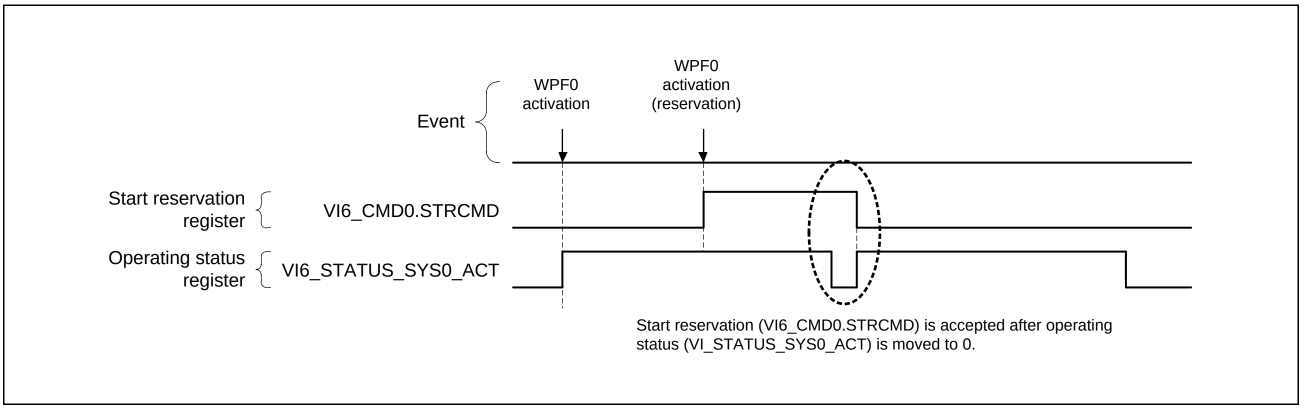

Figure 33.33 VSPD Start reservation and Operating status

33.4.5 Display List

33.4.5.1 Functional Description

The VSPD provides the display list function. As a display list, the VSPD automatically downloads the register settings except for the control registers (**Sections 33.3.2.4** and **Section 33.3.2.5**) from external memory and stores the settings in the VSPD registers. This function is advantageous in that the interrupt processing or register setting modification processing can be executed without CPU intervention during multiple-frame processing because the register settings used for VSPD processing are prepared in advance in external memory such as SDRAM.

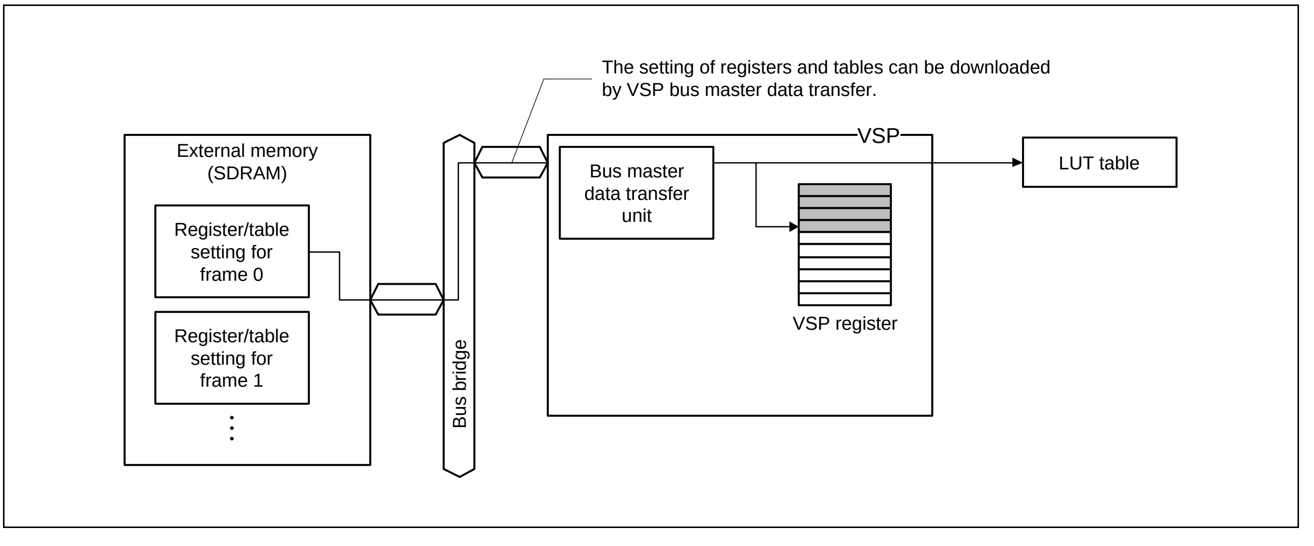

Figure 33.34 Concept of Display List

To use display lists, specify the external memory addresses to the display list control registers described in **Section 33.3.2.5**. The register settings or various types of information should be stored in external memory in the format described in **Section 33.4.5.2**. **Figure 33.35** shows the difference between VSPD operation through normal register settings and through display lists.

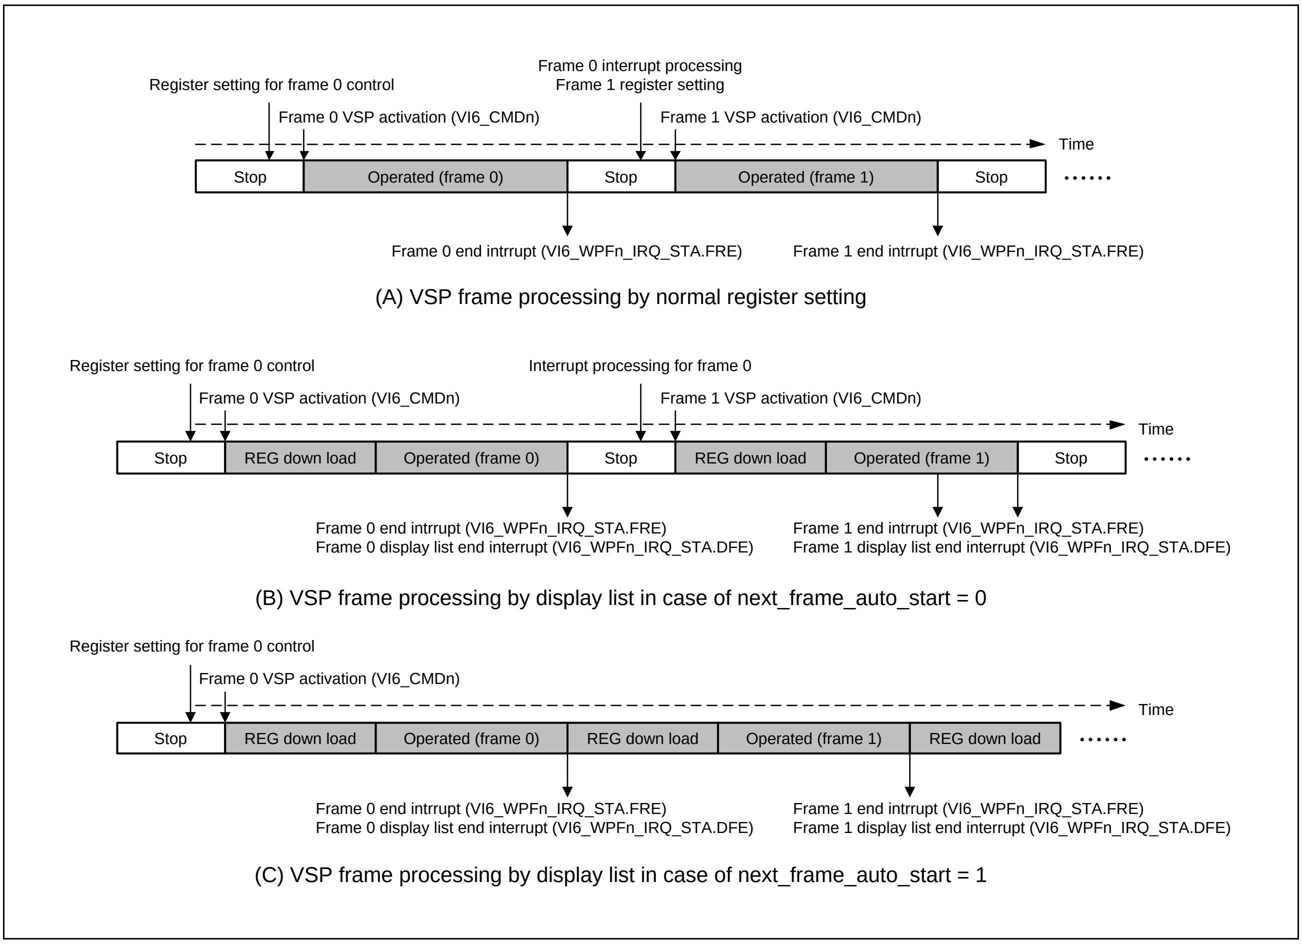

Figure 33.35 Comparison of VSPD Operation between Normal Register Settings and Display Lists

As shown in **Figure 33.35** (A), in the VSPD processing through normal register settings, all registers should be set up before the VSPD is started for each frame. After the VSPD processing is completed, the VSPD outputs a frame end interrupt (VI6_WPFn_IRQ_STA.FRE). This method requires a certain amount of time for register settings or interrupt processing by the CPU between frames. In contrast, when display lists are used, the VSPD automatically downloads register settings from external memory as shown in **Figure 33.35** (B) and (C), which reduces the load on the CPU between frames.

Figure 33.35 (B) shows the display list usage where the VSPD stops at the end of every frame; only the VSPD start processing for each frame is done by the CPU. This is suitable for the cases when the CPU controls synchronization of frame processing in frame buffer management or when the amount of register values or table data to be set in the VSPD is large. In the case shown in **Figure 33.35** (C), as soon as the frame processing ends, the VSPD automatically begins next frame operation and starts downloading new register settings. This is the fastest operation using display lists.

Table 33.30 shows the modes of the display list and the supported functions for each mode. The detail of each mode is described in the following sections.

Table 33.30 Display list mode and supported functions

Mode	Extended Display List	Continuous Frames
Normal Display List Mode	Supported	Controlled by “next frame auto start” in the header of the display list.
Header-less Display List Mode	Not Supported	Controlled by VI6_DL_CTRL.CFM0 bit.

33.4.5.2 Normal Display List Mode

The VSPD display lists include control information as well as simple register settings in order to control multiple-frame processing in an optimum way for each application. **Figure 33.36** shows the display list structure.

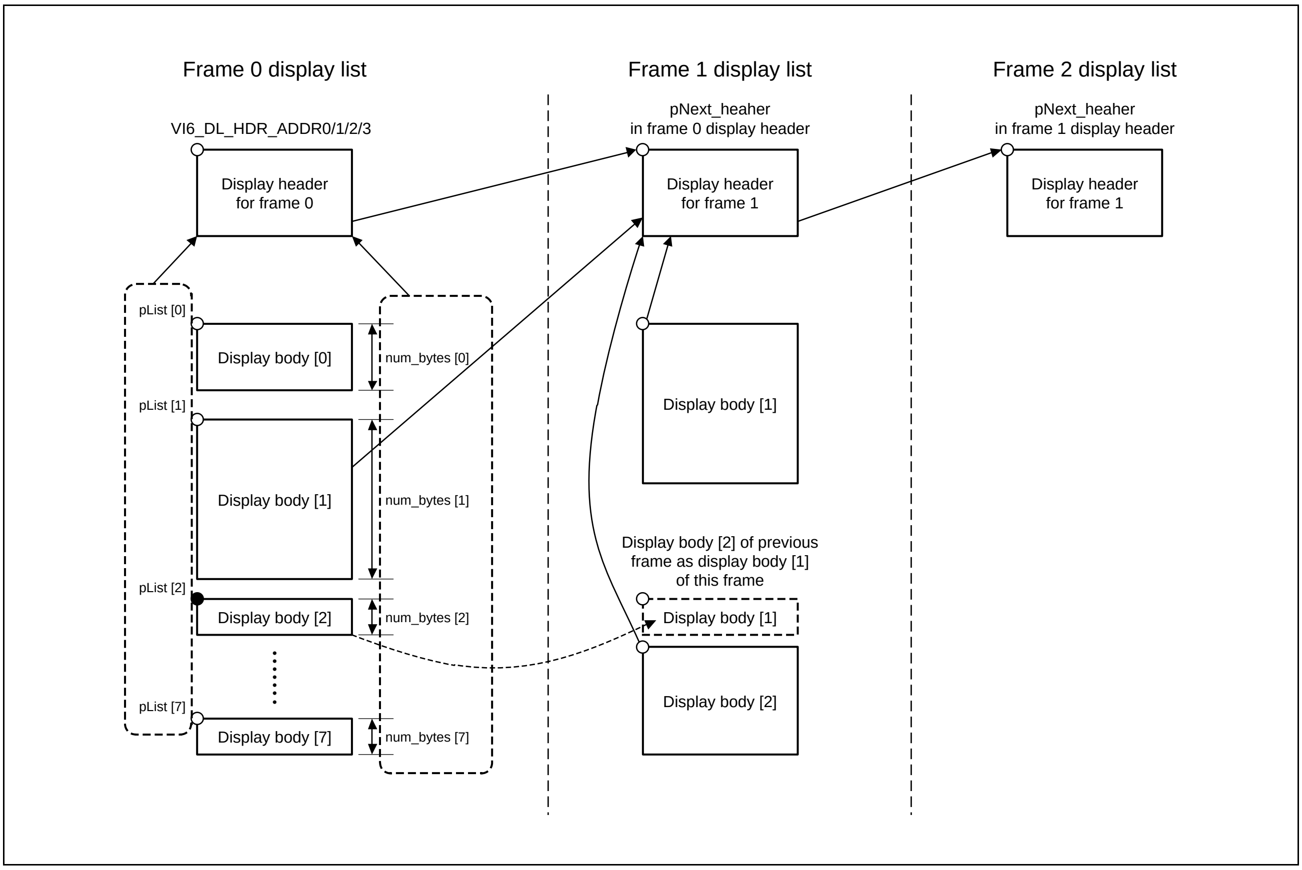

Figure 33.36 Structure and Concept of VSPD Display List

A VSPD display list consists of two sections; a header section for storing various information and control flags and a body section for storing register and table settings. A combination of these two sections is defined as a display list for a frame. The register and table settings can be divided and stored in up to eight separate bodies allocated in memory. Therefore, the separate bodies storing the register settings for one frame (for example, frame 0) can have non-sequential start addresses; that is, the bodies for one frame can be allocated to areas distant from each other in memory. To gather these bodies and configure the register settings for one frame, a header is used. A display header stores the number of bodies linked with the header and the start address and size of each body.

The VSPD analyzes the header to gather register and table settings stored in separate memory areas and reconfigures the complete register settings.

The addresses of display headers should be specified in the VSPD registers described in **Section 33.3.2.5**. When activated in a mode that uses display lists, the VSPD downloads display headers from the addresses specified in VI6_DL_HDR_ADDR0 (number 0 correspond to the WPF channel index numbers), analyzes the numbers of bodies and the address and data size of each body, downloads the bodies, and completes register and table settings. After display list downloading is completed, the VSPD becomes ready for frame image processing; the VSPD then starts the actual frame processing.

After processing of a frame ends, the VSPD proceeds to the next frame processing. Here, there are two modes for starting the next frame processing as shown in **Figure 33.35**. In one mode, the VSPD stops operation and waits for the next activation by the CPU in the same way as when display lists are not used. In this mode, the address used for downloading the display header of the next frame is kept by the internal hardware. Therefore, if valid address information is not stored in the display header for the previous frame, a correct value should be specified in VI6_DL_HDR_ADDR0 while the VSPD is stopped. When the VSPD is started after a correct value is specified, the VSPD starts next frame processing with the same procedure for the previous frame. In contrast to this mode, which stops the VSPD after the end of one-frame processing, there is another mode for automatically starting next frame processing. In automatic start mode, the VSPD downloads the next display header as soon as the previous frame processing ends. After downloading ends, the VSPD starts image processing. The information regarding mode selection, that is, whether to automatically start next frame processing, should be stored in the display header downloaded for the previous frame.

In the automatic start mode, the VSPD continues processing until the display header for a frame specifies that the next frame should not be started automatically. To stop processing during automatic execution, use a software reset (VI6_SRESET).

To strictly define the display list format described above, the following shows the grammatical structure of a display list using pseudo-code. First, to simplify the description of the display list format in the following pages, **Table 33.31** defines a function. Function zero bits (num bits) generates a string of one-bit 0s for the number of bits specified by the parameter for the function. By using this function, **Table 33.32** defines the header section format of a display list and **Table 33.33** defines the body section format and **Table 33.34** defines the extended display list body section format.

Data order of Display List Header Section, Display List Body Section and Extended Display List Body Section are assumed as the data is stored in SDRAM by big endian. **Table 33.35** shows an example of data order. If data order is not same as the definition, data order within 8byte unit can be adjusted by setting VI6_DL_SWAP (see the **Section 33.3.2.5(3)**).

Table 33.31 Definition of a Function for Simple Description

Syntax	Bit Count
zero_bits (num_bits)	
{	
for (i = 0; i<num_bits; i++) {	
zero_bit	1
}	
}	

Bit String	Contents
zero_bit	zero_bit indicates a 1-bit integer having a value of 0.

Table 33.32 Format of Display List Header Section

Syntax	Bit Count
display_header () /* Fixed length */	
{	
zero_bits (29)	
num_list_minus1	3
for (i=0; i<8; i++)	
zero_bits (15)	
num_bytes [i]	17
pList [i]	32
}	
pNext_header	32
zero_bits (23)	
wait_wup	1
zero_bits (3)	
ignore_upd_dl	1
zero_bits (2)	
current_frame_int_enable	1
next_frame_auto_start /* 76 bytes from the beginning of this header*/	1
if (VI6_DL_EXT_CTRL.EXT) {	
zero_bits (32) /* padding zero 4 bytes for alignment */	
zero_bits (6)	
pre_ext_dl_exec	1
post_ext_dl_exec	1
zero_bits (8)	
pre_ext_dl_num_cmd	16
pre_ext_dl_pList	32
zero_bits (16)	
post_ext_dl_num_cmd	16
post_ext_dl_pList /* 96 bytes from the beginning of this header*/	32
}	
}	

Bit String	Contents
num_list_minus1	Specifies the value obtained by subtracting 1 from the total number of display list bodies linked with the display header. For example, when this bit field is set to 0, this display list uses one body.
num_bytes [i]	Specifies the number of bytes in the i-th display list body (indicated by index i). Be sure to specify a multiple of eight bytes. For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0.
pList [i]	Specifies the start address of the i-th display list body (indicated by index i). Be sure to specify an address aligned with an 8-byte boundary (the lower-order three bits are 0). For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0.
pNext_header	Specifies the address of the display list header for the next frame. After display list downloading ends, the VSPD keeps its value in the internal memory and uses it in the next display list header downloading. Be sure to specify an address aligned with an 8-byte boundary (the lower-order three bits are 0).
wait_wup	When this bit is 1, VSPD starts reading image data from external memory after WUP (Wake Up) signal from any channel of VIN asserts. This bit is available for WPF0.
ignore_upd_dl	If this bit is set to 1, new display list pointed by VI6_DL_HDR_ADDR0 is not downloaded in VSPD H/W for the next frame, even if S/W sets VI6_DL_HDR_ADDR0 during the frame. New display list is downloaded in VSPD H/W at next frame of the processing which this bit is 0. This bit is available for WPF0.
current_frame_int_enable	This is a flag that indicates whether to set the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) to 1 when the current frame processing ends. If this flag is set to 0, the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) is not set to 1 when one-frame processing by this display header ends. In this state, even if the display list end interrupt is enabled (VI6_WPFn_IRQ_ENB.DFEE is set to 1), no interrupt will be generated. If this flag is set to 1, the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) is set to 1 when one-frame processing by this display header ends. In this state, if the display list end interrupt is enabled (VI6_WPFn_IRQ_ENB.DFEE is set to 1), the VSPD generates an interrupt.
Next_frame_auto_start	Enables or disables automatic start of next frame processing when one-frame processing by this display header ends. If this bit is set to 1, the VSPD starts next frame processing as soon as one-frame processing by this display header ends, and starts downloading the next frame display header from the pNext_header address specified in this display header. If this bit is set to 0, the VSPD stops operation when one-frame processing by this display header ends. In this case, start the VSPD through VI6_CMDn to process the next frame.
pre_ext_dl_exec	Enables execution of the extended display list for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. If this bit is set to 1, the VSPD executes the extended display list for frame preprocessing. The VSPD does not execute it if this bit is set to 0. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
post_ext_dl_exec	Set 0 to this bit.
pre_ext_dl_num_cmd	Specifies the number of commands in the extended display list body section for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. The number of commands that can be specified is 1, and a command is 16 bytes. When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
pre_ext_dl_pList	Specifies the start address of the area where the extended display list body section for frame preprocessing is stored when VI6_DL_EXT_CTRL.EXT is 1. Be sure to specify an address aligned with a 16-byte boundary (lower-order four bits are 0). When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
post_ext_dl_num_cmd	Set 0 to this bit.
post_ext_dl_pList	Set 0 to this bit.

Table 33.33 Format of Display List Body Section

Syntax	Bit Count
display_list (num_bytes) /* Variable length (num_bytes) */	
{	
for (i =0; i<num_bytes; i+=8) {	
set_address	32
set_data	32
}	
}	

Bit String	Contents
set_address	Specifies the address where the value specified by set_data is to be stored. Specify a register address. Note : Register space of VSPD is 32Kbyte (H'0000 - H'7FFC). So, set 0 to upper 17bit of set_address in Display List Body Section.
set_data	Specifies the value to be stored in the address specified by set_address. Specify a value to be set in a register.

pList + 15	set_data [1] (bit7-0)
~~	~~~

33.4.5.3 Header-less Display List Mode

The header-less display list does not have the display header listed in **Table 33.32**, and it has the simplest structure that has only single body. The extended display list function is not available in case of the header-less display list mode. Set the value 1 to VI6_DL_CTRL.NH0 (see the **Section 33.3.2.5(1)**) to use the header-less display list. The start address downloaded by the header-less display list should be set to VI6_DL_HDR_ADDR0. And the size of the display body which is originally defined in the display header should be set to VI6_DL_BODY_SIZE0. The header-less display list is available only in WPF0.

33.4.5.4 Restrictions on Display List Usage

Access to the general control registers and display list control registers through a display list is prohibited. When using display lists, be sure to observe the following restrictions on register access by the CPU.

1. Do not execute write access to the same register (same address) from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSPD is not guaranteed.
2. Do not execute write access to the same LUT lookup table from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSPD is not guaranteed. Here, the same lookup table means the address space having the same space name shown in **Table 33.36**.
3. When read access by the CPU and write access through a display list to the same register (same address) occur at the same time, the read value returned to the CPU is not guaranteed.
4. When read access by the CPU and write access through a display list to the same LUT lookup table occur at the same time, the read value returned to the CPU is not guaranteed. Here, the same lookup table means the address space having the same space name shown in **Table 33.36**.
5. For other restrictions on values and timing of register setting through display lists, refer to the restrictions on normal register settings described in **Section 33.3.2.3**.

6. Manipulation and setting of the registers described in **Section 33.3.2.4** and **Section 33.3.2.5** through a display list is prohibited.
7. The extended display list function enabled by VI6_DL_EXT_CTRL.EXT is to control the registers of the ICB connected with the VSPD. Do not use extended display lists for any other purpose.

33.4.6 Interrupt Processing

When a WPF module generates an internal source that should be notified, an interrupt signal is output. As internal sources are generated in WPF independently, the VSPD has the following registers to control interrupts in WPF.

WPFn Interrupt Enable Registers (VI6_WPFn_IRQ_ENB: n = 0) (refer to **Section 33.3.2.4(12)**)

WPFn Interrupt Status Registers (VI6_WPFn_IRQ_STA: n = 0) (refer to **Section 33.3.2.4(13)**)

CAUTION

To use interrupts, enable them through WPF interrupt enable registers. If an interrupt source register has already been set to 1 for some reason, an unintended interrupt will occur as soon as the corresponding interrupt enable register is set as enabled. To avoid this, before enabling interrupts through WPF interrupt enable registers, be sure to clear all WPF interrupt sources to be enabled to 0. Be careful about this procedure when setting up registers before starting the VSPD.

33.4.7 Lookup Table Settings

33.4.7.1 LUT

For a single entry to the LUT space (see **Table 33.36**) of the VSPD, the LUT data is set by a write access in the format shown in **Figure 33.37**.

The entry address of each space is (start address of the space) + (entry number counting from the base point 0 × 4). For example, the address of entry 7 to the LUT space is (offset address) + H’7000 + 7 × 4 = (offset address) + H’701C.

Table 33.36 shows the spaces for which entries can be made. Note that if the module that references that space is operating, write accesses to the relevant space are prohibited. For example, while RPF2 is operating, accesses to the entire space of VI6_CLUT2_TBL are prohibited. When a read access is made to the relevant space during operation of the referencing module, undefined values will be read out.

The operating/stopped state of each module in **Table 33.36** is the operating state of the WPF to which each module is connected. Determine whether the module is operating or stopped using each WPF operating status bit in the VI6_STATUS register.

Table 33.36 LUT Space Addresses

Space Name	Space Addresses	Entry Count	Module that References the Space in the Left Column
VI6_LUT_TBL	(offset address) + H’7000 to (offset address) + H’73FC	256	LUT

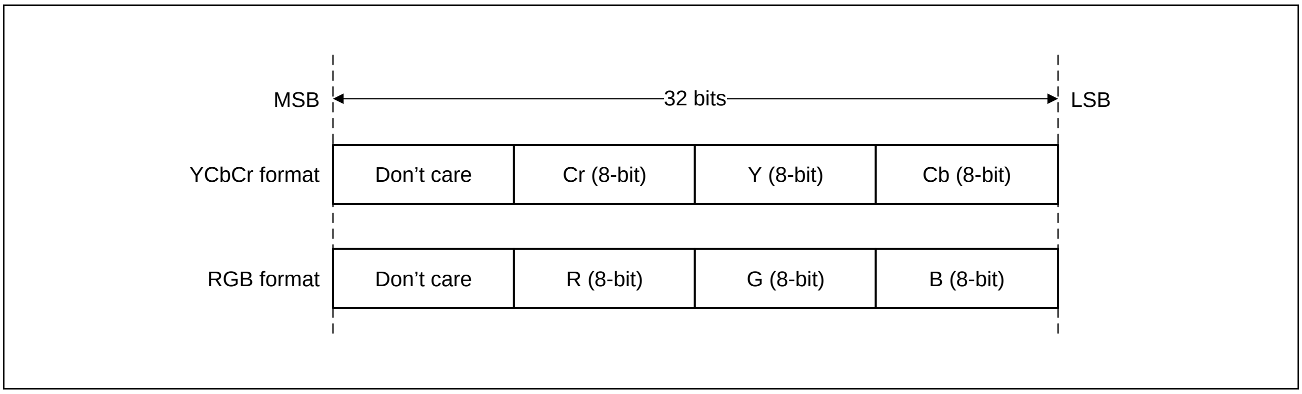

Figure 33.37 VI6_LUT_TBL Formats

33.4.8 Linked with DU

33.4.8.1 Operation flow of VSPD and DU

This section shows operation flow of VSPD by using Normal Display List Mode. For details of Normal Display List Mode, refer to **Section 33.4.5.2**.

Figure 33.38 and **Figure 33.39** shows a procedure (register setting flow) to display image data to display panel.

Figure 33.38 shows setting flow to start VSPD/LIF0 linked with DU. **Figure 33.39** shows setting flow to update display image.

Using display list with enabling next_frame_auto_start shown in **Section 33.4.5** is required to take the flow from **Figure 33.38** and **Figure 33.39**.

NOTE

If display sync operation ([1-8] step in **Figure 33.38**) is set before activating the VSPD, invalid data is displayed until image data read from external memory is ready to be transferred to DU. In this case, image data from external memory is displayed late by one vsync or more.

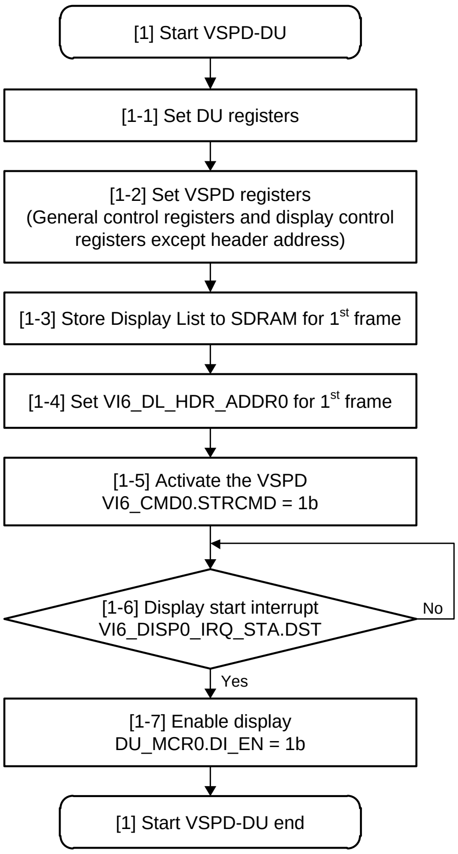

Figure 33.38 Setting flow to start VSPD linked with DU

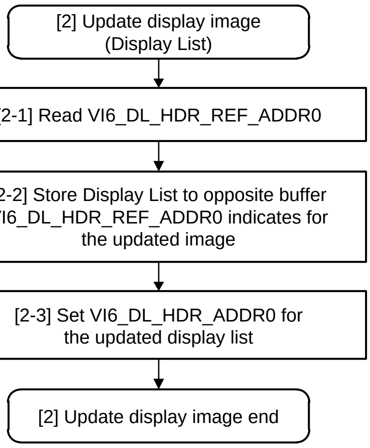

Figure 33.39 Setting flow to update display image

It is possible to update display list at any time (arbitrary timing) as shown in **Figure 33.39**. Don’t overwrite display list in external memory pointed by VI6_DL_HDR_REF_ADDR. It is because VSPD is reading the display list pointed by VI6_DL_HDR_REF_ADDR or will be reading the display list soon.

Detail explanation is shown below.

As shown in **Section 33.3.2.5(6)**, when VSPD is reading display list from external memory (Period [A] in **Figure 33.40**), VI6_DL_HDR_REF_ADDRn indicates header address of the display list referred by VSPD. When VSPD is not reading display list from external memory (Period [B] in **Figure 33.40**), VI6_DL_HDR_REF_ADDRn indicates the value of VI6_DL_HDR_ADDRn, and there is possibility that the display list is being read soon by VSPD at next frame start timing. Therefore, keep display list in external memory pointed by VI6_DL_HDR_REF_ADDR. Detail software sequence to update display list and VSPD -H/W behavior are shown below.

[1] Store latest display list in external memory area different from the area pointed by VI6_DL_HDR_REF_ADDR, because the area pointed by VI6_DL_HDR_REF_ADDR is being read or is being read soon by VSPD.

[2] Set header address of new display list into VI6_DL_HDR_ADDRn.

[3] VSPD reads display list from the external memory area pointed by VI6_DL_HDR_ADDRn at frame start timing.

Refer also to **Section 33.3.2.5(2)** and **Section 33.3.2.5(6)**.

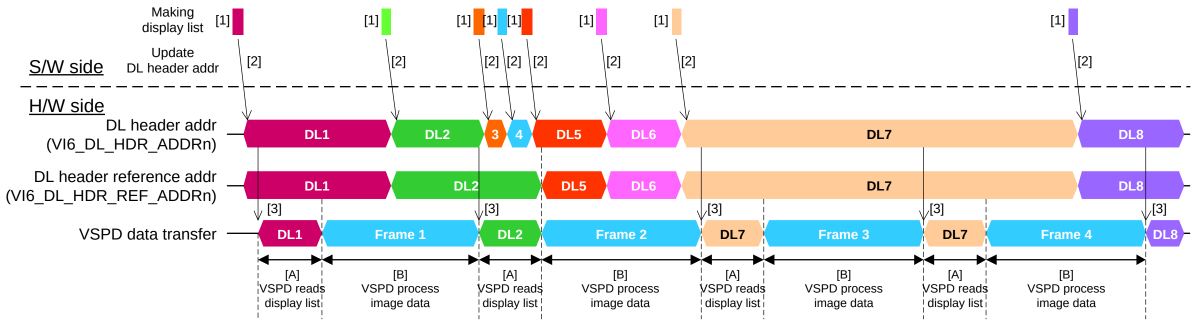

Figure 33.40 Updating display list at arbitrary timing

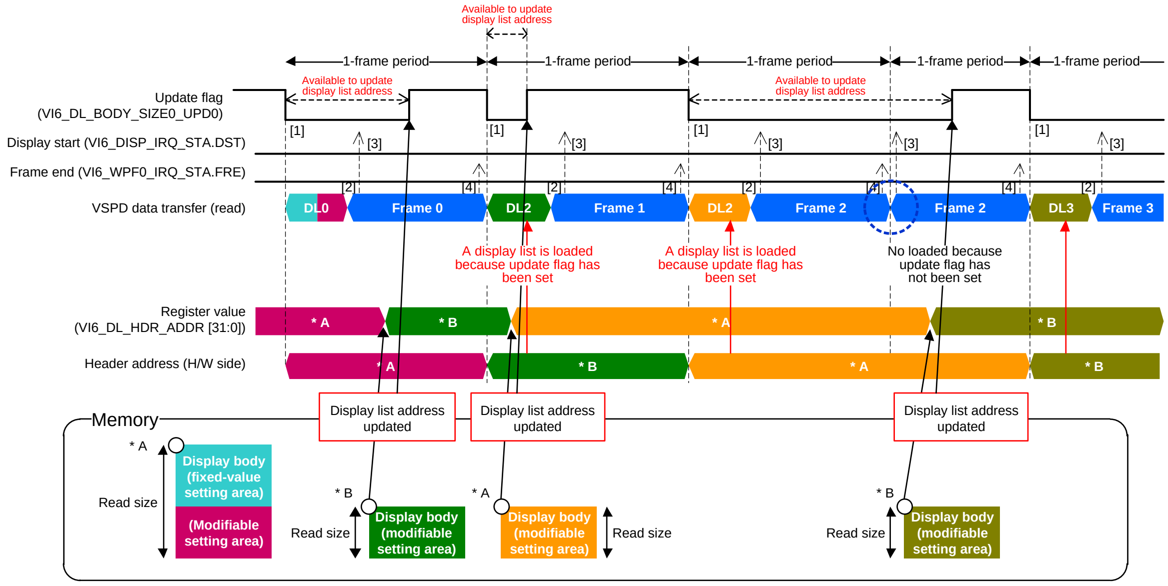
33.4.8.2 Controlling Two Register Planes Using Display Lists

This section shows operation flow of VSPD by using Header-less Display List Mode. Start procedure and stop procedure are same with Normal Display List Mode in **Section 33.4.8.1** except for the point that VI6_DL_BODY_SIZE0 should be set before step [1-5] in start procedure shown in **Figure 33.38**. The procedure to update display list is different with Normal Display List Mode, and is described later. **Figure 33.41** shows the control of two register planes using header-less display lists (see **Section 33.4.5.3**) and its timing. In the description hereafter, the use of header-less display lists is always assumed and they are simply called display lists.



Display list plane A: “Fixed-value settings” and “modifiable settings” are stored as a set in contiguous area A.
Display list plane B: Only the “modifiable settings” are stored in area B, which is separate from display list A.

To switch settings for every frame, modify two display list planes alternately. After every modification, update the display list address register (VI6_DL_HDR_ADDR0 [31:0]) and writing 1 to update flag (VI6_DL_BODY_SIZE0.UPD0) in the VSPD.
Update flag (VI6_DL_BODY_SIZE0.UPD0) is negated automatically after header address is loaded into H/W side.

Figure 33.41 Controlling Two Register Planes Using a Display List

The VSPD downloads a display list immediately after activation. In the start frame, download the display list that contains all necessary settings. From the next frame on, only the necessary register or table values should be specified in a display list.

When the update flag of VI6_DL_BODY_SIZE0.UPD0 is set to 1, VSPD downloads a new display list at the start of the next frame. When the update flag of VI6_DL_BODY_SIZE0.UPD0 is set to 0, the register settings acquired from the display list previously downloaded are retained and used for the next operation without downloading a new display list.

Order of each VSPD -H/W Events mentioned as [1], [2], [3] and [4] in **Figure 33.41** are shown below.

[1] VI6_DL_BODY_SIZE0.BS0 and VI6_DL_HDR_ADDR0 are downloaded in H/W side. And Update Flag (VI6_DL_BODY_SIZE0.UPD0) is negated automatically.

[2] Reading DisplayList from external memory into VSPD -H/W is finished through master access.

[3] Display start interrupt status (VI6_DISP_IRQ_STA.DST) asserts.

[4] Frame end interrupt status (VI6_WPF0_IRQ_STA.FRE) asserts.

Don’t overwrite the display list in external memory for a period from “[4] VI6_WPF0_IRQ_STA.FRE” to next “[3] VI6_DISP_IRQ_STA.DST”, because VSPD is reading the display list for the period.

33.5 Usage Note

33.5.1 Assignment in Memory Space

Make sure that VSPD memory space shall be mapped to Non-Cache region.

33.5.2 Limitations on Software Reset and Module Standby

Stop LCDC with the software reset sequence following to the guidance in the **Section 33.4.1**.

33.5.3 Input Image Size

Table 33.37 is a list of input size specifications.

Table 33.37 List of Input Size Specifications

Module	Min. Input Size	Max. Input Size	Restriction on Setting Unit
RPF	1 (horizontal) x 1 (vertical) pixel	1920 (horizontal) x 1080 (vertical) pixels	YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. YCbCr420: 2-pixel units both horizontally and vertically. Other formats: 1-pixel units both horizontally and vertically. *Note 1.* When the 1-bpp alpha plane*1 is input, the size can always be specified in 8-pixel units both horizontally and vertically regardless of the input format. *Note 2.* These restrictions including note 1 are applied to the following. VI6_RPFn_SRC_BSIZE VI6_RPFn_SRC_ESIZE
LUT	1 (horizontal) x 1 (vertical) pixel	1920 (horizontal) x 1080 (vertical) pixels	1-pixel units both horizontally and vertically.
BRS	1 (horizontal) x 1 (vertical) pixel	1920 (horizontal) x 1080 (vertical) pixels	1-pixel units both horizontally and vertically.
LIF	1 (horizontal) x 1 (vertical) pixel	1920 (horizontal) x 1080 (vertical) pixels	1-pixel units both horizontally and vertically.
WPF	1 (horizontal) x 1 (vertical) pixel	1920 (horizontal) x 1080 (vertical) pixels	YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. YCbCr420: 2-pixel units both horizontally and vertically. Other formats: 1-pixel units both horizontally and vertically. *Note 1.* This restriction on the WPF only applies to the WPF output size. The WPF input size should be specified in 1-pixel units.

Note 1. When VI6_RPFn_ALPH_SEL.ASEL is set to 011b.

The most important restriction shown in **Table 33.37** is the setting unit. Make appropriate register settings so that the size of the image input to each module does comply with setting units and does not exceed the limits shown in **Table 33.37**.

33.5.4 Output Image Size

The size of the output from each WPF is determined by the results of processing in the modules connected with the DPR. As shown in **Figure 33.1**, the data input to the VSPD is sent to the WPF output modules through the RPF and the modules connected with the DPR. When there is no processing that changes the image size through this data path, the WPF output size is the same as the RPF input size. **Table 33.38** is a list of the processing that changes image size.

Table 33.38 Image Processing that changes image size

Module	Function*1	Related Register	Size of Output from Module
WPF	Input size clipping	VI6_WPFn_HSZCLIP VI6_WPFn_VSZCLIP	When this function is disabled, the input size and the output size are the same. When this function is enabled, the output is in the following size. Horizontal output size: VI6_WPFn_HSZCLIP.HCL_SIZE x 2 setting Vertical output size: VI6_WPFn_VSZCLIP.VCL_SIZE x 2 setting
LIF	Padding line	VI6_LIFn_CTRL	When padding with dummy lines is disabled, output size is same with Input size. When padding with dummy lines is enabled: Horizontal output size: input size Vertical output size: VI6_LIF0_PADLN_SIZE setting

Note 1. For details of each function, refer to the descriptions of the related registers.

Note 2. Refer to **Section 33.3.2.1** for explanation of register bit field.

The input image size can be changed only with the modules and functions shown in **Table 33.38**. With the other modules and functions, the input size and output size are the same. Accordingly, after module connections with the DPR are determined, the VSPD output size can also be determined through the following steps.

1. The image size (VI6_RPFn_SRC_ESIZE) read from the external memory and sent to the DPR by the RPFn is the initial value.
2. When the module connected with the DPR is not a module (function) shown in **Table 33.38**, the output size from the module is the same as the input size; the image size does not need to be updated.
3. When a module connected with the DPR is a module (function) shown in **Table 33.38**, the output image size should be updated to the size shown in the table, which should be used as the input image size for the module connected behind it.
4. When the final image size at the WPFn is determined, this size is the VSPD output size for that WPFn path.

Figure 33.42 shows how to determine the image size in a sample DPR connection through the above steps. The related conditions that determine the image size are also shown.

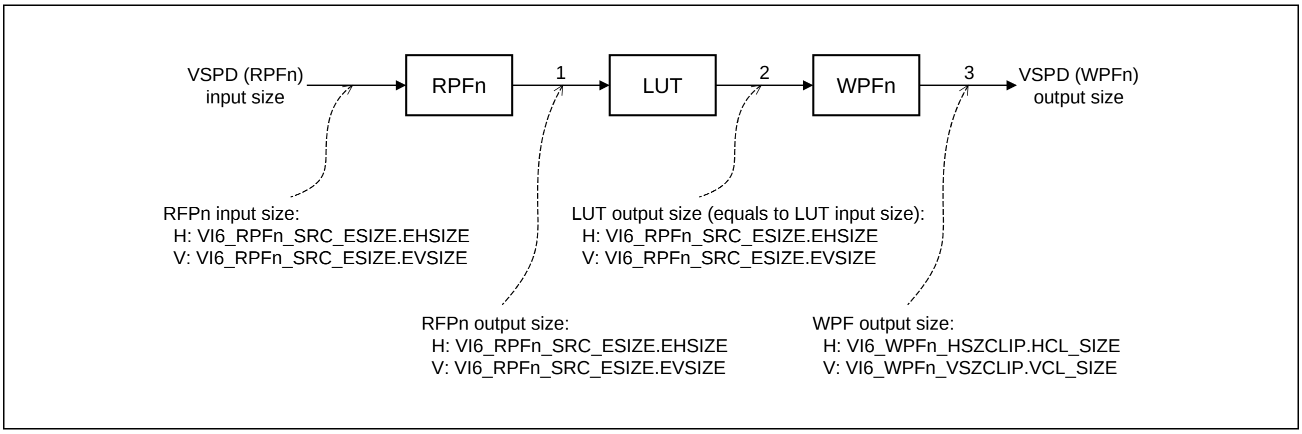


Figure 33.42 Input/output Size for Each Module in a Sample DPR Connection

Make appropriate register settings in each module so that the VSPD output image size determined as shown in the figure does not violate the restrictions shown in **Table 33.38**.

33.5.5 Restriction

When the data output from this unit is written back to the same memory area where the input data for this unit has been read, this unit has the following restrictions.

1. The access order and format on the frame memory are the same between the input pixels and output pixels.
2. Specifying a larger output image size than the input image size, either vertically, horizontally, or both vertically and horizontally, is prohibited.
3. When the YCbCr4:2:0 format is input, operation between color components is prohibited.

These restrictions are summarized in. Refer to the descriptions of the registers related to each restriction. In the table, RPFm indicates the RPFn that inputs the master layer, and WPFwb indicates the WPFn that writes back the output image to the source image area for the master layer.

Table 33.39 Restrictions on Use when Output Data is Written Back to Input Data Area

No.	Restriction	Related Registers
Restriction 1	The RPFm input format and the WPFwb output format should be the same.	VI6_RPFn_INFMT.RDFMT VI6_RPFn_INFMT.VIR
	The RPFm source image storing address and the WPFwb destination address should be the same.	VI6_RPFn_SRCM_ADDR_*
	The RPFm source picture memory stride and the WPFwb destination memory stride should be the same.	VI6_RPFn_SRCM_PSTRIDE VI6_RPFn_SRCM_ASTRIDE
	The RPFm and WPFwb data swapping settings should be the same.	VI6_WPFn_DSWAP
Restriction 2	The RPFm basic read size and extended read size should be the same.	VI6_RPFn_SRC_BSIZE VI6_RPFn_SRC_ESIZE
	Color space conversion is prohibited in RPFm and WPFwb.	VI6_RPFn_INFMT.CSC VI6_WPFn_OUTFMT.CSC
Restriction 3*[1]	NOP should be specified for IROP operation.	VI6_RPFn_ALPH_SEL.IROP
	Color keying is prohibited.	VI6_RPFn_CKEY_CTRL.CV

Note 1. Note: When the input format is not YCbCr4:2:0, restriction 3 in not applied.

34. MIPI DSI

34.1 Overview

This chapter describes the features of the MIPI-DSI unit of this LSI.

This unit is the MIPI-DSI Tx module, it is composed of MIPI DSI-2 Host Controller (LINK), and MIPI D-PHY Tx (D-PHY).

This unit supports MIPI Alliance Specification for Display Serial Interface (DSI) Specification. This unit provides a solution for transmitting MIPI DSI compliant digital video and packets. Normative References are below.

- MIPI Alliance Specification for Display Serial Interface Version 1.3.1
- MIPI Alliance Specification for D-PHY Version 2.1

34.1.1 Features

The following is key features of this unit.

In this document the word “DSI” means “Display Serial Interface Version 1.3.1”.

■ Overview

- 1 channel
- The number of Lane: 4-lane
- Support up to Full HD (1920 × 1080), 60 fps (RGB888)
- Maximum Bandwidth: 1.5 Gbps per lane
- Support Output Data Format: RGB666 / RGB888

■ Protocol Interface

- PPI Interface (8bit)
- Packet generation from Video Input signal for Video Mode (Video-Input Operation)
  - Supports RGB format (18bit, 18bit Loosely and 24bit)
  - Not supports RGB format (30bit and 36bit)
  - Not supports YCbCr 4:2:2 format (16bit, 20bit Loosely and 24bit)
  - Not supports YCbCr 4:2:0 format (12bit)
  - Not supports Compressed Pixel Stream
  - Supports Blanking Packet or LP-11 selection during each of HSA, HBP and HFP blanking interval
  - Supports “Non-Burst Mode with Sync Pulse”, “Non-Burst Mode with Sync Event” and “Burst Mode”
  - Not supports interlaced video
  - Not supports deskew pattern insertion after vertical video data timing
- LP only packet generation and LP packet reception from descriptor list (Sequence Operation channel 0)
  - Supports one sequence input channel
- HS or LP packet generation and LP packet reception from descriptor list (Sequence Operation channel 1)
  - Supports one sequence input channel

■ Link Layer

- Supports 1, 2, 3 and 4 lane configurations
- Supports unidirectional high-speed mode Tx
- Supports bidirectional LP mode Tx/Rx (Only Lane0)
- Supports ECC/Checksum generation for Tx packet
- Supports ECC/Checksum verification and ECC error correction for Rx packet
- Supports automated insertion of EoTp in HS mode
- Supports ULPS (Tx)
- Supports automated power change to LP mode and return to HS mode
- Supports automated clock stop and resume (non-continuous clock mode)
- Supports assignment for Virtual Channel for video input channel in Video-Input Operation
- Supports assignment for individual Virtual Channel for each packet in Sequence Operation
- Supports detection for PHY contention error and timeout error
- Supports generation of scrambled packets
- Not supports input of TE signal

■ PHY Layer

- Number of Lanes
  - Data Lane (DL): 4 Lanes
  - Clock Lane (CL): 1 Lane
- Transfer Rate
  - High Speed (HS) Mode: 80 – 1500Mbps
- Lane Module Functions
  - DL: CIL-MFAA (HS-TX, LP-TX, LP-RX, LP-CD)
  - CL: CIL-MCNN (HS-TX, LP-TX)
- Optional Functions
  - Escape Mode
    - LPDT
      - LP Transmit: Supported
      - LP Receive: Supported
      - ULPS: Supported
      - Reset Trigger: Supported
    - Bi-Direction
      - Bus Turn-Around: Supported
      - Contention Detection: Supported
    - Calibration
      - Deskew Calibration / Preamble: Not-Supported

    - Pre/De-Emphasis: Not-Supported
    - Equalization: Not-Supported
  - Others
    - HS-IDLE: Not-Supported
    - 16bit, 32bit width of Tx Data: Not-Supported
- Power Supply Voltage (at Core Power Pins, Min/Typ/Max)
  - VDD: Same with the condition of this LSI
  - VCCQLV18: Min:1.65V – Typ:1.80V – Max:1.95V

34.1.2 Block Diagram

Figure 34.1 shows a block diagram.

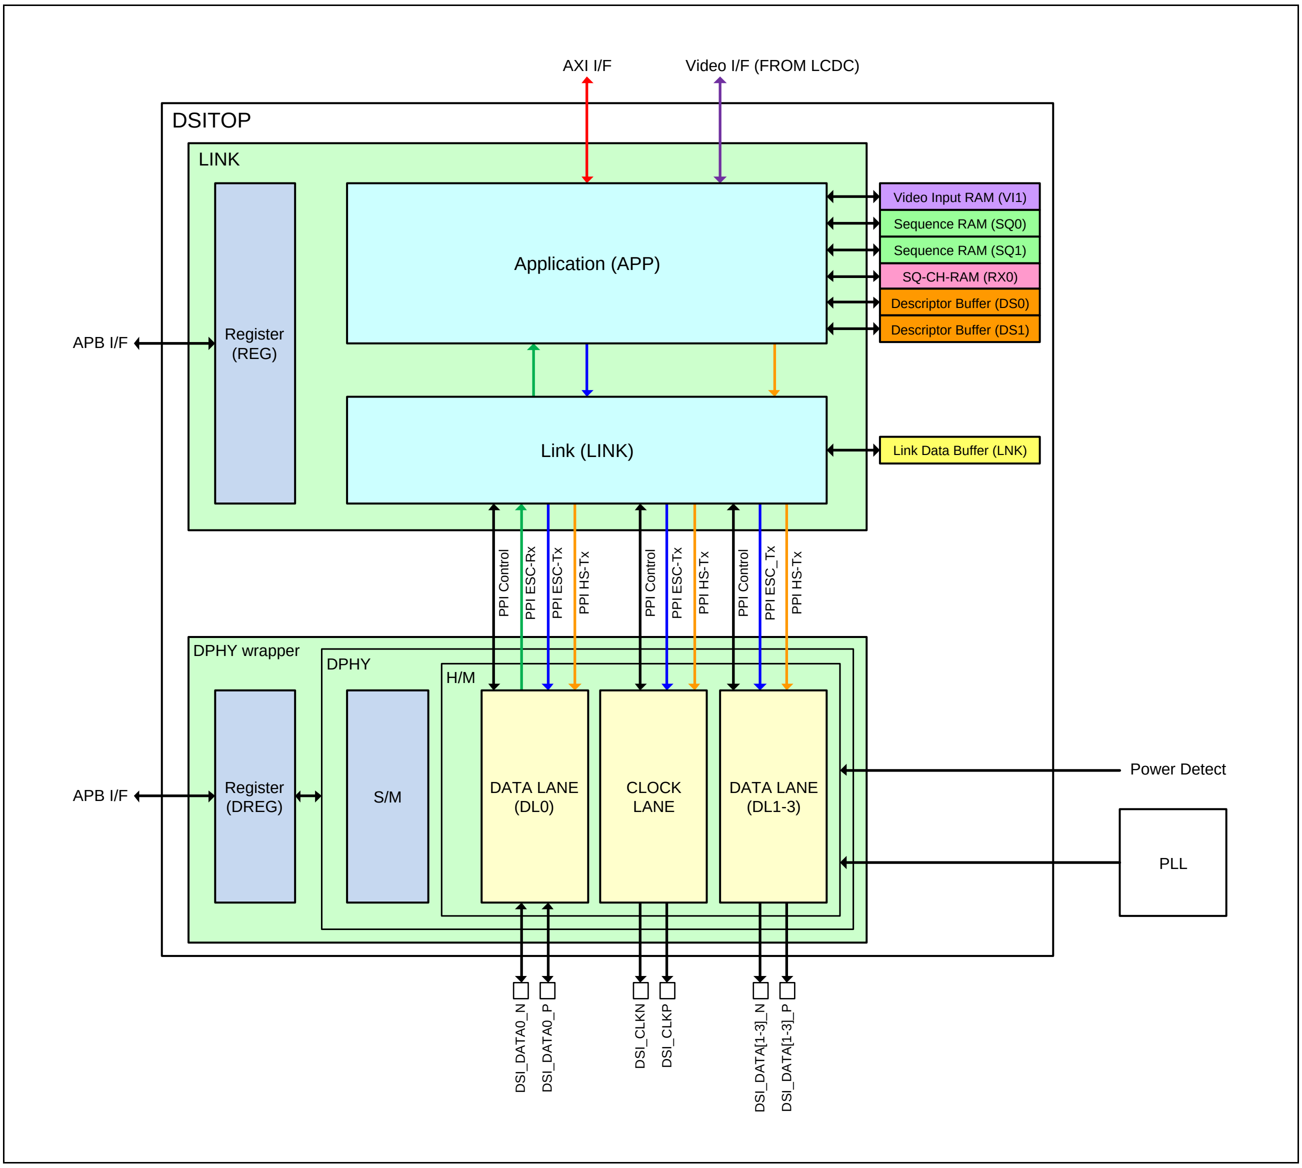

Figure 34.1 Block Diagram

34.1.3 Clock

Table 34.1 shows a list of clocks for this unit.

- T_{LPX}: Transmitted length of any Low-Power state period (Min: 50ns)
- $T_{LPX(H)}$: TLPX of Host Processor (the DSI-2 TX module)
- $T_{LPX(P)}$: TLPX of Peripheral device (connected device)

Table 34.1 Clocks and the frequency range

Clock name	I/O	Description	Frequency (MHz)
MIPI_DSI_PCLK	I	APB clock.	100/50/25/12.5/3.125
MIPI_DSI_ACLK	I	AXI clock.	200/100/50/25/6.25
MIPI_DSI_VCLK	I	Video clock.	148.5~5.803
MIPI_DSI_LPCLK	I	DSI Escape mode Transmit Clock (TxClkEsc). Set D-PHY TxClkEsc (1/$T_{LPX(H)}$) frequency. $T_{LPX(H)}$/$T_{LPX(P)}$ needs to set between 2/3 to 3/2.	16.656/8.328/4.164/2.082
MIPI_DSI_SYSCLK	I	System clock for D-PHY.	133.25
MIPI_DSI_PLLCLK	I	PLL Multiplied clock. {Transfer rate x 4} MHz	160~3000
hsclk	—	DSI High-Speed Transmit Word Clock (TxWordClkHS). Upper limit for D-PHY 1.5Gbps. Lower limit for D-PHY 80Mbps. This clock is supplied from D-PHY directly, and its frequency is 1/16 for MIPI_DSI_PLLCLK.	10 to 187.5
lppclk	—	DSI Escape mode Receive Clock (RxClkEsc). This clock is supplied from D-PHY directly, and its frequency is half of (1/$T_{LPX(P)}$). This clock is generated dividing in D-PHY.	2 to 10

Video clock and DSI HS Byte clock must follow the relationship.

Video clock Frequency [Hz] × Video Pixel Bit Depth[bit]

<= DSI HS Byte clock Frequency [Hz] × 8 [bit] × Number of DSI HS Data Lane

34.1.4 External Pins

Table 34.2 shows the pin configuration.

Table 34.2 External Pins

Pin Name	Input/Output	Function
DSI_CLKP	Output	MIPI DSI clock lane differential clock (pos)
DSI_CLKN	Output	MIPI DSI clock lane differential clock (neg)
DSI_DATA0_P	Output	MIPI DSI data lane0 differential data (pos)
DSI_DATA0_N	Output	MIPI DSI data lane0 differential data (neg)
DSI_DATA1_P	Output	MIPI DSI data lane1 differential data (pos)
DSI_DATA1_N	Output	MIPI DSI data lane1 differential data (neg)
DSI_DATA2_P	Output	MIPI DSI data lane2 differential data (pos)
DSI_DATA2_N	Output	MIPI DSI data lane2 differential data (neg)
DSI_DATA3_P	Output	MIPI DSI data lane3 differential data (pos)
DSI_DATA3_N	Output	MIPI DSI data lane3 differential data (neg)

34.2 Register Configuration

34.2.1 Registers in LINK

This section describes about registers in LINK. All registers can access by 8/16/32 bit.

Base Address: H’0_1086_0000 (Cortex-A55 Address Space)
Base Address: H’4086_0000 (Cortex-M33 Address Space Non-Secure)
Base Address: H’5086_0000 (Cortex-M33 Address Space Secure)

Table 34.3 Resister list (1/3)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Interrupt Status Register	ISR	*2	H’0000_0000	H’000	8/16/32
Link Status Register	LINKSR	*2	H’0000_0000	H’010	8/16/32
Tx Set Register	TXSETR	*2	H’0003_0003	H’100	8/16/32
HS Clock Set Register	HSCLKSETR	*2	H’0000_0000	H’104	8/16/32

…	…		…		32
Sequence Channel 1 Descriptor 07-A Register	SQCH1DSC07AR	*2	*1	H'870	32
Sequence Channel 1 Descriptor 07-B Register	SQCH1DSC07BR	*2	*1	H'874	32
Sequence Channel 1 Descriptor 07-C Register	SQCH1DSC07CR	*2	*1	H'878	32
Sequence Channel 1 Descriptor 07-D Register	SQCH1DSC07DR	*2	*1	H'87C	32

Note: Other addresses are Reserved. Do not Access to them.

Note 1. Initial Values are determined by initial value of Descriptor RAM.

Note 2. Refer to the respective register description and **Table 34.5**.

34.2.2 Registers in D-PHY

This section describes about registers in D-PHY. All registers can access by 8/16/32 bit.

Base Address: H’0_1085_0000 (Cortex-A55 Address Space)
Base Address: H’4085_0000 (Cortex-M33 Address Space Non-Secure)
Base Address: H’5085_0000 (Cortex-M33 Address Space Secure)

Table 34.4 Resister list

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
D-PHY Control Resister 0	DSIDPHYCTRL0	RW	H’00010104	H’00	8/16/32
D-PHY Timing Resister 0	DSIDPHYTIM0	RW	H’01002710	H’04	8/16/32
D-PHY Timing Resister 1	DSIDPHYTIM1	RW	H’04030909	H’08	8/16/32
D-PHY Timing Resister 2	DSIDPHYTIM2	RW	H’05100119	H’0C	8/16/32
D-PHY Timing Resister 3	DSIDPHYTIM3	RW	H’0409060B	H’10	8/16/32

34.3 Register Descriptions

34.3.1 Resisters in LINK

Legend for Register Description.

Table 34.5 Resister R/W

R/W	Write Access	Read Access
R	Ignored	Valid
RW	Valid	Valid
R0W	Valid	The read value is always 0.

34.3.1.1 Interrupt Status Register (ISR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	PPI	—	—	—	FERR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	RCV	—	—	—	VIN1	—	—	—	SQ1	—	—	—	SQ0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	—	0	R	Reserved When read, the initial value is read. The written value will be ignored.
27 to 21	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	PPI	0	R	PPI Interrupt When this value is “1”, an interrupt of DSI D-PHY PPI related exists. Refer to the description of PLSR register for more information.
19 to 17	—	All 0	R	Reserved
16	FERR	0	R	FERR Interrupt When this value is “1”, an interrupt of DSI Fatal Error exists. Refer to the description of FERRSR register for more information.
15 to 13	—	All 0	R	Reserved
12	RCV	0	R	RCV Interrupt When this value is “1”, an interrupt of DSI Packet Receive exists. Refer to the description of RXSR register for more information.
11 to 9	—	All 0	R	Reserved
8	VIN1	0	R	VIN1 Interrupt When this value is “1”, an interrupt of Video Input-Operation channel 1 exists. Refer to the description of VICH1SR register for more information.
7 to 5	—	All 0	R	Reserved
4	SQ1	0	R	SQ1 Interrupt When this value is “1”, an interrupt of Sequence Operation channel 1 exists. Refer to the description of SQCH1SR register for more information.
3 to 1	—	All 0	R	Reserved
0	SQ0	0	R	SQ1 Interrupt When this value is “1”, an interrupt of Sequence Operation channel 0 exists. Refer to the description of SQCH0SR register for more information.

34.3.1.2 Link Status Register (LINKSR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	LPBUSY	HSBUSY	—	—	—	VICHRUN1	—	—	—	SQCHRUN1	—	—	—	SQCHRUN0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
13	LPBUSY	0	R	LP Operation Busy When this value is “1”, it indicates an operation related to LP is running.
12	HSBUSY	0	R	HS Operation Busy When this value is “1”, it indicates an operation related to HS is running.
11 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	VICHRUN1	0	R	Video-Input Channel 1 Running This bit is copy of VICH1SR.RUNNING.
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	SQCHRUN1	0	R	Sequence Channel 1 Running This bit is copy of SQCH1SR.RUNNING.
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	SQCHRUN0	0	R	Sequence Channel 0 Running This bit is copy of SQCH0SR.RUNNING.

34.3.1.3 Tx Set Register (TXSETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NUMLANECAP	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DLEN	CLEN	—	—	—	—	—	—	NUMLANEUSE	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17 to 16	NUMLANECAP	H’3	R	Number of Lanes Capability H’3 (fixed value): Maximum Lane count is 4 (Lane0, Lane1, Lane2 and Lane3 can be used)
15 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	DLEN	0	RW	Data Lane Enable When this bit is “1”, Data Lane is enabled by PHY interface. Be enabled lanes are determined by NUMLANEUSE.
8	CLEN	0	RW	Clock Lane Enable When this bit is “1”, Clock Lane is enabled by PHY interface.
7 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	NUMLANEUSE	H’3	RW	Number of Lanes for Use Set Lane count for use. Selected Data Lanes are Enabled if DLEN is “1”. H’0: 1Lane (Use of Lane0) H’1: 2Lane (Use of Lane0 and Lane1) H’2: 3Lane (Use of Lane0, Lane1 and Lane2) H’3: 4Lane (Use of Lane0, Lane1, Lane2 and Lane3) Setting value over NUMLANECAP is prohibited.

34.3.1.4 HS Clock Set Register (HSCLKSETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HSCLK MODE	HSCLK RUN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	HSCLKMODE	0	RW	HS Clock running Mode 0b: Request for clock lane HS transmission when HS Transmission scheduled. (non-continuous clock mode) 1b: Keep clock lane to HS transmission. (continuous clock mode) If HSCLKRUN=0, this field has no meaning. Prohibited to change this bit during HSCLKRUN=1.
0	HSCLKRUN	0	RW	Start HS Clock running on Clock Lane 0b: No HS transmission (keep LP) 1b: Allow HS transmission according to HSCLKMODE Confirm stable TxWordClkHS(hsclk) before setting this field to 1. Setting 1 to this field during TXSETR.CLEN=0 is prohibited.

34.3.1.5 ULPS Set Register (ULPSSETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ULPSWKUP							
Initial Value	0	0	0	0	0	0	0	0	1	0	1	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	ULPSWKUP	H'A0	RW	Twakeup period of ULPS This period is specified by count value of MIPI_DSI_LPCLK *128. This period should be more than 1ms. For example; ● In case MIPI_DSI_LPCLK is 4/3MHz, MIPI_DSI_LPCLK *128=96us, Setting ULPSWKUP = H'0B, Twakeup period = 1.06ms (11*96us) ● In case MIPI_DSI_LPCLK is 20MHz, MIPI_DSI_LPCLK *128=6.4us, Setting ULPSWKUP = H'A0, Twakeup period = 1.02ms (160*6.4us) Setting 1 to this field during TXSETR.CLEN=0 is prohibited.

34.3.1.6 ULPS Control Register (ULPSCR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	DLULP SEXT	DLULP SENT	—	—	CLULP SEXT	CLULP SENT	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R0W	R0W	R	R	R0W	R0W	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29	DLULPSEXT	0	R0W	DL ULPS Exit When write “1”, request to all enabled data lane exit from Ultra-low Power State (ULPS). Write “1” when enabled data lanes are not in ULPS, is prohibited. Writing “0” has no effect.
28	DLULPSENT	0	R0W	DL ULPS Enter When write “1”, request to enabled data lane transition to Ultra-low Power State (ULPS). Write “1” when enabled data lanes are in ULPS, is prohibited. Writing “0” has no effect.
27, 26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25	CLULPSEXT	0	R0W	CL ULPS Exit When write “1”, request to clock lane exit from Ultra-low Power State (ULPS). Write “1” when clock lane is not in ULPS, is prohibited. Writing “0” has no effect.
24	CLULPSENT	0	R0W	CL ULPS Enter When write “1”, request to clock lane transition to Ultra-low Power State (ULPS). Before setting this field, HSCLKSETR.HSCLKRUN must be set to 0. Write “1” when clock lane is in ULPS, is prohibited. Writing “0” has no effect.
23 to 0	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

34.3.1.7 Reset Control Register (RSTCR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FCETX STP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SWRST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	—	0	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	FCETXSTP	0	RW	Force Tx Stop Mode When this value is “1”, force to change to Transmit mode and StopState by ForceTxStopmode on all PPI Data Lane. Set “1” when SWRST=0 is prohibited.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	SWRST	0	RW	Request of Software Reset Set to “1” to request for Software Reset. After the request of Software Reset, wait to confirm the completion of the Reset procedure by RSTSR.SWRSTx=1. And set to “0” after that.

34.3.1.8 Reset Status Register (RSTSR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DL0DIR	—	—	—	DLSTPST				—	—	—	SWRST V1	SWRST IB	SWRST APB	SWRST LP	SWRST HS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15	DL0DIR	0	R	Direction (Tx or Rx) of PPI Data Lane0 0: PHY is in Tx Mode 1: PHY is in Rx Mode This field is copy of PLSR.DL0DIR
14 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 8	DLSTPST	All 0	R	Status of Stopstate on Data Lane bit 3: Stopstate of Data Lane3 bit 2: Stopstate of Data Lane2 bit 1: Stopstate of Data Lane1 bit 0: Stopstate of Data Lane0 This field is copy of PLSR.DLSTPST
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	SWRSTV1	0	R	Status of Software Reset by RSTCR.SWRST at MIPI_DSI_VCLK 0: Not on Reset procedure at MIPI_DSI_VCLK 1: Now on Reset procedure at MIPI_DSI_VCLK
3	SWRSTIB	0	R	Status of Software Reset by RSTCR.SWRST at MIPI_DSI_ACLK 0: Not on Reset procedure at MIPI_DSI_ACLK 1: Now on Reset procedure at MIPI_DSI_ACLK
2	SWRSTAPB	0	R	Status of Software Reset by RSTCR.SWRST at MIPI_DSI_PCLK 0: Not on Reset procedure at MIPI_DSI_PCLK 1: Now on Reset procedure at MIPI_DSI_PCLK
1	SWRSTLP	0	R	Status of Software Reset by RSTCR.SWRST at MIPI_DSI_LPCLK 0: Not on Reset procedure at MIPI_DSI_LPCLK 1: Now on Reset procedure at MIPI_DSI_LPCLK
0	SWRSTHS	0	R	Status of Software Reset by RSTCR.SWRST at hsclk 0: Not on Reset procedure at hsclk 1: Now on Reset procedure at hsclk

34.3.1.9 DSI Set Register (DSISETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EOTPEN	TEIDIR	SCREN	—	—	—	—	—	CRCEN				—	—	—	ECCEN
Initial Value	1	0	0	0	0	0	0	0	1	1	1	1	0	0	0	1
R/W	RW	RW	RW	R	R	R	R	R	RW	RW	RW	RW	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MRPSZ															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	EOTPEN	0	RW	HS Transfer EoTp Enable 0: Transfer EoTp disable 1: Transfer EoTp enable EoTp is always disabled in LP Transfer.
30	TEIDIR	0	RW	Tearing Effect Input Direction External Tearing Effect Setting 0: rise edge detect 1: fall edge detect
29	SCREN	0	RW	Scramble Enable 0: Scrambling data is disabled 1: Scrambling data is enabled This bit should not set to “1”, if peer-device does not support data scrambling function.
28 to 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 20	CRCEN	H’F	RW	Force Tx Stop Mode When this value is “1”, force to change to Transmit mode and StopState by ForceTxStopmode on all PPI Data Lane. Set “1” when SWRST=0 is prohibited.
19 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	ECCEN	0	RW	Enable Received ECC check 0: Received ECC check is disabled 1: Received ECC check is enabled
15 to 0	MRPSZ	H’0001	RW	Maximum Return Packet Size If returned long packet’s WC is over this value, the DSI-Tx Module asserts RXSR.MAXRPSZERR error. In that case data will not save to memory space. Setting 0 for this field is prohibited. Set this field equal or more than peripheral setting.

34.3.1.10 Receive Buffer Size Register (RXBUFSZR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	RXBUFSZ				—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 20	RXBUFSZ	H’0	R	Receive Buffer Size H’0: 128B
19 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

34.3.1.11 Tx Packet Payload Data 0 Register (TXPPD0R)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DATA	All 0	RW	Tx Packet Payload Data 0 When sequence operation Long packet is set (SQCHxDSCyAR.FMT=1) and Payload Data Access use Packet Payload Data register (SQCHxDSCyBR.DTSEL =H’0) , the values in this register is used for Long Packet Payload. [7:0]: Data 0 [15:8]: Data 1 [23:16]: Data 2 [31:24]: Data 3

34.3.1.12 Tx Packet Payload Data 1 Register (TXPPD1R)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DATA	All 0	RW	Tx Packet Payload Data 1 When sequence operation Long packet is set (SQCHxDSCyAR.FMT=1) and Payload Data Access use Packet Payload Data register (SQCHxDSCyBR.DTSEL =H'0) , the values in this register is used for Long Packet Payload. [7:0]: Data 4 [15:8]: Data 5 [23:16]: Data 6 [31:24]: Data 7

34.3.1.15 Rx Status Register (RXSR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	RXAKE	—	ECCERR1B	—	MAXRPSZERR	NORETERR	PRESPTOERR	RXOVFERR	IBERR	CRCERR	WCERR	—	UEXPKTERR	ECCERR	MLFERR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EXTTEDET	RXACK	RXTE	RXRTRG	RXUK5TRG	RXEOTP	—	RXRESP	—	—	—	—	—	TATO	LRXHTO	BTAREQEND
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30	RXAKE	0	R	Rx Acknowledge and Error Report When this value is “1”, the Acknowledge and Error Report Packet is received. Write “1” to RXSCR.RXAKE register to clear this field.
29	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	ECCERR1B	0	R	ECC Error (1bit) When this value is “1”, the Rx ECC Error (1bit) is detected. Write “1” to RXSCR.ECCERR1B register to clear this field.
27	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
26	MAXRPSZERR	0	R	Maximum Return Packet Size Error When this value is “1”, the WC value of Rx Long Packet is larger than DSISETR.MRPSZ. Write “1” to RXSCR.MAXRPSZERR register to clear this field.
25	NORETERR	0	R	Nothing Return Error When this value is “1”, no trigger or packet is returned in BTA period. Write “1” to RXSCR.NORETERR register to clear this field.
24	PRESPTOERR	0	R	Peripheral Response Timeout Error When this value is “1”, the Rx Peripheral Response Timeout is detected after changing to Rx mode along with Bus Turn-Around and within the time specified by PRESPTOBTASETR.PRESPTOBTA, PRESPTOLPSETR.PRESPTOLPR, PRESPTOLPSETR.PRESPTOLPW, PRESPTOLPSETR.PRESPTOHSR or PRESPTOLPSETR.PRESPTOHSW. The value is selected from kind of BTA. Write “1” to RXSCR.PRESPTOERR register to clear this field.
23	RXOVFERR	0	R	Receive Buffer Overflow Error When this value is “1”, the Buffer Overflow Error is detected at Rx Long Packet. Write “1” to RXSCR.RXOVFERR register to clear this field.
22	IBERR	0	R	Internal Bus Error When this value is “1”, the Internal Bus Write had failed response. Write “1” to RXSCR.IBERR register to clear this field.
21	CRCERR	0	R	CRC Error When this value is “1”, the Rx CRC Error is detected. Write “1” to RXSCR.CRCERR register to clear this field.
20	WCERR	0	R	Word Count Error When this value is “1”, the Rx Packet’s actual WC length is shorter than packet header’s WC. Write “1” to RXSCR.WCERR register to clear this field.

Bit	Bit Name	Initial Value	R/W	Description
19	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	UEXPKTERR	0	R	Unexpected Packet Error When this value is “1”, the unexpected Packet is received. “Unexpected Packet” means unexpected DT for receive or unexpected response for receive. Write “1” to RXSCR.UEXPKTERR register to clear this field.
17	ECCERR	0	R	ECC Error (over 1bit) When this value is “1”, the Rx ECC Error (over 1bit) is detected. Write “1” to RXSCR.ECCERR register to clear this field.
16	MLFERR	0	R	Malform Error When this value is “1”, the Rx Packet under 4 Byte length is received. Write “1” to RXSCR.MLFERR register to clear this field.
15	EXTTEDET	0	R	External Tearing Effect Detect When this value is “1”, External Tearing Effect is detected. Write “1” to RXSCR.EXTTEDET register to clear this field.
14	RXACK	0	R	Rx ACK Trigger When this value is “1”, the ACK trigger is received. Write “1” to RXSCR.RXACK register to clear this field.
13	RXTE	0	R	Rx Tearing Effect Trigger When this value is “1”, Tearing Effect Trigger is received. Write “1” to RXSCR.RXTE register to clear this field.
12	RXRTRG	0	R	Rx Reset Trigger When this value is “1”, Reset Trigger is received. Normally, the DSI-Tx Module does not receive Reset Trigger. Write “1” to RXSCR.RXRTRG register to clear this field.
11	RXUK5TRG	0	R	Rx Unknown-5 Trigger When this value is “1”, Unknown-5 Trigger is received. Normally, the DSI-Tx Module does not receive Unknown-5 Trigger. Write “1” to RXSCR.RXUK5TRG register to clear this field.
10	RXEOTP	0	R	Rx EoTp When this value is “1”, the EoTp is received. Write “1” to RXSCR.RXEOTP register to clear this field.
9	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	RXRESP	0	R	Rx Response Packet When this value is “1”, the Response Packet is received. Write “1” to RXSCR.RXRESP register to clear this field.
7 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	TATO	0	R	Turnaround Acknowledge Timeout When this value is “1”, the Turnaround Acknowledge Timeout (TA_TO) is detected. Write “1” to RXSCR.TATO register to clear this field.
1	LRXHTO	0	R	LP-RX Host Processor Timeout When this value is “1”, the LP-RX Host Processor Timeout (LRX-H_TO) is detected. Write “1” to RXSCR.LRXHTO register to clear this field.
0	BTAREQEND	0	R	BTA Request End When this value is “1”, the completion of Transmission request includes Rx is detected. This bit is set if all BTA requests are finished including error. Status of BTA request are indicated by RXSR[31:1]. Write “1” to RXSCR.BTAREQEND register to clear this field.

34.3.1.18 Peripheral Response Timeout BTA Set Register (PRESPTOBTASETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PRESPTOBTA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PRESPTOBTA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PRESPTOBTA	All 0	RW	Peripheral Response Timeout (Bus Turn Around) Count Set Timeout value to measure the interval between Start of Rx mode and Start of Packet Receive along with Bus Turn-Around with SQCHxDSCyAR.BTA= H'3. The limit Time for Timeout is calculated by formula of PRESPTOBTA * (period of MIPI_DSI_LPCLK). When RXSR.PRESPTOERR is "1", the Timeout is detected. Notice, the Timeout is not detected when PRESPTOBTA=0. Since counting clock is asynchronous with Packet Receive, there is some jitter in the Timeout.

34.3.1.19 Peripheral Response Timeout LP Set Register (PRESPTOLPSETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PRESPTOLPR															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PRESPTOLPW															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PRESPTOLPR	All 0	RW	Peripheral Response Timeout (LPDT READ Request) Count Set Timeout value to measure the interval between Start of Rx mode and Start of Packet Receive along with Bus Turn-Around with SQCHxDSCyAR.BTA=H’2 and SQCHxDSCyAR.SPD=1b. The limit Time for Timeout is calculated by formula of PRESPTOLPR * (period of MIPI_DSI_LPCLK). When RXSR.PRESPTOERR is “1”, the Timeout is detected. Notice, the Timeout is not detected when PRESPTOLPR=0. Since counting clock is asynchronous with Packet Receive, there is some jitter in the Timeout.
15 to 0	PRESPTOLPW	All 0	RW	Peripheral Response Timeout (LPDT WRITE Request) Count Set Timeout value to measure the interval between Start of Rx mode and Start of Packet Receive along with Bus Turn-Around with SQCHxDSCyAR.BTA=01b and SQCHxDSCyAR.SPD=1b. The limit Time for Timeout is calculated by formula of PRESPTOLPW * (period of MIPI_DSI_LPCLK). When RXSR.PRESPTOERR is “1”, the Timeout is detected. Notice, the Timeout is not detected when PRESPTOLPW=0. Since counting clock is asynchronous with Packet Receive, there is some jitter in the Timeout.

34.3.1.20 Peripheral Response Timeout HS Set Register (PRESPTOHSSETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PRESPTOHSR															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PRESPTOHSW															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PRESPTOHSR	All 0	RW	Peripheral Response Timeout (HS READ Request) Count Set Timeout value to measure the interval between Start of Rx mode and Start of Packet Receive along with Bus Turn-Around with SQCHxDSCyAR.BTA=H’2 and SQCHxDSCyAR.SPD=0b. The limit Time for Timeout is calculated by formula of PRESPTOHSR * (period of MIPI_DSI_LPCLK). When RXSR.PRESPTOERR is “1”, the Timeout is detected. Notice, the Timeout is not detected when PRESPTOHSR=0. Since counting clock is asynchronous with Packet Receive, there is some jitter in the Timeout.
15 to 0	PRESPTOHSW	All 0	RW	Peripheral Response Timeout (HS WRITE Request) Count Set Timeout value to measure the interval between Start of Rx mode and Start of Packet Receive along with Bus Turn-Around with SQCHxDSCyAR.BTA=H’1 and SQCHxDSCyAR.SPD=0b. The limit Time for Timeout is calculated by formula of PRESPTOHSW * (period of MIPI_DSI_LPCLK). When RXSR.PRESPTOERR is “1”, the Timeout is detected. Notice, the Timeout is not detected when PRESPTOHSW=0. Since counting clock is asynchronous with Packet Receive, there is some jitter in the Timeout.

34.3.1.21 Acknowledge and Error Report Packet Parameter Latest Info Register (AKEPLATIR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	VC3	VC2	VC1	VC0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ERRRPTLAT															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	−	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	VC3	0	R	Virtual Channel Identifier 3 Latest This field shows Virtual channel identifier of received Acknowledge and Error Report Packet. 0: Virtual channel identifier is not 3 1: Virtual channel identifier is 3 This field shows latest information. Whenever an Acknowledge and Error Report Packet is received, this field is updated.
18	VC2	0	R	Virtual Channel Identifier 2 Latest This field shows Virtual channel identifier of received Acknowledge and Error Report Packet. 0: Virtual channel identifier is not 2 1: Virtual channel identifier is 2 This field shows latest information. Whenever an Acknowledge and Error Report Packet is received, this field is updated.
17	VC1	0	R	Virtual Channel Identifier 1 Latest This field shows Virtual channel identifier of received Acknowledge and Error Report Packet. 0: Virtual channel identifier is not 1 1: Virtual channel identifier is 1 This field shows latest information. Whenever an Acknowledge and Error Report Packet is received, this field is updated.
16	VC0	0	R	Virtual Channel Identifier 0 Latest This field shows Virtual channel identifier of received Acknowledge and Error Report Packet. 0: Virtual channel identifier is not 0 1: Virtual channel identifier is 0 This field shows latest information. Whenever an Acknowledge and Error Report Packet is received, this field is updated.
15 to 0	ERRRPTLAT	All 0	R	Error Report Latest This field shows Error Report of received Acknowledge and Error Report Packet. This field shows latest information. Whenever an Acknowledge and Error Report Packet is received, this field is updated.

34.3.1.22 Acknowledge and Error Report Packet Parameter Accumulate Status Register (AKEPACMSR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	VC3	VC2	VC1	VC0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ERRRPTACM															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	VC3	0	R	Virtual Channel Identifier 3 Accumulate This field is set to “1”, when an Acknowledge and Error Report Packet whose Virtual channel identifier = 3 is received. This field shows accumulated information. This bit is cleared by AKEPSCR.VC3.
18	VC2	0	R	Virtual Channel Identifier 2 Accumulate This field is set to “1”, when an Acknowledge and Error Report Packet whose Virtual channel identifier = 2 is received. This field shows accumulated information. This bit is cleared by AKEPSCR.VC2.
17	VC1	0	R	Virtual Channel Identifier 1 Accumulate This field is set to “1”, when an Acknowledge and Error Report Packet whose Virtual channel identifier = 1 is received. This field shows accumulated information. This bit is cleared by AKEPSCR.VC1.
16	VC0	0	R	Virtual Channel Identifier 0 Accumulate This field is set to “1”, when an Acknowledge and Error Report Packet whose Virtual channel identifier = 0 is received. This field shows accumulated information. This bit is cleared by AKEPSCR.VC0.
15 to 0	ERRRPTACM	All 0	R	Error Report Accumulate Each bit of this field is set to “1”, when an Acknowledge and Error Report Packet whose each Error Report bit = 1 is received. This field shows accumulated information. Each bit is cleared by corresponding AKESCR.ERRRPTACM.

34.3.1.23 Acknowledge and Error Report Packet Parameter Status Clear Register (AKEPSCR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	VC3	VC2	VC1	VC0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W	R0W	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	SLT3INFOOWC	0	R0W	RXRSS3R.INFOOW Clear Write 1 to clear RXRSS3R.INFOOW. Writing “0” has no effect. To prevent missing of RXRSS3R.INFOOW, clear RXRSS3R.INFOOW before clearing RXRSSR.SLT3VLD.
2	SLT2INFOOWC	0	R0W	RXRSS2R.INFOOW Clear Write 1 to clear RXRSS2R.INFOOW. Writing “0” has no effect. To prevent missing of RXRSS2R.INFOOW, clear RXRSS2R.INFOOW before clearing RXRSSR.SLT2VLD.
1	SLT1INFOOWC	0	R0W	RXRSS1R.INFOOW Clear Write 1 to clear RXRSS1R.INFOOW. Writing “0” has no effect. To prevent missing of RXRSS1R.INFOOW, clear RXRSS1R.INFOOW before clearing RXRSSR.SLT1VLD.
0	SLT0INFOOWC	0	R0W	RXRSS0R.INFOOW Clear Write 1 to clear RXRSS0R.INFOOW. Writing “0” has no effect. To prevent missing of RXRSS0R.INFOOW, clear RXRSS0R.INFOOW before clearing RXRSSR.SLT0VLD.

34.3.1.28 Rx Result Save Slot x Register (RXRSSxR)

x = 0, 1, 2, 3.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INFOOW	RXAKE	RXCORERR	RXPKTDFAIL	RXFAIL	RXFATALERR	RXSUC	FMT	VC		DT					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA1								DATA0							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	INFOOW	0	R	Information Overwrite This bit is set if information of RXRSSxR are updated when RXRSSR.SLTxVLD is 1. Write 1 to RXRINFOOWSCR.SLTxINFOOWC to clear this bit.
30	RXAKE	0	R	Receive Acknowledge and Error Report Packet RXSR.RXAKE is also reported.
29	RXCORERR	0	R	Receive Correctable Error Received packet has Correctable Error. RXSR.ECCERR1B is also reported.
28	RXPKTDFAIL	0	R	Receive Packet Data Fail Packet Header Saved Correctly but Data did not save correctly. One or more of the following bits are also reported. RXSR.CRCERR, RXSR.WCERR, RXSR.MAXRPSZERR, RXSR.UEXPKTERR, RXSR.RXOVFERR or RXSR.IBERR. When both of this bit and RXRESP are asserted, it means redundant packet received in BTA.
27	RXFAIL	0	R	Receive Fail Expected receive did not done. One or more of the following bits are also reported. RXSR.PRESPTOERR, RXSR.ECCERR, RXSR.MLFERR or RXSR.NORETERR.
26	RXFATALERR	0	R	Fatal Error Fatal timeout occurred during BTA. One or more of the following bits are also reported. FERRSR.TATO or FERRSR.LRXHTO.
25	RXSUC	0	R	Receive Success When this value is “1”, the Response Packet or ACK trigger is received. One or more of the following bits are also reported. RXSR.RXRESP or RXSR.RXACK.
24	FMT	0	R	Packet format of Rx Packet Header 0: Short packet 1: Long packet This field is valid when RXPKTDFAIL=1 or (RXSUC=1 and DT!=0).
23 to 22	VC	All 0	R	Identifier of virtual channel of Rx Packet Header This field is valid when (RXSUC=1 and DT!=0).
21 to 16	DT	All 0	R	Data type of Rx Packet Header H’00: ACK trigger received H’01 to H’3F: Data type This field is valid when RXSUC=1.

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	DATA1	All 0	R	Data1 of Rx Packet Header When Rx Packet format is Long Packet, this value is upper 8 bits of the word count. This field is valid when (RXSUC=1 and DT!=0).
7 to 0	DATA0	All 0	R	Data0 of Rx Packet Header When Rx Packet format is Long Packet, this value is lower 8 bits of the word count. This field is valid when (RXSUC=1 and DT!=0).

34.3.1.29 Rx Packet Payload Data 0 Register (RXPPD0R)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA

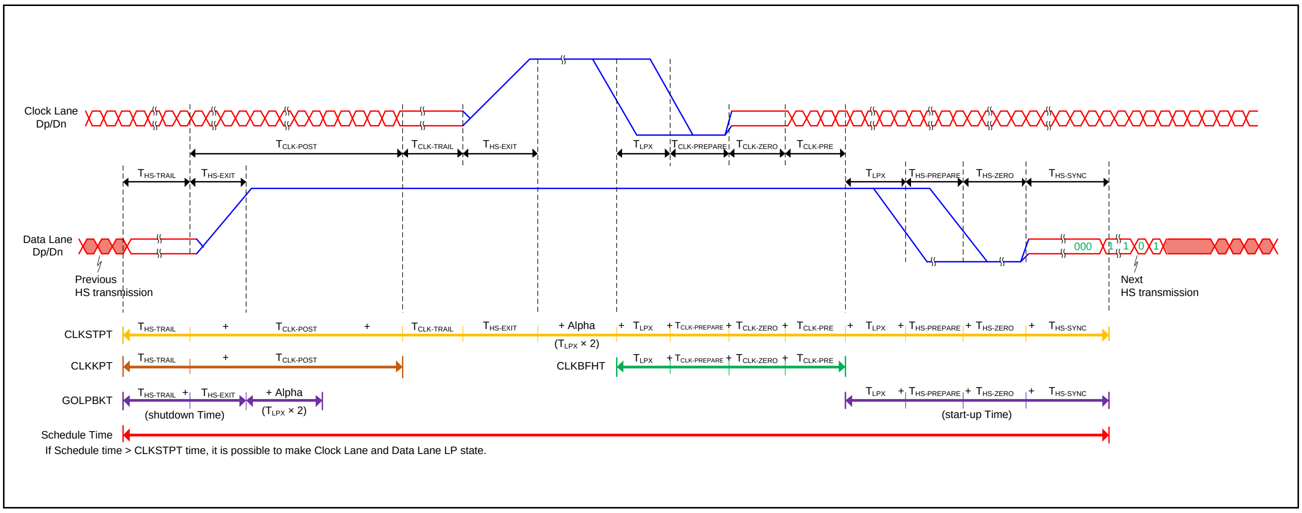
34.3.1.39 Clock Lane Stop Time Set Register (CLSTPTSETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CLKKPT								CLKBFHT							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CLKSTPT										—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CLKKPT	All 0	RW	Clock Keep Time Period time what HS Clock Lane keep active after HS packet transferred. The time is calculated by formula of CLKKPT * (period of high-speed serial UI * 32). This time corresponds to D-PHY specification's ($T_{\text{HS-TRAIL}}$ + $T_{\text{CLK-POST}}$). Set larger value than calculated. Set appropriate value (other than 0) before HSCLKSETR.HSCLKRUN is set to 1.
23 to 16	CLKBFHT	All 0	RW	Clock Beforehand Time Period time what Clock Lane back to HS beforehand to HS packet transfer. If HS transfers are scheduled in LP, clock lane will start beforehand to HS transfer by this setting. The time is calculated by formula of CLKBFHT * (period of high-speed serial UI * 32). This time corresponds to D-PHY specification's (T_{LPX} + $T_{\text{CLK-PREPARE}}$ + $T_{\text{CLK-ZERO}}$ + $T_{\text{CLK-PRE}}$). Set larger value than calculated. Set appropriate value (other than 0) before HSCLKSETR.HSCLKRUN is set to 1.
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 2	CLKSTPT	All 0	RW	Clock Stop Time Period time what HS Clock Lane is changed to LP and back to HS. If data lane will end HS and time of CLKKPT is over, and scheduled time till next HS transfers is more than this setting, clock lane will be changed to LP. This setting is no meaning if HSCLKSETR.HSCLKMODE is 1b or HSCLKSETR.HSCLKRUN is 0b. The time is calculated by formula of CLKSTPT * (period of high-speed serial UI * 32) This time correspond to D-PHY specification's ($T_{\text{HS-TRAIL}}$ + $T_{\text{CLK-POST}}$ + $T_{\text{CLK-TRAIL}}$ + $T_{\text{HS-EXIT}}$ + T_{LPX} *2 + T_{LPX} + $T_{\text{CLK-PREPARE}}$ + $T_{\text{CLK-ZERO}}$ + $T_{\text{CLK-PRE}}$ + T_{LPX} + $T_{\text{HS-PREPARE}}$ + $T_{\text{HS-ZERO}}$ + $T_{\text{HS-SYNC}}$). About each parameter, please refer D-PHY specification and **Figure 34.2**. Set larger value than calculated. Setting 0 to this field is prohibited.
1 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.



If Schedule time > CLKSTPT time, it is possible to make Clock Lane and Data Lane LP state.

Figure 34.2 Switching the Clock Lane between Clock Transmission and Low-Power Mode

34.3.1.40 LP Transition Time Set Register (LPTRNSTSETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GOLPBKT									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9 to 0	GOLPBKT	All 0	RW	Go LP and Back Time Period time what HS Data Lanes are changed to LP and back to HS. If scheduled time between HS transfers is more than this setting, data lanes will be changed to LP. The time is calculated by formula of GOLPBKT * (period of high-speed serial 8*UI). This time correspond to D-PHY specification's ($T_{HS\text{-}TRAIL}$ + $T_{HS\text{-}EXIT}$ + T_{LPX} *2 + T_{LPX} + $T_{HS\text{-}PREPARE}$ + $T_{HS\text{-}ZERO}$ + $T_{HS\text{-}SYNC}$). About each parameter, please refer DPHY specification and **Figure 34.3**. The unit of this setting is 8UI, so if the result of this formula contains half-finished than 8UI, round it up. Set the rounded up value plus at least 3.

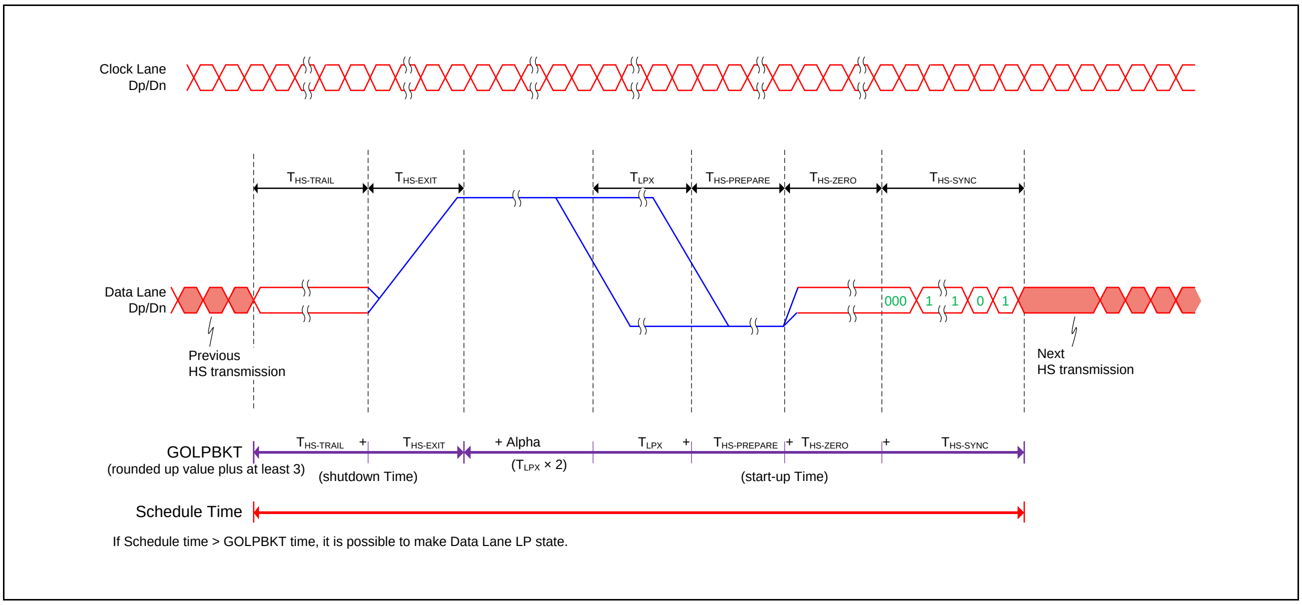


Figure 34.3 Switching the Data Lane between High-Speed Mode and Low-Power Mode

34.3.1.41 Physical Lane Status Register (PLSR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29	DLFROMULPS	0	R	From ULPS (Data Lane) When this value is "1", all PPI Data Lanes which enabled by TXSETR.NUMLANEUSE were changed to StopState from ULPS by ULPS Exit. Write "1" to PLSCR.DLFROMULPS register to clear this field.
28	DLTOULPS	0	R	To ULPS (Data Lane) When this value is "1", all PPI Data Lanes which enabled by TXSETR.NUMLANEUSE were changed to ULPS from StopState by ULPS Enter. Write "1" to PLSCR.DLTOULPS register to clear this field.
27	CLHS2LP	0	R	HS to LP (Clock Lane) When this value is "1", the clock lane transitions to LP from HS is detected. Checking this bit during non-continuous clock mode operation is no meaning. So, ignore this bit when HSCLKSETR.HSCLKMODE=0b. Write "1" to PLSCR.CLHS2LP register to clear this field.
26	CLLP2HS	0	R	LP to HS (Clock Lane) When this value is "1", the clock lane transitions to HS from LP is detected. Checking this bit during non-continuous clock mode operation is no meaning. So, ignore this bit when HSCLKSETR.HSCLKMODE=0b. Write "1" to PLSCR.CLLP2HS register to clear this field.
25	CLFROMULPS	0	R	From ULPS (Clock Lane) When this value is "1", the clock lane exits from ULPS is detected. Write "1" to PLSCR.CLFROMULPS register to clear this field.
24	CLTOULPS	0	R	To ULPS (Clock Lane) When this value is "1", the clock lane enters to ULPS is detected. Write "1" to PLSCR.CLTOULPS register to clear this field.
23 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15	DL0DIR	0	R	Direction (Tx or Rx) of Data Lane0 0: PHY is in Tx Mode 1: PHY is in Rx Mode This field shows a status of direction on PPI data lane0 after synchronized to MIPI_DSI_LPCLK. So, this field does not show current status, during MIPI_DSI_LPCLK is not running.
14	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
13	DL0TX2RX	0	R	Tx to Rx on Data Lane0 When this value is “1”, the transition of Direction from 0 (Tx) to 1(Rx) is detected on Data Lane0. Write “1” to PLSCR.DL0TX2RX register to clear this field.
12	DL0RX2TX	0	R	Rx to Tx on Data Lane0 When this value is “1”, the transition of Direction from 1 (Rx) to 0(Tx) is detected on Data Lane0. Write “1” to PLSCR.DL0RX2TX register to clear this field.
11 to 8	DLSTPST	*1	R	Status of Stopstate on Data Lane bit 3: Stopstate of Data Lane3 bit 2: Stopstate of Data Lane2 bit 1: Stopstate of Data Lane1 bit 0: Stopstate of Data Lane0 This field shows a status of Stopstate on PPI data lane after synchronized to MIPI_DSI_LPCLK. So, this field does not show current status, during MIPI_DSI_LPCLK is not running.
7 to 4	DLULPSACTN	H’F	R	Status of UlpsActiveNot on Data Lane bit 3: UlpsActiveNot of Data Lane3 bit 2: UlpsActiveNot of Data Lane2 bit 1: UlpsActiveNot of Data Lane1 bit 0: UlpsActiveNot of Data Lane0 This field shows a status of UlpsActiveNot on PPI data lane after synchronized to MIPI_DSI_LPCLK. So, this field does not show current status, during MIPI_DSI_LPCLK is not running.
3	DL0RXULPSESC	0	R	Status of RxUlpsEsc on Data Lane0 This field shows a status of RxUlpsEsc on PPI data lane0 after synchronized to MIPI_DSI_LPCLK. So, this field does not show current status, during MIPI_DSI_LPCLK is not running.
2	DL0RXLPDTESC	0	R	Status of RxLpdtEsc on Data Lane0 This field shows a status of RxLpdtEsc on PPI data lane0 after synchronized to MIPI_DSI_LPCLK. So, this field does not show current status, during MIPI_DSI_LPCLK is not running.
1	CLSTPST	*2	R	Status of Stopstate on PPI Clock Lane This field shows a status of Stopstate on PPI clock lane after synchronized to MIPI_DSI_LPCLK. So, this field does not show current status, during MIPI_DSI_LPCLK is not running.
0	CLULPSACTN	1	R	Status of UlpsActiveNot on PPI Clock Lane This field shows a status of UlpsActiveNot on PPI clock lane after synchronized to MIPI_DSI_LPCLK. So, this field does not show current status, during MIPI_DSI_LPCLK is not running.

Note 1. This Initial Value depends on ppi_dl0_stopstate, ppi_dl1_stopstate, ppi_dl2_stopstate and ppi_dl3_stopstate.

Note 2. This Initial Value depends on ppi_cl_stopstate.

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29	DLFROMULPS	0	RW	Interrupt enable for the all data lane transition from ULPS 0: Disable interrupt of dsi_int_ppi when PLSR.DLFROMULPS =1 1: Enable interrupt of dsi_int_ppi when PLSR.DLFROMULPS =1
28	DLTOULPS	0	RW	Interrupt enable for the all data lane transition to ULPS 0: Disable interrupt of dsi_int_ppi when PLSR.DLTOULPS =1 1: Enable interrupt of dsi_int_ppi when PLSR.DLTOULPS =1
27	CLHS2LP	0	RW	Interrupt enable for the clock lane transition to LP from HS 0: Disable interrupt of dsi_int_ppi when PLSR.CLHS2LP=1 1: Enable interrupt of dsi_int_ppi when PLSR.CLHS2LP=1
26	CLLP2HS	0	RW	Interrupt enable for the clock lane transition to HS from LP 0: Disable interrupt of dsi_int_ppi when PLSR.CLLP2HS=1 1: Enable interrupt of dsi_int_ppi when PLSR.CLLP2HS=1
25	CLFROMULPS	0	RW	Interrupt enable for the clock lane transition from ULPS 0: Disable interrupt of dsi_int_ppi when PLSR.CLFROMULPS=1 1: Enable interrupt of dsi_int_ppi when PLSR.CLFROMULPS=1
24	CLTOULPS	0	RW	Interrupt enable for the clock lane transition to ULPS 0: Disable interrupt of dsi_int_ppi when PLSR.CLTOULPS=1 1: Enable interrupt of dsi_int_ppi when PLSR.CLTOULPS=1
23 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	DL0TX2RX	0	RW	Interrupt enable for the data lane 0 change direction from Tx to Rx 0: Disable interrupt of dsi_int_ppi when PLSR.DL0TX2RX =1 1: Enable interrupt of dsi_int_ppi when PLSR.DL0TX2RX =1
12	DL0RX2TX	0	RW	Interrupt enable for the data lane 0 change direction from Rx to Tx 0: Disable interrupt of dsi_int_ppi when PLSR.DL0RX2TX =1 1: Enable interrupt of dsi_int_ppi when PLSR.DL0RX2TX =1
11 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

34.3.1.44 Video-Input Channel 1 Set 0 Register (VICH1SET0R)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	VSEN	—	HFPNOLP	HBPNOLP	HSANOLP	—	—	—	—	—	—	VSTPAFT	VSTART
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R0W	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	—	0	RW	Reserved When read, the initial value is read. The written value will be ignored.
12	VSEN	0	RW	Video Skew Calibration Enable Skew Calibration is not supported. This bit should be fixed at 0.
11	—	0	RW	Reserved When read, the initial value is read. The written value will be ignored.
10	HFPNOLP	0	RW	HFP period No LP Set suppress not to transition LP during HFP period. 0: Does not suppress transition to LP during the period 1: Suppress transition to LP during the period and keep HS. HS is kept by sending blanking packet.
9	HBPNOLP	0	RW	HBP period No LP Set suppress not to transition LP during HBP period. 0: Does not suppress transition to LP during the period 1: Suppress transition to LP during the period and keep HS. HS is kept by sending blanking packet.
8	HSANOLP	0	RW	HSA period No LP Set suppress not to transition LP during HSA period. When TXESYNC=0, this field has no meaning. 0: Does not suppress transition to LP during the period 1: Suppress transition to LP during the period and keep HS. HS is kept by sending blanking packet.
7 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	—	0	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	VSTPAFT	0	R0W	Video-Input signals stop after Video-Input Operation stop Stop Video-Input Operation. Video-Input Operation will end at the end of video-frame. After Video-Input Operation end, stop Video-Input signals. If the Video-Input operation is stopped, VICH1SR.RUNNING bit will change to 0. Set “1” to both VSTPAFT and VSTART is prohibited. Set “1” during VICH1SR.RUNNING=0 is prohibited.

Bit	Bit Name	Initial Value	R/W	Description
0	VSTART	0	R0W	Video-Input Operation Start Write 1 to start Video-Input Operation. Set “1” to both VSTART and VSTPAFT is prohibited. Set “1” during VICH1SR.RUNNING=1 is prohibited.

34.3.1.45 Video-Input Channel 1 Set 1 Register (VICH1SET1R)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CSPC	—	BPP						CHBUFSZ				—	—	—	—
Initial Value	0	0	0	1	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	DLY												—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	CSPC	0	R	Color space of input video pixel This field reflects color space of VICH1PPSETR.DT selected data type. 0: RGB 1: Reserved
30	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29 to 24	BPP	H’10	R	Bit Per Pixel of input video pixel This field reflects bits per pixel of VICH1PPSETR.DT selected data type. H’10: Reserved H’12: 18bpp H’18: 24bpp, 18bpp Loosely (RGB)
23 to 20	CHBUFSZ	H’6	R	Channel Buffer Size H’6: 8kB
19 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17 to 16	—	H’3	R	Reserved When read, the initial value is read. The written value will be ignored.
15 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 2	DLY	All 0	RW	Delay Value The delay Time is calculated by formula of DLY * (period of high-speed serial UI * 32). Setting 0 to this field is prohibited. If VICH1SET0R.HFPNOLP=1, set this field more than HFP period. If VICH1SET0R.HBPNOLP=1, set this field more than HBP period. If VICH1SET0R.HSANOLP=1, set this field more than HSA period.
1 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

34.3.1.46 Video-Input Channel 1 Status Register (VICH1SR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	VBUFOVF	VBUFUDF	—	TIMERR	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	VIRDY	RUNNING	STOP	START
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
25, 24	—	00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23	VBUFOVF	0	R	Video-Input Buffer Overflow Error Data overflow is occurred in Video-Input Buffer. Write “1” to VICH1SCR.VBUFOVF register to clear this field.
22	VBUFUDF	0	R	Video-Input Buffer Underflow Error Data underflow is occurred in Video-Input Buffer. Write “1” to VICH1SCR.VBUFUDF register to clear this field.
21	—	0	R	Reserved When read, the initial value is read. The written value will be ignored.
20	TIMERR	0	R	Timing Error Timing error is occurred during video input operation. Write “1” to VICH1SCR.TIMERR register to clear this field.
19 to 15	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14	—	0	R	Reserved When read, the initial value is read. The written value will be ignored.
13 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	VIRDY	0	R	Video-Input Signal Accept Ready The value will be set to 1 when the input signal can accept by Video-Input Operation channel 1 ready.
2	RUNNING	0	R	Video-Input Operation channel 1 Transfer Running The value will be set to 1 during the Video-Input Operation channel 1 Transfer running. VICH1SET0R, VICH1SET1R, VICH1PPSETR, VICH1VSSETR, VICH1VPSETR, VICH1HSSETR and VICH1HPSETR are prohibited to change value during running (VICH1SR.RUNNING=1).
1	STOP	0	R	Video Input Operation channel 1 Transfer Stop Write “1” to VICH1SCR.STOP register to clear this field.
0	START	0	R	Video Input Operation channel 1 Transfer Start. Write “1” to VICH1SCR.START register to clear this field.

34.3.1.47 Video-Input Channel 1 Status Clear Register (VICH1SCR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R0W	R	R	R	R	R	R	R	R	R	R	R0W	R	R0W	R0W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30 to 26	—	All 0	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
25 to 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23	VBUFOVF	0	R0W	VICH1SR.VBUFOVF Clear Set to "1" to clear VICH1SR.VBUFOVF. Writing "0" has no effect.
22	VBUFUDF	0	R0W	VICH1SR.VBUFUDF Clear Set to "1" to clear VICH1SR.VBUFUDF. Writing "0" has no effect.
21	—	0	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
20	TIMERR	0	R0W	VICH1SR.TIMERR Clear Set to "1" to clear VICH1SR.TIMERR. Writing "0" has no effect.
19 to 15	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14	—	0	R0W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
13 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	VIRDY	0	R0W	VICH1SR.VIRDY Clear Set to "1" to clear VICH1SR.VIRDY. Writing "0" has no effect.
2	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	STOP	0	R0W	VICH1SR.STOP Clear Set to "1" to clear VICH1SR.STOP. Writing "0" has no effect.
0	START	0	R0W	VICH1SR.START Clear Set to "1" to clear VICH1SR.START. Writing "0" has no effect.

34.3.1.48 Video-Input Channel 1 Interrupt Enable Register (VICH1IER)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	VBUFOVF	VBUFUDF	—	TIMERR	—	—	—	—

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	R	R	R	R	R	R	R	R	R	R	RW	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30 to 26	—	All 0	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
25, 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23	VBUFOVF	0	RW	Interrupt enable for the Video-Input Buffer Overflow Error 0: Disable interrupt of dsi_int_vin1 when VICH1SR.VBUFOVF=1 1: Enable interrupt of dsi_int_vin1 when VICH1SR.VBUFOVF=1
22	VBUFUDF	0	RW	Interrupt enable for the Video-Input Buffer Underflow Error 0: Disable interrupt of dsi_int_vin1 when VICH1SR.VBUFUDF=1 1: Enable interrupt of dsi_int_vin1 when VICH1SR.VBUFUDF=1
21	—	0	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
20	TIMERR	0	RW	Interrupt enable for the Timing Error 0: Disable interrupt of dsi_int_vin1 when VICH1SR.TIMERR=1 1: Enable interrupt of dsi_int_vin1 when VICH1SR.TIMERR=1
19 to 15	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14	—	0	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
13 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	VIRDY	0	RW	Interrupt enable for the Video Input Accept Ready 0: Disable interrupt of dsi_int_vin1 when VICH1SR.VIRDY=1 1: Enable interrupt of dsi_int_vin1 when VICH1SR.VIRDY=1
2	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	STOP	0	RW	Interrupt enable for the Video Input Operation channel 1Transfer Stop 0: Disable interrupt of dsi_int_vin1 when VICH1SR.STOP=1 1: Enable interrupt of dsi_int_vin1 when VICH1SR.STOP=1
0	START	0	RW	Interrupt enable for the Video Input Operation channel 1 Transfer Start 0: Disable interrupt of dsi_int_vin1 when VICH1SR.START=1 1: Enable interrupt of dsi_int_vin1 when VICH1SR.START=1

34.3.1.49 Video-Input Channel 1 Pixel Packet Set Register (VICH1PPSETR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	VC		DT

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30	RXAKE	0	R	Receive Acknowledge and Error Report Packet RXSR.RXAKE is also reported. Write “1” to SQCHxSCR.RXAKE register to clear this field.
29	RXCORERR	0	R	Receive Correctable Error Received packet has Correctable Error. RXSR.ECCERR1B is also reported. Write “1” to SQCHxSCR.RXCORERR register to clear this field.
28	RXPKTDFAIL	0	R	Receive Packet Data Fail Packet Header Saved Correctly but Data did not save correctly. One or more of the following bits are also reported. RXSR.CRCERR, RXSR.WCERR, RXSR.UEXPKTERR, RXSR.MAXRPSZERR, RXSR.RXOVFERR or RXSR.IBERR. Write “1” to SQCHxSCR.RXPKTDFAIL register to clear this field.
27	RXFAIL	0	R	Receive Fail Expected receive did not done. One or more of the following bits are also reported. RXSR.PRESPTOERR, RXSR.ECCERR, RXSR.MLFERR or RXSR.NORETERR. Write “1” to SQCHxSCR.RXFAIL register to clear this field.
26	RXFATALERR	0	R	Receive Fatal Error Fatal timeout occurred during BTA. One or more of the following bits are also reported. FERRSR.TATO or FERRSR.LRXHTO. Write “1” to SQCHxSCR.RXFATALERR register to clear this field.
25	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	TXIBERR	0	R	Tx Internal Bus Error When this value is “1”, the Internal Bus Read had failed response. Write “1” to SQCHxSCR.TXIBERR register to clear this field.
23	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	—	0	R	Reserved When read, the initial value is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
21, 20	—	00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	PKTBIGERR	0	R	Packet is too big Error Sequence operation channel 0: Hard wired to 0. Sequence operation channel 1: This bit is asserted when length of sequence packet is bigger than Video-Input channel’s BLLP. Write “1” to SQCHxSCR.PKTBIGERR register to clear this field.
18, 17	—	00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16, 15	—	00	R	Reserved When read, the initial value is read. The written value will be ignored.
14 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	ADESFIN	0	R	All Descriptor Finished by Setting Descriptor finished by descriptor SQCHxDSCyAR.NXACT=H’0 setting. Write “1” to SQCHxSCR.ADESFIN register to clear this field.
7 to 5	—	000	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	AACTFIN	0	R	Descriptor’s All Action Finished This bit is set if this descriptor’s all action finished with SQCHxDSCyCR.FINACT[0] =1b. Write “1” to SQCHxSCR.AACTFIN register to clear this field.
3	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	RUNNING	0	R	Sequence Operation Running The value will be set to 1 during the sequence operation running. Do not change descriptor values while this bit is 1. Do not change the values in SQCHxSET0R and SQCHxSET1R.
1, 0	—	00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

34.3.1.57 Sequence Channel x Status Clear Register (SQCHxSCR)

“x” indicates channel number.

“x” is 0 or 1.

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	*2	RW	Reserved When read, the last written value is read. When writing, be sure to write 0. Operation is not guaranteed if a value other than 0 is written.
29 to 28	NXACT	*2	RW	Next Action H'0: Terminate Operation after this descriptor finished. H'1: Operate next descriptor after this descriptor finished H'2: Reserved H'3: Reserved
27 to 26	BTA	*2	RW	Bus Turn Around Set Tx Request or no-operation with Bus Turn-Around (BTA) or not. H'0: Tx Request without BTA or no-operation. H'1: Tx non-Read Request with BTA. H'2: Tx Read Request with BTA. H'3: BTA only
25	SPD	*2	RW	Speed Set the speed type in Tx Request. 0: High Speed 1: Low Power Prohibited to set this bit 1 during Video-Input Operation running.
24	FMT	*2	RW	Format Packet format of Tx Packet Header. This field should be set by the data type. 0: Short Packet 1: Long Packet
23 to 22	VC	*2	RW	Virtual Channel Identifier of virtual channel of Tx Packet Header.
21 to 16	DT	*2	RW	Data Type Data type of Tx Packet Header.
15 to 8	DATA1	*2	RW	Data 1 Data1 of Tx Packet Header.*1 When Tx Packet format is Long Packet, this value is upper 8 bits of the word count.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	DATA0	*[2]	RW	Data 0 Data0 of Tx Packet Header.*[1] When Tx Packet format is Long Packet, this value is lower 8 bits of the word count.

Note 1. • The maximum size for Command Transfer mode Long Packet by using Register is 16 Byte.
(SQCHxDSCyBR.DTSEL = H’0 and SQCHxDSCyAR.FMT=1)
• The maximum size for Command Transfer mode Long Packet by using internal bus memory is SQCHxSET1R.CHBUFSZ Byte.
(SQCHxDSCyBR.DTSEL = H’1 and SQCHxDSCyAR.FMT=1)

Note 2. Initial Values are determined by initial value of Descriptor RAM.

34.3.1.60 Sequence Channel x Descriptor y-B Register (SQCHxDSCyBR)

“x” indicates channel number.

“x” is 0 or 1.

“y” indicates descriptor number.

“y” is 0 to 7.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LADDR	*1	RW	Lower Address Set Lower 32 bits address for long packet Payload Data in Sequence Operation channel x Descriptor y. When Sequence Operation Data Select is “use memory space” (SQCHxDSCyBR.DTSEL =H’1) and Sequence Operation Format is Long packet (SQCHxDSCyAR.FMT=1b), the DSI-Tx Module accesses the address by internal bus Master Read in Write action and internal bus Write in Read action. Set lower three bits to “000b”.

Note 1. Initial Values are determined by initial value of Descriptor RAM.

34.3.2 Resisters in D-PHY

34.3.2.1 DSI D-PHY Control Register 0 (DSIDPHYCTRL0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CAL_EN_HSRX_OFS

7 to 0	THS_ZERO	11	RW	Timing parameter*1

Note 1. **Table 34.6** lists the recommended setting values.

34.4 Operation

34.4.1 Interrupts

Interrupts can be divided into the following categories:

Table 34.7 Interrupt Signals (1/2)

Interrupt Signal	Category	Interrupt Condition	Interrupt Source Register
dsi_int_sq0	Sequence operation channel 0 interrupt	Receive Acknowledge and Error Report Packet in Sequence Operation BTA	SQCH0SR.RXAKE
		Receive Correctable Error in Sequence Operation BTA	SQCH0SR.RXCORERR
		Receive Packet Data Error in Sequence Operation BTA	SQCH0SR.RXPKTDFAIL
		Receive Fail Error in Sequence Operation BTA	SQCH0SR.RXFAIL
		Receive Fatal Error in Sequence Operation BTA	SQCH0SR.RXFATALERR
		Transmit Internal Bus Error in Sequence Operation	SQCH0SR.TXIBERR
		Descriptor Finished by Setting in Sequence Operation	SQCH0SR.ADESFIN
		Descriptor’s All Action Finished in Sequence Operation	SQCH0SR.AACTFIN
dsi_int_sq1	Sequence operation channel 1 interrupt	Receive Acknowledge and Error Report Packet in Sequence Operation BTA	SQCH1SR.RXAKE
		Receive Correctable Error in Sequence Operation BTA	SQCH1SR.RXCORERR
		Receive Packet Data Error in Sequence Operation BTA	SQCH1SR.RXPKTDFAIL
		Receive Fail Error in Sequence Operation BTA	SQCH1SR.RXFAIL
		Receive Fatal Error in Sequence Operation BTA	SQCH1SR.RXFATALERR
		Transmit Internal Bus Error in Sequence Operation	SQCH1SR.TXIBERR
		Transmit Packet is too big Error in Sequence Operation	SQCH1SR.PKTBIGERR
		Descriptor Finished by Setting in Sequence Operation	SQCH1SR.ADESFIN
		Descriptor’s All Action Finished in Sequence Operation	SQCH1SR.AACTFIN
dsi_int_vin1	Video-Input operation channel 1 interrupt	Transmit Buffer Overflow in Video-Input Operation	VICH1SR.VBUFOVF
		Transmit Buffer Underflow in Video-Input Operation	VICH1SR.VBUFUDF
		Transmit Timing Error in Video-Input Operation	VICH1SR.TIMERR
		Video-Input Signal Accept Ready	VICH1SR.VIRDY
		Video-Input Operation Stopped	VICH1SR.STOP
		Video-Input Operation Started	VICH1SR.START

Table 34.7 Interrupt Signals (2/2)

Interrupt Signal	Category	Interrupt Condition	Interrupt Source Register
dsi_int_rcv	DSI Packet Receive interrupt	Receive Acknowledge and Error Report Packet	RXSR.RXAKE
		ECC 1bit Error	RXSR.ECCERR1B
		Maximum Return Packet Size Error	RXSR.MAXRPSZERR
		No Return Error	RXSR.NORETERR
		Peripheral Response timeout	RXSR.PRESPTOERR
		Receive Buffer overflow error	RXSR.RXOVFERR
		Internal Bus Error detect on data save	RXSR.IBERR
		CRC Error	RXSR.CRCERR
		Word Count Error	RXSR.WCERR
		Unexpected Packet Error	RXSR.UEXPKTERR
		ECC Error	RXSR.ECCERR
		Malformed Error	RXSR.MLFERR
		External Tearing Effect	RXSR.EXTTEDET
		Receive ACK trigger	RXSR.RXACK
		Receive Tearing Effect trigger	RXSR.RXTE
		Receive Reset trigger	RXSR.RXRTRG
		Receive Unknown-5 trigger	RXSR.RXUK5TRG
		Receive EoTp	RXSR.RXEOTP
		Receive Response packet	RXSR.RXRESP
		Turnaround Acknowledge Timeout	RXSR.TATO
		LP-RX Host Processor Timeout	RXSR.LRXHTO
		BTA request End	RXSR.BTAREQEND
dsi_int_ferr	DSI Fatal Error interrupt	Contention Error LP1	FERRSR.ERRCLP1
		Contention Error LP0	FERRSR.ERRCLP0
		Control Error	FERRSR.ERRCTRL
		Sync Escape Error	FERRSR.ERRSYNESC
		Error Escape	FERRSR.ERRESC
		Turnaround Acknowledge Timeout	FERRSR.TATO
		LP-RX Host Processor Timeout	FERRSR.LRXHTO
		HS TX Timeout	FERRSR.HTXTO
dsi_int_ppi	DSI D-PHY PPI interrupt	Data Lanes return from ULPS	PLSR.DLFROMULPS
		Data Lanes go to ULPS	PLSR.DLTOULPS
		Clock Lane change HS to LP	PLSR.CLHS2LP
		Clock Lane change LP to HS	PLSR.CLLP2HS
		Clock Lanes return from ULPS	PLSR.CLFROMULPS
		Clock Lanes go to ULPS	PLSR.CLTOULPS
		Data Lane 0 change TX to RX	PLSR.DL0TX2RX
		Data Lane 0 change RX to TX	PLSR.DL0RX2TX

The interrupt signal consists of combination logic. The interrupt signal from a Status Register is enabled by the signal related Interrupt Enable Register. These interrupt signals are bound by OR logic.

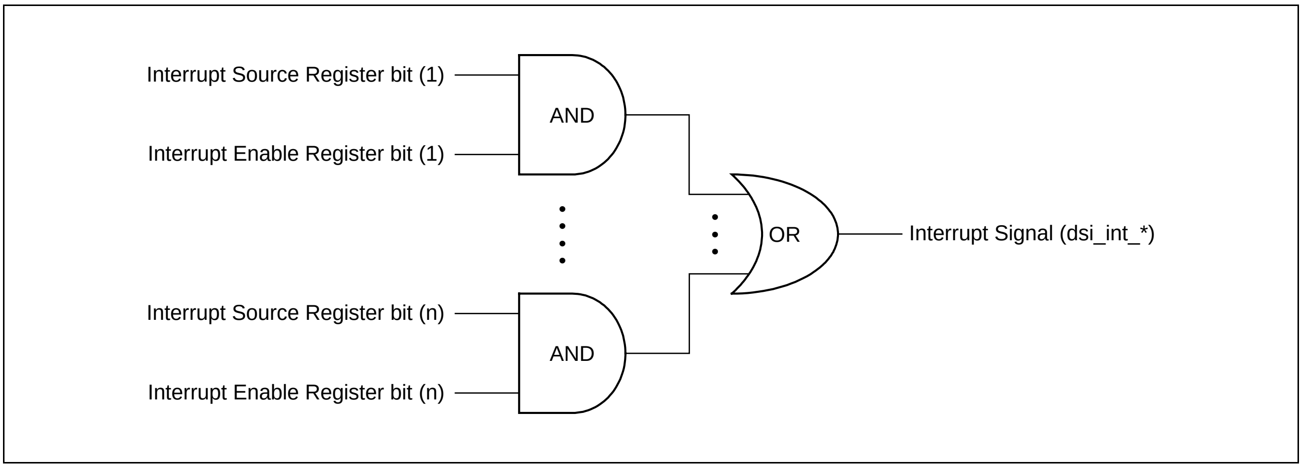

Figure 34.4 Interrupt signal output

34.4.2 Operation Flow

This chapter shows various operation procedures for using the DSI-Tx Module. As for the interrupt operation, Interrupt Enable bit of each interrupt source is enabled (set to 1) before use, and after confirming the interrupt, the interrupt source is cleared. And more, previous action's interrupt source must be cleared before setting the interrupt enable. Flows in this chapter indicate only interrupt bit. The DSI-Tx Module does not care whether firmware use the bits by interrupt action or flag polling action. These descriptions are omitted in each flow in this chapter unless otherwise specified. Error checks are also omitted in normal flow.

34.4.2.1 Reset

(1) Power on Reset and Initial Settings for All Operations

The power on sequence of the DSI-Tx Module is shown **Figure 34.5**.

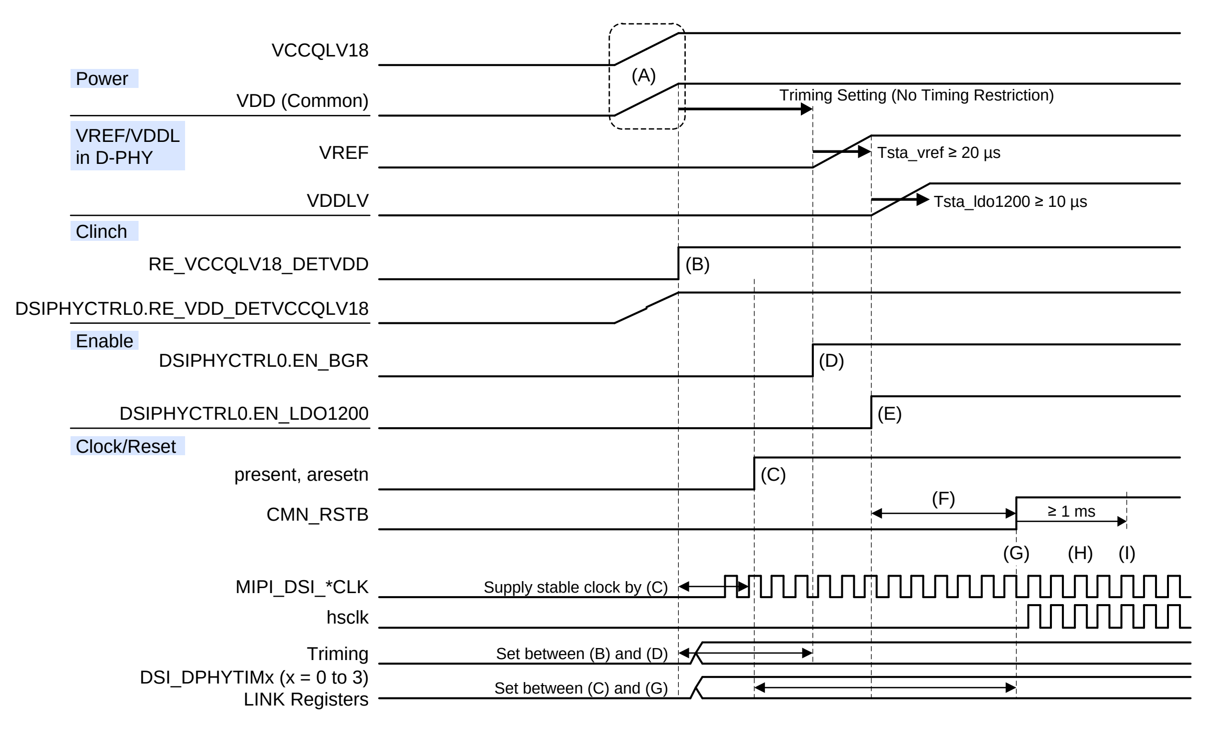

Figure 34.5 Power on sequence

(A) Bring up VDD and VCCQLV18. There are no restrictions on the order to bring up VDD and VCCQLV18.

(B) Set 1 to RE_VCCQLV18_DETVDD.

(C) De-assert preestn and aresetn after after MIPI_DSI_*CLK is stable.

(D) Write 1 to DSIDPHYCTRL0.EN_BGR.

(E) Write 1 to DSIDPHYCTRL0.EN_LDO1200 after waiting for more than 20 usec.

(F) Write DSIDPHYTIMx (x=0 to 3) registers and LINK registers after waiting for more than 10 usec.

(G) De-assert CMN_RSTB.

(H) Wait for more than 1 msec.

(I) The DSI-Tx Module is ready.

At power-on reset, all registers of the DSI-Tx Module are initialized.

Perform the initial settings of the register after canceling the power-on reset. It is not necessary to set the register that is used with the default value.

The registers that need to be initialized are as follows.

- Common Settings
  - TXSETR
  - ULPSSETR
  - DSISETR
  - CLSTPTSETR
  - LPTRNSTSETR
- Timeout Settings
  - PRESPTOBTASETR
  - PRESPTOLPSETR
  - PRESPTOHSSETR
  - HSTXTOSETR
  - LRXHTOSETR
  - TATOSETR

These registers can only be changed during the initial setup after a power-on reset and during a software reset in **Section 34.4.2.1(2)**. It is prohibited to change at any other time

(2) Software Reset

Figure 34.6 shows the operation during software reset. Make sure that APB clock (MIPI_DSI_PCLK), Internal Bus clock (MIPI_DSI_ACLK), Video clock (MIPI_DSI_VCLK), PLL Multiplied clock (MIPI_DSI_PLLCLK), Escape mode Transmit clock (MIPI_DSI_LPCLK) are running and CMN_RSTB is High before starting software reset.

Writing 1 to RSTCR.SWRST will issue a software reset. After issuing the software reset, check the start of the software reset process with RSTSR.SWRSTxx = 1. Then write 1 to RSTCR.FCETXSTP to transition the valid data lane of the D-PHY to the Tx Stop State. By checking RSTSR.DL0DIR = 0 and RSTSR.DLSTPST [x] = 1 of the valid data lane, it is possible to confirm that the valid data lane of D-PHY has transitioned to Tx Stop State. After confirming that the valid data lane of the D-PHY has transitioned to the Tx Stop State, write 0 to RSTCR.FCETXSTP. Then write 0 to RSTCR.SWRST and check the completion of the software reset process with RSTSR.SWRSTx = 0. Since all registers are synchronously reset except for some registers*[1], the software reset process is not completed even if a software reset is issued while the clock is stopped.

Note 1. Registers that require initial settings as described in **Section 34.4.2.1(1)**, GPO0R register, GPO1R register, RSTCR register, RSTSR register, and SQCHxDSCyAR – SQCHxDSCyDR register are not initialized by software reset.

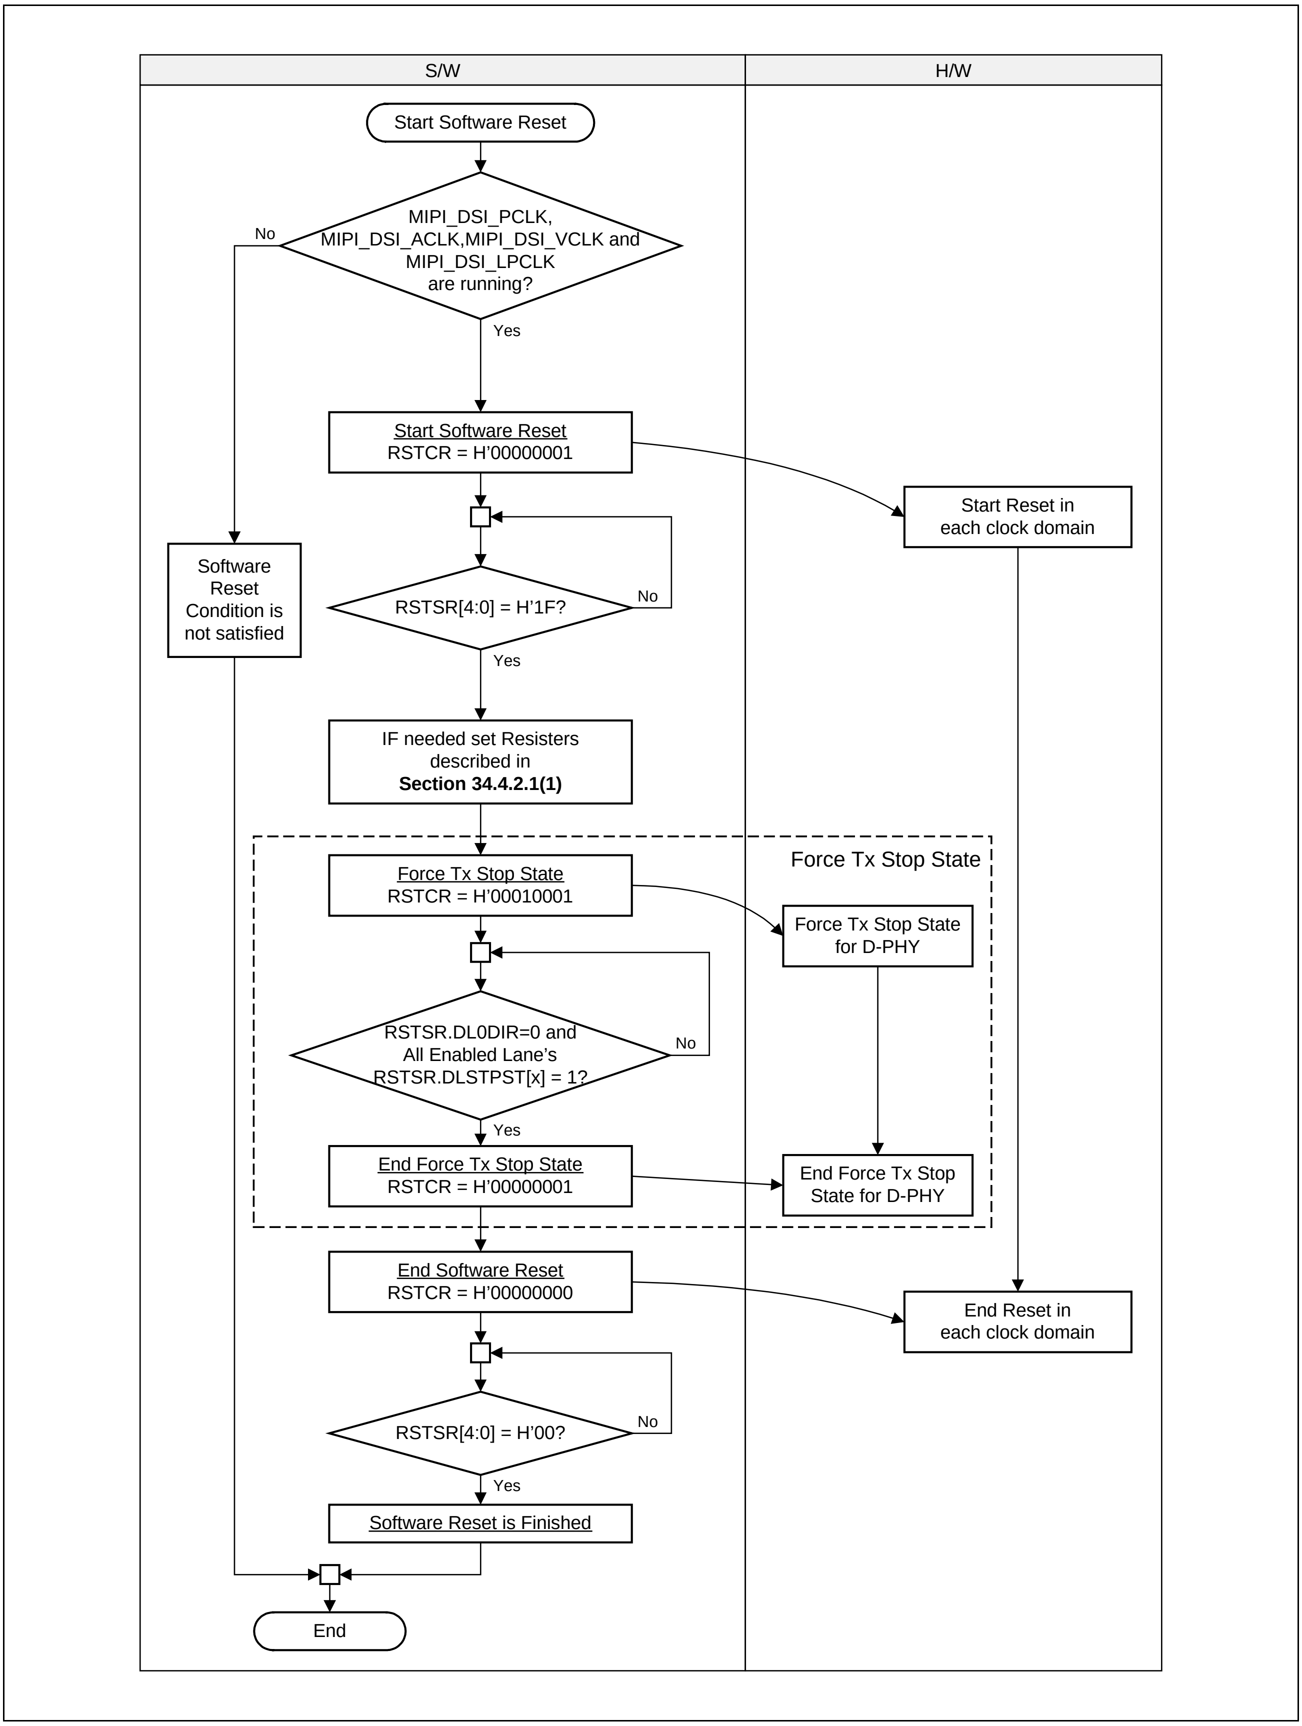

Figure 34.6 Software Reset

34.4.2.2 Start/Stop of HS clock

The following describes the HS Clock Start / Stop sequence. HS Clock Start / Stop is controlled by Software.

Figure 34.7 shows the operation at HS Clock Start.

Write 1 to TXSETR.CLEN to enable DPHY clock lanes before starting Video-Input Operation or Sequence Operation channel 1 operation.

After the clock lane is enabled and the source clock of the clock lane is stable, write 1 to HSCLKSETR.HSCLKRUN to set the clock lane to HS. It is forbidden to change HSCLKRUN while Sequence Channel is in operation.

At the same time as writing 1 to HSCLKSETR.HSCLKRUN, set continuous clock mode and non-continuous clock mode with HSCLKSETR.HSCLKMODE.

In continuous clock mode, always set the clock lane to HS. PLSR.CLLP2HS is set to 1 when the clock lane transitions from LP to HS. After checking, perform the following operations.

In non-continuous clock mode, the DSI-Tx Module automatically transitions the clock lane from LP to HS depending on the presence or absence of HS Transmission. PLSR.CLLP2HS and PLSR.CLHS2LP are set for each transition, but confirmation is not required.

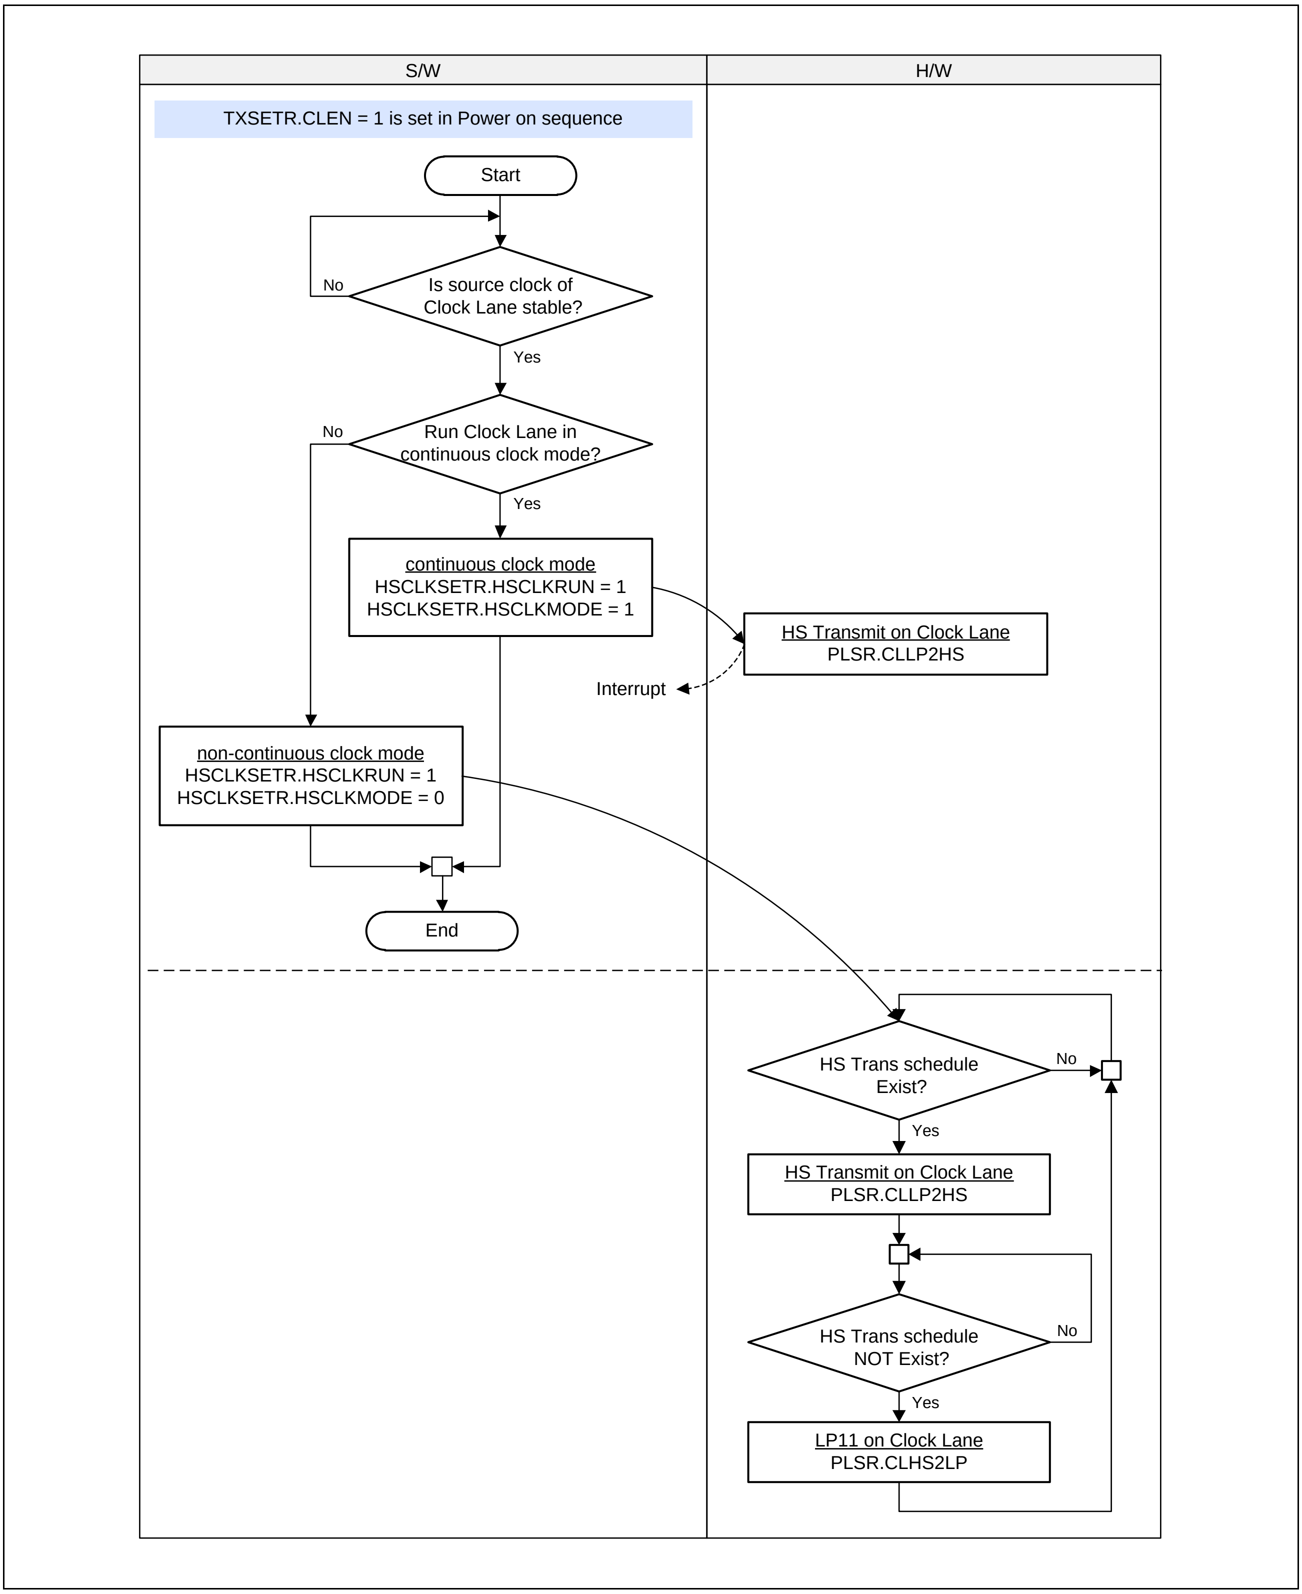

Figure 34.7 Start of HS clock

Figure 34.8 shows the operation when HS Clock Stop. After confirming that Video-Input Operation and Sequence Operation channel 1 are not running, write 0 to HSCLKSETR.HSCLKRUN to make the clock lane LP. PLSR.CLHS2LP is set to 1 when the clock lane transitions from HS to LP. In non-continuous clock mode, you do not need to check PLSR.CLHS2LP because the clock lane is likely to be LP already when you write 0 to HSCLKSETR.HSCLKRUN. It is possible to check the clock lane status by reading PLSR.CLSTPST.

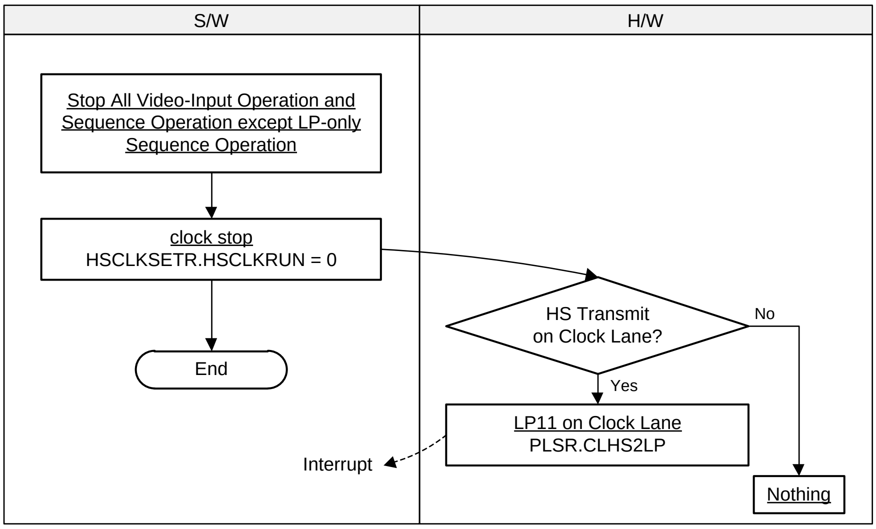

Figure 34.8 Stop of HS clock

34.4.2.3 Sequence Operation

(1) Basic Running Sequence

Sequence Operation requires initial settings before the operation starts.

- Channel Register Setting
  - Set SQCHxSET1R, SQCHxIER
- Prepare Write Data
  - Prepare Write Data to Memory Area
  - Prepare Write Data to TXPPDxR Registers
- Allocate Read Data Area
  - Clear RXRSSR Register if previous valid flag remains.
  - Allocate each read action's Memory area.
- Write all Descriptors
- Confirm running HSCLK if Sequence channel 1 is targeted to run.

When "1" is written to SQCHxSET0R.START, Sequence Operation channel x starts the processing of Descriptor, and when the processing of Descriptor of SQCHxDSCyAR.NXACT = "00b" is completed, the processing of Descriptor ends.

Since Descriptor consists of SRAM, the initial value is indefinite. When the user sets the Descriptor, set all the bits.

After writing 1 to SQCHxSET0R.START on Sequence Operation channel x and SQCHxSR.RUNNING becomes 1, It is prohibited to change the settings of SQCHxSET1R, SQCHxDSCyAR, SQCHxDSCyBR, SQCHxDSCyCR, and SQCHxDSCyDR until SQCHxSR.RUNNING becomes 0.

HS-related operations are prohibited on Sequence Operation channel 0.

(2) Single Packet Transmission

The following describes sending non-read packets using the Sequence Operation channel.

For non-read packet transmission, set the following registers before packet transmission.

SQCHxDSCyAR.NXACT: "00b"

SQCHxDSCyAR.FMT: "0b" Short Packet or "1b" Long Packet

SQCHxDSCyAR.SPD: "0b" High Speed or "1b" Low Speed

SQCHxDSCyAR.BTA: "00b" without BTA or "01b" with BTA

SQCHxDSCyAR.VC, DT, DATA0, DATA1

SQCHxDSCyBR.DTSEL: Specify payload data storage location for non-read packets

"00b" TXPPD0R – TXPPD3R. Payloads size is limited up to 16 Bytes.

"01b" Memory space. Payloads size is limited up to SQCHxSET1R.CHBUFSZ Bytes.

SQCHxDSCyCR.AUXOP "0b"

When setting a Long Packet with SQCHxDSCyAR.FMT, prepare the payload data in the location specified by SQCHxDSCyBR.DTSEL in the form of little endian.

No payload data is required when configuring Short Packets with SQCHxDSCyAR.FMT.

After the above settings, write “1” to SQCHxSET0R.START to send non-read packets.

The user can know the completion of Single Packet Transmission by asserting SQCHxSR.ADESFIN.

If “01b” is set in SQCHxDSCyAR.BTA, BTA is performed after sending a non-read packet.

An ACK trigger or Acknowledge and Error Report Packet may be received when the bus rights are transferred to the peripheral.

The user can get an overview of the reception result by reading the RXRSSxR register with the number specified by SQCHxDSCyCR.ACTCODE. Also, by reading the RXSR register, the user can know the details of the reception result.

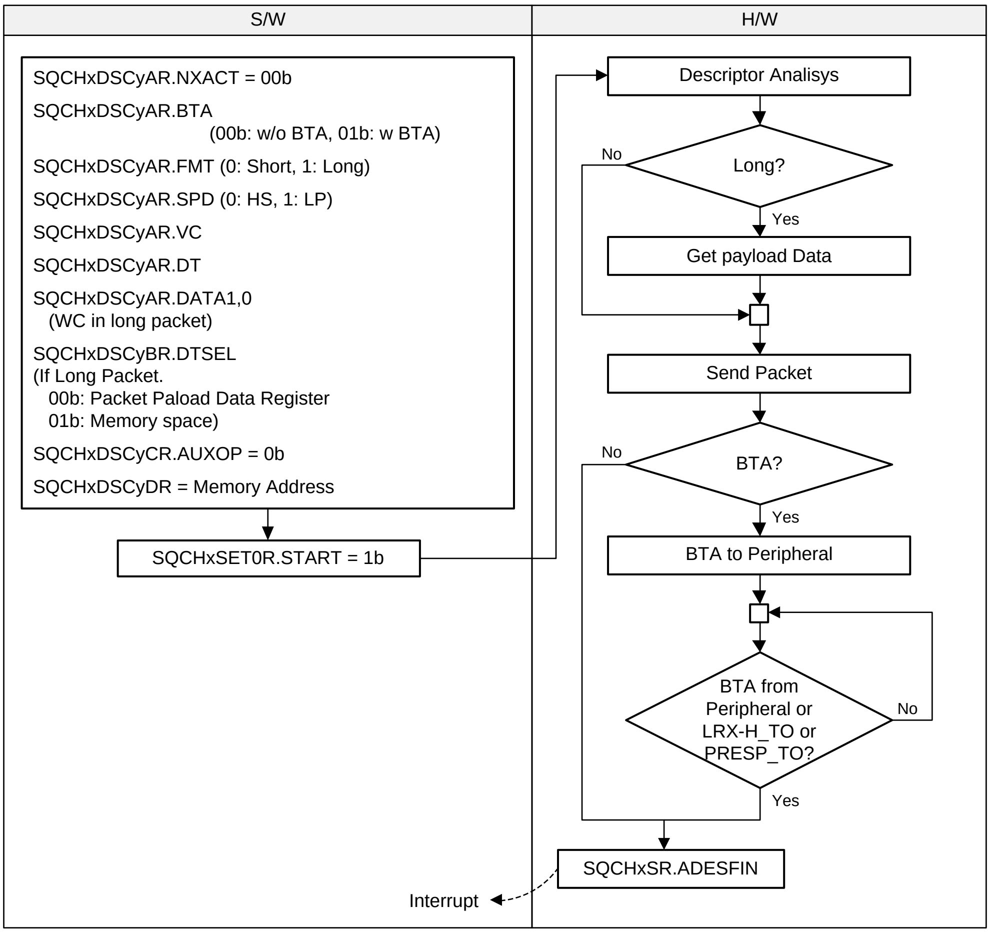

Figure 34.9 Single Packet Transfer

(3) Single Packet Reception

This section describes sending read packets and receiving response packets using the Sequence Operation channel.

Since the read packet is a short packet, set the following registers before sending the packet.

SQCHxDSCyAR.NXACT: “00b”

SQCHxDSCyAR.FMT: “0b” Short Packet

SQCHxDSCyAR.SPD: “0b” High Speed or “1b” Low Speed

SQCHxDSCyAR.BTA: “10b” Read Request with BTA

SQCHxDSCyAR.VC, DT, DATA0, DATA1

SQCHxDSCyBR.DTSEL: Specify the payload data storage location of the response packet

“00b” RXPPD0R – RXPPD3R. Payloads size is limited up to 16 Bytes.

“01b” Memory space. Payloads size is limited up to RXBUFSZR.RXBUFSZ Bytes.

SQCHxDSCyCR.AUXOP: “0b”

SQCHxDSCyCR.ACTCODE: Rx Result Save Slot number

When SQCHxDSC00BR.DTSEL = “00b” is set, receiving payload data of 17 bytes or more is not supported. Therefore, if there is a possibility of receiving payload data of 17 bytes or more, please set SQCHxDSC00BR.DTSEL = “01b”.

After the above settings, write “1” to SQCHxSET0R.START to send the read packet.

BTA is performed after sending the read packet. When the bus right is transferred to the peripheral, the response packet is received. At this time, the Acknowledge and Error Report Packet may also be received at the same time.

The user can know the completion of Single Packet Reception by asserting SQCHxSR.ADESFIN.

The user can get an overview of the reception result by reading the RXRSSxR register with the number specified by SQCHxDSCyCR.ACTCODE, and can know the details of the previous reception result by reading the RXSR register.

If the received response packet is a Short Packet or a Long Packet with WC = 0, the setting value of SQCHxDSC00BR.DTSEL is meaningless.

Figure 34.10 shows the flow of Single Packet Reception.

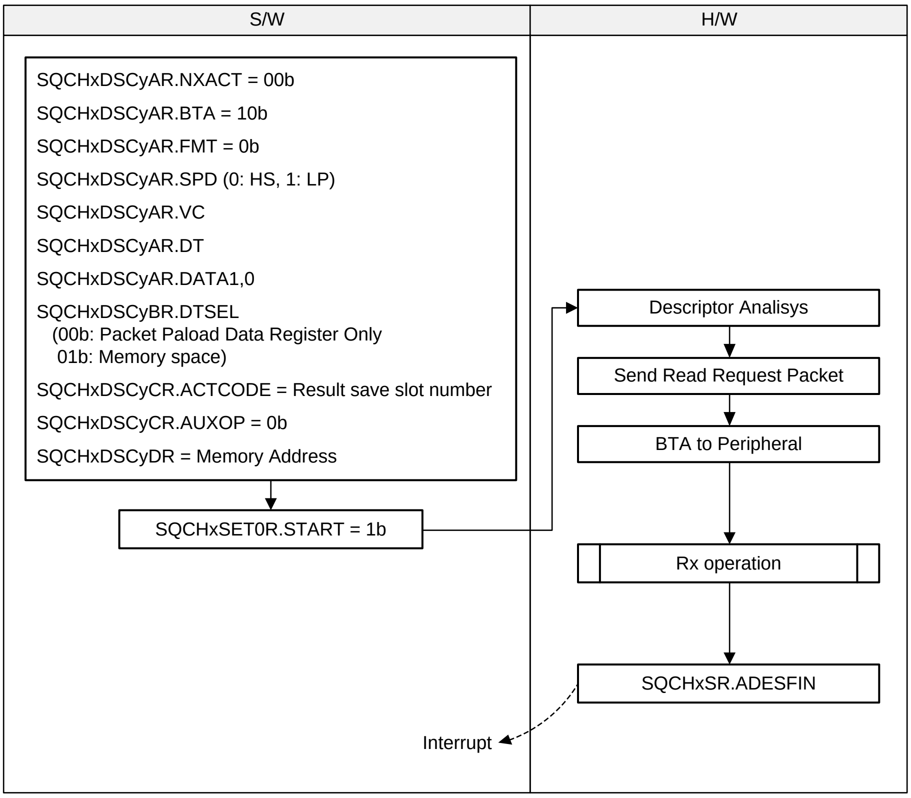

Figure 34.10 Single Packet Receive

(4) Reset Trigger Transmission

The DSI-Tx Module can send triggers using the Sequence Operation channel.

Since the DSI-Tx Module is a host, the only trigger that can be sent is a reset trigger.

After setting SQCHxDSCyAR.NXACT = “00b”, SQCHxDSCyCR.AUXOP = “1b”, and SQCHxDSCyCR.ACTCODE = “H’00”, write “1” to SQCHxSET0R.START to send a reset trigger.

The user can know the completion of reset trigger transmission by asserting SQCHxSR.ADESFIN.

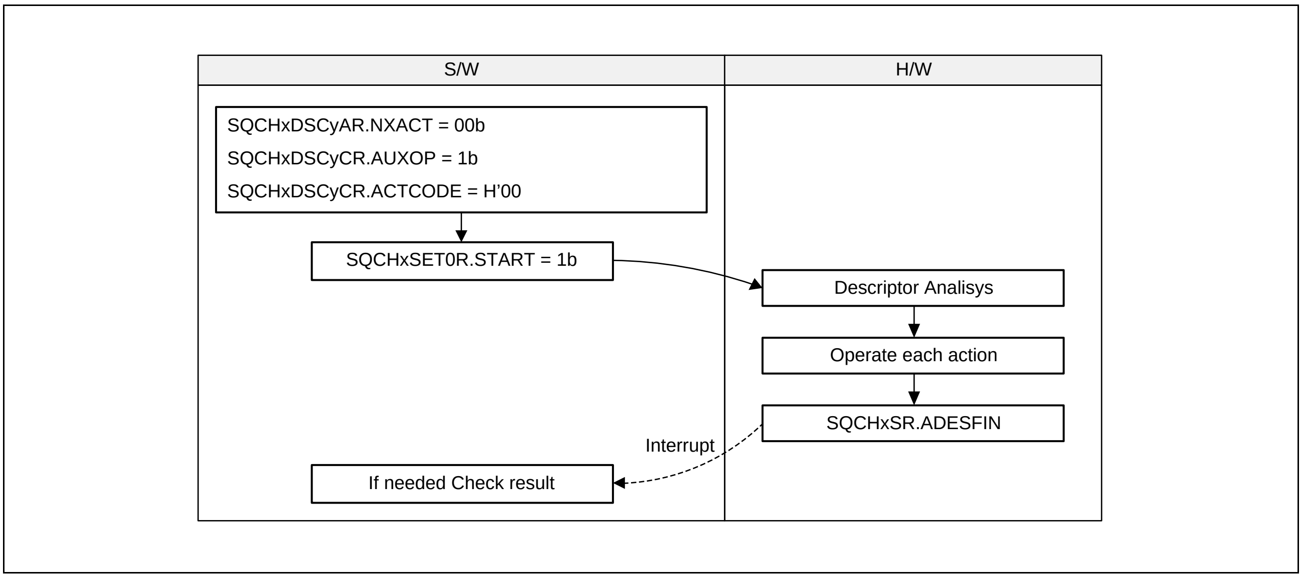

Figure 34.11 Trigger transmission

(5) Execute Operation in Sequence

The following describes the descriptor in Sequence Operation.

By writing “1” to SQCHxSET0R.START, Sequence Operation channel x will be enabled and processing will be performed from descriptor # 0.

When the processing of the corresponding descriptor is completed, the next processing follows SQCHxDSCyAR.NXACT.

SQCHxDSCyAR.NXACT= “00b”: Sequence Operation channel x stop after the processing of the corresponding descriptor is completed

SQCHxDSCyAR.NXACT= “01b”: After the processing of the corresponding descriptor is completed, the next descriptor is executed. The next descriptor after descriptor # N is descriptor # (N + 1).

(6) Receiving EoTp

The DSI-Tx Module can receive End of Transmission Packets (EoTp).

The DSI-Tx Module notifies the reception of EoTp by setting RXSR.RXEOTP to “1”.

(7) Acknowledge and Error Reporting Mechanism

The user can know the reliability of the serial bus by using “Acknowledge and Error Reporting Mechanism”.

If Peripheral detects an error on the serial bus during the period from the previous Peripheral to Host communication to this Peripheral to Host communication, Peripheral will send an “Acknowledge and Error Report” packet.

When the DSI-Tx Module receives the "Acknowledge and Error Report” packet, it sets “1” to RXRSSxR.RXAKE, RXSR.RXAKE, and SQCHxSR.RXAKE. The Virtual Channel Identifier and Error Report of the latest “Acknowledge and Error Report” packet received are stored in the AKEPLATIR register, and the integrated value is displayed in the AKEPACMSR register.

34.4.2.4 Video-Input Operation

(1) Start of Video-Input Operation

The procedure for Start of Video-Input Operation is shown in **Figure 34.12**.

1. Initialize common settings. Refer **Section 34.4.2.1(1)**.
2. Some peripheral setting may be done by Sequence operation. Since it is differed from peripheral devices, it is out of this document.
3. Confirm Video-Input clock and hsclk stable and set HS clock. Refer **Section 34.4.2.2**.
4. Set Video-Input Operation channel parameters (VICH1PPSETR, VICH1VSSETR, VICH1VPSETR,VICH1HSSETR, VICH1HPSETR)
5. Calculate VICH1SET1R.DLY value and set. Refer **Section 34.4.2.4(7)**.
6. Set “1” to VICH1SET0R.VSTART with other VICH1SET0R setting values.
7. Wait until VICH1SR.VIRDY=1.
8. Start Video signal input

VICH1SET0R, VICH1SET1R, VICH1PPSETR, VICH1VSSETR, VICH1VPSETR, VICH1HSSETR and VICH1HPSETR are prohibited to change value between VICH1SET0R.VSTART=1 and VICH1SR.RUNNING=0 after VICH1SET0R.STOP=1.

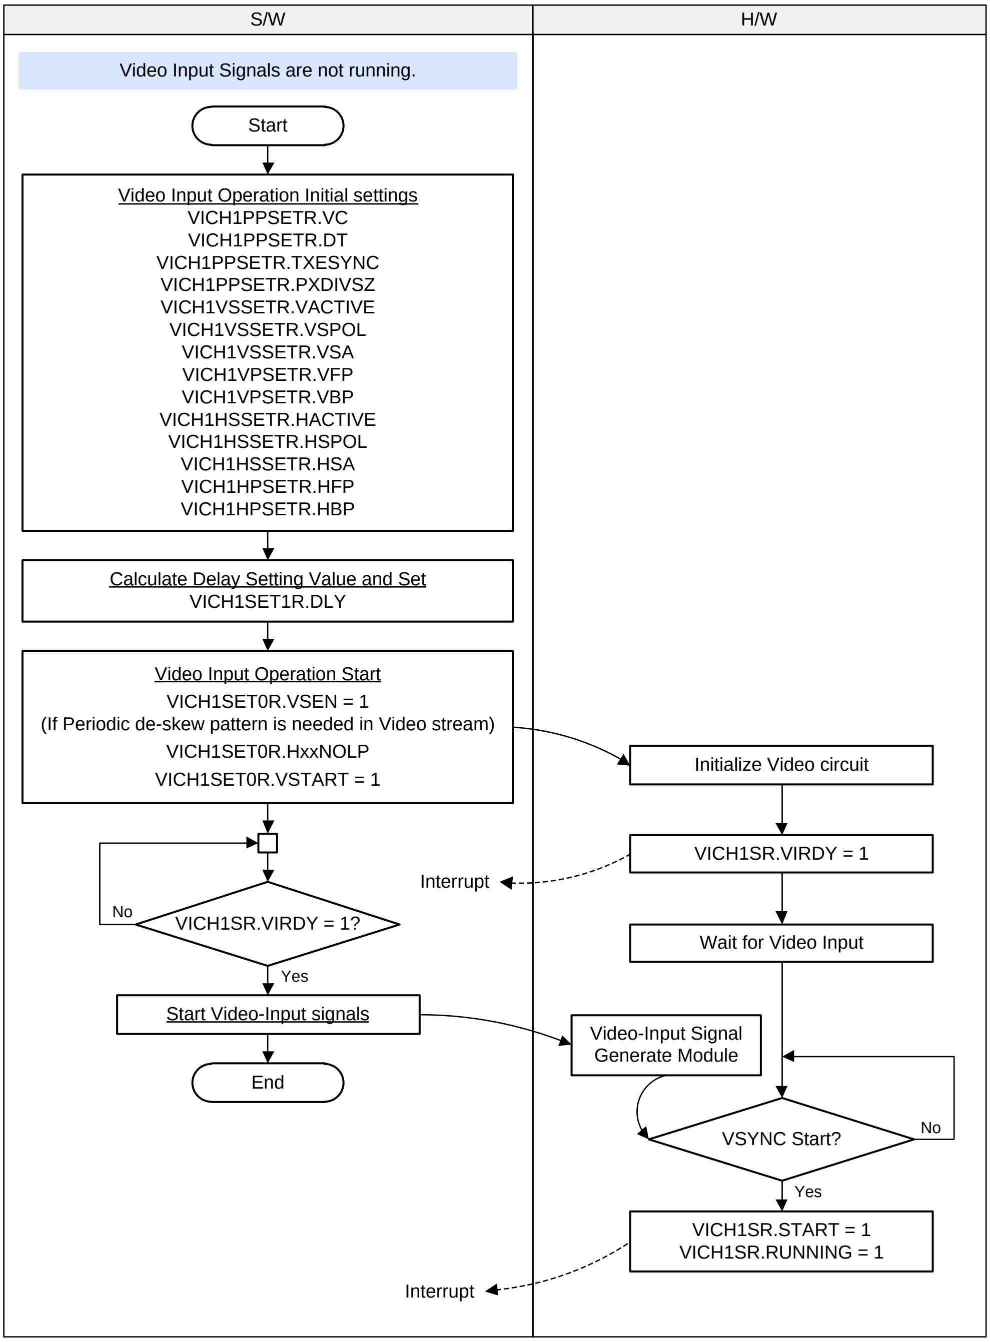

Figure 34.12 Video-Input channel Start

(2) End of Video-Input Operation

The video-input operation stop flow is shown in **Figure 34.13**. Execute the flow when VICH1SR.RUNNING = 1.

(1) VICH1SET0R.VSTPAFT (**Figure 34.13**)

Write 1 to VICH1SET0R.VSTPAFT to request the Video-Input Operation to stop. When the DSI-Tx Module detects the start of one frame (assertion of VSYNC), it stops sending video mode packets and sets VICH1SR.STOP to 1.

After checking VICH1SR.STOP, stop the video input. The video input can be stopped at any time after VICH1SR.STOP becomes 1.

After stopping the video input, wait for LINKSR.HSBUSY to become 0.

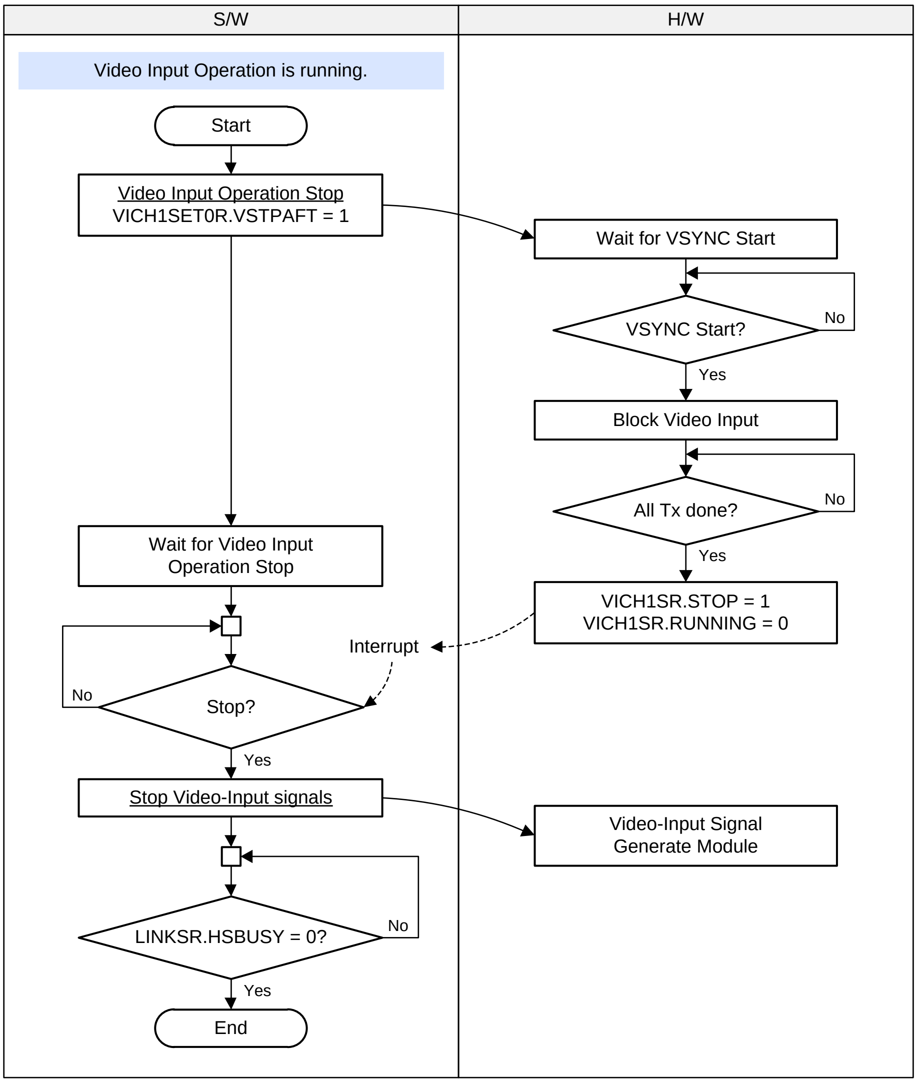

Figure 34.13 End of Video-Input Operation (VICH1SET0R.VSTPAFT)

(3) Burst Mode

The DSI-Tx Module supports Burst Mode.

Burst Mode is a mode that time-compresses pixel data.

Make the D-PHY bandwidth wider than the Video-Input bandwidth for time compression of pixel data. Video transmissions with a 1-line pixel data size (VICH1HSSETR.HACTIVE * VICH1SET1R.BPP / 8) greater than 65,535 Bytes are not supported.

(4) Non-Burst Mode

The DSI-Tx Module supports Non-Burst Mode.

Make the D-PHY bandwidth the same as the Video-Input bandwidth. Video transmissions with a 1-line pixel data size (VICH1HSSETR.HACTIVE * VICH1SET1R.BPP / 8) greater than 65,535 Bytes are not supported.

(5) LP Transition and Blanking

The DSI-Tx Module automatically transitions the Data Lane from HS to LP if both of the following two conditions are met:

If it does not transition from HS to LP, it sends a Blanking Packet with the same VC as the VC in the previous packet to maintain the HS.

- There is time to make an HS => LP => HS transition before the next HS transfer starts.
- The period is not prohibited by VICH1SET0R.xxxNOLP to transition to LP

(6) Non video packet action during Video-Input Operation Running

(a) Packet Transmission/Reception by Sequence operation

The DSI-Tx Module can send and receive packets (see **Section 34.4.2.3(2)** and **Section 34.4.2.3(3)**) using Sequence Operation while Video-Input Operation is operating*[1].

Make sure that all Sequence Operations are finished before starting the Video-Input Operation operation.

While Video-Input Operation is operating*[1], packet transmission / reception using Sequence Operation is performed only immediately after the HSE packet (VICH1PPSETR.TXESYNC = 1b) or VSS packet (VICH1PPSETR.TXESYNC = 0b) on the first horizontal line. Also, sending packets using Sequence Operation is possible only with HS (SQCHxDSCyAR.SPD = 0b). Sending with LP (SQCHxDSCyAR.SPD = 1b) is not supported. Send and receive packets that are completed within the BLLP period of the first horizontal line.

Execution of Sequence Operation processing is prohibited except for sending and receiving HS packets.

Note 1. “while Video-Input Operation is operating” here is different from VICH1SR.RUNNING. It means the period from setting VICH1SET0R.VSTART to 0 in the flow of **Figure 34.12** until VICH1SR.RUNNING becomes 0 in the flow of **Figure 34.13**. Also, please note that there is some latency from executing VICH1SET0R.VSTART to being transmitted to the inside of the module for clock transfer.

(7) Delay about Video-Input Operation

Video-Input Operation run in some latency which call in the DSI-Tx Module “Delay”. “Delay” value must set to VICH1SET1R.DLY before operation.

“Delay” value is defined by calculation using below parameters.

- Clock frequencies
  - Video channel 1 clock (MIPI_DSI_VCLK) frequency
  - DSI High-Speed Transmit Word Clock (TxWordClkHS, hsclk) frequency
- Video parameters
  - HSA period, set by VICH1HSSETR.HSA
  - HACTIVE period, set by VICH1HSSETR.HACTIVE
  - HBP period, set by VICH1HPSETR.HBP
  - HFP period, set by VICH1HPSETR.HFP
  - BPP value, shown in VICH1SET1R.BPP and derived from VICH1PPSETR.DT
- Video transmit settings
  - The number of active lanes, set by TXSETR.NUMLANEUSE
  - Transmit mode, set by VICH1PPSETR.TXESYNC
  - No LP, set by VICH1SET0R.HSANOLP, HBPNOLP, HFPNOLP
  - Clock mode, set by HSCLKSETR.HSCLKMODE
  - Clock stop time, set by CLSTPTSETR.CLKSTPT
  - Go LP and back time, set by LPTRNSTSETR.GOLPBKT
- Other parameters
  - \- Video-Input channel buffer size, shown in VICH1SET1R.CHBUFSZ

34.4.2.5 Enter/Exit of ULPS

The following describes the ULPS transition / return sequence.

The clock lane and data lane (lanes 0 to 3) can be independently transitioned / restored to ULPS.

The clock lane can make ULPS transitions when TXSETR.CLEN = 1. It is forbidden to change TXSETR.CLEN to 0 while the clock lane is ULPS.

The data lane can make ULPS transitions when TXSETR.DLEN = 1. It is forbidden to change TXSETR.DLEN to 0 while the data lane is ULPS.

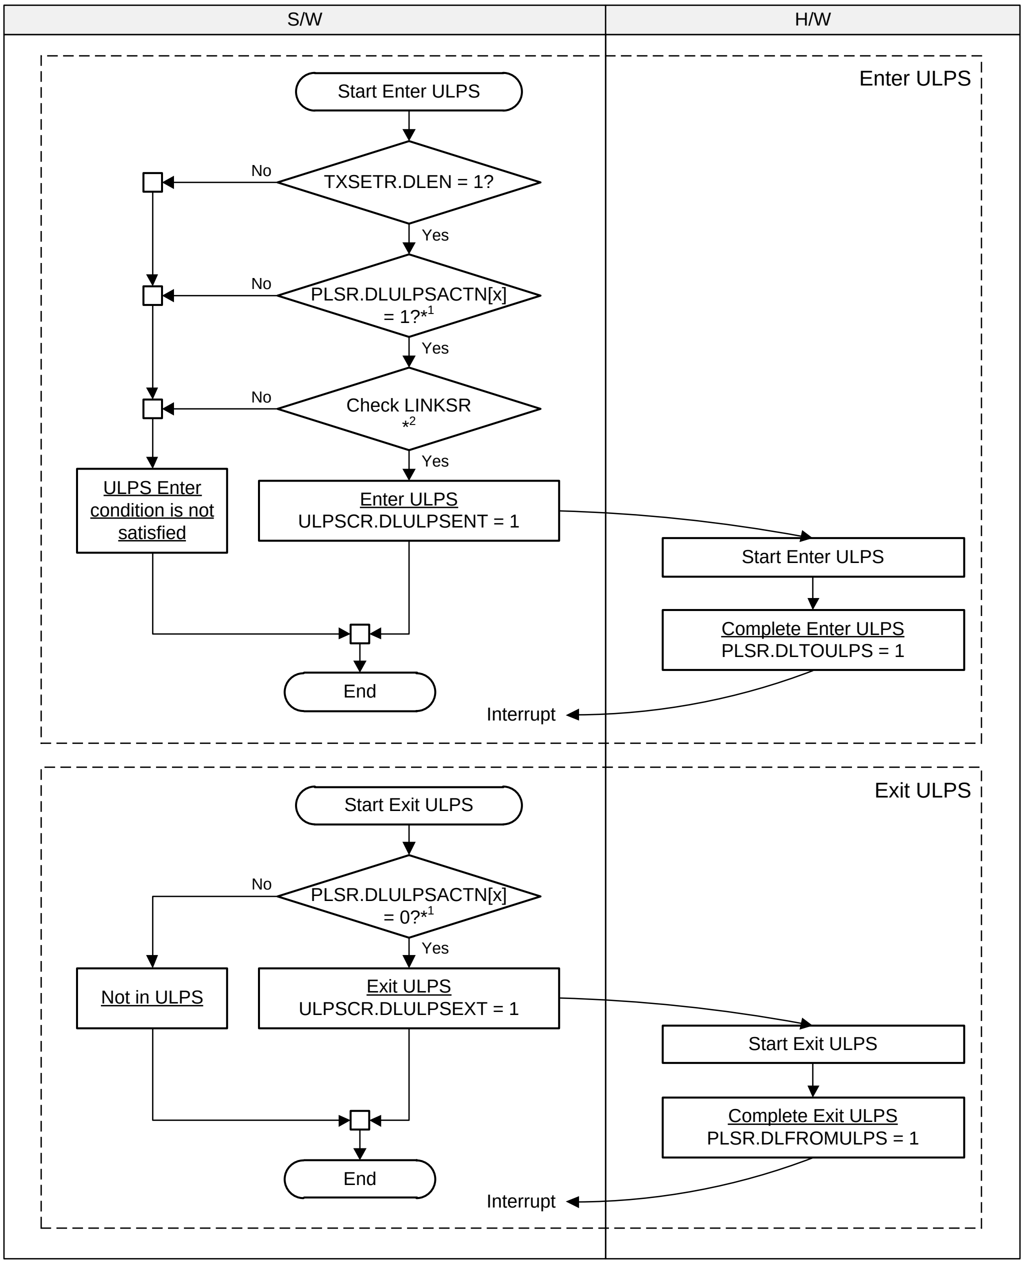
Data lanes enabled in TXSETR.NUMLANEUSE can be ULPS transitioned / restored. ULPS transition / return of data lanes is done simultaneously for all valid lanes. Only certain data lanes cannot be ULPS transitioned / restored.

When the data lane transitions to ULPS, another operation*[1] using the data lane cannot be performed until ULPS is restored.

When the clock lane transitions to ULPS, another operation*[2] using the clock lane cannot be performed until ULPS is restored.

Note 1. Sequence Operation, Video-Input Operation.

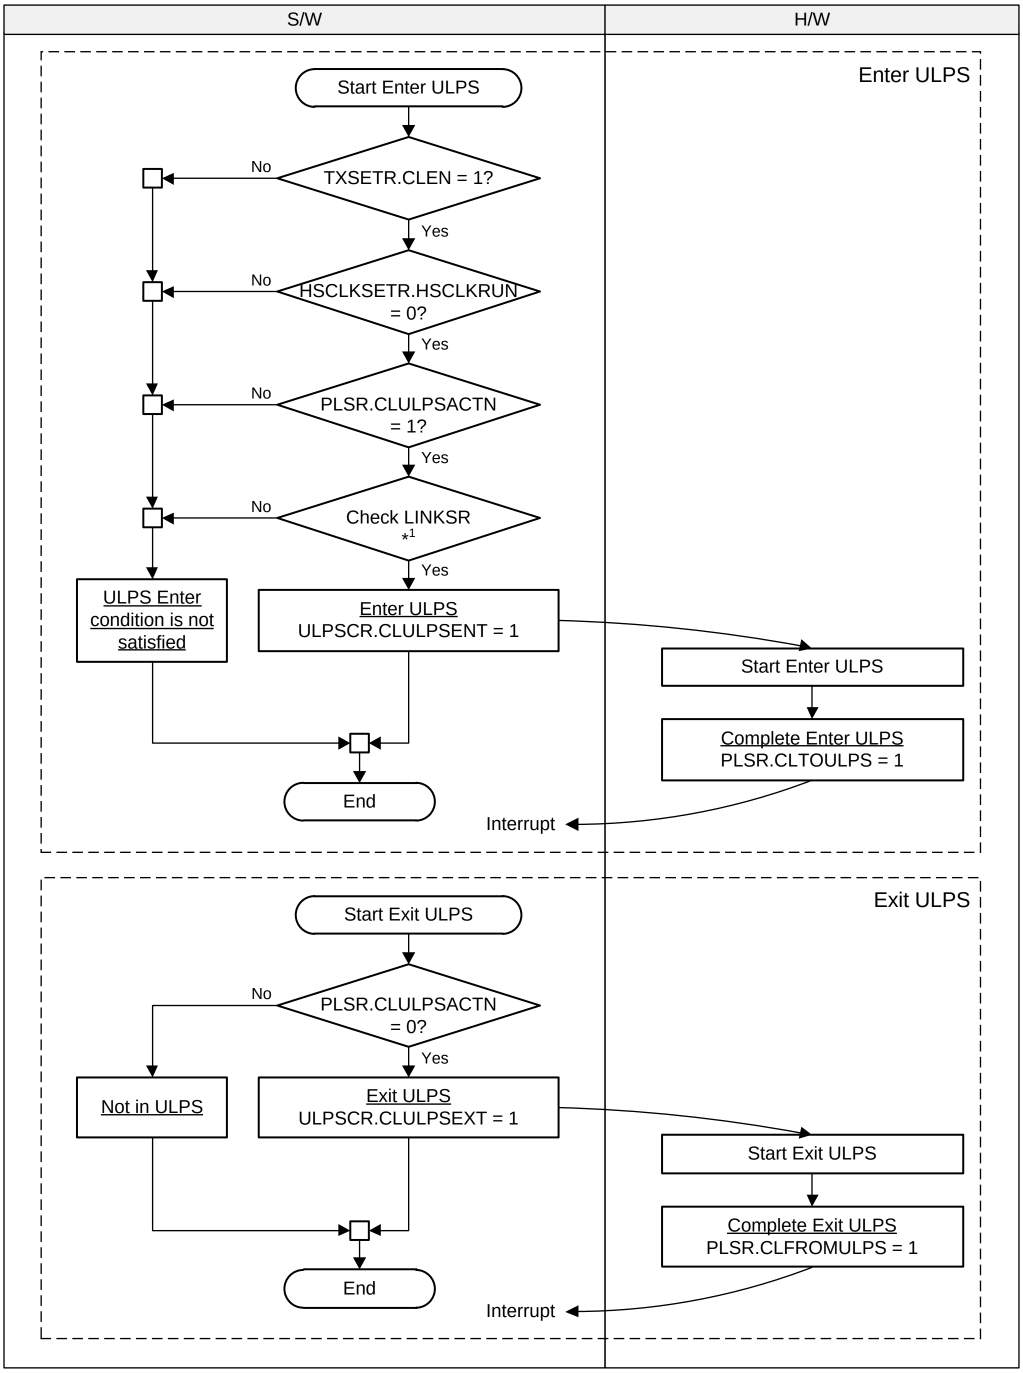
Note 2. HS Sequence Operation, Video-Input Operation.



Note 1. Check all enabled data lane which selected by TXSETR.NUMLANEUSE

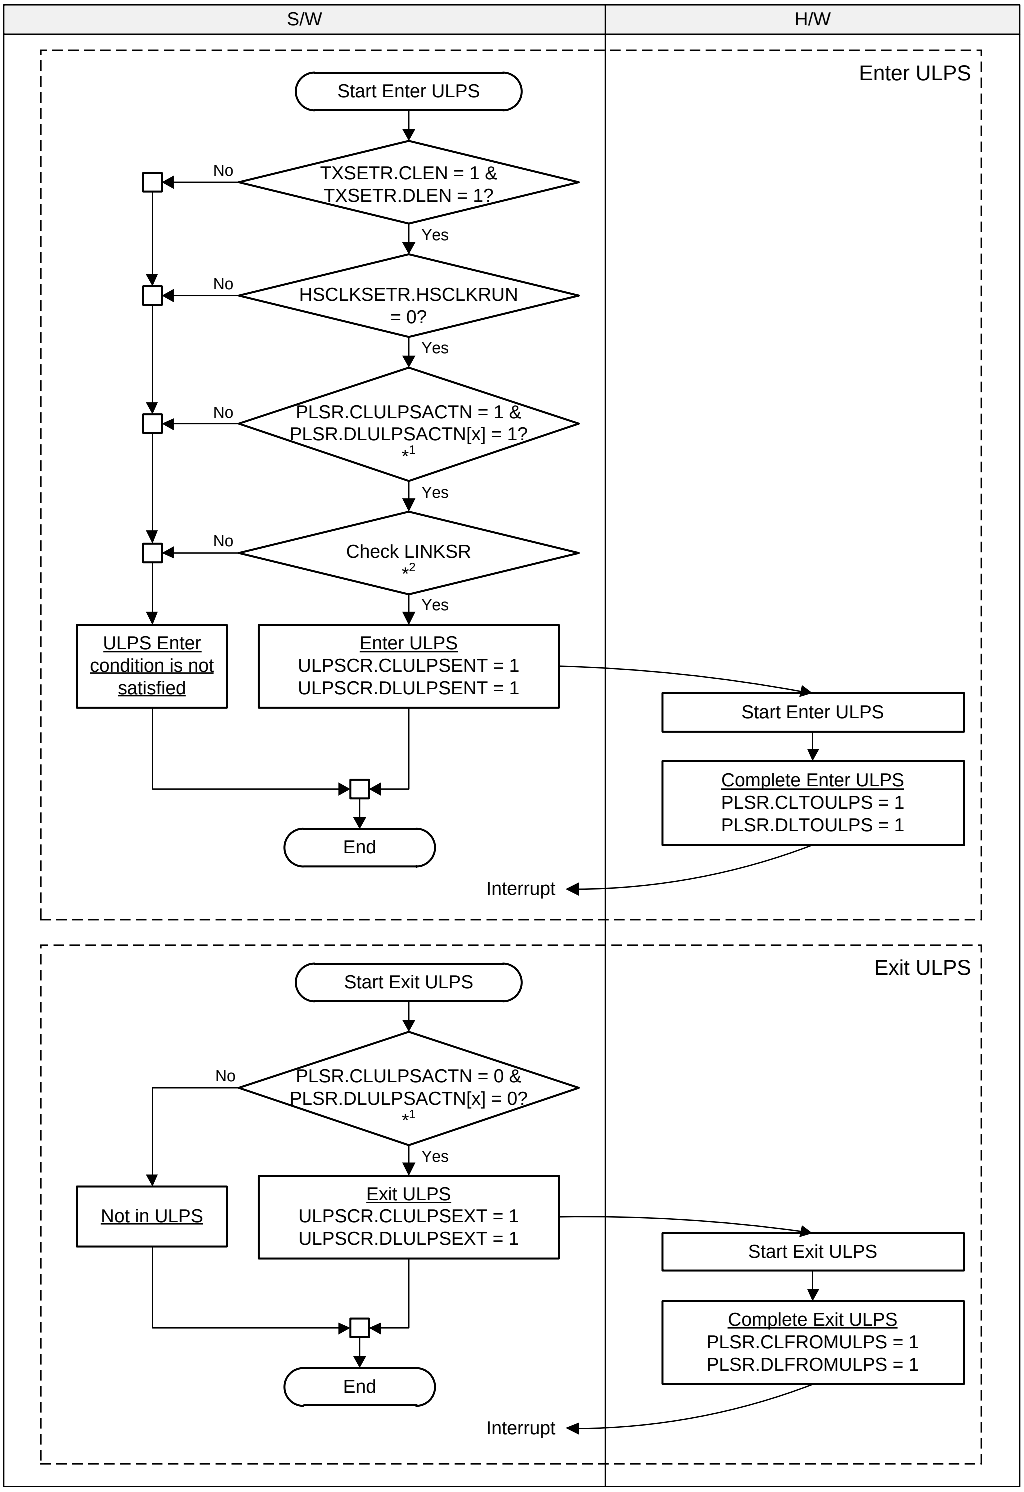
Note 2. (SQCHRUN0=0 and SQCHRUN1=0 and VICHRUN1=0 and HSBUSY=0 and LPBUSY=0)?

Figure 34.14 Enter/Exit of ULPS (Data Lane)



Note 1. (SQCHRUN1=0 and VICHRUN1=0 and HSBUSY=0)?

Figure 34.15 Enter/Exit of ULPS (Clock Lane)



Note 1. Check all enabled data lane which selected by TXSETR.NUMLANEUSE

Note 2. (SQCHRUN0=0 and SQCHRUN1=0 and VICHRUN1=0 and HSBUSY=0 and LPBUSY=0)?

Figure 34.16 Enter/Exit of ULPS (Clock and Data Lane)

34.4.2.6 Error Handling

(1) Error Detection by Peripheral

Peripheral will notify you of the detected error by “Acknowledge and Error Report” packet.

When the DSI-Tx Module receives the “Acknowledge and Error Report” packet, it displays the latest result in the AKEPLATIR register and the accumulated result in the AKEPACMSR register.

When the user receives the “Acknowledge and Error Report” packet, review and change various settings as necessary.

(2) Error Detection in D-PHY

If the D-PHY detects an error, the DSI-Tx Module sets the corresponding register flag.

The errors supported by the DSI-Tx Module are as follows. For details on the error, refer to Annex A Logical PHY-Protocol Interface Description of MIPI Alliance Specification for D-PHY Version 2.1.

- ErrEsc
- ErrSyncEsc
- ErrControl
- ErrContentionLP0
- ErrContentionLP1

If the user detects this error, perform Software Reset (**Section 34.4.2.1(2)**) and Reset Trigger Transmission (**Section 34.4.2.3(4)**) if necessary.

When an ErrContentionLP0 / ErrContentionLP1 error occurs, be sure to execute Software Reset (**Section 34.4.2.1(2)**). At that time, write 1 to RSTCR.FCETXSTP, wait for the time when Contention is resolved (equivalent to LRX-H_TO), and then write 0 to RSTCR.FCETXSTP. Also, if necessary, perform Reset Trigger Transmission (**Section 34.4.2.3(4)**).

For more information on returning from Contention, see *Section 7.2, Contention Detection and Recovery* in *the MIPI Alliance Specification* for Display Serial Interface 1.3.1.

(3) Timeout Error

The DSI-Tx Module has the timers defined in *Section 7.2.2, Contention Recovery Using Timers of the DSI standard* and the DSI-Tx Module original timers.

- Timers defined in DSI Specification
  - HS TX Timeout Error (HTX_TO)
  - LP-RX Host Processor Timeout Error (LRX-H_TO)
  - Turnaround Acknowledge Timeout Error (TA_TO)
- Original Timers
  - Rx Response Timeout Error

(a) HS TX Timeout (HTX_TO) Error

If this error occurs, perform Software Reset (**Section 34.4.2.1(2)**). In addition, perform Reset Trigger Transmission (**Section 34.4.2.3(4)**) if necessary.

If this error is detected, the setting value of HSTXTOSETR.HTXTO may be too small. When multiple channels are operating at the same time, multiple HS packets may be concatenated and transmitted continuously by HS. Set HSTXTOSETR.HTXTO to a value larger than the HS transmission period.

(b) LP-RX Host Processor Timeout (LRX-H_TO) Error

If this error occurs, perform Software Reset (**Section 34.4.2.1(2)**). In addition, perform Reset Trigger Transmission (**Section 34.4.2.3(4)**) if necessary.

If this error is detected, the setting value of LRXHTOSETR. LRXHTO may be too small.

There is a possibility of receiving multiple packets such as response packet and "Acknowledge and Error Report" packet in one reception.

Measure the time from the completion of the Bus Turnaround sequence from Host to Peripheral (LP-11 drive detection by Peripheral) to the completion of Bus Turnaround sequence from Peripheral to Host (LP-11 drive start by Host).

Check the Peripheral specifications, and set the value of DSI_LPCLK cycle count (rounded up) + X or more corresponding to the above time in the LRXHTOSETR.LRXHTO register.S

(c) Turnaround Acknowledge Timeout (TA_TO) Error

If this error occurs, perform Software Reset (**Section 34.4.2.1(2)**) and Reset Trigger Transmission (**Section 34.4.2.3(4)**) if necessary.

If this error is detected, the setting value of TATOSETR.TATO may be too small.

Measure the time from the start of the Peripheral Bus Turnaround sequence (LP-10 drive by the Host) to the completion (LP-11 drive detection by the Peripheral) from the Host.

Check the Peripheral specifications and set the value of DSI_LPCLK cycle count (rounded up) + X or more corresponding to the above time in the TATOSETR.TATO register. This error also occurs if the Peripheral does not support bidirectional communication.

(d) Rx Response Timeout Error

Refer to the Peripheral Response Timeout Error (**Section 34.4.2.6.4.1.1**) for more information.

(4) Rx Related Error in Sequence Operation

(a) Rx Packet Related Error in Sequence Operation

The following describes the received packet error detected by the DSI-Tx Module.

Detects up to one error per packet. (However, ECC 1bit Error may occur at the same time as other errors.)

Errors are determined in the following order:

Peripheral Response Timeout Error, Malformed Packet Error, ECC Error, Unexpected Packet Error, WC Error, CRC Error, Nothing Return Error

34.4.2.6.4.1.1. Peripheral Response Timeout Error

RXSR.PRESPTOERR is set to 1 if the BTA does not start receiving packets or triggers within the time set in the register after the bus right transitions from Host to Peripheral.

If this error is detected, packets and triggers will not be received until the bus right transitions from Peripheral to Host.

[Timeout time setting register]

Peripheral Response Timeout value for BTA-only is set by PRESPTOBTASETR.

Peripheral Response Timeout value for LP Read with BTA is set by PRESPTOLPSETR.PRESPTOLPR.

Peripheral Response Timeout value for LP Write with BTA is set by PRESPTOLPSETR.PRESPTOLPW.

Peripheral Response Timeout value for HS Read with BTA is set by PRESPTOHSSETR.PRESPTOHSR.

Peripheral Response Timeout value for HS Write with BTA is set by PRESPTOHSSETR.PRESPTOHSW.

If this error is detected, the register setting value may be too small, Measure the time from the completion of the Bus Turnaround sequence of Peripheral from the Host (LP-11 drive detection by Peripheral) to the completion of reception of the first byte of the packet or the completion of trigger reception. After checking the Peripheral specifications, set the value of DSI_LPCLK cycle number (rounded up) + X or more corresponding to the above time.

If this error occurs, perform the necessary processing such as resending the previous command.

34.4.2.6.4.1.2. Malformed Packet Error

If a packet less than 4 bytes is received, RXSR.MLFERR is set to 1. Since there is an error in the received data, perform necessary processing such as resending the previous command.

34.4.2.6.4.1.3. ECC Error

ECC generation is required for DSI v1.3.1 standard compliant Peripherals. However, since ECC generation is an option for “earlier revision of DSI Peripherals”, the DSI-Tx Module can select whether to enable or disable ECC checks using DSISETR.ECCEN.

When connecting to a Peripheral that does not support ECC generation, disable ECC checking by setting DSISETR.ECCEN to 0.

34.4.2.6.4.1.3.1. ECC 1bit Error

If an ECC 1bit error is detected, RXSR.ECCERR1B is set to 1 and 1bit error correction is performed.

The DSI-Tx Module automatically corrects the error and restores the normal packet header, so the subsequent packet reception processing continues.

34.4.2.6.4.1.3.2. ECC Multi-bit Error

If an ECC multi-bit error is detected, RXSR.ECCERR is set to 1 and the received packet is discarded. If this error occurs, perform the necessary processing such as resending the previous command.

34.4.2.6.4.1.4. Unexpected Packet Error

If an Unexpected Packet is received, RXSR.UEXPKTERR is set to 1.

When this error occurs, the packet header is stored in the RXRSSxR register, and the subsequent reception processing is stopped until the bus right transitions from Peripheral to Host.

The DSI-Tx Module determines the following packets as Unexpected Packets.

- Received packets in which Data Type field of the packet header is “Reserved” as described in Table23 Data Types for Peripheral-Sourced Packets of the DSI standard
- Received packets other than “Acknowledge and Error Report” packet and “EoTp” in BTA after sending non-read packet
- Received packets other than “Acknowledge and Error Report” packet and “EoTp” when the BTA is BTA only
- BTA after sending read packet receives response packet and then receives response packet again

34.4.2.6.4.1.5. WC Error

RXSR.WCERR is set to 1 if a long packet with payload data shorter than the WC value is received.

When this error occurs, there is an error in the payload data length, but the payload data is not discarded due to this error, and the packet header is stored in the RXRSSxR register.

Since there is an error in the received data, perform necessary processing such as resending the previous command.

34.4.2.6.4.1.6. CRC Error

To connect to Peripherals that do not support CRC generation, the DSI-Tx Module can enable or disable CRC checking for each Virtual Channel using DSISETR.CRCEN[3:0]. When connecting to a Peripheral that does not support CRC generation, disable the CRC check by setting the corresponding bit in DSISETR.CRCEN to 0.

When this error occurs, there is an error in the payload data, but the payload data is not discarded due to this error, and the packet header is stored in the RXRSSxR register.

If this error occurs, perform the necessary processing such as resending the previous command.

34.4.2.6.4.1.7. Nothing Return Error

RXSR.NORETERR is set to 1 if the BTA transitions the bus right from Host to Peripheral and then does not receive packets or triggers and the bus right transitions from Peripheral to Host.

If this error occurs, perform the necessary processing such as resending the command. If the error recurs, perform Software Reset (**Section 34.4.2.1(2)**) and Reset Trigger Transmission (**Section 34.4.2.3(4)**) as necessary.

(b) Rx Long Packet Data Payload Related Error in Sequence Operation

34.4.2.6.4.2.1. Maximum Return Packet Size Error

RXSR.MAXRPSZERR is set to 1 if the WC value of the received long packet is greater than the DSISETR.MRPSZ setting.

When this error occurs, the packet header is stored in the RXRSSxR register and the payload data is discarded.

Although the payload data is discarded, errors related to payload data reception (WC Error, CRC Error) are detected.

If this error occurs, set DSISETR.MRPSZ to a value greater than or equal to the value set by the Set Max Return Packet Size command.

If you still get this error despite the correct settings, consider setting DSISETR.MRPSZ to a larger value because Peripheral is returning a large packet in violation of the DSI standard.

34.4.2.6.4.2.2. Internal Bus Error

If Internal Bus Write detects an error, RXSR.IBERR is set to 1.

Review the settings of SQCHxDSCyDR.LADDR and DSISETR.MRPSZ.

34.4.2.6.4.2.3. Rx Buffer Overflow Error

If the following Rx Buffer Overflow Error is detected, RXSR.RXOVFERR is set to 1.

In the case of SQCHxDSCyBR.DTSEL=00b Packet Payload Data register Mode:

- The Rx Payload Data is over 16 Byte length

In the case of SQCHxDSCyBR.DTSEL=01b Long Packet data use memory space Mode:

- RAM Overflow for the LP Rx is detected

If this error occurs, please execute the following.

In the case of Data register Mode:

- Change to use memory space Mode
- Change peripheral device’s Maximum Return Packet Size as not over 16 Byte

In the case of memory space Mode:

- Change peripheral device’s Maximum Return Packet Size smaller
- Make Internal Bus faster

(5) Tx Packet Related Error in Sequence Operation

(a) Internal Bus Error

If Internal Bus Read detects an error, SQCHxSR.TXIBERR is set to 1. Review the settings of SQCHxDSCyAR.DATA1 / 0 and SQCHxDSCyDR.LADDR.

(b) Packet too big Error

SQCH1SR.PKTBIGERR is set to 1 if the Sequence Operation packet is of a size that cannot be sent within the BLLP period of the first horizontal line of the Video-Input Operation.

If this error occurs, the Sequence Operation packet will not be sent until the Video-Input Operation is completed.

(6) Error in Video-Input operation

(a) Video-Input Buffer Overflow Error

VICH1SR.VBUFOVF is set to 1 if Overflow of Video-Input Buffer is detected.

If this error occurs, perform Software Reset (**Section 34.4.2.1(2)**). Also, take necessary measures such as increasing the frequency of TxWordClkHS (hsclk) and decreasing the VICH1SET1R.DLY value. In addition, perform Reset Trigger Transmission (**Section 34.4.2.3(4)**) if necessary.

(b) Video-Input Buffer Underflow Error

If the Video-Input Buffer Underflow is detected, VICH1SR.VBUFUDF is set to 1.

If this error occurs, perform Software Reset (**Section 34.4.2.1(2)**). Also, take necessary measures such as lowering the frequency of TxWordClkHS (hsclk) and increasing the VICH1SET1R.DLY value. In addition, perform Reset Trigger Transmission (**Section 34.4.2.3(4)**) if necessary.

(c) Timing Error

VICH1SR.TIMERR is set to 1 if no video packets (including Sync Event packets) were sent during the Video-Input Operation at the intended timing.

If this error occurs, perform Software Reset (**Section 34.4.2.1(2)**). Also, take necessary measures such as reviewing the setting value of LPTRNSTSETR.GOLPBKT. In addition, perform Reset Trigger Transmission (**Section 34.4.2.3(4)**) if necessary.

34.4.3 Interface

34.4.3.1 Video-Input Operation

(1) Video Input Timing

Video-Input Timing and Video-Input Parameters are described in **Figure 34.17** and **Table 34.8**.

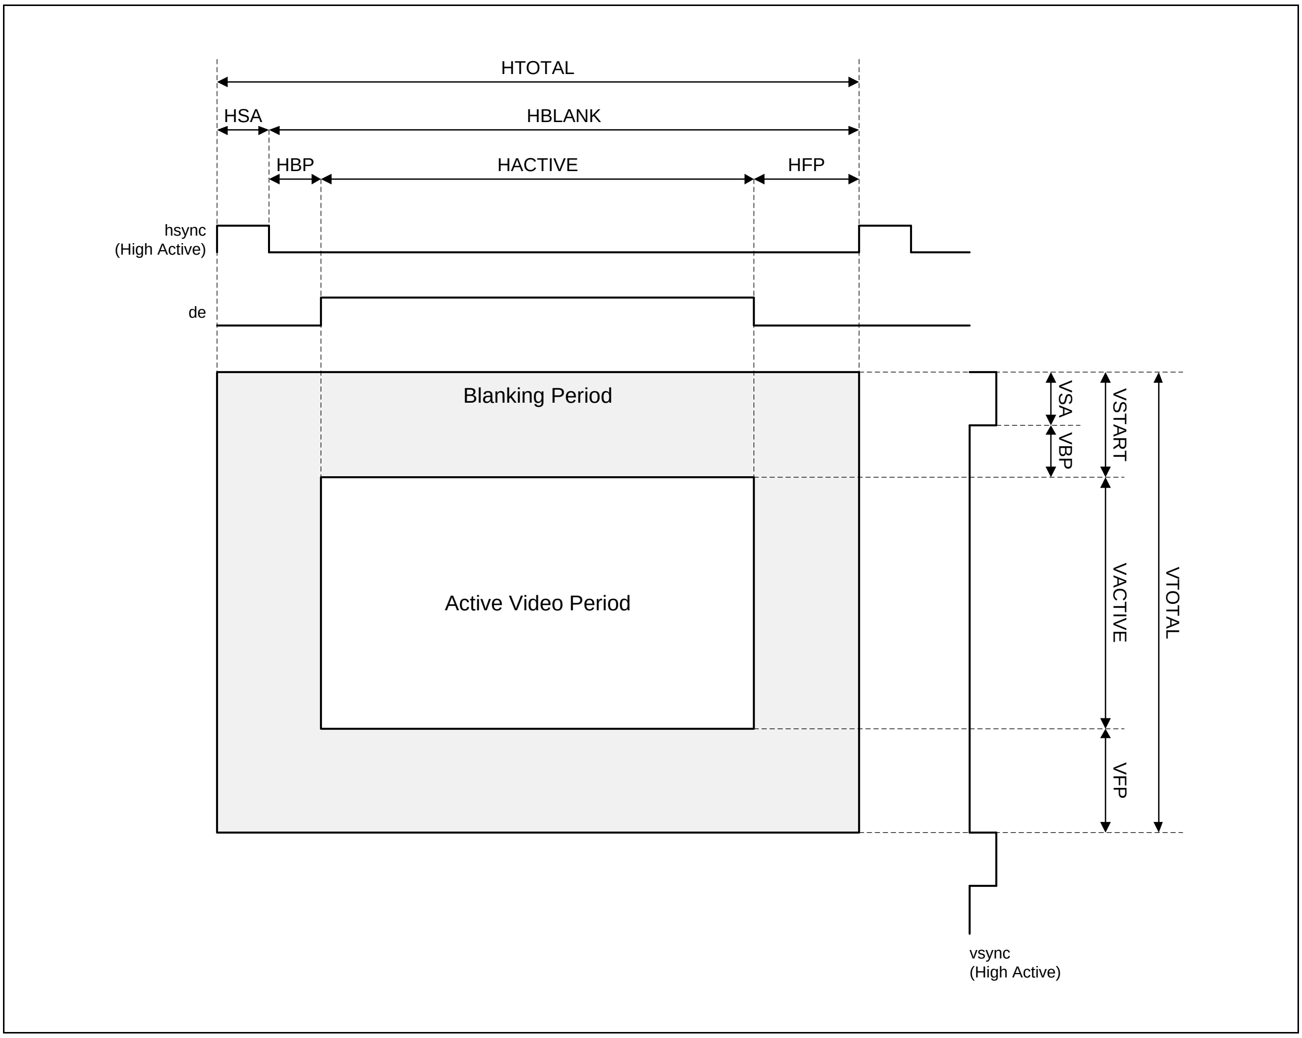


Figure 34.17 Video input Timing

Table 34.8 Configurations for Video Input interface (1/2)

- Common Rules for all mode

<table>
<tr><th>Parameter</th><th>Description</th></tr>
<tr><td>All</td><td>All parameters related to Input Video should be set to the value of not less than 1.
Example for “All parameters”: HSA, HBP, HACTIVE, HFP, VSA, VBP, VACTIVE, VFP</td></tr>
<tr><td>HACTIVE</td><td><table>
<tr><th>VICH1PPSETR.DT</th><th>VICH1HSSETR.HACTIVE</th></tr>

<tr><td>H’2E: Loosely Packed Pixel Stream, 18bit RGB
H’3E: Packed Pixel Stream, 24bit RGB</td><td>No Limitation</td></tr>
</table></td></tr>
</table>

- Additional Rules for non-burst Sync Pulse mode

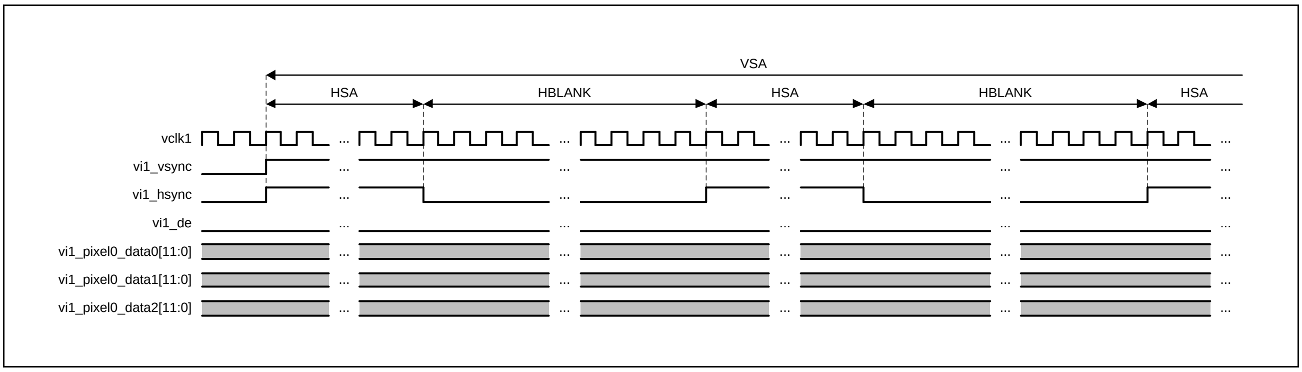
Parameter	Description
Sequence Operation Packet	When a packet by sequence operation is transmitted during Video Opearation (VICH1SR.RUNNING=1), the period of (HBP+HACTIVE+HFP) should be set the value longer than sum of below periods. ● Period for the Tx Sync Event packet (4 Byte) ● Period for the packet by sequence operation ● Period for the Header and CRC of a Blanking Packet (6 Byte)
HBP+HACTIVE+HFP	Transition of HS-LP-HS is caused within the period between current Sync Event Packet and next Sync Event Packet, the period of (HBP+HACTIVE+HFP) should be set to the value within the range described below. (HBP+HACTIVE+HFP) > (period for the Tx Sync Event Packet) + (period for transition time as HS-LP-HS)
HSA	Transmission of Blanking Packet is caused within the period between current Sync Event Packet and next Sync Event Packet, the period of HSA should be set to the value within the range described below. (HSA*BPP)/8 >= 10 Notice, HSA should be set to the value not less than minimum value of (period for the Tx Sync Event Packet) + (period for the Tx Blanking Packet).
HBP	Transmission of Blanking Packet is caused within the period between current Sync Event Packet and next Sync Event Packet, the period of HPB should be set to the value within the range described below. (HBP*BPP)/8 >= 10 Notice, HPB should be set to the value not less than minimum value of (period for the Tx Sync Event Packet) + (period for the Tx Blanking Packet).

Table 34.8 Configurations for Video Input interface (2/2)

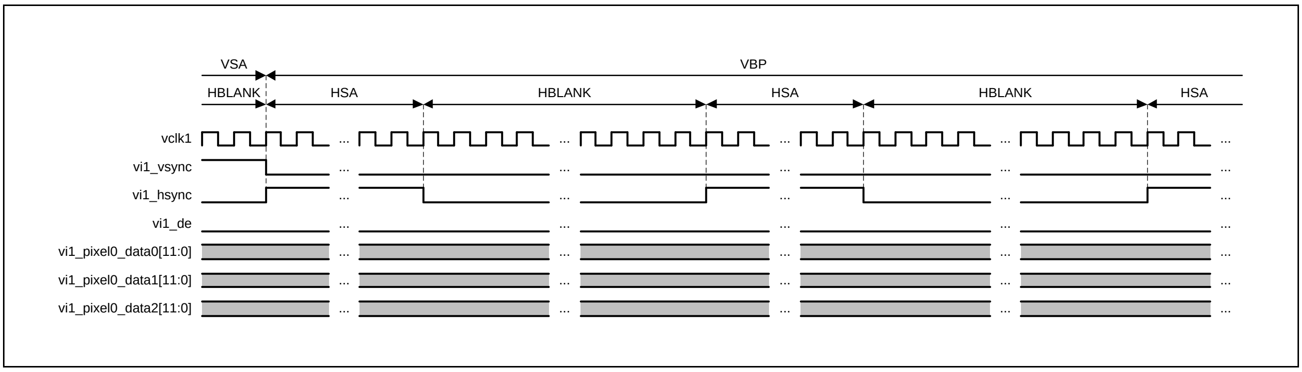
- Additional Rules for non-burst Sync-Event mode and Burst mode

Parameter	Description
Sequence Operation Packet	When a packet by sequence operation is transmitted during Video Operation (VICH1SR.RUNNING=1), the period of HTOTAL should be set the value longer than sum of below periods. ● Period for the Tx Sync Event packet (4 Byte) ● Period for the packet by sequence operation ● Period for the Header and CRC of a Blanking Packet (6 Byte)
HTOTAL	Transition of HS-LP-HS is caused within the period between current Sync Event Packet and next Sync Event Packet, the period of HTOTAL should be set to the value within the range described below. HTOTAL > (period for the Tx Sync Event Packet) +(period for transition time as HS-LPHS)
HSA+HBP	Transmission of Blanking Packet is caused within the period between current Sync Event Packet and next Sync Event Packet, the period of (HSA+HBP) should be set to the value within the range described below. ((HSA+HBP)*BPP)/8 >= 10 Notice, HSA+HBP should be set to the value not less than minimum value of (period for the Tx Sync Event Packet) + (period for the Tx Blanking Packet).

(1) VSA Start (and VFP End)

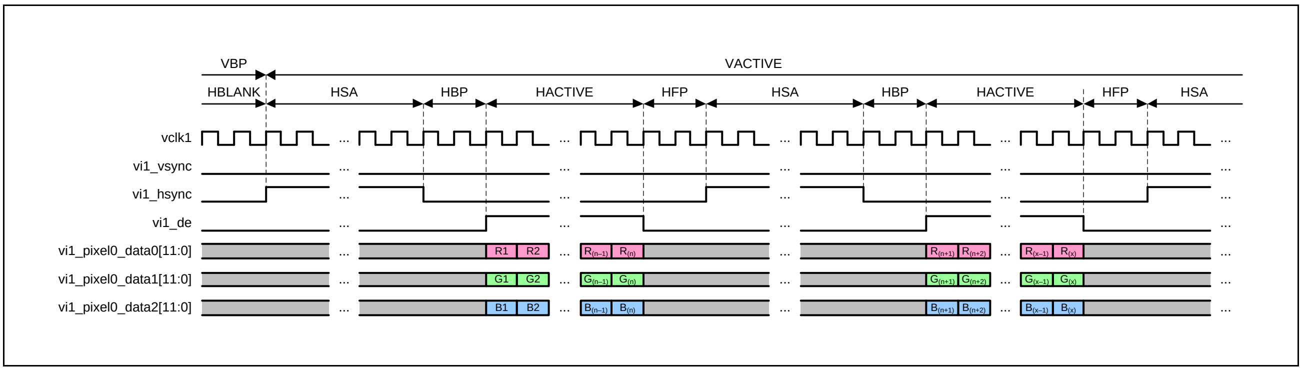


(2) VSA End and VBP Start

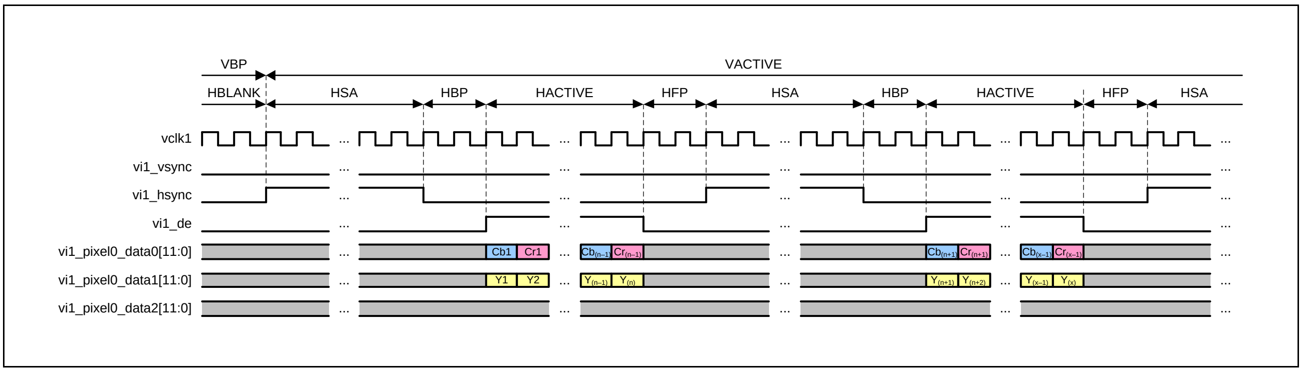


(3) VBP End and VACTIVE Start

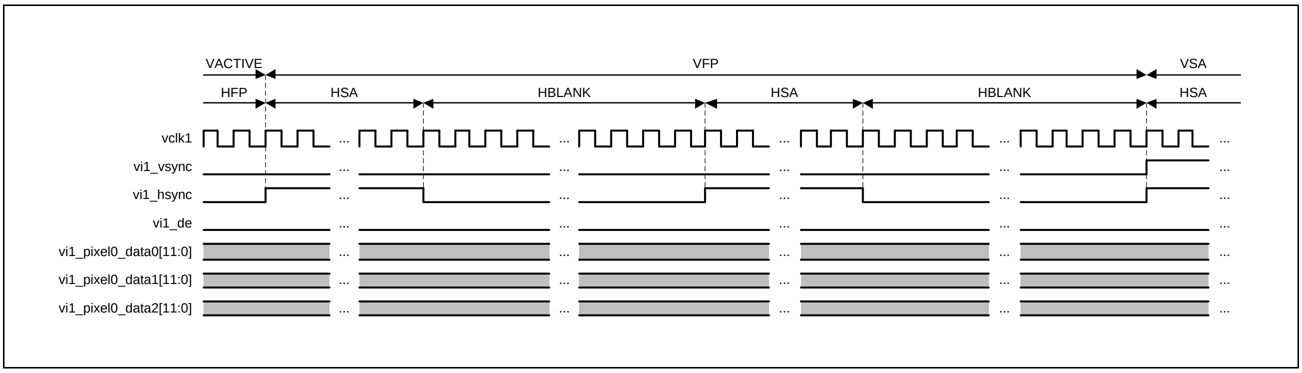
(a) RGB



(b) YCbCr 4: 2: 2



(4) VACTIVE End and VFP Start



34.4.3.2 Video Input Start, End, Change Setting

(1) Video Input Start
Video input must be started after Video-Input Operation Start sequence. It must be start from V-Sync start edge.

(2) Video Input End
End of Video Input must follow sequence of **Section 34.4.2.4(2), End of Video-Input Operation**.

(3) Change of Video Input Setting
Changing of Video-Input setting must be done during Video-Input operation is not running.

34.4.3.3 Clock Frequencies

Video clock and DSI HS Byte clock must follow the relationship.

(1) Burst Mode

Video clock Frequency [Hz] * Video Pixel Bit Depth (BPP) [bit]

<= DSI HS Byte clock Frequency[Hz] * 8[bit] * Number of DSI HS Data Lane

In the case of Video-Input bandwidth equals DSI output bandwidth, it will be indistinguishable from non-burst sync-event mode.

(2) Non-Burst Mode

Video clock Frequency [Hz] * Video Pixel Bit Depth (BPP) [bit]

= DSI HS Byte clock Frequency[Hz] * 8[bit] * Number of DSI HS Data Lane

34.5 Usage Note

34.5.1 Restriction and Notes

In this chapter, restriction and note of the DSI-Tx Module are described.

Table 34.9 Attention and Restriction List

Items	Restriction and Notes
TxWordClkHS	Each Lanes TxWordClkHS must be synchronized. The DSI-Tx Module uses Data Lane0 TxWordClkHS as hsclk.
Unused input signals	All unused input signals must be input 0, except following signals. Following signals must be input 1, when they are not used. ppi_dl1_ulpsactivenot ppi_dl2_ulpsactivenot ppi_dl3_ulpsactivenot
TxReadyHS assert	D-PHY must be asserted TxReadyHS within ($2^{\mathrm{RELDSI2TX\_LNK\_RAM\_WORD\_DEPTH}}$ – 2) hsclk cycles after TxRequestHS asserted.

35. Camera Data Receiving Unit (CRU)

The CRU consists of a MIPI CSI-2 block and an Image Processing block.

(1) MIPI CSI-2

This block can receive signals conforming to the MIPI CSI-2 standard, extracts video signal from various packets, and sends them to Image Processing block in the subsequent stage.

(2) Image Processing

This block can receive video data received from the external Digital Parallel Interface or MIPI CSI-2 block, and perform appropriate image processing for each. The image-processed data is temporarily stored in the FIFO and transferred to an external memory.

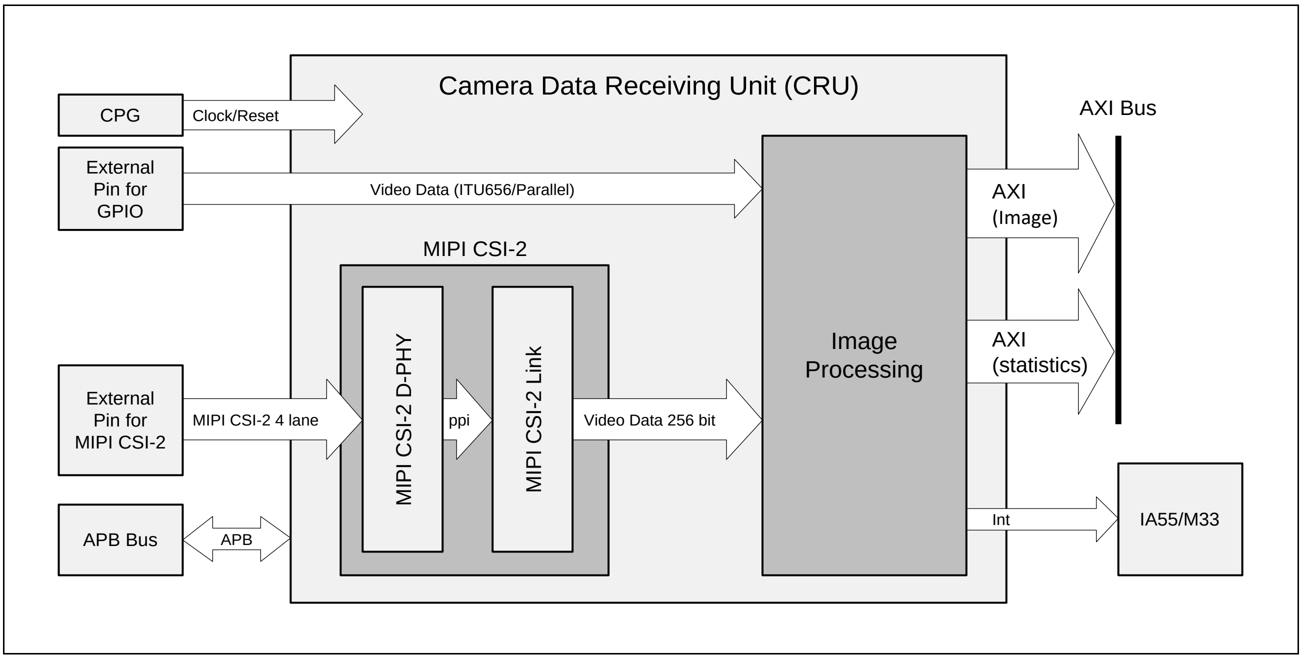


Figure 35.1 Block Diagram of CRU

35.1 MIPI CSI-2

35.1.1 Overview

The MIPI CSI-2 is an MIPI Camera Serial Interface 2 receiver module.

This module supports MIPI CSI-2 V2.1 and MIPI D-PHY V2.1 (80 Mbps ~ 1500 Mbps).

The image signal received by the MIPI-CSI2 is output to the image processing module.

35.1.2 Features

This module supports the following functions.

1) Input Image Size

- Maximum image size: 5 M pixels
- Minimum image size: QVGA (320 × 240) ＝ 76.8 K pixels
- Maximum number of valid pixels in the horizontal direction: 2800 pixels
- Maximum number of valid pixels in the vertical direction: 4095 lines

2) Compliant with Specification for Camera Serial Interface 2 (CSI-2)^{SM}

3) Support 1/2/4 lanes

4) Supported Input Data Format is described in **Table 35.12**.

5) Support Data De-Scrambling

6) Generic Short Packet FIFO with the depth of 16

7) Support Latency Reduction and Transport Efficiency (LRTE)

8) ECC 1bit error correction and 2bit error detection in packet header

9) CRC check for payload data

10) Support 4 Virtual Channel

11) Support Data Interleaving

- Data Type Interleaving
  - Packet Level Interleaved Data Transmission
  - Frame Level Interleaved Data Transmission
- Virtual Channel Identifier Interleaving

12) Receiver Error Detection and Report

- D-PHY Level Errors
- Packed Level Errors
- Protocol Decoding Level Errors

13) Skew Adjustment for D-PHY

14) MIPI CSI-2 Input Bandwidth Limitation

- CRU can receive signals which satisfied both of **Table 35.1** and **Table 35.2**.

15) Blanking period

- Minimum invalid period between horizontal lines: 412ns.

Table 35.1 Supported Image Format and Maximum Transfer Rate

Number of Lanes	Transfer Data Rate per Lane [M bps / Lane]		Total Transfer Data Rate [M bps]	
	MIN	MAX	MIN	MAX
1 lane	80	1500	80	1500
2 Lanes	80	1500	160	3000
4 Lanes	80	1500	320	6000

Table 35.2 Supported Image Format and Maximum Transfer Rate

No.	Input Image Format	MIPI CSI-2 Maximum Transfer Ratio [Mbps]
1	YCbCr/YUV422 8-bit	4256
2	YCbCr/YUV422 10-bit	5238
3	RGB565	4256
4	RGB666	4540
5	RGB888	6000
6	RAW8	2128
7	RAW10	2619
8	RAW12	3095
9	RAW14	3584
10	RAW16	4000
11	Others	2128

35.1.6 Register Descriptions

Access the following registers only in units of 32 bits.

Table 35.6 lists the attributes of the MIPI CSI-2 D-PHY and MIPI CSI-2 LINK registers.

Table 35.6 Attributes of MIPI CSI-2 D-PHY and MIPI CSI-2 LINK Registers

Attribute	Write	Read
R	Disabled	Enabled
RW	Enabled	Enabled
R0W	Enabled	Enabled (always read as 0)

35.1.6.1 Module Configuration Register (CSI2nMCG)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GSNM							
Initial Value	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SDLN				—	—	—	—	VER			
Initial Value	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
26	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	—	1b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 16	GSNM	H'10	R	Indicate the number of stages of the generic short packet FIFO (16 stages).
15 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 8	SDLN	H'4	R	Indicate the supported maximum number of data lanes. H'4: Operable with four lanes, two lanes or one lane.
7 to 4	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3 to 0	VER	H'0	R	Indicate the version of this core.

35.1.6.2 Module Control Register 0 (CSI2nMCT0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	LFSREN	ECCV13	—	—	—	—	RVMD	—	EDMD	ZLMD
Initial Value	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	R	RW	R	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	VDLN			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	H'00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25	LFSREN	1b	RW	Enables or disables de-scrambling. 0b: Disables de-scrambling. 1b: Enables de-scrambling.
24	ECCV13	0b	RW	CSI-2 specification-compliant mode of ECC checking 0b: 26 bits to be checked for ECC 1b: 24 bits to be checked for ECC It is prohibited to set this bit to 1b when receiving four or more virtual channels.
23 to 21	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
19	RVMD	0b	RW	For a packet whose Data Type is H'38 to H'3F (“Reserved” in Table 10 Data Type Classes in the CSI-2 Specification), set the receive operation mode to 0. 0b: Discards the data (notifies an ErrID). 1b: Receives data as a long packet (outputs data to the image processing module when the corresponding bit in CSI2nDTEH is 1, or discards the data and notifies an ErrID when the corresponding bit in CSI2nDTEH is 0),
18	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	EDMD	0b	RW	Notifies ErrFrameData when an ECC 2-bit error or a packet of less than four bytes is received between FS and FE. 0b: Does not notify ErrFrameData. 1b: Notifies ErrFrameData.
16	ZLMD	0b	RW	Sets whether to output a long packet whose word count is 0 to the image processing module. Set this bit to 0. 0b: Output 1b: No output
15 to 4	—	H'000	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3 to 0	VDLN	H'4	RW	Set the number of used data lanes. Change this field when CSI2nMCT3.RXEN = 0. A value equal to or less than the CSI2nMCG.SDLN value can be specified. H'1: Operation with one lane H'2: Operation with two lanes H'4: Operation with four lanes Others: Setting prohibited

35.1.6.3 Module Control Register 2 (CSI2nMCT2)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	FRRSKW								
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	FRRCLK								
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	H'00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24 to 16	FRRSKW	H'000	RW	Internal setting parameter Set the following value by using the ROUNDDOWN function that rounds down the decimal places. (ROUNDDOWN((3 * vclk frequency/hsclk1 frequency), 0) + 1) where vclk = 266 MHz, hsclk1 = transfer rate/8 Example: Set 7 when the vclk frequency is 266 MHz and the transfer rate is 1 Gbps. ROUNDDOWN((3 * 266/(1000/8)), 0) + 1 = 7
15 to 9	—	H'00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8 to 0	FRRCLK	H'000	RW	Parameter for the IP to determine whether packets have been received if RxWordClkHS stops at the timing when the IP cannot recognize that RxValidHS is low. Set the following value by using the ROUNDDOWN function that rounds down the decimal places. (ROUNDDOWN((1.5 * vclk frequency/hsclk1 frequency), 0) + 1) where vclk = 266 MHz, hsclk1 = transfer rate/8 Example: Set 4 when the vclk frequency is 266 MHz and the transfer rate is 1 Gbps. ROUNDDOWN((1.5 * 266/(1000/8)), 0) + 1 = 4

35.1.6.4 Module Control Register 3 (CSI2nMCT3)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RXEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RXEN	0b	RW	Enables data reception in the PPI. The value of this register is reflected in ppi_dl[1:4]_enable and ppi_cl_enable for the lane(s) which is enabled by CSI2nMCT0.VDLN. 0b: Disables reception. 1b: Enables reception.

35.1.6.5 Reset Control Register (CSI2nRTCT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VSRST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	VSRST	0b	R0W	Writing 1 to this bit resets the internal LINK signal by a software reset.

35.1.6.6 Reset Status Register (CSI2nRTST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VSRSTS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	VSRSTS	0b	R	Indicates the execution status of the software reset generated by CSI2nRTCT.VSRST. 0b: Not during a reset 1b: During a reset

35.1.6.7 EPD Option Control Register (CSI2nEPCT)

This register supports the TX_REG_CSI_EPD_EN_SSP register and the TX_REG_CSI_EPD_OP_SLP register that are defined in *Section 9.11.1.2.3, D-PHY EPD Specifications (for EPD Options 1 and 2)* in *the MIPI CSI-2 V2.1 Specification*.

Set the same value as the one set in this register in the CSI-2 transmitter.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EPDEN	SSP														
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EPDOP	SLP														
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	RXS	GSTS	PMS	—	—	—	—	DL3S	DL2S	DL1S	DL0S
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	H'000	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	VC3S	0b	R	When this bit is set to 1, there is an interrupt source regarding virtual channel 3. Check the CSI2nVCST3 register for the details of the interrupt source.
18	VC2S	0b	R	When this bit is set to 1, there is an interrupt source regarding virtual channel 2. Check the CSI2nVCST2 register for the details of the interrupt source.
17	VC1S	0b	R	When this bit is set to 1, there is an interrupt source regarding virtual channel 1. Check the CSI2nVCST1 register for the details of the interrupt source.
16	VC0S	0b	R	When this bit is set to 1, there is an interrupt source regarding virtual channel 0. Check the CSI2nVCST0 register for the details of the interrupt source.
15 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10	RXS	0b	R	When this bit is set to 1, there is an interrupt source regarding the reception in general. Check the CSI2nRXST register for the details of the interrupt source.
9	GSTS	0b	R	When this bit is set to 1, there is an interrupt source regarding reception of generic short packets. Check the CSI2nGSST register for the details of the interrupt source.
8	PMS	0b	R	When this bit is set to 1, there is an interrupt source regarding the power management. Check the CSI2nPMST register for the details of the interrupt source.
7 to 4	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	DL3S	0b	R	When this bit is set to 1, there is an interrupt source regarding data lane 3. Check the CSI2nDLST3 register for the details of the interrupt source.
2	DL2S	0b	R	When this bit is set to 1, there is an interrupt source regarding data lane 2. Check the CSI2nDLST2 register for the details of the interrupt source.
1	DL1S	0b	R	When this bit is set to 1, there is an interrupt source regarding data lane 1. Check the CSI2nDLST1 register for the details of the interrupt source.
0	DL0S	0b	R	When this bit is set to 1, there is an interrupt source regarding data lane 0. Check the CSI2nDLST0 register for the details of the interrupt source.

35.1.6.9 Receive Data Type Enable Low Register (CSI2nDTEL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DTEN[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DTEN[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DTEN[31:0]	H'0000_000F	RW/R	Receive data of a packet whose data type is one of the following. 0b: Does not receive data. 1b: Receives data. *Note*: After multiple data types are selected here, only one data type is selected by the INF[5:0] bits in the ICnMC register in the image processing module.

Bit	Data Type	Attribute	Comment
31	YUV422 10-bit	RW	When this bit is set to 1b, data is output to the image processing module.
30	YUV422 8-bit	RW	
29	YUV420 10-bit (Chroma Shifted Pixel Sampling)	RW	
28	YUV420 8-bit (Chroma Shifted Pixel Sampling)	RW	
27	Reserved	RW	
26	Legacy YUV420 8-bit	RW	
25	YUV420 10-bit	RW	
24	YUV420 8-bit	RW	
23	Reserved	RW	
22	Generic Long Packet Data Type 4	RW	
21	Generic Long Packet Data Type 3	RW	
20	Generic Long Packet Data Type 2	RW	
19	Generic Long Packet Data Type 1	RW	
18-16	Reserved (Embedded 8-bit non Image Data, etc.)	RW	Fixed to 0 since this function is not support.
15	Generic Short Packet Code 8	RW	Fixed to 1 for each bits.
14	Generic Short Packet Code 7	RW	When each bits are set to 1b and CSI2nGSCT.GFIF = 1, data is output to the generic short packet FIFO.
13	Generic Short Packet Code 6	RW	
12	Generic Short Packet Code 5	RW	
11	Generic Short Packet Code 4	RW	
10	Generic Short Packet Code 3	RW	
9	Generic Short Packet Code 2	RW	
8	Generic Short Packet Code 1	RW	
7-4	Reserved	R	Fixed to 0.
3-0	Reserved	R	Fixed to 1.

35.1.6.10 Receive Data Type Enable High Register (CSI2nDTEH)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DTEN[63:48]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	H’00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23 to 18	—	H’00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	RACTDETC	0b	R0W	Write 1 to this bit to clear CSI2nRXST.RACTDET. This bit cannot be modified to 0.
16 to 0	—	H‘0_0000	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

35.1.6.13 Receive Interrupt Enable Register (CSI2nRXIE)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RACTDETE	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	H’00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23 to 18	—	H’00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	RACTDETE	0b	RW	Enables interrupts generated by CSI2nRXST.RACTDET. 0b: Does not assert csi2_int_rx when CSI2nRXST.RACTDET = 1. 1b: Asserts csi2_int_rx when CSI2nRXST.RACTDET = 1.
16 to 0	—	H’0_0000	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

35.1.6.14 Data Lane (N) Status Register (CSI2nDLST(N))

(N) indicates a logical data lane number.

(N) = 0, 1, 2, or 3

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	ULP(N)	—	—	—	—	—	—	RUL(N)	EUL(N)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	EES(N)	ECT(N)	ESS(N)	ESH(N)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	H’00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	ULP(N)	0b	R	Indicates the RxUlpsEsc status of logical data lane (N).
23 to 20	—	H’0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	RUL(N)	0b	R	When this bit is set to 1, logical data lane (N) has transitioned to the ULPS receive mode (RxUlpsEsc). Write 1 to CSI2nDLSC(N).RULC(N) to clear this bit.
16	EUL(N)	0b	R	When this bit is set to 1, logical data lane (N) has exited from the ULPS receive mode (RxUlpsEsc). Write 1 to CSI2nDLSC(N).EULC(N) to clear this bit.
15 to 12	—	H’0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 4	—	H’0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	EES(N)	0b	R	When this bit is set to 1, an escape mode entry error (ErrESC) has occurred on logical data lane (N). Write 1 to CSI2nDLSC(N).EESC(N) to clear this bit.

Bit	Bit Name	Initial Value	R/W	Description
2	ECT(N)	0b	R	When this bit is set to 1, a control error (ErrControl) has occurred on logical data lane (N). Write 1 to CSI2nDLSC(N).ECTC(N) to clear this bit.
1	ESS(N)	0b	R	When this bit is set to 1, an SoT synchronization error (ErrSotSyncHS) has occurred on logical data lane (N). Write 1 to CSI2nDLSC(N).ESSC(N) to clear this bit.
0	ESH(N)	0b	R	When this bit is set to 1, an SoT error (ErrSotHS) has occurred on logical data lane (N). Write 1 to CSI2nDLSC(N).ESHC(N) to clear this bit.

35.1.6.15 Data Lane (N) Status Clear Register (CSI2nDLSC(N))

(N) indicates a logical data lane number.

(N) = 0, 1, 2, or 3

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RULC (N)	EULC (N)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W	R0W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	EESC (N)	ECTC (N)	ESSC (N)	ESHC (N)

R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	H'000	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
18	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
17	RULE(N)	0b	RW	Enables interrupts generated by CSI2nDLST(N).RUL(N). 0b: Does not assert csi2_int_dl when CSI2nDLST(N).RUL(N) = 1. 1b: Asserts csi2_int_dl when CSI2nDLST(N).RUL(N) = 1.
16	EULE(N)	0b	RW	Enables interrupts generated by CSI2nDLST(N).EUL(N). 0b: Does not assert csi2_int_dl when CSI2nDLST(N).EUL(N) = 1. 1b: Asserts csi2_int_dl when CSI2nDLST(N).EUL(N) = 1.
15 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 8	—	H'0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
7 to 4	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	EESE(N)	0b	RW	Enables interrupts generated by CSI2nDLST(N).EES(N). 0b: Does not assert csi2_int_dl when CSI2nDLST(N).EES(N) = 1. 1b: Asserts csi2_int_dl when CSI2nDLST(N).EES(N) = 1.
2	ECTE(N)	0b	RW	Enables interrupts generated by CSI2nDLST(N).ECT(N). 0b: Does not assert csi2_int_dl when CSI2nDLST(N).ECT(N) = 1. 1b: Asserts csi2_int_dl when CSI2nDLST(N).ECT(N) = 1.
1	ESSE(N)	0b	RW	Enables interrupts generated by CSI2nDLST(N).ESS(N). 0b: Does not assert csi2_int_dl when CSI2nDLST(N).ESS(N) = 1. 1b: Asserts csi2_int_dl when CSI2nDLST(N).ESS(N) = 1.
0	ESHE(N)	0b	RW	Enables interrupts generated by CSI2nDLST(N).ESH(N). 0b: Does not assert csi2_int_dl when CSI2nDLST(N).ESH(N) = 1. 1b: Asserts csi2_int_dl when CSI2nDLST(N).ESH(N) = 1.

35.1.6.17 Virtual Channel (M) Status Register (CSI2nVCST(M))

(M) indicates a virtual channel number.

(M) = 0, 1, 2, or 3

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	LER(M)	LSR(M)	FER(M)	FSR(M)	—	—	—	—	—	—	—	OVF(M)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	FRD(M)	FRS(M)	—	ECN(M)	ECC(M)	WCE(M)	IDE(M)	CRC(M)	ECD(M)	MLF(M)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27	LER(M)	0b	R	When this bit is set to 1, a packet whose data type is “Line End Code” has been received. Write 1 to CSI2nVCSC(M).LERC(M) to clear this bit.
26	LSR(M)	0b	R	When this bit is set to 1, a packet whose data type is “Line Start Code” has been received. Write 1 to CSI2nVCSC(M).LSRC(M) to clear this bit.
25	FER(M)	0b	R	When this bit is set to 1, a packet whose data type is “Frame End Code” has been received. Write 1 to CSI2nVCSC(M).FERC(M) to clear this bit.
24	FSR(M)	0b	R	When this bit is set to 1, a packet whose data type is “Frame Start Code” has been received. Write 1 to CSI2nVCSC(M).FSRC(M) to clear this bit.
23 to 17	—	H'00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	OVF(M)	0b	R	When this bit is set to 1, the generic short packets on virtual channel M has been discarded due to an overflow of the generic short packet FIFO. Write 1 to CSI2nVCSC(M).OVFC(M) to clear this bit.
15 to 10	—	H'00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	FRD(M)	0b	R	When this bit is set to 1, ErrFrameData has been detected. This bit is set to 1 if any of the following errors occurs between FS and FE: ● ErrCRC ● ErrWC ● ECC 2-bit error (when CSI2nMCT0.EDMD = 1) ● Reception of a packet of less than four bytes (when CSI2nMCT0.EDMD = 1) Note that this bit is set to 1 if Virtual Channel = M is between FS and FE because the virtual channel of a packet with an ECC 2-bit error or the virtual channel which received a packet of less than four bytes cannot be determined. Write 1 to CSI2nVCSC(M).FRDC(M) to clear this bit.

Bit	Bit Name	Initial Value	R/W	Description
8	FRS(M)	0b	R	When this bit is set to 1, ErrFrameSync has been detected. This bit is set to 1 if any of the following conditions occurs: ● After an FS is received, another FS has been received on the same virtual channel without receiving an FE. ● Although an FE is received, an FS has not been received on the same virtual channel. Write 1 to CSI2nVCSC(M).FRSC(M) to clear this bit.
7	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	ECN(M)	0b	R	When this bit is set to 1, no error was found in the ECC check on the received packets. Write 1 to CSI2nVCSC(M).ECNC(M) to clear this bit.
5	ECC(M)	0b	R	When this bit is set to 1, a 1-bit error was found in the ECC check on the received packets and the error was corrected. Write 1 to CSI2nVCSC(M).ECCC(M) to clear this bit.
4	WCE(M)	0b	R	When this bit is set to 1, it was detected that the data payload length of the packet is shorter than the value indicated by WC. Write 1 to CSI2nVCSC(M).WCEC(M) to clear this bit.
3	IDE(M)	0b	R	When this bit is set to 1, an ErrID was detected and the packet was discarded. This bit is set to 1 if any of the following conditions occurs: ● A packet which is defined as "Reserved" in chapter 9, Low Level Protocol in the CSI-2 Specification has been received. – A packet whose Data Type is H’04 to H’07 has been received. – A packet whose Data Type is H’38 to H’3F has been received when CSI2nMCT0.RVMD = 0. ● A generic short packet (Data Type = H’08 to H’0F) for which the corresponding bit in CSI2nDTEL.DTEN is 0 has been received. ● A long packet (Data Type = H’10 to H’3F) for which the corresponding bit in CSI2nDTEL(H).DTEN is 0 has been received. Write 1 to CSI2nVCSC(M).IDEC(M) to clear this bit. Note that this bit may be set to 1 if more spacers than the count specified in CSI2nEPCT.SSP/SLP are received when using EPD option 2.
2	CRC(M)	0b	R	When this bit is set to 1, a CRC error was detected in the received packet. Write 1 to CSI2nVCSC(M).CRCC(M) to clear this bit.
1	ECD(M)	0b	R	When this bit is set to 1, a 2-bit error was found in the ECC check on the received packets. Because the virtual channel of the packet with an error cannot be determined, the ECD(M) field is set to 1 for all virtual channels. To clear the ECD(M) field for all virtual channels, write 1 to CSI2nVCSC(M).AECDC(M) for any virtual channel. To clear the ECD(M) field of virtual channel M, write 1 to CSI2nVCSC(M).ECDC(M).
0	MLF(M)	0b	R	When this bit is set to 1, a packet of less than 4 bytes has been received. Because the virtual channel of the packet with an error cannot be determined, the MLF(M) field is set to 1 for all virtual channels. To clear the MLF(M) field for all virtual channels, write 1 to CSI2nVCSC(M).AMLFC(M) for any virtual channel. To clear the MLF(M) field of virtual channel M, write 1 to CSI2nVCSC(M).MLFC(M).

35.1.6.18 Virtual Channel (M) Status Clear Register (CSI2nVCSC(M))

(M) indicates a virtual channel number.

(M) = 0, 1, 2, or 3

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	H’0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27	LERE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).LER(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).LER(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).LER(M) = 1.
26	LSRE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).LSR(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).LSR(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).LSR(M) = 1.
25	FERE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).FER(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).FER(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).FER(M) = 1.
24	FSRE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).FSR(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).FSR(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).FSR(M) = 1.
23 to 17	—	H’00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	OVFE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).OVF(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).OVF(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).OVF(M) = 1.
15 to 10	—	H’00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	FRDE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).FRD(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).FRD(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).FRD(M) = 1.
8	FRSE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).FRS(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).FRS(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).FRS(M) = 1.
7	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	ECNE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).ECN(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).ECN(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).ECN(M) = 1.

Bit	Bit Name	Initial Value	R/W	Description
5	ECCE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).ECC(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).ECC(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).ECC(M) = 1.
4	WCEE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).WCE(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).WCE(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).WCE(M) = 1.
3	IDEE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).IDE(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).IDE(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).IDE(M) = 1.
2	CRCE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).CRC(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).CRC(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).CRC(M) = 1.
1	ECDE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).ECD(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).ECD(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).ECD(M) = 1.
0	MLFE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).MLF(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).MLF(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).MLF(M) = 1.

35.1.6.20 Power Management Status Register (CSI2nPMST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	DLUL				—	—	—	—	DLSS			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CLUL	CLSS	—	—	—	—	—	—	CUN	CUX	DUN	DUX	CSN	CSX	DSN	DSX
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 24	DLUL	H'0	R	Indicate the RxUlpsEsc status of a logical data lane. Bit 0: RxUlpsEsc of logical lane 0 Bit 1: RxUlpsEsc of logical lane 1 Bit 2: RxUlpsEsc of logical lane 2 Bit 3: RxUlpsEsc of logical lane 3
23 to 20	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19 to 16	DLSS	H'0	R	Indicate the stop state of a logical data lane. Bit 0: Stop state of logical lane 0 Bit 1: Stop state of logical lane 1 Bit 2: Stop state of logical lane 2 Bit 3: Stop state of logical lane 3
15	CLUL	0b	R	Indicates the inverted state of RxUlpsClkNot of the PPI clock lane. 0b: Not in ULPS 1b: In ULPS
14	CLSS	0b	R	Indicates the stop state of the PPI clock lane. 0b: Not in the stop state 1b: In the stop state
13 to 8	—	H'00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	CUN	0b	R	When this bit is set to 1, the clock lane has transitioned to ULPS mode (inversion of RxUlpsClkNot). Write 1 to CSI2nPMSC.CUNC to clear this bit.
6	CUX	0b	R	When this bit is set to 1, the mode of the clock lane has changed from ULPS mode (inversion of RxUlpsClkNot) to non-ULPS mode. Write 1 to CSI2nPMSC.CUXC to clear this bit.
5	DUN	0b	R	When this bit is set to 1, all valid data lanes have transitioned to ULPS mode. Write 1 to CSI2nPMSC.DUNC to clear this bit.
4	DUX	0b	R	When this bit is set to 1, the mode of all valid data lanes has changed from ULPS mode to a different state. Write 1 to CSI2nPMSC.DUXC to clear this bit.
3	CSN	0b	R	When this bit is set to 1, the clock lane has transitioned to the stop state. Write 1 to CSI2nPMSC.CSNC to clear this bit.
2	CSX	0b	R	When this bit is set to 1, the state of the clock lane has changed from the stop state to a state different from the stop state. Write 1 to CSI2nPMSC.CSXC to clear this bit.

Bit	Bit Name	Initial Value	R/W	Description
1	DSN	0b	R	When this bit is set to 1, all valid data lanes have transitioned to the stop state. Write 1 to CSI2nPMSC.DSNC to clear this bit.
0	DSX	0b	R	When this bit is set to 1, the mode of all valid data lanes has changed from the stop state to a different state. Write 1 to CSI2nPMSC.DSXC to clear this bit.

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	CUNE	0b	RW	Enables interrupts generated by CSI2nPMST.CUN. 0b: Does not assert csi2_int_pm when CSI2nPMST.CUN = 1. 1b: Asserts csi2_int_pm when CSI2nPMST.CUN = 1.
6	CUXE	0b	RW	Enables interrupts generated by CSI2nPMST.CUX. 0b: Does not assert csi2_int_pm when CSI2nPMST.CUX = 1. 1b: Asserts csi2_int_pm when CSI2nPMST.CUX = 1.
5	DUNE	0b	RW	Enables interrupts generated by CSI2nPMST.DUN. 0b: Does not assert csi2_int_pm when CSI2nPMST.DUN = 1. 1b: Asserts csi2_int_pm when CSI2nPMST.DUN = 1.
4	DUXE	0b	RW	Enables interrupts generated by CSI2nPMST.DUX. 0b: Does not assert csi2_int_pm when CSI2nPMST.DUX = 1. 1b: Asserts csi2_int_pm when CSI2nPMST.DUX = 1.
3	CSNE	0b	RW	Enables interrupts generated by CSI2nPMST.CSN. 0b: Does not assert csi2_int_pm when CSI2nPMST.CSN = 1. 1b: Asserts csi2_int_pm when CSI2nPMST.CSN = 1.
2	CSXE	0b	RW	Enables interrupts generated by CSI2nPMST.CSX. 0b: Does not assert csi2_int_pm when CSI2nPMST.CSX = 1. 1b: Asserts csi2_int_pm when CSI2nPMST.CSX = 1.
1	DSNE	0b	RW	Enables interrupts generated by CSI2nPMST.DSN. 0b: Does not assert csi2_int_pm when CSI2nPMST.DSN = 1. 1b: Asserts csi2_int_pm when CSI2nPMST.DSN = 1.
0	DSXE	0b	RW	Enables interrupts generated by CSI2nPMST.DSX. 0b: Does not assert csi2_int_pm when CSI2nPMST.DSX = 1. 1b: Asserts csi2_int_pm when CSI2nPMST.DSX = 1.

35.1.6.23 Generic Short Packet Control Register (CSI2nGSCT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GFIF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SHTH						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
16	GFIF	1b	RW	When this bit is set to 1, the received generic short packet is stored in the generic short packet FIFO (GS FIFO).
15 to 7	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6 to 0	SHTH	H'00	RW	Asserts CSI2nGSST.GTH while the number of packets stored in the generic short packet FIFO equals or exceeds the value of this field + 1. Set this field to 15 or less when using CSI2nGSST.GTH. Set the default value when not using CSI2nGSST.GTH.

35.1.6.24 Generic Short Packet Status Register (CSI2nGSST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STRDS	GCD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PNUM								—	—	—	GOV	—	—	GTH	GNE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	STRDS	0b	R	Indicates whether the received generic short packets can be stored in the generic short packet FIFO. 0b: Can be stored in the generic short packet FIFO. 1b: Cannot be stored in the generic short packet FIFO. This field indicates an inverted value of the store_en signal described in **Section 35.1.7.1** with a delay of internal latency. It may indicate the previous value depending on the signal change timing.
16	GCD	0b	R	When this bit is set to 1, the GS FIFO is being cleared by CSI2nGSCT.GFCLR.
15 to 8	PNUM	H’00	R	Indicate the number of packets stored in the generic short packet FIFO.
7 to 5	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	GOV	0b	R	When this bit is set to 1, the generic short packet FIFO has overflowed. Write 1 to CSI2nGSSC.GOVC to clear this bit.
3, 2	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	GTH	0b	R	When this bit is set to 1, the number of packets stored in the generic short packet FIFO equals or exceeds “CSI2nGSCT.SHTH + 1”.
0	GNE	0b	R	When this bit is set to 1, the generic short packet FIFO is not empty.

35.1.6.25 Generic Short Packet Status Clear Register (CSI2nGSSC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	GOVE	0b	RW	Enables interrupts generated by CSI2nGSST.GOV. 0b: Does not assert csi2_int_gst when CSI2nGSST.GOV = 1. 1b: Asserts csi2_int_gst when CSI2nGSST.GOV = 1.
3, 2	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	GTHE	0b	RW	Enables interrupts generated by CSI2nGSST.GTH. 0b: Does not assert csi2_int_gst when CSI2nGSST.GTH = 1. 1b: Asserts csi2_int_gst when CSI2nGSST.GTH = 1.
0	GNEE	0b	RW	Enables interrupts generated by CSI2nGSST.GNE. 0b: Does not assert csi2_int_gst when CSI2nGSST.GNE = 1. 1b: Asserts csi2_int_gst when CSI2nGSST.GNE = 1.

35.1.6.27 Generic Short Packet Register (CSI2nGSHT)

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	GFEN	0b	R0W	Write 1 to this bit to re-enable storing generic short packets in the GS FIFO which has overflowed and been disabled. This bit cannot be modified to 0.
15 to 9	—	H'00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	GFCLR	0b	RW	Clears the GS FIFO. Writing 1 to this bit requests the FIFO to be cleared. Writing 0 to this bit requests FIFO clearing to be canceled.
7 to 1	—	H'00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	FINC	0b	R0W	Write 1 to this bit to update the next packet with the data of the packet indicated in the CSI2nGSHT register. This bit cannot be modified to 0. Writing 1 to this bit while CSI2nGSST.PNUM = 0 is prohibited.

35.1.6.29 D-PHY Control Register 0 (CSIDPHYCTRL0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18 to 16	—	000b	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14 to 12	UTIL_DL3_SKW_ADJ	000b	RW	Data lane 3 skew adjustment function Set the recommended value 001b. If required, change the value referring to **Figure 35.3**.
11	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10 to 8	UTIL_DL2_SKW_ADJ	000b	RW	Data lane 2 skew adjustment function Set the recommended value 001b. If required, change the value referring to **Figure 35.3**.
7	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6 to 4	UTIL_DL1_SKW_ADJ	000b	RW	Data lane 1 skew adjustment function Set the recommended value 001b. If required, change the value referring to **Figure 35.3**.
3	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2 to 0	UTIL_DL0_SKW_ADJ	000b	RW	Data lane 0 skew adjustment function Set the recommended value 001b. If required, change the value referring to **Figure 35.3**.

The skew adjustment function adjusts the skew by using the circuit shown in **Figure 35.3**.

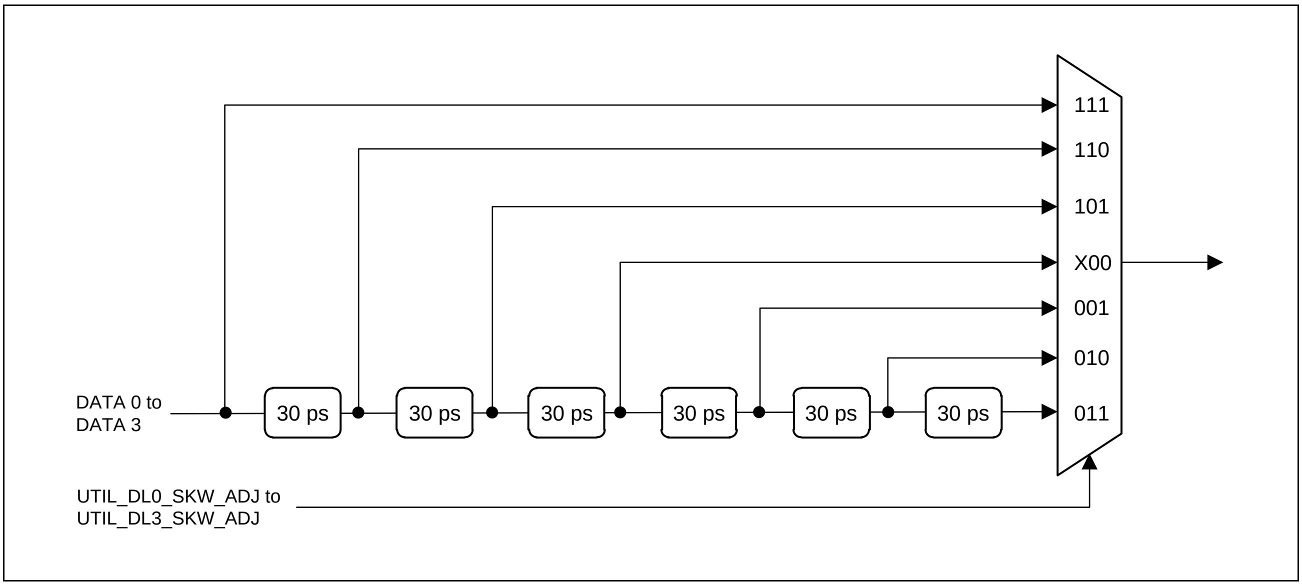

Figure 35.3 Skew Adjustment Circuit

35.1.7 Operation

35.1.7.1 Data Reception

(1) Common Between Short Packets and Long Packets

Figure 35.4 shows the flow when receiving a packet whose data type is A and virtual channel is M.

This flow is common between short packets and long packets.

Upon receiving a packet, the CRU checks the length of the received packet.

If the length of the received packet is less than the packet header length (4 bytes), a virtual channel cannot be determined, resulting in setting CSI2nVCST(M).MLF(M) to 1 for all virtual channels. In addition, this packet is discarded because it is invalid.

When the length of the received packet is 4 bytes or more, ECC checking is performed. The check results are indicated in the CSI2nVCST(M) register.

- 2-bit error: Because the virtual channel of the packet with an error cannot be determined, CSI2nVCST(M).ECD(M) is set to 1 for all virtual channels.
  In addition, the packet is discarded because error correction cannot be performed.
- 1-bit error: CSI2nVCST(M).ECC(M) is set to 1 for the relevant virtual channel.
  Error correction is performed because it is possible.
  No error: CSI2nVCST(M).ECN(M) is set to 1 for the relevant virtual channel.

If the ECC check results are “1-bit error” or “no error”, the Data Type field of the packet header is analyzed.

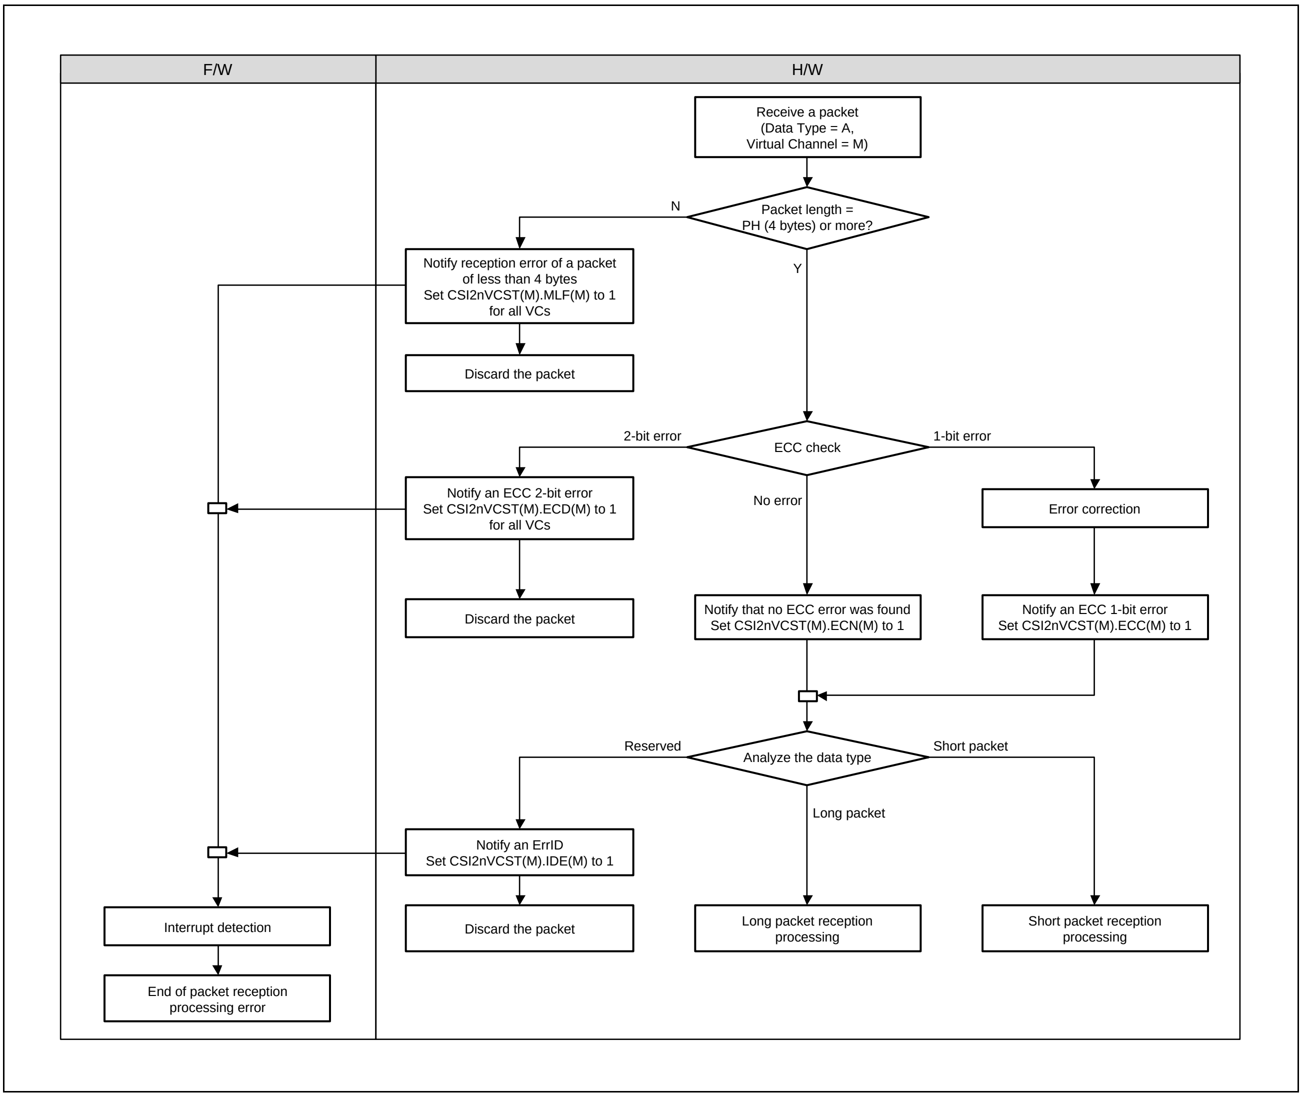

Figure 35.4 Packet Reception Processing

(2) Generic Short Packet Data Type Code

Figure 35.5 shows the flow when receiving a packet whose data type is generic short packet code 1 to 8 and virtual channel is M.

When the corresponding bit in CSI2nDTEL.DTEN is set to 0, CSI2nVCST(M).IDE(M)) is asserted and the packet is discarded.

When the corresponding bit in CSI2nDTEL.DTEN is set to 1 and CSI2nGSCT.GFIF is set to 1, the generic short packet is output to the generic short packet FIFO. For details on the operation when using the generic short packet FIFO, see the flow in **Figure 35.5**.

The initial value of internal signal store_en which is described in the flow is 1. When store_en is set to 1, packets can be stored in the generic short packet FIFO. When it is set to 0, packets cannot be stored in the generic short packet FIFO.

- store_en is set to 0 when the generic short packet FIFO has overflowed.
- store_en is set to 1 when 1 is written to CSI2nGSIU.GFEN.

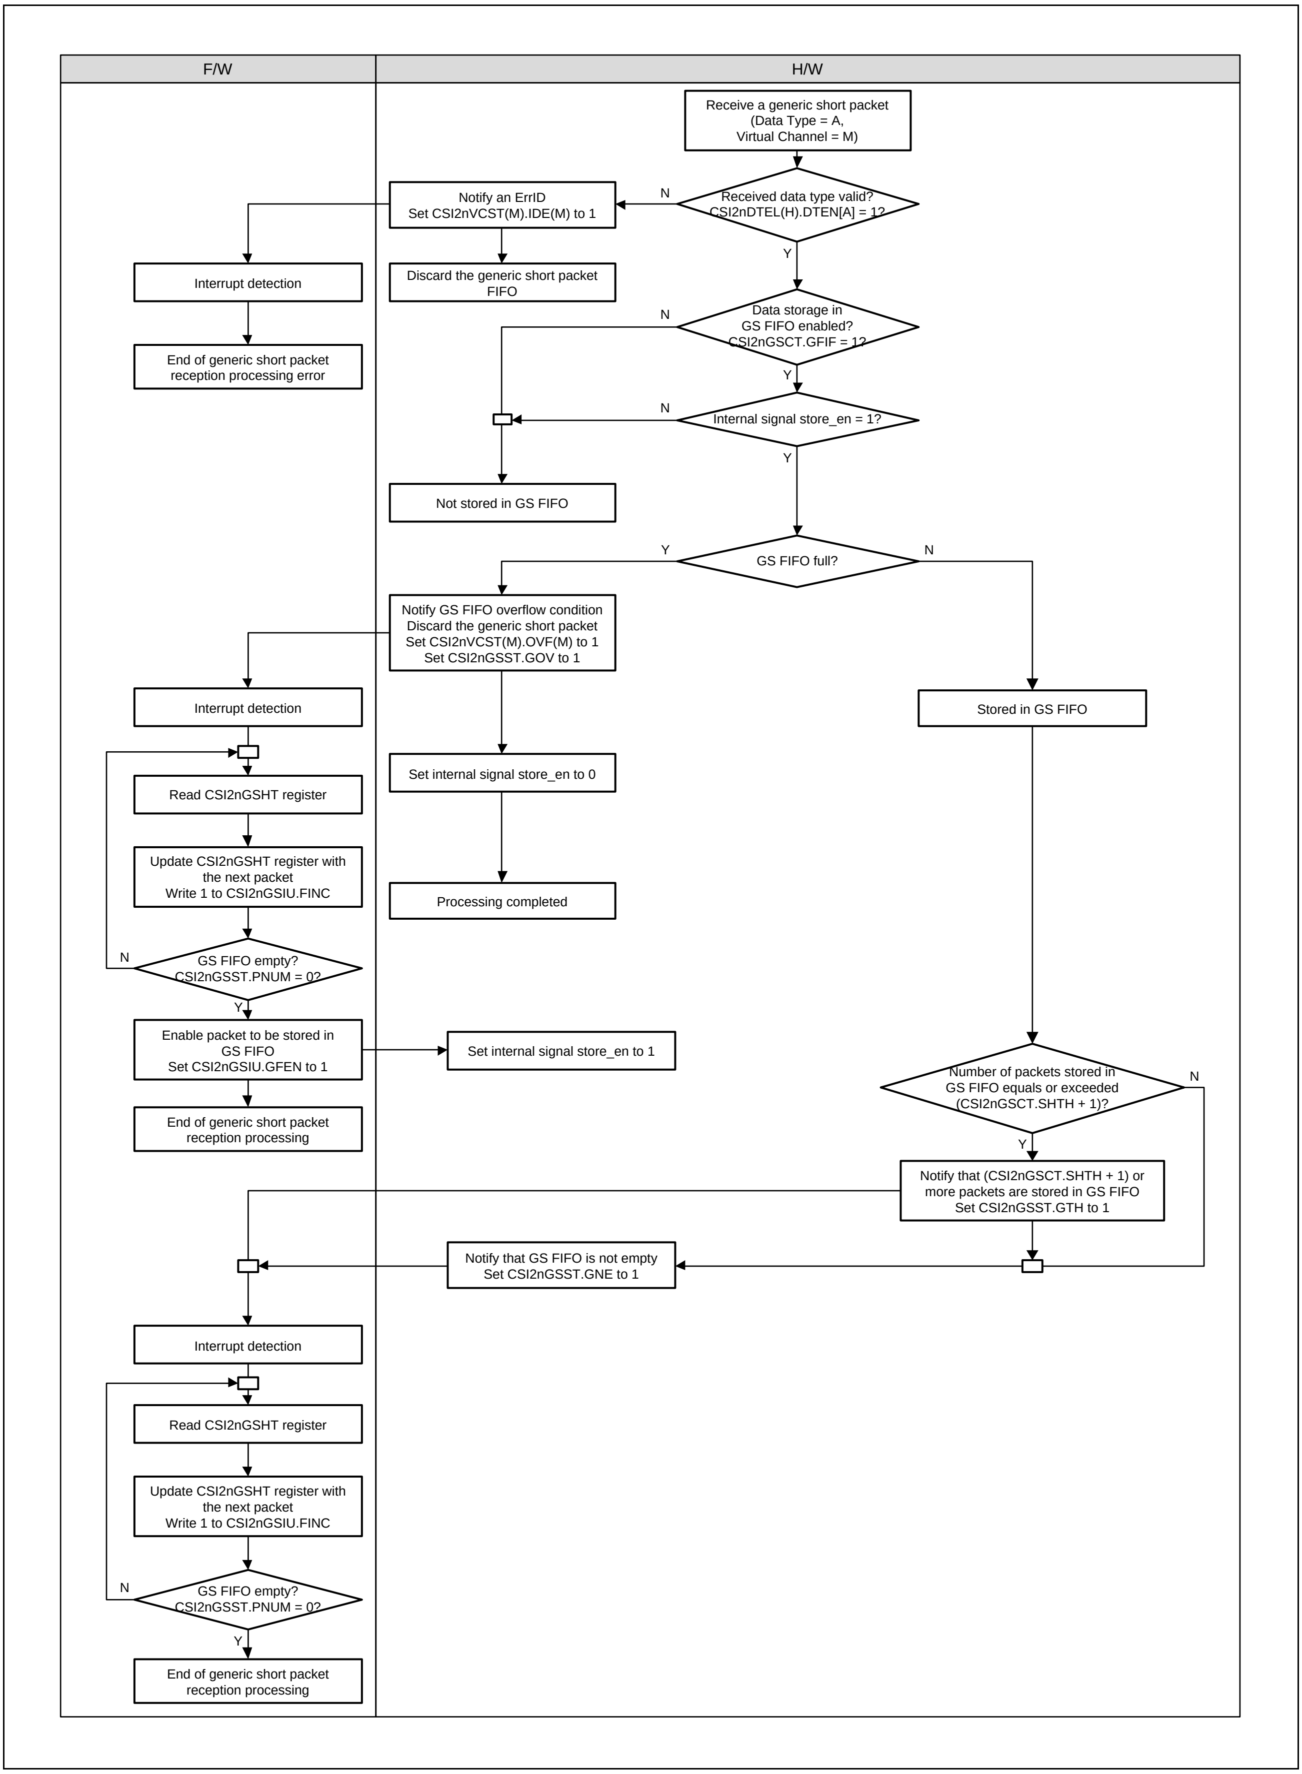

Figure 35.5 Generic Short Packet Receive Processing

(3) Clearing the Generic Short Packet FIFO

Figure 35.6 shows how the generic short packet FIFO is cleared.

Writing 1 to CSI2nGSIU.GFCLR starts clearing the generic short packet FIFO.

After requesting to clear the generic short packet FIFO, check if CSI2nGSST.GCD is set to 1 to make sure that the FIFO is cleared. Then, writing 0 to CSI2nGSIU.GFCLR cancels the request for clearing the generic short packet FIFO. Check if CSI2nGSST.GCD is set to 0 to make sure that the request for clearing the generic short packet FIFO is canceled.

When CSI2nMCG.GSNM is set to 0d, it is prohibited to clear the generic short packet FIFO.

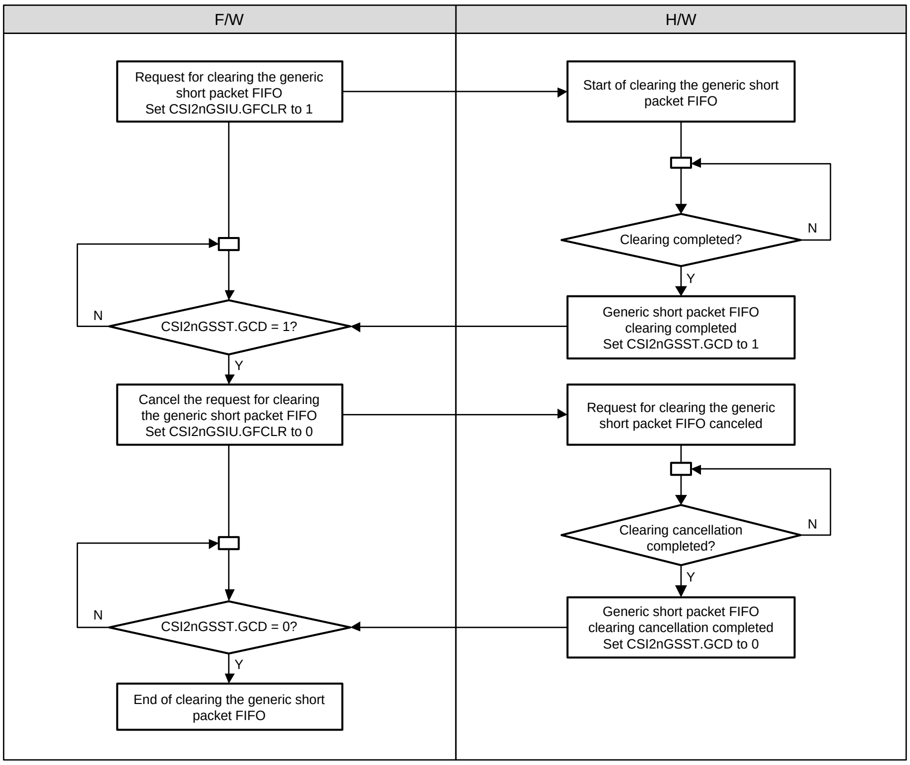

Figure 35.6 Clearing the Generic Short Packet FIFO

35.1.8 Interrupt

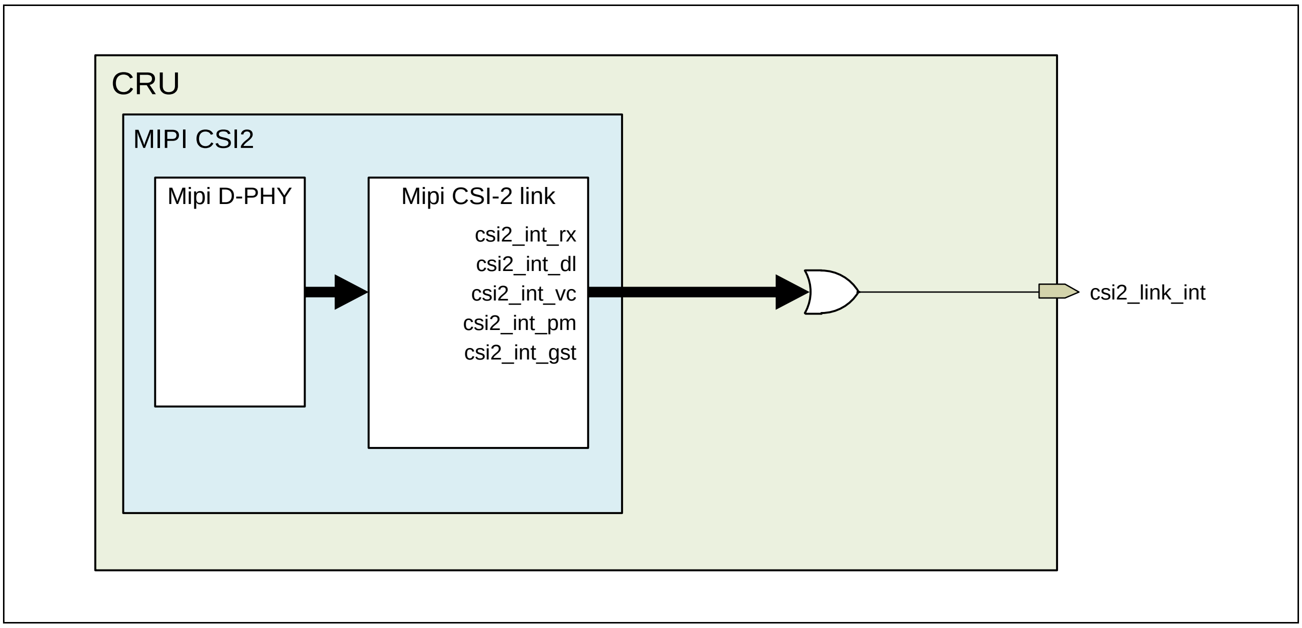

Figure 35.7 Interrupt Structure

Table 35.8 Interruption Status and Generation Condition (1/3)

Interrupt Status	Interrupt Source Register Field	Interrupt Enable Register Field	Generation Condition

	CSI2nGSST.GOV	CSI2nGSIE.GOVE	GS FIFO overflowed.

35.2 Image Processing

35.2.1 Overview

The image processing module is a data conversion module equipped with pixel color space conversion, LUT, pixel format conversion, image clipping, frame subsampling, demosaicing, linear matrix, statistics, etc. An MIPI CSI-2 (**Section 35.1**) input and parallel (including ITU-R BT.656) input are provided as the image sensor interface. Either of the two inputs is selected and stored in the internal FIFO (RAM), and then the data is transferred to the external memory by using the internal AXI bus. The MIPI CSI-2 input processes only a single data type on one channel from virtual channels CH0 to CH3. Some parameters allow changes on a per-frame basis. If multiple virtual channels (with the same image size) are to be processed, channels are switched at the frame boundary by changing register settings.

35.2.1.1 Features

- The operating ranges are as follows:
  - Maximum number of valid pixels: QVGA (320 × 240) to 5 Mpixels
  - Range of valid pixels in the horizontal direction: 320 to 2800 pixels
  - Range of valid pixels in the vertical direction: 240 to 4095 lines
  - The maximum transfer rate depends on the input format, see **Section 35.1.2** for details.
  - Parallel (including ITU-R BT.656) input: 13.5 MHz to 74.25 MHz
- Input data format (type): See **Table 35.12**.
  - MIPI CSI-2 input: YUV, RGB, RAW, etc.
  - Parallel input: YCbCr, 16-bit binary, etc.
- Output data format (type): Only little endian is supported.
  - YCbCr422/YCbCr420, 8-bit multiplexed (Y, U/V order swapping supported)
  - YC separation from YCbCr422 (separated into Y and CbCr components)
  - Interlaced (parallel input only) YCbCr420 output without YC separation is supported.
  - Y component extraction from YCbCr422
  - U/V of the YUV422/YCbCr420 output is expressed in offset binary or two’s complement notation.
  - RGB-888 (24 bits/pixel)
  - RGB-888 (32 bits/pixel)
  - ARGB-8888 (32 bits/pixel)
  - RAW8,10,12,14,16
  - 16-bit binary (parallel input only)
  - MIPI CSI-2 Recommended Memory Storage Format
- Color space conversion
  - YCbCr422 to RGB888
  - RGB888 to YCbCr422
- Image format conversion
  - YCbCr422 → YC separation (separated into Y and CbCr components)

  - YCbCr422 → Y component extraction
  - YCbCr422 → YCbCr420
    Interlaced (parallel input only) YCbCr420 output without YC separation is supported.
  - RGB-888 → RGB-888 (32 bits/pixel)
  - RGB-888 → ARGB-8888 (32 bits/pixel): B First A Last format
  - RGB-888 → ARGB-8888 (32 bits/pixel): A First B Last format
  - RGB-565 → RGB-888 conversion (intermediate processing)
  - RGB-666 → RGB-888 conversion (intermediate processing)
- Conversion 10-bit to 8-bit by using a lookup table (LUT)
- Data clipping (See **Section 35.2.4.13**)
- Image clipping
- Frame subsampling
- Bypassing each function (function bypassed)
- Pattern generator (for debugging)
  - Output Y, U, V register values.
- Demosaicing
  - RAW8, 10, 12, 14, and 16 to RGB888
- Statistics (statistical processing operations: horizontal detection area: 320 to 2048 pixels; vertical detection area: 240 to 4080)
  - Accumulation in the (16×16, 32×32, 64×64, and 128×128) areas for each of R, G, and B from RAW8, 10, 12, 14, and 16 data
  - Summation of absolute values for differences from adjacent pixel values of G from RAW8, 10, 12, 14, and 16 data
- Linear Matrix (Color correction by linear matrix operations)
  - Offset calculation included
- FIFO:
  - For image data: 8 K bytes
  - For statistics data: 512 bytes
- AXI master: Two channels (image processing, statistics system)
- APB slave: Only 32-bit access is supported.

35.2.1.2 Block Diagram

Below figure shows a block diagram of the image processing module.

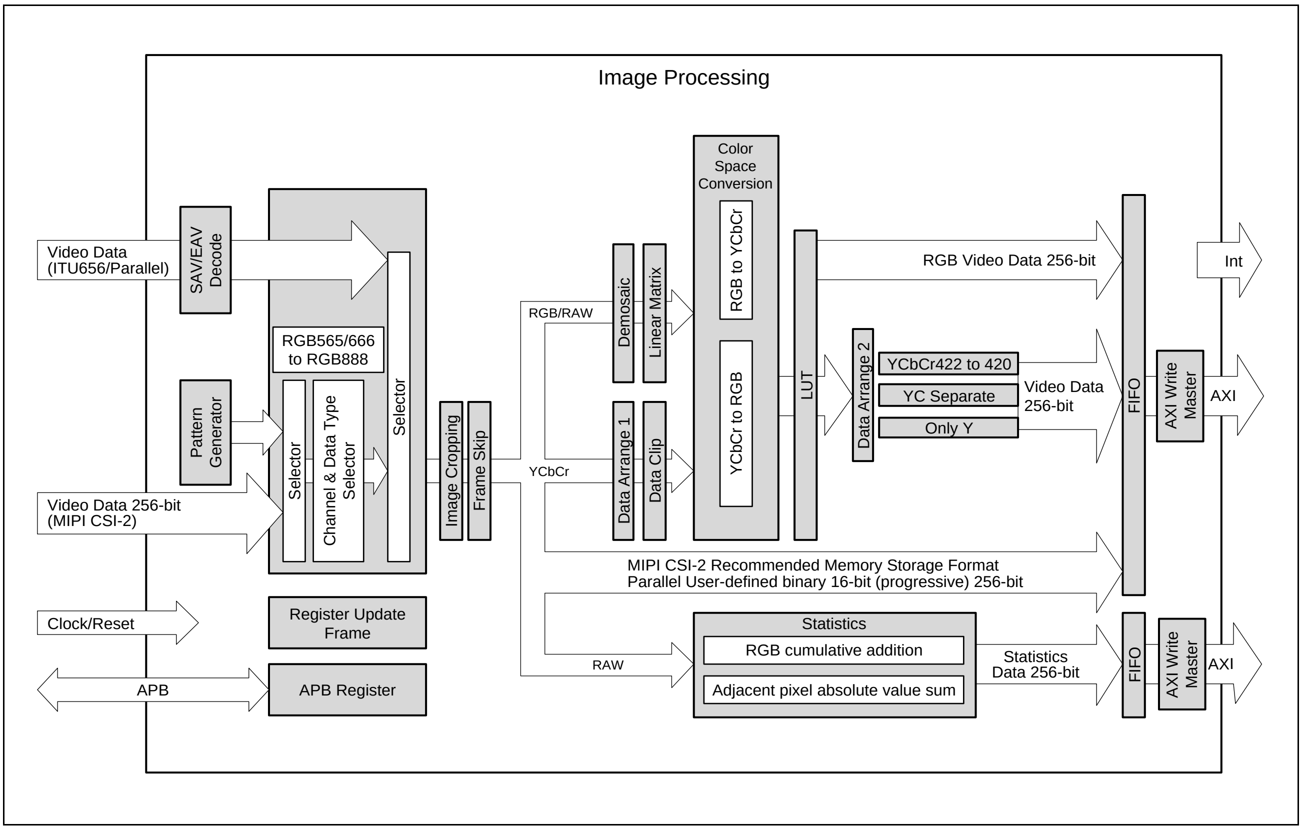

Figure 35.8 Block Diagram of the Image Processing Module

35.2.1.3 Parallel Inputs

Table 35.9 lists the input and output pins used by the image processing module. Because these pins are multiplexed with other pins, they need settings. The MIPI CSI-2 signal is input to the image processing module through the MIPI CSI-2 receiver module.

Table 35.9 Parallel Input Pins

Classification	Pin Name	In/Out	Sync Clock	Sync Edge	Description
Parallel Video Interface	CAM_PCLK	In	—	—	External Parallel Video Clock
	CAM_VSYNC	In	CAM_PCLK	pos	Vsync External Video Input
	CAM_FIELD	In	CAM_PCLK	pos	Field External Video Input
	CAM_HREF	In	CAM_PCLK	pos	Data Enable & Hsync External Video Input
	CAM_DATA15 to CAM_DATA0	In	CAM_PCLK	pos	Data External Video Input When using ITU-R BT.656. Use CAM_DATA9 to CAM_DATA0 (10 bits) Use CAM_DATA9 to CAM_DATA2 (8 bits)

(1) Parallel Data Input Timing

Figure 35.9 and **Figure 35.10** show the input data timing except for the ITU-R BT.656 input.

Figure 35.9 is an example when ICnPIFC.PINF[3:0] = 0010b, ICnPIFC.ITL[2:0] = 101b, ICnPIFC.VSPOL = 0 and ICnPIFC.ENPOL = 0.

Figure 35.10 is an example when ICnPIFC.PINF[3:0] = 0010b, ICnPIFC.ITL[2:0] = 000b, ICnPIFC.VSPOL = 0 and ICnPIFC.ENPOL = 0.

The polarity of CAM_VSYNC and CAM_HREF can be inverted by register settings.

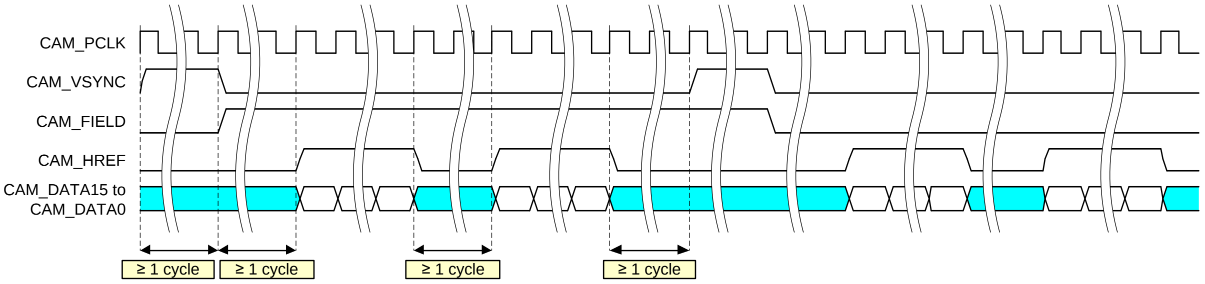

Figure 35.9 Parallel Data Input Timing (Interlaced)

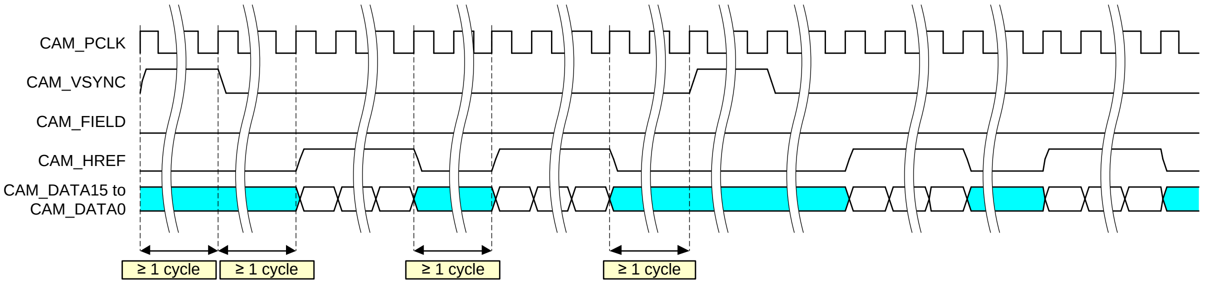

Figure 35.10 Parallel Data Input Timing (Progressive)

(2) Parallel Input Format Correspondence Table

Table 35.10 is a parallel input format correspondence table.

	8 bits	—	—	—	—	—	—	D7	D6	D5	D4	D3	D2	D1	D0	—	—
Binary, 16 bits*[2]		D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

Note 1. Signals D9 to D0 are connected according to the number of Data bit number in TABLE 2: “Video timing reference codes” of ITU-R BT.656-5 standard.

Note 2. The 16-bit binary data is packed with 1-pixel data, such as user-defined RGB, YCbCr, etc., in the 16 bits.

35.2.2 Register Configuration

The following shows the base address of this module.

Module Name	Address
Image Processing	H'0_1083_0000 (Cortex-A55 Address Space) H'4083_0000 (Cortex-M33 Address Space Non-Secure) H'5083_0000 (Cortex-M33 Address Space Secure)

The register values at addresses H'1083_0208 to H'1083_0244 can be changed through frame synchronization. For the changing flows, see **Section 35.3.3.1** and **Section 35.3.3.2**.

35.2.3 Register Descriptions

Access the following registers only in units of 32 bits.

35.2.3.1 CRU Control Register (CRUnCTRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VINSEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	VINSEL	0b	RW	Video data input switch setting 0b: MIPI I/F 1b: Parallel I/F

35.2.3.2 CRU Interrupt Enable Register (CRUnIE)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	CEE	WIE	SIE	EFE	SFE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SDFEOVWE	SDDECEE	SDSLVEE	SDFOE	—	—	—	—	FEOVWE	DECEE	SLVEE	FOE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	000b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
28 to 21	—	H’00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	CEE	0b	RW	ITU-R BT.656 DECERR interrupt control 0b: No interrupts are generated. 1b: Interrupts are generated.
19	WIE	0b	RW	Work count value error interrupt control 0b: No interrupts are generated. 1b: Interrupts are generated.
18	SIE	0b	RW	Scan line interrupt control 0b: No interrupts are generated. 1b: Interrupts are generated.
17	EFE	0b	RW	Frame end interrupt control 0b: No interrupts are generated. 1b: Interrupts are generated.
16	SFE	0b	RW	Frame start interrupt control 0b: No interrupts are generated. 1b: Interrupts are generated.
15 to 12	—	H’0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	SDFEOVWE	0b	RW	Frame End Overwrite (Statistics data-related) interrupt enable control 0b: No interrupts are generated 1b: Interrupts are generated
10	SDDECEE	0b	RW	AXI DECERR Error (Statistics data-related) interrupt enable control 0b: No interrupts are generated 1b: Interrupts are generated
9	SDSLVEE	0b	RW	AXI SLVERR Error (Statistics data-related) interrupt enable control 0b: No interrupts are generated 1b: Interrupts are generated
8	SDFOE	0b	RW	FIFO overflow (Statistics data-related) interrupt enable control 0b: No interrupts are generated 1b: Interrupts are generated
7 to 4	—	H’0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
3	FEOVWE	0b	RW	Frame End Overwrite (image-related) interrupt control 0b: No interrupts are generated. 1b: Interrupts are generated.
2	DECEE	0b	RW	DECERR (image-related) interrupt control 0b: No interrupts are generated. 1b: Interrupts are generated.
1	SLVEE	0b	RW	SLVERR (image-related) interrupt control 0b: No interrupts are generated. 1b: Interrupts are generated.
0	FOE	0b	RW	FIFO overflow (image-related) interrupt control 0b: No interrupts are generated. 1b: Interrupts are generated.

35.2.3.3 CRU Interrupt Status Register (CRUnINTS)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	CES	WIS	SIS	EFS	SFS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SDFEOVWS	SDDECES	SDSLVES	SDFOS	—	—	—	—	FEOVWS	DECES	SLVES	FOS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	000b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
28 to 21	—	H'00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	CES	0b	RW	ITU-R BT.656 DECERR interrupt status Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
19	WIS	0b	RW	Word count value error interrupt status Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
18	SIS	0b	RW	Scan line interrupt status Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
17	EFS	0b	RW	Frame end interrupt status Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
16	SFS	0b	RW	Frame start interrupt status Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
15 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	SDFEOVWS	0b	RW	Frame End Overwrite (Statistics data-related) interrupt status An error occurs if the end of the next frame is received while processing a frame end. Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
10	SDDECES	0b	RW	AXI DECERR Error (Statistics data-related) interrupt status Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
9	SDSLVES	0b	RW	AXI SLVERR Error (Statistics data-related) interrupt status Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
8	SDFOS	0b	RW	FIFO overflow (Statistics data-related) interrupt status Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
7 to 4	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
3	FEOVWS	0b	RW	Frame End Overwrite (image-related) interrupt status An error occurs if the end of the next frame is received while processing a frame end. Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
2	DECES	0b	RW	DECERR (image-related) interrupt status Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
1	SLVES	0b	RW	SLVERR (image-related) interrupt status Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
0	FOS	0b	RW	FIFO overflow (image-related) interrupt status Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated

35.2.3.4 CRU Reset Register (CRUnRST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VRESETN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	VRESETN	0b	RW	0b: Resets the image processing module. 1b: Releases the image processing module from the reset state.

35.2.3.5 CRU General Read/Write Register (CRUnCOM)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	COMMON[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	COMMON[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	COMMON [31:0]	All 0	RW	General register

35.2.3.6 Memory Bank 1 Base Address (Lower) Register for CRU Image Data (AMnMB1ADDRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MB1ADDRL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MB1ADDRL[15:9]							—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB1ADDRL [31:9]	All 0	RW	Image data transfer destination base address 1 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. *Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating).
8 to 0	—	H’000	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

35.2.3.7 Memory Bank 1 Base Address (Higher) Register for CRU Image Data (AMnMB1ADDRH)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MB1ADDRH[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1, 0	MB1ADDRH [1:0]	00b	RW	Image data transfer destination base address 1 (valid bits: [33:32]) (These bits cannot be modified while the AXI is operating.)

35.2.3.8 Memory Bank 2 Base Address (Lower) Register for CRU Image Data (AMnMB2ADDRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MB2ADDRL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MB2ADDRL[15:9]							—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB2ADDRL [31:9]	All 0	RW	Image data transfer destination base address 2 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. *Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating).
8 to 0	—	H'000	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

35.2.3.9 Memory Bank 2 Base Address (Higher) Register for CRU Image Data (AMnMB2ADDRH)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MB2ADDRH[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1, 0	MB2ADDRH [1:0]	00b	RW	Image data transfer destination base address 2 (valid bits: [33:32]) (These bits cannot be modified while the AXI is operating.)

35.2.3.10 Memory Bank 3 Base Address (Lower) Register for CRU Image Data (AMnMB3ADDRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MB3ADDRL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MB3ADDRL[15:9]							—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB3ADDRL [31:9]	All 0	RW	Image data transfer destination base address 3 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. *Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating).
8 to 0	—	H’000	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

35.2.3.11 Memory Bank 3 Base Address (Higher) Register for CRU Image Data (AMnMB3ADDRH)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MB3ADDRH[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1, 0	MB3ADDRH [1:0]	00b	RW	Image data transfer destination base address 3 (valid bits: [33:32]) (These bits cannot be modified while the AXI is operating.)

35.2.3.12 Memory Bank 4 Base Address (Lower) Register for CRU Image Data (AMnMB4ADDRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MB4ADDRL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1, 0	MB8ADDRH [1:0]	00b	RW	Image data transfer destination base address 8 (valid bits: [33:32]) (These bits cannot be modified while the AXI is operating.)

35.2.3.22 UV Data Address Offset (Lower) Register for CRU Image Data (AMnUVAOFL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UVAOFL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UVAOFL[15:9]							—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	UVAOFL [31:9]	All 0	RW	UV data address offset when outputting image data YUV (valid bits: [31:9]) Set it in the base address in units of 512 bytes. *Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating).
8 to 0	—	H'000	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

35.2.3.23 UV Data Address Offset (Higher) Register for CRU Image Data (AMnUVAOFH)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	UVAOFH[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2 to 0	UVAOFH[2:0]	000b	RW	UV data address offset when outputting image data YUV (valid bits: [34:32]) (These bits cannot be modified while the AXI is operating.)

35.2.3.24 Memory Bank Enable Register for CRU Image Data (AMnMBVALID)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	MBVALID[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	MBVALID[7:0]	H'01	RW	Image data transfer destination valid address (Details is written in **Section 35.2.4.3**.) [0]: 0: MB1 invalid, 1: MB1 valid [1]: 0: MB2 invalid, 1: MB2 valid [2]: 0: MB3 invalid, 1: MB3 valid [3]: 0: MB4 invalid, 1: MB4 valid [4]: 0: MB5 invalid, 1: MB5 valid [5]: 0: MB6 invalid, 1: MB6 valid [6]: 0: MB7 invalid, 1: MB7 valid [7]: 0: MB8 invalid, 1: MB8 valid *Note*: Set the valid destination address from the LSB continuously. Data transferred from the LSB is written sequentially only in valid banks, and the process is repeated from the start (LSB) when the last address is reached. (These bits cannot be modified while the AXI is operating.)

35.2.3.25 Memory Bank Status Register for CRU Image Data (AMnMBS)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	MBSTS[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2 to 0	MBSTS[2:0]	000b	R	Indicates which memory bank the image data is being transferred to, MB1 to MB8. (H'0: MB1, H'1: MB2 … H'6: MB7, H'7: MB8)

35.2.3.26 AXI Master Transfer Setting Register for CRU Image Data (AMnAXIATTR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	AXILEN[3:0]			
Initial Value	0	0	0	0	0	0	0	1	0	1	0	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	H’0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 24	—	H’0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
23	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22 to 16	—	H’00	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
15, 14	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13, 12	—	00b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
11, 10	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9, 8	—	01b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
7	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6 to 4	—	101b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	AXILEN[3:0]	H'0	RW	AXI burst max length setting for image data (these bits cannot be modified while the AXI is operating.) For YC separation mode (ICnDMR.YCMODE[2:0] = 010b): H'0: up to 1-beat burst H'1: up to 1-beat burst H'3: up to 2-beat burst H'7: up to 4-beat burst H'F: up to 8-beat burst Others: Setting prohibited. Except for YC separation mode (ICnDMR.YCMODE[2:0] ≠ 010b): H'0: up to 1-beat burst H'1: up to 2-beat burst H'3: up to 4-beat burst H'7: up to 8-beat burst H'F: up to 16-beat burst Others: Setting prohibited. To improve the transfer performance of this unit, it is recommended to use it in H'F.

35.2.3.27 AXI Master FIFO Setting Register for CRU Image Data (AMnFIFO)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FIFOOVFREC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	FIFOOVFREC	1b	RW	Recovery mode when image data FIFO overflowed The image-related AXI master stops when the image data FIFO overflowed. The operation after an overflow can be selected: 0b: Auto recovery: The CRU recovers automatically in the next frame after the image-related AXI master stopped and the FIFO was cleared. After recovery, transfer resumes to the start address of the MB to which data was being transferred to. 1b: Stop: The image-related AXI master stops and the FIFO is cleared. The status can be verified by the reg_axi_mst_err_int interrupt. The CRU recovers in the next frame after AXI_TRANS_START bit in the AMnFIFOTRST register is set to 1. The image data being processed at the time of the FIFO overflow will be corrupted. The FIFO overflow may have been caused by bus congestion. Take actions for bus congestion.

35.2.3.28 AXI Master Transfer Resume Register for CRU Image Data (AMnFIFOTRST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AXI_TRANS_START
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	AXI_TRANS_START	0b	RW	AXI transfer control for image data (valid when AMnFIFO.FIFOOVFREC = 1). See **Section 35.2.3.27**. 0b: Writing prohibited. Write 1 to this bit to recover the image-related AXI (transfer resume) (This bit returns to 0 when transfer is resumed.)

35.2.3.29 AXI Master FIFO Pointer Register for CRU Image Data (AMnFIFOPNTR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FIFORPNTR_UV[7:0]								FIFORPNTR_Y[7:0]							
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	FIFOWPNTR[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	FIFORPNTR_UV[7:0]	H'01	R	FIFO read pointer for image data (for UV) Not during YC separation mode (ICnDMR.YCMODE[2:0] = 010b): Unused During YC separation mode (ICnDMR.YCMODE[2:0] = 010b): FIFO read pointer for UV data [7:1] RAM read pointer value for UV data FIFO [0] Fixed to 1
23 to 16	FIFORPNTR_Y[7:0]	H'00	R	FIFO read pointer for image data Not during YC separation mode (ICnDMR.YCMODE[2:0] = 010b): All FIFO read pointer [7:0] RAM read pointer value for FIFO During YC separation mode (ICnDMR.YCMODE[2:0] = 010b): Y data FIFO read pointer [7:1] RAM read pointer value for Y data FIFO [0] Fixed to 0
15 to 8	—	H'00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	FIFOWPNTR[7:0]	H'00	R	FIFO write pointer for image data Not during YC separation mode (ICnDMR.YCMODE[2:0] = 010b): [7:0] RAM write pointer value for FIFO *Note*: The amount of data stored in the FIFO can be found by FIFOWPNTR[7:0] - FIFORPNTR_Y[7:0]. During YC separation mode (ICnDMR.YCMODE[2:0] = 010b): [7:1] RAM write pointer value for FIFO [0] Fixed to 0 *Note*: The amount of data stored in the FIFO can be found by FIFOWPNTR[7:1] - FIFORPNTR_Y[7:1], FIFOWPNTR[7:1] - FIFORPNTR_UV[7:1].

35.2.3.30 AXI Master Transfer Stop Register for CRU Image Data (AMnAXISTP)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AXI_STOP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	AXI_STOP	0b	RW	Image data AXI transfer stop (used to stop the CRU from receiving data. Perform the reception stop procedure described in **Section 35.3.2** and **Section 35.3.5**.) 0b: Does not stop the AXI master from transferring data. 1b: Stops the AXI master from transferring data.

35.2.3.31 AXI Master Transfer Stop Status Register for CRU Image Data (AMnAXISTPACK)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AXI_STOP_ACK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	AXI_STOP_ACK	0b	R	Image data AXI transfer stop response (used to stop the CRU from receiving data. Perform the reception stop procedure described in **Section 35.3.2** and **Section 35.3.5**.) 0b: The AXI master is transferring data. 1b: The AXI master has finished transferring data (valid when AXI_STOP = 1)

35.2.3.32 Memory Bank 1 Base Address Lower Register for CRU Statistics Data (AMnSDMB1ADDRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SDMB1ADDRL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SDMB1ADDRL[15:9]							—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	SDMB1ADDRL[31:9]	All 0	RW	Statistics data transfer destination base address 1 (valid bits are [31:9]) Set it as the base address in units of 512 bytes. *Note*: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-SD is operating.)
8 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

35.2.3.33 Memory Bank 1 Base Address Higher Register for CRU Statistics Data (AMnSDMB1ADDRH)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SDMB1ADDRH [1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1, 0	SDMB1ADDRH[1:0]	00b	RW	Statics data transfer destination base address 1 (valid bits are [33:32]) *Note*: These bits cannot be modified while the AXI-SD is operating.

35.2.3.34 Memory Bank 2 Base Address Lower Register for CRU Statistics Data (AMnSDMB2ADDRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SDMB2ADDRL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SDMB2ADDRL[15:9]							—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	SDMB2ADDRL[31:9]	All 0	RW	Statistics data transfer destination base address 2 (valid bits are [31:9]) Set it as the base address in units of 512 bytes. *Note*: The 9 lower-order bits cannot be written. (These bits cannot be modified while the AXI-SD is operating.)
8 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

35.2.3.35 Memory Bank 2 Base Address Higher Register for CRU Statistics Data (AMnSDMB2ADDRH)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	SDAXI_TRANS_START	0b	RW	Statistics Data AXI transfer control, this bit is effective when AMnSDFIFO.SDFIFOOVFREC is 1. Details, refer to **Section 35.2.3.51, AXI-SD Master FIFO Setting Register (AMnSDFIFO)**. 0b: Prohibited to write 0 (0 is set automatically, after recovering transfer). 1b: Writing 1 for AXI-SD recover (recovering transfer).

35.2.3.53 AXI-SD Master FIFO Pointer Register (AMnSDFIFOPNTR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	SDFIFORPNTR[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SDFIFOWPNTR[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20 to 16	SDFIFORPNTR[4:0]	H'00	R	Statistics Data FIFO-SD read pointer for statistics data The read pointer and write pointer comparison allows checking if there are data in the FIFO-SD. FIFO-SD read pointer [3:0] Real RAM address for FIFO-SD (Max: H'F) *Note 1.* When (AMnSDFIFOPNTR.SDFIFOWPNTR[3:0] ≠ AMnSDFIFOPNTR.SDFIFORPNTR[3:0], data are present in FIFO-SD. *Note 2.* Refer to bit-3 to bit-0, bit-4 is only for debugging.
15 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4 to 0	SDFIFOWPNTR[4:0]	H'00	R	Statistics Data FIFO-SD write pointer for statistics data The read pointer and write pointer comparison allows checking if there are data in the FIFO-SD. FIFO-SD write pointer [3:0] Real RAM address for FIFO-SD (Max: H'F) *Note 1.* When (AMnSDFIFOPNTR.SDFIFOWPNTR[3:0] ≠ AMnSDFIFOPNTR.SDFIFORPNTR[3:0], data are present in FIFO-SD. *Note 2.* Refer to bit-3 to bit-0, bit-4 is only for debugging.

35.2.3.54 AXI-SD Master Transfer Stop Register (AMnSDAXISTP)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	SDAXISTOP	0b	RW	Statistics Data AXI-SD transfer stop (unused to stop the CRU receiving data. Follow the procedure for stopping reception described in **Section 35.3.2, Stopping Reception for the MIPI CSI-2 Input**. 0b: Disable to stop the AXI-SD mater transferring data. 1b: Enable to stop the AXI-SD master transferring data.

35.2.3.55 AXI-SD Master Transfer Stop Status Register (AMnSDAXISTPACK)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SDAXISTOPACK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	SDAXISTOPACK	0b	R	Statistics data AXI-SD transfer stop response (unused to stop CRU receiving data. Follow the procedure or stopping reception described in **Section 35.3.2, Stopping Reception for the MIPI CSI-2 Input**. 0b: The AXI-SD master is transferring data. 1b: The AXI-SD master has finished transferring data (valid when AXI_STOP = 1).

35.2.3.56 CRU Image Processing Enable Register (ICnEN)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ICEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	ICEN	0b	RW	Enables the operation of the image processing module. (Enable or disable the operation according to **Section 35.3.1** and **Section 35.3.2**.) 0b: Disables the image processing module. 1b: Enables the image processing module. *Note*: If this bit is set to 0, a frame start is not detected. If this bit is changed from 1 to 0 while a frame is being processed, the data at that time is processed as the frame end and then the next frames are not processed.

35.2.3.57 CRU Image Processing Register Setting Change Control Register (ICnREGC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	REFEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	REFEN	0b	RW	Allows register setting changes to be reflected. By using this register for an MIPI CSI-2 input, the registers at addresses H'1083_0208 to H'1083_0244 can be changed through frame synchronization during operation. (Allow or disallow this according to **Section 35.3.3.1**, **Section 35.3.3.2**.) 0b: Does not allow register setting changes to be reflected. 1b: Allows register setting changes to be reflected. *Note 1.* If this bit is set to 1 while the image processing module is operating (ICnEN.ICEN = 1), the register setting values (at addresses H'1083_0208 to H'1083_0244) are reflected at a frame start, and then the bit is cleared to 0 automatically. *Note 2.* If the image processing module is stopped (ICnEN.ICEN = 0), the register setting values can be reflected irrespective of this register. Note that registers other than the above cannot be changed during operation.

35.2.3.58 CRU Image Processing Main Control Register (ICnMC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	RAWSTTYP[1:0]		VCSEL[1:0]		INF[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	IBINSEL	CLP[1:0]		—	—	—	—	STITHR	LUTTHR	CSCTHR	LMXTHR	DEMTHR	CLPTHR	DECTHR	—
Initial Value	0	0	1	1	0	0	0	0	1	1	1	1	1	1	1	0
R/W	R	RW	RW	RW	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	H'00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored..
25, 24	RAWSTTYP [1:0]	00b	RW	Specify the type of the 1st pixel of the 1st line of the RAW data This setting is for recognizing the components of RAW data when demosaicing. 00b: R (RGRG…) 01b: Gr (GRGR…) 10b: Gb (GBGB…) 11b: B (BGBG…)
23, 22	VCSEL[1:0]	00b	RW	Specify a virtual channel to be processed by the image processing module. A single channel specified by the register is selected from virtual channels 0 to 3.
21 to 16	INF[5:0]	H'1E	RW	Specify the MIPI input image formats to be processed in the image processing module. For details about the formats, see Data Type Codes in the MIPI CSI-2 V2.1 Specification. From the formats specified here, only one format is processed. *Note 1.* Initial value: YUV422 8-bit *Note 2.* The following values can be set. Other settings are prohibited. H'13 to H'16: Generic Long Packet Data Type H'18 to H'1A, H'1C to H'1F: YUV Data H'20 to H'24: RGB Data H'28 to H'2F: RAW Data H'30 to H'37: User-Defined Byte-based Data The data types specified here must have been set in CSI2nDTEL.DTEN and CSI2DTEH.DTEN of MIPI CSI2.
15	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
14	IBINSEL	0b	RW	Binary selection for UV of input image format YUV422 0b: Offset binary (straight binary) 1b: Two's complement binary

Bit	Bit Name	Initial Value	R/W	Description
13, 12	CLP[1:0]	11b	RW	Data clipping setting for the YCbCr (YUV) format To make the input data to be RGB-converted comply with the ITU-R BT.601 standard, specify whether to clip the values below 16 and above 240 (when YCbCr is 8-bit). 00b: No clipping for Y When CbCr is 8-bit: Values below 16 and above 240 are clipped for CbCr When CbCr is 10-bit: Values below 64 and above 960 are clipped for CbCr 01b: When YCbCr is 8-bit: Values below 16 and above 240 are clipped for Y Values below 16 and above 240 are clipped for CbCr When YCbCr is 10-bit: Values below 64 and above 960 are clipped for Y Values below 64 and above 960 are clipped for CbCr 10b: No clipping for Y When CbCr is 8-bit: Values below 16 are increased to 128 and values above 240 are clipped to 128 for CbCr When CbCr is 10-bit: Values below 64 are increased to 512 and values above 960 are clipped to 512 for CbCr 11b: No clipping for Y and CbCr (initial value)
11 to 8	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	STITHR	1b	RW	Bypassing Statistics processing for RAW data 0: Statistics processing is performed 1: Statistics processing is not performed (bypassed) *Note*: This setting of 0b applies only for the corresponding format shown in **Table 35.12**.
6	LUTTHR	1b	RW	Bypassing LUT-based image color conversion Regardless of whether this setting is 0b or 1b, the output of the LUT is 8 bits for 10 bits of input. 0b: Image color conversion is performed. 1b: Image color conversion is not performed (bypassed). *Note*: This setting of 0b applies only for the corresponding format shown in **Table 35.12**.
5	CSCTHR	1b	RW	Bypassing color space conversion (YCbCr(YUV) → RGB, RGB → YCbCr(YUV)) and data clipping. 0b: Color space conversion and data clipping are performed. 1b: Color space conversion and data clipping are not performed (bypassed). *Note 1.* This setting of 0b applies only for the corresponding format shown in **Table 35.12**. For other image formats, color space conversion is not performed regardless of the settings (RAW is subject to RGB conversion after demosaic processing). *Note 2.* Even when this bit is 1, the data is expanded from 8-bit to 10-bit.
4	LMXTHR	1b	RW	Bypassing Linear Matrix processing for RAW data 0: Linear Matrix processing is performed 1: Linear Matrix processing is not performed (bypassed) *Note*: This setting of 0b applies only for the corresponding format shown in **Table 35.12**. For other image formats, Linear Matrix processing is not performed regardless of the settings (RAW is subject to RGB conversion after demosaic processing).

Bit	Bit Name	Initial Value	R/W	Description
3	DEMTHR	1b	RW	Bypassing Demosaicing processing for RAW data 0: Demosaicing processing is performed 1: Demosaicing processing is not performed (bypassed) *Note*: This setting of 0b applies only for the corresponding format shown in **Table 35.12**. For other image formats, Demosaicing processing is not performed regardless of the settings (RAW is subject to RGB conversion after demosaic processing).
2	CLPTHR	1b	RW	Bypassing image clipping (Details is described in **Section 35.2.4.8**.) 0b: Image clipping is performed. 1b: Image clipping is not performed (bypassed). *Note*: This setting of 0b applies only for the corresponding format shown in **Table 35.12**.
1	DECTHR	1b	RW	Bypassing frame skip (Details is described in **Section 35.2.4.9**.) 0b: Frame subsampling is performed. 1b: Frame subsampling is not performed (bypassed). *Note*: This setting of 0b applies only for the corresponding format shown in **Table 35.12**.
0	—	0b	R	Reserved Whenever it is read, 0 is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

(1) Bypass Setting for Each Function

Figure 35.11 shows where the bypass settings by the DECTHR, CLPTHR, DEMTHR, LMXTHR, CSCTHR, LUTTHR, and STITHR bits of the ICnMC register work.

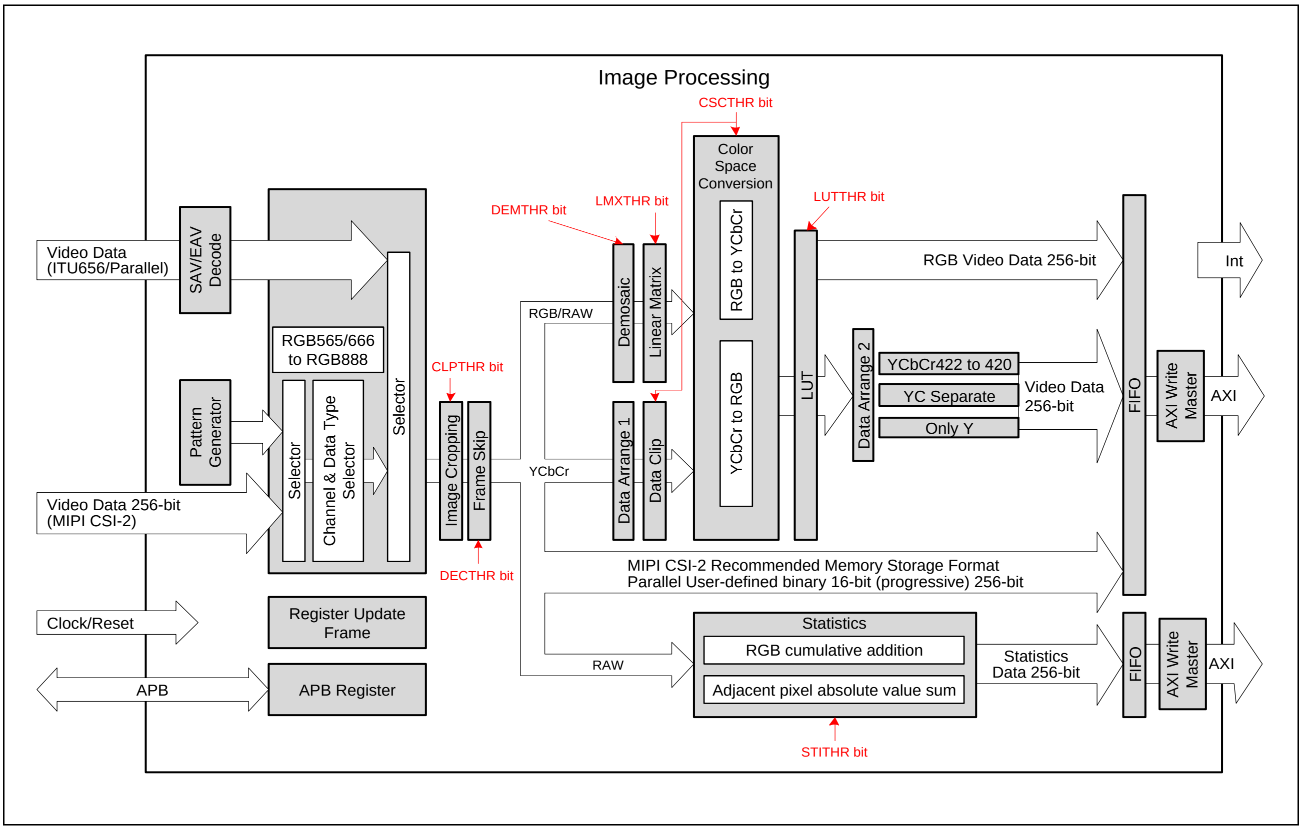

Figure 35.11 Bypass Setting of Each Function

35.2.3.59 CRU Image Clipping Start Line Register (ICnSLPrC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored..
11 to 0	ELPrC[11:0]	H’000	RW	End line in the vertical direction when clipping the input image to the specified area Set a value of 1 or greater because the frame start is processed as the first line. The image is output up to the specified line. *Note*: Set a value in a way that 1 ≤ ICnSLPrC.SLPrC ≤ ICnELPrC.ELPrC.

35.2.3.61 CRU Image Clipping Start Pixel Register (ICnSPPrC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SPPrC[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	SPPrC[11:0]	H’000	RW	Start pixel in the horizontal direction when clipping the input image to the specified area Set a value of 1 or greater because the line start is processed as the first pixel. The image is output from the specified pixel data. (If 0 is specified, the same operation as for setting of 1 is performed.) *Note 1.* Set a value in a way that 1 ≤ ICnSPPrC.SPPrC ≤ (ICnEPPrC.EPPrC + 1 − 320). *Note 2.* Specify an odd value when the input format is YUV422 (ICnMC.INF[5:0] = H’1E to H’1F or ICnPIFC.PINF[3:0] = H’0 to H’B). If an even number of 2 or greater is specified, the CRU operates as if an odd number (the specified number - 1) is specified. (Example: When 34 is specified, the data is output from the 33rd pixel.) *Note 3.* Even when the input format is RGB, etc., set a value that satisfies the following formula so that a line consists of an even number of pixels if the RGBtoYCbCr output is YUV422/420. ICnEPPrC.EPPrC - ICnSPPrC.SPPrC = 2N − 1 (N = 160, 161, 162,...)

35.2.3.62 CRU Image Clipping End Pixel Register (ICnEPPrC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	EPPrC[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	EPPrC[11:0]	H’000	RW	End pixel in the horizontal direction when clipping the input image to the specified area Set a value of 1 or greater because the line start is processed as the first pixel. The image is output up to the specified image data. *Note 1.* Set a value in a way that 1 ≤ ICnSPPrC.SPPrC ≤ (ICnEPPrC.EPPrC + 1 − 320). *Note 2.* Specify an even value when the input forma is YUV422 (ICnMC.INF[5:0] = H’1E to H’1F or ICnPIFC.PINF[3:0] = H’0 to H’B). If an odd number is specified, the CRU operates as if an even number (the specified number + 1) is specified. (Example: When 127 is specified, the data is output up to the 128th pixel.) *Note 3.* Even when the input format is RGB, etc., set a value that satisfies the following formula so that a line consists of an even number of pixels if the RGBtoYCbCr output is YUV422/420. ICnEPPrC.EPPrC - ICnSPPrC.SPPrC = 2N − 1 (N = 160, 161, 162,...)

35.2.3.63 CRU Scan Line Interrupt Register (ICnSI)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	SI[11:0]	H'000	RW	Line specification for generating a scan line interrupt When the line number being processed in a frame of the image processing module matches the line setting value specified by this bit, an image_conv_int interrupt can be generated. *Note*: By using the ICnINTCTRL.DECINTE bit, whether to generate interrupts in subsampled frames can be specified.

35.2.3.64 CRU Linear Matrix Offset Register (ICnLMXOF)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	BOF[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GOF[7:0]								ROF[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	H'00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 16	BOF[7:0]	H'00	RW	B offset value of linear matric calculation (bit 7: sign) *Note*: Setting range: −128 (H'80) to 127 (H'7F)
15 to 8	GOF[7:0]	H'00	RW	G offset value of linear matric calculation (bit7: sign) *Note*: Setting range: −128 (H'80) to 127 (H'7F)
7 to 0	ROF[7:0]	H'00	RW	R offset value of linear matric calculation (bit7: sign) *Note*: Setting range: −128 (H'80) to 127 (H'7F)

35.2.3.65 CRU Linear Matrix R Coefficient 1 Register (ICnLMXRC1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	RR[12:0]												
Initial Value	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	RR[12:0]	H’0400	RW	Coefficient R of R data for linear matrix calculation (bit 12: sign) *Note*: Specify a signed 13-bit integer by multiplying the desired coefficient value (−4 to approx. 4) by 1024. Setting range: −4096 (H’1000) to 4095 (H’0FFF)

35.2.3.66 CRU Linear Matrix R Coefficient 2 Register (ICnLMXRC2)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	RB[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	RG[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	RB[12:0]	All 0	RW	Coefficient B of R data for linear matrix calculation (bit 12: sign) *Note*: Specify a signed 13-bit integer by multiplying the desired coefficient value (−4 to approx. 4) by 1024. Setting range: −4096 (H'1000) to 4095 (H'0FFF)
15 to 13	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	RG[12:0]	All 0	RW	Coefficient G of R data for linear matrix calculation (bit 12: sign) *Note*: Specify a signed 13-bit integer by multiplying the desired coefficient value (−4 to approx. 4) by 1024. Setting range: −4096 (H'1000) to 4095 (H'0FFF)

35.2.3.67 CRU Linear Matrix G Coefficient 1 Register (ICnLMXGC1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	BB[12:0]	H’0400	RW	Coefficient B of B data for linear matrix calculation (bit 12: sign) *Note*: Specify a signed 13-bit integer by multiplying the desired coefficient value (−4 to approx. 4) by 1024. Setting range: −4096 (H’1000) to 4095 (H’0FFF)
15 to 13	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	BG[12:0]	All 0	RW	Coefficient G of B data for linear matrix calculation (bit 12: sign) *Note*: Specify a signed 13-bit integer by multiplying the desired coefficient value (−4 to approx. 4) by 1024. Setting range: −4096 (H’1000) to 4095 (H’0FFF)

35.2.3.71 CRU Statistics Control 1 Register (ICnSTIC1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	STSADPOS[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STUNIT[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19 to 16	STSADPOS [3:0]	H'0	RW	Input data bit position selection (0 – 8) for the sum of absolute values for adjacent pixels for statistics processing. Use the 8 lower-order bits from the MSB-“n” bit for each type of RAW. *Note*: Comply with the restrictions described in ICnSTIC1.STUNIT.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	STUNIT[1:0]	00b	RW	Setting an arithmetic processing unit for statistics processing (blocks). 00b: 16 × 16 pixels 01b: 32 × 32 pixels 10b: 64 × 64 pixels 11b: 128 × 128 pixels Example) In case of QVGA, STUNIT should be only 0. In case of VGA, STUNIT should be lesser than 1. In case of Full-HD, STUNIT should be lesser than 2. *Note*: Set the STUNIT and the STHPOS parameters, complying the following formula. ((HSIZE – STHPOS) >> (4 + STUNIT)) × (VSIZE >> (4 + STUNIT)) × 4 > 512 HIZE: horizontal pixels / VSIZE: vertical lines

35.2.3.72 CRU Statistics Control 2 Register (ICnSTIC2)

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	ENPOL	VSPOL	EC	—	ITL[2:0]			—	—	—	—	PINF[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RW	RW	RW	R	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14	ENPOL	0b	RW	Polarity of the CAM_HREF input 0b: CAM_HREF signal is input with the polarity of High during the valid period of image data. 1b: CAM_HREF signal is input with the polarity of Low during the valid period of image data.
13	VSPOL	0b	RW	Polarity of the CAM_VSYNC input 0b: CAM_VSYNC signal is input with the polarity of VBLANK period High. 1b: CAM_VSYNC signal is input with the polarity of VBLANK period Low.
12	EC	0b	RW	Error correction according to ITU-R BT.656 0b: Error correction is not performed. 1b: Error correction is performed by using parity bits.
11	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10 to 8	ITL[2:0]	000b	RW	Progressive/interlace setting Bit 1: 0 x0b: Progressive input 01b: Interlaced input - no conversion 11b: Setting prohibited Bit 2 0b: Input the Top (Odd) field in field 1 in interlaced mode. 1b: Input the Bottom (Even) field in field 1 in interlaced mode. *Note 1.* The internal processing of the image processing module assumes that the Top field is input to field 1. Therefore, when 101b is set, field 1 and field 2 are swapped in the CRU. *Note 2.* The order of writing to the memory banks changes depending on the CAM_FIELD pin input and the ITL[2] setting. See **Table 35.15** for details. *Note 3.* For ITU-R BT.656, ITL[2:0] shall be set to 001b. Also, be sure to input from field1 (F = 0) at the beginning.
7 to 4	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	PINF[3:0]	H'0	RW	Format of the parallel I/F input 0000b: ITU-R BT.656 (8-bit) 0001b: ITU-R BT.656 (10-bit) 0010b: YCbCr separated 8-bit Cb1st except ITU-R BT.656 0011b: YCbCr separated 8-bit Cr1st except ITU-R BT.656 0100b: YCbCr multiplexed 8-bit Cb1st except ITU-R BT.656 0101b: YCbCr multiplexed 8-bit Cr1st except ITU-R BT.656 0110b: YCbCr multiplexed 8-bit Cb2nd except ITU-R BT.656 0111b: YCbCr multiplexed 8-bit Cr2nd except ITU-R BT.656 1000b: YCbCr multiplexed 10-bit Cb1st except ITU-R BT.656 1001b: YCbCr multiplexed 10-bit Cr1st except ITU-R BT.656 1010b: YCbCr multiplexed 10-bit Cb2nd except ITU-R BT.656 1011b: YCbCr multiplexed 10-bit Cr2nd except ITU-R BT.656 Others: Binary 16-bit except ITU-R BT.656

(1) Interlaced Mode

By setting the ITL[2] bit, the Top Field and the Bottom Field can be switched.

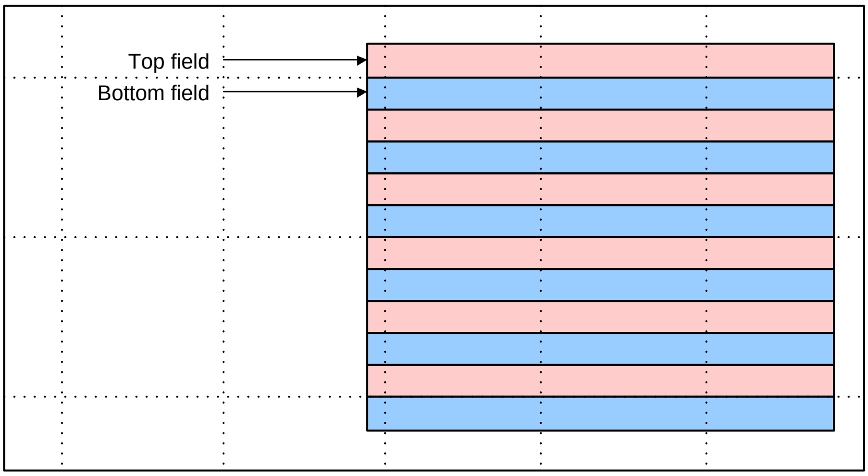

Figure 35.12 Interlaced Mode

35.2.3.74 CRU Module Status Register (ICnMS)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	IA	AV	CA
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	IA	0b	R	Indicates whether the image converter block (module covering the video data input up to the pre-FIFO stage) is processing. 0b: Image data has not been received yet. 1b: Image data is being converted.
1	AV	0b	R	Indicates whether processing is performed within the image-clipped area. (For details, see **Section 35.2.4.8**.) 0b: Processing is performed outside the image-clipped area. 1b: Processing is performed within the image-clipped area.
0	CA	0b	R	Indicates whether the frame is subsampled. (For details, see **Section 35.2.4.9**.) 0b: A subsampled frame is being processed. 1b: A frame which is not subsampled is being processed. *Note*: This bit is 0 when CRUnRST.VRESETN is 0. This bit is set to 1 two cycles of PCLK after CRUnRST.VRESETN is changed from 0 to 1.

35.2.3.75 CRU Frame Subsampling Control Register (ICnDEC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	LC[11:0]	H’000	R	Indicate the line counter value before image clipping and subsampling in the image processing module.

35.2.3.77 CRU Word Count Register (ICnWC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WC[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	WCLC[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	WC[15:0]	H’0000	R	Indicate the current word count from LINK for the MIPI CSI-2 input. *Note 1.* These bits are cleared to 0 at a frame start. *Note 2.* If the word count value does not match the value set in ICnEWC.EWC[15:0], the unmatched value is retained until the next frame start.
15 to 12	—	H’0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	WCLC[11:0]	H’000	R	Indicate the count of continuous lines for which the word count value from LINK for the MIPI CSI-2 input matches the value set in ICnEWC.EWC[15:0]. *Note 1.* This value is cleared by a frame start. *Note 2.* If the word count value does not match the value set in ICnEWC.EWC[15:0], the unmatched value is retained until the next frame start.

35.2.3.78 CRU Word Count Check Control Register (ICnEWC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EWC[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	H'0000	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	EWC[15:0]	H'0000	RW	Specify an expected word count value that is output from LINK for the MIPI CSI-2 input. If this setting value does not match the word count value that is output from LINK for the MIPI CSI-2 input, the image_conv_err_int interrupt can be output. These bits are used for debugging when the operation for the MIPI CSI-2 input is abnormal.

35.2.3.79 CRU Frame Subsampling Interrupt Control Register (ICnINTCTRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DECINTE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	DECINTE	0b	RW	Specifies whether an interrupt (CRUnINTS.SFS, CRUnINTS.EFS, or CRUnINTS.SI) is generated for a subsampled frame. 0b: No interrupt is generated for a subsampled frame. (Initial value) 1b: An interrupt is generated for a subsampled frame.

35.2.3.80 CRU Output Image Format Register (ICnDMR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	A8BIT[7:0]								—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LUTWR	LUTSEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	LUTWR	0b	RW	Enables APB read/write access to the lookup table (LUT). 0b: Disables APB access (set this bit to 0 in operation with the normal path). 1b: Enables APB access (normal access is unavailable in this case). *Note*: **Figure 35.50, Storing LUT Data (Both)** for the LUT setting procedure.
0	LUTSEL	0b	RW	Specifies the access path of the lookup table (LUT). 0b: Normal path (image conversion by using the LUT) 1b: APB I/F (read/write from registers) Used to write (and confirm) data to the LUT in initial setting. Set this bit to 0 after finishing writing and reading data. Note that the LUT data is retained even after a reset. *Note*: **Figure 35.50, Storing LUT Data (Both)** for the LUT setting procedure.

35.2.3.95 CRU Lookup Table Status Register (ICnLUTS)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LUTREGSEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	LUTREGSEL	0b	R	Indicates that the lookup table (LUT) can be accessed for a read and write from the APB. The LUTWR register value is reflected in this register after a while. Access the lookup table after confirming this bit. 0b: Both read access and write access are unavailable. 1b: Both read access and write access are available. *Note*: **Figure 35.50, Storing LUT Data (Both)** for the LUT setting procedure.

35.2.3.96 CRU Lookup Table Pointer Register (ICnLUTP)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	LTCRPR[9:0]										LTCBPR[9:6]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTCBPR[5:0]						LTYPR[9:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29 to 20	LTCRPR[9:0]	H’000	RW	Lookup table (LUT) Cr/B pointer Specify the current pointer (access point) to lookup table Cr/B in APB access. The pointer is incremented automatically when ICnLUTD.LTCRDT[7:0] are written. It returns to 0 upon an overflow. It is not incremented when reading these bits. *Note*: **Figure 35.50, Storing LUT Data (Both)** for the LUT setting procedure.
19 to 10	LTCBPR[9:0]	H’000	RW	Lookup table (LUT) Cb/G pointer Specify the current pointer (access point) to lookup table Cb/G in APB access. The pointer is incremented automatically when ICnLUTD.LTCBDT[7:0] are written. It returns to 0 upon an overflow. It is not incremented when reading these bits. *Note*: **Figure 35.50, Storing LUT Data (Both)** for the LUT setting procedure.
9 to 0	LTYPR[9:0]	H’000	RW	Lookup table (LUT) Y/R pointer Specify the current pointer (access point) to the lookup table Y/R in APB access. The pointer is incremented automatically when ICnLUTD.LUTYDT[7:0] are written. It returns to 0 upon an overflow. It is not incremented when reading these bits. *Note*: **Figure 35.50, Storing LUT Data (Both)** for the LUT setting procedure.

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	H'000	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20 to 16	TIRATE[4:0]	H'00	RW	Specify the test image generation rate. 16 pixels / (18 + TIRATE) cycles
15 to 12	TIPTNV1[3:0]	H'0	RW	Specify the pixel (V) counter bits for the test image pattern. 0000b: Selects bits [3:0]. 0001b: Selects bits [4:1]. 0010b: Selects bits [5:2]. Omitted 1100b: Selects bits [15:12]. 1101b to 1111b: Setting prohibited
11 to 8	TIPTNU1[3:0]	H'0	RW	Specify the pixel (U) counter bits for the test image pattern. 0000b: Selects bits [3:0]. 0001b: Selects bits [4:1]. 0010b: Selects bits [5:2]. Omitted 1100b: Selects bits [15:12]. 1101b to 1111b: Setting prohibited
7 to 4	TIPTNY1[3:0]	H'0	RW	Specify the pixel (Y) counter bits for the test image pattern. 0000b: Selects bits [3:0]. 0001b: Selects bits [4:1]. 0010b: Selects bits [5:2]. Omitted 1100b: Selects bits [15:12]. 1101b to 1111b: Setting prohibited
3, 2	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	TIMODE	0b	RW	Specifies a test image generation pattern. 0b: Selects a counter value for YUV output. 1b: Same-color YUV output for the entire screen
0	TIEN	0b	RW	Enables generation of a test image pattern. 0b: Does not generate a test image pattern (processes image data from LINK). 1b: Generates a test image pattern.

Note 1. Output format

YCbCr422 output format supports YCbCr multiplexed 8bit,YC Separation and Only Y.

YCbCr420 output format supports YCbCr multiplexed 8bit.

RGB output format supports RGB888 (24 bits), RGB888 (32 bits) and ARGB8888 (32 bits).

RAW output format only supports the same width as the input RAW.

Note 2. YUV422 input format

This format is converted from 10 bits to 8 bits by the LUT when ICnMC.LUTTHR = 0, and the upper 8 bits out of 10 bits are converted when ICnMC.LUTTHR = 1.

Note 3. RGB565 and RGB666 input format

This format is once expanded to RGB888 and processed internally. (See **Section 35.2.4.6**)

35.2.4.2 Output Formats

Table 35.13 lists the image output formats.

Table 35.13 Image Output Formats (1/2)

Format			Register	Image Data[255:0]

35.2.4.3 Transfer to DRAM

(1) Image Data Transfer Destination Address (Image Storage Destination)

- The transfer destination address (image data storage destination) is determined by the AMnMB1ADDRL to AMnMB8ADDRL, and AMnMB1ADDRH to AMnMB8ADDRH registers (MB1ADDR, MB2ADDR, …).
- Up to eight transfer destination addresses (image data storage destinations) are supported.
- A valid register (MB1ADDR, MB2ADDR, …) is switched by AMnMBVALID.
- UV data address offset UVAOF when outputting YUV image data is determined by the AMnUVAOFL and AMnUVAOFH registers.

(a) AMnMBVALID[7:0] = 1111_1111b (eight transfer destinations)

Transfer sequence: MB1 → MB2 → … → MB8 → MB1 → MB2 → …

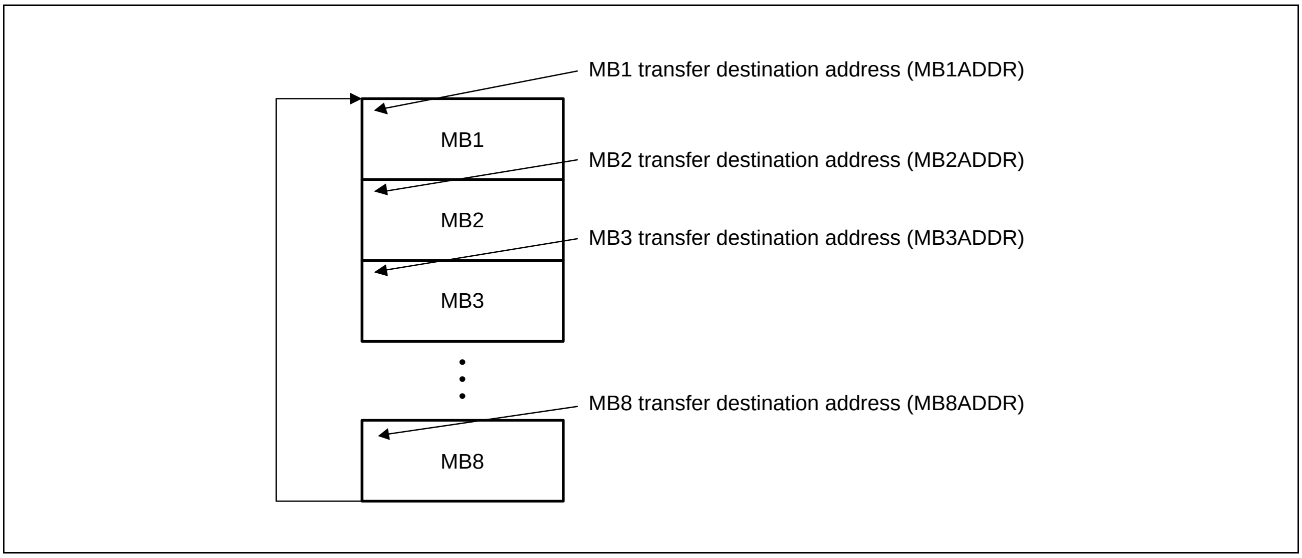

Figure 35.13 Memory Banks (Eight Transfer Destinations)

(b) AMnMBVALID[7:0] = 0000_1111b (four transfer destinations)

MB1 → MB2 → MB3 → MB4 → MB1 → MB2 → …

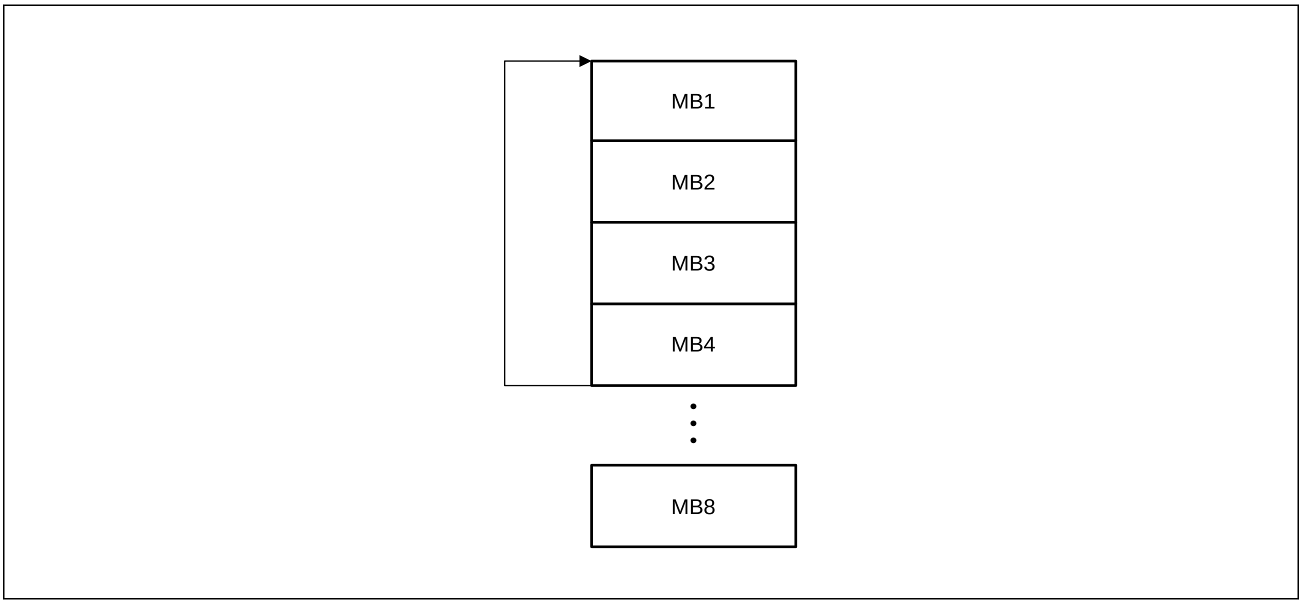

Figure 35.14 Memory Banks (Four Transfer Destinations)

(c) AMnMBVALID[7:0] = 0000_0001b (one transfer destination)

MB1 → MB1 → MB1 → …

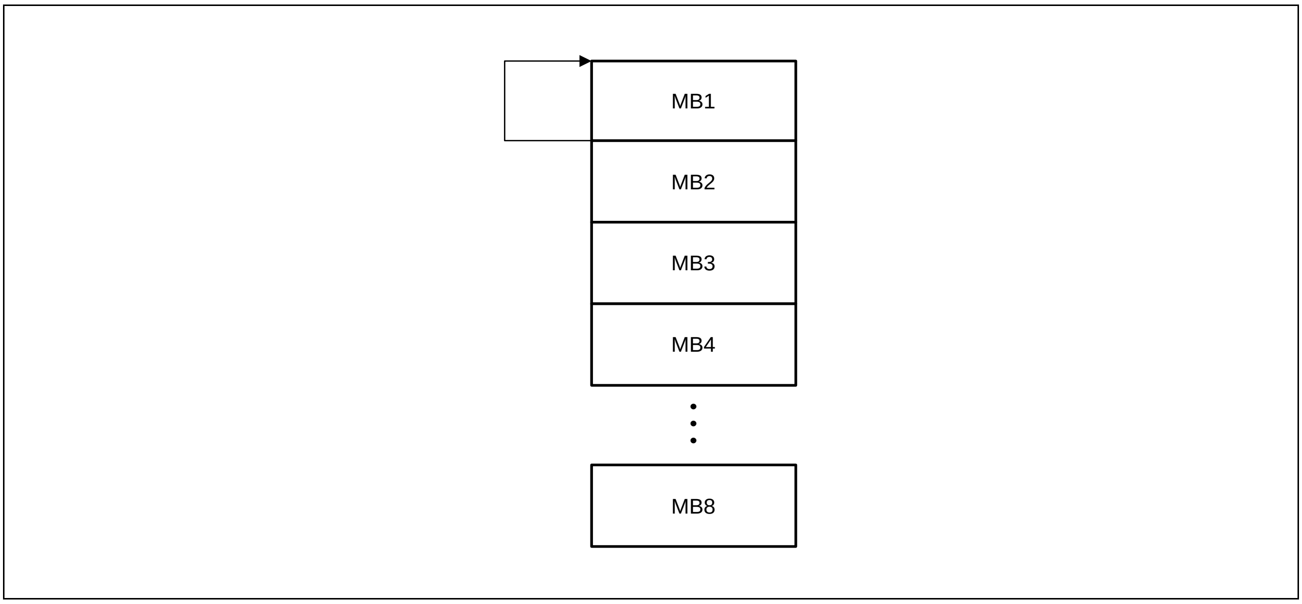

Figure 35.15 Memory Banks (One Transfer Destinations)

(2) Image Data Transfer Destination Address (Storage in Y/UV Separation)

The following shows the sequence of data storage in the MB1 transfer destination address (MB1ADDR) in the case of Y First (YUYV...).

(a) When YUV is Not Separated (ICnDMR.YCMODE[2:0] = 000b to 001b, 100b to 101b):

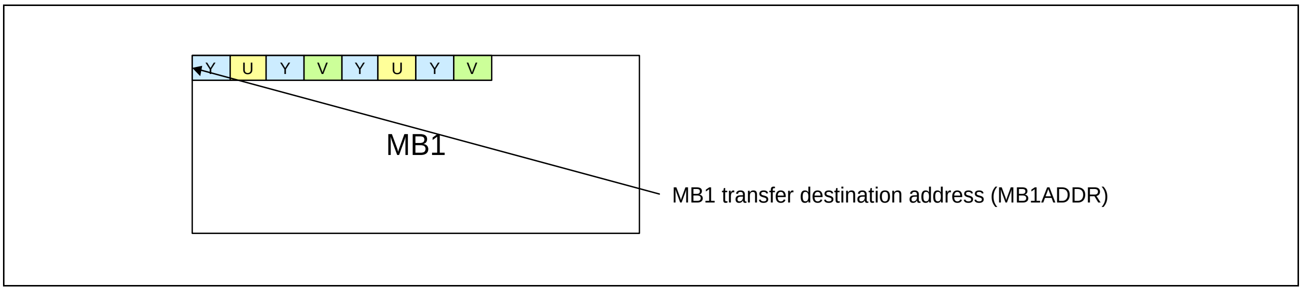

Figure 35.16 Data Storage (YUV is Not Separated)

(b) When YUV is Separated (ICnDMR.YCMODE[2:0] = 010b):

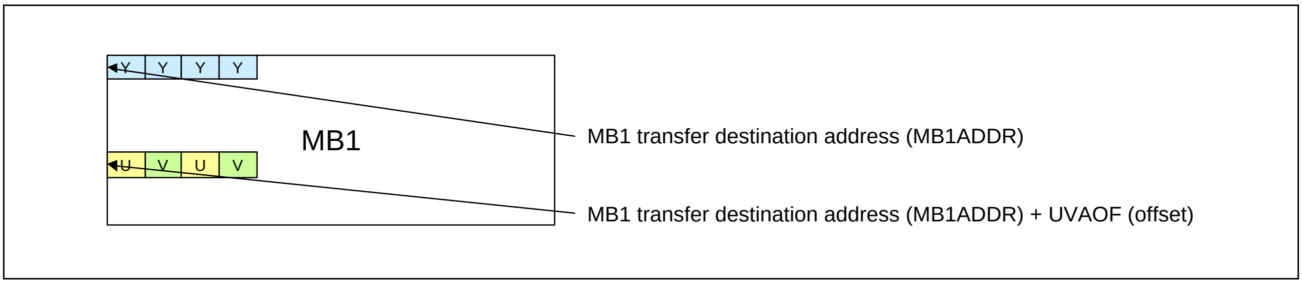

Figure 35.17 Data Storage (YUV is Separated)

(c) When Only Y is Separated (ICnDMR.YCMODE[2:0] = 011b)

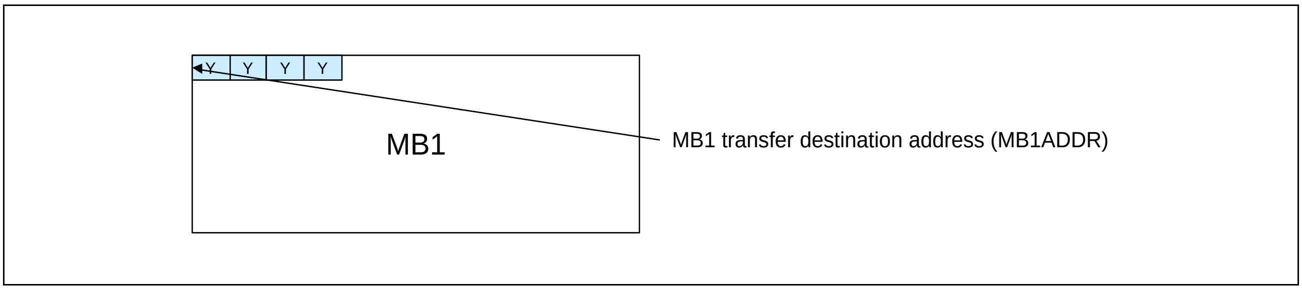

Figure 35.18 Data Storage (Only Y is Separated)

(3) Image Data Transfer Destination Address (Storage in Interlaced Mode)

The following shows the data storage sequence for interlaced data that the parallel input supports.

(a) When YUV is Not Separated (ICnDMR.YCMODE[2:0] = 000b to 001b, 100b to 101b):

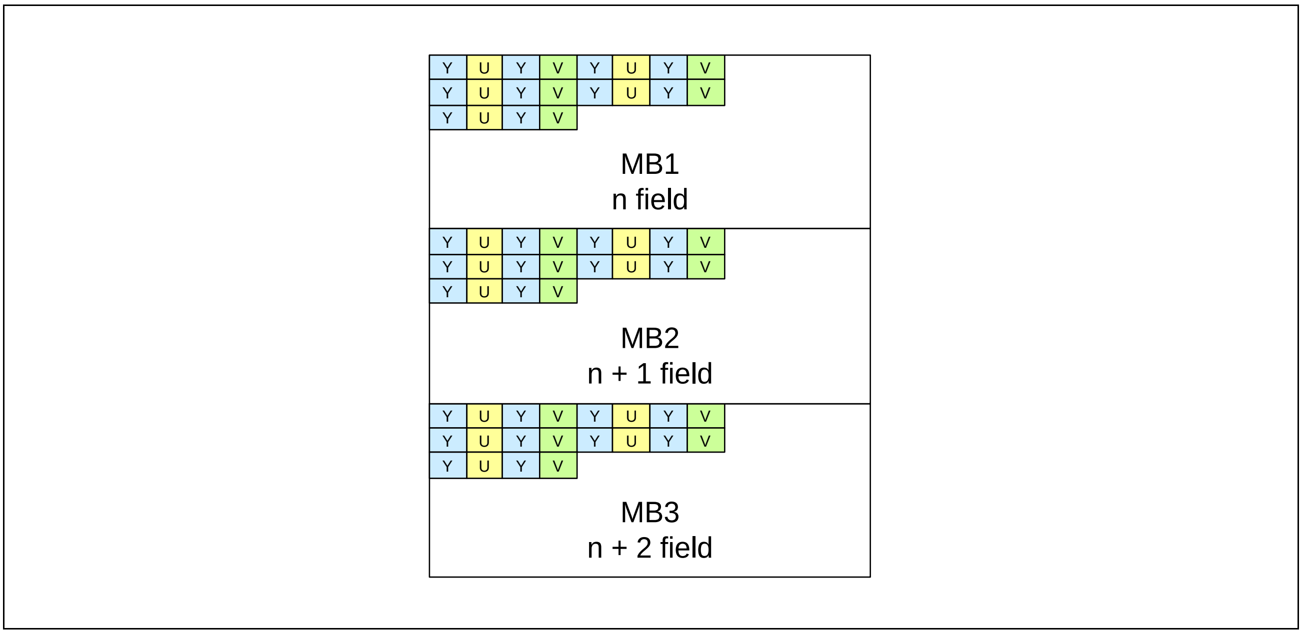

Figure 35.19 Data Storage (Interlaced, YUV is Not Separated)

(b) When YUV is Separated (ICnDMR.YCMODE[2:0] = 010b):

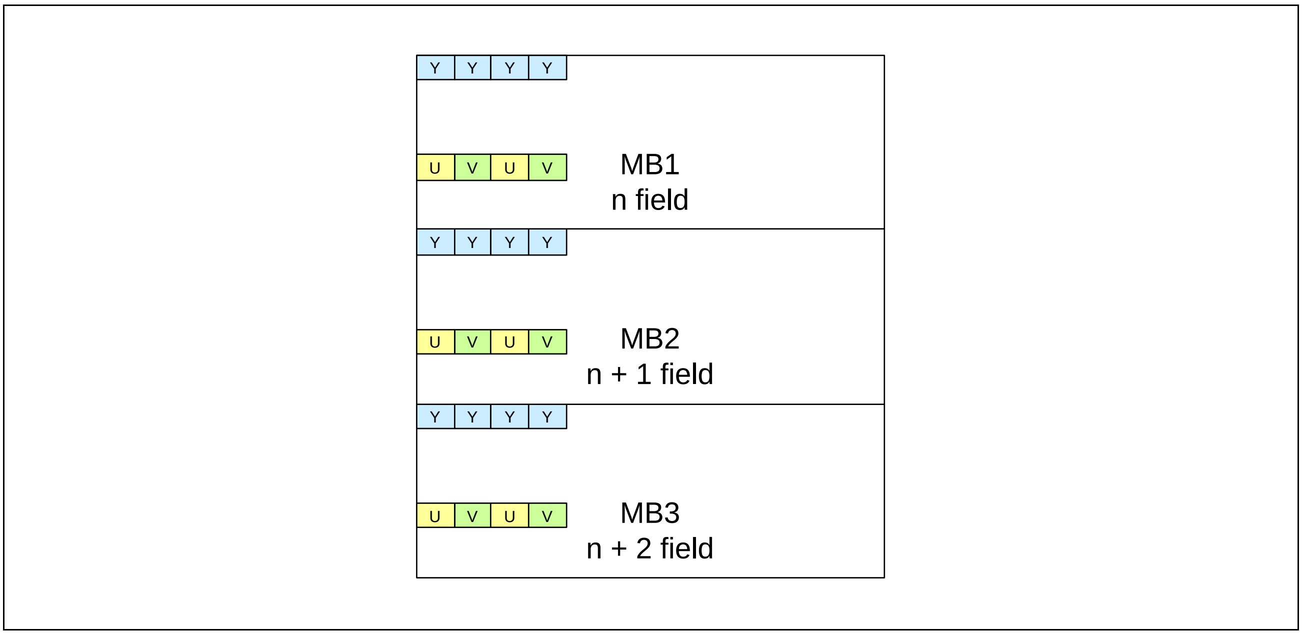

Figure 35.20 Data Storage (Interlaced, YUV is Separated)

(c) When Only Y is Separated (ICnDMR.YCMODE[2:0] = 011b)

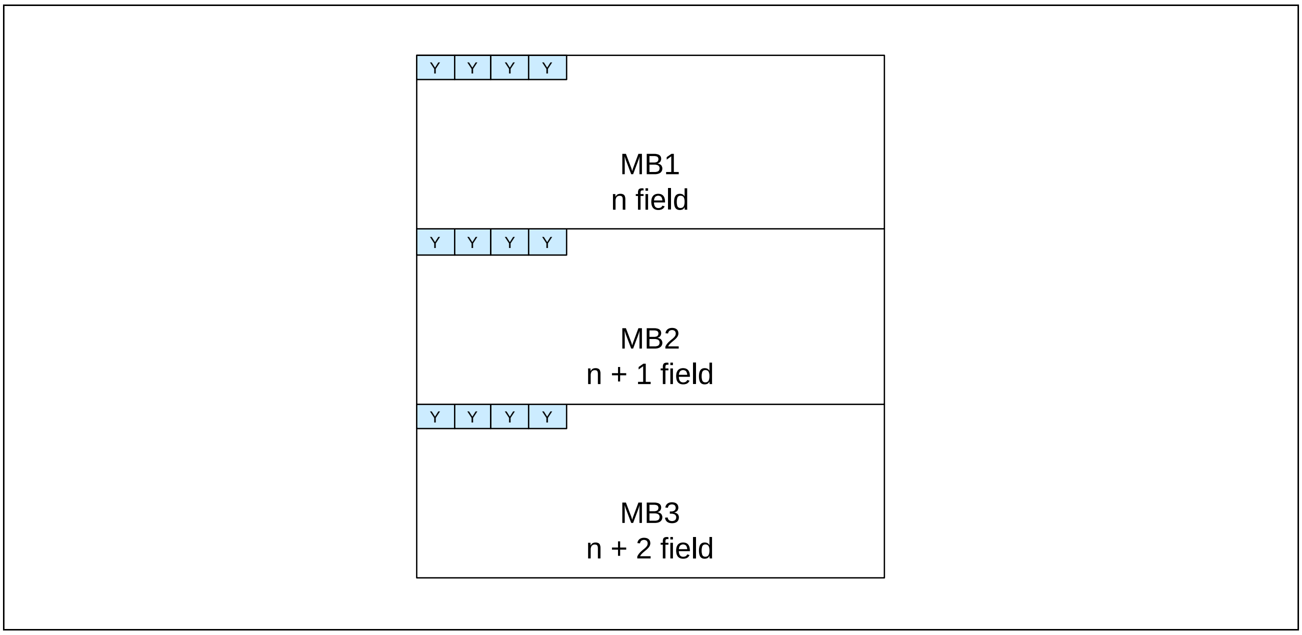

Figure 35.21 Data Storage (Interlaced, Only Y is Separated)

(d) Memory Bank Write Order by CAM_FIELD Pin Input and ICnPIFC.ITL[2] Register Setting

The order of writing to the memory bank changes depending on the CAM_FIELD input and the ICnPIFC.ITL[2] register setting. See **Table 35.15** for details.

Table 35.15 Relationship between CAM_FIELD/ICnPIFC.ITL[2] and Memory Bank Write Order

CAM_FIELD	ICnPIFC.ITL[2]	Write Order to Memory Banks
Start from 0 0 → 1 → 0 → 1 → 0 →	0	Writes to memory banks in ascending order. e.g. when MBVALID[7:0] = H'FF is setting MB1 → MB2 → MB3 → MB4 → MB5 → MB6 → MB7 → MB8 →
	1	Even and odd numbers are replaced and written to the memory bank e.g. when MBVALID[7:0] = H'FF is setting MB2 → MB1 → MB4 → MB3 → MB6 → MB5 → MB8 → MB7 →
Start from 1 1 → 0 → 1 → 0 → 1 →	0	Even and odd numbers are replaced and written to the memory bank e.g. when MBVALID[7:0] = H'FF is setting MB2 → MB1 → MB4 → MB3 → MB6 → MB5 → MB8 → MB7 →
	1	Writes to memory banks in ascending order. e.g. when MBVALID[7:0] = H'FF is setting MB1 → MB2 → MB3 → MB4 → MB5 → MB6 → MB7 → MB8 →

(4) Statistics Data Transfer Destination Address (Statistics Data Storage Destination)

The results of statistics processing are transferred from the statistics data bus to external memory. The external transfer destination start address is determined by AMnSDMB1 to 8ADDRL and AMnSDMB1 to 8ADDRH.

The number of planes of the memory bank is determined by AMnSDMBVALID. The transfer start address (statistics data storage destination) is determined by the MnSDMB1 to 8ADDRL and AMnSDMB1 to 8ADDRH registers.

The valid AMnSDMB1ADDR, AMnSDMB2ADDR, …registers are switched by AMnSDMBVALID.

(a) AMnSDMBVALID[7:0] = 1111_1111b (eight transfer destinations)

Order of transfer destinations: SDMB1 → SDMB2 → … → SDMB8 → SDMB1 → SDMB2 → …

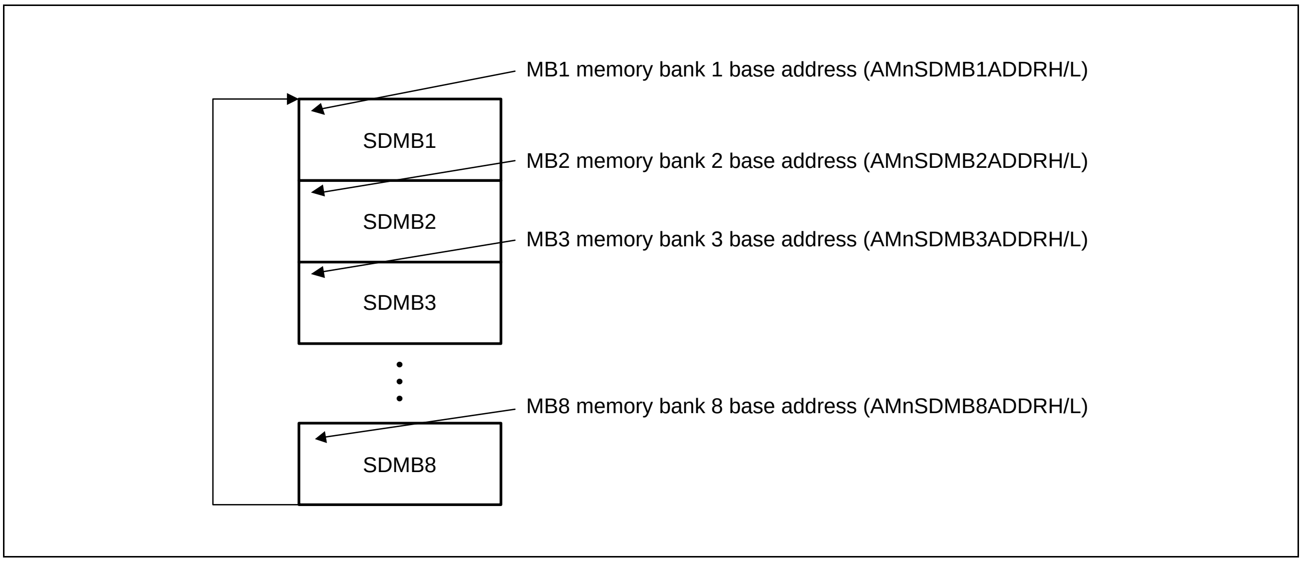

Figure 35.22 Image of Memory Bank (Eight Transfer Destinations)

(5) Processing of the Last Line in a Frame

Note that data is written to the end of the frame (32 bytes × number of AXI bursts specified by the AXILEN[3:0] bits in the AMnAXIATTR register). Because overrun data is written for a frame, ignore it. Set the start address taking this into consideration.

The figure below shows the case of full HD YUV422.

Figure 35.23 Data Storage

35.2.4.4 SAV/EAV Decode

This function relates to the parallel input.

The function detects the data start and data end as defined by the ITU-R BT.656 Standard. If the preamble data (SAV/EAV) is invalid, 1-bit error data can be corrected by the error correction function (switched by the EC bit of the ICnPIFC register) if enabled. If 2-bit error data is received, it is not corrected. In this case, an interrupt signal (image_conv_err_int) that indicates that an invalid format has been received is asserted. (CRUnIE.CEE must be set to 1.) This function continues its operation from the next line even if an error occurs.

35.2.4.5 Parallel User-Defined Binary 16-Bit (Progressive)

User-defined binary 16-bit (progressive) from the parallel interface can be output to memory as user-defined binary 16-bit (progressive) in that format.

This mode can be supported by setting the register as follows.

CRUnCTRL.VINSEL = 1
ICnMC.PINF = H’C, H’D, H’E or H’F

35.2.4.6 RGB565/RGB666 to RGB888

RGB565 and RGB666 inputs are converted to RGB888 as shown in **Table 35.16**.

Table 35.16 Conversion Table from RGB565/RGB666 to RGB888

RGB565	RGB888
R[4:0]	{R[4:0], R[4:2]}
G[5:0]	{G[5:0], G[5:4]}
B[4:0]	{B[4:0], B[4:2]}

RGB666	RGB888
R[5:0]	{R[5:0], R[5:4]}
G[5:0]	{G[5:0], G[5:4]}
B[5:0]	{B[5:0], B[5:4]}

35.2.4.7 MIPI CSI-2 Recommended Storage Format

In the output format, there are data types that can be output in MIPI CSI-2 Recommended Memory Storage Format.

This format packs the received data in byte units and outputs them.

The data is packed according to the method specified for each Data Type in the MIPI CSI-2 standard, so please refer to the standard for details such as bit positions.

(1) Mode Setting

This mode can be supported by setting the ICnMC register as follows.
ICnMC.LUTTHR = 1
ICnMC.DEMTHR = 1
ICnMC.LMXTHR = 1
ICnMC.CSCTHR = 1
ICnMC.CLPTHR = 1

(2) Supported Data Types

See to **Table 35.12** for supported datatypes.

35.2.4.8 Image Clipping

This function clips the input image to the range specified by registers. Specify the clipping range by setting the following registers.

(Horizontal direction)

- Image clipping start pixel register: ICnSPPrC.SPPrC[11:0]
- Image clipping end pixel register: ICnEPPrC.EPPrC[11:0]

(Vertical direction)

- Image clipping start line register: ICnSLPrC.SLPrC[11:0]
- Image clipping end line register: ICnELPrC.ELPrC[11:0]

While the image clipped to the size which is indicated in grey is being processed, the AV bit of the ICnMS register is set to 1. If any other part of the image is being processed, the AV bit of the ICnMS register is set to 0. An image is clipped in the same way even if the image is subsampled.

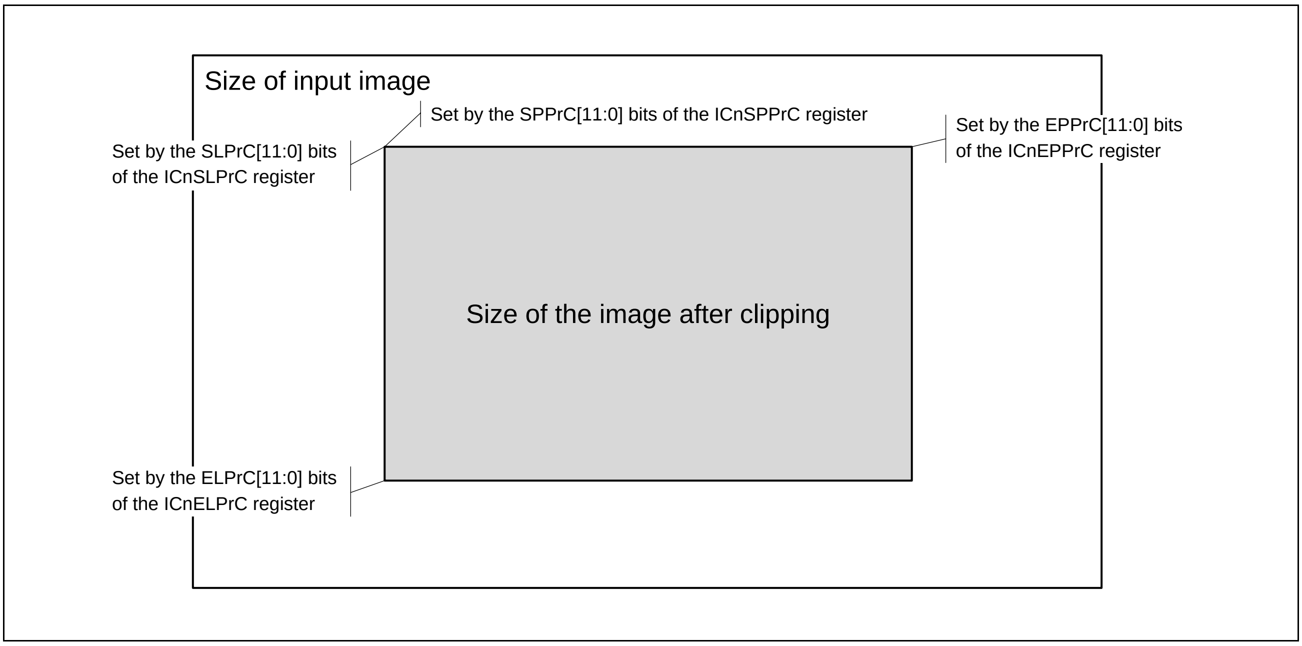

Figure 35.24 Image Clipping

35.2.4.9 Frame Subsampling

This function subsamples the input image by setting a register. Set the following register to specify the reduced frequency of transmission (once every × frames).

- Frame subsampling control register: ICnDEC.FRMDEC[3:0]

The following shows the operation when ICnDEC.FRMDEC[3:0] is set to 2.

The image is sampled every (register value + 1) frames. ICnMS.CA is set to 1 when a non-subsampled image is being processed.

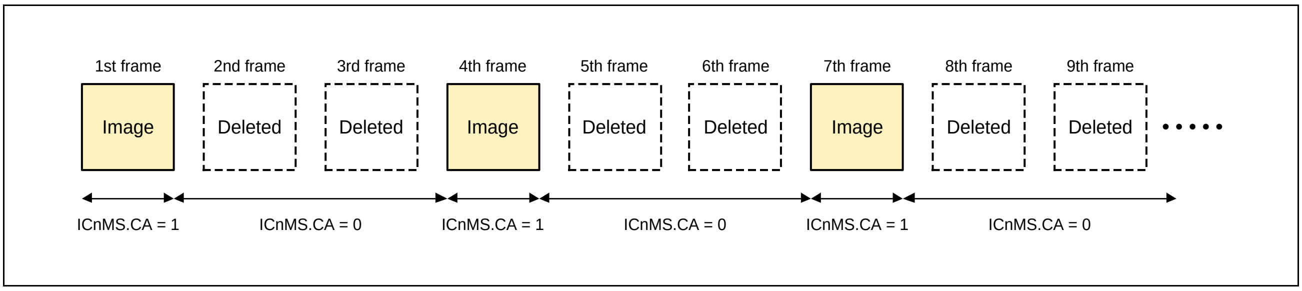

Figure 35.25 Frame Subsampling When ICnDEC.FRMDEC[3:0] is Set to 2 (Progressive)

In interlaced mode, the top field and bottom field are handled as one set (i.e., processed every two frames).

For example, when ICnDEC.FRMDEC[3:0] is set to 2, the first and second frames are output, the third to sixth frames are ignored, and then the seventh and eighth frames are output.

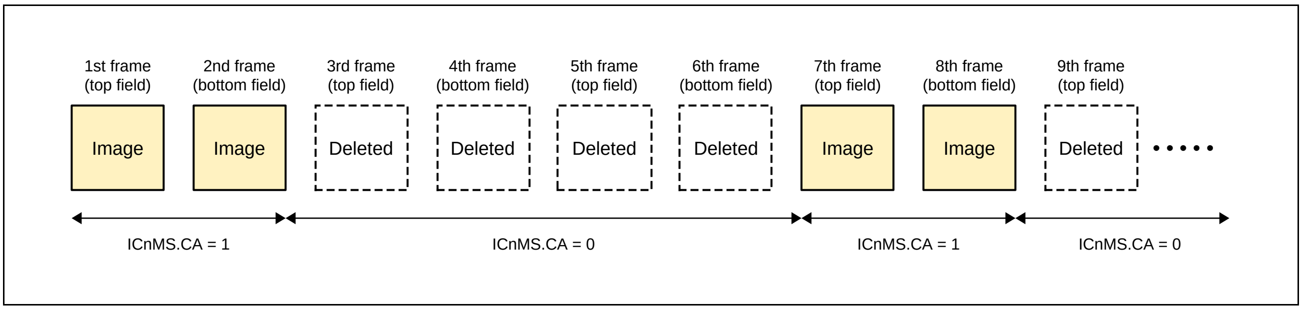

Figure 35.26 Frame Subsampling When ICnDEC.FRMDEC[3:0] is Set to 2 (Interlaced)

35.2.4.10 Demosaicing

This function is only valid on input data of the RAW type. Its operation is on the assumption that the RAW data input from MIPI-CSI-2 are Bayer data and generates pixel data that are interpolated from the RAW data.

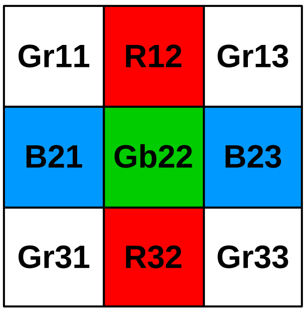
The demosaicing function uses a bilinear method. The 2×2 pixels surrounding the calculation target position are used to linearly interpolate the luminance. The interpolation formula is shown below. The edges of the image are processed by mirroring as follows.

The following describes the method of calculating the RGB components (R22, Gb22/Gr22, B22) of the pixels at the center position.

In the case of RAW10/12, the eight higher-order bits are used for the calculation.

(1) Calculating the Gb22 data portion

Figure 35.27 shows the method of interpolation calculation for pixel data (R/G/B) of Gb22.



$$R22 = (R12 + R32)/2$$

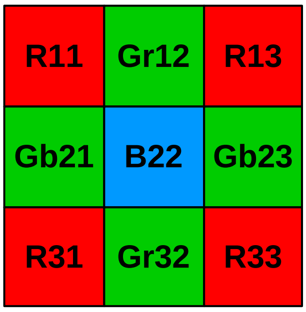
$$Gb22 = Gb22$$

$$B22 = (B21 + B23)/2$$

Figure 35.27 Calculation of the Gb22 Data

(2) Calculating the B22 data portion

Figure 35.28 shows the method of interpolation calculation for pixel data (R/G/B) of B22.



$$R22 = (R11 + R13 + R31 + R33)/4$$

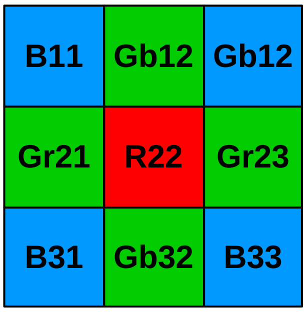
$$Gb22 = (Gr12 + Gb21 + Gb23 + Gr32)/4$$

$$B22 = B22$$

Figure 35.28 Calculation of the B22 Data Portion

(3) Calculating the R22 data portion

Figure 35.29 shows the method of interpolation calculation for pixel data (R/G/B) of R22.



B11	Gb12	Gb12
Gr21	R22	Gr23
B31	Gb32	B33

R22 = R22

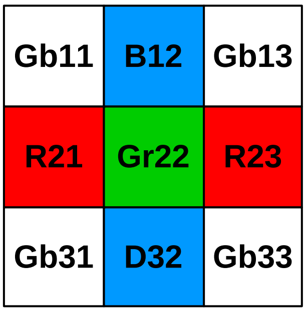
Gr22 = (Gb12 + Gr21 + Gr23 + Gb32)/4

B22 = (B11 + B13 + B31 + B33)/4

Figure 35.29 Calculation of the R22 Data Portion

(4) Calculating the Gr22 data portion

Figure 35.30 shows the method of interpolation calculation for pixel data (R/G/B) of G22.



Gb11	B12	Gb13
R21	Gr22	R23
Gb31	D32	Gb33

R22 = (R21 + R23)/2

Gr22 = Gr22

B22 = (B12 + B32)/2

Figure 35.30 Calculation of the Gr22 Data Portion

35.2.4.11 Linear Matrix

Linear matrix processing involves calculation of the matrix of R’, G’, and B’ (8 bits per color) by using the registers listed below to set the following coefficients for R, G, and B (8 bits per color) after demosaicing as the previous stage.

Gof = Register ICnLMXOF.GOF[7:0]
Rof = Register ICnLMXOF.ROF[7:0]
Bof = Register ICnLMXOF.BOF[7:0]

Rr = Register ICnLMXRC1.RR[12:0]
Rb = Register ICnLMXRC2.RB[12:0]
Rg = Register ICnLMXRC2.RG[12:0]

Gr = Register ICnLMXGC1.GR[12:0]
Gb = Register ICnLMXGC2.GB[12:0]
Gg = Register ICnLMXGC2.GG[12:0]

Br = Register ICnLMXBC1.BR[12:0]
Bb = Register ICnLMXBC2.BB[12:0]
Bg = Register ICnLMXBC2.BG[12:0]

$$\mathrm{R'} = \frac{\mathrm{Rr} \cdot (\mathrm{R} + \mathrm{Rof})^{*1} + \mathrm{Rg} \cdot (\mathrm{G} + \mathrm{Gof})^{*1} + \mathrm{Rb} \cdot (\mathrm{B} + \mathrm{Bof})^{*1}}{1024}$$

$$\mathrm{G'} = \frac{\mathrm{Gr} \cdot (\mathrm{R} + \mathrm{Rof})^{*1} + \mathrm{Gg} \cdot (\mathrm{G} + \mathrm{Gof})^{*1} + \mathrm{Gb} \cdot (\mathrm{B} + \mathrm{Bof})^{*1}}{1024}$$

$$\mathrm{B'} = \frac{\mathrm{Br} \cdot (\mathrm{R} + \mathrm{Rof})^{*1} + \mathrm{Bg} \cdot (\mathrm{G} + \mathrm{Gof})^{*1} + \mathrm{Bb} \cdot (\mathrm{B} + \mathrm{Bof})^{*1}}{1024}$$

Note 1. When the result of addition is a negative value, it is converted to 0.

35.2.4.12 Data Arrange

This function converts the negative expression of UV in the YUV (YCbC) data when inputting and outputting image data. The Data Arrange1 input side is set by the IBINSEL bit of the ICnMC register, and the Data Arrange2 output side is set by the OBINSEL bit of the ICnDMR register.

Set Data Arrange1 according to the sensor specifications. Data Arrange1 supports 8 or 10 bits depending on the number of bits of input data. Set Data Arrange2 according to the specifications used by the output destination. Data Arrange2 supports 8 bits depending on the output data. YUV of the MIPI CSI-2 module is usually used in offset binary. It may be output in two’s complement depending on the sensor used.

Table 35.17 shows an example of processing when the input is 8 bits.

Data Arrange1 also has 10-bit input, and when 10-bit input is used, it can be converted to 10-bit offset binary/2’s complement as well as 8-bit.

Table 35.17 Input Format and Image Processing

UV Value (Hex)	Offset Binary (Dec) Register Settings: DataArrange1: ICnMC.IBINSEL = 0 DataArrange2: ICnDMR. OBINSEL = 0	Two’s Complement (Dec) Register Settings: DataArrange1: ICnMC.IBINSEL = 1 DataArrange2: ICnDMR. OBINSEL = 1
H’FF	127	−1
H’FE	126	−2
. . .	. . .	…
H’81	1	−127
H’80	0	−128
H’7F	−1	127
. . .	…	…
H’01	−127	1
H’00	−128	0

35.2.4.13 Data Clipping

Data in the YCbCr (YUV) format is clipped. To make the input data to be RGB-converted comply with the ITU-R BT.601 standard, specify whether to clip the values below 16 and above 240 for YCbCr-8bit and below 64 and above 960 for YCbCr-10bit. Data clipping can be set by the CLP[1:0] bits in the ICnMC register. (See **Section 35.2.3.58**.)

35.2.4.14 Color Space Conversion

(1) RGB to YCbCr

The RGB data (8 or 10 bits) which is image-clipped, frame-subsampled, or demosaiced is extended to 12 bits, and then is converted into YCbCr (10 bits). By setting coefficients in registers, perform calculations equivalent to ITU-R BT.601 and ITU-R BT.709.

Perform calculations according to the coefficients and formulas specified by the following registers:

YCLRP = ICnYCCR1.YCLRP[12:0]
YCLBP = ICnYCCR2.YCLBP[12:0]
YCLGP = ICnYCCR2.YCLGP[12:0]
YCLSFT = ICnYCCR3.YCLSFT[4:0]
YCLAP = ICnYCCR3.YCLAP[11:0]

CBCLRP = ICnCBCCR1.CBCLRP[12:0]
CBCLBP = ICnCBCCR2.CBCLBP[12:0]
CBCLGP = ICnCBCCR2.CBCLGP[12:0]
CBCLSFT = ICnCBCCR3.CBCLSFT[4:0]
CBCLAP = ICnCBCCR3.CBCLAP[11:0]

CRCLRP = ICnCRCCR1.CRCLRP[12:0]
CRCLBP = ICnCRCCR2.CRCLBP[12:0]
CRCLGP = ICnCRCCR2.CRCLGP[12:0]
CRCLSFT = ICnCRCCR3.CRCLSFT[4:0]
CRCLAP = ICnCRCCR3.CRCLAP[11:0]

$Y = ((\mathrm{YCLRP} \times R + \mathrm{YCLGP} \times G + \mathrm{YCLBP} \times B) / 2^{\mathrm{YCLSFT}}) + \mathrm{YCLAP}$
$Cb = ((\mathrm{CBCLRP} \times R + \mathrm{CBCLGP} \times G + \mathrm{CBCLBP} \times B) / 2^{\mathrm{CBCLSFT}}) + \mathrm{CBCLAP}$
$Cr = ((\mathrm{CRCLRP} \times R + \mathrm{CRCLGP} \times G + \mathrm{CRCLBP} \times B) / 2^{\mathrm{CRCLSFT}}) + \mathrm{CRCLAP}$

In the case of ITU-R BT.601 (8 bits) (same as defaults):

$Y = 0.257 \times R + 0.504 \times G + 0.098 \times B + 16$
$Cb = -0.148 \times R - 0.291 \times G + 0.439 \times B + 128$
$Cr = 0.439 \times R - 0.368 \times G - 0.071 \times B + 128$

Register Settings:

YCLRP = H’0107
YCLBP = H’0064
YCLGP = H’0204
YCLSFT = H’0A
YCLAP = H’100

CBCLRP = H’1F68
CBCLBP = H’01C2
CBCLGP = H’1ED6
CBCLSFT = H’0A
CBCLAP = H’800

CRCLRP = H’01C2
CRCLBP = H’1FB7
CRCLGP = H’1E87
CRCLSFT = H’0A
CRCLAP = H’800

(2) YCbCr to RGB

The YCbCr data (8 or 10 bits) which is data-arranged and data-clipped is extended to 12 bits (the extension method: 0 added to lower bits), and then is converted into RGB (10 bits). By setting coefficients in registers, perform calculations equivalent to ITU-R BT.601 and ITU-R BT.709. Perform calculations according to the coefficients and formulas specified by the following registers:

YMUL = ICnCSCC1.YMUL[13:0]
YSUB = ICnCSCC2.YSUB[11:0]
RCRMUL = ICnCSCC2.CSUB[11:0]
GCRMUL = ICnCSCC3.RCRMUL[13:0]
GCBMUL = ICnCSCC3.GCRMUL[13:0]
BCBMUL = ICnCSCC4.GCBMUL[13:0]
CSUB = ICnCSCC4.BCBMUL[13:0]

$$\mathrm{R} = \frac{\mathrm{YMUL} \times (\mathrm{Y} - \mathrm{YSUB})^{*1} + \mathrm{RCRMUL} \times (\mathrm{Cr} - \mathrm{CSUB})}{4096}$$

$$\mathrm{G} = \frac{\mathrm{YMUL} \times (\mathrm{Y} - \mathrm{YSUB})^{*1} - \mathrm{GCRMUL} \times (\mathrm{Cr} - \mathrm{CSUB}) - \mathrm{GCBMUL} \times (\mathrm{Cb} - \mathrm{CSUB})}{4096}$$

$$\mathrm{B} = \frac{\mathrm{YMUL} \times (\mathrm{Y} - \mathrm{YSUB})^{*1} + \mathrm{BCBMUL} \times (\mathrm{Cb} - \mathrm{CSUB})}{4096}$$

Note 1. A negative value is rounded to 0.

In the case of ITU-R BT.601 (8 bits) (same as defaults):

$\mathrm{R} = 1.164 \times (\mathrm{Y} - 16) + 1.596 \times (\mathrm{Cr} - 128)$
$\mathrm{G} = 1.164 \times (\mathrm{Y} - 16) - 0.813 \times (\mathrm{Cr} - 128) - 0.392 \times (\mathrm{Cb} - 128)$
$\mathrm{B} = 1.164 \times (\mathrm{Y} - 16) + 2.017 \times (\mathrm{Cb} - 128)$

Register Settings:

YMUL = H’129F
YSUB = H’100
RCRMUL = H’1989
GCRMUL = H’0D02
GCBMUL = H’0645
BCBMUL = H’2045
CSUB = H’800

35.2.4.15 LUT (Lookup Table)

Used to convert 10-bit data after color space conversion (YCbCr to RGB or RGB to YCbCr) into 8-bit data.

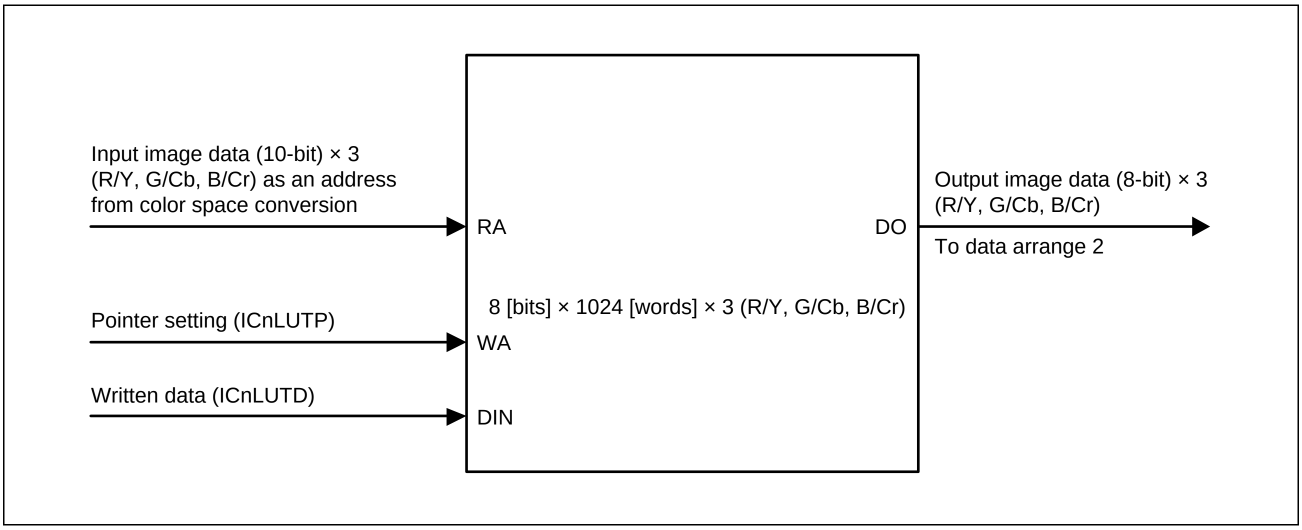


Figure 35.31 Lookup Table (LUT)

(1) Pointer Access

The pointer is incremented every time the ICnLUTD register is written.

The incremented value can be read from the ICnLUTP register. When the ICnLUTD register is read, the pointer is not incremented. The pointer must be set immediately before the register is read.

Follow the procedure below to access the lookup table. See **Section 35.3.1**.

The lookup table cannot be accessed from the CPU in normal mode.

(2) Lookup Table Usage Notes

1. Set the lookup table only after the CRU has stopped its operation.
2. Rewrite the entire lookup table before use because the initial values are not guaranteed after the power is turned on.
3. Data to be set in the lookup table must be restricted to the range that is compatible with the input bit width.

35.2.4.16 YCbCr422 to 420

Data is skipped from YCbCR422 to produce YCbCr420. Averaging or any other calculations are not performed. This conversion can be set by the YCMODE[2:0] bits in the ICnDMR register. (See **Section 35.2.3.80**.)

35.2.4.17 Y/C Separation / Only Y

Only Y can be separated or extracted from Y/C, and then can be stored in memory. For details, see **Section 35.2.4.3(2)**.

35.2.4.18 Statistics

This function is limited to a RAW data input through SVC0 of CRU0/1. This module divides one image vertically and horizontally into blocks (see **Figure 35.32**). The statistical information within this block is transferred to memory and the image is adjusted by weighting the information of every block by the CPU and providing feedback to the external video state.

1) In-block accumulation

Accumulation of each color component, R, G, and B, is performed within each block.

On the CPU side, the weighting is applied per block based on the information from each block, and the obtained evaluation values can be used for exposure control, etc. from the next frame.

The weighting could in general be center-weighted allocation, weighted allocation according to the subject, and so on. If the subject is judged to be dark, exposure control is applied to widen the aperture, and if the subject is judged to be bright, the aperture is made narrower.

Additionally, each color component among the R, G, and B components is adjusted and the latter stage performs operations in such a way that the B component is reduced, for example, in video which appears bluish in white regions.

This adjustment of each color includes changing the coefficients of the sensor or the linear matrix as the latter stage.

2) In-block sum of absolute difference values

Focusing on the G component within the block, the overall value for the differences from the adjacent parts of the image is extracted and accumulation is performed within the block.

On the CPU side, the weighting is applied per block based on the information from each block, and the obtained evaluation values can be used for focus adjustment, etc. from the next frame.

The weighing could in general be center-weighted allocation, weighted allocation according to the subject, and so on. If the obtained evaluation value is compared with the previous frame and if the amount continues to be reduced, the evaluation value is increased to adjust the focus, for example, by adjusting the distance between the lens and the sensor toward the opposite direction.

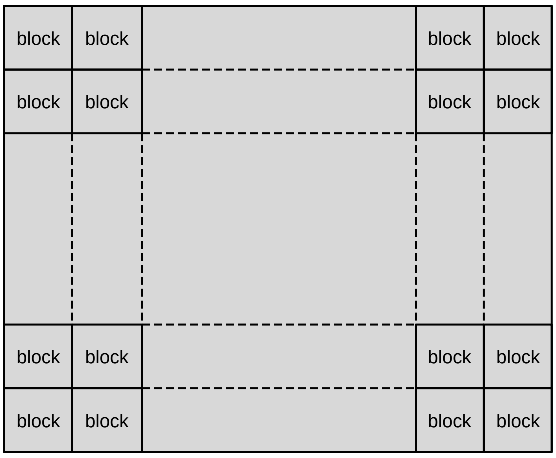

Figure 35.32 Image of Dividing an Image into Blocks Vertically and Horizontally

Figure 35.33 is a block diagram of statistics. The result of AE/AWB statistical calculations for per block is 8 bits × 3 = 3 bytes, respectively, and that of the AF statistical calculations is 1 byte for G only, so a total of 4 bytes of data are output.

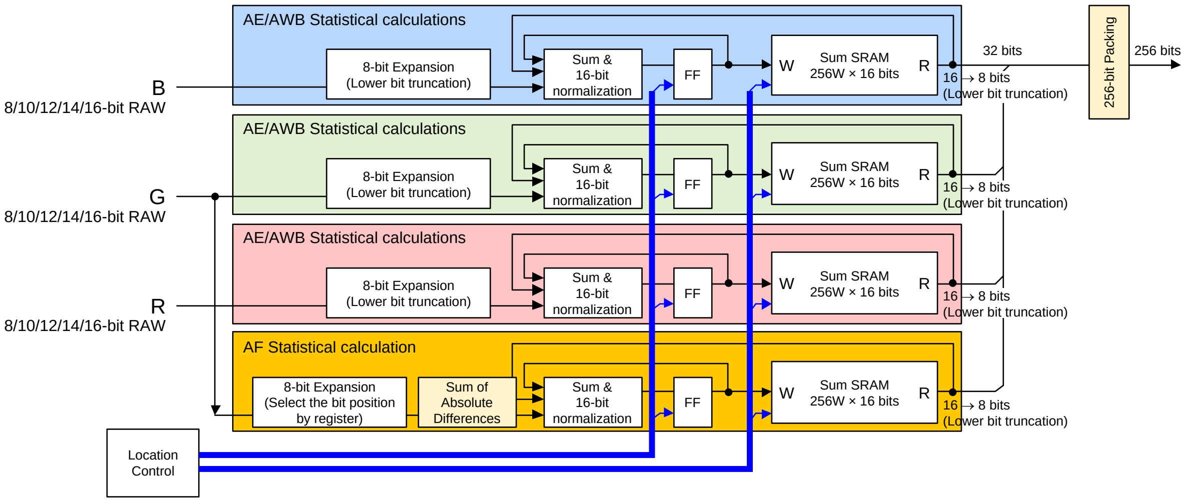

Figure 35.33 Statistics Block Diagram

(1) RGB cumulative addition

The STUNIT[1:0] bit fields in each of the ICnSTIC1 registers are used to select the pixel (block) sizes for statistical calculations from among four values, 16×16, 32×32, 64×64, and 128×128. The target pixels when the setting is 16×16 are described in **(a) Target pixels when the block size is selected as 16×16 (ICnSTIC1.STUNIT[1:0] = 0b)** and the methods of calculation for each block-size setting are described in **(b) Methods of calculation for each block-size setting**.

(a) Target pixels when the block size is selected as 16×16 (ICnSTIC1.STUNIT[1:0] = 0b)

G component: 128 pixels are present in the area of 16×16

R and B components: 32 pixels are present in the area of 16×16

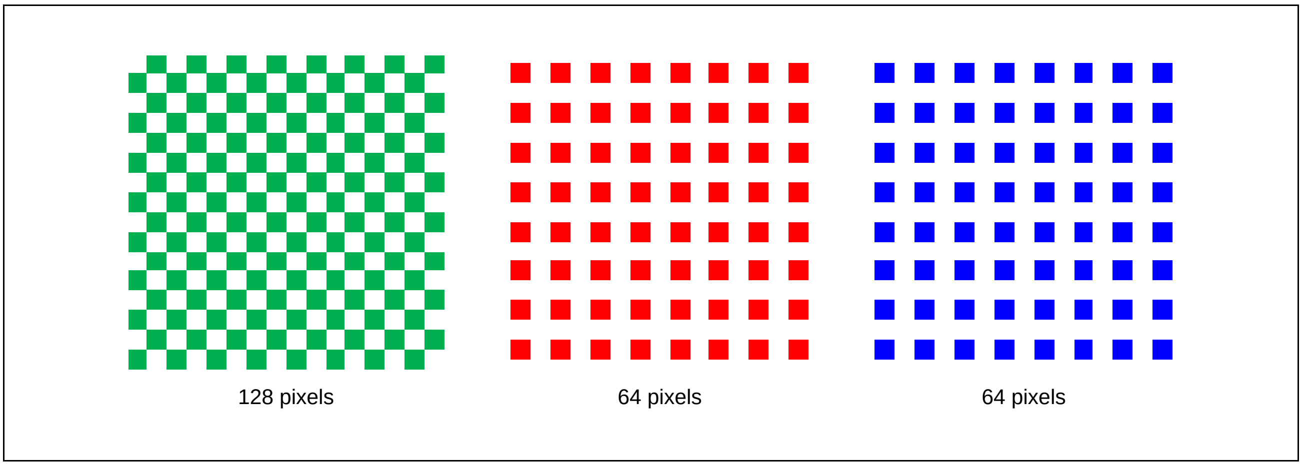

Figure 35.34 Target Pixels when the Block Size is Selected as 16×16

(b) Methods of calculation for each block-size setting

[G component]

- When the block size is 16×16: 8 bits × 128 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 32×32: 8 bits × 512 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 64×64: 8 bits × 2048 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 128×128: 8 bits × 8192 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.

[R and B components]

- When the block size is 16×16: 8 bits × 64 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 32×32: 8 bits × 256 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 64×64: 8 bits × 1024 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.

- When the block size is 128×128: 8 bits × 4096 pixels are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.

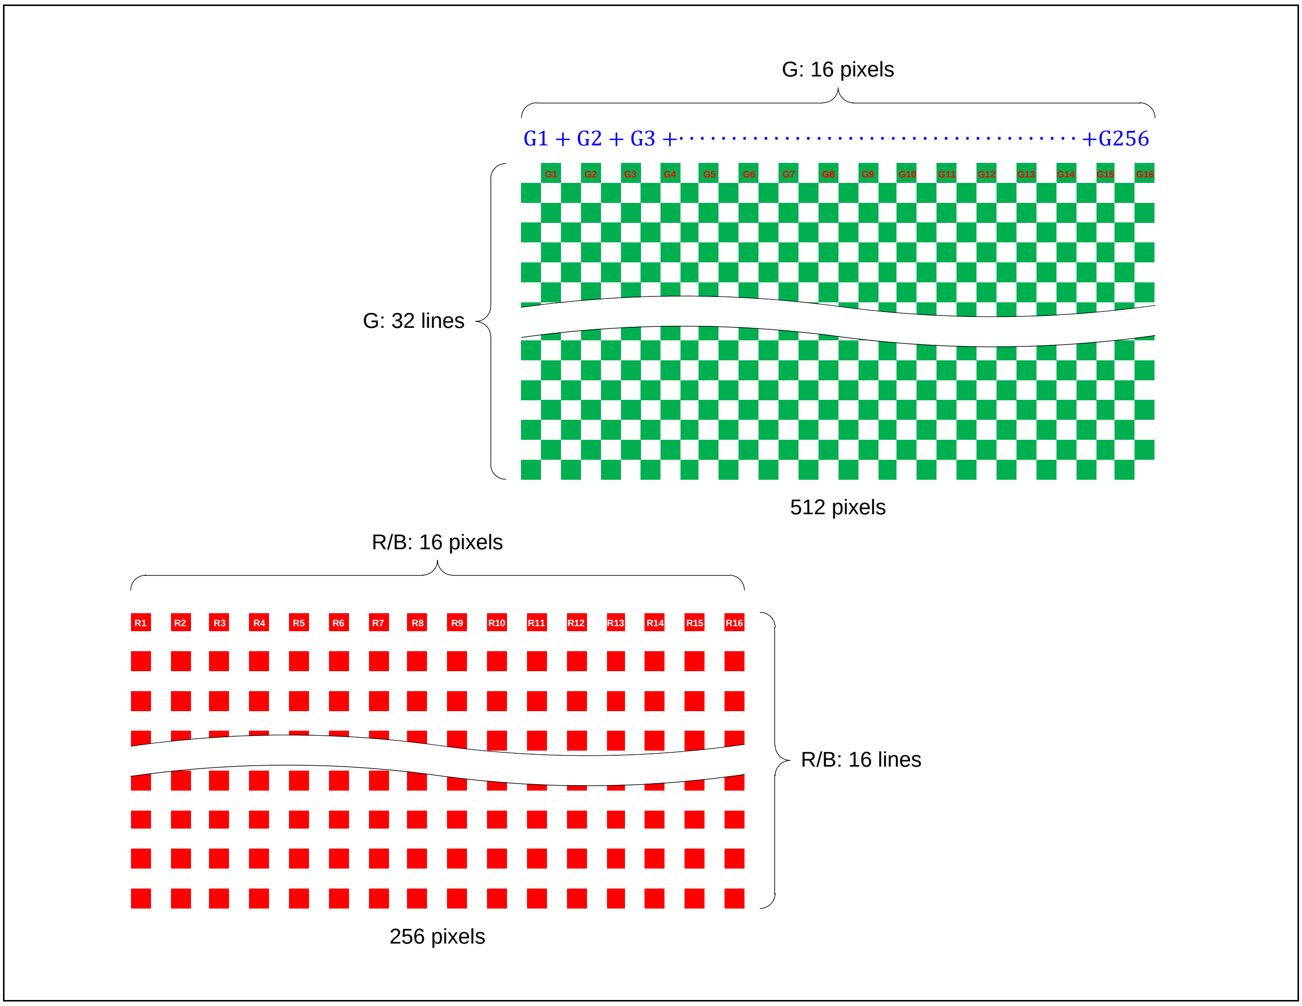

Figure 35.35 Illustration Diagram of Accumulation within the Block when the Block Size is 32×32

(2) Sum of absolute values for adjacent pixels

Set the area for which the sum of absolute values for adjacent pixels is taken with the use of register ICnSTIC1.STUNIT[1:0] to make the calculations in the following ways.

- **In the case of 16×16 pixel unit operations (ICnSTIC1.STUNIT[1:0] = 0b):**
  - For 8-bit data: Up to 16 bits
  - For 10- to 16-bit data: A sum-of-absolute-differences (SAD) operation is performed with the eight higher-order bits (default).
  - Addition can also be performed with the eight lower-order bits by shifting the bits by setting register ICnSTIC1.STSADPOS[3:0].

- **Methods of calculation for the setting area:**

[G component calculation]

- When the block size is 16×16: Adjacent differences × 112 are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 32×32: Adjacent differences × 480 are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 64×64: Adjacent differences × 1984 are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.
- When the block size is 128×128: Adjacent differences × 8064 are accumulated: The eight higher-order bits are output after accumulation and normalization with a 16-bit precision.

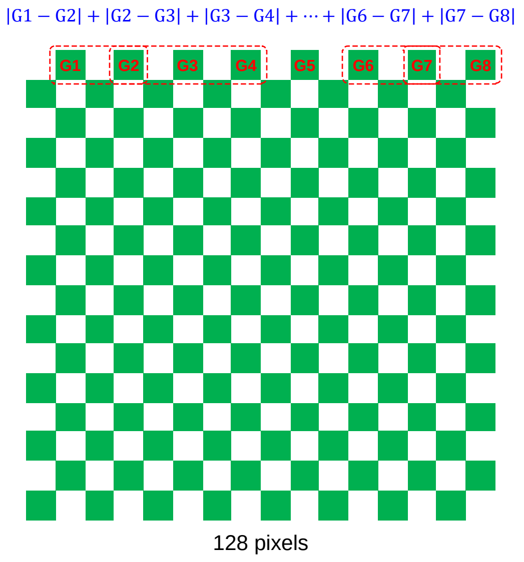

Figure 35.36 Illustration Diagram of Sum of Absolute Values for Adjacent Pixels when the Block Size is 16×16

(3) Statistics data generated image

The following describes the amounts of data in the operations when a 1920×1080 pixel area is set as 16×16 blocks and as 128×128 blocks for the statistics function. The numerals in the figures below represent the block numbers. In processing of the right end or bottom of the image, if the input image size is greater than the size specified as the number of blocks in the horizontal direction, that difference does not fall within the target range for arithmetic processing. This also applies in the vertical direction.

● In the case of operations for a 1920×1080 pixel area as 16×16 blocks:

As shown in **Figure 35.37**, the calculated values for each of the blocks are transferred sequentially. A total of 31 Kbytes of data are transferred for one frame. For the format of data for transmission, see **Table 35.14**.

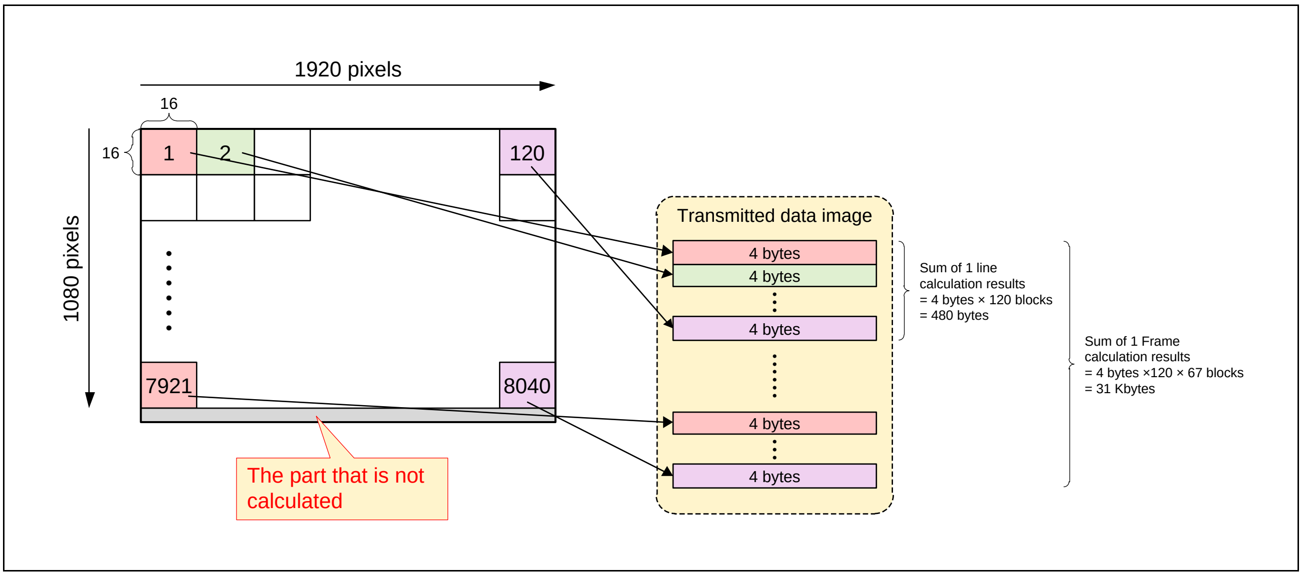

Figure 35.37 Illustration Diagram of the Amounts of Data in the Operations when a 1920×1080 Pixel Area is Set as 16×16 Blocks

- **In the case of operations for a 1920×1080 pixel area as 128×128 blocks:**

The calculated values for the corresponding blocks are sequentially transferred. A total of 480 bytes of data are transferred for one frame.

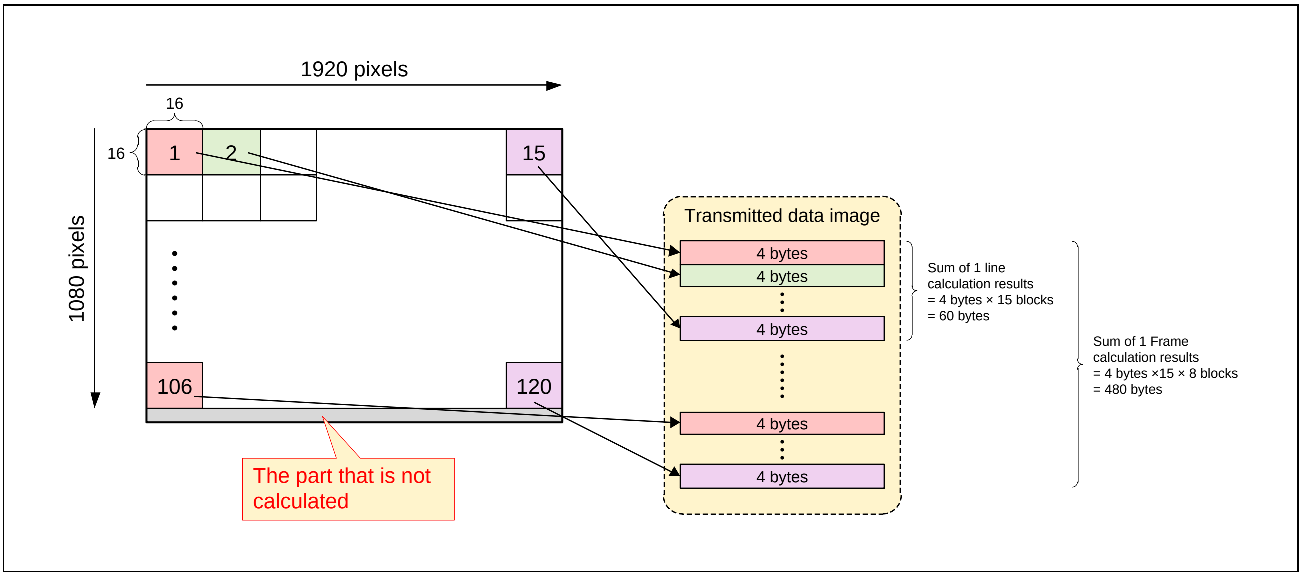

Figure 35.38 Illustration Diagram of the Amounts of Data in the Operations when a 1920×1080 Pixel Area is Set as 16×16 Blocks

(4) Horizontal pixels exceed 2048

Statistics can only detect up to 2048 pixels horizontally. If horizontal pixel exceeds 2048 pixels, the offset setting (ICnSTIC2.STHPOS[8:0]) can be used to detect the center pixel and calculate Statistics.

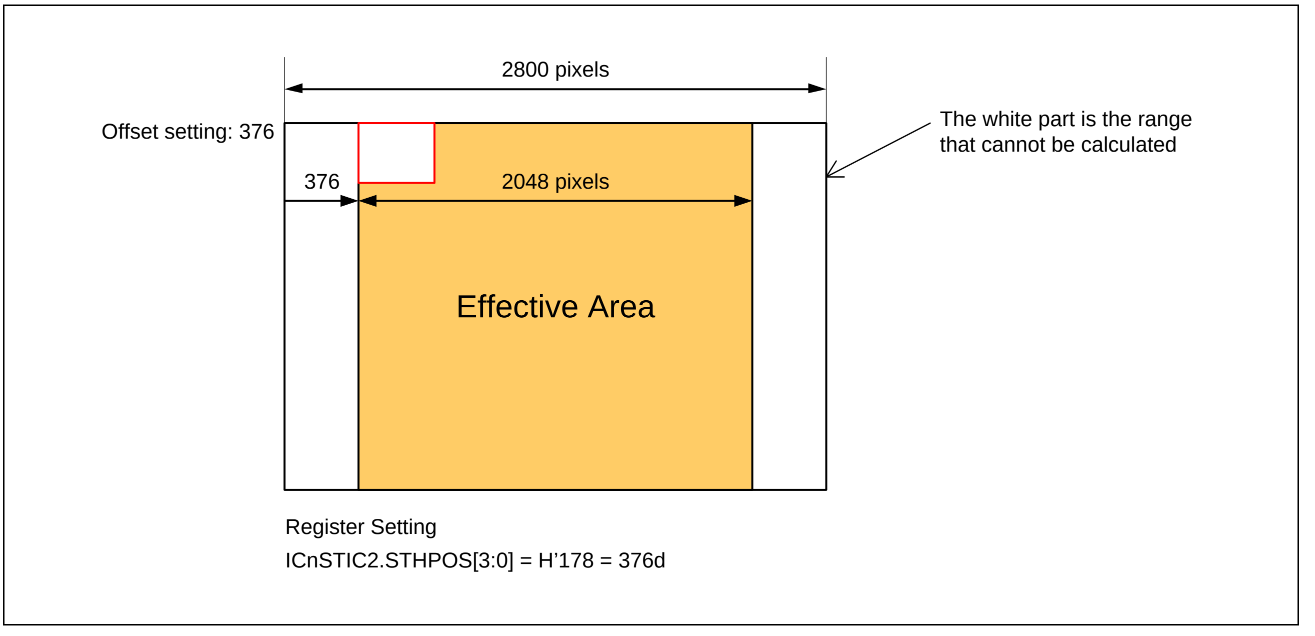

Figure 35.39 Statistics Calculation Example at 2800 Pixels Width

35.2.4.19 Pattern Generator (for Debugging)

A test image (YUV422 only) can be generated for use as an MIPI CSI-2 input by setting the following registers. This function is used for debugging to identify where the problem is originated (in the sensor or in the internal settings). Two modes are implemented for this pattern (monochrome or pattern). See **Section 35.3** for the setting procedure.

TIEN = ICnTICTRL1.TIEN: Enables generation of a test image pattern.
TIMODE = ICnTICTRL1.TIMODE: Selects a test image generation pattern (monochrome or pattern).

TIPTNY1[3:0] = ICnTICTRL1.TIPTNY1[3:0]: Bit settings for the pixel (Y) counter.
TIPTNU1[3:0] = ICnTICTRL1.TIPTNU1[3:0]: Bit settings for the pixel (U) counter.
TIPTNV1[3:0] = ICnTICTRL1.TIPTNV1[3:0]: Bit settings for the pixel (V) counter.

TIRATE[4:0] = ICnTICTRL1.TIRATE[4:0]: Specify a test image generation rate.

TIPTNY2[7:0] = ICnTICTRL2.TIPTNY2[7:0]: Specify V for the entire-screen same-color test image pattern.
TIPTNU2[7:0] = ICnTICTRL2.TIPTNU2[7:0]: Specify U for the entire-screen same-color test image pattern.
TIPTNV2[7:0] = ICnTICTRL2.TIPTNV2[7:0]: Specify Y for the entire-screen same-color test image pattern.

TIPPL[11:0] = ICnTISIZE1.TIPPL[11:0]: Number of valid pixels per line in the test image pattern.
TIN[11:0] = ICnTISIZE2.TIN[11:0]: Valid period (number of lines) per frame in the test image pattern.
TIM[11:0] = ICnTISIZE2.TIM[11:0]: Invalid period (number of lines) per frame in the test image pattern.

(1) Image and Settings (Common to Monochrome and Pattern Generation)

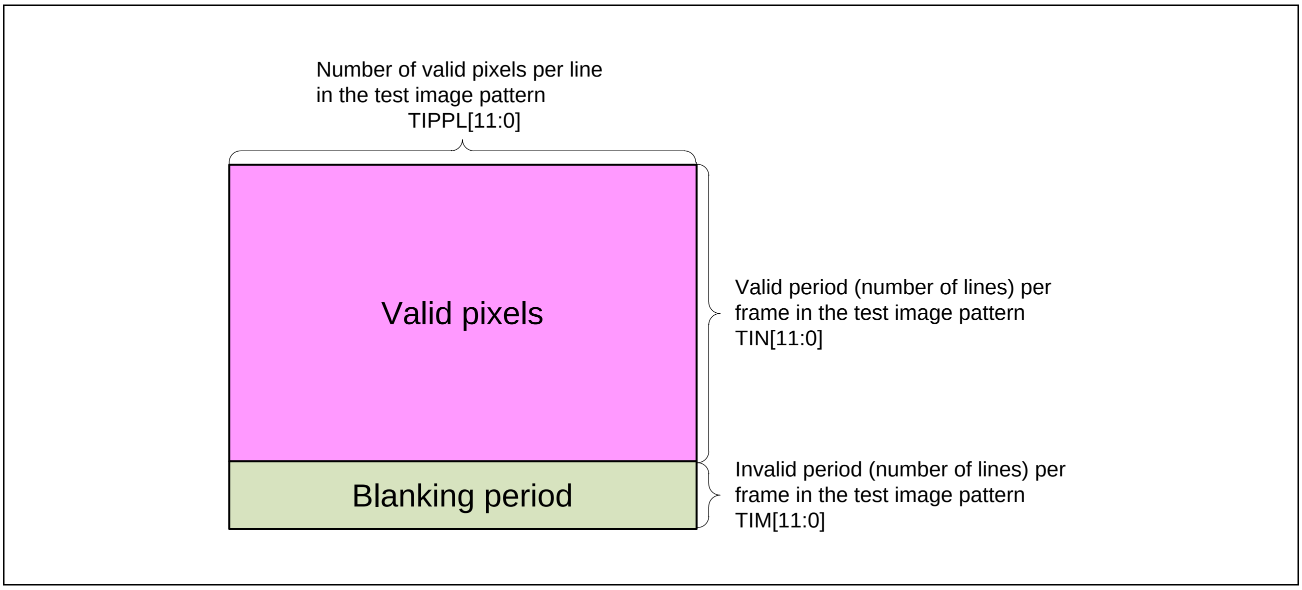

Figure 35.40 Image and Settings

(2) Timing Generation and Settings (Common to Monochrome and Pattern Generation)

(Bits TIRATE[4:0] allow the test image generation rate to be set in the range between 3.783 Gbps and 1.390 Gbps.)

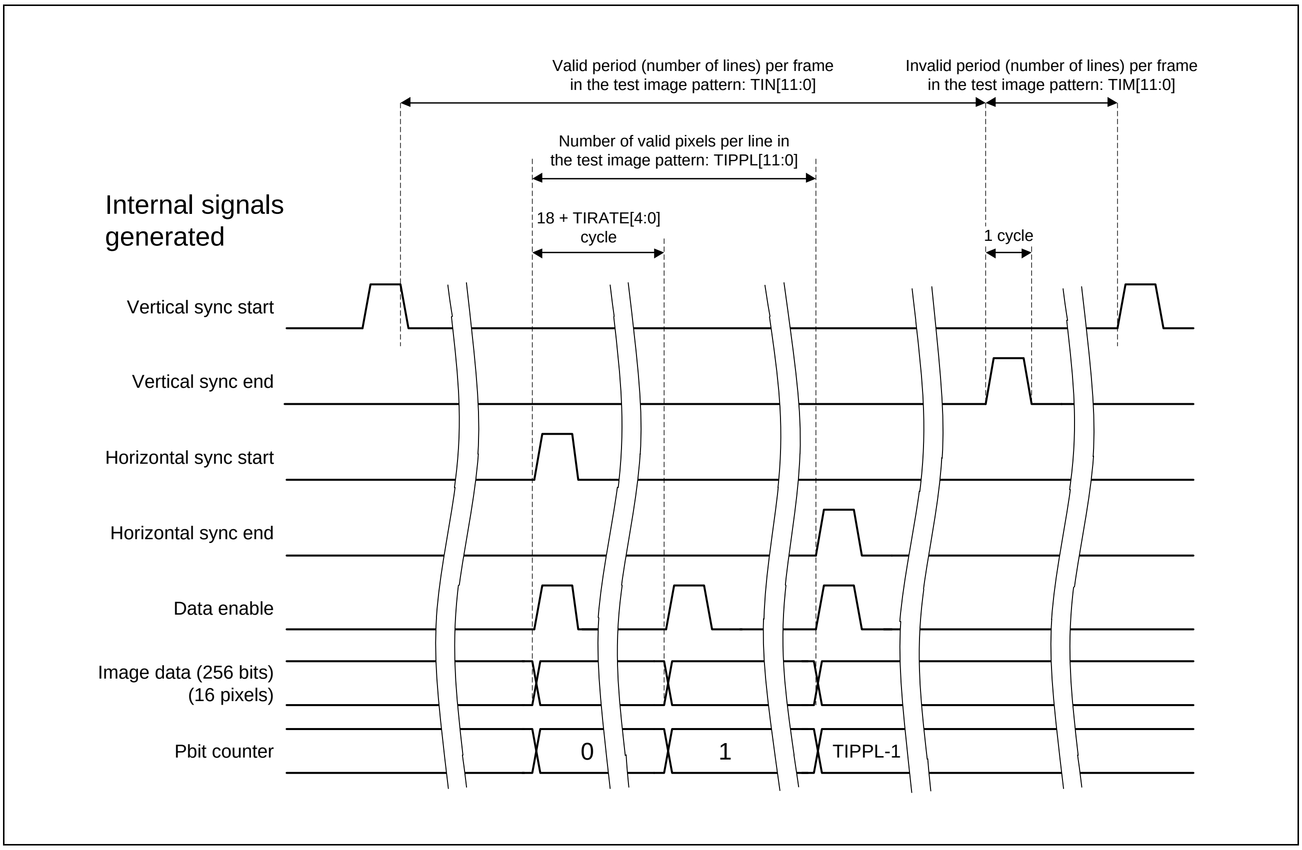

Figure 35.41 Timing Generation and Settings

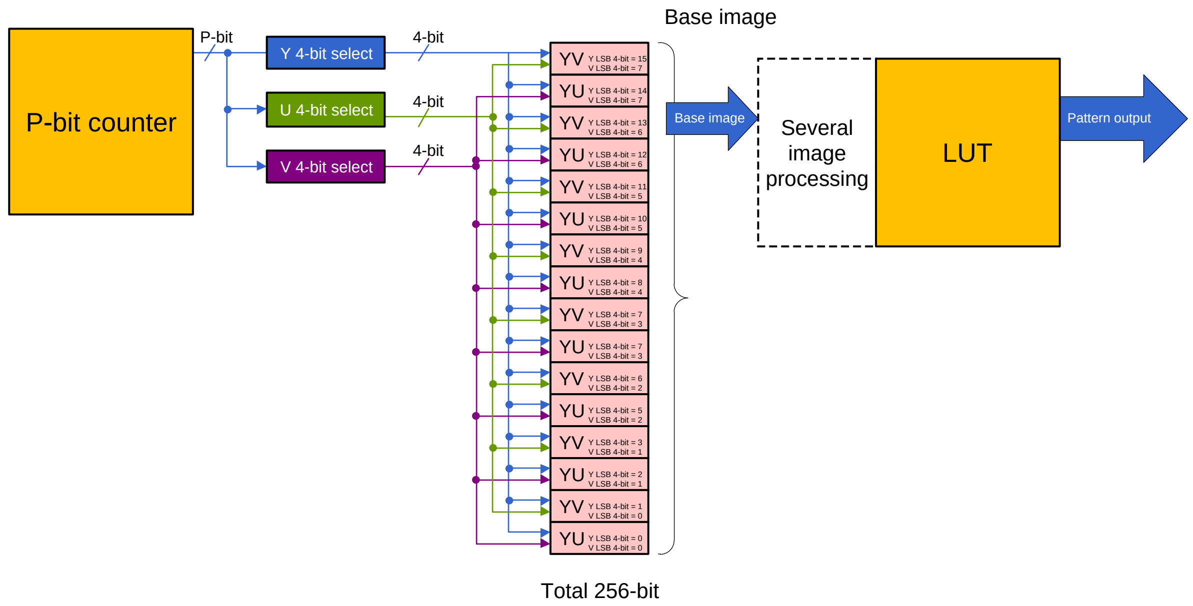
(3) Data Generation Circuit (in the Case of Pattern Generation)

Image YUV422 8-bit data of 256 bits (16 pixels) is generated as follows (other formats cannot be generated). The 16-bit Pbit counter is incremented in 18 + TIRATE[4:0] (cycles at 266 MHz). The bits of this Pbit counter are selected by the TIPTNV1[3:0], TIPTNU1[3:0], and TIPTNY1[3:0] bits, and then they are packed and sent as follows:

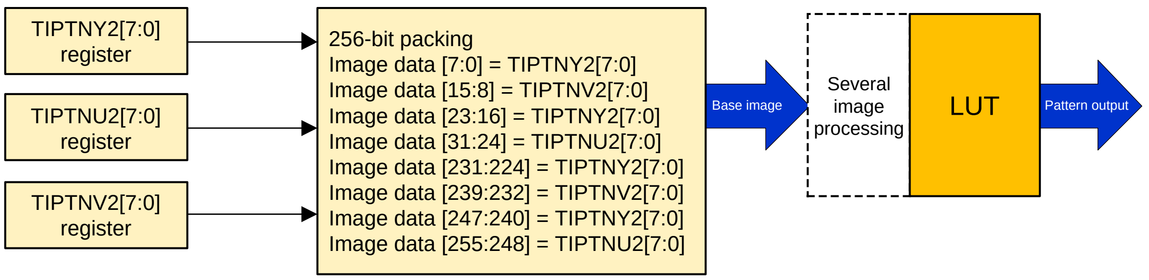


Note: The counter is 16 bits wide.

Figure 35.42 Data Generation Circuit (in the Case of Pattern Generation)

(4) Data Generation Circuit (in the Case of Monochrome Generation)

Image YUV422 8-bit data of 256 bits (16 pixels) is generated in monochrome as follows (other formats cannot be generated). The values set by the TIPTNV2[7:0], TIPTNU2[7:0], and TIPTNY2[7:0] bits are packed and sent as follows:



256-bit packing
Image data [7:0] = TIPTNY2[7:0]
Image data [15:8] = TIPTNV2[7:0]
Image data [23:16] = TIPTNY2[7:0]
Image data [31:24] = TIPTNU2[7:0]
Image data [231:224] = TIPTNY2[7:0]
Image data [239:232] = TIPTNV2[7:0]
Image data [247:240] = TIPTNY2[7:0]
Image data [255:248] = TIPTNU2[7:0]

Figure 35.43 Data Generation Circuit (in the Case of Monochrome Generation)

(5) Generated Image Data Example (in the Case of Pattern Generation)

VGA (640x480): TIEN = 1b, TIMODE = 0b, TIPTNY1[3:0] = 0000b, TIPTNU1[3:0] = 0100b, TIPTNV1[3:0] = 1000b (Offset binary: ICnMC.IBINSEL = 0, ICnDMR.OBINSEL = 0)

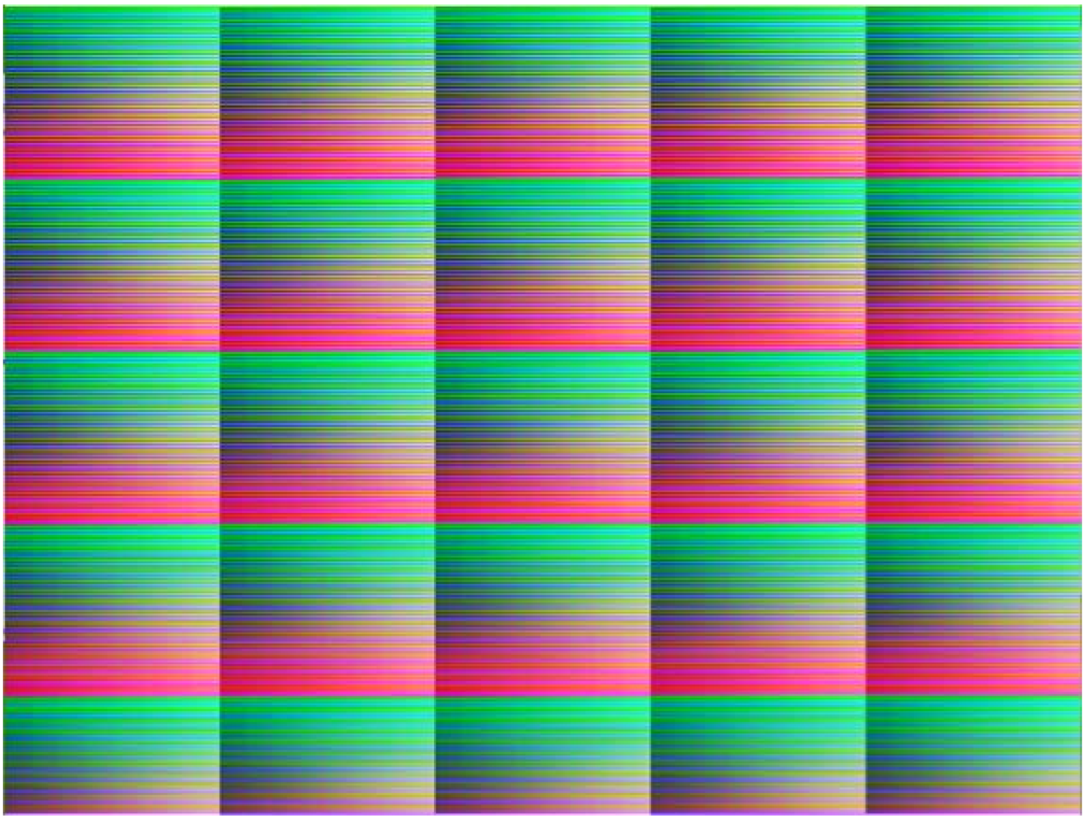


Figure 35.44 Generated Image Data Example (in the Case of Pattern Generation)

(6) Generated Image Data Example (in the Case of Monochrome Generation)

VGA (640x480): TIEN = 1b, TIMODE = 1b, TIPTNY2[7:0] = H’52, TIPTNU2[7:0] = H’5A, TIPTNV2[3:0] = H’F0
(Offset binary: ICnMC.IBINSEL = 0, ICnDMR.OBINSEL = 0)

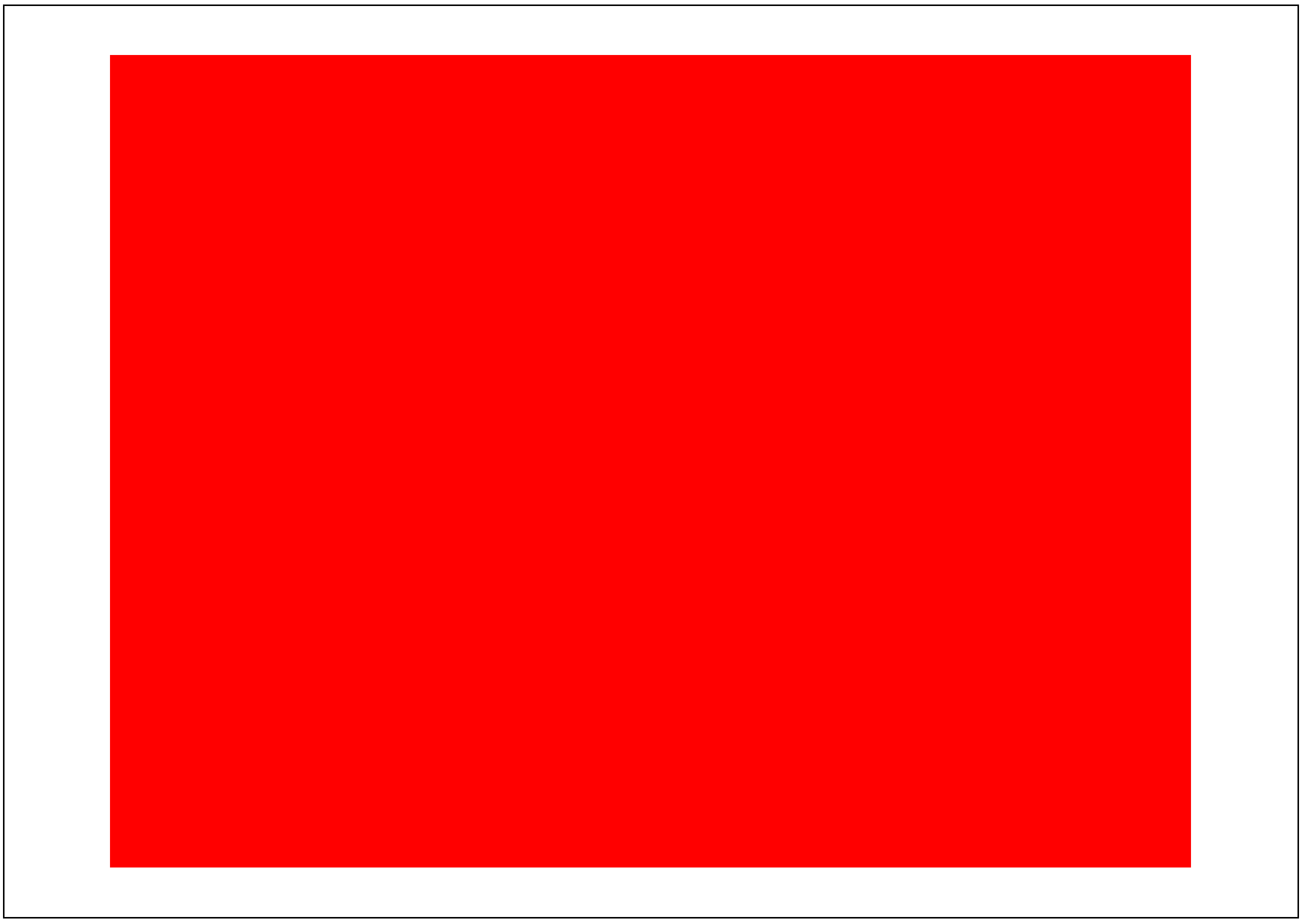

Figure 35.45 Generated Image Data Example (in the Case of Monochrome Generation)

35.2.5 Interrupts

Table 35.18 lists the interrupt sources, registers, and interrupt signals to the interrupt controller.

Table 35.18 Interrupt Sources, Registers, and Interrupt Signals to the Interrupt Controller

Internal Signal Name	Item	Interrupt Source Status/Clear	Interrupt Enable Register Field	Generation Condition
axi_mst_err_int	FIFO overflow (image-related)	CRUnINTS.FOS	CRUnIE.FOE	When the image-related FIFO overflowed
	SLVERR error (image-related)	CRUnINTS.SLVES	CRUnIE.SLVEE	When an SLVERR error occurred in the image-related AXI
	DECERR error (image-related)	CRUnINTS.DECES	CRUnIE.DECEE	When a DECERR error occurred in the image-related AXI
	Frame End Overwrite (image-related)	CRUnINTS.FEOVWS	CRUnIE.FEOVWE	When the Frame End is overwritten in the image-related FIFO
	FIFO-SD overflow (statistics data) (for debugging)	CRUnINTS.SDFOS	CRUnIE1.SDFOE	When Statistics Data FIFO-SD overflows
	SLVERR error (statistics data)	CRUnINTS.SDSLVES	CRUnIE1.SDSLVEE	When the SLVERR error of Statistics Data AXI-SD occurs
	DECERR error (statistics data)	CRUnINTS.SDDECES	CRUnIE1.SDDECEE	When the Statistics Data AXI-SD DECERR error
	Frame End Overwrite (Statistics-related)	CRUnINTS.SDFEOVWS	CRUnIE.SDFEOVWE	When the Frame End is overwritten in the Statistics Data FIFO-SD
image_conv_int	Frame Start	CRUnINTS.SFS	CRUnIE.SFE	When a frame starts *Note*: By using the ICnINTCTRLDECINTE register, whether to generate interrupts in subsampled frames can be specified.
	Frame End	CRUnINTS.EFS	CRUnIE.EFE	When a frame ends *Note*: By using the ICnINTCTRLDECINTE register, whether to generate interrupts in subsampled frames can be specified.
	Scan Line	CRUnINTS.SIS	CRUnIE.SIE	When there is a match with the line number specified in the register (ICnSI.SI[11:0]) *Note*: By using the ICnINTCTRLDECINTE register, whether to generate interrupts in subsampled frames can be specified.
image_conv_err_int	Abnormal word count Value	CRUnINTS.WIS	CRUnIE.WIE	When the word count value set in the register (ICnEWC.EWC[15:0]) did not match the word count value of MIPI
	ITU656 DECERR	CRUnINTS.CES	CRUnIE.CEE	When an ITU656 error was detected

35.2.6 Usage Notes

There are no special usage notes currently.

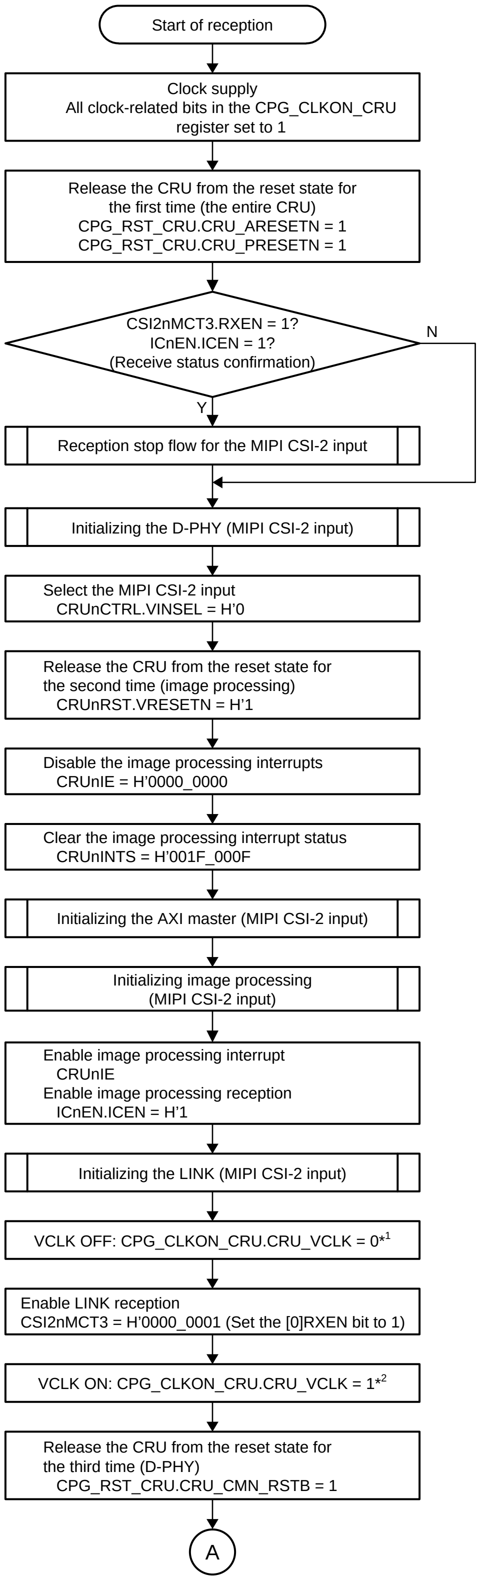
35.3 Operation

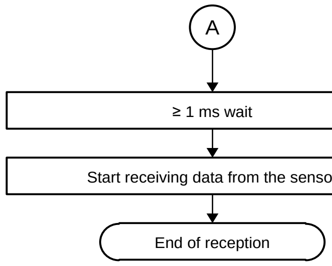
Table 35.19 lists the operations that this section deals with. Follow the procedures described below. If the procedure is not followed, an unexpected behavior may result. The subsections that follow describe each operation.

Table 35.19 List of Operations

Item		Description
Starting reception for the MIPI CSI-2 input		Describes the procedure to start reception for the MIPI CSI-2 input (including the pattern generator).
	Initializing the D-PHY (MIPI CSI-2 input)	Describes the procedure to initialize the D-PHY for the MIPI CSI-2 input.
	Initializing the AXI master (MIPI CSI-2 input)	Describes the procedure to initialize the AXI master for the MIPI CSI-2 input.
	Initializing image processing (MIPI CSI-2 input)	Describes the procedure to initialize image processing for the MIPI CSI-2 input.
	Storing LUT data (both)	Describes the procedure to store LUT data for both the MIPI CSI-2 input and the parallel input.
	Initializing the LINK (MIPI CSI-2 input)	Describes the procedure to initialize the LINK for the MIPI CSI-2 input.
Stopping reception for the MIPI CSI-2 input		Describes the procedure to stop reception for the MIPI CSI-2 input (not including the pattern generator).
	Determining LINK packet stop (MIPI CSI-2 input)	Describes the procedure to determine LINK packet stop for the MIPI CSI-2 input.
	Stopping the D-PHY (MIPI CSI-2 input)	Describes the procedure to stop the D-PHY for the MIPI CSI-2 input.
	Stopping image processing reception (MIPI CSI-2 input)	Describes the procedure to stop image processing reception for the MIPI CSI-2 input.
Changing frame synchronization settings	By setting registers	Describes the procedure to change the frame synchronization settings by setting registers from the CPU for the MIPI CSI-2 input.
	By using the DMAC	Describes the procedure to change the frame synchronization settings by using the DMAC for the MIPI CSI-2 input.
Starting reception for the parallel input		Describes the procedure to start reception for the parallel input (including the pattern generator).
	Initializing the AXI master (parallel input)	Describes the procedure to initialize the AXI master for the parallel input.
	Initializing image processing (parallel input)	Describes the procedure to initialize image processing for the parallel input.
Stopping reception for the parallel input		Describes the procedure to stop reception for the parallel input (not including the pattern generator).
	Determining image processing reception stop (parallel input)	Describes the procedure to determine image processing reception stop for the parallel input.
	Stopping image processing reception (parallel input)	Describes the procedure to stop image processing reception for the parallel input.
Stopping the pattern generator		Describes the stop procedure using the pattern generator.

35.3.1 Starting Reception for the MIPI CSI-2 Input





Note 1. After VCLK OFF setting, confirm whether VCLK is off by reading CPG_CLKMON_CRU.CLK1_ON = 0.

Note 2. After VCLK ON setting, confirm whether VCLK is on by reading CPG_CLKMON_CRU.CLK1_ON = 1.

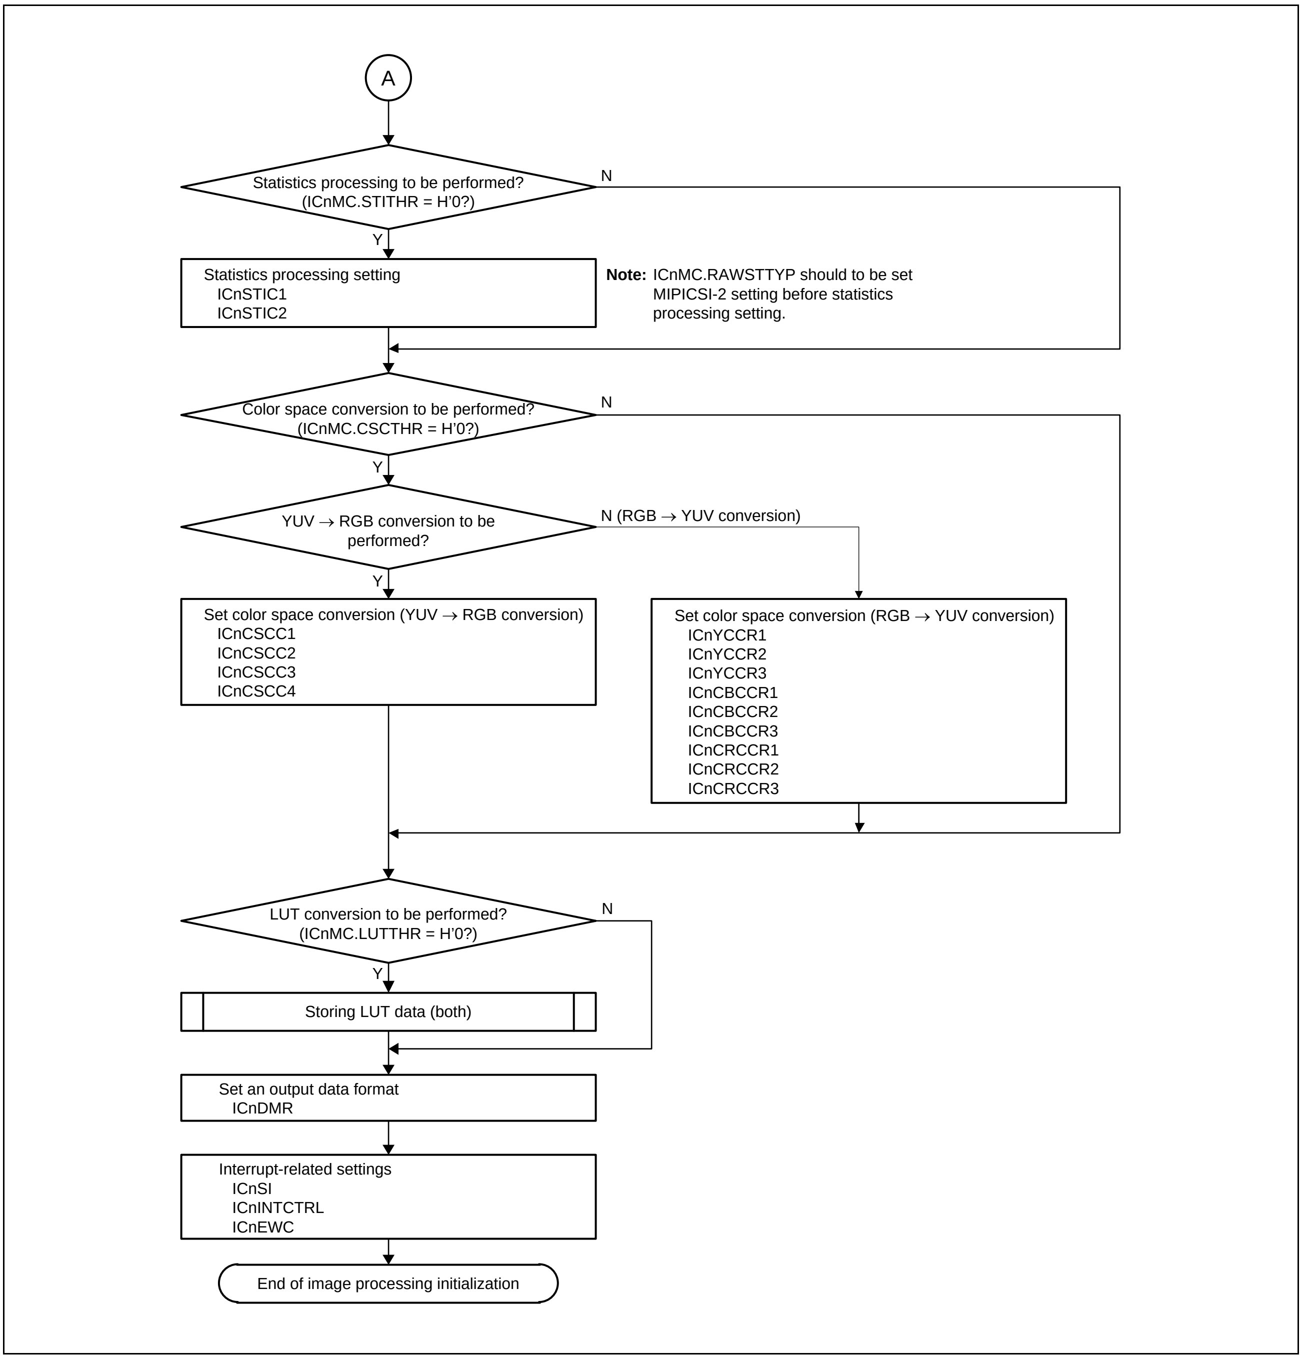

Figure 35.49 Initializing Image Processing (MIPI CSI-2 Input)

35.3.1.4 Storing LUT Data (Both)

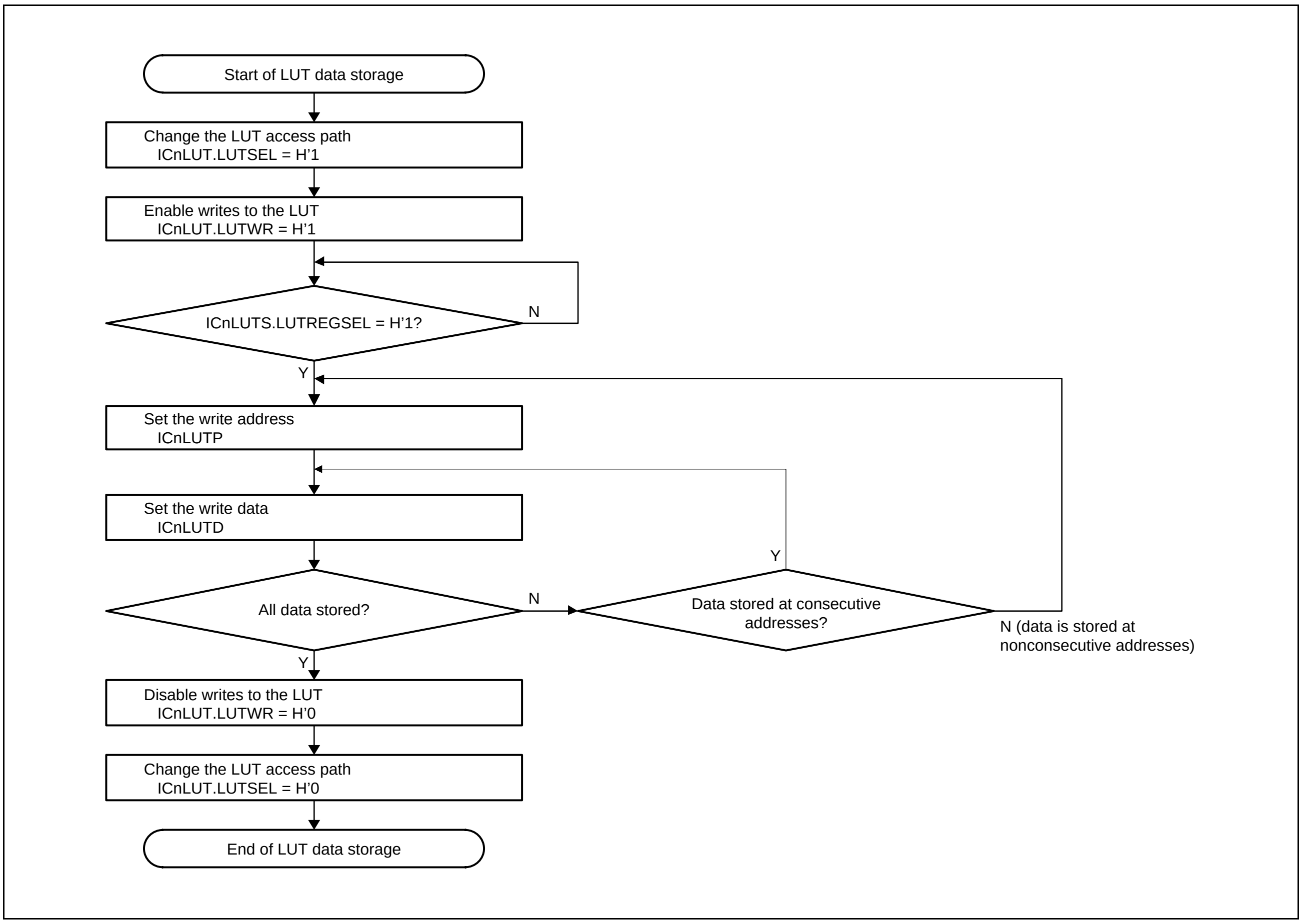

Figure 35.50 Storing LUT Data (Both)

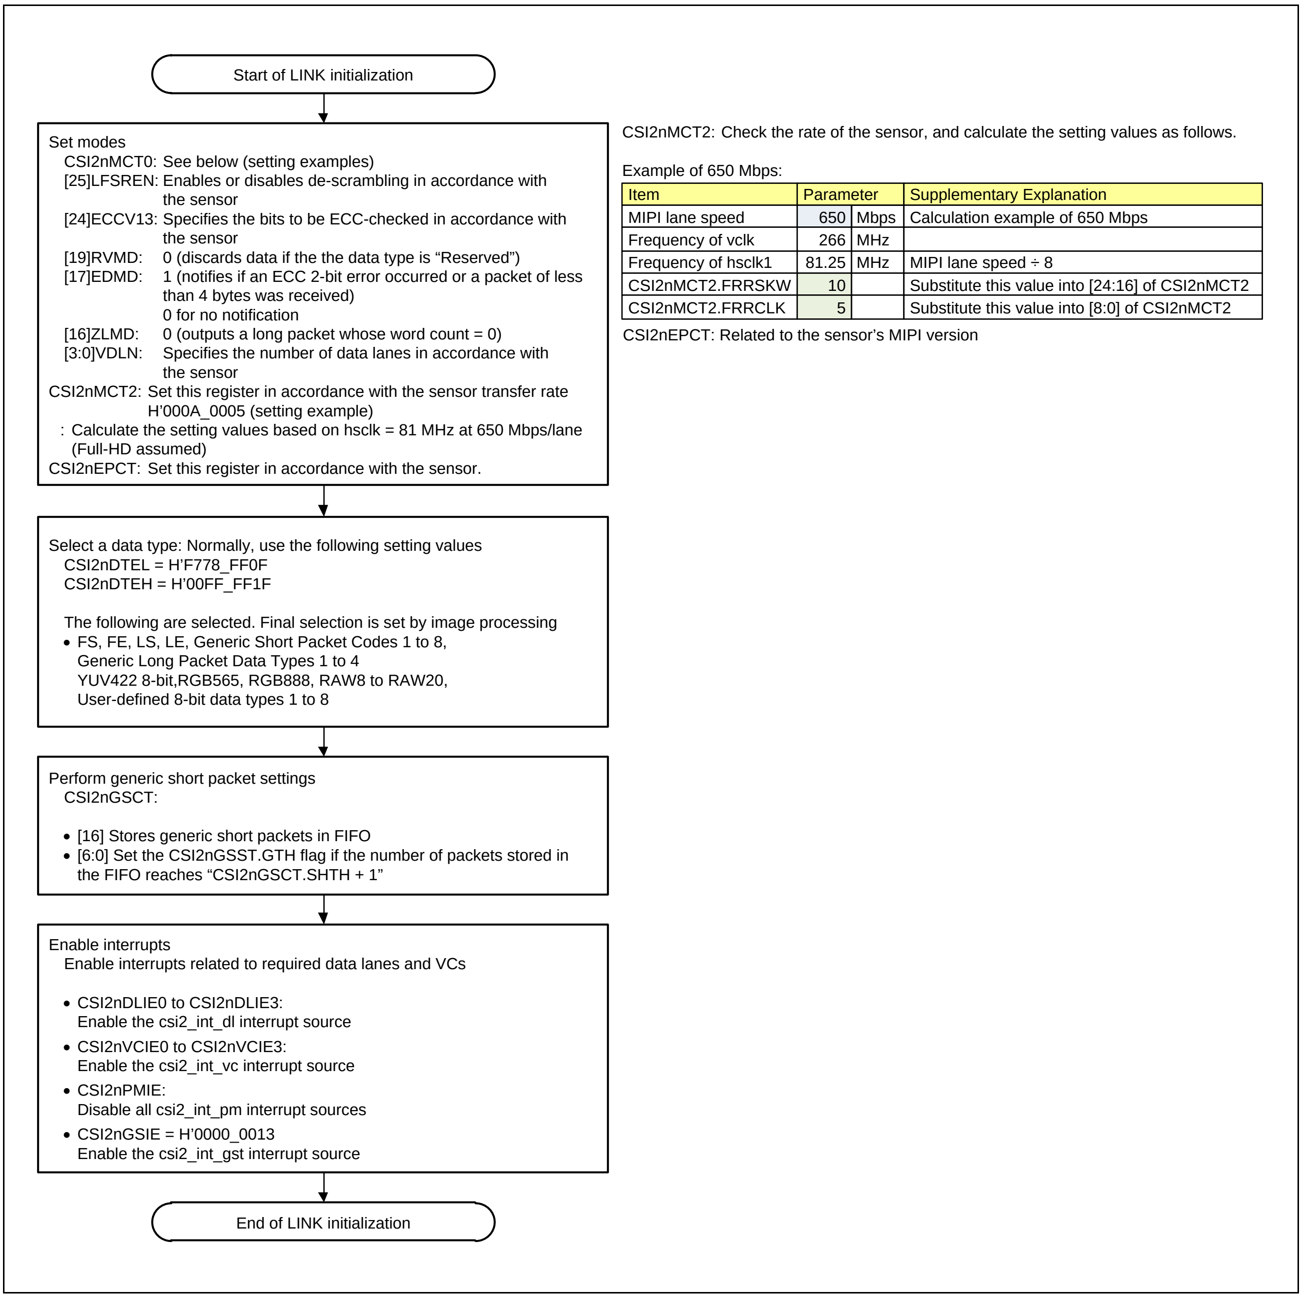
35.3.1.5 Initializing the LINK (MIPI CSI-2 Input)



Set modes
CSI2nMCT0: See below (setting examples)
[25]LFSREN: Enables or disables de-scrambling in accordance with the sensor
[24]ECCV13: Specifies the bits to be ECC-checked in accordance with the sensor
[19]RVMD: 0 (discards data if the the data type is “Reserved”)
[17]EDMD: 1 (notifies if an ECC 2-bit error occurred or a packet of less than 4 bytes was received)
0 for no notification
[16]ZLMD: 0 (outputs a long packet whose word count = 0)
[3:0]VDLN: Specifies the number of data lanes in accordance with the sensor
CSI2nMCT2: Set this register in accordance with the sensor transfer rate H’000A_0005 (setting example)
: Calculate the setting values based on hsclk = 81 MHz at 650 Mbps/lane (Full-HD assumed)
CSI2nEPCT: Set this register in accordance with the sensor.

CSI2nMCT2: Check the rate of the sensor, and calculate the setting values as follows.

Example of 650 Mbps:

Item	Parameter		Supplementary Explanation
MIPI lane speed	650	Mbps	Calculation example of 650 Mbps
Frequency of vclk	266	MHz	
Frequency of hsclk1	81.25	MHz	MIPI lane speed ÷ 8
CSI2nMCT2.FRRSKW	10		Substitute this value into [24:16] of CSI2nMCT2
CSI2nMCT2.FRRCLK	5		Substitute this value into [8:0] of CSI2nMCT2

CSI2nEPCT: Related to the sensor’s MIPI version

Select a data type: Normally, use the following setting values
CSI2nDTEL = H’F778_FF0F
CSI2nDTEH = H’00FF_FF1F

The following are selected. Final selection is set by image processing
- FS, FE, LS, LE, Generic Short Packet Codes 1 to 8, Generic Long Packet Data Types 1 to 4 YUV422 8-bit,RGB565, RGB888, RAW8 to RAW20, User-defined 8-bit data types 1 to 8

Perform generic short packet settings
CSI2nGSCT:

- [16] Stores generic short packets in FIFO
- [6:0] Set the CSI2nGSST.GTH flag if the number of packets stored in the FIFO reaches “CSI2nGSCT.SHTH + 1”

Enable interrupts
Enable interrupts related to required data lanes and VCs

- CSI2nDLIE0 to CSI2nDLIE3: Enable the csi2_int_dl interrupt source
- CSI2nVCIE0 to CSI2nVCIE3: Enable the csi2_int_vc interrupt source
- CSI2nPMIE: Disable all csi2_int_pm interrupt sources
- CSI2nGSIE = H’0000_0013 Enable the csi2_int_gst interrupt source

Figure 35.51 Initializing the LINK (MIPI CSI-2 Input)

35.3.2 Stopping Reception for the MIPI CSI-2 Input

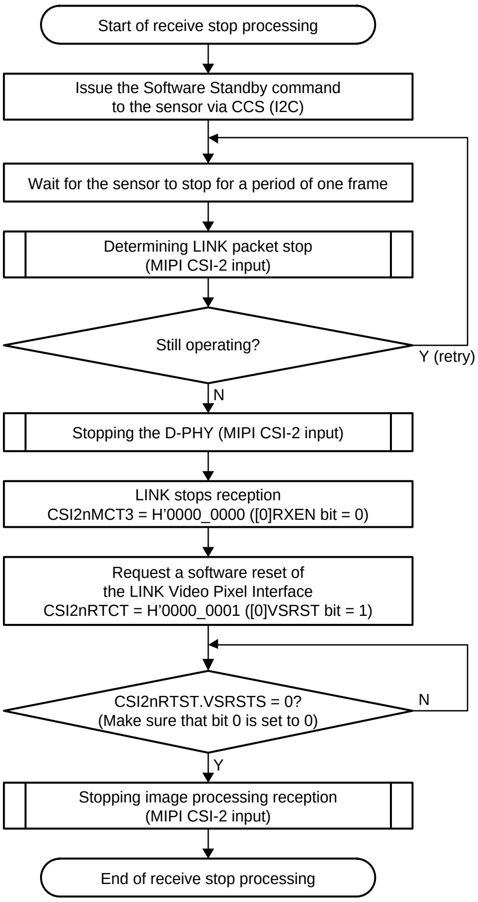


Figure 35.52 Reception Stop Flow for the MIPI CSI-2 Input

35.3.2.1 Determining LINK Packet Stop (MIPI CSI-2 Input)

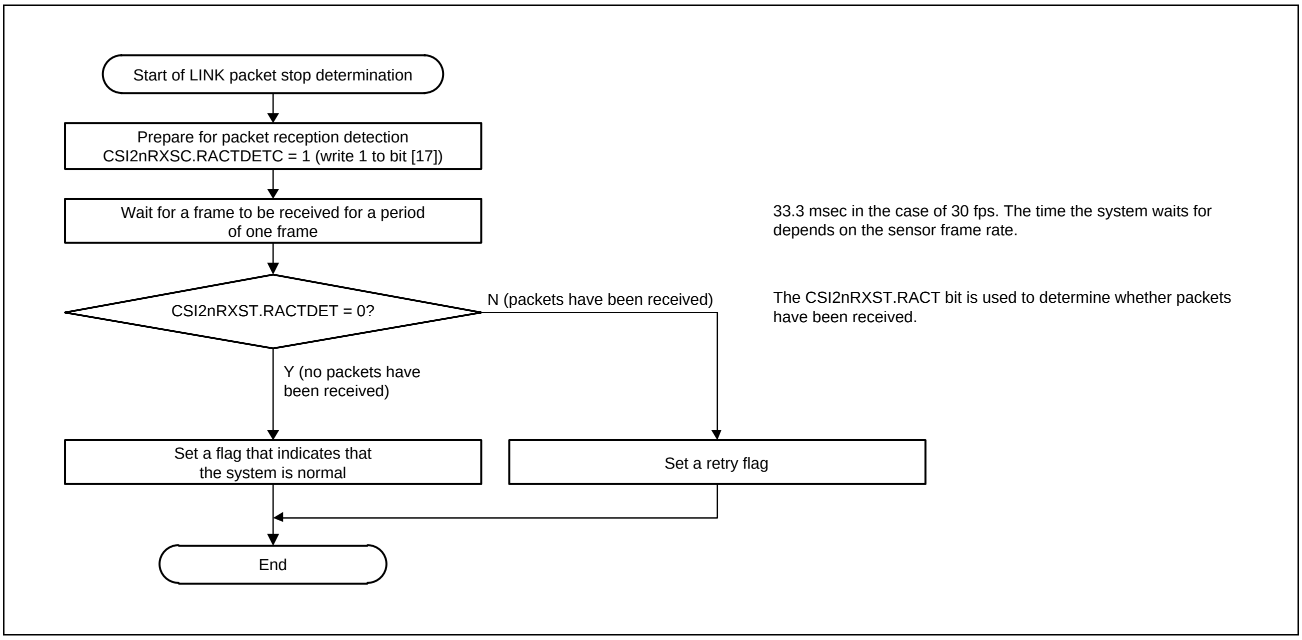

Figure 35.53 Determining LINK Packet Stop (MIPI CSI-2 Input)

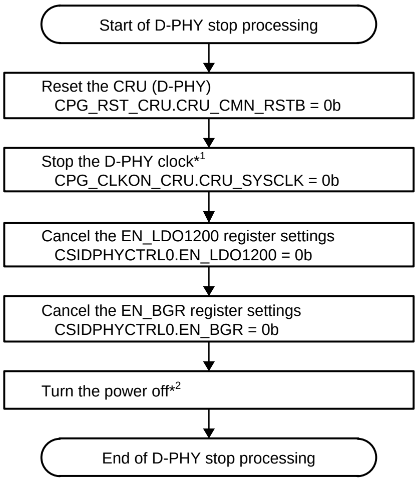
35.3.2.2 Stopping the D-PHY (MIPI CSI-2 Input)

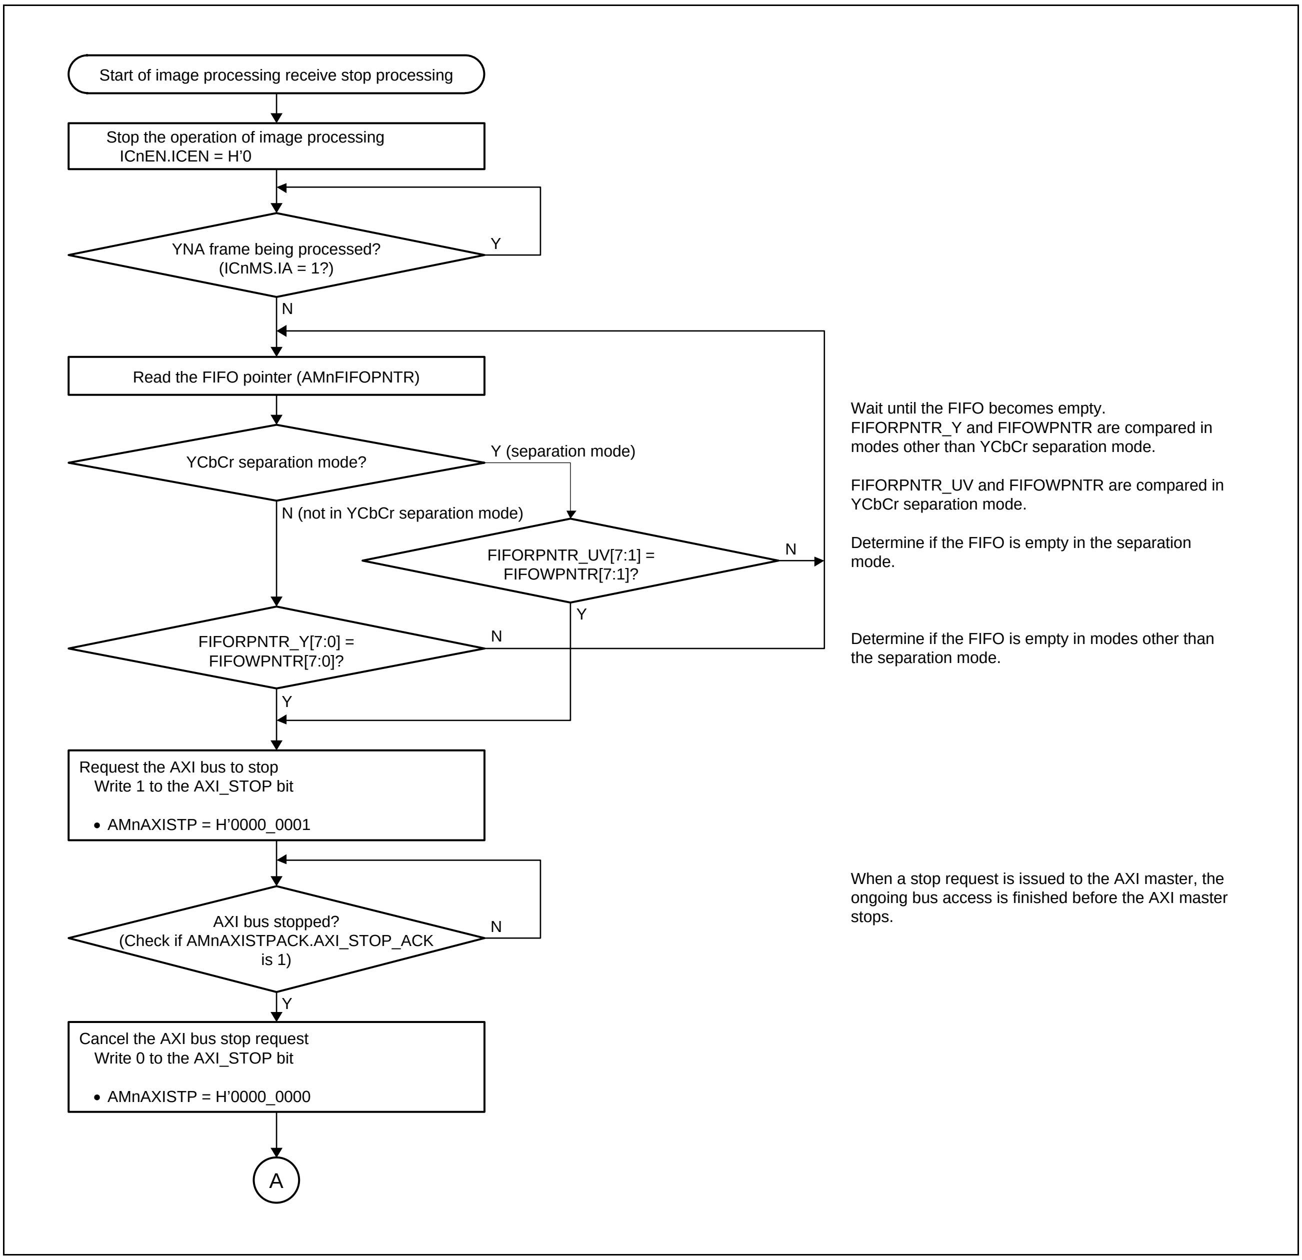


Note 1. This step can be skipped if D-PHY is to be restarted immediately.

Note 2. This step can be skipped if D-PHY is to be restarted immediately.

Figure 35.54 Stopping the D-PHY (MIPI CSI-2 Input)

35.3.2.3 Stopping Image Processing Reception (MIPI CSI-2 Input)



Wait until the FIFO becomes empty.
FIFORPNTR_Y and FIFOWPNTR are compared in modes other than YCbCr separation mode.

FIFORPNTR_UV and FIFOWPNTR are compared in YCbCr separation mode.

Determine if the FIFO is empty in the separation mode.

Determine if the FIFO is empty in modes other than the separation mode.

When a stop request is issued to the AXI master, the ongoing bus access is finished before the AXI master stops.

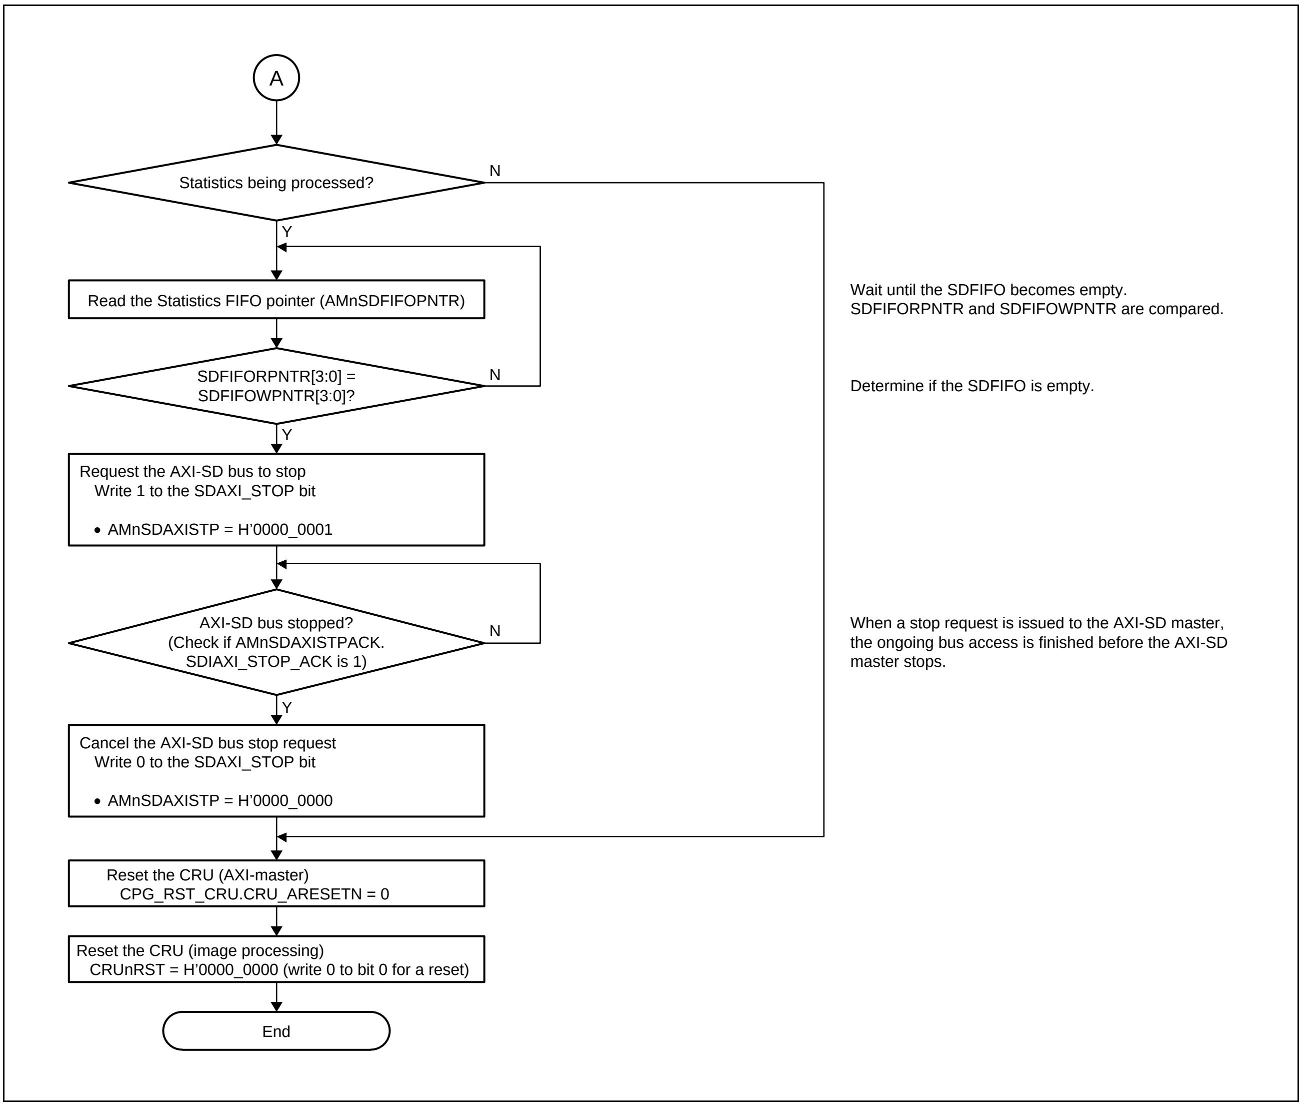


Figure 35.55 Stopping Image Processing Reception (MIPI CSI-2 Input)

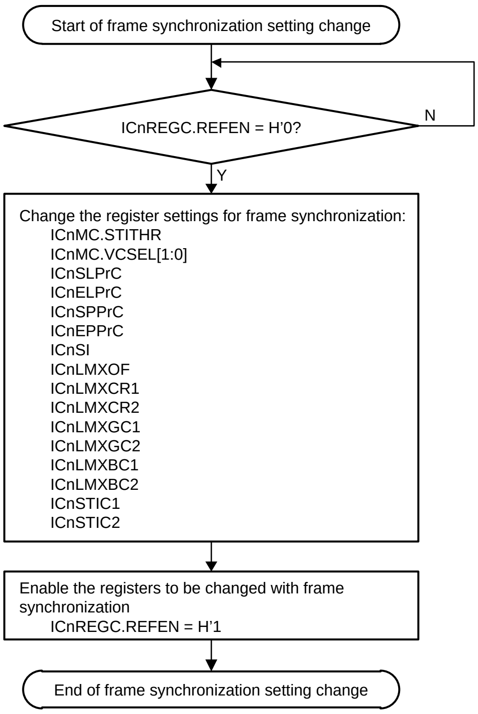
35.3.3 Frame Synchronization Settings

During the CRU is receiving data via the MIPI CSI-2 input, the following registers can only be changed with frame synchronization:

- ICnMC.STITHR
- ICnMC.VCSEL[1:0]
- ICnSLPrC, ICnSPPrC, ICnELPrC, ICnEPPrC
- ICnSI, ICnLMXOF
- ICnLMXRC1, ICnLMXRC2
- ICnLMXGC1, ICnLMXGC2
- ICnLMXBC1, ICnLMXBC2
- ICnSTIC1, ICnSTIC2

This section shows the flows for changing the frame synchronization settings both by setting registers from the CPU and by using the DMAC.

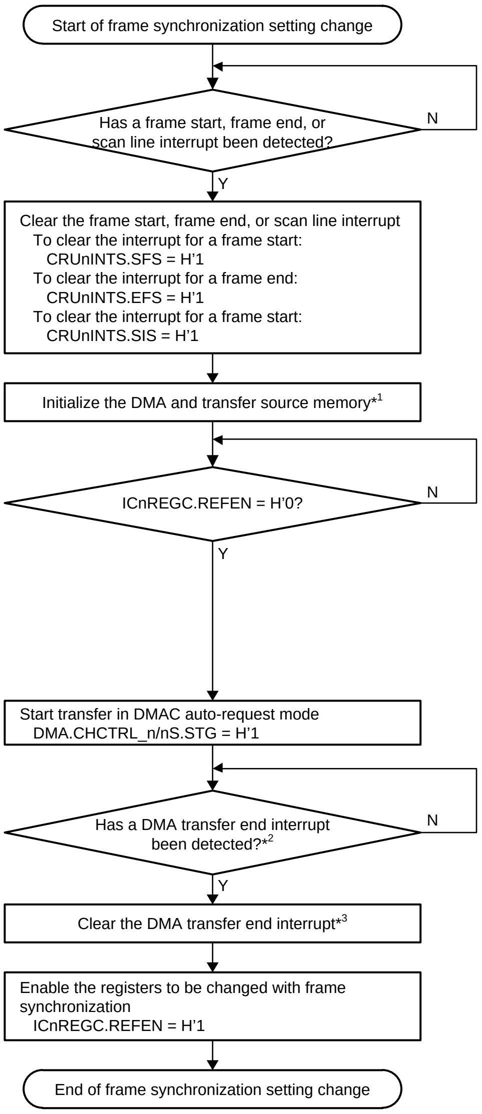
35.3.3.1 Changing Frame Synchronization Settings (by Setting Registers)



Note: This flow for changing the frame synchronization settings is only valid for the MIPI CSI-2 input. It cannot be used for the parallel input.

Figure 35.56 Flow for Changing the Frame Synchronization Settings (by Setting Registers)

35.3.3.2 Changing Frame Synchronization Settings (by Using the DMAC)



NOTES:

1. This flow for changing the frame synchronization settings is only valid for the MIPI CSI-2 input. It cannot be used for the parallel input.
2. In the initial settings when the CRU starts, interrupts for a frame start, frame end and scan line must be set.

   To set an interrupt for a frame start:
   CRUnIE.SFE = H'1

   To set an interrupt for a frame end:
   CRUnIE.EFE = H'1

   To set an interrupt for a frame start:
   CRUnIE.SIE = H'1

   In addition, CRU and DMA interrupts must be enabled by seeing the section about the interrupt controller.

Note 1. Perform initialization by seeing the section about DMA.

- Note that the following register settings are required:
  DMA.CHCFG_n/nS.DAD = H'0: Increment
  DMA.CHCFG_n/nS.SAD = H'0: Increment
  DMA.CHCFG_n/nS.DDS = H'3: 32 bits
- Set the DMA transfer size to 32 bits for both transfer destination and transfer source
- In transfer source memory initialization, store the values that set the following register: (Start address: Up to 64 bytes in ICnMC)
  ICnMC.STITHR, ICnMC.VCSEL[1:0],
  ICnSLPrC, ICnSPPrC, ICnELPrC, ICnEPPrC,
  ICnSI, ICnLMXOF,
  ICnLMXRC1, ICnLMXRC2, ICnLMXGC1, ICnLMXGC2,
  ICnLMXBC1, ICnLMXBC2,
  ICnSTIC1

Note 2. A setting is required in advance (see the sections about DMA and interrupt controller).

Note 3. Clear the interrupt by seeing the section about DMA and interrupt controller.

Figure 35.57 Flow for Changing the Frame Synchronization Settings (by Using the DMAC)

35.3.4 Starting Reception for the Parallel Input

35.3.4.1 Initializing the AXI Master (Parallel Input)

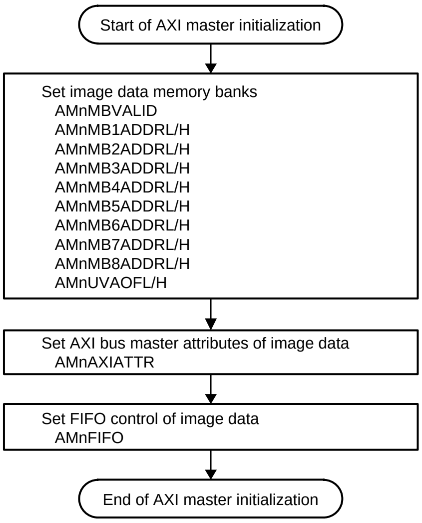

Figure 35.59 Initializing the AXI Master (Parallel Input)

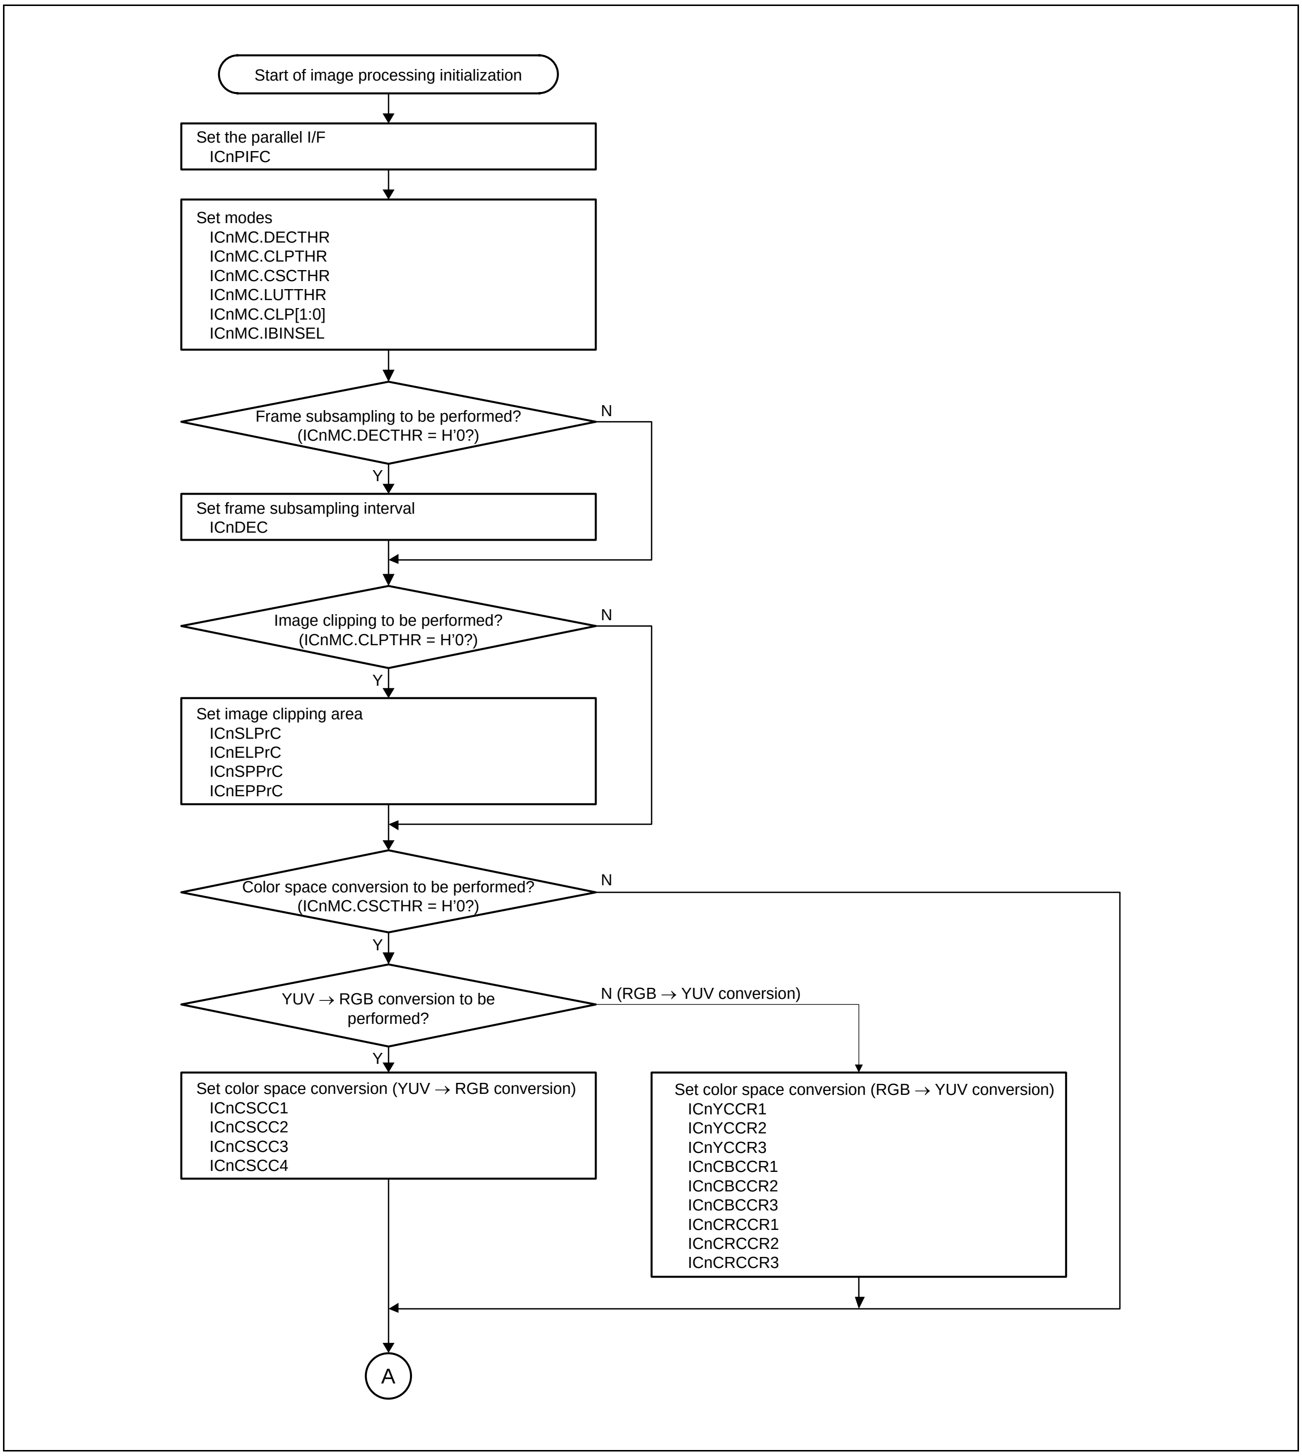
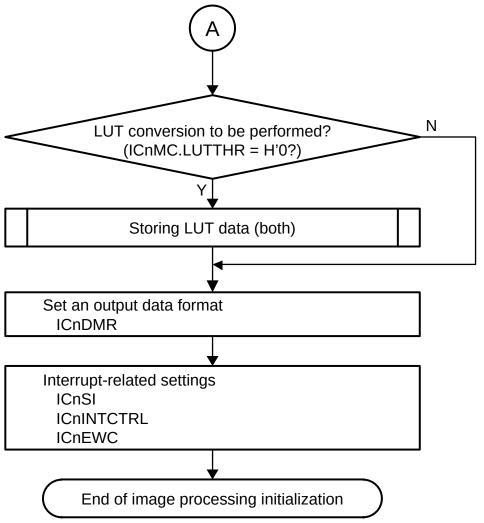
35.3.4.2 Initializing Image Processing (Parallel Input)





Note: When the same value previously specified is used, this flow can be skipped.

Figure 35.60 Initializing Image Processing (Parallel Input)

35.3.4.3 Storing LUT Data (Both)

See **Section 35.3.1.4, Storing LUT Data (Both)**.

35.3.5 Stopping Reception for the Parallel Input

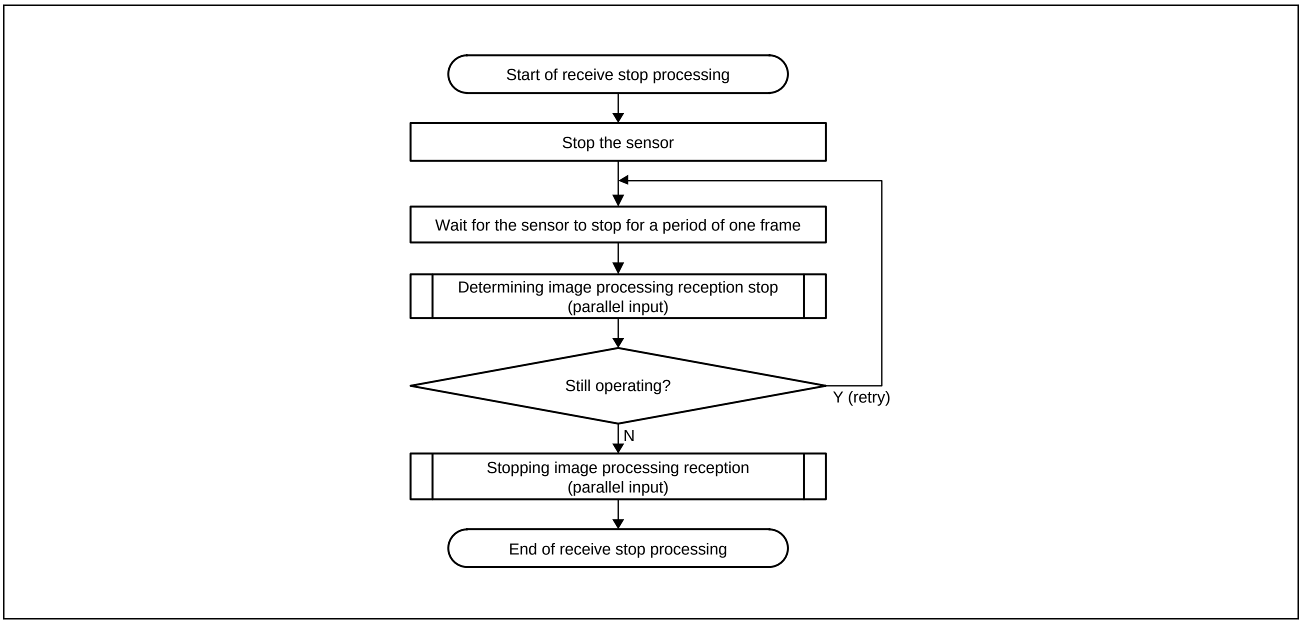


Figure 35.61 Reception Stop Flow for the Parallel Input

35.3.5.1 Determining Image Processing Reception Stop (Parallel Input)

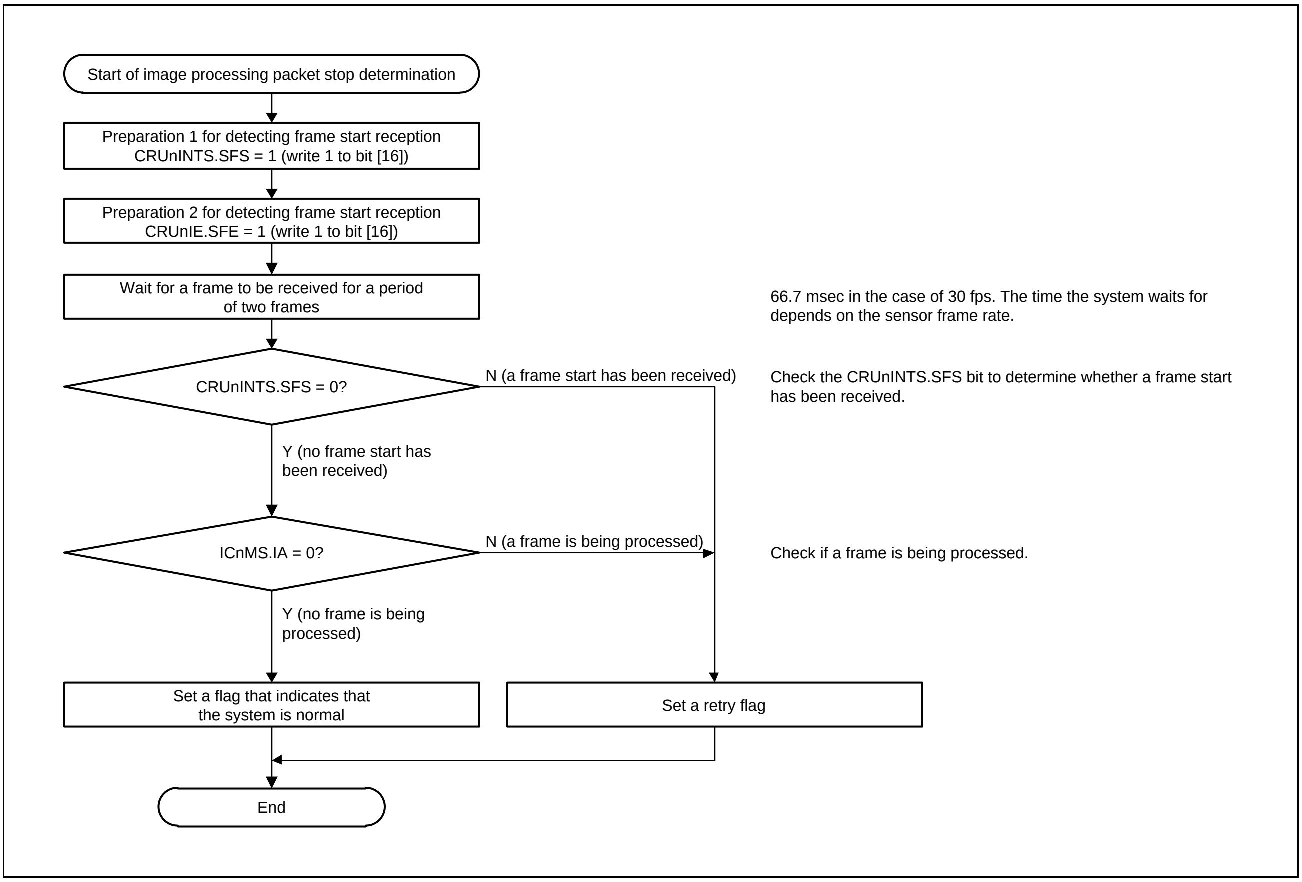

Figure 35.62 Determining Image Processing Reception Stop (Parallel Input)

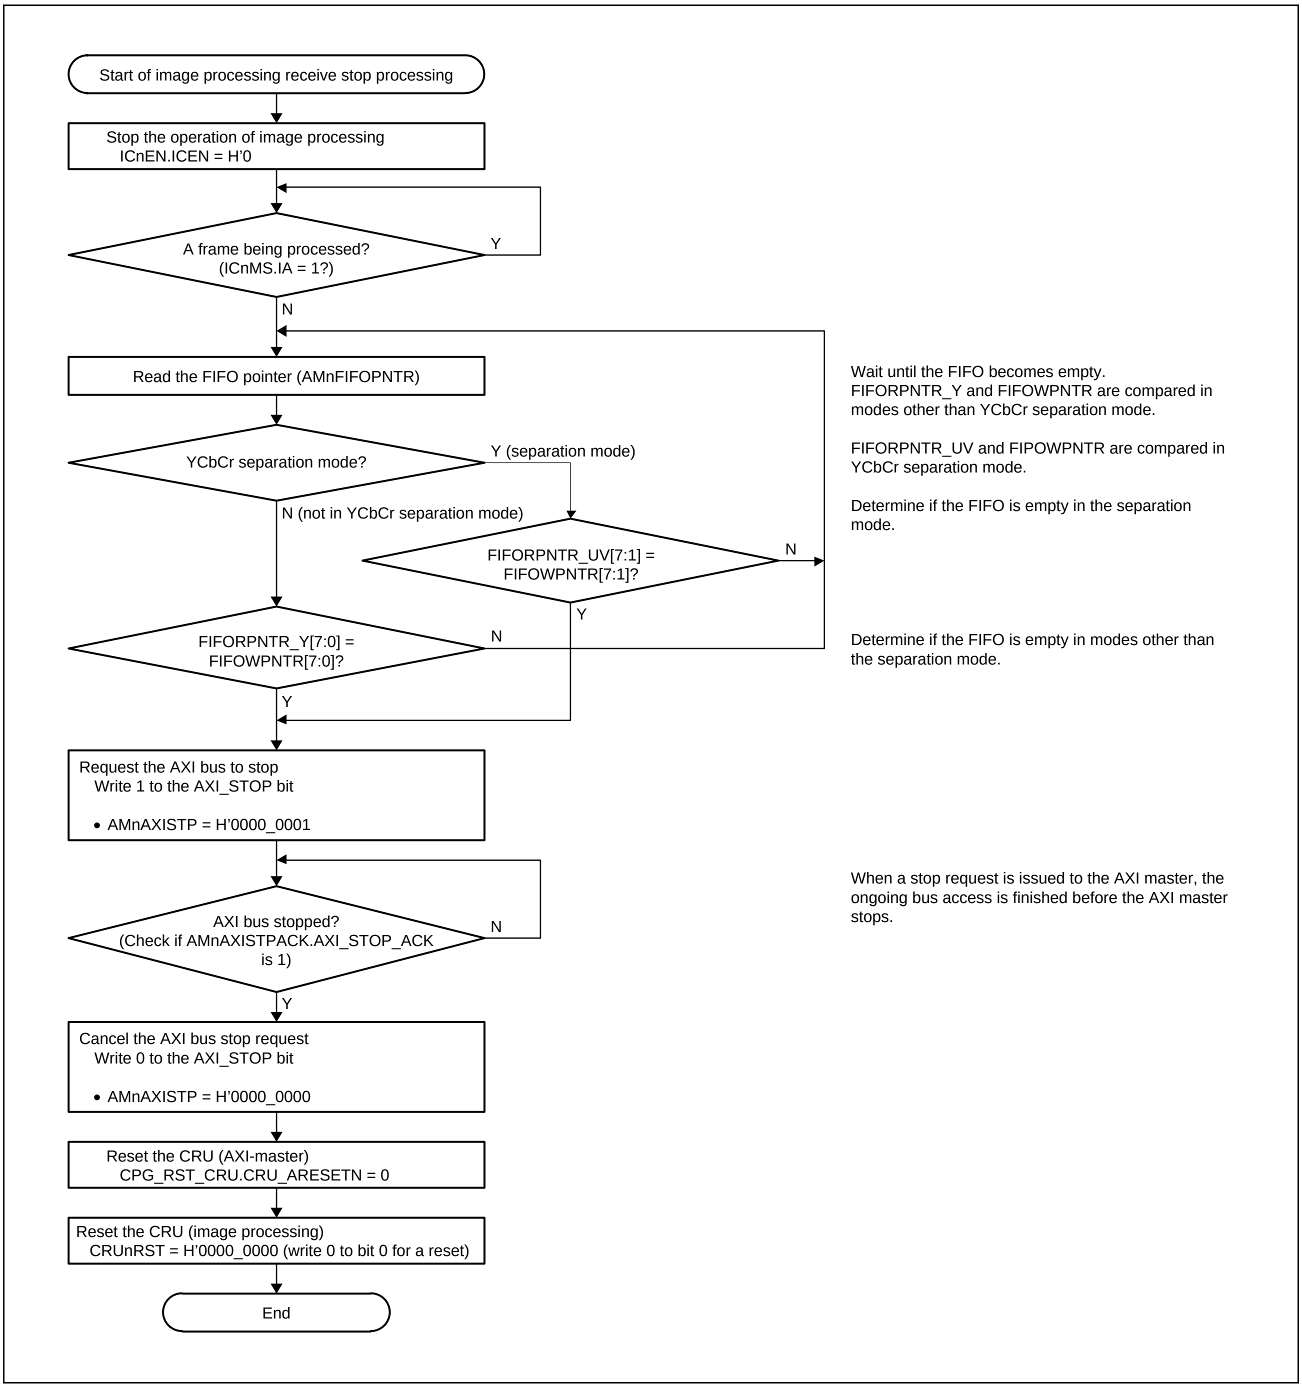
35.3.5.2 Stopping Image Processing Reception (Parallel Input)



Wait until the FIFO becomes empty.
FIFORPNTR_Y and FIFOWPNTR are compared in modes other than YCbCr separation mode.

FIFORPNTR_UV and FIPOWPNTR are compared in YCbCr separation mode.

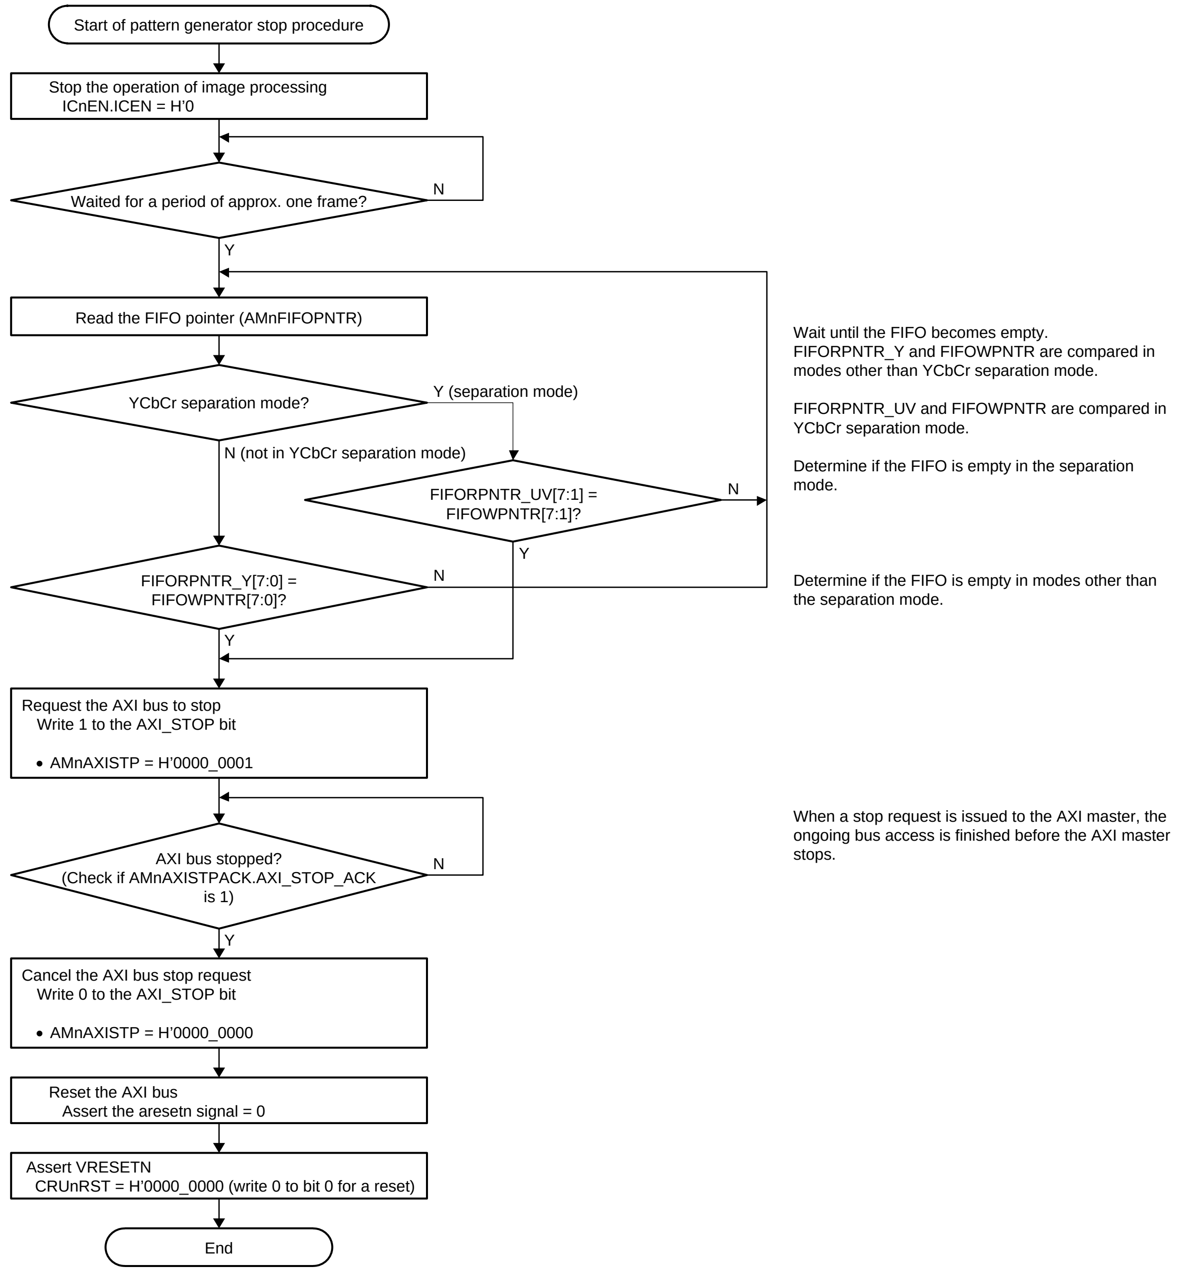
Determine if the FIFO is empty in the separation mode.

Determine if the FIFO is empty in modes other than the separation mode.

When a stop request is issued to the AXI master, the ongoing bus access is finished before the AXI master stops.

Figure 35.63 Stopping Image Processing Reception (Parallel Input)

35.3.6 Stopping the Pattern Generator



Wait until the FIFO becomes empty.
FIFORPNTR_Y and FIFOWPNTR are compared in modes other than YCbCr separation mode.

FIFORPNTR_UV and FIFOWPNTR are compared in YCbCr separation mode.

Determine if the FIFO is empty in the separation mode.

Determine if the FIFO is empty in modes other than the separation mode.

When a stop request is issued to the AXI master, the ongoing bus access is finished before the AXI master stops.

Note: The waiting time is determined by the pattern generator setting values.

Figure 35.64 Flow for Stopping the Pattern Generator

36. Image Scaling Unit (ISU)

The ISU is a module that reads out the image stored in the external DRAM, scale down image size, and outputs the reduced image into the DRAM. ISU also support a color format conversion and cropping image.

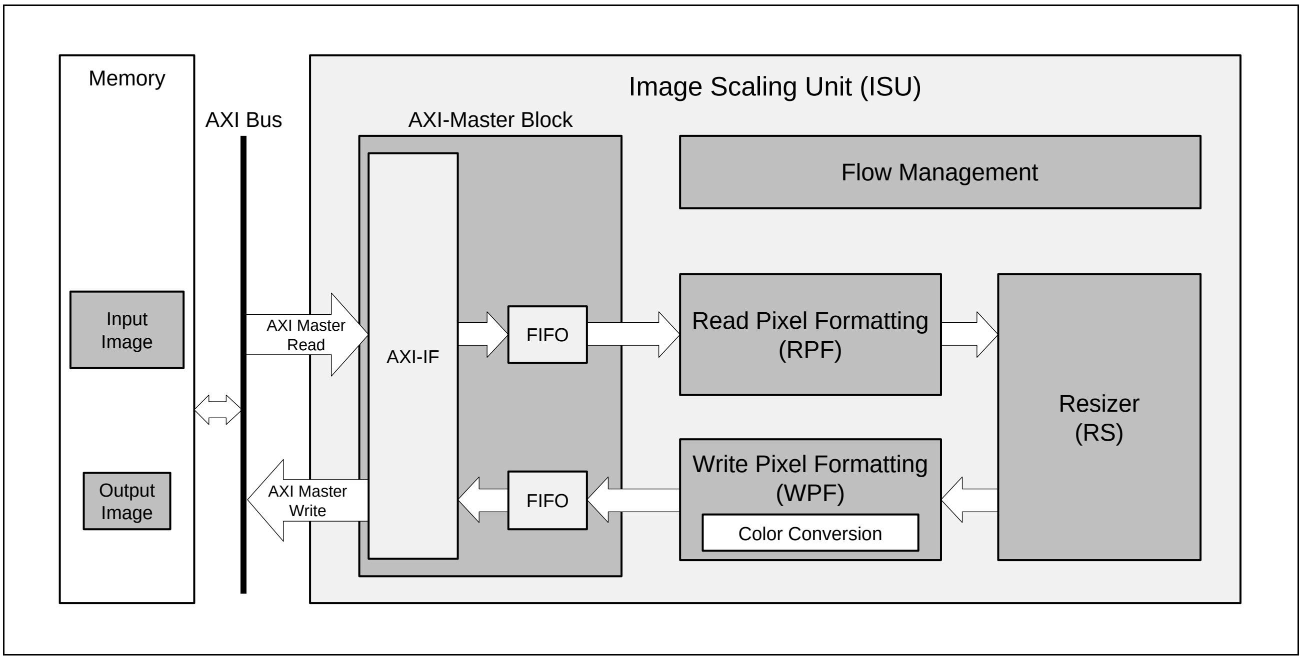


Figure 36.1 ISU Block Diagram

36.1 Features

The ISU functionality consists of “Resizer” and “Color Format Conversion”. “Color Format Conversion” can convert color space and color format (RGB/ARGB, YCbCr/YUV, RAW).

- Resizer
  - Scaling ratio: × 1/1 to 1/15 (Scale down)
  - Scaling algorithm: Bilinear
  - Horizontal and Vertical image scaling ratio are adjustable individually.
  - Cropping image

- Color Space and Color Format Conversion
  - Supported color format: RGB/ARGB, YCbCr/YUV, RAW(Grayscale)
    A(Alpha) of ARGB format is transparency. Zero is transparent (colorless).
  - Color space conversion by using 3 × 3 matrix which coefficients can be set arbitrary.
  - Convert color space and color format each other.
  - Endian Correction.

Table 36.1 Supported Image Format

Item	Description
Input	● Color Format – RGB/ARGB: 8 Formats RGB565, RGB888, BGR888, BGR666, ARGB8888, ARGB1555, RGBA8888, ABGR8888 – YCbCr/YUV: 4 Format YCbCr422 (Interleave) = UYVY YCbCr422 (Interleave) = YUY2 (YUYV) YCbCr422 (Semi-Planar) = NV16 YCbCr420 (Semi-Planar) = NV12 – RAW: 3 Format RAW8, RAW10, RAW12 (Grayscale)*[1] ● Maximum Size 2800 × 2047
Output	● Color Format – RGB/ARGB: 8 Format RGB565, RGB888, BGR888, BGR666, ARGB8888, ARGB1555, RGBA8888, ABGR8888 – YCbCr/YUV: 4 Format YCbCr422 (Interleave) = UYVY YCbCr422 (Interleave) = YUY2 (YUYV) YCbCr422 (Semi-Planar) = NV16 YCbCr420 (Semi-Planar) = NV12 – RAW: 3 Format RAW8, RAW10, RAW12 (Grayscale)*[1] ● Maximum Size 1920 × 1080

Note 1. RAW10 and RAW12 are rounded to 8-bit internally.

36.1.1 Flow Management (FM)

Controls the processing of the entire ISU. The frame processing is controlled by receiving the frame processing start instruction from the register. There are three types of frame processing:

1. Register Mode
2. Descriptor Mode (without automatic start of next frame)
3. Descriptor Mode (with automatic start of next frame)

36.1.1.1 Frame Processing Mode

There are the following three types of frame processing methods depending on the register settings.

- Register Setting Mode (1) is one-time processing operation according to register setting at once.
- Descriptor Mode without Auto-start (2) is also one-time processing operation according descriptor, not register setting. Descriptor Mode with Auto-start (3) automatically reads out the descriptor and continues its operation until all descriptors have been processed.

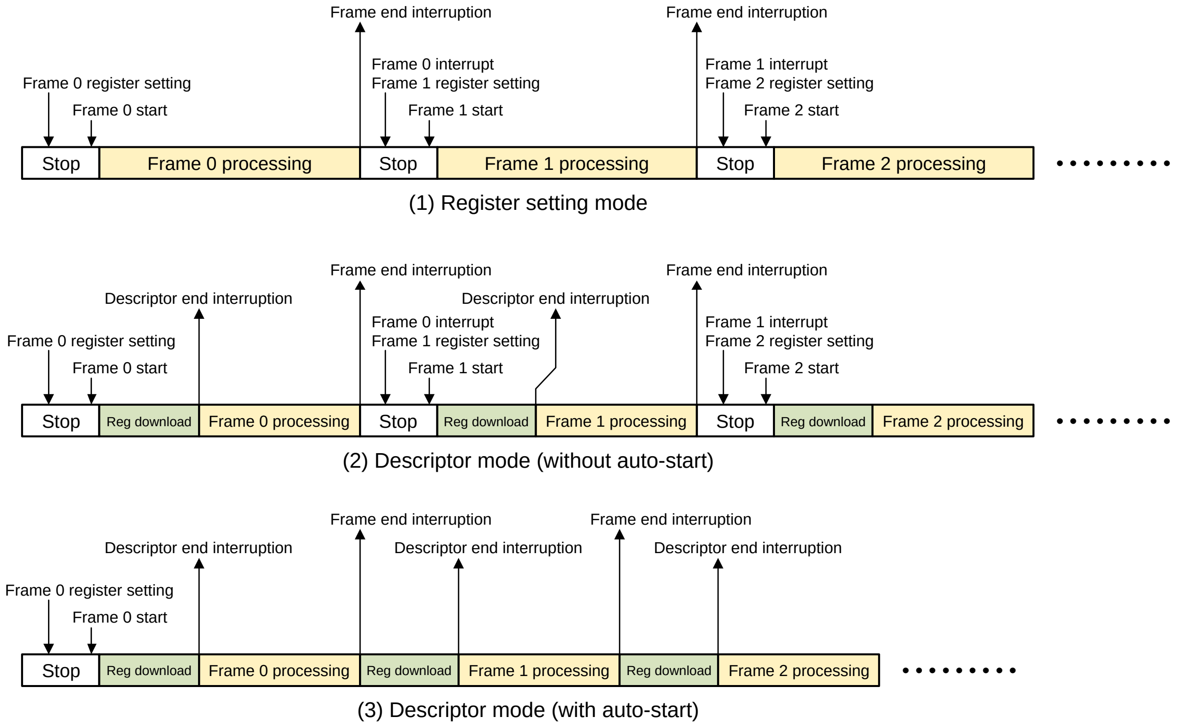

Figure 36.2 Frame Processing Mode

36.1.1.2 Descriptor

Descriptor Mode is the processing which reads out the descriptor format data stored in the memory and sets the registers automatically. It also includes the Auto-start setting for the next frame.

Flow Management (FM) read this descriptor setting data while not frame processing.

(1) Descriptor Format

The descriptor format is shown below.

Table 36.2 Descriptor Format

No.	Category	Item	Byte	Setting Range	Description
1	Header*1 *2	Descriptor Table Byte Count Setting	4 bytes	H’0000_0000 to H’0000_2000	Up to 8 Kbytes. The total number of bytes of register address and register setting data.
2	Register Setting Main body*3 *4 *5	Register Address 1	4 bytes	H’0000_0100 to H’0000_01F0	1st Register Setting Address
		Register Setting Data 1	4 bytes	H’0000_0000 to H’FFFF_FFFF	1st Register Setting Data
		Register Address 2	4 bytes	H’0000_0100 to H’0000_01F0	2nd Register Setting Address
		Register Setting Data 2	4 bytes	H’0000_0000 to H’FFFF_FFFF	2nd Register Setting Data
		Register Address 3	4 bytes	H’0000_0100 to H’0000_01F0	3rd Register Setting Address
		Register Setting Data 3	4 bytes	H’0000_0000 to H’FFFF_FFFF	3rd Register Setting Data
		Register Address 4	4 bytes	H’0000_0100 to H’0000_01F0	4th Register Setting Address
		Register Setting Data 4	4 bytes	H’0000_0000 to H’FFFF_FFFF	4th Register Setting Data
		•	•	•	•
		•	•	•	•
		•	•	•	•
3	Footer*2	Next Descriptor Table Address	8 bytes	H’0000_0000_0000_0000 to H’0000_0002_3FFF_FFFF	The next address is a multiple of 32 bytes. The setting range will be changed according to the product specifications.
		Control identifier register	4 bytes	H’0000_0000 to H’0000_0003	b31 to 2: All-0
					b1: Select bit to generate a frame end interruption. 0: Does not generate a Frame end interruption. 1: Generate a Frame end interruption.
					b0: Select bit for auto-start of next frame or end at this frame. 0: Disable next frame auto-start. (Exit without next frame operation.) 1: Enable next frame auto-start.

Note 1. The location of the Descriptor List is a 32-byte boundary. (Address that is a multiple of 32-byte) 0,32,64 ...

Note 2. The number of bytes is fixed for the header and footer. The register body is 8 bytes per set (address 4 bytes, data 4 bytes)

Note 3. The registers that can be set in the descriptor are limited to the Common register.

Note 4. Operation when the same register address is described in multiple addresses is not guaranteed.

Note 5. Specify in the offset address to be added to the Base Address(H’1084_0000). Specifically, the lower 10 bits [9: 0] should be the address of the register map, and the upper 22 bits [31:10] should be the address of All ‘0’. If the upper 22 bits are other than All ‘0’, it will be out of the register area and a list error will occur.

(2) Descriptor Error

An error flag is issued in the following cases.

(a) When the number of bytes in the header exceeds the limit, or when the value is not in units of 8 bytes

An error interrupt is generated, and subsequent frame processing is not executed.

Normal operation and recovery are not guaranteed unless the system is reset.

(b) When the register address is outside the specified address

A decoding error will occur if decoding is performed for items outside the register area.

Ignore the write to the register where the error occurred and continue the process itself.

36.1.2 AXI-Master

In response to a descriptor read request or input image read request from Flow Management (FM), the descriptor or input image is read from the DRAM. It also writes a reduced image to DRAM in response to a reduced image write request from WPF.

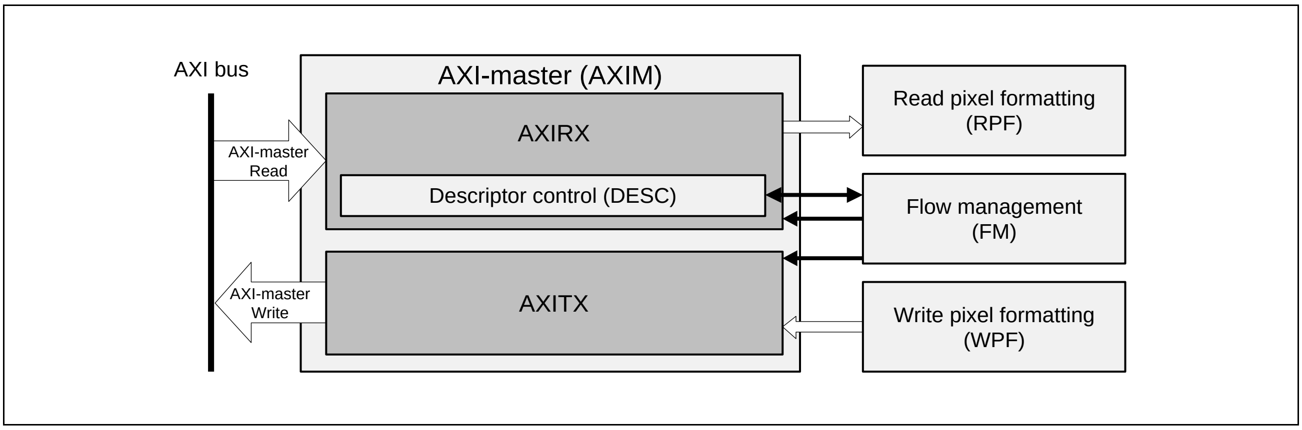

Figure 36.3 AXI-Master Block Diagram

36.1.2.1 Read Input Image (AXIRX)

In response to the descriptor read request from FM or the frame transfer start request, the descriptor or input image data is read from DRAM by AXI.

(1) Image Input Format

AXIRX support to read following formats from memory.

Table 36.3 Input Image Format

Read Method	Image Format	Variation
Interleave (Plane Number = 1)	ARGB (8 Types)	● The order of colors is different / the number of color bits is different. ● There may or may not be A.
	YCbCr422 8-bit (2 Types)	The two types differ only in the order of the colors of Cb and Cr.
	RAW (3 Types)	Grayscale 8-/10-/12-bit.
Semi-Planner (Plane Number = 2)	YCbCr422 8-bit (1 Types)	
	YCbCr420 8-bit (1 Types)	

- Interleave

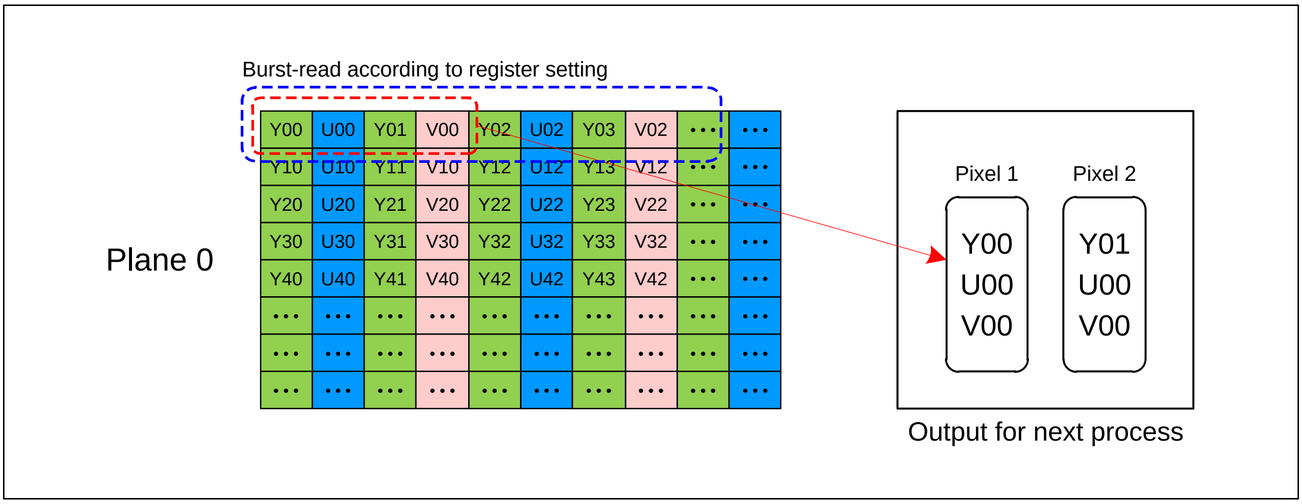

Figure 36.4 Example of Interleave Format for YCbCr422 (YUV422)

- Semi-planar

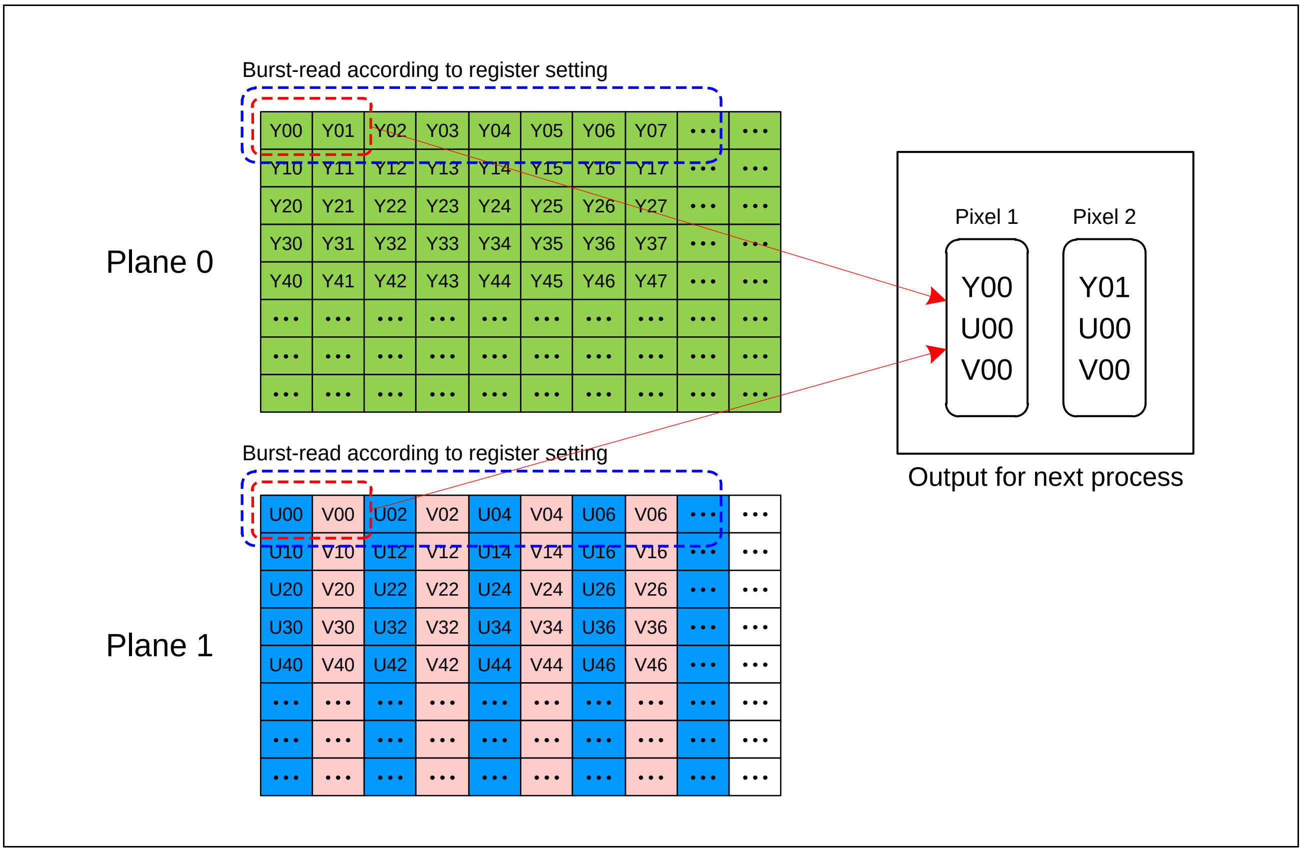

Figure 36.5 Example of Semi-planar Format for YCbCr422 (YUV422)

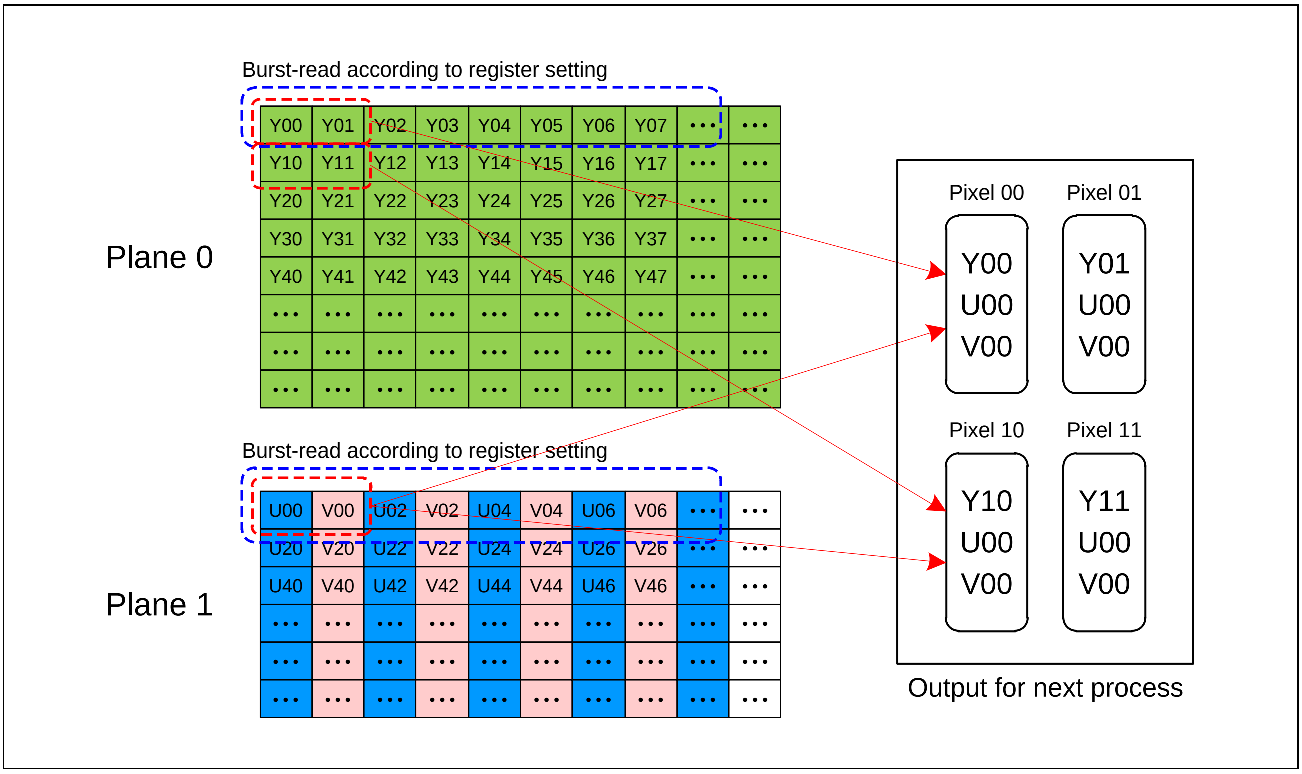

Figure 36.6 Example of Semi-planar format for YCbCr420 (YUV420)

(2) Input Setting

Data is read from each plane according to following register setting. Registers are required to set for each plane (Max 2 Plane).

Table 36.4 Input Image Setting

No.	Category	Register	Variation
(1)	Start Address	ISU_RPF_SRC_ADDH_PL0.SADD_PL0[1:0] ISU_RPF_SRC_ADDL_PL0.SADD_PL0[31:0]	● Start address for Plane0 of input image.
		ISU_RPF_SRC_ADDH_PL0.SADD_PL1[1:0] ISU_RPF_SRC_ADDL_PL0.SADD_PL1[31:0]	● Start address for Plane1 of input image.
(2)	Image Stride	ISU_RPF_SRC_STRD.SSTRPL0[15:0]	● Image stride of Plane0 [Byte]
		ISU_RPF_SRC_STRD.SSTRPL1[15:0]	● Image stride of Plane1 [Byte]
(3)	Input Area	ISU_RPF_SRC_SIZE.S_HSIZE[11:0]	● Horizontal size of processing area [Pixel] ● Max 2800 pixels
(4)		ISU_RPF_SRC_SIZE.S_VSIZE[10:0]	● Vertical size of processing area [Pixel] ● Max 2047 pixels

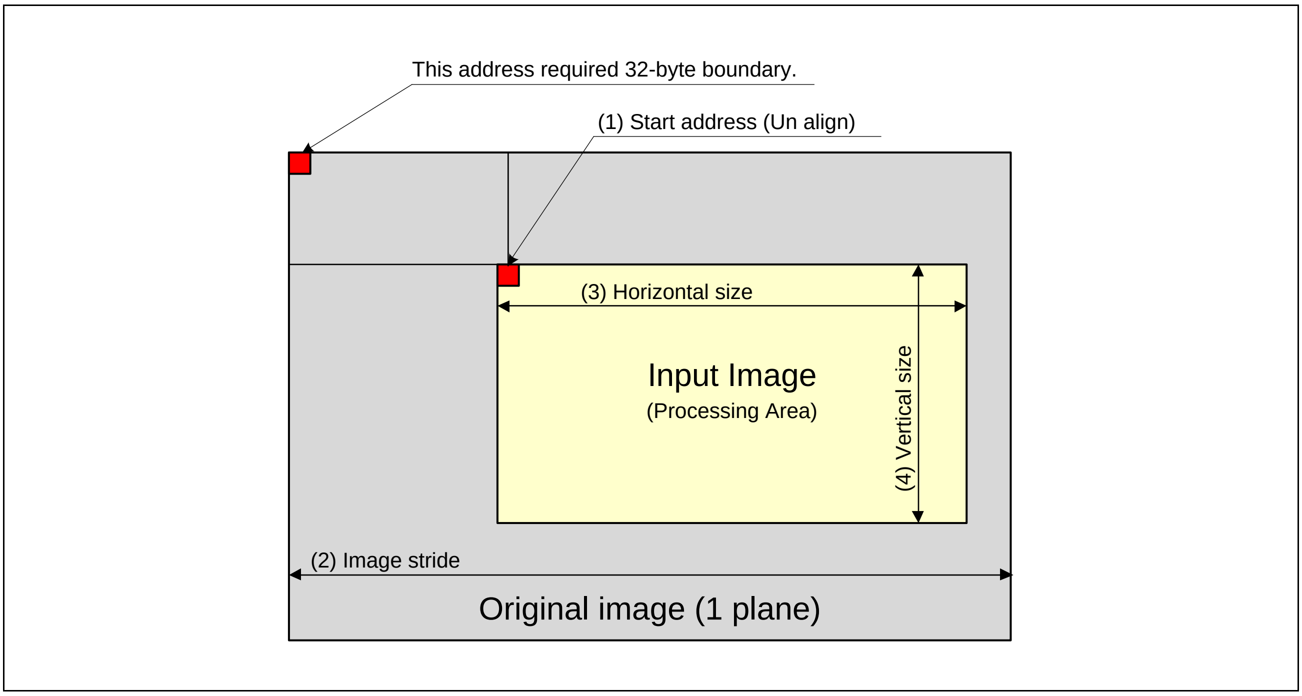

Figure 36.7 Input Area (Processing Area) Setting

(3) Write Output Image (AXITX)

This function write the resized (reduced) image data to DRAM.

(4) Support Format

AXITX support same format as AXIRX.

(5) Output Setting

Data is written out for each plane according to following setting. Registers are required to set for each plane (Max plane number is 2).

Table 36.5 Output Image Setting

No.	Category	Register	Variation
(1)	Start Address	ISU_WPF_DST_ADDH_PL0.DADD_PL0[1:0] ISU_WPF_DST_ADDL_PL0.DADD_PL0[31:0]	• Start address of Plane0 for output image.
		ISU_WPF_DST_ADDH_PL1.DADD_PL1[1:0] ISU_WPF_DST_ADDL_PL1.DADD_PL1[31:0]	• Start address of Plane1 for output image.
(2)	Image Stride	ISU_WPF_DST_STRD.DSTRPL0[15:0]	• Image stride of Plane0 [Byte]
		ISU_WPF_DST_STRD.DSTRPL1[15:0]	• Image stride of Plane1 [Byte]
(3)	Processing Area	ISU_RS_OS_CROP.O_HSIZE[10:0]	• Horizontal crop size [Pixel] • Max 1920 pixels
(4)		ISU_RS_OS_CROP.O_VSIZE[10:0]	• Vertical crop size [Pixel] • Max 1080 pixels

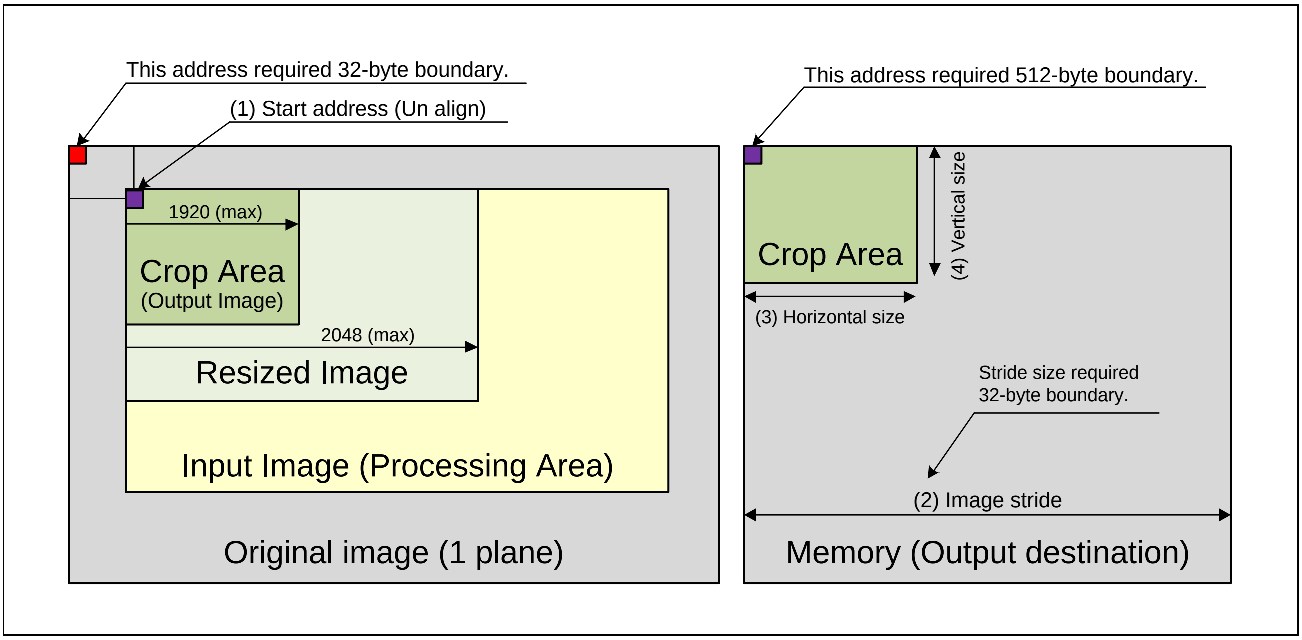

Figure 36.8 Output Setting

36.1.3 Read Pixel Formatting (RPF)

This function converts the input image data from AXI-Master and outputs it to the resizer. There are four types of conversion: Data swap, Data extraction, Offset binary conversion (YCbCr only), and pixel normalization. RPF also includes a test pattern generation function.

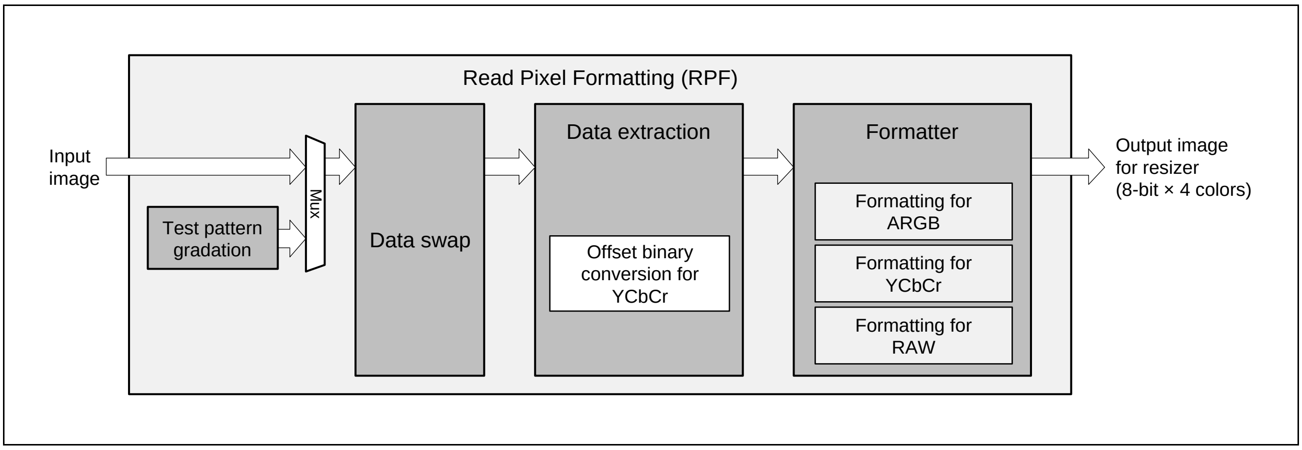

Figure 36.9 RPF Block Diagram

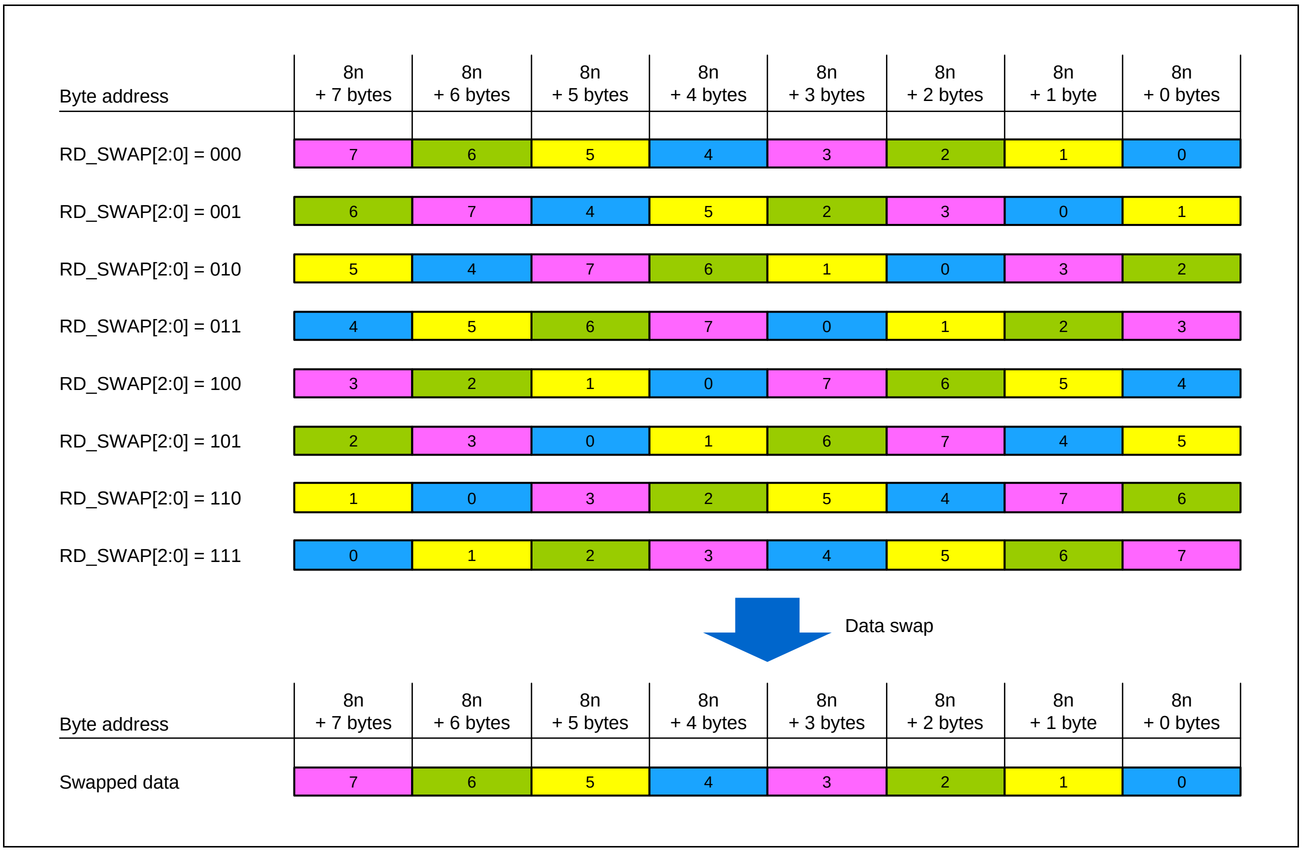
36.1.3.1 Data Swap (Endian Correction)

This function corrects byte order so that image data can be handled by ISU. Each bytes can be arranged any order according the register setting of ISU_RPF_SRC_DSWAP.RD_SWAP[2:0].



Byte address	8n + 7 bytes	8n + 6 bytes	8n + 5 bytes	8n + 4 bytes	8n + 3 bytes	8n + 2 bytes	8n + 1 byte	8n + 0 bytes
RD_SWAP[2:0] = 000	7	6	5	4	3	2	1	0
RD_SWAP[2:0] = 001	6	7	4	5	2	3	0	1
RD_SWAP[2:0] = 010	5	4	7	6	1	0	3	2
RD_SWAP[2:0] = 011	4	5	6	7	0	1	2	3

36.1.3.2 Formatter

8-bit normalization is required for ARGB/RGB and RAW formats since Resizer can handle 8-bit format only.

On the other hand, although YCbCr/YUV does not need 8-bit normalization since its components are already 8-bit, it is necessary to exchange into YCbCr/YUV444 format.

■ RGB/ARGB

This function support 8 ARGB/RGB formats as bellow. All formats are “Number of planes = 1”.

Table 36.6 ARGB Support Format

	Format				n								n + 1								n + 2								n + 3							
RDFMT [5:0]	Color Format	Padding	bit/pixel	phase	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0

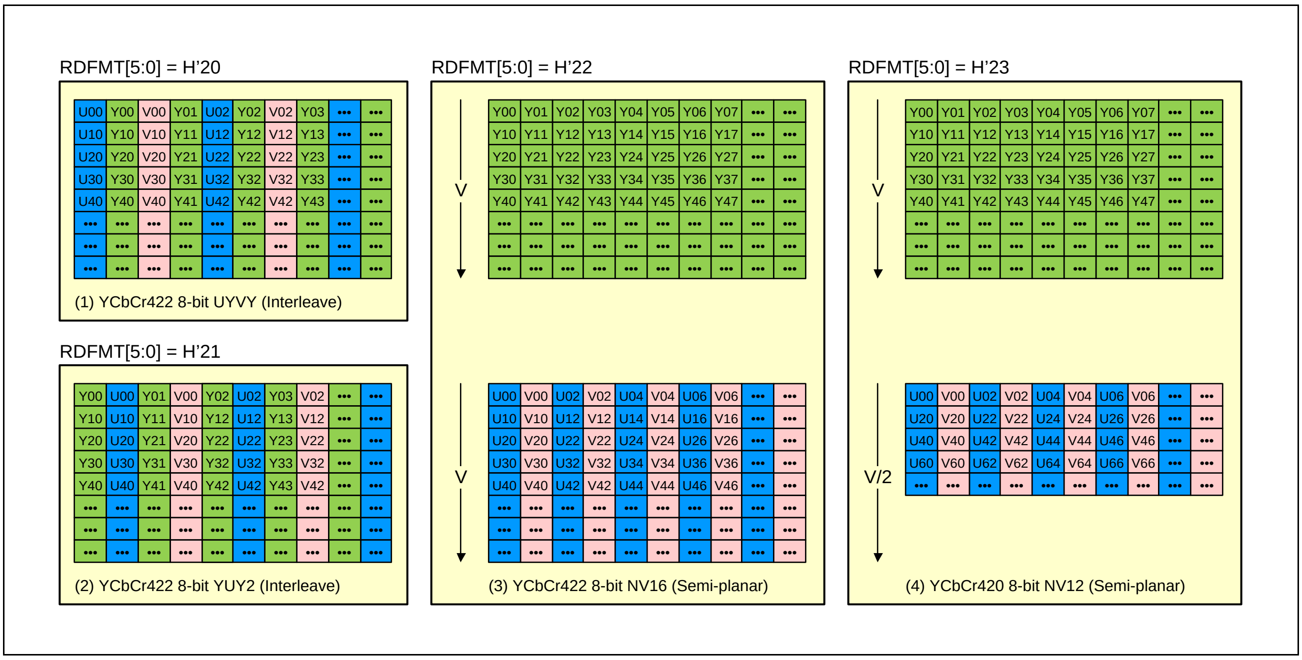
■ YCbCr/YUV

This function support 4 YCrCb/YUV formats as bellow.

Table 36.7 YCbCr/YUV Support Format

Data Format	RDFMT[5:0]	Color Format	Alias	Figure Index
Interleave (Number of Planes = 1)	H’20	YCbCr422 8-bit	UYVY	
	H’21	YCbCr422 8-bit	YUY2	
Semi-Planar (Number of Planes = 2)	H’22	YCbCr422 8-bit	NV16	
	H’23	YCbCr420 8-bit	NV12	



(1) YCbCr422 8-bit UYVY (Interleave)

(2) YCbCr422 8-bit YUY2 (Interleave)

(3) YCbCr422 8-bit NV16 (Semi-planar)

(4) YCbCr420 8-bit NV12 (Semi-planar)

Figure 36.11 YCbCr/YUV Support Format

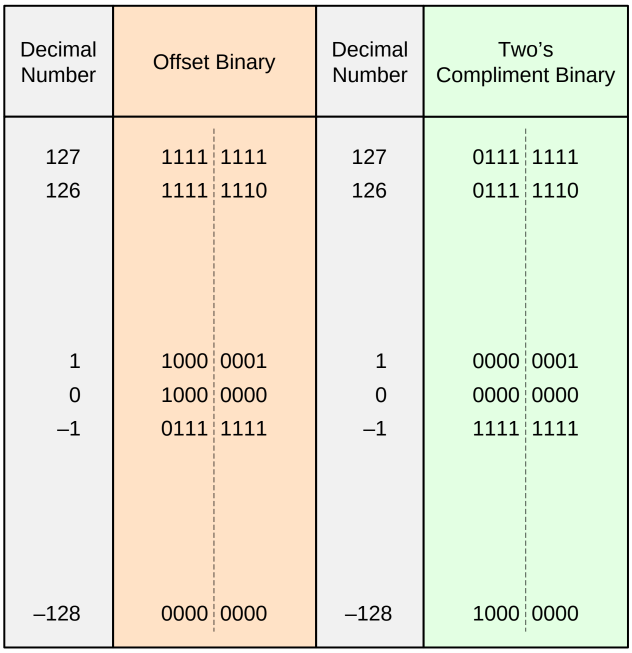
ISU can handle only Offset Binary as the chroma data format (CbCr/UV). Therefore, it is necessary to convert from Two’s Complement Binary to Offset Binary.

■ ISU_RPF_UVBIN.UVCHG = 0 (Default)

ISU uses original data on DRAM as chroma value when RDFMT = H’20 to H’23.
(CrCb/UV is Offset Binary.)

■ ISU_RPF_UVBIN.UVCHG = 1

ISU convert chroma data (CrCb/UV) from Two’s Complement Binary to Offset Binary.



Decimal Number	Offset Binary	Decimal Number	Two’s Compliment Binary
127	1111 1111	127	0111 1111
126	1111 1110	126	0111 1110
1	1000 0001	1	0000 0001
0	1000 0000	0	0000 0000
–1	0111 1111	–1	1111 1111
–128	0000 0000	–128	1000 0000

Figure 36.12 Types of Binary Expression

■ RAW

This function support 3 RAW formats as bellow. All formats are “Number of planes = 1”.

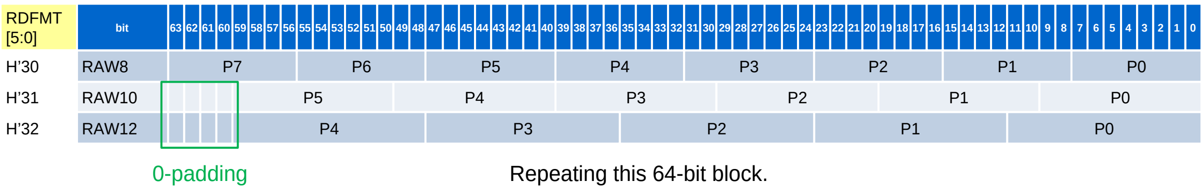


Figure 36.13 RAW Support Format

36.1.3.3 Data Extraction

These functions extract each color components (ex. R, G, B) and normalized as 8-bit for each so that image data can be handled by Resizer. Appropriate processing is performed for each input color format (RGB/ARGB, YCbCr/YUV, RAW) by setting of ISU_RPF_FMT.RDFMT[5:0].

■ RGB/ARGB

For RGB/ARGB format normalization, upper bits are copied to lower bits.

Figure 36.15 8-bit Normalization for ARGB Format

■ YCbCr/YUV

For YCbCr/YUV420 Semi-Planar format, even line re-use previous odd line’s chroma information.

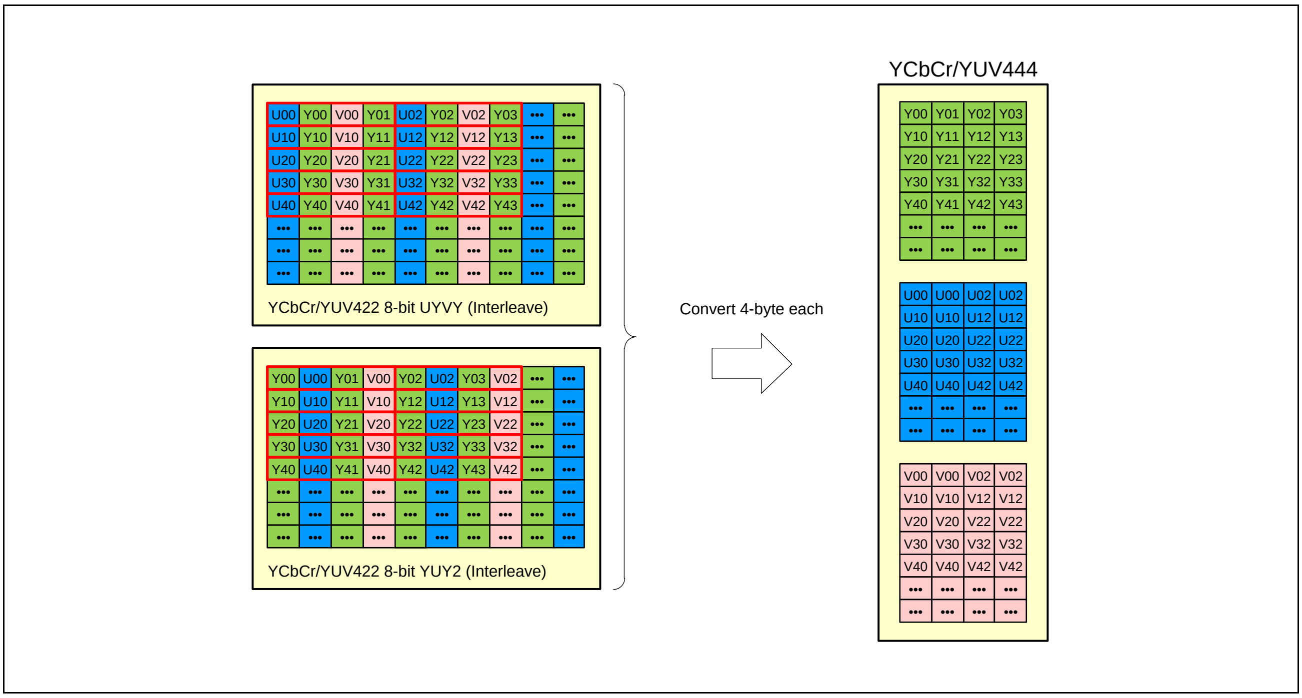

Figure 36.16 YCbCr/YUV444 Conversion from YCbCr/YUV422 Format

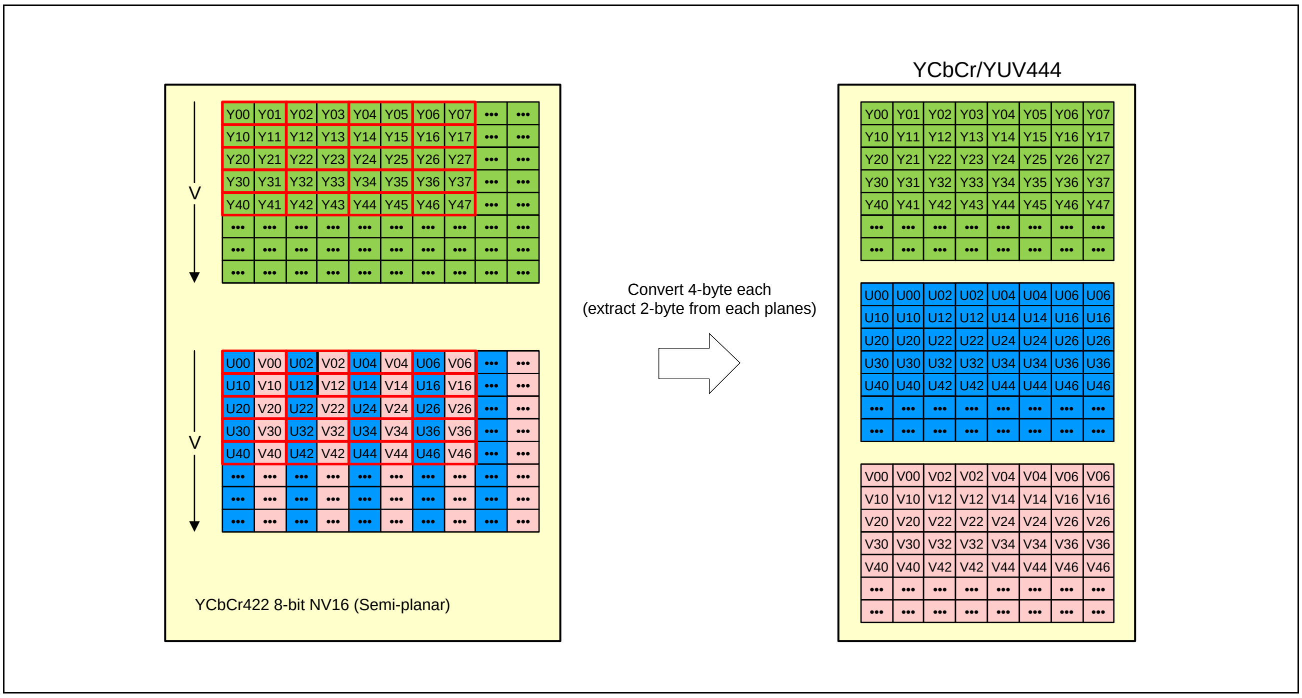

Figure 36.17 YCbCr/YUV444 Conversion from YCbCr/YUV422 Semi-Planar Format

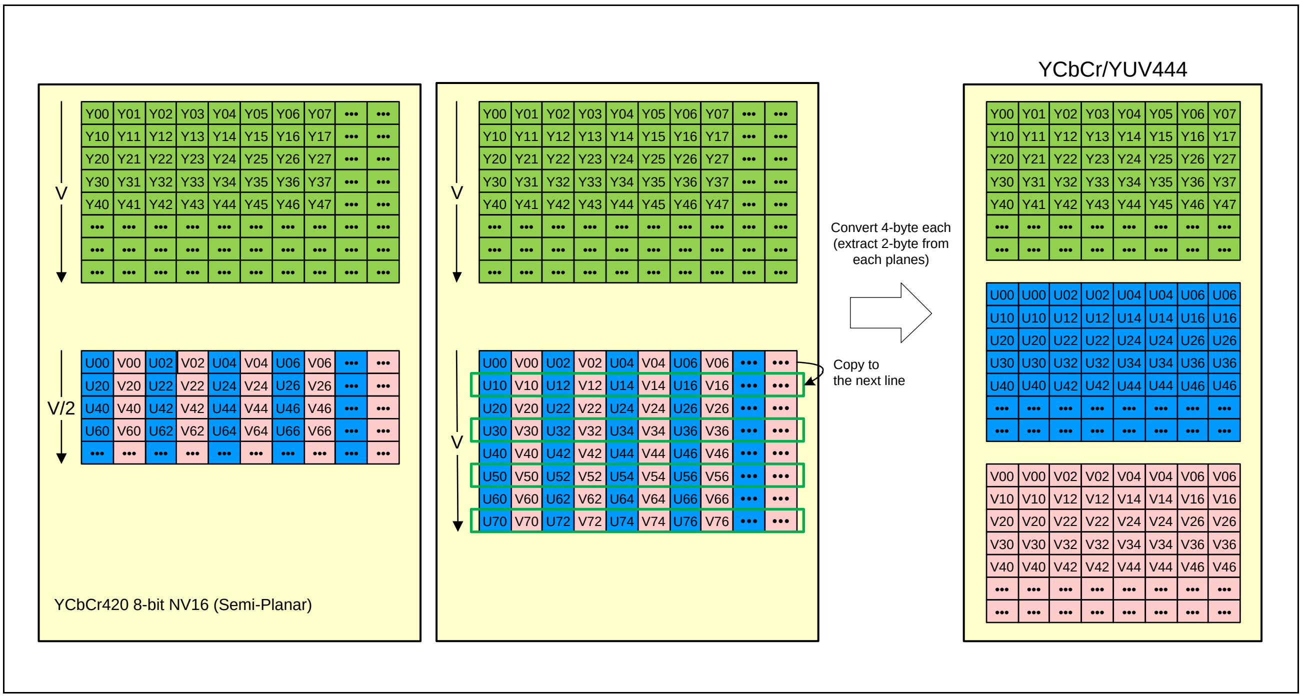

Figure 36.18 YCbCr/YUV444 Conversion from YCbCr/YUV420 Semi-Planar Format

■ RAW

RAW is converted to 8-bit by using upper 8-bit of RAW8-/10-/12-bit.

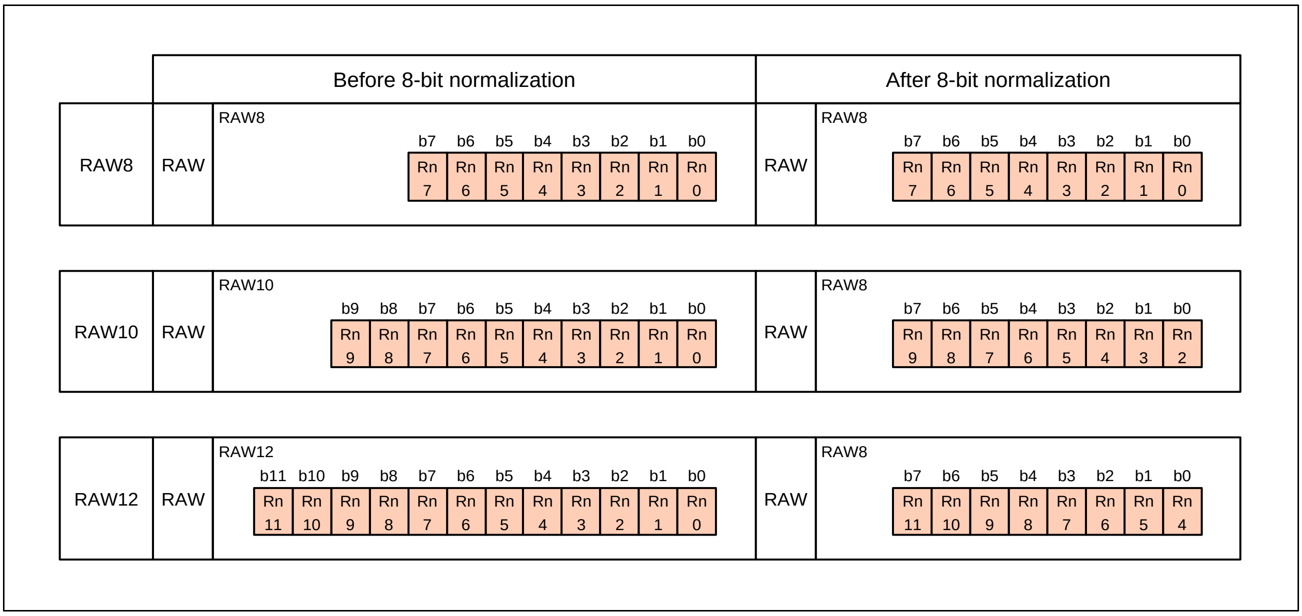

Figure 36.19 8-bit Normalization for RAW Format

36.1.3.4 Test Pattern Generation

Instead of the input image data from AXI-Master, RPF can generates a test pattern and outputs it to the Resizer.

The test pattern is an 8-bit gradation image from the upper left to the lower right in ARGB8888 format according to the register setting.

Please switch between the test pattern and the input image data from AXI-Master according below procedure.

1. Enable the test pattern. (ISU_RPF_SRC_TD1.TMODE_EN = 1b)
2. Start the resizing process. (ISU_FM_FRCON.START = 1b)

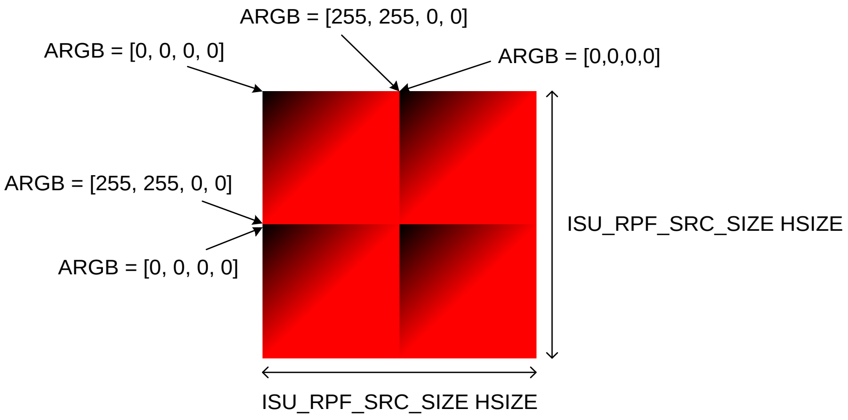

Figure 36.20 Test Pattern of R Gradation

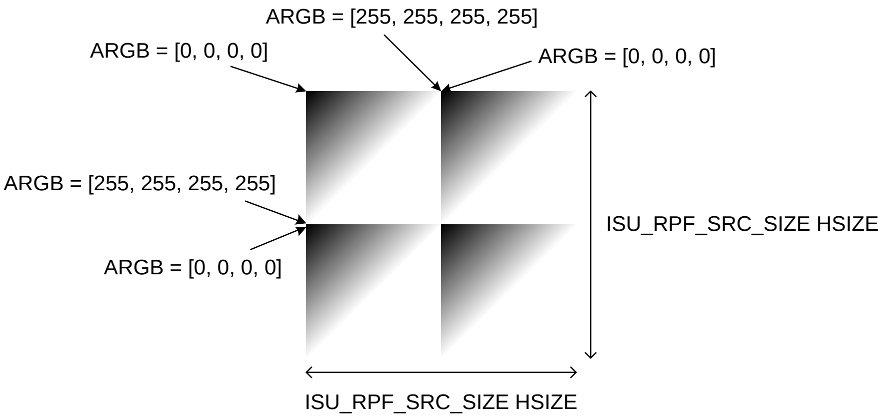

Figure 36.21 Pattern of R,G,B Gradation

36.1.4 Resizer (RS)

Resizer (RS) reduces the image size by using bi-linear algorithm (4-point linear interpolation) according to register setting of horizontal / vertical resize ratio.

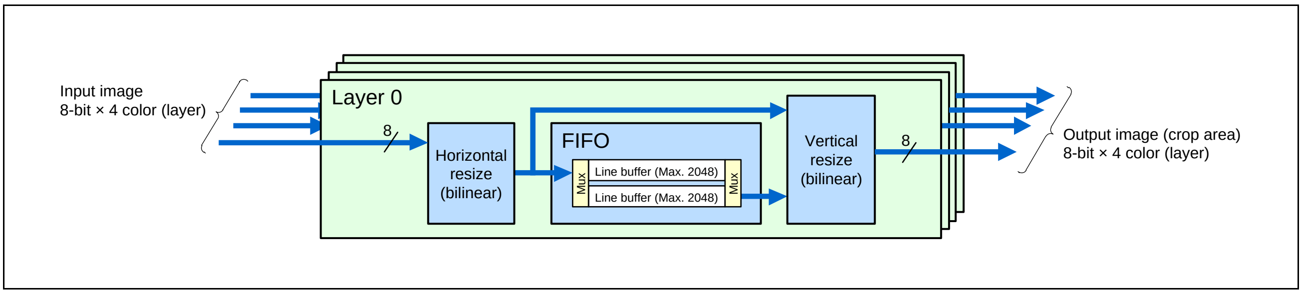

Figure 36.22 Resizer Block Diagram

The resize processing is different whether the Resized image size is smaller or larger than the Crop area.

If the Resized image size is smaller than the Crop area, fill in the missing edge pixels according to the register settings below.

When ISU_RS_PADDMODE.PADSEL = 0, Fill in the padding area by copying the right / bottom edge pixels after the reduction.

When ISU_RS_PADDMODE.PADSEL = 1, Fill in the padding area with the value specified by the register.

If the Resized image size is larger than the Crop area, it will be cut off by the Crop area.

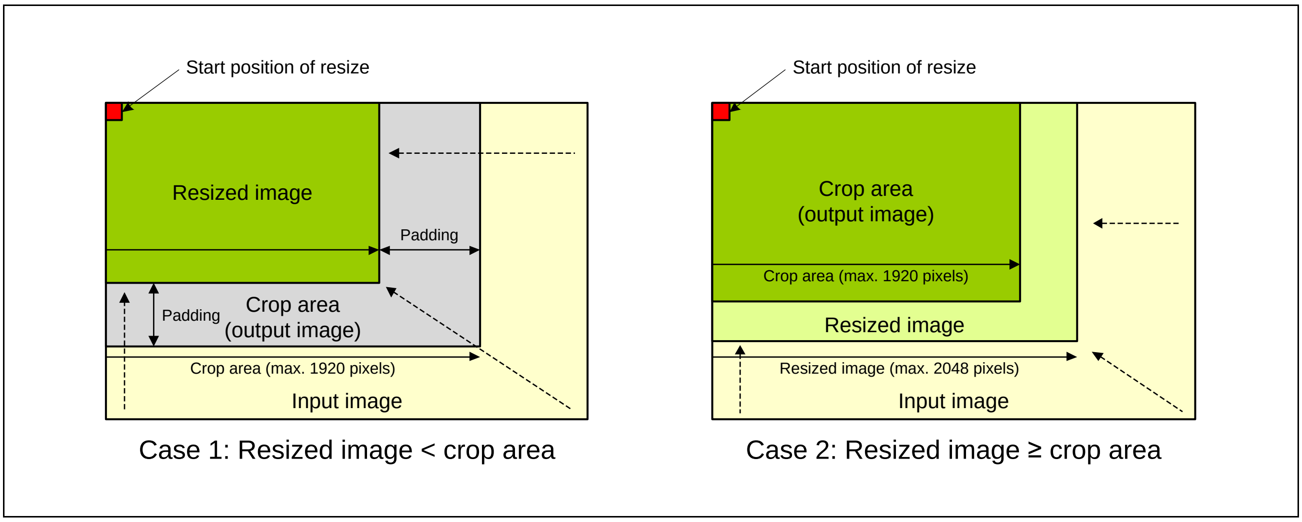

Figure 36.23 Relationship of Resized Image and Crop Area

36.1.4.1 Resize Start Position

The resize processing start from Resize Start Position (ISU_RS_STPOS) on the input image in according to the register setting. This position setting is specified in pixel coordinates from the top left of the image. If 0 is specified, the input image will be the Resizer (RS) target image as it is.

Padding area will be filled based on the setting of ISU_RS_PADDMODE.PADSEL.

- Register ISU_RS_STPOS.HSTART = Resize Start H position
- Register ISU_RS_STPOS.VSTART = Resize Start V position

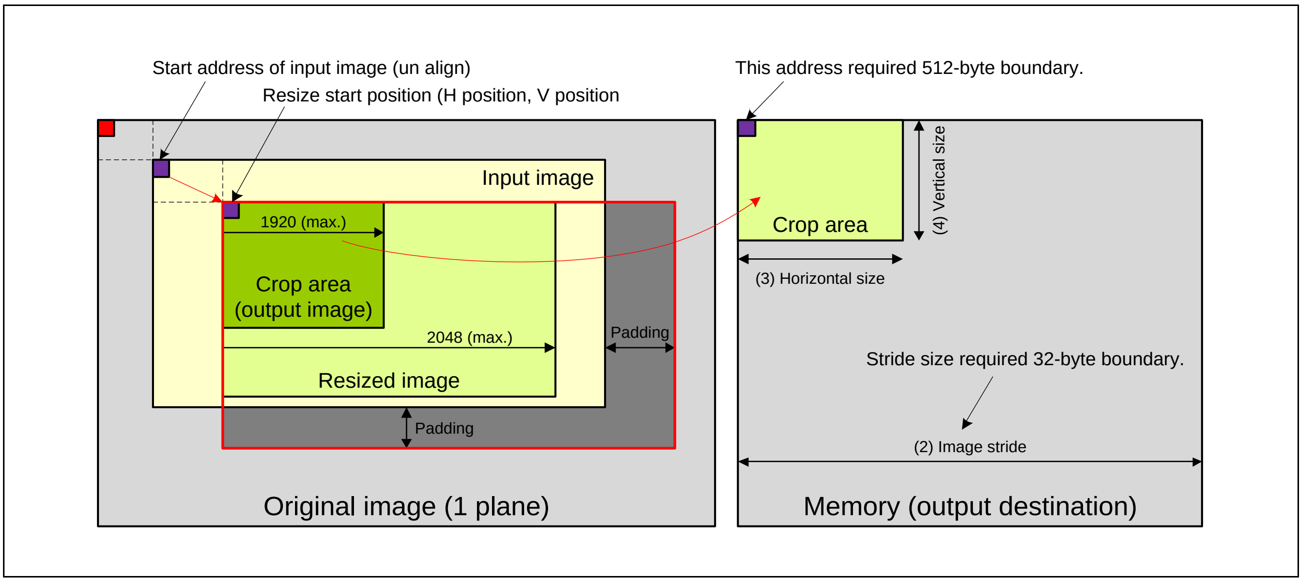

Figure 36.24 Resize Start Position

36.1.4.2 Sub Pixel Offset

The Resize Start Position Tuning (ISU_RS_POS_TUNE) can be used to adjust the start position by sub pixel level to reduce moiré.

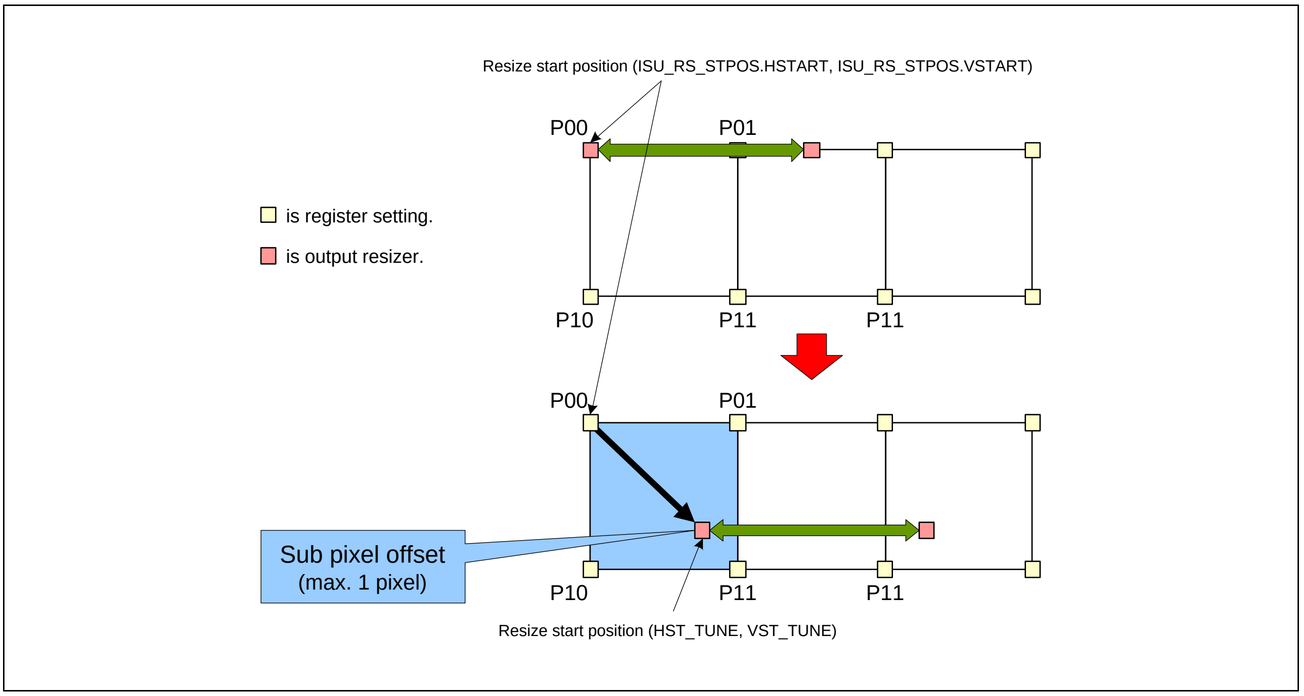

Figure 36.25 Sub Pixel Position Adjustment

36.1.4.3 Scaling Calculation

The resizer can be handled resizing magnification independently for horizontally and vertically. The image size of this processing result can be calculated approximately by using “Input image horizontal size x hscale” and “Input image vertical size × vscale”.

Table 36.8 Scaling Coefficient Setting

No.	Category	Register	Variation
(1)	Horizontal Scaling Ratio	RS_HSCALE.HMANT[3:0]	- m_h: Integer part of Horizontal scaling coefficient.
		RS_HSCALE.HFRAC[11:0]	- f_h: Fraction part of Horizontal scaling coefficient.
(2)	Vertical Scaling Ratio	RS_VSCALE.VMANT[3:0]	- m_v: Integer part of Vertical scaling coefficient.
		RS_VSCALE.VFRAC[11:0]	- f_v: Fraction part of Vertical scaling coefficient.

$$\mathrm{hascale} = \frac{4096}{4096 \times \mathrm{m_h} + \mathrm{f_h}} \qquad \mathrm{vscale} = \frac{4096}{4096 \times \mathrm{m_v} + \mathrm{f_v}}$$

Figure 36.26 Sub Pixel Position Adjustment

$$\mathrm{hascale} = \frac{4096}{4096 \times \mathrm{m_h} + \mathrm{f_h}}$$

$\mathrm{hsize_{org}}$: Horizontal Size of Input Image

$$\mathrm{hsize_{down\_scaled}} = \langle 1 + \left[\langle 1 + \frac{\langle \mathrm{hsize_{org}} - 1 \rangle}{\mathrm{m}_{\acute{\mathrm{h}}}} \rangle - 1 \right] \times \mathrm{m}_{\acute{\mathrm{h}}} \times \mathrm{hscale} \rangle$$

$$\mathrm{hsize_{down\_scaled}} = \langle 1 + \left[\left[\langle 1 + \frac{\langle \mathrm{hsize_{org}} - 1 \rangle}{\mathrm{m}_{\acute{\mathrm{h}}}} \rangle - 1 \right] \times \mathrm{m}_{\acute{\mathrm{h}}} \times 4096 \right] / (4096 \times \mathrm{m_h} + \mathrm{f_h}) \rangle$$

Figure 36.27 Horizontal Scaling Calculation

$$\mathrm{vscale} = \frac{4096}{4096 \times \mathrm{m_v} + \mathrm{f_v}}$$

$\mathrm{vsize}_{\mathrm{org}}$: Vertcal Size of Input Image

$$\mathrm{vsize}_{\mathrm{down\_scaled}} = \langle 1 + \left[\langle 1 + \frac{\langle \mathrm{vsize}_{\mathrm{org}} - 1 \rangle}{\mathrm{m}_{\acute{\mathrm{v}}}} \rangle - 1 \right] \times \mathrm{m}_{\acute{\mathrm{v}}} \times \mathrm{vscale} \rangle$$

$$\mathrm{vsize}_{\mathrm{down\_scaled}} = \langle 1 + \left[\left[\langle 1 + \frac{\langle \mathrm{vsize}_{\mathrm{org}} - 1 \rangle}{\mathrm{m}_{\acute{\mathrm{v}}}} \rangle - 1 \right] \times \mathrm{m}_{\acute{\mathrm{v}}} \times 4096 \right] / (4096 \times \mathrm{m_v} + \mathrm{f_v}) \rangle$$

Figure 36.28 Vertical Scaling Calculation

36.1.4.4 Resize Processing

Following figure shows the processing image of bi-linear algorithm (4-point interpolation).

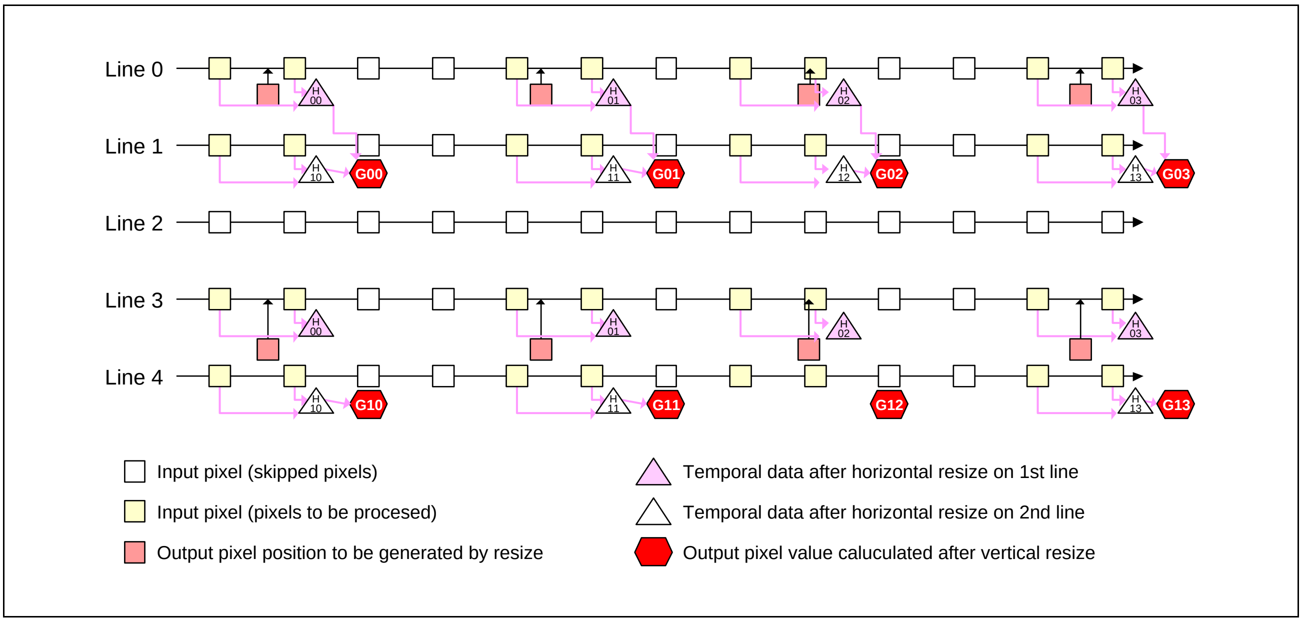

Figure 36.29 Points Bi-Linear Resize

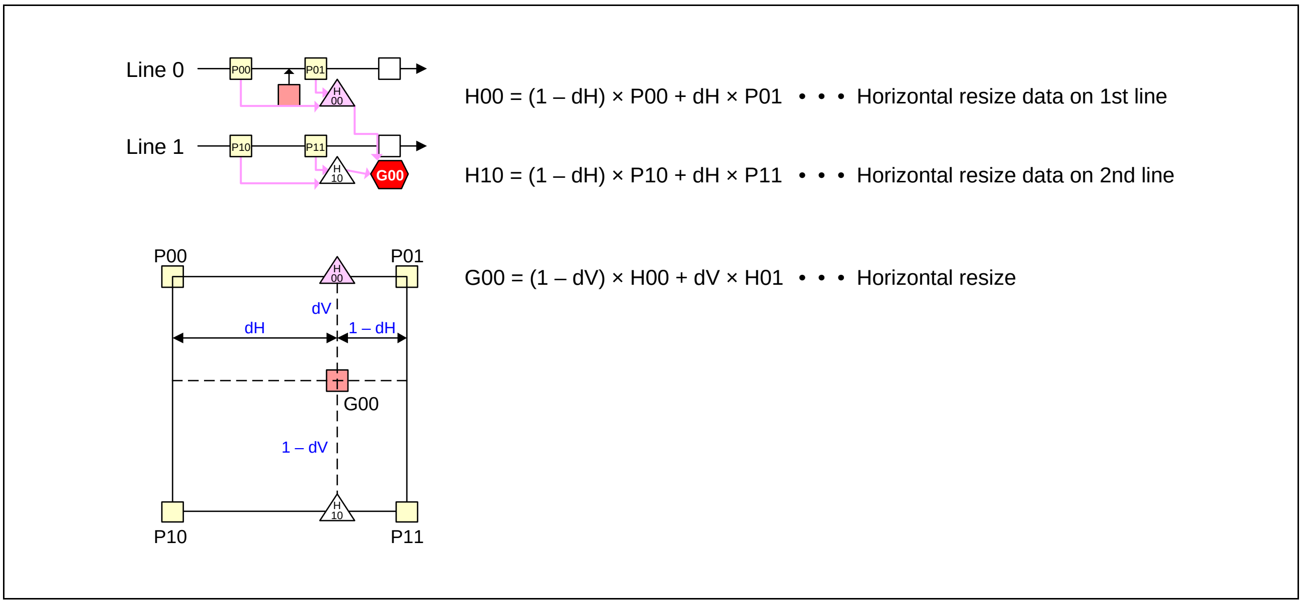
The outline of the calculation procedure of 4-point linear interpolation is shown below.

Although dH and dV are not exist actually, it is used to help understanding for this algorithm. The pixel value of the target pixel position G00 will be calculated from the nearest 4 input pixels, and dH and dV indicate sub pixel position of G00 calculated from Horizontal/Vertical scaling ratio.



$H00 = (1 - dH) \times P00 + dH \times P01$ • • • Horizontal resize data on 1st line

$H10 = (1 - dH) \times P10 + dH \times P11$ • • • Horizontal resize data on 2nd line

$G00 = (1 - dV) \times H00 + dV \times H01$ • • • Horizontal resize

Figure 36.30 Calculation for 4 Points Bi-linear Resize

36.1.5 Write Pixel Formatting (WPF)

WPF converts the resized image data from RS and outputs it to AXI-Master.

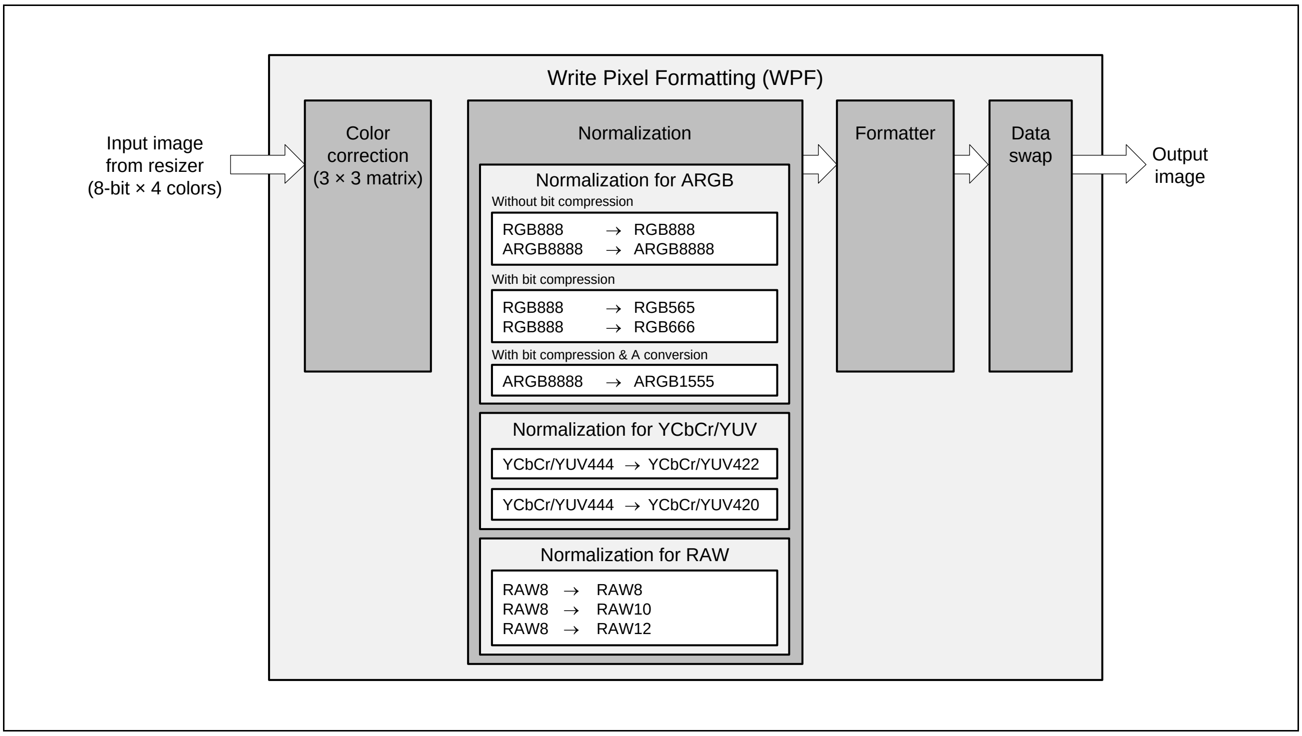


Figure 36.31 WPF Block Diagram

36.1.5.1 Color Correction

This function is color space conversion between RGB and YCbCr and YUV by using 3 × 3 color matrix. Matrix coefficients can be set by registers. The matrix calculation formula and circuit block diagram are shown below.

3 × 3 Matrix

$$\begin{bmatrix} C1' \\ C2' \\ C3' \end{bmatrix} = \begin{bmatrix} K11 & K12 & K13 \\ K21 & K22 & K23 \\ K31 & K32 & K33 \end{bmatrix} \cdot \begin{bmatrix} A - OFST\_A1 \\ B - OFST\_B1 \\ C - OFST\_C1 \end{bmatrix} + \begin{bmatrix} OFST\_A2 \\ OFST\_B2 \\ OFST\_C2 \end{bmatrix}$$

Level clipping

$$C1'' = MAX\,(CLPMIN\_A,\ MIN\,(CLPMAX\_A,\ C1'))$$
$$C2'' = MAX\,(CLPMIN\_B,\ MIN\,(CLPMAX\_B,\ C2'))$$
$$C3'' = MAX\,(CLPMIN\_C,\ MIN\,(CLPMAX\_C,\ C3'))$$

Figure 36.32 Color Correction Equation

Figure 36.34 Normalization for RGB Format

■ ARGB

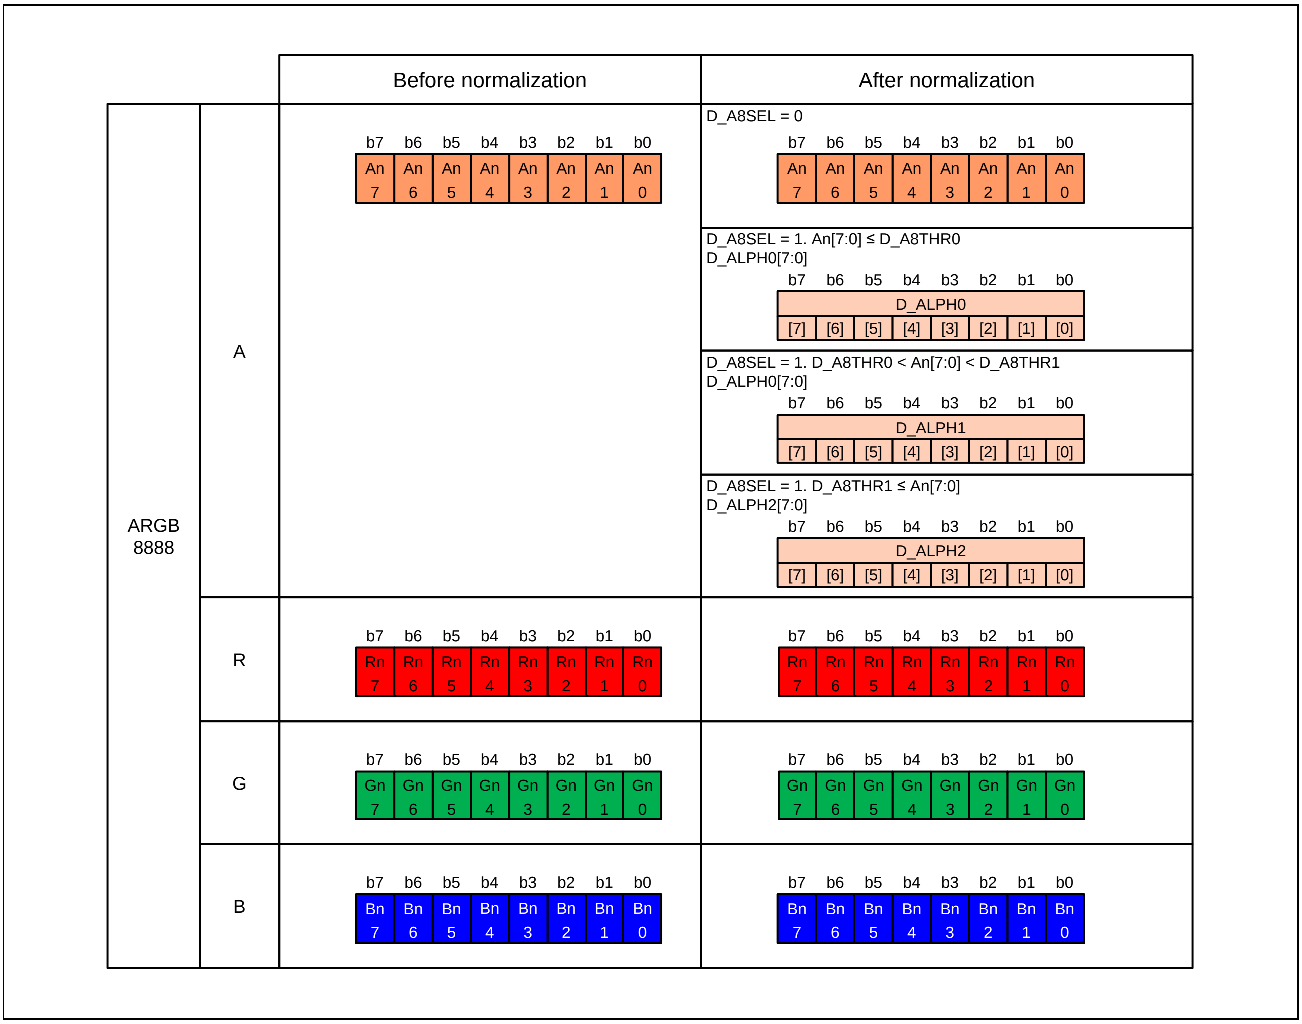

Figure 36.35 Normalization for ARGB8888 Format

“A(An)” of ARGB8888 is normalized according to the following logic.

If ISU_WPF_ALPH_SEL2.D_A8SEL = 0, An is output as it is.

If ISU_WPF_ALPH_SEL2.D_A8SEL = 1, replace it with the following value according to the relationship between ISU_WPF_ALPH_SEL2.D_A8THR0 to 1 and An.

If An ≤ D_A8THR0, replace it with ISU_WPF_ALPH_VAL.D_ALPH0.

If D_A8THR0 < An <D_A8THR1, replace it with ISU_WPF_ALPH_VAL.D_ALPH1.

If D_A8THR1 ≤ An, replace it with ISU_WPF_ALPH_VAL.D_ALPH2.

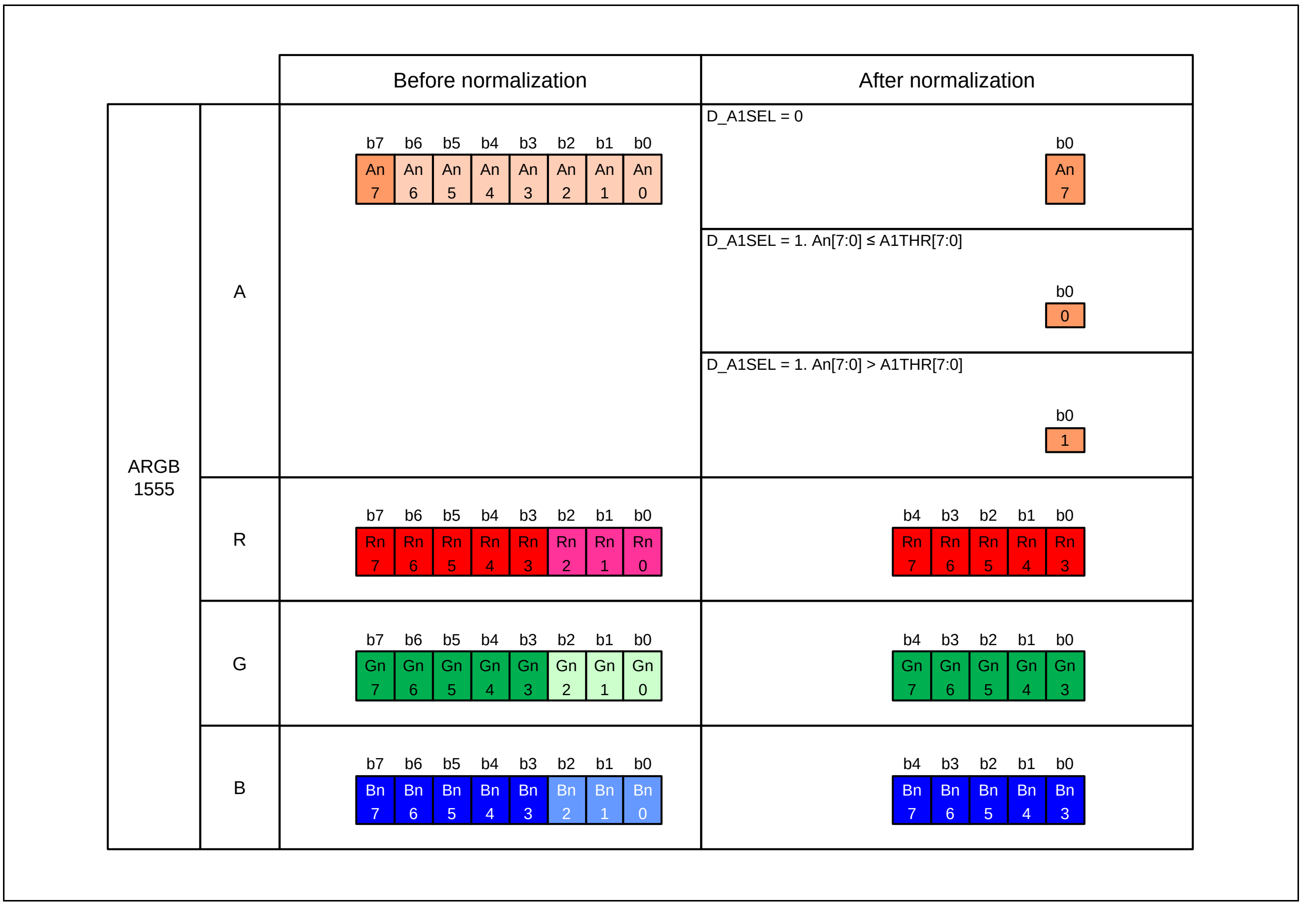

Figure 36.36 Normalization for ARGB1555 Format

“A(An)” of ARGB1555 A is compressed according to the following.

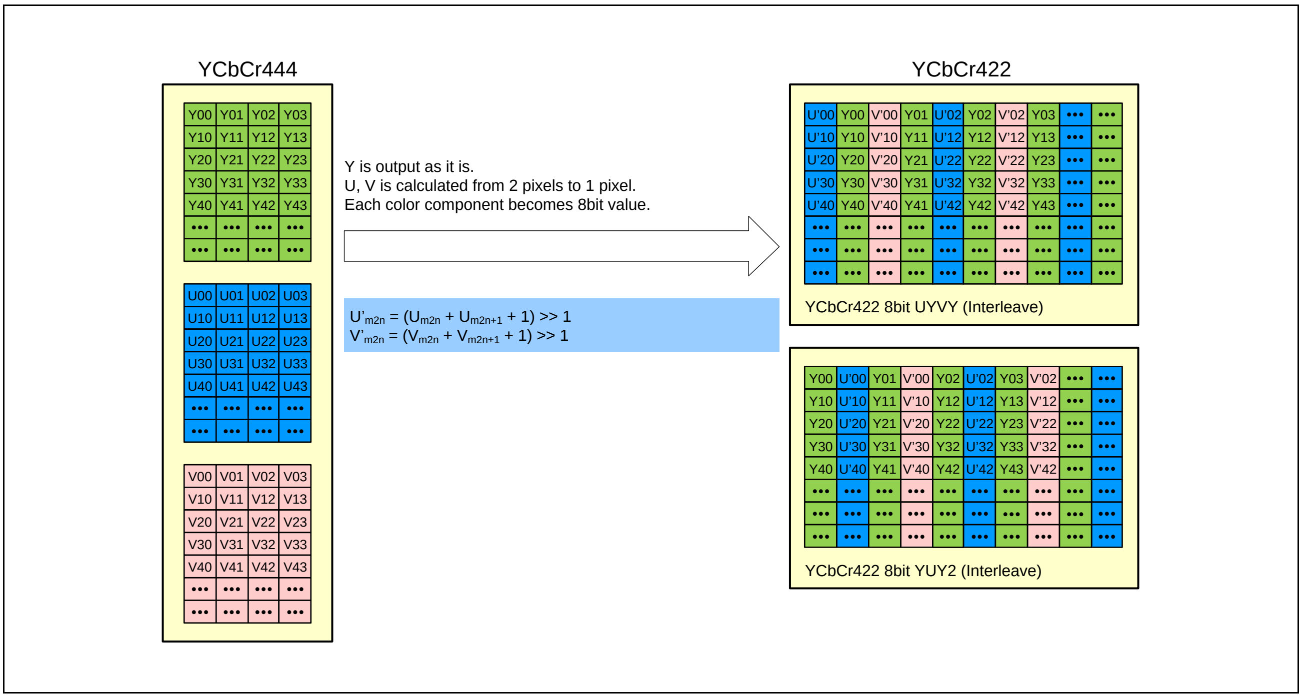
If ISU_WPF_ALPH_SEL1.D_A1SEL = 0, An7 is output.

If ISU_WPF_ALPH_SEL1.D_A1SEL = 1, replace it with the following value according to the relationship between ISU_WPF_ALPH_SEL1.D_A1THR and An.

If An ≤ D_A1THR, 0 is output.

If D_A1THR < An, 1 is output.

■ YCbCr/YUV



Y is output as it is.
U, V is calculated from 2 pixels to 1 pixel.
Each color component becomes 8bit value.

$U'_{m2n} = (U_{m2n} + U_{m2n+1} + 1) >> 1$
$V'_{m2n} = (V_{m2n} + V_{m2n+1} + 1) >> 1$

36.1.5.3 Formatter

Following data format are described as 2-/3-/4-/8-byte per unit. Eventually, these data unit are packed in 32-byte (256-bit) each so that it can be handled in next process. Image format setting is indicated by ISU_WPF_FMT.WDFMT[5:0].

■ RGB/ARGB

This function support 8 ARGB/RGB formats as bellow. All formats are “Number of planes = 1”.

Table 36.9 ARGB Support Format

	Format				n								n + 1								n + 2								n + 3							
WDFMT [5:0]	Color Format	Padding	bit/pixel	phase	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0

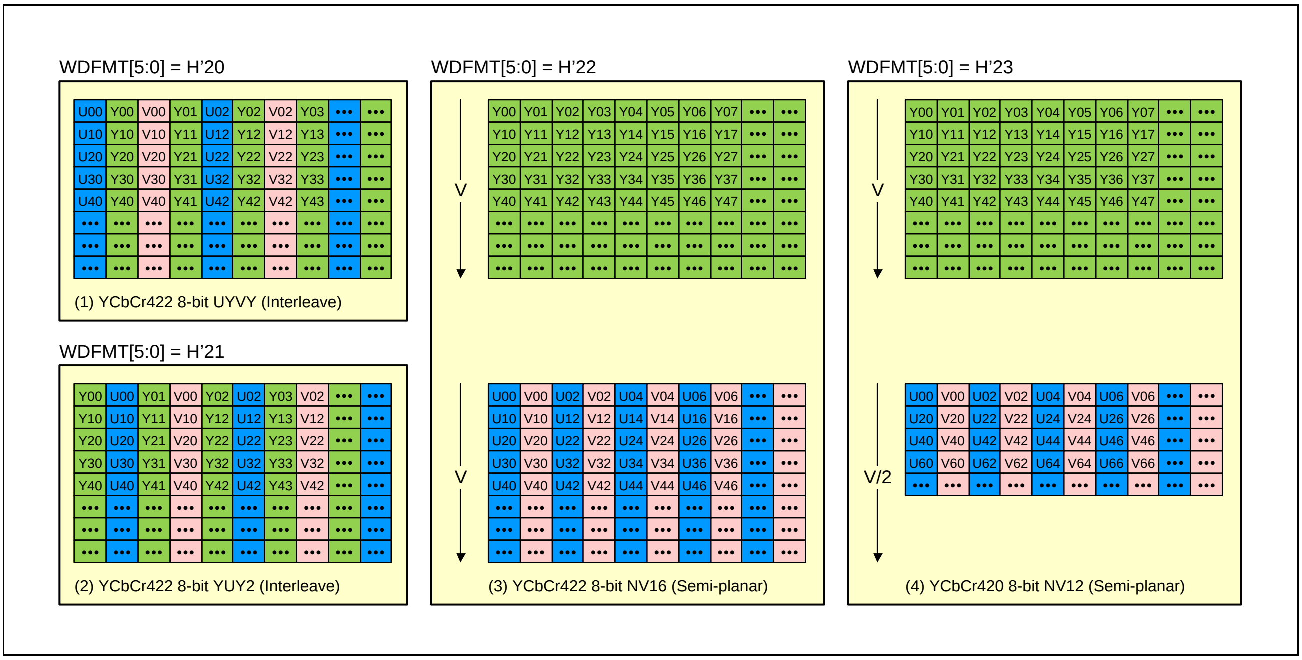
■ YCbCr/YUV

This function support 4 YCrCb/YUV formats as bellow.

Table 36.10 YCbCr/YUV Support Format

Data Format	RDFMT[5:0]	Color Format	Alias	Figure Index
Interleave (Number of Planes = 1)	H’20	YCbCr422 8-bit	UYVY	
	H’21	YCbCr422 8-bit	YUY2	
Semi-Planar (Number of Planes = 2)	H’22	YCbCr422 8-bit	NV16	
	H’23	YCbCr420 8-bit	NV12	



(1) YCbCr422 8-bit UYVY (Interleave)

(2) YCbCr422 8-bit YUY2 (Interleave)

(3) YCbCr422 8-bit NV16 (Semi-planar)

(4) YCbCr420 8-bit NV12 (Semi-planar)

Figure 36.41 YCbCr/YUV Support Format

■ RAW

This function support 3 RAW formats as bellow. All formats are “Number of planes = 1”.

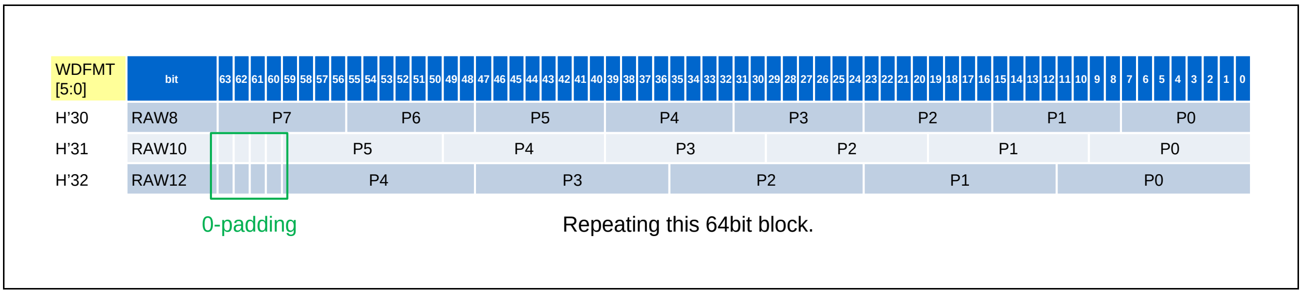


Figure 36.42 RAW Support Format

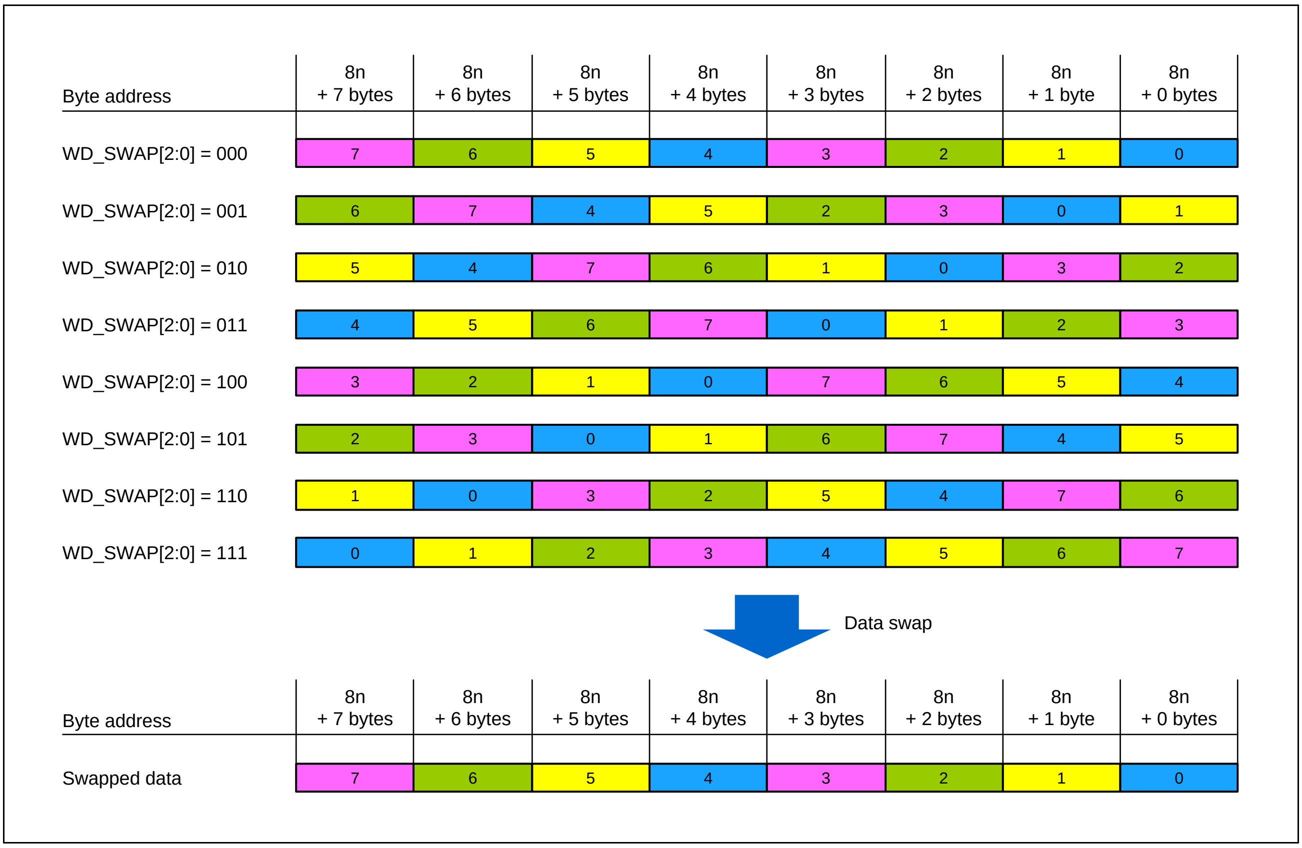
36.1.5.4 Data Swap (Endian Correction)

This function corrects byte order so that modify endian of data on memory. Each bytes can be arranged any order according the register setting.



Byte address	8n + 7 bytes	8n + 6 bytes	8n + 5 bytes	8n + 4 bytes	8n + 3 bytes	8n + 2 bytes	8n + 1 byte	8n + 0 bytes
WD_SWAP[2:0] = 000	7	6	5	4	3	2	1	0
WD_SWAP[2:0] = 001	6	7	4	5	2	3	0	1
WD_SWAP[2:0] = 010	5	4	7	6	1	0	3	2
WD_SWAP[2:0] = 011	4	5	6	7	0	1	2	3
WD_SWAP[2:0] = 100	3	2	1	0	7	6	5	4
WD_SWAP[2:0] = 101	2	3	0	1	6	7	4	5
WD_SWAP[2:0] = 110	1	0	3	2	5	4	7	6
WD_SWAP[2:0] = 111	0	1	2	3	4	5	6	7

Byte address	8n + 7 bytes	8n + 6 bytes	8n + 5 bytes	8n + 4 bytes	8n + 3 bytes	8n + 2 bytes	8n + 1 byte	8n + 0 bytes
Swapped data	7	6	5	4	3	2	1	0

Figure 36.43 Data Swap Correction

36.2 Register Configuration

The address of the ISU register is represented by the offset address from the base address. ISU base address is as follows:

Base Address: H’0_1084_0000 (Cortex-A55 Address Space)
Base Address: H’4084_0000 (Cortex-M33 Address Space Non-Secure)
Base Address: H’5084_0000 (Cortex-M33 Address Space Secure)

36.2.1 System Management Register

“System Management Register” sets descriptor processing and interrupts control.

The descriptor cannot access these registers.

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
FM Descriptor List Address Registers 0	ISU_FM_DL_STADDH	R/W	H’0000_0000	H’000	32
FM Descriptor List Address Registers 1	ISU_FM_DL_STADDL	R/W	H’0000_0000	H’004	32
FM Frame Control Registers	ISU_FM_FRCON	R/W	H’0000_0000	H’008	32
FM Module Stop Registers	ISU_FM_STOP	R/W	H’0000_0000	H’00C	32
FM Interrupt Enable Registers	ISU_FM_INT_EN	R/W	H’0000_0000	H’010	32
FM Interrupt Status Registers	ISU_FM_INT_STA	R/W	H’0000_0000	H’014	32
AXI Error Action Registers	ISU_AXI_ERACT	R/W	H’0000_0000	H’020	32
AXI FIFO Capability Registers	ISU_AXI_FIFO_CAP	R	H’4000_4000	H’02C	32

36.2.2 Common Register

“Common Register” sets input/output, reduction ratio and color conversion coefficient.

Prohibits write to these registers during frame processing.

The descriptor can access these registers.

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
RPF Source Image Size Registers	ISU_RPF_SRC_SIZE	R/W	H’0000_0000	H’100	32

36.3 Register Descriptions

36.3.1 FM Descriptor List Address Registers 0 (ISU_FM_DL_STADDH)

This register sets the start address [33:32] of the “Descriptor List”.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DLADD[33:32]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	DLADD [33:32]	All 0	R/W	Set the start address [33:32] of the “Descriptor-List”.

36.3.2 FM Descriptor List Address Registers 1 (ISU_FM_DL_STADDL)

This register sets the start address [31:0] of the “Descriptor List”.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DLADD[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DLADD[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DLADD [31:0]	All 0	R/W	Set the start address [31:0] of the “Descriptor List”. *Note 1.* Set an address that is a multiple of 32-byte.

36.3.3 FM Frame Control Registers (ISU_FM_FRCON)

This register controls the frame processing method selection and processing start.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DESON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	START
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	DESON	All 0	R/W	Processing method selection Select “Register Mode” or “Descriptor Mode”. 0: Register Mode When executing in this mode, set the register before starting frame processing. 1: Descriptor Mode When executing in this mode, write a “Descriptor List” before starting frame processing.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	START	All 0	R/W	Frame processing start instruction [Write] 0: NOP 1: Start frame processing [Read] This bit is always read as 0. *Note 1.* If 1 is written during frame processing, it will be ignored. *Note 2.* Also, when 1 is written, the frame end interrupt (ISU_FM_INT_STA.FREND) and descriptor footer read completion interrupt (ISU_FM_INT_STA.DESEND) are automatically cleared.

36.3.4 FM Module Stop Registers (ISU_FM_STOP)

This register controls an emergency stop.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STOP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	STOP	All 0	R/W	Emergency stop instruction [Write] 0: NOP 1: Start emergency stop [Read] This bit is always read as 0. *Note 1.* It will be cleared automatically after the emergency stop is completed. If 1 is written during the emergency stop process, it will be ignored. *Note 2.* If you want to stop frame synchronously, you can stop it by setting the footer of the “Descriptor List” not to process the next frame.

36.3.5 FM Interrupt Enable Registers (ISU_FM_INT_EN)

This register controls the interrupt factor.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	AXIRXERRE	—	—	—	AXITXERRE	—	—	—	—	—	—	—	LISTERRE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SRSTENDE	—	—	—	—	—	—	DESENDE	FRENDE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	AXIRXERRE	All 0	R/W	Control of AXI bus read error interrupt (ISU_INT_ERR) Controls interrupt by “ISU_FM_INT_STA.RRESPERR”. 0: Do not output interrupt factors 1: Output interrupt factor
27 to 25	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	AXITXERRE	All 0	R/W	Control of AXI bus write error interrupt (ISU_INT_ERR) Controls interrupt by “ISU_FM_INT_STA.BRESPERR”. 0: Do not output interrupt factors 1: Output interrupt factor
23 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	LISTERRE	All 0	R/W	Control of “Descriptor List” format violation interrupt (ISU_INT_ERR) Controls interrupt by the number of bytes set in the header exceeding the limit or not being in 8-byte units. 0: Do not output interrupt factors 1: Output interrupt factor
15 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	SRSTENDE	All 0	R/W	Control of emergency stop completion interrupt (ISU_INT_STOPE) Controls interrupt by the completion of emergency stop. 0: Do not output interrupt factors 1: Output interrupt factor
7 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	DESENDE	All 0	R/W	Control of descriptor footer read completion interrupt (ISU_INT_DESE) Controls interrupt by the completion of descriptor footer read. 0: Do not output interrupt factors 1: Output interrupt factor *Note 1.* When an error occurs due to a format violation of “Descriptor List”, the ISU_INT_DESE interrupt does not occur even if this bit is set to 1.

Bit	Bit Name	Initial Value	R/W	Description
0	FRENDE	All 0	R/W	Control of frame processing end interrupt (ISU_INT_FRE) Controls interrupt by the frame processing end. 0: Not output interrupt factor 1: Output interrupt factor *Note 1.* This bit is updated according to the setting of the footer if the descriptor mode is set.

36.3.6 FM Interrupt Status Registers (ISU_FM_INT_STA)

This register displays the status of the interrupt factors.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	RRESPERR[2:0]			—	BRESPERR[2:0]			—	—	—	—	—	—	LISTERR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/WC0	R/WC0	R/WC0	R	R/WC0	R/WC0	R/WC0	R	R	R	R	R	R	R/WC0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SRSTEND	—	—	—	—	—	—	DESEND	FREND
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/WC0	R	R	R	R	R	R	R/WC0	R/WC0

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29 to 27	RRESPERR [2:0]	All 0	R/WC0	Displays the status of the AXI read response. Each bit means the following factors. [0] EXOKAY 0: EXOKAY no response 1: EXOKAY response [1] SLVERR 0: SLVERR no response 1: SLVERR response [2] DECERR 0: DECERR no response 1: DECERR response *Note 1.* If you want to clear it, please clear 3-bit at the same time.
26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25 to 23	BRESPERR [2:0]	All 0	R	Displays the status of the AXI write response. Each bit means the following factors. [0] EXOKAY 0: EXOKAY no response 1: EXOKAY response [1] SLVERR 0: SLVERR no response 1: SLVERR response [2] DECERR 0: DECERR no response 1: DECERR response *Note 1.* If you want to clear it, please clear 3-bit at the same time.

Bit	Bit Name	Initial Value	R/W	Description
22 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	LISTERR	All 0	R/WC0	Displays the status of “Descriptor List” format violations (ISU_INT_ERR). 0: Descriptor list does not violate format 1: Descriptor list does violate format
15 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	SRSTEND	All 0	R/WC0	Displays the status of the emergency stop completion (ISU_INT_STOPE). 0: Emergency stop not completed 1: Emergency stop completed
7 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	DESEND	All 0	R/WC0	Displays the status of the descriptor footer read completion (ISU_INT_DESE). 0: Descriptor footer read incomplete 1: Descriptor footer read completed
0	FREND	All 0	R/WC0	Displays the status of the frame processing end (ISU_INT_FRE). 0: Frame processing incomplete 1: Frame processing completed

36.3.7 AXI Error Action Registers (ISU_AXI_ERACT)

This register sets the operation of AXI-Master after an AXI error occurs.

For each AXI error condition, choose whether to ignore and continue or stop subsequent transactions.

Transaction continuation settings are used for debugging purposes.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	RRESPEXO_ACT	RRESPSLV_ACT	RRESPDEC_ACT	—	BRESPEXO_ACT	BRESPSLV_ACT	BRESPDEC_ACT	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29	RRESPEXO_ACT	All 0	R/W	Operation settings after AXI read response EXOKAY occurs 0: Transaction stop 1: Transaction continuation (For debugging)
28	RRESPSLV_ACT	All 0	R/W	Operation settings after AXI read response SLVERR occurs 0: Transaction stop 1: Transaction continuation (For debugging)
27	RRESPDEC_ACT	All 0	R/W	Operation settings after AXI read response DECERR occurs 0: Transaction stop 1: Transaction continuation (For debugging)
26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25	BRESPEXO_ACT	All 0	R/W	Operation settings after AXI write response EXOKAY occurs 0: Transaction stop 1: Transaction continuation (For debugging)
24	BRESPSLV_ACT	All 0	R/W	Operation settings after AXI write response SLVERR occurs 0: Transaction stop 1: Transaction continuation (For debugging)
23	BRESPDEC_ACT	All 0	R/W	Operation settings after AXI write response DECERR occurs 0: Transaction stop 1: Transaction continuation (For debugging)
22 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

36.3.8 AXI FIFO Capability Registers (ISU_AXI_FIFO_CAP)

This register is a register that displays the free space of the FIFO in AXI-Master.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SCAP_PL0[6:0]							—	—	SCAP_PL1[5:0]					
Initial Value	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	DCAP_PL0[6:0]							—	—	DCAP_PL1[5:0]					
Initial Value	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30 to 24	SCAP_PL0 [6:0]	H’40	R	Free space in FIFO of the input image “Plane0” 0 to 32 in Semi-Planar mode. 0 to 64 in other modes.
23 to 22	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21 to 16	SCAP_PL1 [5:0]	All 0	R	Free space in FIFO of the input image “Plane1” 0 to 32 in Semi-Planar mode. 0 in other modes.
15	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14 to 8	DCAP_PL0 [6:0]	H’40	R	Free space in FIFO of the output image “Plane0” 0 to 32 in Semi-Planar mode. 0 to 64 in other modes.
7 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5 to 0	DCAP_PL1 [5:0]	All 0	R	Free space in FIFO of the output image “Plane1” 0 to 32 in Semi-Planar mode. 0 in other modes.

36.3.9 RPF Source Image Size Registers (ISU_RPF_SRC_SIZE)

This register sets the size of the input image.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	S_HSIZE[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	S_VSIZE[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 16	S_HSIZE [11:0]	All 0	R/W	Horizontal size of the input image Set the horizontal size of the input image in pixels. Set the size from 1 to 2800. 0: Setting prohibited 2801 to: Setting prohibited *Note 1.* For YCbCr type, set it to an even number.
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	S_VSIZE [11:0]	All 0	R/W	Vertical size of the input image Set the vertical size of the input image in pixels. Set the size from 1 to 2047. 0: Setting prohibited 2048 to: Setting prohibited *Note 1.* For YCbCr420, set it to an even number.

36.3.10 RPF Source Stride Registers (ISU_RPF_SRC_STRD)

This register sets the stride of the input image.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SSTRPL0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SSTRPL1[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SSTRPL0 [15:0]	All 0	R/W	Set the “Plane0 (Y/RGB/RAW)” stride Set the “Plane0 (Y/RGB/RAW)” stride in bytes. *Note 1.* Set it as a multiple of 32 bytes and at least the number of horizontal pixels (ISU_RPF_SRC_SIZE.S_HSIZE).
15 to 0	SSTRPL1 [15:0]	All 0	R/W	Set the “Plane1 (C(Cb/Cr))” stride Set the “Plane1 (C(Cb/Cr))” stride in bytes. *Note 1.* Set it as a multiple of 32 bytes and at least the number of horizontal pixels (ISU_RPF_SRC_SIZE.S_HSIZE).

36.3.11 RPF Source Plane0 Address Registers 0 (ISU_RPF_SRC_ADDH_PL0)

This register sets the start address [33:32] of the input image of “Plane0”.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SADD_PL0 [33:32]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	SADD_PL0 [33:32]	All 0	R/W	Set the start address [33:32] for “Plane0 (Y/RGB/RAW)”.

36.3.12 RPF Source Plane0 Address Registers 1 (ISU_RPF_SRC_ADDL_PL0)

This register sets the start address [31:0] of the input image of “Plane0”.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SADD_PL0[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SADD_PL0[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SADD_PL0 [31:0]	All 0	R/W	Set the start address [31:0] of “Plane0 (Y/RGB/RAW)”. *Note 1.* Set an address that is a multiple of 32-byte.

36.3.13 RPF Source Plane1 Address Registers 0 (ISU_RPF_SRC_ADDH_PL1)

This register sets the start address [33:32] of the input image of “Plane1”.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SADD_PL1 [33:32]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R/W	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	SADD_PL1 [33:32]	All 0	R/W	Set the start address [33:32] of “Plane1 (C(Cb/Cr))”.

36.3.14 RPF Source Plane1 Address Registers 1 (ISU_RPF_SRC_ADDL_PL1)

This register sets the start address [31:0] of the input image of “Plane1”.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SADD_PL1[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SADD_PL1[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SADD_PL1 [31:0]	All 0	R/W	Set the start address [31:0] for “Plane1 (C(Cb/Cr))”. *Note 1.* Set an address that is a multiple of 32-byte.

36.3.15 RPF Source Image Format Registers (ISU_RPF_FMT)

This register sets the color format of the input image.

For details, refer to **Section 36.1.3.2, Formatter**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	RDFMT[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R/W	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5 to 0	RDFMT[5:0]	All 0	R/W	Color format of input image The following formats can be configured. H’00: ARGB1555 H’01: RGB565 H’02: BGR666 H’03: RGB888 H’04: BGR888 H’05: ARGB8888 H’06: RGBA8888 H’07: ABGR8888 H’20: YCbCr422 8-bit UYVY H’21: YCbCr422 8-bit YUY2 H’22: YCbCr422 8-bit NV16 H’23: YCbCr420 8-bit NV12 H’30: RAW8 H’31: RAW10 H’32: RAW12 Others: Setting prohibited

36.3.16 RPF Source Image UV Format Registers (ISU_RPF_UVBIN)

This register sets whether to convert CbCr / UV to offset binary.

For details, refer to **Section 36.1.3.2, Formatter**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UVCHG
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	UVCHG	All 0	R/W	Offset binary conversion selection for CbCr / UV data 0: No conversion 1: Conversion

36.3.17 RPF Source Image Data Swap Registers (ISU_RPF_SRC_DSWAP)

This register sets the data swap of the input image.

For details, refer to **Section 36.1.3.1, Data Swap (Endian Correction)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RD_SWAP[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2 to 0	RD_SWAP [2:0]	All 0	R/W	Data swap for input images

36.3.18 RPF Source ALPHA Data Selection Registers (ISU_RPF_ALPH_SEL)

This register sets the extension method from A (Alpha) 1-bit to 8-bit at the time of ARGB1555 input.

For details, refer to **Section 36.1.3.3, Data Extraction**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	S_A1SEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	S_ALPH1[7:0]								S_ALPH0[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	S_A1SEL	All 0	R/W	Setting of how to extend A(Alpha) from 1-bit to 8-bit 0: Copy input Alpha value 1-bit to all 8-bit 1: Select the register value according to the input Alpha value 1 bit S_ALPH0 when Alpha = 0 S_ALPH1 when Alpha = 1
15 to 8	S_ALPH1 [7:0]	All 0	R/W	Extended Alpha value when S_A1SEL = 1 and input Alpha value is 1.
7 to 0	S_ALPH0 [7:0]	All 0	R/W	Extended Alpha value when S_A1SEL = 1 and input Alpha value is 0.

36.3.19 RPF Source TEST Data Registers 1 (ISU_RPF_SRC_TD1)

This register controls the test pattern generation.

For details, refer to **Section 36.1.3.4, Test Pattern Generation**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMODE_EN	—	—	—	—	—	—	—	—	—	—	—	GRADA_A	GRADA_R	GRADA_G	GRADA_B
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	GRAD_TYPE	GRADA_STEP[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	TMODE_EN	All 0	R/W	Control of test pattern generation 0: Normal operation 1: Test pattern generation After one frame of the test pattern is generated, it is automatically cleared to 0. *Note 1.* Setting in descriptor mode is prohibited.
30 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	GRADA_A	All 0	R/W	A color when generating a test pattern 0: 0 fixed 1: Gradation
18	GRADA_R	All 0	R/W	R color when generating a test pattern 0: 0 fixed 1: Gradation
17	GRADA_G	All 0	R/W	G color when generating a test pattern 0: 0 fixed 1: Gradation
16	GRADA_B	All 0	R/W	B color when generating a test pattern 0: 0 fixed 1: Gradation
15 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	GRADA_TYPE	All 0	R/W	Gradient type 0: Gradation from 0 to 255 1: Gradation from 255 to 0
3 to 0	GRADA_STEP[3:0]	All 0	R/W	Gradient step *Note 1.* If the setting is 0, the initial value (ISU_RPF_SRC_TD2.INIT_*) is entered.

36.3.20 RPF Source TEST Data Registers 2 (ISU_RPF_SRC_TD2)

This register sets the initial value of each color of ARGB for test pattern generation.

For details, refer to **Section 36.1.3.4, Test Pattern Generation**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INIT_A[7:0]								INIT_R[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INIT_G[7:0]								INIT_B[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	INIT_A[7:0]	All 0	R/W	Initial value of A color
23 to 16	INIT_R[7:0]	All 0	R/W	Initial value of R color
15 to 8	INIT_G[7:0]	All 0	R/W	Initial value of G color
7 to 0	INIT_B[7:0]	All 0	R/W	Initial value of B color

36.3.21 RS Scaling Factor Registers 0 (ISU_RS_HSCALE)

This register sets the reduction factor of the input image in the horizontal direction.

For details, refer to **Section 36.1.4.3, Scaling Calculation**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	HMANT[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	HFRAC[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19 to 16	HMANT[3:0]	All 0	R/W	Horizontal reduction factor (integer part) 0: Setting prohibited
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	HFRAC[11:0]	All 0	R/W	Horizontal multiplication factor (decimal part)

36.3.22 RS Scaling Factor Registers 1 (ISU_RS_VSCALE)

This register sets the reduction factor of the input image in the vertical direction.

For details, refer to **Section 36.1.4.3, Scaling Calculation**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	VMANT[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	VFRAC[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19 to 16	VMANT[3:0]	All 0	R/W	Vertical reduction factor (integer part) 0: Setting prohibited
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	VFRAC[11:0]	All 0	R/W	Vertical reduction factor (decimal part)

36.3.23 RS Output Image Start Position Registers (ISU_RS_STPOS)

This register sets the resize start position.

For details, refer to **Section 36.1.4.1, Resize Start Position**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	HSTART[10:0]										
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	VSTART[10:0]										
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
26 to 16	HSTART [10:0]	All 0	R/W	Resize start horizontal position Set the resizing start horizontal position by the number of pixels with the upper left of the input image as the origin. Set it with less than the number of input horizontal pixels (ISU_RPF_SRC_SIZE.S_HSIZE).
15 to 11	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10 to 0	VSTART [10:0]	All 0	R/W	Resize start vertical position Set the resizing start vertical position by the number of pixels with the upper left of the input image as the origin. Set it with less than the number of input vertical pixels (ISU_RPF_SRC_SIZE.S_VSIZE).

36.3.24 RS Output Image Start Position Tuning Registers (ISU_RS_POS_TUNE)

This register sets the offset for fine adjustment of the reduction start position.

For details, refer to **Section 36.1.4.2, Sub Pixel Offset**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	HST_TUNE[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	VST_TUNE[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 16	HST_TUNE [11:0]	All 0	R/W	Offset from the resize-starting horizontal position (ISU_RS_STPOS.HSTART) Set the offset to be added to the horizontal position at the start of resizing in 4,096 steps (0 to less than 1 pixel of the input image).
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	VST_TUNE [11:0]	All 0	R/W	Offset from the resize-starting vertical position (ISU_RS_STPOS.VSTART) Set the offset to be added to the vertical position at the start of resizing in 4,096 steps (0 to less than 1 pixel of the input image).

36.3.25 RS Output Size Crop Registers (ISU_RS_OS_CROP)

This register sets the crop size of the reduced image.

For details, refer to **Section 36.1.4, Resizer (RS)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	O_HSIZE[10:0]										
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	O_VSIZE[10:0]										
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
26 to 16	O_HSIZE [10:0]	All 0	R/W	Horizontal crop size Set the horizontal crop size in pixels. Set it in the range of 1 to 1920. 0: Setting prohibited 1921 to: Setting prohibited *Note 1.* For YCbCr type, set it to an even number.
15 to 11	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10 to 0	O_VSIZE [10:0]	All 0	R/W	Vertical crop size Set the vertical crop size in pixels. Set it in the range of 1 to 1080. 0: Setting prohibited 1081 to: Setting prohibited *Note 1.* For YCbCr420, set it to an even number.

36.3.26 RS CROP Padding Mode Registers (ISU_RS_PADDMODE)

This register sets the padding method when the reduced image is smaller than the set crop size.

For details, refer to **Section 36.1.4, Resizer (RS)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PADDSEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	PADDSEL	All 0	R/W	Selecting a padding method Set the padding method when the reduced image is smaller than the set crop size. 0: Fill in the padding area by copying the edge pixels after the reduction. 1: Fill in the padding area with the color specified by the register (ISU_RS_PADDVAL.VAL_*).

36.3.27 RS CROP Padding Value Registers (ISU_RS_PADDVAL)

This register sets the color that fills the edges with padding.

For details, refer to **Section 36.1.4, Resizer (RS)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VAL_L3[7:0]								VAL_L2[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	VAL_L3[7:0]	All 0	R/W	The value to fill Layer 3 if the reduced image is smaller than the set crop size.
23 to 16	VAL_L2[7:0]	All 0	R/W	The value to fill Layer 2 if the reduced image is smaller than the set crop size.
15 to 8	VAL_L1[7:0]	All 0	R/W	The value to fill Layer 1 if the reduced image is smaller than the set crop size.
7 to 0	VAL_L0[7:0]	All 0	R/W	The value to fill Layer 0 if the reduced image is smaller than the set crop size.

36.3.28 WPF Destination Plane0 Address Registers 0 (ISU_WPF_DST_ADDH_PL0)

This register sets the start address [33:32] of the output image of “Plane0”.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DADD_PL0 [33:32]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	DADD_PL0 [33:32]	All 0	R/W	Set the write start address [33:32] for “Plane0 (Y/RGB/RAW)”.

36.3.29 WPF Destination Plane0 Address Registers 1 (ISU_WPF_DST_ADDL_PL0)

This register sets the start address [33:32] of the output image of “Plane0”.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DADD_PL0[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DADD_PL0[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DADD_PL0 [31:0]	All 0	R/W	Set the write start address [31:0] for “Plane0 (Y/RGB/RAW)”. *Note 1.* Set an address that is a multiple of 512-byte.

36.3.30 WPF Destination Plane1 Address Registers 0 (ISU_WPF_DST_ADDH_PL1)

This register sets the start address [33:32] of the output image of “Plane1”.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DADD_PL1 [33:32]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	DADD_PL1 [33:32]	All 0	R/W	Set the write start address [33:32] for “Plane1 (C(Cb/Cr))”.

36.3.31 WPF Destination Plane1 Address Registers 1 (ISU_WPF_DST_ADDL_PL1)

This register sets the start address [31:0] of the output image of “Plane1”.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DADD_PL1[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DADD_PL1[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DADD_PL1 [31:0]	All 0	R/W	Set the write start address [31:0] for “Plane1 (C(Cb/Cr))”. *Note 1.* Set an address that is a multiple of 512-byte.

36.3.32 WPF Destination Stride Registers (ISU_WPF_DST_STRD)

This register sets the stride of the output image.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSTRPL0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSTRPL1[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	DSTRPL0 [15:0]	All 0	R/W	Set the “Plane0 (Y/RGB/RAW)” stride Set the “Plane0 (Y/RGB/RAW)” stride in bytes. *Note 1.* Set it as a multiple of 32 bytes and at least the number of horizontal crop size (ISU_RS_OS_CROP.O_HSIZE).
15 to 0	DSTRPL1 [15:0]	All 0	R/W	Set the “Plane1 (C(Cb/Cr))” stride Set the “Plane1 (C(Cb/Cr))” stride in bytes. *Note 1.* Set it as a multiple of 32 bytes and at least the number of horizontal crop size (ISU_RS_OS_CROP.O_HSIZE).

36.3.33 WPF Destination Image Format Registers (ISU_WPF_FMT)

This register sets the color format of the output image.

For details, refer to **Section 36.1.5.3, Formatter**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	WDFMT[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5 to 0	WDFMT[5:0]	All 0	R/W	Color format of output image The following formats can be configured. H’00: ARGB1555 H’01: RGB565 H’02: BGR666 H’03: RGB888 H’04: BGR888 H’05: ARGB8888 H’06: RGBA8888 H’07: ABGR8888 H’20: YCbCr422 8-bit UYVY H’21: YCbCr422 8-bit YUY2 H’22: YCbCr422 8-bit NV16 H’23: YCbCr420 8-bit NV12 H’30: RAW8 H’31: RAW10 H’32: RAW12 Others: Setting prohibited

36.3.34 WPF Color Correction Control Registers (ISU_WPF_CCOL)

This register sets the color conversion correction control.

For details, refer to **Section 36.1.5.1, Color Correction**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CMAT_SEL	CMAT_ASEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CMAT_SEL	0	R/W	Color conversion correction control 0: No conversion 1: Conversion
0	CMAT_ASEL	0	R/W	A (Alpha) color conversion correction control 0: No conversion 1: Conversion

36.3.35 WPF Color Correction MUL Coefficient Registers1 (ISU_WPF_MUL1)

This register sets the matrix value K11 for the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	K11[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 0	K11[13:0]	All 0	R/W	Color Correction Coefficient K11 Signed fixed point: 4-bit integer part, 10-bit decimal part

36.3.36 WPF Color Correction MUL Coefficient Registers2 (ISU_WPF_MUL2)

This register sets the matrix value K12 and K13 for the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	K12[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	K13[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29 to 16	K12[13:0]	All 0	R/W	Color Correction Coefficient K12 Signed fixed point: 4-bit integer part, 10-bit decimal part
15 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 0	K13[13:0]	All 0	R/W	Color Correction Coefficient K13 Signed fixed point: 4-bit integer part, 10-bit decimal part

36.3.37 WPF Color Correction MUL Coefficient Registers3 (ISU_WPF_MUL3)

This register sets the matrix value K21 for the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	K21[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 0	K21[13:0]	All 0	R/W	Color Correction Coefficient K21 Signed fixed point: 4-bit integer part, 10-bit decimal part

36.3.38 WPF Color Correction MUL Coefficient Registers4 (ISU_WPF_MUL4)

This register sets the matrix value K22 and K23 for the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	K22[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	K23[13:0]

R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29 to 16	K22[13:0]	All 0	R/W	Color Correction Coefficient K22 Signed fixed point: 4-bit integer part, 10-bit decimal part
15 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 0	K23[13:0]	All 0	R/W	Color Correction Coefficient K23 Signed fixed point: 4-bit integer part, 10-bit decimal part

36.3.39 WPF Color Correction MUL Coefficient Registers5 (ISU_WPF_MUL5)

This register sets the matrix value K31 for the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	K31[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 0	K31[13:0]	All 0	R/W	Color Correction Coefficient K31 Signed fixed point: 4-bit integer part, 10-bit decimal part

36.3.40 WPF Color Correction MUL Coefficient Registers6 (ISU_WPF_MUL6)

This register sets the matrix value K32 and K33 for the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	K32[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	K33[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29 to 16	K32[13:0]	All 0	R/W	Color Correction Coefficient K32 Signed fixed point: 4-bit integer part, 10-bit decimal part
15 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 0	K33[13:0]	All 0	R/W	Color Correction Coefficient K33 Signed fixed point: 4-bit integer part, 10-bit decimal part

36.3.41 WPF Color Correction Offset Coefficient Registers1 (ISU_WPF_OFST1)

This register sets the offset 1 of the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OFST_A1[7:0]								OFST_B1[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OFST_C1[7:0]								—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	OFST_A1 [7:0]	All 0	R/W	Color Correction Offset value A1 Unsigned integer 8-bit
23 to 16	OFST_B1 [7:0]	All 0	R/W	Color Correction Offset value B1 Unsigned integer 8-bit
15 to 8	OFST_C1 [7:0]	All 0	R/W	Color Correction Offset value C1 Unsigned integer 8-bit
7 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

36.3.42 WPF Color Correction Offset Coefficient Registers2 (ISU_WPF_OFST2)

This register sets the offset 2 of the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OFST_A2[7:0]								OFST_B2[7:0]

	—	—	—	—	—	—	—	—	—	—	—	—	AWLEN_MAX[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19 to 16	ARLEN_ MAX[3:0]	H'F	R/W	Upper limit of read data burst length H'3: Up to 4-beat burst H'7: Up to 8-beat burst H'F: Up to 16-beat burst Others: Setting prohibited
15 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3 to 0	AWLEN_ MAX[3:0]	H'F	R/W	Upper limit of write data burst length H'3: Up to 4-beat burst H'7: Up to 8-beat burst H'F: Up to 16-beat burst Others: Setting prohibited

36.4 Operation

36.4.1 Start Processing

After setting various registers, write 1 to the start instruction bit to start.

At that time, start it together with the setting of whether to execute by the descriptor method.

Table 36.11 Explanation for ISU FM Frame Control Registers (ISU_FM_FRCON)

ICU_FM_FRCON		Description
Bit 16	DESON	0: Execute with Descriptor read OFF. 1: Execute with Descriptor read ON.
Bit 0	START	When the frame processing start is executed, the frame completion interrupt and descriptor capture completion interrupt are automatically cleared. [Write] 0: NOP 1: Start Frame Processing [Read] Always Zero is read.

36.4.1.1 Descriptor List Address

In the case of the descriptor method (DESON = 1 and START is set to 1), the access to acquire the descriptor list is performed first. The access destination is set in advance in the following register.

- FM Descriptor List Address Register0 (ISU_FM_DL_STADDH [2: 0])
- FM Descriptor List Address Register1 (ISU_FM_DL_STADDL [31: 0])

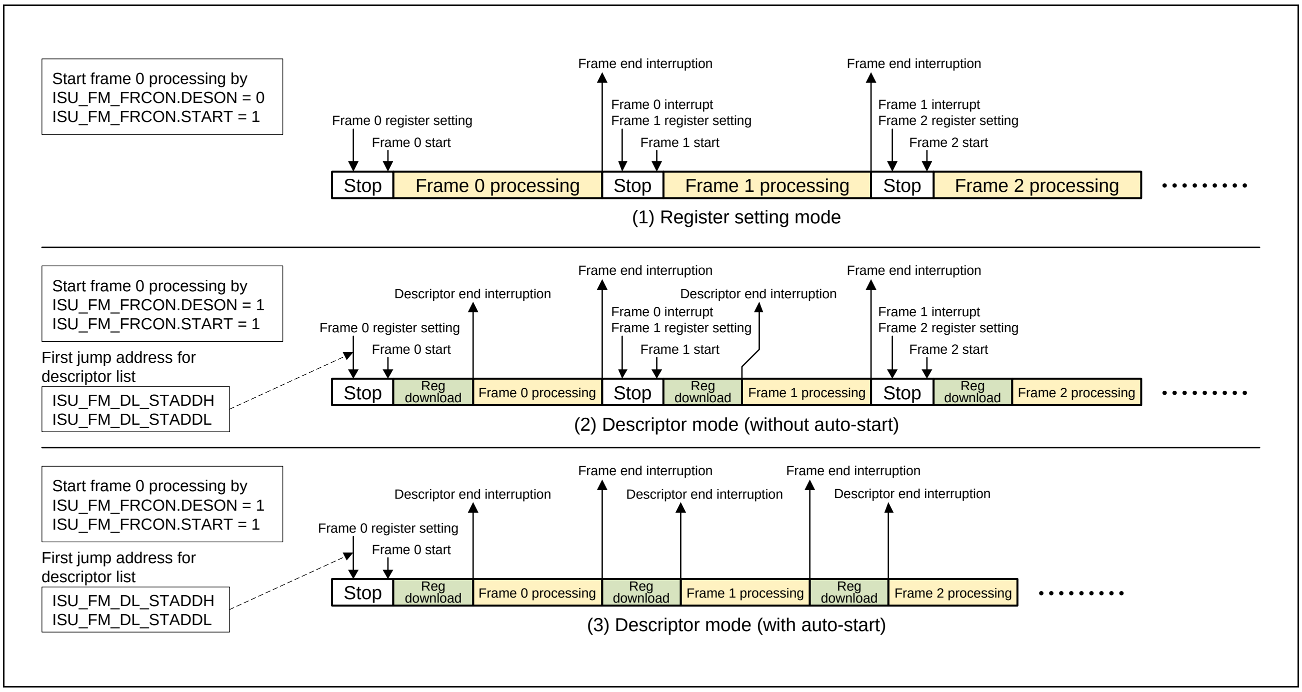

Figure 36.44 Relationship Between Register ISU_FM_FRCON Setting and Frame Processing Mode

36.4.1.2 Frame End Interruption

- When started with ISU_FM_FRCON.DESON = 0
  - An interrupt is generated when one frame processing is completed inside the ISU.
  - Completion of 1-frame processing shall meet the following conditions.
    1) Write the reduced data from the AXI bus and receive the response of the response channel.
    2) The FIFO pointer of the input image is in the initial state (empty state), and the FIFO pointer of the output image is also in the initial state (empty state).
    3) You have not accidentally started capturing the image of the next frame.
  - When the descriptor is not used, only one interrupt is held instead of two interrupts.

- When started with ISU_FM_FRCON.DESON = 1
  - One frame processing by the descriptor is completed, and an interrupt is issued in the descriptor list. An interrupt is generated when it is enabled (see the corresponding bit in the footer).
  - In the descriptor method, it advances to the next frame without doing anything after the interrupt occurs. In this case, the interrupt remains on.
  - If an interrupt is issued in the next frame, it means that two interrupts have occurred. In this case, the interrupt is cleared by clearing the interrupt twice (clearing from the oldest one).
  - ISU retains the latest two interrupt information.

36.4.2 Stop Processing

There are two ways to stop it.

- Normal stop
  - When started with ISU_FM_FRCON.DESON = 0
    It will end automatically when the processing of one frame is completed. After completion, the read and write FIFOs on the AXI-Master side will also be empty.
  - When started with ISU_FM_FRCON.DESON = 1
    If there is no instruction to execute the next frame in the footer of the descriptor, it will automatically end after executing one frame. After completion, the read and write FIFOs on the AXI-Master side will also be empty.

- Emergency stop

Emergency stop will be stopped by register setting from APB.

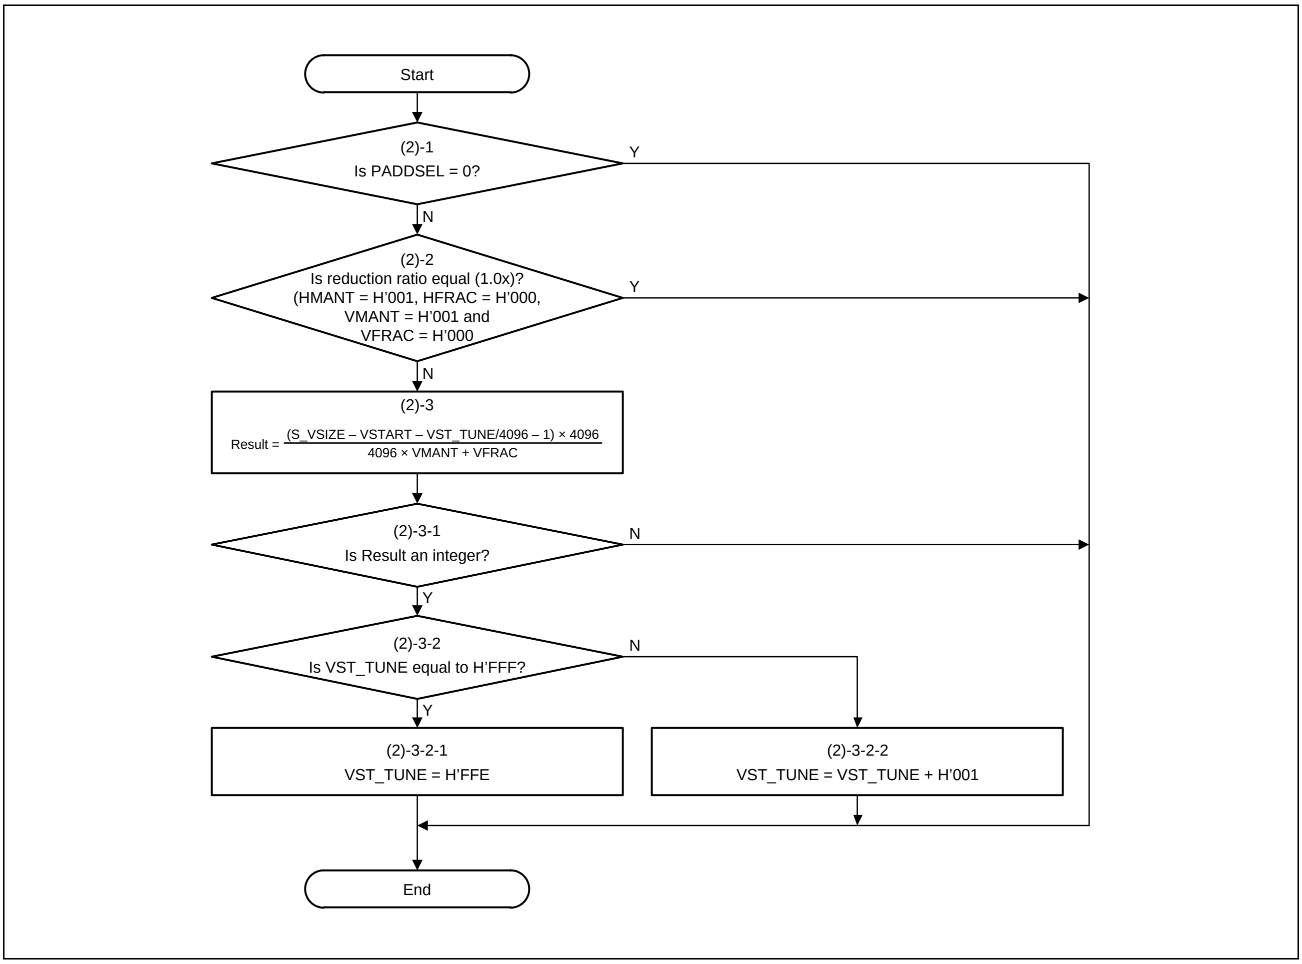
In response to the instruction from APB, the transfer to the bus in process of AXI-Master is executed until a correct response is made, and after it is completed, an interrupt signal is issued. After that, when restarting from the system side, ISU system reset is always applied from the outside and executed from initialization.

If the APB instructs the emergency stop again during the emergency stop process, only the first emergency stop instruction will be valid.

36.4.3 Setting the vertical size, start position and reduction factor

Set the input image size, start position, and reduction ratio before calculating the reduction by Resizer (RS).

Before setting the parameters, please check and adjust the following settings for the vertical direction.



(1) List of related registers

ISU_RPF_SRC_SIZE. S_VSIZE[11:0]
ISU_RS_STPOS.VSTART[10:0]
ISU_RS_POS_TUNE.VST_TUNE[11:0]
ISU_RS_VSCALE.VMANT[3:0]
ISU_RS_VSCALE.VFRAC[11:0]
ISU_RS_HSCALE.HMANT[3:0]
ISU_RS_HSCALE.HFRAC[11:0]
ISU_RS_PADDMODE.PADDSEL

(2) Confirmation and determination of setting values

(2)-1 When PADDSEL = 0
There is no need to change those register parameters.

(2)-2 When the reduction ratio is equal (1.0x)
In other words, when HMANT = H'1, HFRAC = H'000, VMANT = H'1 and VFRAC = H'000
There is no need to change those register parameters.

(2)-3 When the setting value is other than the above (other than equal)
Perform the following calculations.

$$\mathrm{Result} = \frac{(\mathrm{S\_VSIZE} - \mathrm{VSTART} - \mathrm{VST\_TUNE}/4096 - 1) \times 4096}{4096 \times \mathrm{VMANT} + \mathrm{VFRAC}}$$

(2)-3-1 If the calculation result (Result) is not an integer
There is no need to change those register parameters.

(2)-3-2 If the calculation result (Result) is an integer

(2)-3-2-1 If VST_TUNE is equal to H’FFF
VST_TUNE = H’FFE

(2)-3-2-2 If VST_TUNE is not equal to H’FFF
VST_TUNE = VST_TUNE + H’001 (Add 1 to correct the start position)

36.5 Usage Notes

This section shows examples of converting image size and color format using the image scaling unit (ISU).

36.5.1 Interlace to Progressive (IP) Conversion

Although ISU does not have dedicated IP Conversion feature, it is possible to realize similar result by controlling image output address.

Since the ISU does not have functionality to read two images alternately, IP conversion is handled by arranging top and bottom images in a grid pattern by setting the output stride for two lines and shifting the output start address. The output stride must be set to a value in consideration of restrictions for 512-byte boundary of the output start address.

For example, if the output data size for one line is a 300-byte image, 600 bytes are required for two lines. However, when converting to Interface to Progressive, the output stride must be a multiple of 512Byte because the start address of the Bottom line must be set to the 512Byte boundary as well as the start address of the TOP line.

Since this method simply realizes IP Conversion by using the output address control, please note there is not any image processing between Top line and Bottom line.

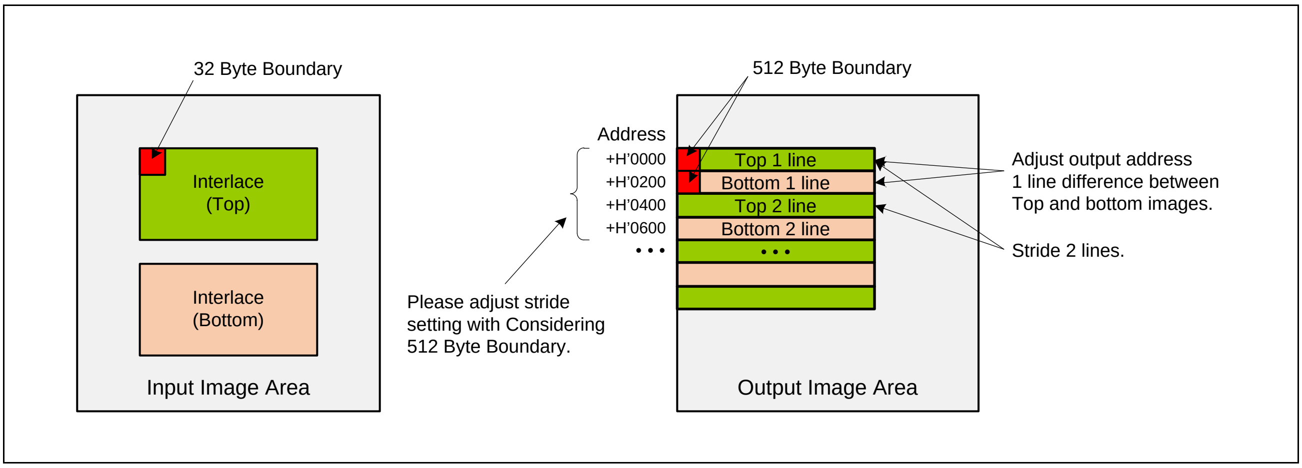


Figure 36.45 Schematic Diagram of IP Conversion

36.5.2 Image Size Conversion

36.5.2.1 NTSC (720 × 480) → WQVGA (400 × 240) with Preserving Aspect Ratio

Set as follows to handle image size conversion.

Table 36.12 Image Size Conversion Example 1

Item	Description
Assuming that the following image is input from the CRU	
Input size	720 × 480
Input format	YCbCr422 8-bit UYVY, Interleave * For IP conversion, see **Section 36.5.1**.
Input start address	H'0_5000_0000 (InterlaceTop) H'0_5010_0000 (InterlaceBottom) H'0_5020_0000 (Progressive)
Input stride	Plane 0 = H'5A0
ISU setting	
Output (CROP) size	380 × 240 (Right-end 20 pixels padding)
Output format	YCbCr422 8-bit UYVY, Interleave
Output start address	Plane 0 = H'0_6000_000
Output stride	Plane 0 = H'300
Processing method	Descriptor method with automatic start of the next frame
Color format conversion	None
Descriptor address	Table 1: H'8000_0000 Table 2: H'8000_0100 Table 3: H'8000_0200

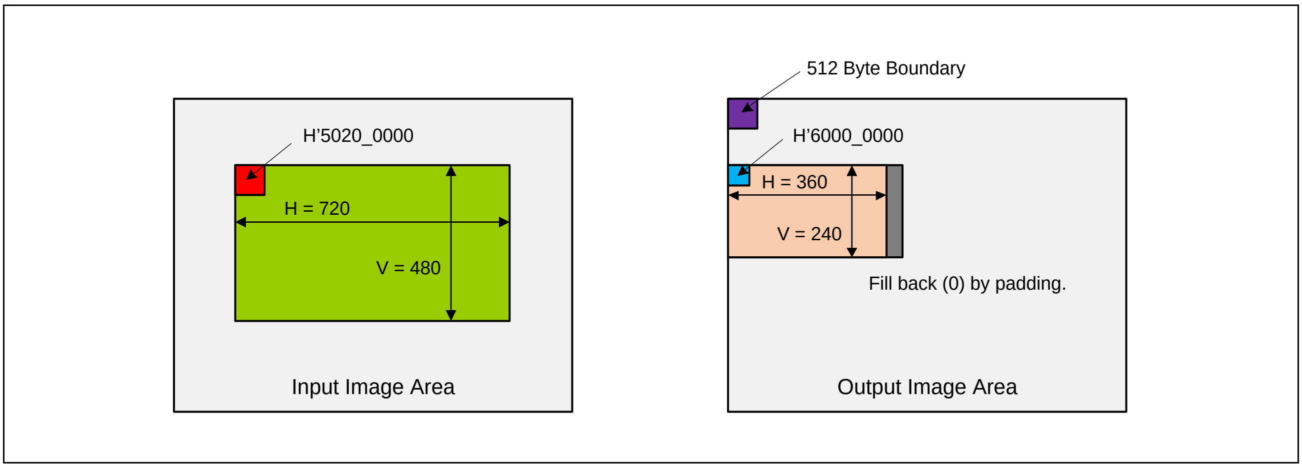

Figure 36.46 Image Size Conversion Example 1

Obtain the multiplication coefficient in the horizontal direction.

720 / 360 = 2.0
HMANT (integer part) = 2 = H’2
HFRAC (decimal part) = 0.0 × 4096 (Q12) = 0.0 = H’0

Obtain the multiplication coefficient in the vertical direction.

480 / 240 = 2.0
VMANT (integer part) = 2 = H’2
VFRAC (decimal part) = 0.0 × 4096 (Q12) = 0.0 = H’0

Note: HFRAC and VFRAC are set by unsigned fixed point Q12 and are truncated after the decimal point.

Set PADDSEL and VAL_L* to make the right-end 20 pixels a black image.

PADDSEL = H’1 (filled with the color specified when the reduced image is smaller than the specified CROP)
VAL_L1, VAL_L2, and VAL_L3 correspond to Y, Cb, and Cr respectively.
Set VAL_L1 = H’10, L2 = H’80, and L3 = H’80 for black images with YCbCr.

36.5.2.2 NTSC (720 × 480) → WQVGA (400 × 240) without Preserving Aspect Ratio

Set as follows to handle image size conversion.

Table 36.16 Image Size Conversion Example 2

Item	Description
Assuming that the following image is input from the CRU	
Input size	720 × 480
Input format	YCbCr422 8-bit UYVY, Interleave * For IP conversion, see **Section 36.5.1**.
Input start address	H'0_5000_0000 (InterlaceTop) H'0_5010_0000 (InterlaceBottom) H'0_5020_0000 (Progressive)
Input stride	Plane 0 = H'5A0
ISU setting	
Output (CROP) size	400 × 240
Output format	YCbCr422 8-bit UYVY, Interleave
Output start address	Plane 0 = H'0_6000_000
Output stride	Plane 0 = H'320
Processing method	Descriptor method without automatic start of the next frame
Color format conversion	None
Descriptor address	Table 1: H'8000_0000 Table 2: H'8000_0100 Table 3: H'8000_0200

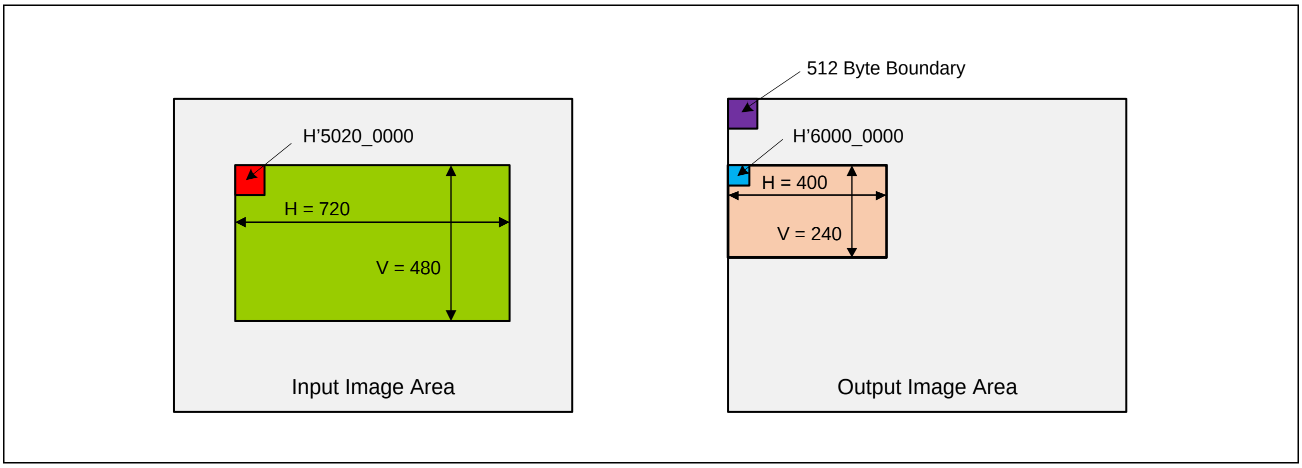

Figure 36.48 Image Size Conversion Example 2

Obtain the multiplication coefficient in the horizontal direction.

720 / 400 = 1.8
HMANT (integer part) = 1 = H’1
HFRAC (decimal part) = 0.8 × 4096 (Q12) = 3276.8 = H’CCC

Obtain the multiplication coefficient in the vertical direction.

480 / 240 = 2.0
VMANT (integer part) = 2 = H’2
VFRAC (decimal part) = 0.0 × 4096 (Q12) = 0.0 = H’0

Note: HFRAC and VFRAC are set by unsigned fixed point Q12 and are truncated after the decimal point.

36.5.3.2 YCbCr422 → ARGB8888

Set as follows to handle color format conversion.

Table 36.28 Color Format Conversion Example 2

Item	Description
Assuming that the following image is input from the CRU	
Input size	320 × 240
Input format	YCbCr422 8-bit UYVY (Interleave)
Input start address	H’0_5000_0000
Input stride	Plane 0 = H’280
ISU setting	
Output (CROP) size	320 × 240
Output format	ARGB8888
Output start address	Plane 0 = H’0_6000_000
Output stride	Plane 0 = H’500
Processing method	Register
Color format conversion	YCbCr → RGB (BT.601 SDTV)

The following shows the matrix operation formula for conversion and color correction.

$$\begin{bmatrix} C1' \\ C2' \\ C3' \end{bmatrix} = \begin{bmatrix} K11 & K12 & K13 \\ K21 & K22 & K23 \\ K31 & K32 & K33 \end{bmatrix} \cdot \begin{bmatrix} A - OFS\_A1 \\ B - OFS\_B1 \\ C - OFS\_C1 \end{bmatrix} + \begin{bmatrix} OFST\_A2 \\ OFST\_B2 \\ OFST\_C2 \end{bmatrix}$$

$$C1'' = MAX\,(clip\_a\_min,\ Min\,(clip\_a\_max,\ C1'))$$
$$C2'' = MAX\,(clip\_b\_min,\ Min\,(clip\_b\_max,\ C2'))$$
$$C3'' = MAX\,(clip\_c\_min,\ Min\,(clip\_c\_max,\ C3'))$$

Figure 36.55 Matrix Operation Formula for Conversion and Color Correction

The following shows the YCbCr422-to-RGB conversion formula (BT.601 SDTV).

$R = 1.164\ (Y - 16) + 1.596\ (Cr - 128)$
$G = 1.164\ (Y - 16) - 0.391\ (Cb - 128) - 0.813\ (Cr - 128)$
$B = 1.164\ (Y - 16) + 2.018\ (Cb - 128)$
* R/G/B: 0 to 255

Perform YCbCr-to-RGB conversion with the following allocation.

$R = K11\ (Y - OFST\_A1) + K12\ (Cb - OFST\_B1) + K13\ (Cr - OFST\_C1) + OFST\_A2$
$G = K21\ (Y - OFST\_A1) + K22\ (Cb - OFST\_B1) + K23\ (Cr - OFST\_C1) + OFST\_B2$
$B = K31\ (Y - OFST\_A1) + K32\ (Cb - OFST\_B1) + K33\ (Cr - OFST\_C1) + OFST\_C2$

Note: K** is set by signed fixed point Q10.
Example: K11 = 1.164 × 1024 = 1191.936 = H’4A8
Rounded to the nearest whole number.

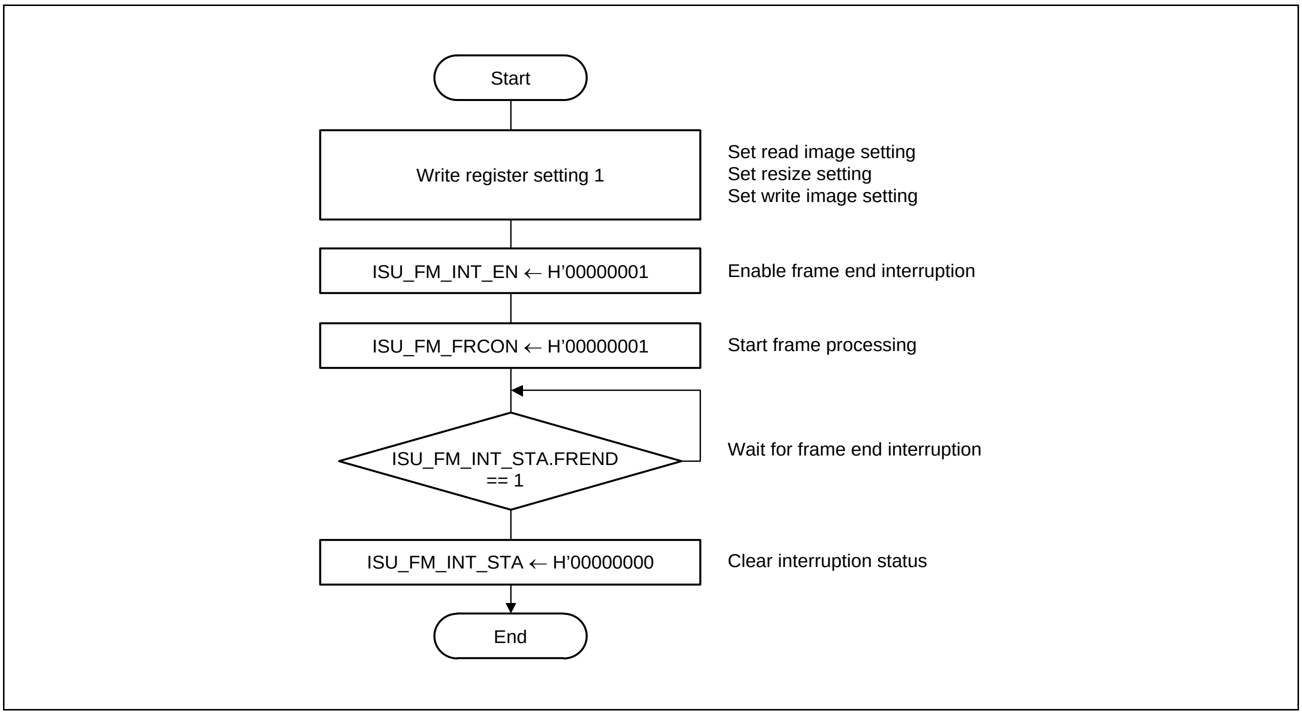

Figure 36.56 Flowchart of Color Format Conversion 2

36.5.3.3 BGR888 → YCbCr422

Set as follows to handle color format conversion.

Table 36.30 Color Format Conversion Example 3

Item	Description
Assuming that the following image is input from the CRU	
Input size	320 × 240
Input format	BGR888
Input start address	H’0_5000_0000
Input stride	Plane 0 = H’03C0
ISU setting	
Output (CROP) size	320 × 240
Output format	YCbCr422 8-bit UYVY (Interleave)
Output start address	Plane 0 = H’0_6000_000
Output stride	Plane 0 = H’0280
Processing method	Register
Reduction setting	No reduction
Color format conversion	RGB → YCbCr (BT.601 SDTV)

The following shows the matrix operation formula for conversion and color correction.

$$\begin{bmatrix} C1' \\ C2' \\ C3' \end{bmatrix} = \begin{bmatrix} K11 & K12 & K13 \\ K21 & K22 & K23 \\ K31 & K32 & K33 \end{bmatrix} \cdot \begin{bmatrix} A - OFS\_A1 \\ B - OFS\_B1 \\ C - OFS\_C1 \end{bmatrix} + \begin{bmatrix} OFST\_A2 \\ OFST\_B2 \\ OFST\_C2 \end{bmatrix}$$

$$C1'' = MAX\ (clip\_a\_min,\ Min\ (clip\_a\_max,\ C1'))$$
$$C2'' = MAX\ (clip\_b\_min,\ Min\ (clip\_b\_max,\ C2'))$$
$$C3'' = MAX\ (clip\_c\_min,\ Min\ (clip\_c\_max,\ C3'))$$

Figure 36.57 Matrix Operation Formula for Conversion and Color Correction

The following shows the RGB-to-YCbCr422 conversion formula (BT.601 SDTV).

$Y = 0.257R + 0.504G + 0.098B + 16$
$Cb = -0.148R - 0.291G + 0.439B + 128$
$Cr = 0.439R - 0.368G - 0.071B + 128$
* Brightness: 16 to 235
* Color difference: 16 to 240

Perform RGB-to-YCbCr conversion with the following allocation.

$Y = K11\ (R - OFST\_A1) + K12\ (G - OFST\_B1) + K13\ (B - OFST\_C1) + OFST\_A2$
$Cb = K21\ (R - OFST\_A1) + K22\ (G - OFST\_B1) + K23\ (B - OFST\_C1) + OFST\_B2$
$Cr = K31\ (R - OFST\_A1) + K32\ (G - OFST\_B1) + K33\ (B - OFST\_C1) + OFST\_C2$

Note: K** is set by signed fixed point Q10.
Example: K11 = 0.257 × 1024 = 263.168 = H’107
Rounded to the nearest whole number.

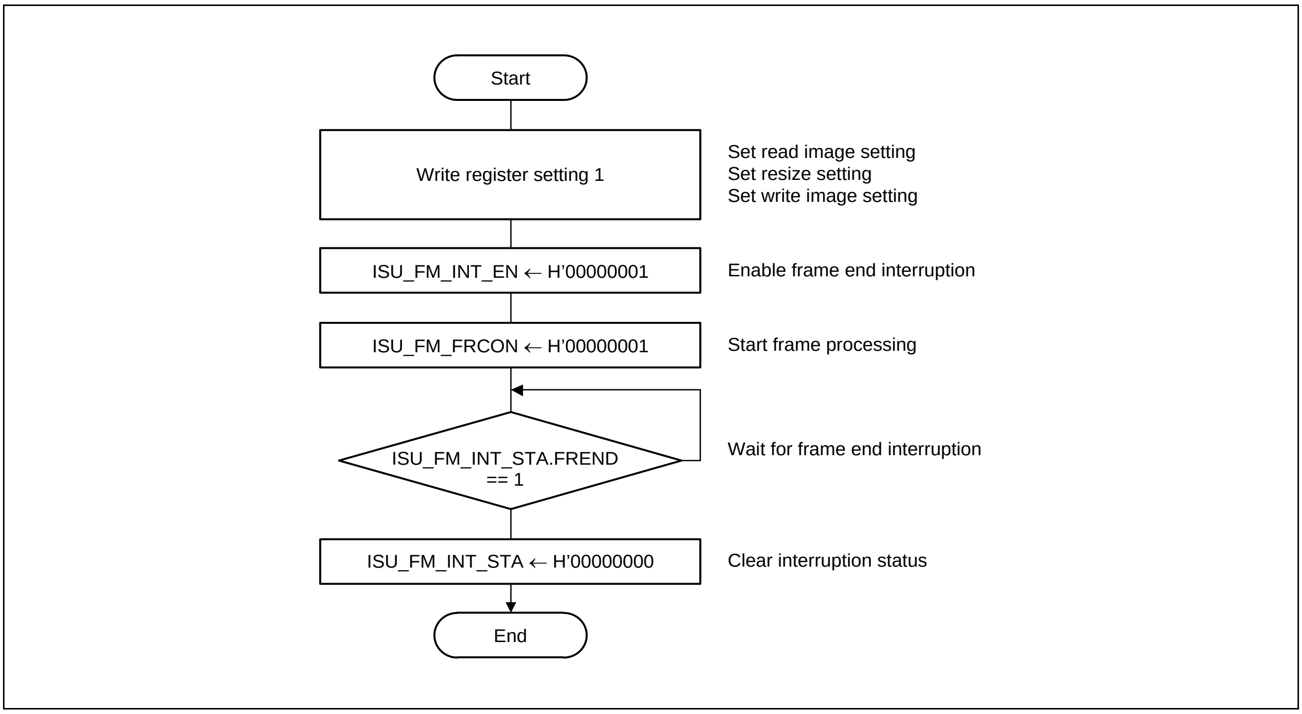

Figure 36.58 Flowchart of Color Format Conversion Example 3

37. Video Codec Processor (VCPL4)

The VCPL4 is a H.264 codec module. Require software or the library to RENESAS for operating this module.

Figure 37.1 shows VCPL4 and related modules for this LSI. The VCPL4 is connected memory bus (AXI-bus) via companion modules, FCPCS. For detail information, refer **Section 38**.

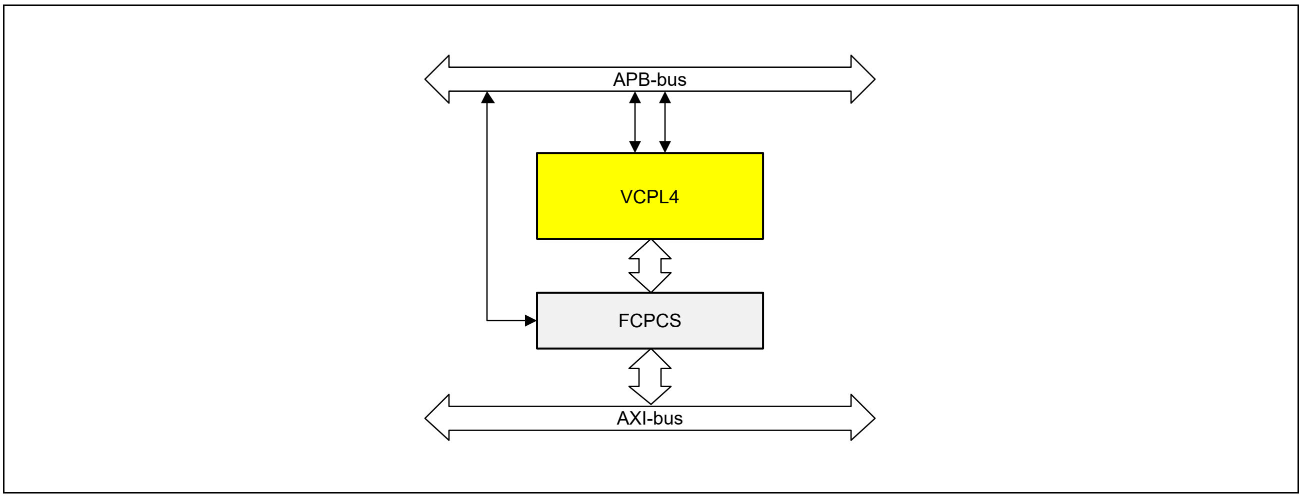

Figure 37.1 VCPL4 and Related Modules

37.1 Features

The VCPL4 has the following features.

- Support for H.264 decoding and encoding
- Support up to 1920 × 1080 resolution
- Data handling on a picture-by-picture basis
    - Encode/decode data one picture (frame or field) at a time.
- High picture quality
    - Support the H.264 high-efficiency coding tools (CABAC, 8 × 8 frequency conversion, and quantization matrix).
    - High-efficiency motion vector detection by a combination of discrete search and trace search
    - Optimal-mode selection by Rate-Distortion (RD) cost evaluation
    - Picture quality control based on activity analysis results which match visual models

Table 37.1 Main Function of the VCPL4

Item	Description
Encoding standard supported	● H.264/AVC – High Profile@Level 4.1 – Main Profile@Level 4.1 – Baseline Profile@Level 4.1 (The arbitrary slice order, flexible macroblock order and redundant slice aren't supported)
Decoding standard supported	● H.264/AVC – High Profile@Level 4.1 – Main Profile@Level 4.1 – Baseline Profile@Level 4.1 (The arbitrary slice order, flexible macroblock order and redundant slice aren't supported)
Maximum pixel rate	1920 × 1080p × 30 fps
Maximum bit rate	200 Mbps × 1ch *Note*: a target bitrate can be set for each picture by using Renesas software.
Picture size supported in decoding	● Minimum size: Horizontal 80 pixels × vertical 80 lines ● Maximum size: 1920 pixels × vertical 1080 lines ● Horizontal size is a multiple of 2 pixels, and vertical size is a multiple of 2 lines. Additionally, 1080 × 1920 is supported.
Picture size supported in encoding	● Minimum size: Horizontal 80 pixels × vertical 80 lines ● Maximum size: Horizontal 1920 pixels × vertical 1080 lines ● Horizontal size is a multiple of 8 pixels, and vertical size is a multiple of 8 lines. Additionally, 320 × 180, 854 × 480 (WVGA+), 1080 × 1920 are supported.
Color format	● YCbCr 4:2:0 semi-planar (Y and C plane) are supported as an input picture in encoding. ● YCbCr 4:2:0 semi-planar is supported as an output picture in decoding. ● Cb/Cr and Cr/Cb interleaving order is supported in YCbCr 4:2:0 semi-planar.
Bit stream format	● Video elementary stream as shown in **Figure 37.1**. ● Function to add or remove the emulation prevention byte in the H.264 bit stream is supported.
Picture structure	Frame structure and field structure

Table 37.2 Main Function of the VCPL4

Standard	Standard	Decoding Range
H.264	Slice header and subsequent data	Slice header (other than the first slice header in picture) and subsequent data

37.2 Usage Note

37.2.1 Limitations on Software Reset and Module Standby

Before executing following operations for VCPL4, confirm that VCPL4 is not encoding or decoding a picture. If VCPL4 is encoding or decoding a picture, wait completion of encoding or decoding.

- Execute Software Reset by CPG
- Enter Module Standby (stop clock supply) by CPG

37.2.2 Note on Input Bitstream for Decoding

In decoding process of VCPL4, input bitstream not conformant to video codec standard might cause hang of VCPL4.

37.3 Interrupt Request

VCPL4 interrupt requests are listed in the following table.

Table 37.3 Interrupt Requests

Unit Interrupt Signal	Outline
VCP.vcpl4.vint	Interruption request signal from VLC block
VCP.vcpl4.cint	Interruption request signal from CE block
VCP.vcpl4.vedcint	EDC error Interrupt from VLC block
VCP.vcpl4.cedcint	EDC error Interrupt from CE block

38. Frame Compression Processor (FCPCS)

The FCPCS is a companion module of a video processing module with Renesas lossless data compression and decompression (FCL) for the Renesas video codec processor (VCPL4). It provides data compression and decompression, data caching, and converting of AXI transaction in order to reduce the memory bandwidth.

The FCPCS is connected to codec IP cores called VCPL4 (H.264 decoder and encoder).

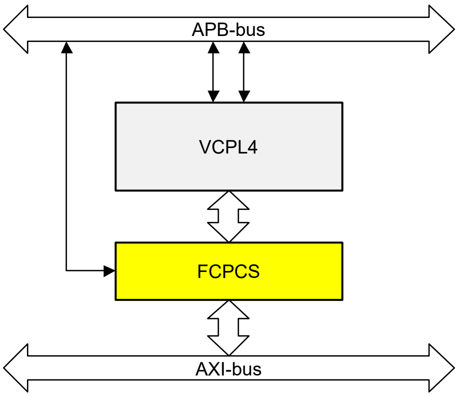

Figure 38.1 FCPCS and Related Modules

38.1 Features

The FCPCS has the following features.

- Support for Lossless compression for decoded picture and decompression for reference picture
- Support 1920 × 1080 resolution
- Support for reference picture cache
- Lossless compression ratio is typically 50%. It may not be compressed since Lossless compression relies on the statistical nature of the original image.

Table 38.1 Main Function of the FCPCS

Item	Description
Data compression and decompression	Renesas lossless (FCL) compression and decompression, Compression for decoded picture, and decompression for reference picture YCbCr 4:2:0 semi-planar and 8-bit depth are supported
Reference picture cache	64 Kbyte
AXI transaction	[Read access] • Out-of-order completion allowed. • Outstanding transactions supported. [Write access] • Out-of-order completion allowed. • Outstanding transactions supported.

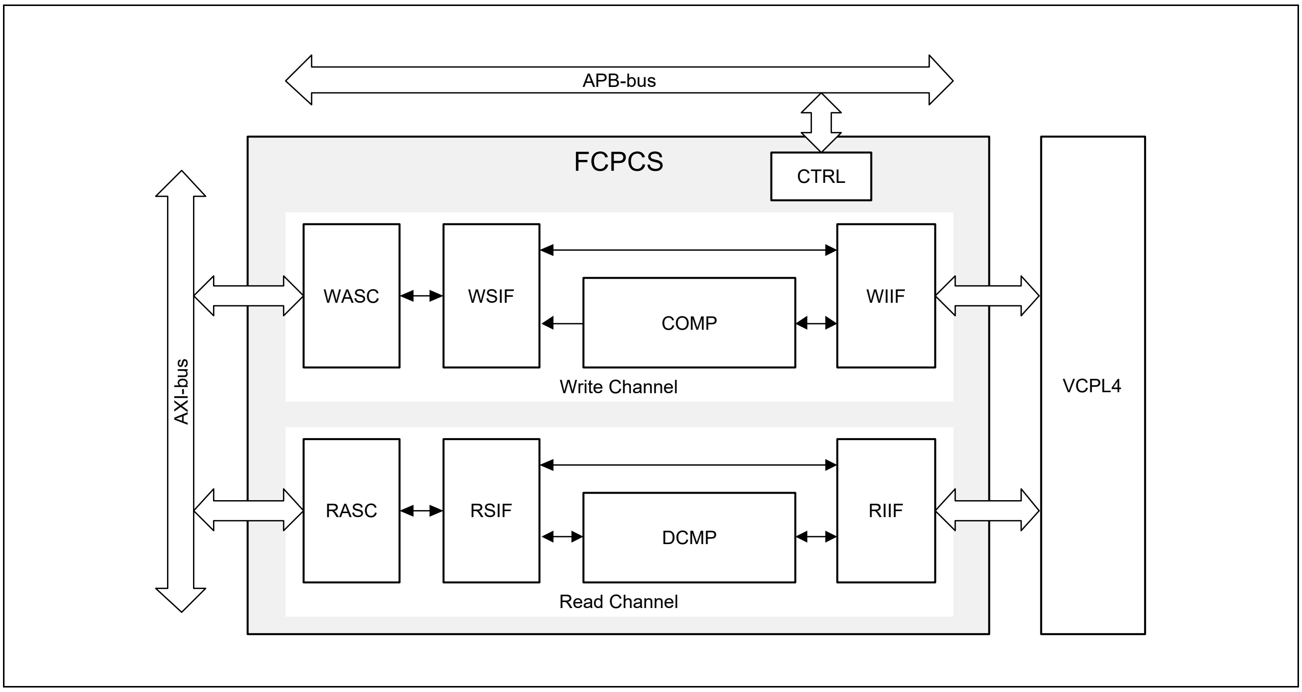

Figure 38.2 FCPCS Block Diagram

Table 38.2 Main Function of the FCPCS

Channel	Abbreviation	Description
Write Channel	COMP	Compression module
	WIIF	Write channel interface for VCPL4
	WSIF	System AXI write channel interface
	WASC	Synchronization of write channel
Read Channel	DCMP	Decompression and cache control module
	RIIF	Read channel interface for VCPL4
	RSIF	System AXI read channel interface
	RASC	Synchronization of read channel

38.2 Usage Note

38.2.1 Limitations on Software Reset and Module Standby

Before executing following operations for FCPCS, confirm that connected modules (VCPL4) are not encoding or decoding a picture. If connected modules are encoding or decoding a picture, wait completion of encoding and decoding.

- Execute Software Reset by CPG
- Enter Module Standby (stop clock supply) by CPG

38.3 Interrupt Request

FCPCS interrupt requests are listed in the following table.

Table 38.3 Interrupt Requests

Unit Interrupt Signal	Outline
VCP.fcpcs.edcint	EDC error Interrupt from FCPCS

39. 3D Graphics Engine (3DGE)

39.1 Overview

This LSI includes the Arm Mali-G31 GPU as a 3D Graphics Engine (3DGE). The Arm Mali-G31 GPU is a graphics acceleration platform that is based on open standards. It supports 2D graphics, 3D graphics, and General Purpose computing on GPU (GPGPU).

39.1.1 Features

The 3DGE has the following features.

- One single-pixel shader core
- 8Kbytes L2 cache
- A programmable architecture.
- An API feature set with support for shader-based and fixed-function graphics APIs.
- Anti-aliasing capabilities.
- An effective core for General Purpose computing on GPU (GPGPU) applications.
- High memory bandwidth and low power consumption for 3D graphics content.
- Latency tolerance.
- Compressed texture formats.
- Coherency aware interconnects for system memory and resource sharing.

The 3DGE and software support compute and graphics API standards.

The 3DGE supports these compute API standards:

- OpenCL 2.0 Full Profile.

The 3DGE supports these graphics API standards:

- OpenGLES 1.1, 2.0, 3.0, 3.1 and 3.2.

39.1.2 Block Diagram

The 3DGE contains the shader processor core and associated blocks, including the tiler, the memory-management unit, and the level 2 cache memory subsystem.

Figure 39.1 shows a block diagram.

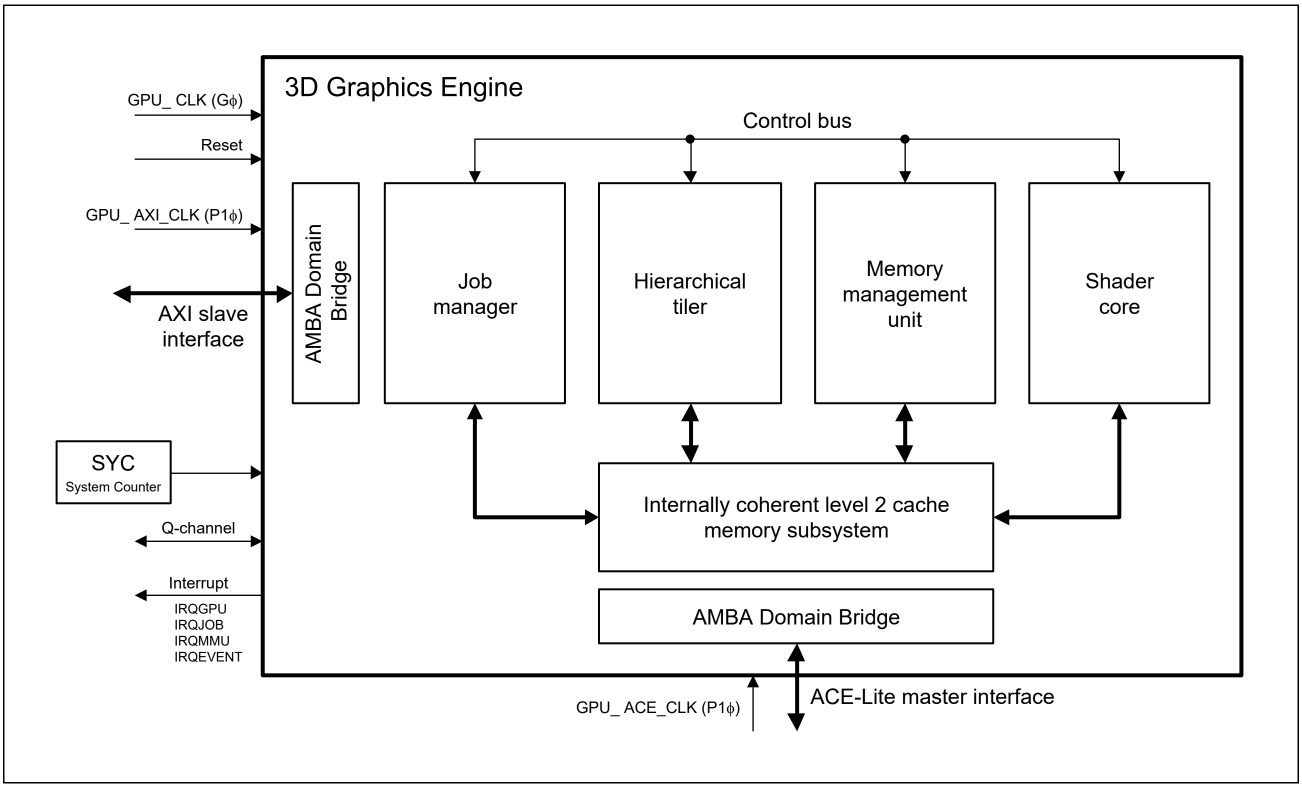

Figure 39.1 Block Diagram

The 3DGE uses a centralized hardware resource manager, called the job manager, that controls the internal GPU functions.

The application software runs on the application processor. When it requires graphics to be displayed on screen, it uses the graphics device driver to send a graphics job to the 3DGE. In the 3DGE, the job manager receives the job, interprets it, and then sends a series of graphics tasks to the internal functional units.

The job manager issues and sends commands to specific functional blocks in the 3DGE.

- The shader core is the main processing engines of the 3DGE. The shader core carries out all the rendering and computation operations.
- The tiler creates lists of all the objects in a scene, so that the shader core processes the objects efficiently.
- The memory management unit performs virtual address to physical address translation of external bus interface accesses.
- The Level 2 cache memory subsystem provides caching for all internal master blocks. It also supports cache coherency for caches in the shader cores. The L2 cache sits between the internal master blocks and the external interconnect. All transactions go through the cache. If the cache cannot service an internal transaction, it performs an external transaction to read or write data.

39.1.3 External Pins

In 3D Graphics Engine, there are no external pins.

39.1.4 Register Configuration

Base address of registers is allocated to H’0_1184_0000. The address range is 64 KB (H’0_1184 0000 - H’0_1184 FFFF).

39.1.5 Usage Note

Renesas does not provide technical support for users to program 3DGE registers directly. Renesas provides users with drivers to program 3DGE. 3DGE supports OpenGLES as a graphics API. When drawing graphics, control according to this API.

39.1.6 Starting SYC

When using 3DGE, it is necessary to supply the clock to the SYC (system counter) and release the reset to keep it running.

40. SD/MMC Host Interface

NOTE

Development of the SD host--related products needs the conclusion of the following agreement. SD Host/Ancillary Product License Agreement (SD HALA)

40.1 Overview

40.1.1 Features

- 2 channels
- Channel 0 supports SDHI / e-MMC
- Channel 1 supports SDHI
- SD memory/IO card interface (1-bit/4-bit SD bus)
- SD, SDHC, and SDXC SD memory card access supported
- Default, high-speed, UHS-I/SDR50, and SDR104 transfer modes supported
- SD clock (SD_CLK) frequency = SDxϕ/4 frequency/2^n (n = 0 to 9) (x = 0, 1)
- Error check function: CRC7 (for command/response), CRC16 (for data)
- Interrupt request: 2
- Card detect function
- Write protect supported
- MMC interface (1-/4-/8-bit MMC bus)
- e-MMC device access supported
- Backward-compatible, high-speed, HS200 transfer modes supported
- High-priority interrupt (HPI) supported

Block Diagram

Figure 40.1 shows a block diagram of the SD/MMC host interfaces.

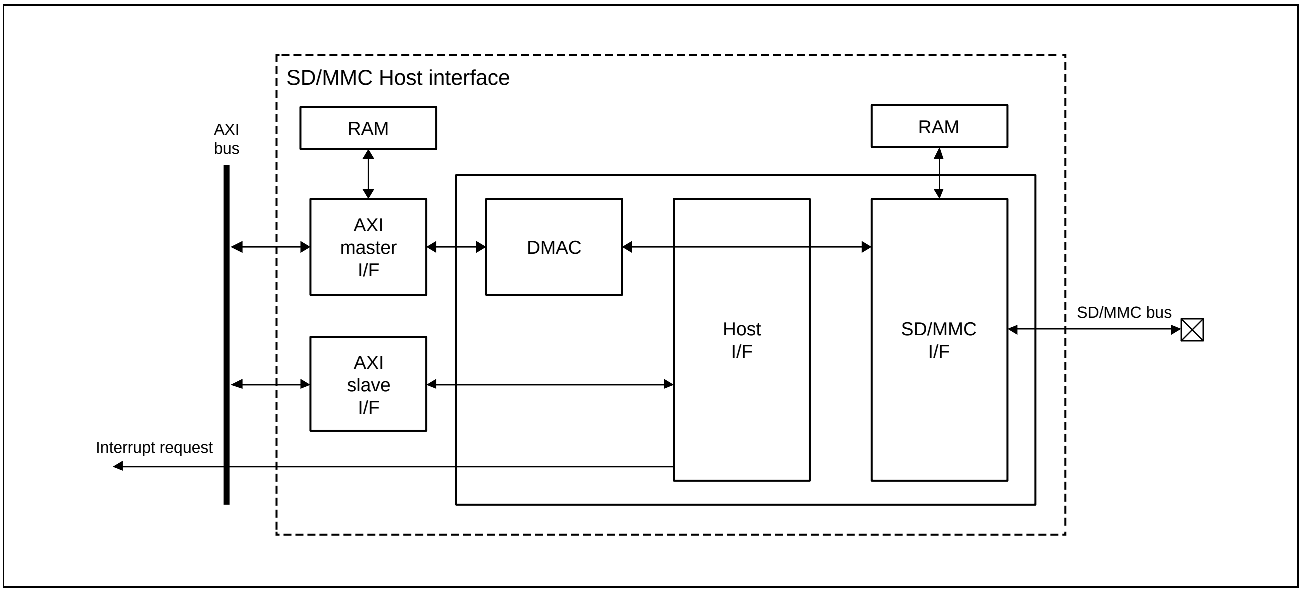

Figure 40.1 Block Diagram of SD/MMC Host Interface

40.1.2 External Pins

Table 40.1 lists the input and output pins used by the interface. The operating voltage on the pins of the SD/MMC host interface is 3.3 V or 1.8 V. Channels 0 and 1 can operate with different voltages. Before using the pins of the SD/MMC host interface, be sure to set the SD ch0/1 IO Voltage Mode Control Register (SD_ch0 and SD_ch1) and Driving Ability Control Register (IOLH).

For details, see the following sections:

Section 41.3.7, Driving Ability Control Register,
Section 41.3.17, SD ch0 IO Voltage Mode Control Register,
Section 41.3.18, SD ch1 IO Voltage Mode Control Register.

Table 40.1 Pin Configuration

PIN Name	I/O	Function
SDx_CLK*[1]	O	SD/MMC clock output
SDx_CMD*[1]	I/O	SD/MMC command output, response input
SDx_DATA0*[1]	I/O	SD/MMC Data 0 [bit 0]
SDx_DATA1*[1]	I/O	SD/MMC Data 1 [bit 1], SDIO interrupt

SD0_DATA7*[1]	I/O	SD/MMC Data 7 [bit 7]
SDx_CD*[1]	I	SD/MMC card detection*[2]
SDx_WP*[1]	I	SD/MMC write protection*[2]
SD0_RST#	O	SD/MMC reset

Note 1. x (= 0, 1) is the channel number of the SD/MMC host interface. In this manual, those pins are referred as SDDAT0, SDDAT1, …, SDDAT7.

Note 2. Fix to 1 when not in use.

40.1.3 Register Configuration

The base addresses for each channel are as follows. The SD interface and MMC interface are switched by setting the command type register (SD_CMD).

Channel 0:
H’0_11C0_0000 (Cortex-A55 Address Space)
H’41C0_0000 (Cortex-M33 Address Space Non-Secure)
H’51C0_0000 (Cortex-M33 Address Space Secure)

Channel 1:
H’0_11C1_0000 (Cortex-A55 Address Space)
H’41C1_0000 (Cortex-M33 Address Space Non-Secure)
H’51C1_0000 (Cortex-M33 Address Space Secure)

Table 40.2 Register Configurations (1/2)

Name	Abbreviation	Address	Access Width	Mirror
Command type register	SD_CMD	H’0000	16/32/64	
Command argument registers	SD_ARG	H’0010	16/32/64	
	SD_ARG1	H’0018	16/32/64	SD_ARG[31:16]
Data stop register	SD_STOP	H’0020	16/32/64

SCC register area*[2]	—	—	—	—

Note 1. Only for channel 0.

Note 2. Refer to **Section 40.7, SCC Register Descriptions**.

40.2 Register Description

40.2.1 Command Type Register (SD_CMD)

The command type register (SD_CMD) is used to select the command type and response type. The command sequence is started by writing to SD_CMD.

For details on the SD_CMD setting, refer to **Section 40.4.14, Example of SD_CMD Register Setting**.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	MD7	00	R/W	Multiple Block Transfer Mode (enabled at multiple block transfer) 00: CMD12 is automatically issued at multiple block transfer. 01: CMD12 is not automatically issued at multiple block transfer. 10: Setting prohibited 11: Setting prohibited
14	MD6			
13	MD5	0	R/W	Single/Multiple Block Transfer (enabled when the command with data is handled) 0: Single block transfer 1: Multi block transfer
12	MD4	0	R/W	Write/Read Mode (enabled when the command with data is handled) 0: Write (SD/MMC host interfaces -> SD card) 1: Read (SD/MMC host interfaces <- SD card)
11	MD3	0	R/W	Data Mode (Command Type) 0: Command without data transfer (bc, bcr, ac) 1: Command with data transfer (adtc)
10	MD2	000	R/W	Mode/Response Type 000: Normal mode The response type and the transfer mode are selected by SD_CMD[7:0], and the SD_CMD[15:11] setting is disabled. 001: Setting prohibited 010: Setting prohibited 011: Extended mode/No response 100: Extended mode/R1, R5, R6, or R7 response from the SD card 101: Extended mode/R1b response from the SD card 110: Extended mode/R2 response from the SD card 111: Extended mode/R3 or R4 response from the SD card Some commands cannot be used in normal mode. For details, see **Section 40.4.14, Example of SD_CMD Register Setting** to select mode/response type.
9	MD1			
8	MD0			
7	C1	00	R/W	00: CMD 01: ACMD 10: Setting prohibited 11: Setting prohibited
6	C0			
5	CF45	000000	R/W	Command Index These bits specify Command Format[45:40] (command index). [Examples] CMD6: SD_CMD[7:0] = 0000 0110b CMD18: SD_CMD[7:0] = 0001 0010b ACMD13: SD_CMD[7:0] = 0100 1101b
4	CF44			
3	CF43			
2	CF42			
1	CF41			
0	CF40			

Note: SD_CMD cannot be written to when the CBSY bit in SD_INFO2 is 1.

40.2.2 Command Argument Register (SD_ARG)

Command arguments for SD cards are set in the SD command argument registers (SD_ARG). Set the command arguments before writing to SD_CMD.

Note that the argument of CMD12 within command sequences is H'0000 0000 regardless of the setting of SD_ARG.

SD_ARG

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 0	CF39 to CF8	All 0	R/W	Set command format[39:8] (argument).

SD_ARG1 (Mirror of SD_ARG[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	CF39 to CF24	All 0	R/W	Set command format[39:24] (argument).

40.2.3 Data Stop Register (SD_STOP)

The data stop register (SD_STOP) is used to enable or disable block counting at multiple block transfer, and to control the issuing of CMD12 within command sequences.

Bit	Bit Name	Initial Value	R/W	Description
63 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
18	—	0*1	R/W	Reserved The write value should always be 0.
17	HPIMODE	0*1	R/W	HPI Mode Enable 0: Disables HPI mode. 1: Enables HPI mode.
16	HPICMD	0*1	R/W*3	HPI Command Issue When HPICMD is set to 1 while HPIMODE is 1, the HPI command (CMD12) is issued. This bit is cleared to 0 when reception of the response to CMD12 is completed. The timing with which this bit is set to 1 is as follows. • After reception of the response to CMD12 that was issued by setting the STP bit to 1 has been completed during the CMD6/CMD38 or CMD25 sequence. • After reception of the response to CMD24/CMD25 has been completed After HPICMD is set to 1, do not write 0 to this bit while the CBSY bit in SD_INFO2 is 1. Do not set this bit to 1 when the CBSY bit in SD_INFO2 is 0.
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	SEC	0*1	R/W	Block Count Enable*2 0: Disables SD_SECCNT setting value. 1: Enables SD_SECCNT setting value. Set SEC to 1 at multiple block transfer. When SD_CMD is set as follows to start the command sequence while SEC is set to 1, CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT. 1. CMD18 or CMD25 in normal mode (SD_CMD[10:8] = 000) 2. SD_CMD[15:13] = 001 in extended mode (CMD12 is automatically issued, multiple block transfer) When the command sequence is halted because of a communications error or timeout, CMD12 is not automatically issued.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

Bit	Bit Name	Initial Value	R/W	Description
0	STP	0*[1]	R/W	Stop ● When STP is set to 1 during multiple block transfer, CMD12 is issued to halt the transfer through the SD/MMC host interface. However, if a command sequence is halted because of a communications error or timeout, CMD12 is not issued. Although continued buffer access is possible even after STP has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. ● When STP has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD12 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. ● When STP has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of the STP bit and CMD12 is not issued. ● When STP is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. ● When STP is set to 1 after a command sequence has been completed, CMD12 is not issued and the access end flag is not set. ● Set STP to 1 after the response end flag has been set. ● Set STP to 0 after the response end flag has been set.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

Note 3. It is effective only if 1 is written.

40.2.4 Block Count Register (SD_SECCNT)

The block count register (SD_SECCNT) is used to specify the number of transfer blocks at multiple block transfer.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 0	CNT31 to CNT0	All 0	R/W	Number of Transfer Blocks*[1] When H’0000 0001 is set, the number of transfer blocks is 1. : When H’0000 FFFF is set, the number of transfer blocks is 65535. : When H’FFFF FFFF is set, the number of transfer blocks is 4294967295. Do not set this register to H’0000 0000 if multiple blocks are to be transferred.

Note 1. Do not change the value of these bits when the CBSY bit in SD_INFO2 is set to 1.

40.2.5 SD Card Response Registers (SD_RSP)

The SD card response registers (SD_RSP) hold the response from the SD card.

SD_RSP10

Bit	Bit Name	Initial Value	R/W	Description
63 to 0	R71 to R8	All 0	R	Hold the response from the SD card

SD_RSP1 (Mirror of SD_RSP10[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	R39 to R24	All 0	R	Hold the response from the SD card

SD_RSP32 (Mirror of SD_RSP10[63:32])

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 0	R71 to R40	All 0	R	Hold the response from the SD card

SD_RSP3 (Mirror of SD_RSP32[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	R71 to R56	All 0	R	Hold the response from the SD card

SD_RSP54

Bit	Bit Name	Initial Value	R/W	Description
63 to 56	—	All 0	R	These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
55 to 0	R127 to R72	All 0	R	Hold the response from the SD card

SD_RSP5 (Mirror of SD_RSP54[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	R103 to R88	All 0	R	Hold the response from the SD card

SD_RSP76 (Mirror of SD_RSP54[63:32])

Bit	Bit Name	Initial Value	R/W	Description
63 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
23 to 0	R127 to R104	All 0	R	Hold the response from the SD card

SD_RSP7 (Mirror of SD_RSP76[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
7 to 0	R127 to R120	All 0	R	Hold the response from the SD card

Table 40.3 lists the response types and corresponding SD_RSP registers.

Table 40.3 Response Types and Corresponding SD_RSP Registers

Response Types	SD_RSP Registers
R1, R1b[39:8]	SD_RSP10 SD_RSP54*[1]
R2[127:8]	SD_RSP54 and SD_RSP10
R3[39:8]	SD_RSP10
R4[39:8]	SD_RSP10
R5[39:8]	SD_RSP10
R6[39:8]	SD_RSP10
R7[39:8]	SD_RSP10

Note 1. The response to CMD18 and to CMD25 is stored in both R[39:8] and R[103:72].
This makes it possible to confirm the response to CMD18 and CMD25 by reading R[103:72] even if the response to automatic CMD12 is stored in R[39:8].

40.2.6 SD Card Interrupt Flag Register (SD_INFO1)

The SD card interrupt flag register 1 (SD_INFO1) indicates the response end and access end in the command sequence. This register also indicates the card detect/write protect state.

For CMD12 and CMD52 (SDIO abort) at multiple block transfer, INFO0 is not set but only INFO2 is set.

Even if the command sequence is halted because of a communications error or timeout, INFO0 or INFO2 is set.

INFO10, INFO9, and INFO8 change depending on the SDDAT3 state after a reset is released and continue to change in 4-bit transfer mode.

To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	HPIRES	0*2	R/W*1	Response Reception Completion [Setting condition] When reception of the response to CMD12 that was issued by setting the STP bit to 1 is completed during the CMD6/CMD38 or CMD25 sequence in HPI mode. [Clearing condition] When 0 is written to HPIRES
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
10	INFO10	Unknown	R	Indicates the SDDAT3 state. 0: SDDAT3 is set to 0. 1: SDDAT3 is set to 1.
9	INFO9	0	R/W*1	SDDAT3 Card Insertion [Setting condition] After change in SDDAT3 from 0 to 1, two cycles of 2 P1ϕ have elapsed with SDDAT3 held 1. [Clearing condition] When 0 is written to INFO9
8	INFO8	0	R/W*1	SDDAT3 Card Removal [Setting condition] After change in SDDAT3 from 1 to 0, two cycles of 2 P1ϕ have elapsed with SDDAT3 held 0. [Clearing condition] When 0 is written to INFO8
7	INFO7	Unknown	R	Write Protect Indicates the ISDWP state. 0: ISDWP is set to 1. 1: ISDWP is set to 0.
6	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
5	INFO5	Unknown	R	Indicates the ISDCD state. 0: Indicates that Mcycle has elapsed with ISDCD held 1. 1: Indicates that Mcycle has elapsed with ISDCD held 0. Mcycle is set by bits 3 to 0 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
4	INFO4	0	R/W*1	ISDCD Card Insertion [Setting condition] After change in ISDCD from 1 to 0, Mcycle has elapsed with ISDCD held 0. [Clearing condition] When 0 is written to INFO4 Mcycle is set by bits 3 to 0 in SD_OPTION.
3	INFO3	0	R/W*1	ISDCD Card Removal [Setting condition] After change in ISDCD from 0 to 1, Mcycle has elapsed with ISDCD held 1. [Clearing condition] When 0 is written to INFO3 Mcycle is set by bits 3 to 0 in SD_OPTION.
2	INFO2	0*2	R/W*1	Access End [Setting conditions] 1. When read access to the buffer is completed in the case of transfer for single block read 2. When read access to the buffer for the last block of data is completed in the case of transfer for multiple block read 3. When read access to the buffer and reception of the response to CMD12 are completed in the case of transfer for multiple block read with automatic issuing of CMD12 4. When reception of the busy state after reception of the CRC status is completed in the case of transfer for single block write 5. When reception of the busy state after reception of the CRC status of the last block of data is completed in the case of transfer for multiple block write 6. When reception of the response busy state for CMD12 is completed in the case of transfer for multiple block write with automatic issuing of CMD12 7. When reception of the response to CMD12 that was issued by setting the STP bit to1 is completed in the case of transfer for multiple block read 8. When reception of the response busy state for CMD12 that was issued by setting the STP bit to1 is completed in the case of transfer for multiple block write 9. When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is completed in the case of transfer for multiple block read 10. When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is completed in the case of transfer for multiple block write In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO2 When the access end bit is set to 1, the command sequence is terminated.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.

Bit	Bit Name	Initial Value	R/W	Description
0	INFO0	0*2	R/W*1	Response End [Setting conditions] 1. When the reception of the response is completed 2. When the transmission of the command not requiring a response is completed, 3. When receiving busy reception after R1b response 4. When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block read 5. When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block write, In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO0 When issuing a command without data, the command sequence ends when the response end is set to 1.

Note 1. It is effective only if 0 is written.

Note 2. The value is initialized by a reset and also in the case of a reset by the SDRST bit in SOFT_RST.

40.2.7 SD Card Interrupt Flag Register (SD_INFO2)

The SD card interrupt flag register 2 (SD_INFO2) indicates the access status of the SD buffer (SD_BUF) and SD card. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	ILA	0*2	R/W*1	Illegal Access Error [Setting conditions] 1. Writing of data to SD_CMD within a command sequence (CBSY=1) 2. When SD_CMD[11] = 1 (command with data transfer) and SD_CMD[7:0] = 0000 1100b (CMD12) are set in SD_CMD [Clearing condition] When 0 is written to ILA
14	CBSY	0*2	R	Command Type Register Busy 0: A command sequence has been completed. 1: A command sequence is being executed.
13	SCLKDIVEN	1*2	R	0: The SD bus (CMD, DAT) is busy. Do not attempt to write to the SD_CLK_CTRL register. 1: The SD bus (CMD, DAT) is not busy. When a command sequence is started by writing to SD_CMD, the CBSY bit is set to 1 and, at the same time, the SCLKDIVEN bit is set to 0. The SCLKDIVEN bit is set to 1 after 8 cycles of SDCLK have elapsed after setting of the CBSY bit to 0 due to completion of the command sequence.
12	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
11	—	0	R/W	Reserved The write value should always be 1.
10	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
9	BWE	0*2	R/W*1	SD_BUF Write Enable 0: Data cannot be written in SD_BUF0. 1: Data can be written in SD_BUF0. [Setting conditions] 1. When SD_BUF is empty at single block transfer 2. When either bank 1 or bank 2 of SD_BUF is empty at multiple block transfer [Clearing conditions] 1. When 0 is written to BWE 2. Writing of a block of data to SD_BUF by DMA transfer When data is written to SD_BUF0 by the CPU, clear BWE and then write amount of data specified by SD_SIZE*3

Bit	Bit Name	Initial Value	R/W	Description
8	BRE	0*2	R/W*1	SD_BUF Read Enable 0: Data cannot be read from SD_BUF0. 1: Data can be read from SD_BUF0. [Setting conditions] 1. When data set in SD_SIZE is stored in SD_BUF at single block transfer 2. When data set in SD_SIZE is stored in either bank 1 or bank 2 of SD_BUF at multiple block transfer [Clearing conditions] 1. When 0 is written to BRE 2. Reading of a block of data from SD_BUF by DMA transfer When data is read from SD_BUF0 by the CPU, clear BRE and then read amount of data specified by SD_SIZE*3. Even if a CRC error or an END error occurs while block data is read, data is stored in SD_BUF and BRE is set.
7	DAT0	Unknown	R	SDDAT0 Indicates the SDDAT0 state. 0: SDDAT0 is set to 0. 1: SDDAT0 is set to 1. If the data timeout (ERR3) is set but the response timeout (ERR6) is not set after the Erase command has been issued, the end of the Erase sequence (DAT0 = 1) is confirmed by polling DAT0. If a communications error or timeout occurs during a write sequence, the DAT0 bit may retain the value 0. While the SD clock (SDCLK) is stopped, the DAT0 bit retains the value before the clock is stopped.
6	ERR6	0*2	R/W*1	Response Timeout [Setting condition] When a response is not received even after 640 cycles of SDCLK have elapsed (including a response to a command issued within a command sequence*5) [Clearing condition] When 0 is written to ERR6 The command sequence is halted by a response timeout.*4
5	ERR5	0*2	R/W*1	SD_BUF Illegal Read Access [Setting conditions] 1. When SD_BUF is empty while SD_BUF0 is read 2. When data with a CRC error or END error is read from SD_BUF0 [Clearing condition] When 0 is written to ERR5
4	ERR4	0*2	R/W*1	SD_BUF Illegal Write Access [Setting conditions] 1. When data is written to SD_BUF0 while it is not in the data read/write command state 2. When data is written to SD_BUF0 while SD_BUF is full 3. When data is written to SD_BUF0 while an error occurs in the CRC status or CRC status length 4. When data is written to SD_BUF0 while the interface remains in a busy state for at least Ncycle after the CRC status [Clearing condition] When 0 is written to ERR4 Ncycle is set by bits 7 to 4 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
3	ERR3	0*[2]	R/W*[1]	Data Timeout (except response timeout) [Setting conditions] 1. After R1b response, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle. 2. After CRC status, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle. 3. After write data, the CRC status is not received even after Ncycle has elapsed. 4. After read command, read data is not received even after Ncycle has elapsed. 5. After CMD12 has been issued within a command sequence, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle. 6. After the reception of read data, read data for the next block are not received even after Ncycle has elapsed. 7. After release of the read wait state, read data for the next block are not received even after Ncycle has elapsed. [Clearing condition] When 0 is written to ERR3 Ncycle is set by bits 7 to 4 in SD_OPTION. The command sequence is halted by the data timeout.
2	ERR2	0*[2]	R/W*[1]	END Error [Setting conditions] 1. When an error occurs in the response length (and the end bit has not been detected) 2. When an error occurs in the read data length (and the end bit has not been detected among the valid bits) 3. When an error occurs in the CRC status length (and the end bit has not been detected) 4. An error in the length of a response to a command issued within a command sequence*[5] (i.e. the end bit has not been detected) [Clearing condition] When 0 is written to ERR2 The command sequence is halted by the End error.*[4]
1	ERR1	0*[2]	R/W*[1]	CRC Error [Setting conditions] 1. When an error occurs in the CRC status (i.e. the received CRC status was not 010') 2. When a CRC error occurs in the read data 3. When a CRC error occurs in the response 4. A CRC error in the response to a command issued within a command sequence*[5] [Clearing condition] When 0 is written to ERR1 The command sequence is halted by the CRC error.*[4]
0	ERR0	0*[2]	R/W*[1]	CMD Error [Setting conditions] 1. The command index of the transmitted command differing from the command index of the received response 2. The command index of a command issued within a command sequence*[5] differing from the command index of the received response [Clearing condition] When 0 is written to ERR0 The command sequence is halted by the CMD error.*[4]

Note 1. It is effective only if 0 is written.

Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 3. When the WMODE bit in HOST_MODE is 0, the single byte from the fraction of a full 16-bit unit is regarded as excess data due to an odd value for the number of bytes setting in SD_SIZE. When the WMODE bit in HOST_MODE is 1, the single byte or three bytes from the fraction of a full 64-bit unit are regarded as excess data due to an odd value for the number of bytes setting in SD_SIZE, or the two bytes from the fraction of a full 64-bit unit are regarded as excess data due if the value for the number of bytes setting in SD_SIZE is even but is not on a four-byte boundary.

Note 4. After the C52PUB bit in SDIO_MODE has been set to 1, if a communications error or timeout for response occurs in response to the CMD52 that is issued, since the command sequence has not been completed, complete the sequence with error processing as in usage examples in **Figure 40.16** under **Section 40.4.8, IO_RW_EXTENDED (CMD53/Multiple Block Read)** or in **Figure 40.19** under **Section 40.4.9, IO_RW_EXTENDED (CMD53/Multiple Block Write)**.

Note 5. “Command issued within a command sequence” refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

40.2.8 SD_INFO1 Interrupt Mask Register (SD_INFO1_MASK)

The SD_INFO1 interrupt mask register (SD_INFO1_MASK) is used to enable or disable the SD_INFO1 interrupt.

When 0 is set in SD_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	IMASK16	1	R/W	HPIRES interrupt masked
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	IMASK9	1	R/W	INFO9 interrupt masked
8	IMASK8	1	R/W	INFO8 interrupt masked
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
4	IMASK4	1	R/W	INFO4 interrupt masked
3	IMASK3	1	R/W	INFO3 interrupt masked
2	IMASK2	1	R/W	INFO2 interrupt masked
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
0	IMASK0	1	R/W	INFO0 interrupt masked

40.2.9 SD_INFO2 Interrupt Mask Register (SD_INFO2_MASK)

The SD_INFO2 interrupt mask register (SD_INFO2_MASK) is used to enable or disable the SD_INFO2 interrupt.

When 0 is set in SD_INFO2_MASK while the corresponding flag in SD_INFO2 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	IMASK	1	R/W	ILA interrupt masked
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
11	—	1	R/W	Reserved The write value should always be 1.
10	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
9	BMASK1	1	R/W	BWE interrupt masked
8	BMASK0	1	R/W	BRE interrupt masked
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
6	EMASK6	1	R/W	ERR6 interrupt masked
5	EMASK5	1	R/W	ERR5 interrupt masked
4	EMASK4	1	R/W	ERR4 interrupt masked
3	EMASK3	1	R/W	ERR3 interrupt masked
2	EMASK2	1	R/W	ERR2 interrupt masked
1	EMASK1	1	R/W	ERR1 interrupt masked
0	EMASK0	1	R/W	ERR0 interrupt masked

40.2.10 SD Clock Control Register (SD_CLK_CTRL)

The SD clock control register (SD_CLK_CTRL) is used to control the SD clock (SDCLK) output and to set the frequency. Set SCLKEN to 1 before writing to SD_CMD to issue a command. Do not write to SD_CLK_CTRL while the SCLKDIVEN bit in SD_INFO2 is set to 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	—	0	R/W	Reserved The write value should always be 0.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
10	—	0[*1]	R/W	Reserved The write value should always be 0.
9	SDCLKOFFEN	0	R/W	SD Clock (SDCLK) Output Automatic Control Enable 0: Automatic control for SD clock (SDCLK) output is disabled. 1: Automatic control for SD clock (SDCLK) output is enabled. This function of automatic control for SD clock (SDCLK) output causes SDCLK output only within a command sequence. The timing with which SDCLK output starts and stops is as follows. SDCLK output starts after writing to SD_CMD. SDCLK output stops when 8 cycles of SDCLK have elapsed after the end of the command sequence. In addition, SDCLK is fixed to 0 while SCLKEN of SD_CLK_CTRL is 0, regardless of the value of this bit.
8	SCLKEN	0[*1]	R/W[*2]	SD Clock (SDCLK) Output Control Enable 0: SD clock (SDCLK) output is disabled. The SDCLK signal is fixed 0. 1: SD clock (SDCLK) output is enabled.
7	DIV7	0	R/W[*2]	SD Clock (SDCLK) 1000 0000b: (SDxϕ/4)/512 0100 0000b: (SDxϕ/4)/256 0010 0000b: (SDxϕ/4)/128 0001 0000b: (SDxϕ/4)/64 0000 1000b: (SDxϕ/4)/32 0000 0100b: (SDxϕ/4)/16 0000 0010b: (SDxϕ/4)/8 0000 0001b: (SDxϕ/4)/4 0000 0000b: (SDxϕ/4)/2 1111 1111b: SDxϕ/4 (x = 0, 1) Other settings are prohibited.
6	DIV6	0	R/W[*2]	
5	DIV5	1	R/W[*2]	
4	DIV4	0	R/W[*2]	
3	DIV3	0	R/W[*2]	
2	DIV2	0	R/W[*2]	
1	DIV1	0	R/W[*2]	
0	DIV0	0	R/W[*2]	

Note 1. This initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Writing to SD_CLK_CTRL is impossible when the CBSY bit in SD_INFO2 is 1.

Notes on when setting the SD clock (SDCLK) to P1ϕ (DIV[7:0] = 1111 1111b)

When changing the setting of bits DIV[7:0] to 1111 1111b, or from 1111 1111b to other setting, perform the following processing before writing to SD_CMD.

(1) Set the SCLKEN bit to 0 by writing to SD_CLK_CTRL. (Do not change the setting of bits other than SCLKEN at this time.)

(2) Change the setting of bits DIV[7:0] by writing to SD_CLK_CTRL. (Do not change the setting of bits other than DIV[7:0] at this time. The SCLKEN bit should retain the value 0.)

(3) Set the SCLKEN bit to 1 by writing to SD_CLK_CTRL. (Do not change the setting of bits other than SCLKEN at this time.)

Also when changing the setting of bits DIV[7:0] to 1111 1111b after having set the SDRST bit in SOFT_RST to 0 and then changed it to 1, perform this processing before writing to SD_CMD.

40.2.11 Transfer Data Length Register (SD_SIZE)

The transfer data length register (SD_SIZE) is used to specify the transfer data size.

Bit	Bit Name	Initial Value	R/W	Description
63 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
11, 10	—	All 0	R	Reserved
9 to 0	LEN9 to LEN0	1000000000	R/W	Transfer Data Size*[1] These bits specify a size between 1 and 512 bytes for single block transfer. In cases of multiple block transfer with automatic issuing of CMD12 (CMD18 and CMD25), the only specifiable transfer data size is 512 bytes. Furthermore, in cases of multiple block transfer without automatic issuing of CMD12, as well as 512 bytes, 32, 64, 128, and 256 bytes are specifiable. However, in the reading of 32, 64, 128, and 256 bytes for the transfer of multiple blocks, this is restricted to multiple block transfer by CMD53. Additionally, if a command accompanies data transfer, do not set these bits to 0. Do not specify a data size larger than 512 bytes.

Note 1. Do not change the values of these bits when the CBSY bit in SD_INFO2 is 1.

40.2.12 SD Card Access Control Option Register (SD_OPTION)

The SD card access control option register (SD_OPTION) is used to set the bus width and timeout counter.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	WIDTH	0*1	R/W	Bus width*2 {WIDTH,WIDTH8} = 01: 8 bits width {WIDTH,WIDTH8} = 00: 4 bits width {WIDTH,WIDTH8} = 10,11: 1 bit width In the case of writing of one-byte block, 8 bits width cannot be specified for the bus width. Change the bus width to 4 bits or 1 bit before writing one-byte block.
14	—	1	R	Reserved This bit is always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to this bit.
13	WIDTH8	0*1	R/W	Bus width*2 See the description of the WIDTH bit.
12 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	EXTOP	0*1	R/W	Timeout Mode Select 0: Bits TOP27 to TOP24 specify the timeout count from SDCLK*2^{13} to SDCLK*2^{27}. 1: Bits TOP27 to TOP24 specify the timeout count from SDCLK*2^{14} to SDCLK*2^{28}.
8	TOUTMASK	0*1	R/W	Timeout Mask 0: Enables timeout. 1: Disables timeout. (The ERR6 and ERR3 bits in SD_INFO2 and the E6 to E0 bits in SD_ERR_STS2 are not set.) If a timeout occurs while it is disabled, perform a software reset to terminate a command sequence.
7	TOP27	1*1	R/W	Timeout Counter*2 0000: SDCLK*2^{13} 0001: SDCLK*2^{14} : 1101: SDCLK*2^{26} 1110: SDCLK*2^{27} 1111: Setting prohibited
6	TOP26	1*1	R/W	
5	TOP25	1*1	R/W	
4	TOP24	0*1	R/W	
3	CTOP24	1*1	R/W	Card Detect Time Counter 0000: SDCLK*2^{10} 0001: SDCLK*2^{11} : 1101: SDCLK*2^{23} 1110: SDCLK*2^{24} 1111: Setting prohibited
2	CTOP23	1*1	R/W	
1	CTOP22	1*1	R/W	
0	CTOP21	0*1	R/W	

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Do not change the values of these bits when the CBSY bit in SD_INFO2 is 1.

40.2.13 SD Error Status Register 1 (SD_ERR_STS1)

The SD error status register 1 (SD_ERR_STS1) indicates the CRC status, CRC error, End error, and CMD error.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 15	—	Unknown	R	Reserved These bits are always read as unknown. The write value should always be 0.
14	E14	0*[1]	R	These bits hold the CRC status. (normal: 010)
13	E13	1*[1]		
12	E12	0*[1]		
11	E11	0*[1]	R	Set to 1 when an error occurs in the CRC status.
10	E10	0*[1]	R	Set to 1 when a CRC error occurs in the read data.
9	E9	0*[1]	R	Set to 1 when a CRC error occurs in the response to a command issued within a command sequence*[2]. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E8.
8	E8	0*[1]	R	Set to 1 when a CRC error occurs in a response (other than a response to a command issued within a command sequence*[2]).
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5	E5	0*[1]	R	Set to 1 when an error occurs in the CRC status length (and the end bit has not been detected).
4	E4	0*[1]	R	Set to 1 when an error occurs in the read data length (and the end bit has not been detected among the valid bits).
3	E3	0*[1]	R	Set to 1 when an error occurs in the response length to a command issued within a command sequence*[2]. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0*[1]	R	Set to 1 when an error occurs in the response length (other than a response to a command issued within a command sequence*[2]).
1	E1	0*[1]	R	Set to 1 when an error occurs in the command index of the response to a command issued within a command sequence*[2]. In cases where CMD12 is issued by setting a command index in SD_CMD, this is Indicated in E0.
0	E0	0*[1]	R	Set to 1 when an error occurs in the command index of a response (other than a response to a command issued within a command sequence*[2]).

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. “Command issued within a command sequence” refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

40.2.14 SD Error Status Register 2 (SD_ERR_STS2)

The SD error status register 2 (SD_ERR_STS2) indicates the timeout state. Ncycle is set by bits 7 to 4 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
63 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
6	E6	0*[1]	R	Set to 1 when the interface remains in a busy state for at least Ncycle after the CRC status.
5	E5	0*[1]	R	Set to 1 when the CRC status is not received even after Ncycle has elapsed after data writing.
4	E4	0*[1]	R	Set to 1 when read data is not received even after Ncycle has elapsed after the command has been read. Set to 1 when read data for the next block are not received even after Ncycle has elapsed after the reception of read data. Set to 1 when read data for the next block are not received even after Ncycle has elapsed after release of the read wait state.
3	E3	0*[1]	R	Set to 1 when the interface remains in a busy state for at least Ncycle after CMD12 has been issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0*[1]	R	Set to 1 when the interface remains in a busy state for at least Ncycle after R1b response.
1	E1	0*[1]	R	Set to 1 when the response to a command issued within a command sequence*[2] is not received even after 640 cycles of SDCLK have elapsed. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E0.
0	E0	0*[1]	R	Set to 1 when the response (other than a response to a command issued within a command sequence*[2]) is not received even after 640 cycles of SDCLK have elapsed.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. “Command issued within a command sequence” refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

40.2.15 SD Buffer Read/Write Register (SD_BUF0)

Bit	Bit Name	Initial Value	R/W	Description
63 to 0	BUF63 to BUF0	Unknown	R/W	When writing to the SD card, the write data is written to this register. When reading from the SD card, the read data is read from this register. This register is internally connected to two 512-byte buffers (SD_BUF). When both buffers are not empty at multiple block read, suspend data reception by stopping the SD clock. When either buffer becomes empty, restart data reception by starting supply of the SD clock.

Note: When using the DMAC, the bus width should be fixed at 64 bits.

40.2.16 SDIO Mode Control Register (SDIO_MODE)

The SDIO mode control register (SDIO_MODE) controls the CMD52 issuance and the read wait state at multiple block transfer, and the reception of SDIO interrupt. C52PUB and IOABT should not be set to 1 simultaneously.

Bit	Bit Name	Initial Value	R/W	Description
63 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	C52PUB	0	R/W	SDIO None Abort ● When C52PUB is set to 1 in the CMD53 (multiple block) write sequence, CMD52 is automatically issued between blocks if SD_BUF becomes empty.C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1. ● When C52PUB and RWREQ are set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks and CMD52 is automatically issued. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1. ● If C52PUB is set to 1 in the CMD53 (multiple block) read sequence, be sure to set RWREQ to 1 as well as C52PUB. ● Set SD_ARG before setting C52PUB to 1. ● Set C52PUB to 1 after the response end flag has been set.
8	IOABT	0	R/W	SDIO Abort ● When IOABT is set to 1 in the CMD53 (multiple block) sequence, the CMD53 sequence is halted and CMD52 is issued. However, if a command sequence is halted because of a communications error or timeout, CMD52 is not issued. Although continued buffer access is possible even after IOABT has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. Set SD_ARG before setting IOABT to 1. ● When IOABT has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD52 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. ● When IOABT has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of IOABT and CMD52 is not issued. ● When IOABT is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. ● When IOABT is set to 1 after a command sequence has been completed, CMD52 is not issued and the access end flag is not set. ● Set IOABT to 1 after the response end flag has been set. Set IOABT to 0 after the access end flag has been set.
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

Bit	Bit Name	Initial Value	R/W	Description
2	RWREQ	0	R/W	Read Wait Request When RWREQ is set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks. [Read wait state releasing] (1) The read wait state is released, when RWREQ is cleared to 0 in the read wait state. (2) When IOABT is set to 1 in the read wait state, RWREQ is automatically cleared to 0 after CMD52 has been issued, and then the read wait state is released. (3) When C52PUB and RWREQ are set to 1 simultaneously in the CMD53 (multiple block) read sequence, the read wait state is not automatically released. Therefore, after the CMD52 response is received, clear RWREQ. (Be sure to set RWREQ and C52PUB simultaneously.) When RWREQ is set to 1 while the last block in the CMD53 (multiple block) read sequence is transferred, the read wait state is not entered and RWREQ is automatically cleared to 0 by setting access end. Set RWREQ to 1 after the response end flag has been set.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
0	IOMOD	0	R/W	SDIO Mode*[1] 0: Disables the SD/MMC host interfaces to receive SDIO interrupt from the SDIO card 1: Enables the SD/MMC host interfaces to receive SDIO interrupt from the SDIO card

Note 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

40.2.17 SDIO Interrupt Flag Register (SDIO_INFO1)

The SDIO interrupt flag register (SDIO_INFO1) indicates the status regarding to the SDIO card access. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	EXWT	0*2	R/W*1	[Setting condition] While the last block in the CMD53 (multiple block) read sequence is transferred, RWREQ in SDIO_MODE is set to 1. [Clearing condition] When 0 is written to EXWT
14	EXPUB52	0*2	R/W*1	[Setting conditions] 1. While the last block in the CMD53 (multiple block) sequence is transferred, C52PUB in SDIO_MODE is set to 1. 2. While C52PUB is set to 1 in the CMD53 (multiple block) write sequence, the last block is transferred. [Clearing condition] When 0 is written to EXPUB52
13 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2, 1	—	All 0*2	R/W	Reserved The write value should always be 1. The value may change during operation.
0	IOIRQ	0*2	R/W*1	[Setting condition] When SDIO interrupt from an SDIO card is received while IOMOD in SDIO_MODE is set to 1. [Clearing condition] When 0 is written to IOIRQ*3

Note 1. It is effective only if 0 is written.

Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 3. Before clearing this bit, access the SDIO card to negate the SDIO interrupt signal from the SDIO card. If the interrupt signal is not negated, this bit may be set again.

40.2.18 SDIO_INFO1 Interrupt Mask Register (SDIO_INFO1_MASK)

The SDIO_INFO1 interrupt mask register (SDIO_INFO1_MASK) enables or disables the SD_INFO1 interrupt. When 0 is set in SDIO_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	MEXWT	1	R/W	EXWT interrupt masked
14	MEXPUB52	1	R/W	EXPUB52 interrupt masked
13 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2	—	1	R/W	Reserved The write value should always be 1.
1	—	1	R/W	Reserved The write value should always be 1.
0	IOMSK	1	R/W	IOIRQ interrupt masked

40.2.19 DMA Mode Enable Register (CC_EXT_MODE)

The DMA mode enable register (CC_EXT_MODE) enables the DMA transfer.

Bit	Bit Name	Initial Value	R/W	Description
63 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
12	—	1	R	Reserved This bit is always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to this bit.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9, 8	—	All 0	R/W	Reserved The write value should always be 0.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5	—	0	R/W	Reserved The write value should always be 0.
4	—	1	R	Reserved This bit is always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to this bit.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1	DMASDRW	0	R/W	SD_BUF Read/Write DMA Transfer*[1] 0: The SD_BUF read/write DMA transfer is disabled. 1: The SD_BUF read/write DMA transfer is enabled.
0	—	0	R/W	Reserved The write value should always be 0.

Note 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

40.2.20 Software Reset Register (SOFT_RST)

The software reset register (SOFT_RST) sets a software reset. Also use this register to check that release from the reset state has been completed before attempting to use the SD/MMC host interfaces and before attempting access to the other registers.

Bit	Bit Name	Initial Value	R/W	Description
63 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2, 1	—	11	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
0	SDRST	1	R/W	Software Reset of SD Interface Unit 0: Reset 1: Reset released

40.2.21 Version Register (VERSION)

The version register (VERSION) indicates the version of the SD/MMC host interfaces.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15, 14	UR7, UR6	11	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
13, 12	UR5, UR4	00	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
11 to 8	UR3 to UR0	H'C	R	Version of Renesas' IP
7 to 0	IP7 to IP0	H'10	R	Version of introductory IP

40.2.22 Host Interface Mode Setting Register (HOST_MODE)

The host interface mode setting register (HOST_MODE) selects the width for access to the data bus.

Bit	Bit Name	Initial Value	R/W	Description
63 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	BUSWIDTH	0	R/W	Width for Access to SD_BUF*1*2 Read or write access to SD_BUF0 can be performed with the specified width for access. 0: 16-bit access 1: 32-bit access This bit is enabled while the WMODE bit is set to 1.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1	ENDIAN	0	R/W	SD_BUF0 data swap
0	WMODE	0	R/W	Width for Access to SD_BUF*1*2 Read or write access to SD_BUF0 can be performed with the specified width for access. 0: 64-bit access 1: 16-bit or 32-bit access

Note 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

Note 2. When using the built-in DMAC of this module, fix the bus width to 64 bits.

40.2.23 SD Interface Mode Setting Register (SDIF_MODE)

The SD interface mode setting register specifies transfer mode.

Bit	Bit Name	Initial Value	R/W	Description
63 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	—	0*[1]	R/W	Reserved The write value should always be 0.
8	NOCHKCR	0*[1]	R/W	CRC Check Mask (test command for MMC supported) Enables or disables checking of the CRC16 and CRC status. 0: Enables the CRC check. 1: Disables the CRC check (the CRC16 value is ignored at read, and the CRC status is not detected at write)
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

40.2.24 SD Status Register (SD_STATUS)

The effective bit of the SD status register controls the output value on the SD0_RST# pin.

Bit	Bit Name	Initial Value	R/W	Description
63 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1	SD_RST	0	R/W	Controls the output value on the SD0_RST# pin. 0: The output value on the SD0_RST# pin is 0. 1: The output value on the SD0_RST# pin is 1.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.

40.2.25 DMAC Transfer Mode Register (DM_CM_DTRAN_MODE)

The DMAC Transfer Mode Register (DM_CM_DTRAN_MODE) sets the operation mode of the module built-in DMAC.

High 32 bits (bit 63 to 32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
17, 16	CH_NUM	00	R/W	DMAC channel selector 00 : SD down stream 01 : SD up stream Other settings are prohibited.
15 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5, 4	BUS_WIDTH [1:0]	11	R/W	Bus width selector 11: 64-bit Other settings are prohibited.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

40.2.26 DMAC Transfer Control Register (DM_CM_DTRAN_CTRL)

The DMAC Transfer Control Register (DM_CM_DTRAN_CTRL) controls the module built-in DMAC operation. High 32 bits (bit 63-32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	—	0	R/W	Reserved The write value should always be 0.
7 to 1	—	All 0	R	Reserved
0	DM_START	0	R/W	DMAC Start Writing 1 to this bit starts DMAC operation. This bit is automatically cleared when DMA transfer is started.

40.2.27 DMAC Reset Register (DM_CM_RST)

High 32 bits (bit 63 to 32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 10	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
9	DTRANRST1	1	R/W	Soft resets of the module built-in DMAC channel 1 0: Reset 1: Reset released
8	DTRANRST0	1	R/W	Soft resets of the module built-in DMAC channel 0 0: Reset 1: Reset released
7 to 1	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
0	SEQRST	1	R/W	Soft resets of the sequencer 0: Reset 1: Reset released

NOTE

Make sure there is no communication to the SD/MMC device before applying a software reset using this register.

40.2.28 DMAC Interrupt Register 1 (DM_CM_INFO1)

The DMAC interrupt register 1 (DM_CM_INFO1) indicates the status of the module built-in DMAC and a sequencer. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
20	DTRANEND1	0*[1]	R/W	Module built-in DMAC Channel 1 Transfer End [Setting conditions] 1. When transfer of DMAC channel 1 is completed 2. When an error occurs on DMAC channel 1 [Clearing condition] When 0 is written to DTRANEND1
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	DTRANEND0	0*[2]	R/W	Module built-in DMAC Channel 0 Transfer End [Setting conditions] 1. When transfer of DMAC channel 0 is completed 2. When an error occurs on DMAC channel 0 [Clearing condition] When 0 is written to DTRANEND0
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	SEQEND	0*[3]	R/W	Sequencer Operation End [Setting conditions] 1. When operation of a sequencer is completed 2. When a sequencer error occurs [Clearing condition] When 0 is written to SEQEND

Note 1. The initial value is applied at a reset and when the DTRANRST1 bit in DM_CM_RST is 0.

Note 2. The initial value is applied at a reset and when the DTRANRST0 bit in DM_CM_RST is 0.

Note 3. The initial value is applied at a reset and when the SEQRST bit in DM_CM_RST is 0.

40.2.29 DM_CM_INFO1 Interrupt Mask Register (DM_CM_INFO1_MASK)

The DM_CM_INFO1 interrupt mask register (DM_CM_INFO1_MASK) enables or disables the DM_CM_INFO1 interrupt. When 0 is set in DM_CM_INFO1_MASK while the corresponding flag in DM_CM_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 21	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
20	DTRANEND1_MASK	1	R/W	DTRANEND1 interrupt masked
19 to 17	—	All 1	R/W	Reserved The write value should always be 1.
16	DTRANEND0_MASK	1	R/W	DTRANEND0 interrupt masked
15 to 1	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
0	SEQEND_MASK	1	R/W	SEQEND interrupt masked

40.2.30 DMAC Interrupt Register 2 (DM_CM_INFO2)

The DMAC interrupt register 2 (DM_CM_INFO2) indicates the status of the module built-in DMAC and a sequencer. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
19, 18	—	00	R	Reserved The write value should always be 0.
17	DTRANERR1	0*1	R/W	Module built-in DMAC Channel 1 Error [Setting condition] When an error occurs on DMAC channel 1 [Clearing condition] When 0 is written to DTRANERR1
16	DTRANERR0	0*2	R/W	Module built-in DMAC Channel 0 Error [Setting condition] When an error occurs on the DMAC channel 0 [Clearing condition] When 0 is written to DTRANERR0
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	SEQERR	0*3	R/W	Sequencer error [Setting condition] When a sequencer error occurs [Clearing condition] When 0 is written to SEQERR

Note 1. The initial value is applied at a reset and when the DTRANRST1 bit in DM_CM_RST is 0.

Note 2. The initial value is applied at a reset and when the DTRANRST0 bit in DM_CM_RST is 0.

Note 3. The initial value is applied at a reset and when the SEQRST bit in DM_CM_RST is 0.

40.2.31 DM_CM_INFO2 Interrupt Mask Register (DM_CM_INFO2_MASK)

The DM_CM_INFO2 interrupt mask register (DM_CM_INFO2_MASK) enables or disables the DM_CM_INFO2 interrupt. When 0 is set in DM_CM_INFO2_MASK while the corresponding flag in DM_CM_INFO2 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 20	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
19, 18	—	11	R	Reserved The write value should always be 1.
17	DTRANERR1_MASK	1	R/W	DTRANERR1 interrupt masked
16	DTRANERR0_MASK	1	R/W	DTRANERR0 interrupt masked
15 to 1	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
0	SEQERR_MASK	1	R/W	SEQERR interrupt masked

40.2.32 DMAC Transfer Address Register (DM_DTRAN_ADDR)

The DMAC Transfer Address Register (DM_DTRAN_ADDR) sets the transfer destination and source address of the module built-in DMAC.

Higher-order 32 bits (bit 63 to 32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 3	DADDR	All 0	R/W	Destination address / Source address (8 byte unit) Note that the value of DM_DTRAN_ADDR + transfer data length is less than or equal to 2^{32}.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

40.3 Operation

40.3.1 SD Interface

(1) SD Data Format

When data is read from the SD card, the procedure is as follows.

1. The SD/MMC host interface receives data from the SD card via the SDDAT signal. (SDDAT signal: see **Figure 40.2**, **Figure 40.3** and **Figure 40.4**.)
2. The receive data is stored in SD_BUF of the SD/MMC host interfaces. (SD_BUF store data: see **Figure 40.5**)
3. The data stored in SD_BUF is read from SD_BUF0. (Reading from SD_BUF0: see **Table 40.4**)

When data is written to the SD card, the above procedure will be reversed.

When accessing SD_BUF0, caution should be taken for the transfer order in SDDAT and the store order in SD_BUF. In addition, data stored in SD_BUF0 can be replaced in bytes with the EXT_SWAP. (See **Figure 40.5**)

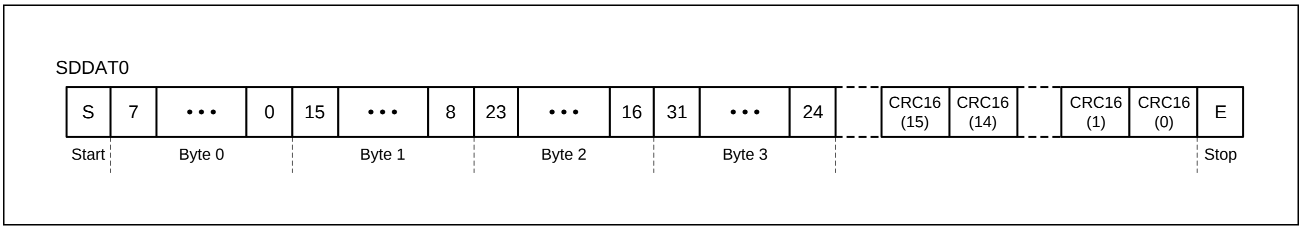

Figure 40.2 SDDAT in 1-Bit Width Mode

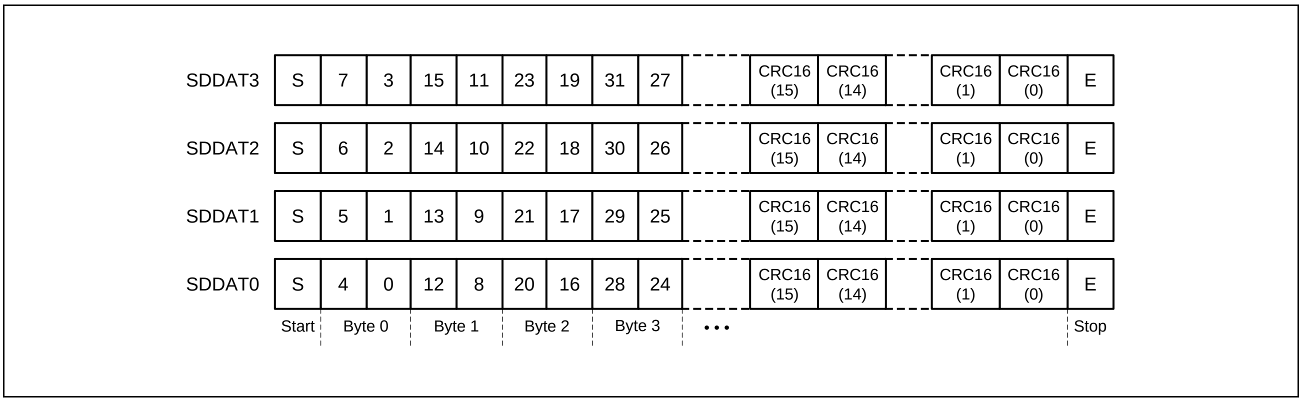

Figure 40.3 SDDAT in 4-Bit Width Mode

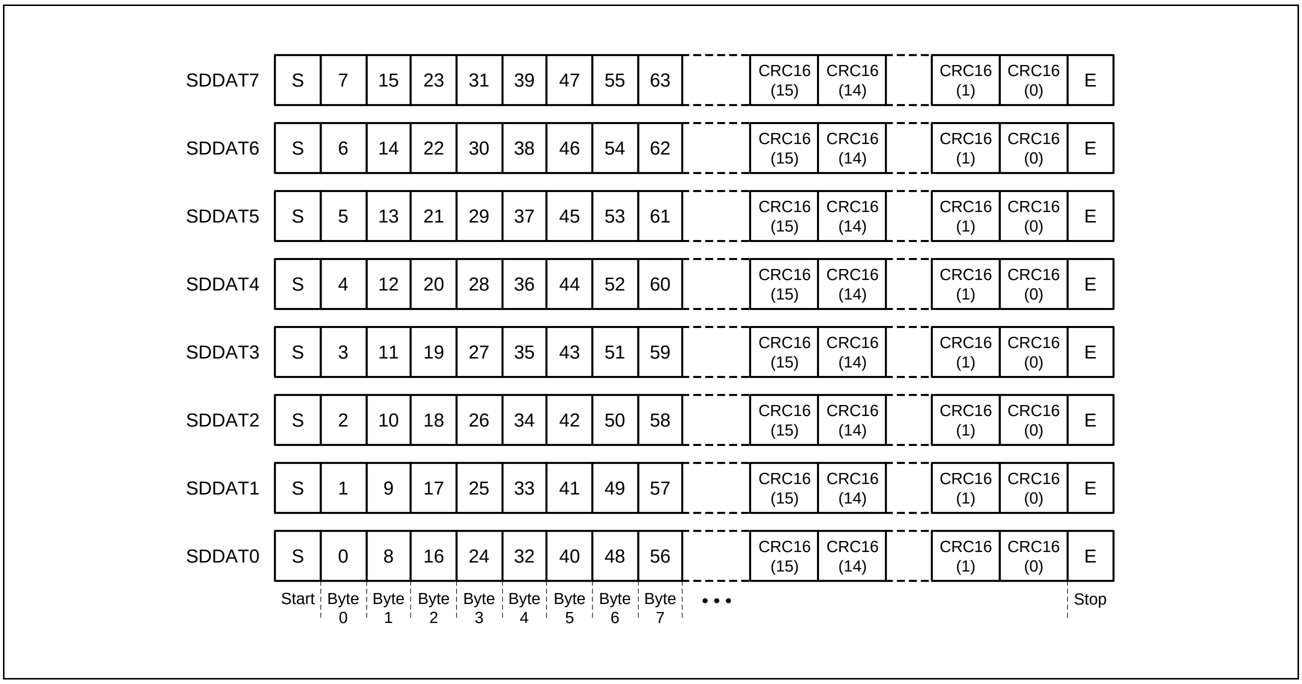

Figure 40.4 SDDAT in 8-Bit Width Mode

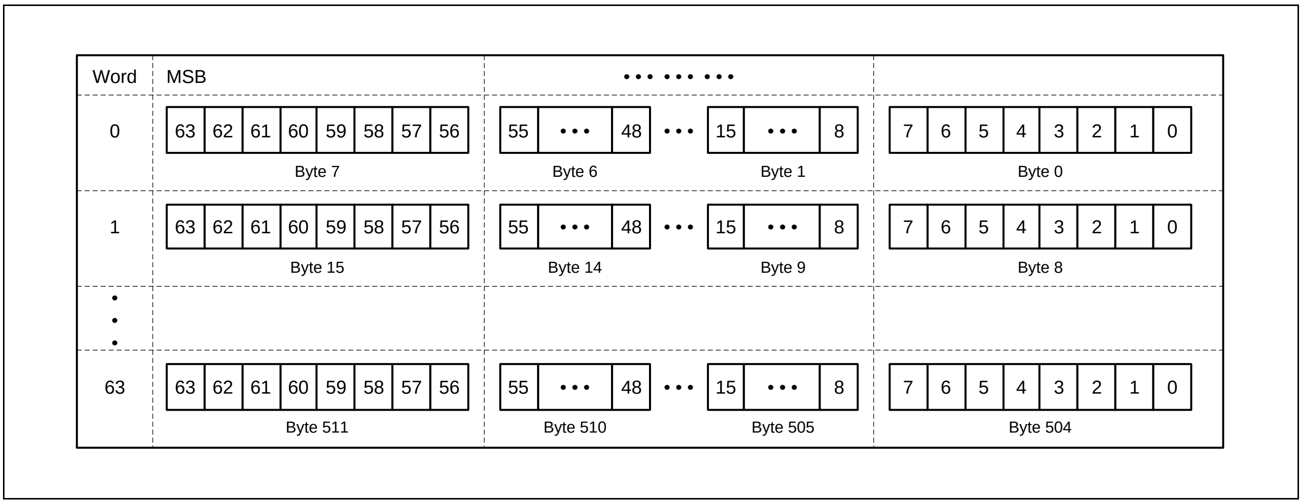

Figure 40.5 SD_BUF Store Data

Table 40.4 Reading from SD_BUF0

WMODE*[1]	BUSWIDTH*[1]	ENDIAN*[1]	Read Data*[2]
0	0	0	H’0123456789ABCDEF
0	0	1	H’EFCDAB8967452301
1	1	0	H’89ABCDEF (1st) H’01234567 (2nd)
1	1	1	H’EFCDAB89 (1st) H’67452301 (2nd)
1	0	0	H’CDEF (1st) H’89AB (2nd) H’4567 (3rd) H’0123 (4th)
1	0	1	H’EFCD (1st) H’AB89 (2nd) H’6745 (3rd) H’2301 (4th)

Note 1. The name of a bit in HOST_MODE.

Note 2. When the data stored in SD_BUF is H’0123456789ABCDEF

(2) Bus Signal Voltage Switch

Change the electric potential of the bus signal in the following procedure after checking that the SD card supports 1.8 V.

(1) Issuing CMD11
Perform command sequence processing of CMD11.

(2) Stopping the SD clock (a)
Set the SCLKEN bit in the SD_CLK_CTRL to 0 to stop*[1] the output of the SD clock. When the SDCLKOFFEN bit in the SD_CLK_CTRL register is 1, the SDCLKOFFEN bit is also set to 0.

Note 1. When the SDCLKOFFEN bit in the SD_CLK_CTRL register is 1, the SD clock has automatically been stopped.

(3) Checking the value of SDDAT
Check that the DAT0 bit in the SD_INFO2 register is 0.

(4) Changing the supply voltage of the host device
Change the voltage which is supplied through the power supply pin of the given channel (SD0_PVDD for channel 0 or SD1_PVDD for channel 1) from 3.3 V to 1.8 V.

For details, see the following sections:

Section 41.3.4, Port Function Control Register,
Section 41.3.7, Driving Ability Control Register,
Section 41.3.17, SD ch0 IO Voltage Mode Control Register,
Section 41.3.18, SD ch1 IO Voltage Mode Control Register.

(5) Starting supply of the SD clock (b)
After the SD clock has been stopped ((a) above) and 5 ms or more has elapsed, set the SCLKEN bit in the SD_CLK_CTRL register to 1 and allow the output of the SD clock. The SDCLKOFFEN bit must be 0.

(6) Checking the value of SDDAT
After supplying the SD clock has been started ((b) above) and 1 ms or more has elapsed, check that the DAT0 bit in the SD_INFO2 register is 1. It is possible to set the SDCLKOFFEN bit in the SD_CLK_CTRL register to 1 and allow SD Clock (SDCLK) Output Automatic Control Enable.

40.3.2 Card Detect/Write Protect

(1) Card Detect

The SD/MMC host interface has two types of card detect functions as described in the following.

- Card detect with ISDCD

  Figure 40.6 shows the timing chart of card detect using ISDCD. ISDCD is connected to the card socket and pulled up on the host device. The resistance of the pull-up resistor is decided by the specification of the SD host device.

  [Card insertion]

  ISDCD is pulled down when a card is inserted. At this time, if ISDCD has been pulled down for the Mcycle period (set in SD_OPTION), INFO4 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

  [Card removal]

  ISDCD is pulled up when a card is removed. At this time, if ISDCD has been pulled up for the Mcycle period (set in SD_OPTION), INFO3 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

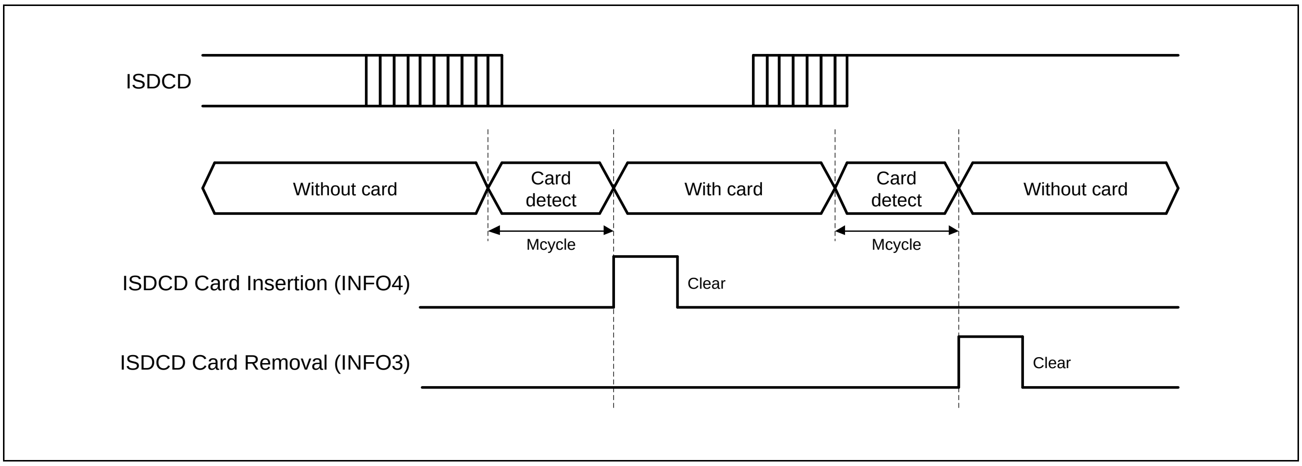

Figure 40.6 Example of Card Detect with ISDCD

- SD card detect with SDDAT3

  Figure 40.7 shows the timing chart when the SD card is detected using SDDAT3. In addition, SDDAT3 is pulled down on the host device. The resistance of the pull-down resistor is decided by the specification of the SD host device.

  [Card insertion]

  When an SD card is inserted, SDDAT3 is pulled up. Accordingly, INFO9 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

  [Card removal]

  When an SD card is removed, SDDAT3 is pulled down. Accordingly, INFO8 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

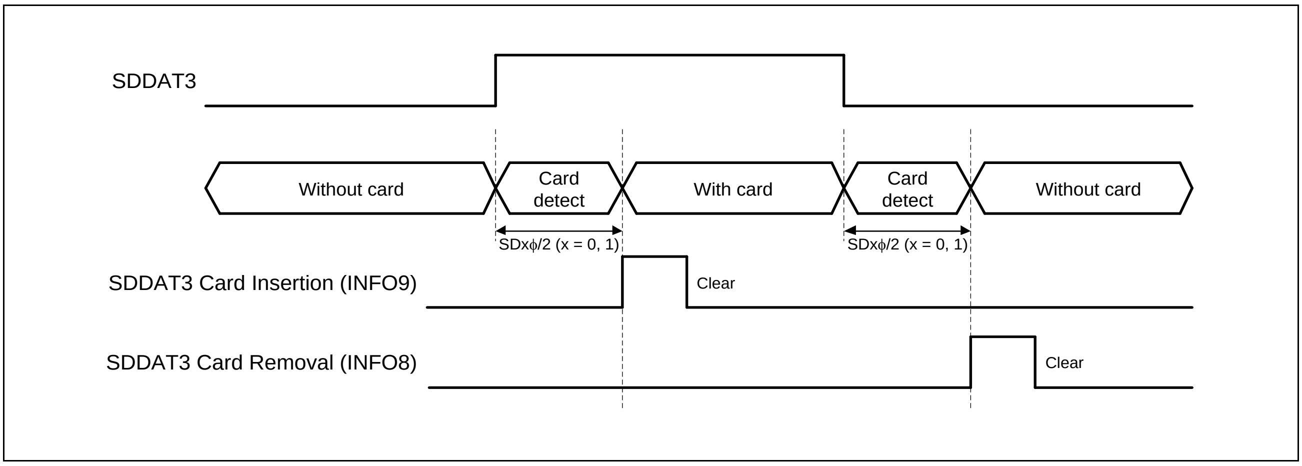

Figure 40.7 SD Card Detect with SDDAT3

(2) Write Protect

The SD/MMC host interface has two types of write protect functions.

- Write protect with ISDWP

  ISDWP is connected to the card socket, and pulled up or pulled down by the card insertion. The selection of pulling up or pulling down and the resistance value is decided by the specifications of the SD host device. As the ISDWP state is reflected to INFO7 in SD_INFO1, the write protect is decided after the SD card is inserted.

- Write protect with command

  The card’s internal write protection and the card lock/unlock operation are realized by the command.

40.3.3 Interrupt Request

(1) Interrupt Request

The SD/MMC host interface has the interrupt requests shown in **Table 40.5** shows the relationship between the interrupt flag registers and the interrupt mask registers. When a bit in an interrupt mask register is set to 0, an interrupt occurs by setting the corresponding bit in the interrupt flag register to 1.

To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Table 40.5 Interrupt Request

	Interrupt Flag Register		Interrupt Mask Register	
Interrupt Request	Register Name	Bit Name	Register Name	Bit Name
Card access interrupt*[1]	SD_INFO1	INFO2	SD_INFO1_MASK	IMASK2
		INFO0		IMASK0
	SD_INFO2	ILA	SD_INFO2_MASK	IMASK
		BWE		BMASK1
		BRE		BMASK0
		ERR6		EMASK6
		ERR5		EMASK5
		ERR4		EMASK4
		ERR3		EMASK3
		ERR2		EMASK2
		ERR1		EMASK1
		ERR0		EMASK0
SDIO access interrupt*[2]	SDIO_INFO1	EXWT	SDIO_INFO1_MASK	MEXWT
		EXPUB52		MEXPUB52
		IOIRQ		IOMSK
Card detect interrupt*[1]	SD_INFO1	INFO9	SD_INFO1_MASK	IMASK9
		INFO8		IMASK8
		INFO4		IMASK4
		INFO3		IMASK3
DMAC interrupt*[1]	DM_CM_INFO1	DTRANEND1	DM_CM_INFO1_MASK	DTRANEND1_MASK
		DTRANEND0		DTRANEND0_MASK
		SEQEND		SEQEND_MASK
	DM_CM_INFO2	DTRANERR1	DM_CM_INFO2_MASK	DTARERR1_MASK
		DTRANERR0		DTARERR0_MASK
		SEQERR		SEQERR_MASK

Note 1. Interrupt signal “OXMNIRQ” is asserted.

Note 2. Interrupt signal both “OXMNIRQ” and “OXASIOIRQ” are asserted.

40.3.4 Communications Errors and Timeouts

- Communications Errors and Timeouts

  Table 40.6 and **Table 40.7** show the relationships between the SD card interrupt flag register and SD error status register for communications errors and timeouts, respectively. When a bit in the SD card interrupt flag register is set to 1, the corresponding bit in the SD error status register is set to 1. The values of the SD error status register are cleared by writing to SD_CMD or writing 0 to the SDRST bit in SOFT_RST.

Table 40.6 Communications Errors

Communication Error	SD Interrupt Flag Register		SD Error Status Register		Description
	Register Name	Bit Name	Register Name	Bit Name	
END error	SD_INFO2	ERR2	SD_ERR_STS1	E5	When an error occurs in the CRC status length
				E4	When an error occurs in read data length
				E3	When an error occurs in the response length to a command issued within a command sequence
				E2	When an error occurs in the response length (other than a response to a command issued within a command sequence)
CRC error		ERR1		E11	When an error occurs in the CRC status
				E10	When a CRC error occurs in the read data
				E9	When a CRC error occurs in the response to a command issued within a command sequence
				E8	When a CRC error occurs in the response (other than a response to a command issued within a command sequence)
CMD error		ERR0		E1	The command index of the transmitted command differed from the command index of the received response (for a command issued within a command sequence)
				E0	The command index of the transmitted command differed from the command index of the received response (for a command issued other than within a command sequence)

Table 40.7 Timeouts

Timeout	SD Interrupt Flag Register		SD Error Status Register		Description
	Register Name	Bit Name	Register Name	Bit Name	
Response timeout	SD_INFO2	ERR6	SD_ERR_STS2	E1	When the response to a command issued within a command sequence is not received even after 640 cycles of SDCLK have elapsed
				E0	When the response (other than a response to a command issued within a command sequence) is not received even after 640 cycles of SDCLK have elapsed
Data timeout (other than response timeout)		ERR3		E6	When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle*[1] after the CRC status
				E5	When the CRC status is not received t even after Ncycle*[1] has elapsed after data writing
				E4	When read data is not received even after Ncycle*[1] has elapsed after read command
					When read data for the next block are not received even after Ncycle*[1] has elapsed after the reception of read data
					When read data for the next block are not received even after Ncycle*[1] has elapsed after release of the read wait state
				E3	When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle*[1] after CMD12 has been issued within a command sequence
				E2	When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle*[1] after R1b response

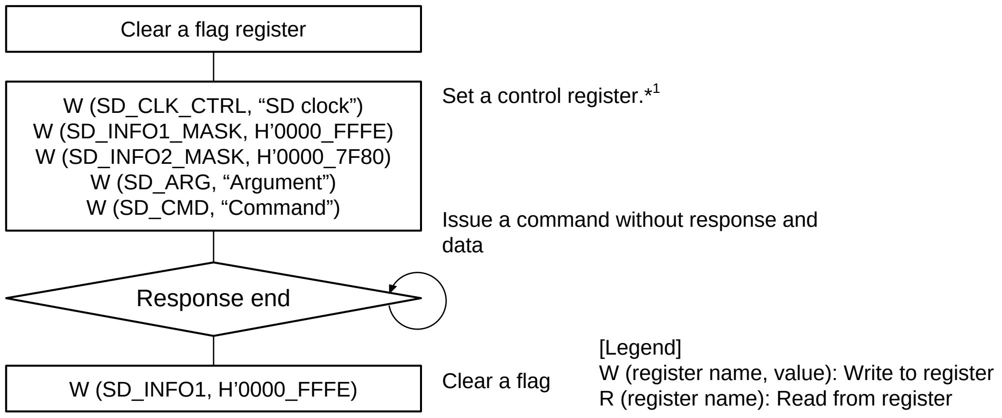
Note 1. Ncycle is set by bit 7 to bit 4 in SD_OPTION.

40.4 Usage Example

40.4.1 Command without Data Transfer

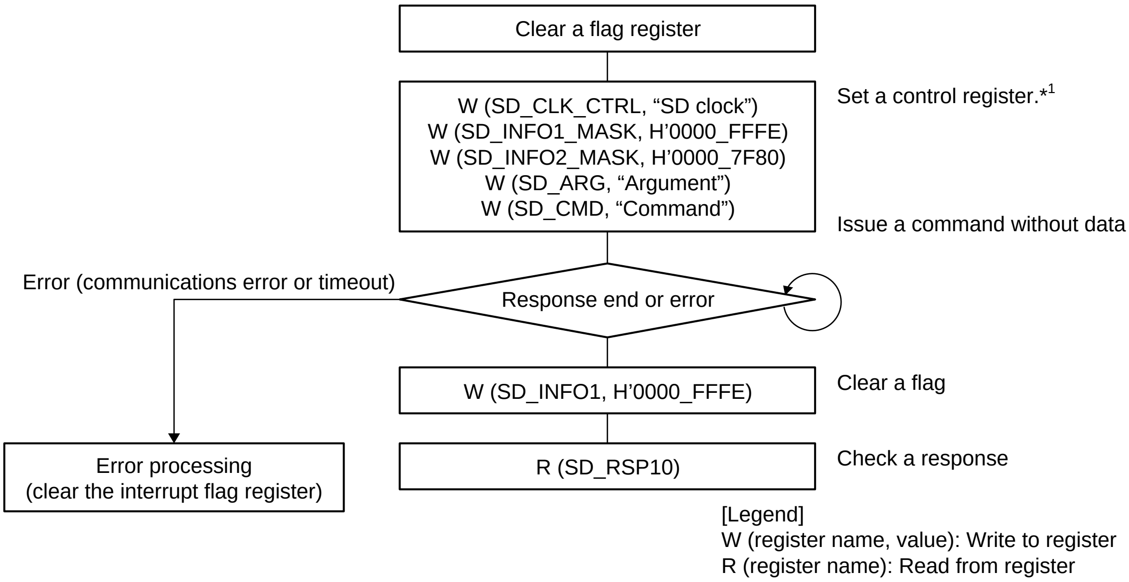
(1) Flowchart

Figure 40.8 and **Figure 40.9** show flowchart examples.



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.8 Flow Example of Command without Response and Data



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.9 Flow Example of Command without Data

(2) Operation for Command without Data Transfer

The legend below is used for description of register read/write.

W (register name, value):Write to register

R (register name):Read from register

The operation is described as below.

(a) Command without response and data

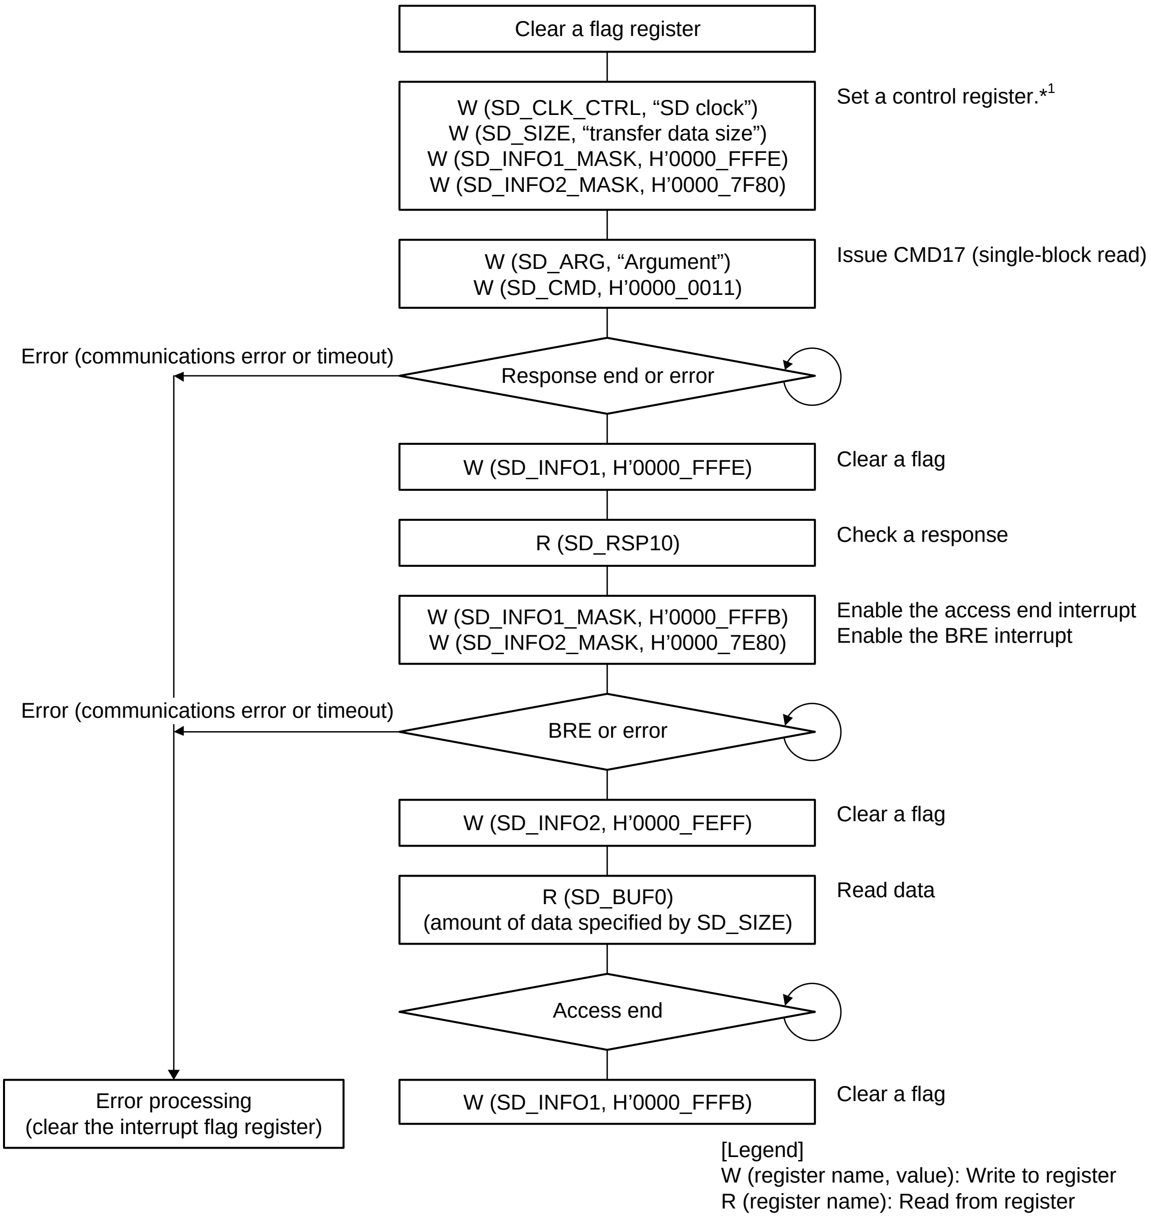
1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
   Set CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear
   When transmission of a command is completed, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.

(b) Command without data

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
   Set CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear
   When a response is received, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.
5. Read a response from SD_RSP10.
   Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

40.4.2 Single Block Read

(1) Flowchart



Note: The error processing of SDR104/HS200 requires a re-tuning.

Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.10 Single Block Read Flowchart Example

(2) Operation for Single Block Read

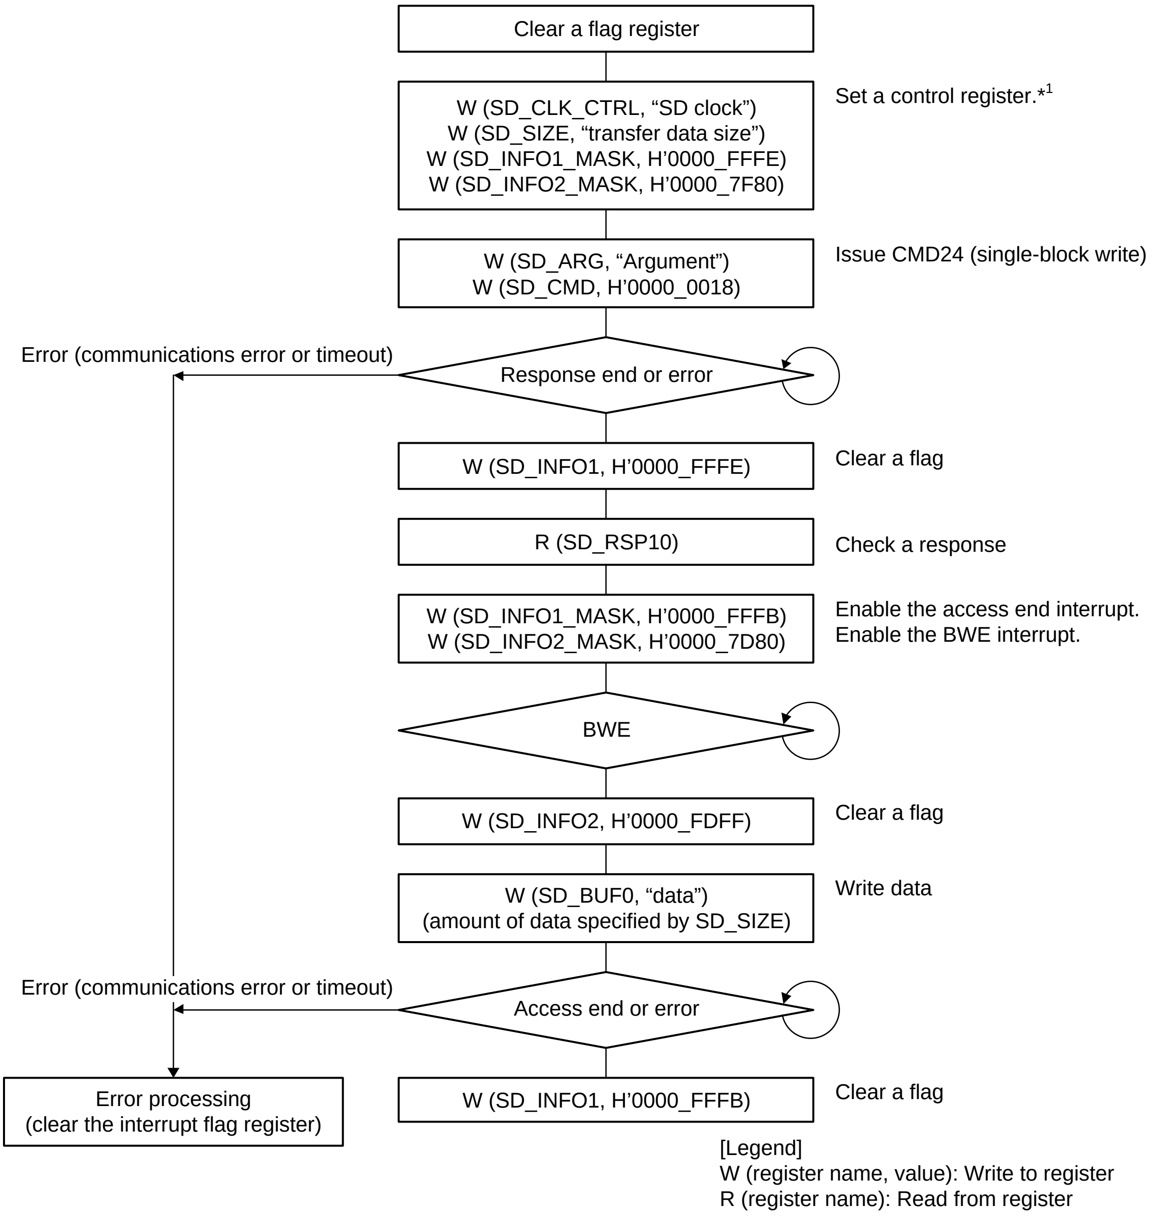
The operation of the single block read is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD17)
   Set CMD17 Argument in SD_ARG and write H’0000 0011 to SD_CMD.
   Accordingly, CMD17 is issued, and the single block read operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
   If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data receive from SD card and data read
   Write H’0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H’0000 7E80 to SD_INFO2_MASK to enable the BRE interrupt. When the data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0.
   However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress.
6. Operation complete
   When the data read from SD_BUF0 is completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to end the single block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

40.4.3 Single Block Write

(1) Flowchart



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.11 Single Block Write Flowchart Example

(2) Operation for Single Block Write

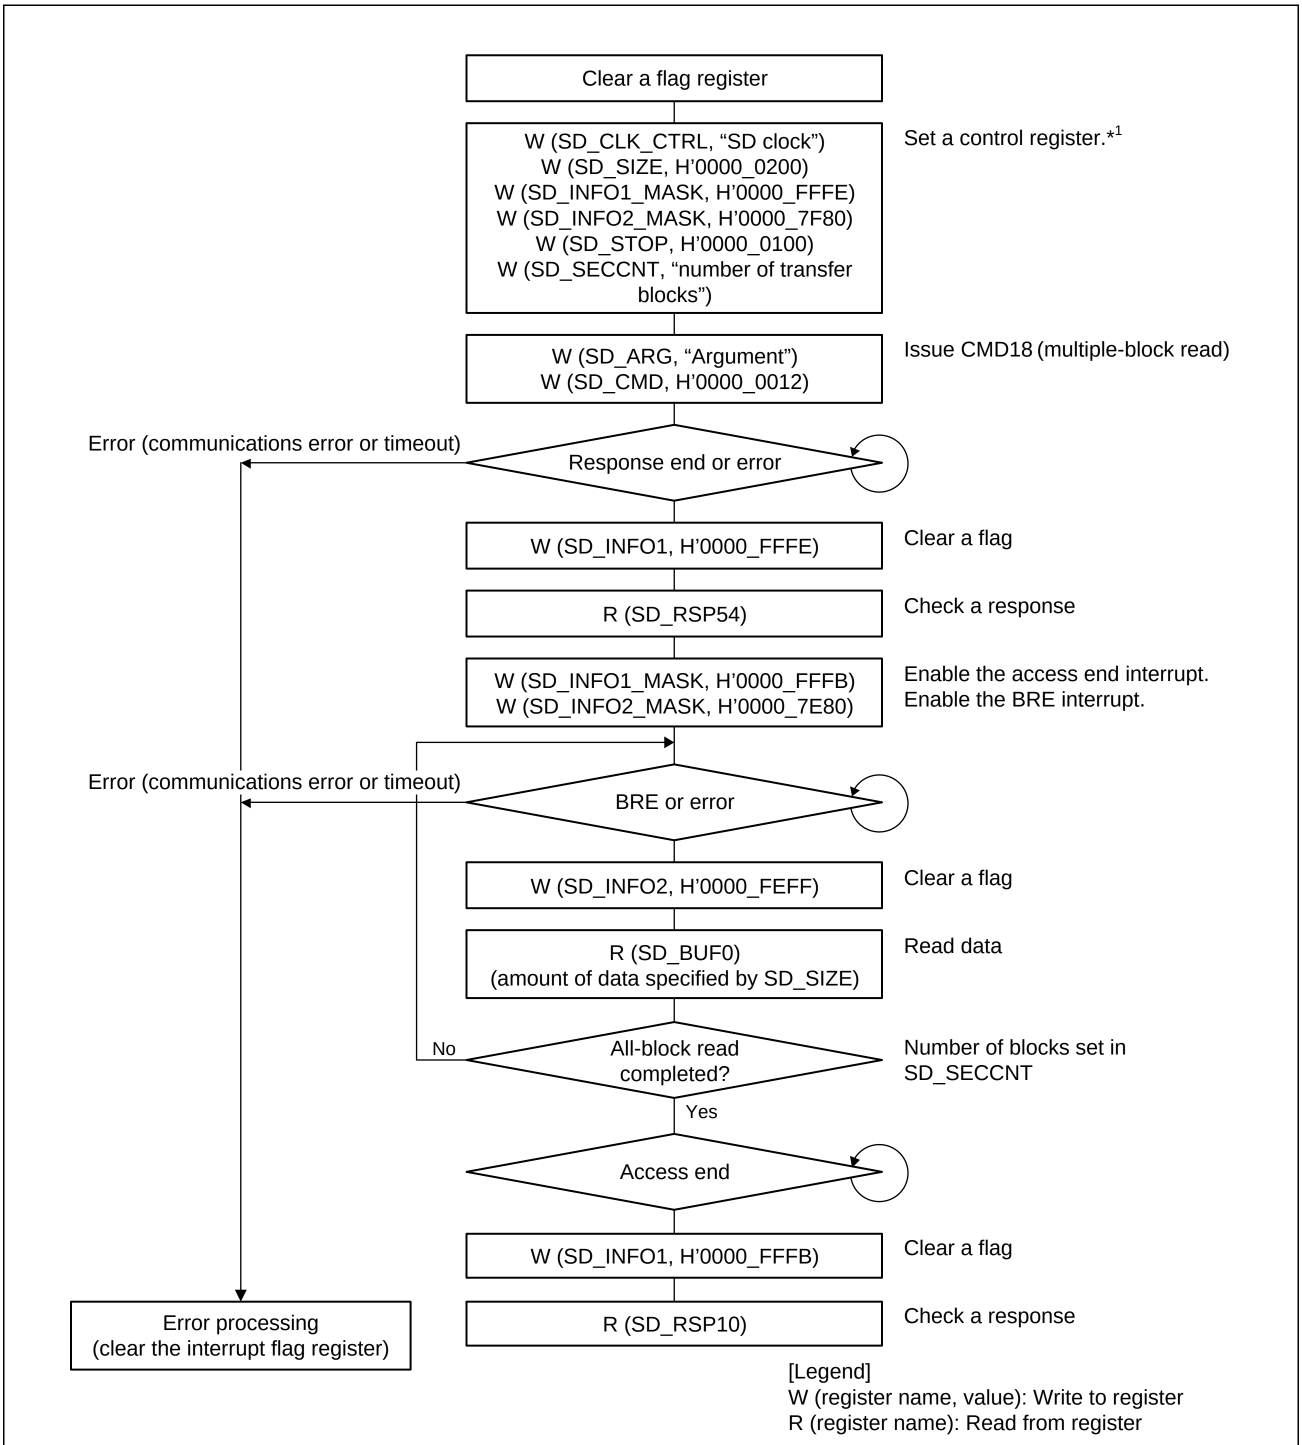
The operation of the single block write is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD24)
   Set CMD24 Argument in SD_ARG and write H’0000 0018 to SD_CMD.
   Accordingly, CMD24 is issued, and the single block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
   If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data write and data transmit to SD card
   Write H’0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H’0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card.
   However, a communications error or timeout may be generated if data are being transmitted after writing to SD_BUF0.
6. Operation complete
   When the CRC status and busy state are received from the SD card, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to end the single block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

40.4.4 Multiple Block Read

(1) Flowchart



Note: The error processing of SDR104/HS200 requires a re-tuning.

Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.12 Multiple Block Read Flowchart Example

(2) Operation for Multiple Block Read

The operation of the multiple block read is described below.

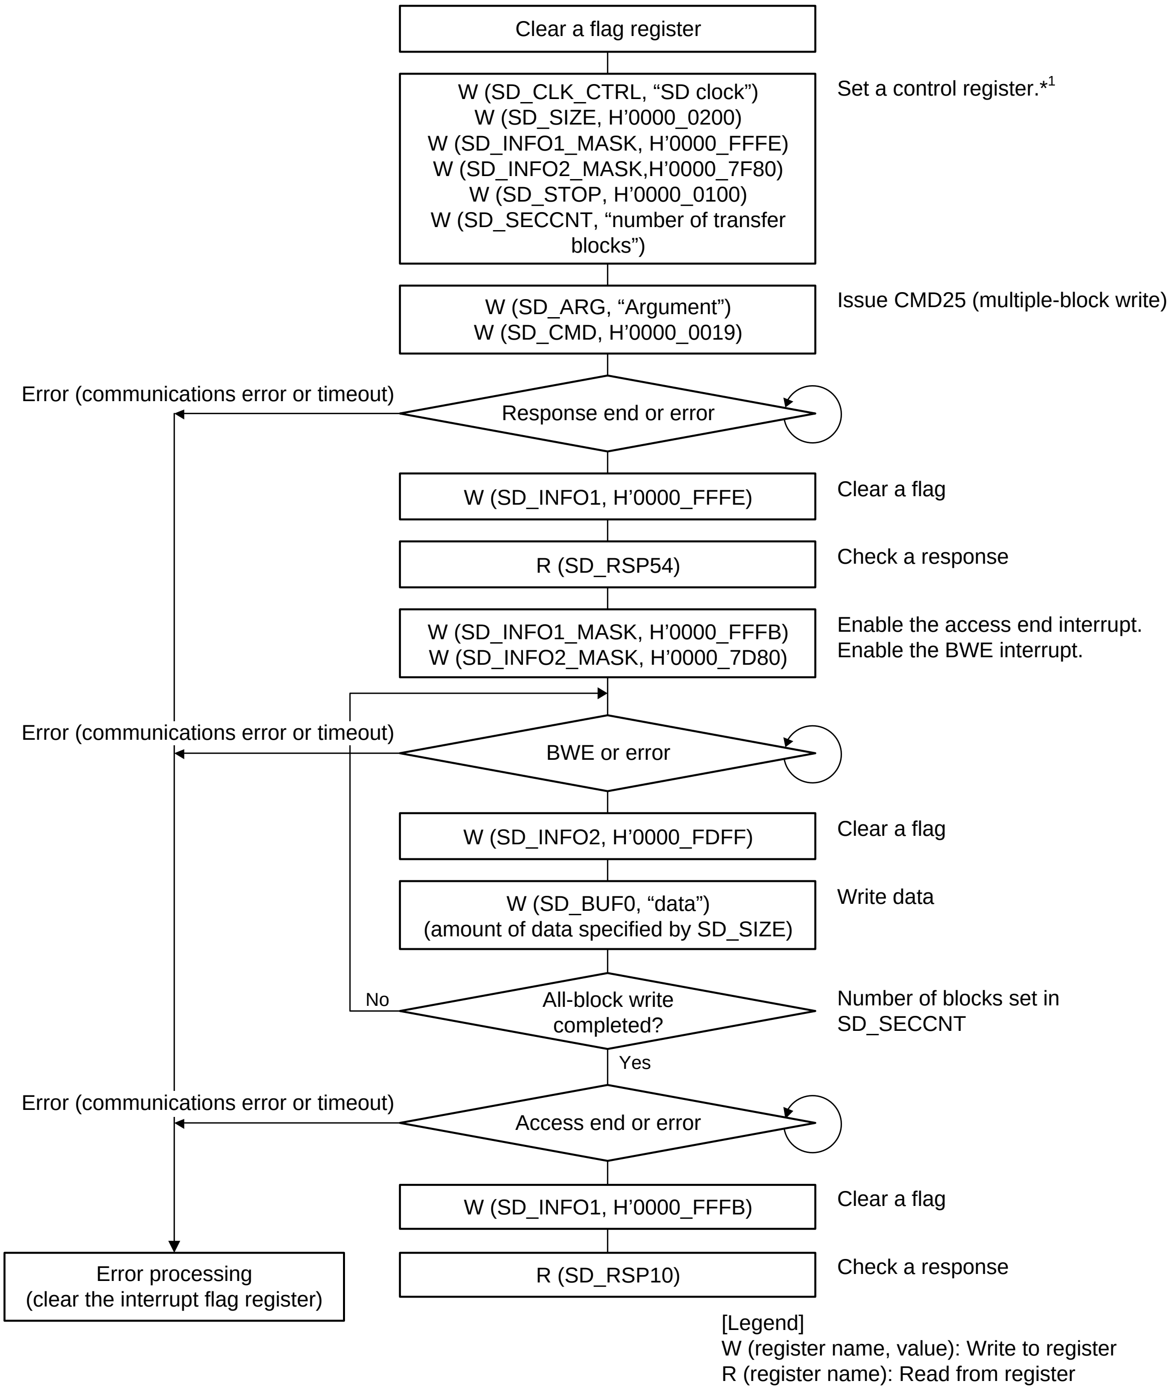
1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD18)
   Set CMD18 Argument in SD_ARG and write H'0000 0012 to SD_CMD.
   Accordingly, CMD18 is issued, and the multiple block read operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data receive from SD card and data read
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7E80 to SD_INFO2_MASK to enable the BRE interrupt. When one-block data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress. CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 Argument is automatically set to H'0000 000.
6. Operation complete
   When all-block data read and the CMD12 response receive are completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to read the response. This is the end of multiple block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

40.4.5 Multiple Block Write (when Using Internal Timer)

(1) Flowchart

Figure 40.13 shows the flowchart when using an internal timer.



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.13 Multiple Block Write Flowchart Example (when Using Internal Timer)

(2) Operation for Multiple Block Write

The operation of the multiple block write is described below.

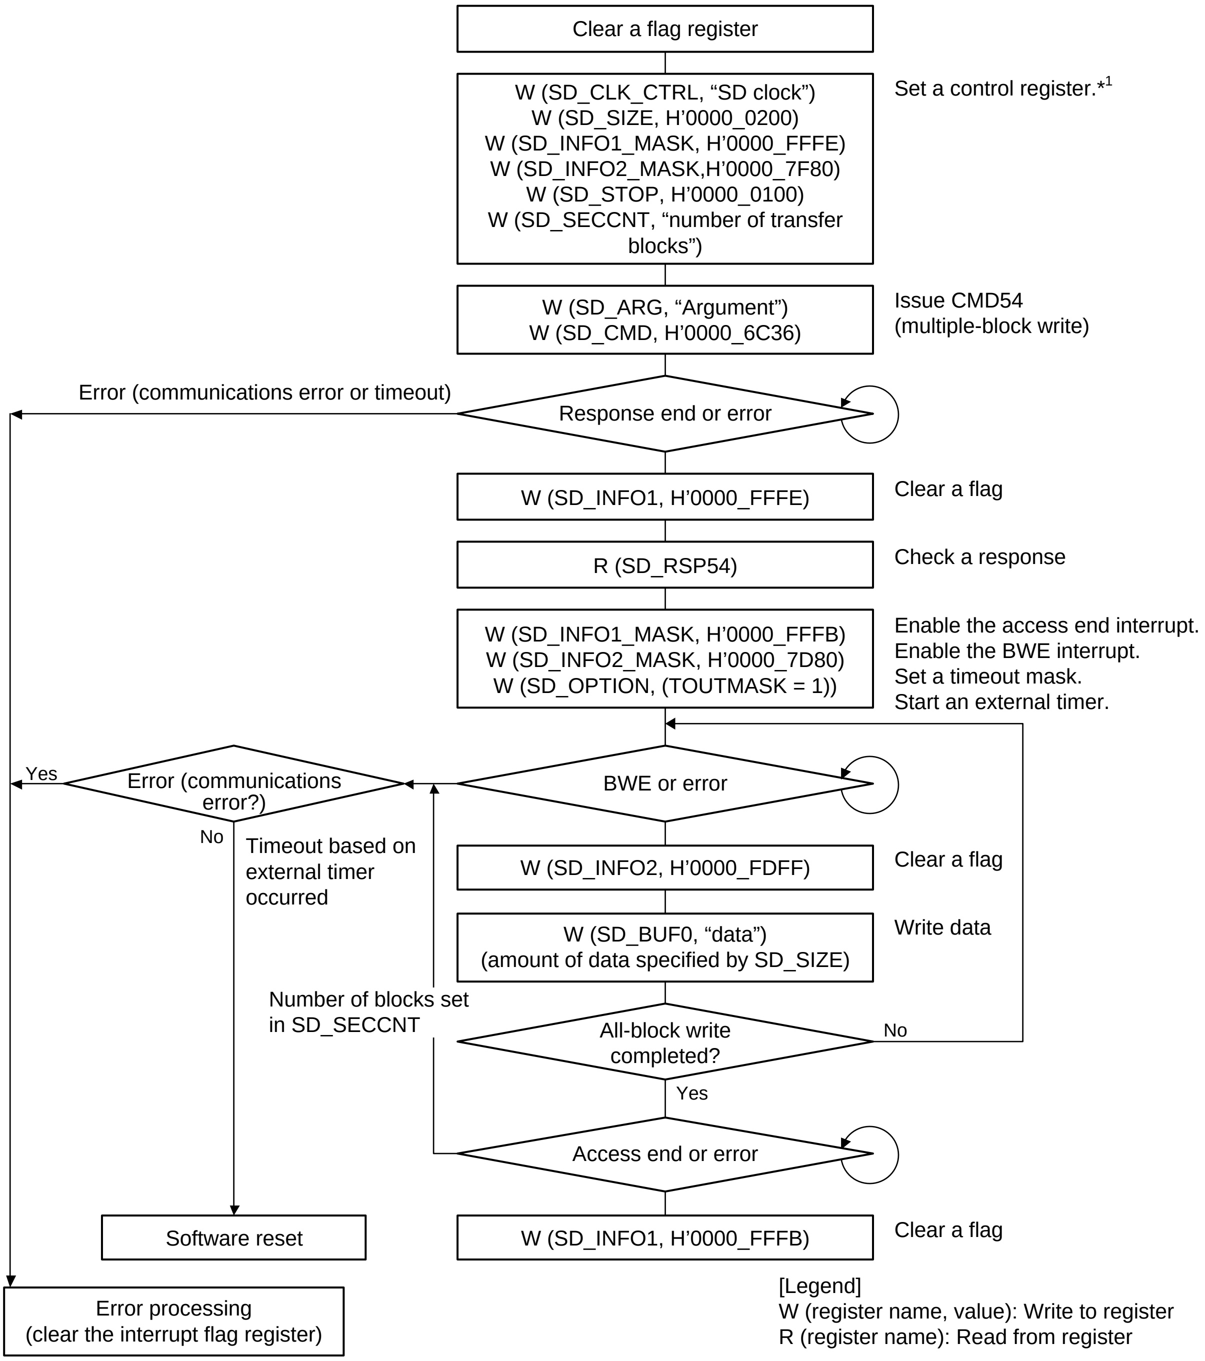
1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write H’0000 0019 to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write H’0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H’0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress. CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 Argument is automatically set to H’0000 0000.
6. Operation complete
   When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

40.4.6 Multiple Block Write (when Using External Timer)

(1) Flowchart

The flowchart when using an external timer instead of an internal timer of this module is shown below.



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.14 Multiple Block Write Flowchart Example (when Using External Timer)

(2) Operation for Multiple Block Write

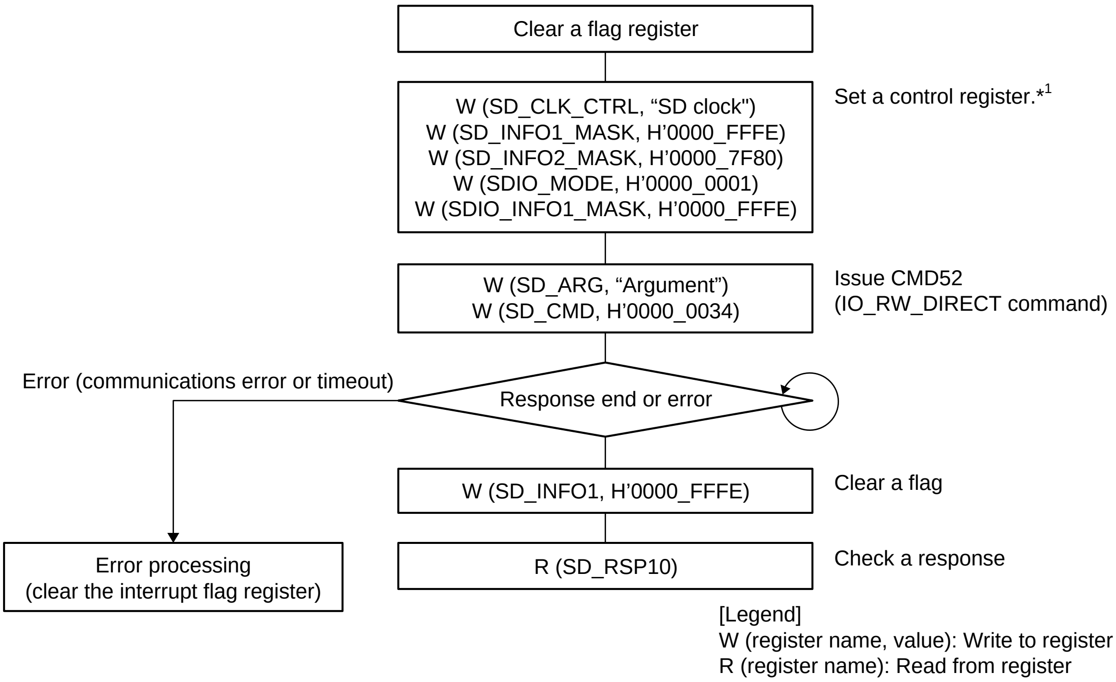
The operation of the multiple block write is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD54)
   Set CMD54 Argument in SD_ARG and write H'0000 6C36 to SD_CMD.
   Accordingly, CMD54 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. Set the TOUTMASK bit in SD_OPTION to disable timeout and start an external timer.
   When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 resister is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. Operation complete
   When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs at response reception (a communications error or timeout) or at data transmission. Perform a software reset if a timeout occurs at data transmission based on an external timer.

40.4.7 IO_RW_DIRECT Commend (CMD52)

(1) Flowchart



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

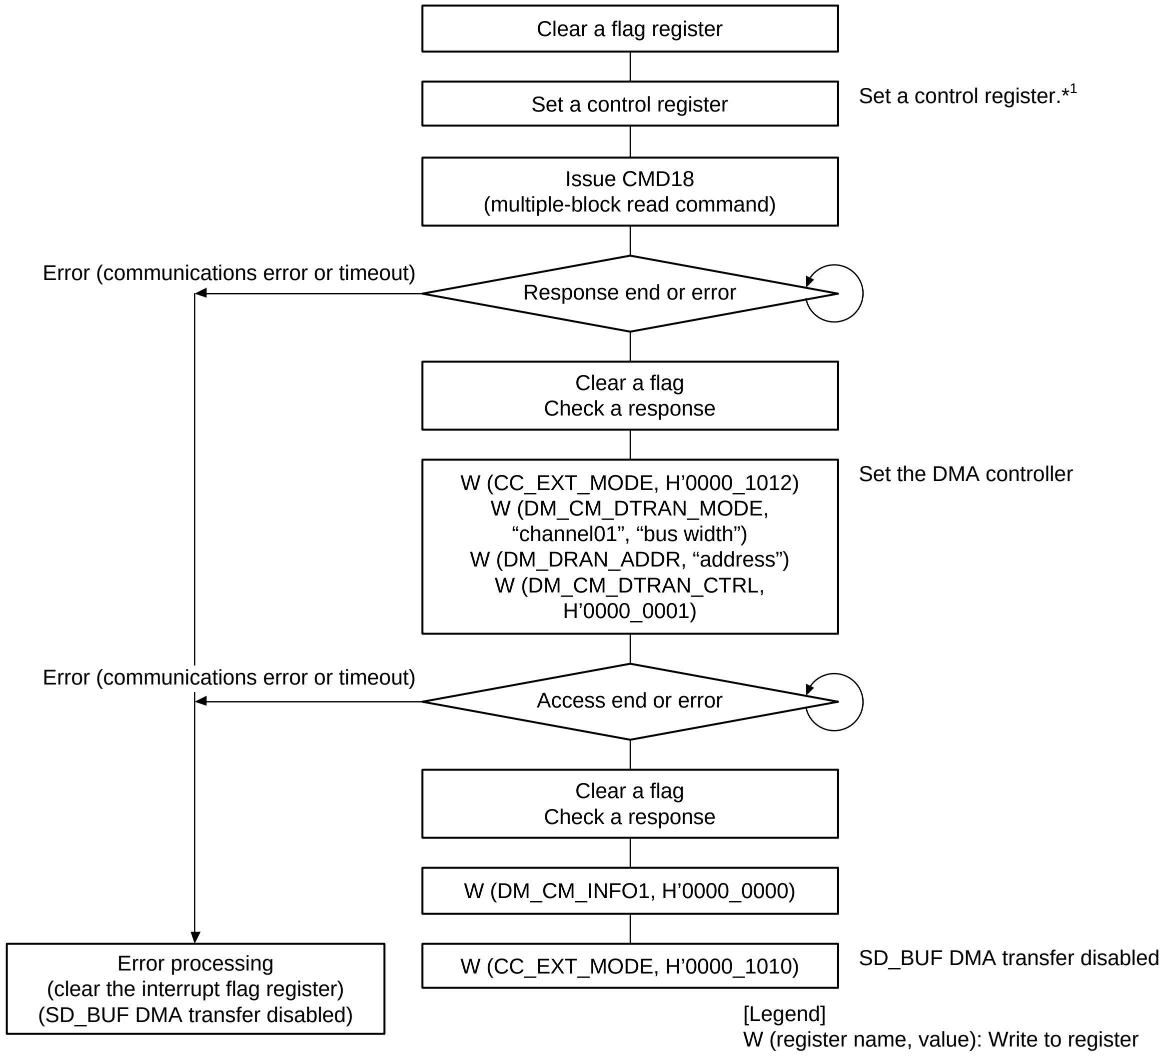
40.4.10 DMA Transfer

(1) SD_BUF DMA Transfer

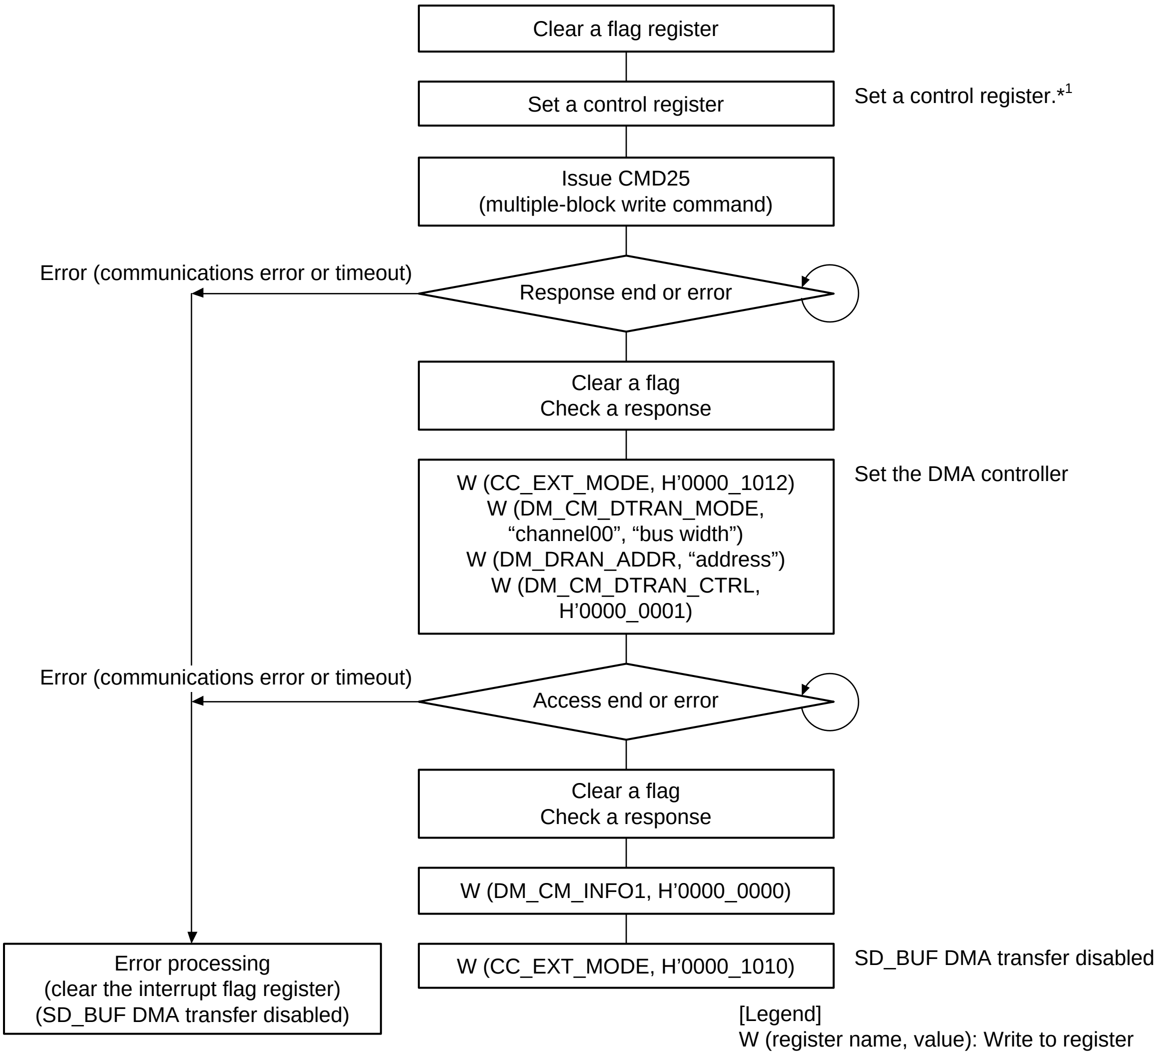
Figure 40.22 shows a flowchart example for SD_BUF DMA read when CMD18 (multiple block read) is issued.



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.22 SD_BUF DMA Read Flowchart Example

Figure 40.23 shows a flowchart example for SD_BUF DMA write when CMD25 (multiple block write) is issued.

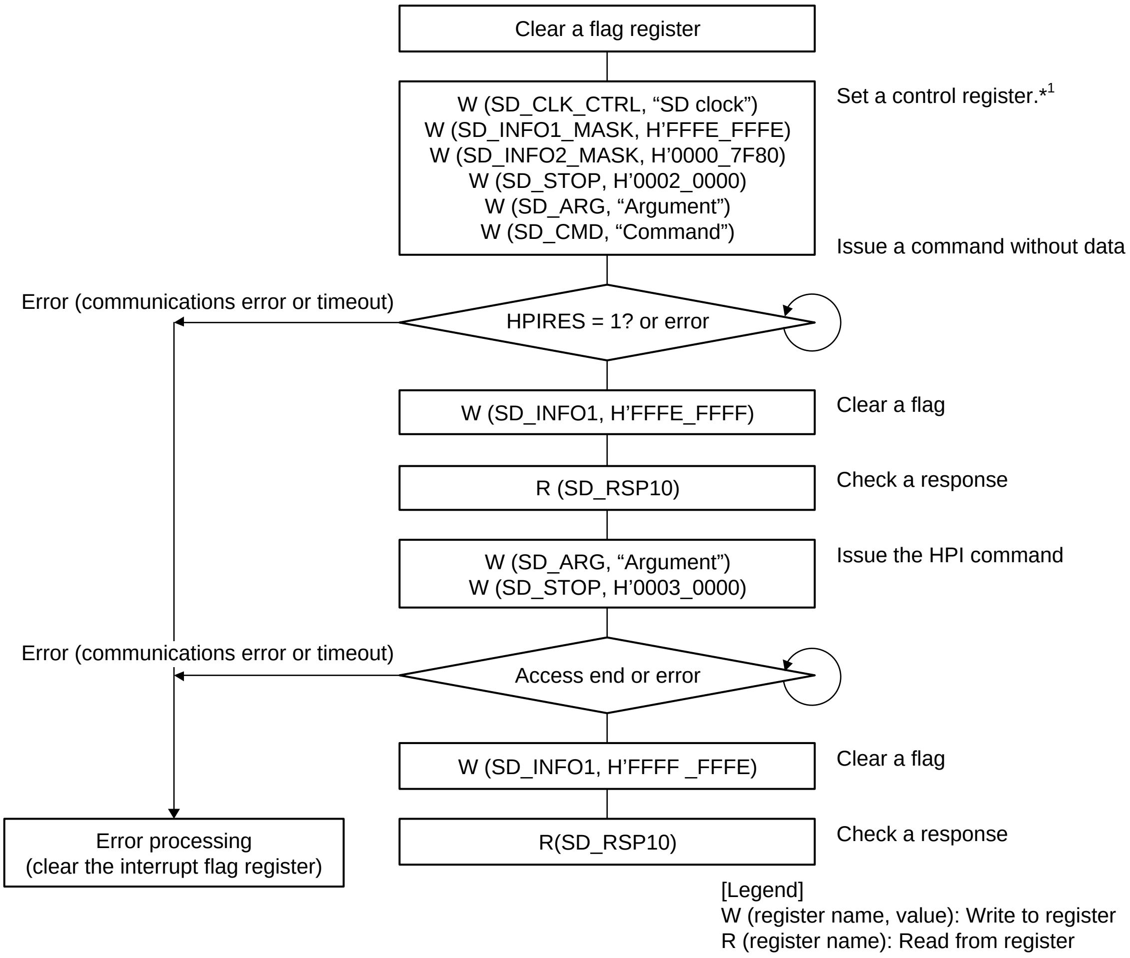


Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.23 SD_BUF DMA Write Flowchart Example

40.4.11 High-Priority Interrupt (without Data Transfer)

(1) Flowchart



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.24 Example of the High-Priority Interrupt (without Data Transfer) Flowchart

(2) Operation for High-Priority Interrupt without Data Transfer

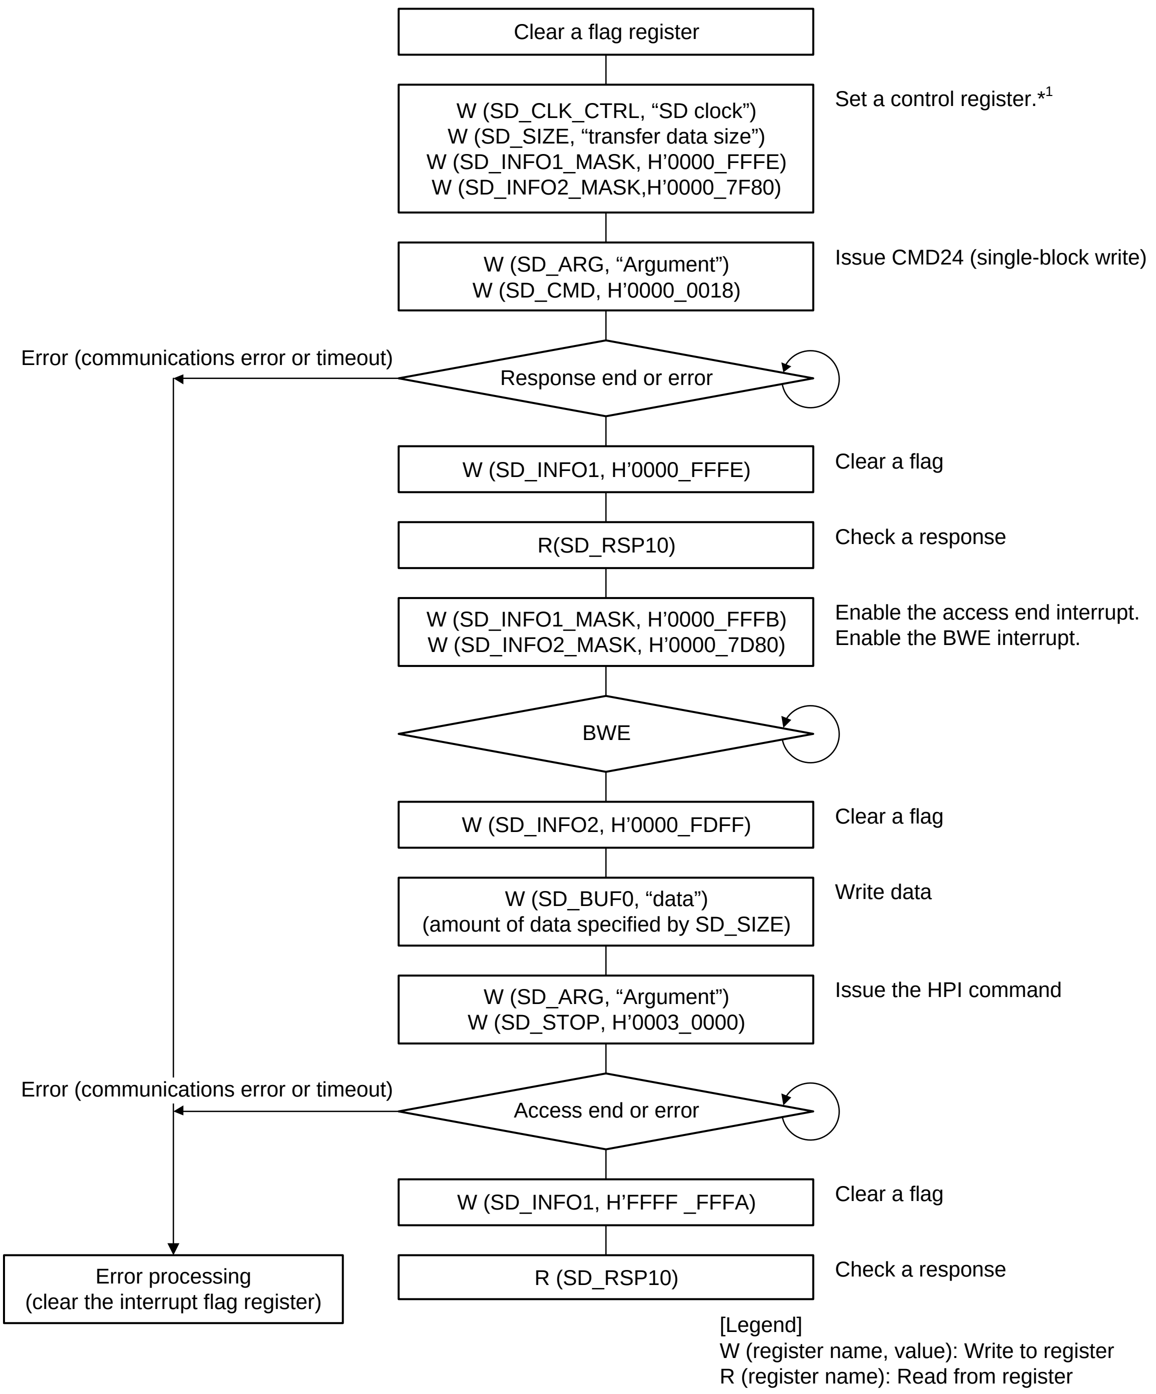
The operation of the high-priority interrupt (HPI) without data transfer is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), HPI enable, interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
   Set the CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear
   On receiving the response, the HPIRES bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the HPIRES bit to 0.
5. Read the response from SD_RSP10.
6. HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO0 bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO0 bit to 0 to read the response from SD_RSP10.
   This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

40.4.12 High-Priority Interrupt (at Single Block Write)

(1) Flowchart



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.25 Example of the High-Priority Interrupt (at Single Block Write) Flowchart

(2) Operation for HPI at Single Block Write

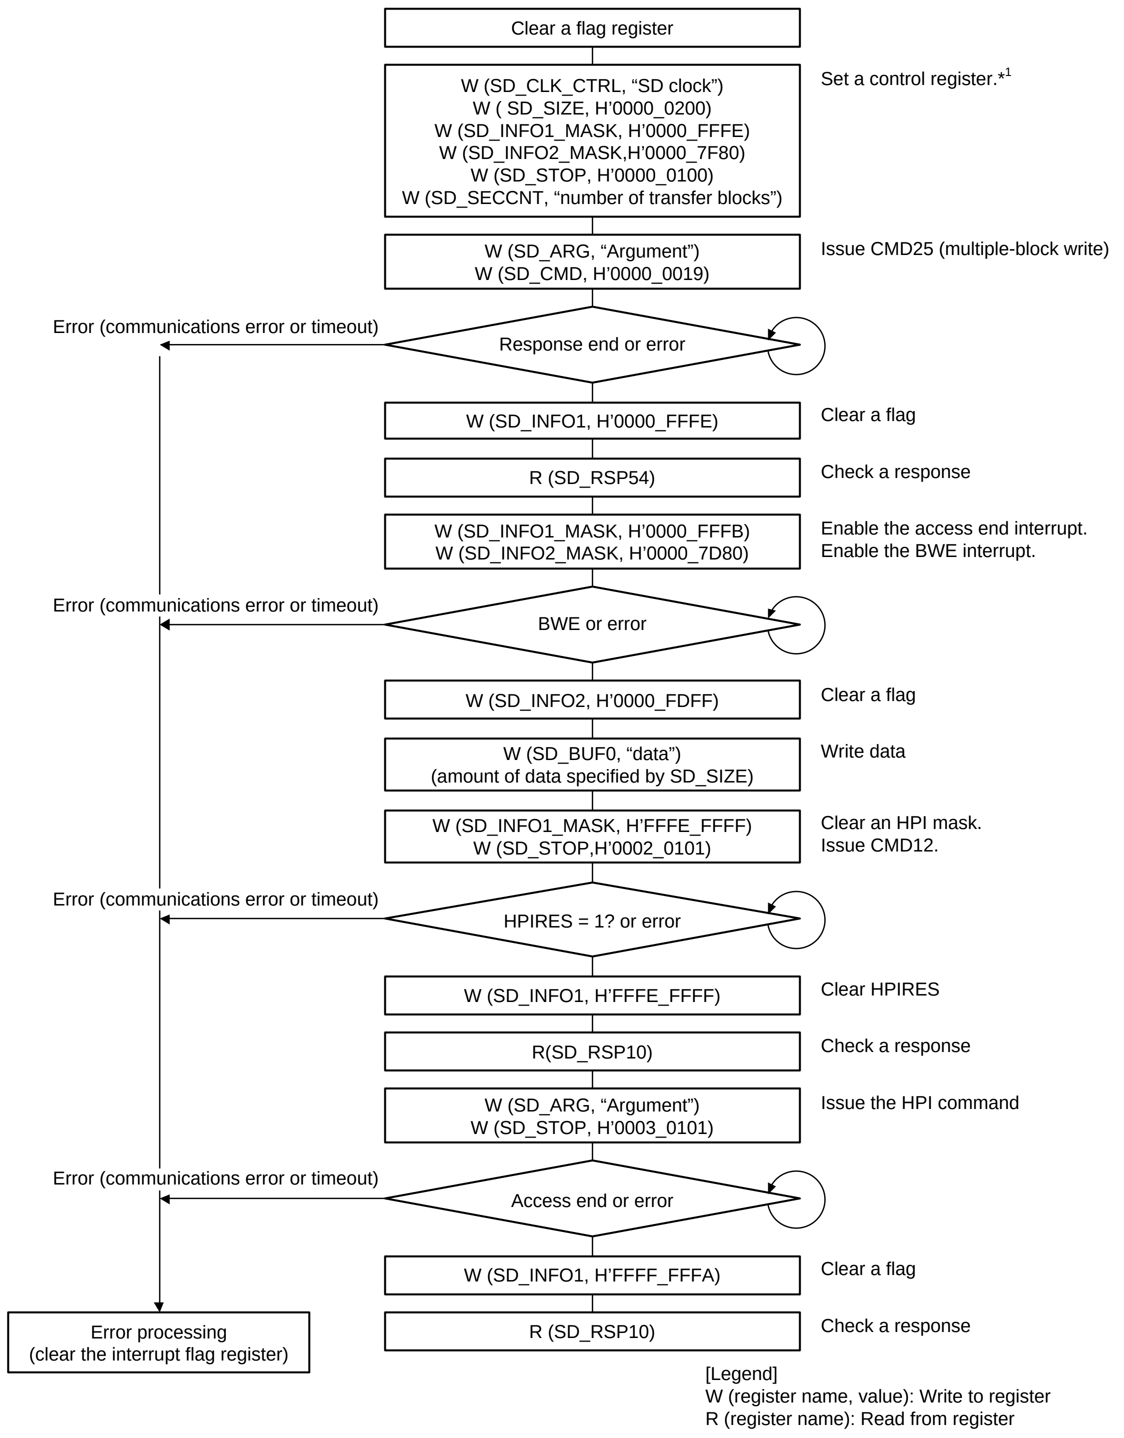
The operation of HPI at single block write is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD24)
   Set CMD24 Argument in SD_ARG and write H’0000 0018 to SD_CMD.
   Accordingly, CMD24 is issued, and the single block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
   If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data write and data transmit to SD card
   Write H’0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H’0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
6. HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

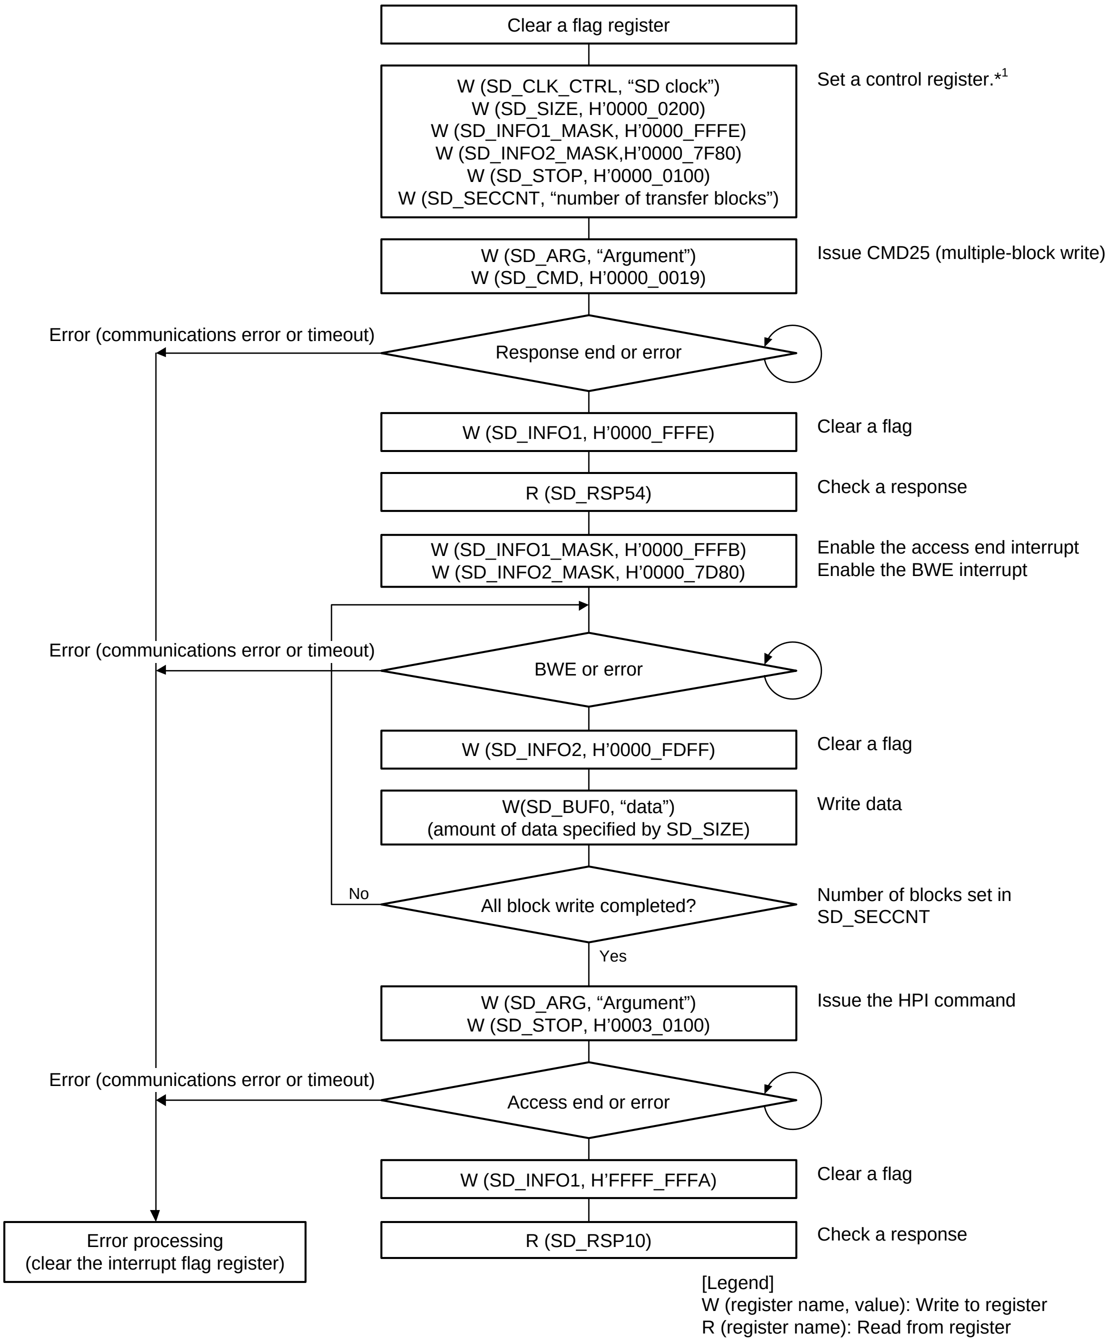
40.4.13 High-Priority Interrupt (at Multiple Block Write)

(1) Flowchart



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.26 Example of the High-Priority Interrupt (at Multiple Block Write) Flowchart (a)



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.27 Example of the High-Priority Interrupt (at Multiple Block Write) Flowchart (b)

(2) Operation for HPI at Multiple Block Transfer

The operation of HPI at the multiple block write is described below.

(a) When not all the data has been written to SD_BUF

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write H’0000 0019 to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write H’0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H’0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
   Then, the CRC status and busy state are received from the SD card.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. Command issue (CMD12)
   Write H’FFFE FFFF to SD_INFO1_MASK to enable the HPIRES interrupt. Write H’0002 0101 to SD_STOP, which causes CMD12 to be issued.
7. Response check
   When the response is received, the HPIRES bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the HPIRES bit to 0 to read the response from SD_RSP10.
8. HPI command issue (CMD25)
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
9. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

(b) When all the data has been written to SD_BUF

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write H’0000 0019 to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write H’0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H’0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
   Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

40.4.14 Example of SD_CMD Register Setting

Table 40.8 lists the example of SD_CMD (SD interface) register setting.

Table 40.8 Example of SD_CMD Register Setting (SD) (1/2)

Type	Command	Example of SD_CMD Register Setting	Remark
CMD	CMD0	H’0000 0000	
	CMD2	H’0000 0002	
	CMD3	H’0000 0003	
	CMD4	H’0000 0004

	CMD55	H'0000 0037	
	CMD56	H'0000 0038	

40.5 Usage Notes

(1) SD_BUF Illegal Write Access

When writing data to SD_BUF0 after the single block write or multi block write command is issued, the data of the size specified by SD_SIZE must be written to.

If the data of the size which exceeds the size specified by SD_SIZE is written to, the ERR4 bit in SD_INFO2 is set to 1. In addition, the data written to SD_BUF0 may not be transmitted and it causes the SCLKDIVEN bit in SD_INFO2 to hold the value of 0. In such cases, clearing the SDRST bit in SOFT_RST to 0 and then restoring its value to 1 clears the SCLKDIVEN bit to 1.

However, for the single byte (in the case of 16- or 32-bit access) or three bytes (in the case of 32-bit access) when the number of bytes setting in SD_SIZE is odd, or the fraction of bytes when the number of bytes setting in SD_SIZE is even (in the case of 32-bit access), since the portion of dummy data writing is regarded as excess data and ignored, it is not within the scope of the above description (the fraction of bytes: the two bytes that are not in a four-byte unit).

(2) Block Number Limitation for Multiple Block Read

When performing a multiple block read of one or two blocks, depending on the timing with which the response register is read, the response value may not be read properly. This must be avoided by either of the following countermeasures.

1) When receiving one or two blocks of data, use single block reading.
2) Read the response to CMD18 from SD_RSP54.

<Mechanism of incorrect reading>

Figure 40.28 shows the processing flows of SD/MMC host interface (hardware) operation and software operation when a multiple block read is performed on two blocks. As shown in the incorrect operation of **Figure 40.28**, when an interrupt is generated on reception of the CMD18 response and the timing with which the SD card response register (SD_RSP10) is read by the interrupt is delayed, the data during the CMD12 response reception or the CMD12 response may be read. In the case of a multiple block read of three or more blocks, CMD12 is not issued until the block of data has been read, so this problem does not arise. Furthermore, in the case of a multiple block write, since the CMD25 response is read before the block of data is sent, the problem does not arise.

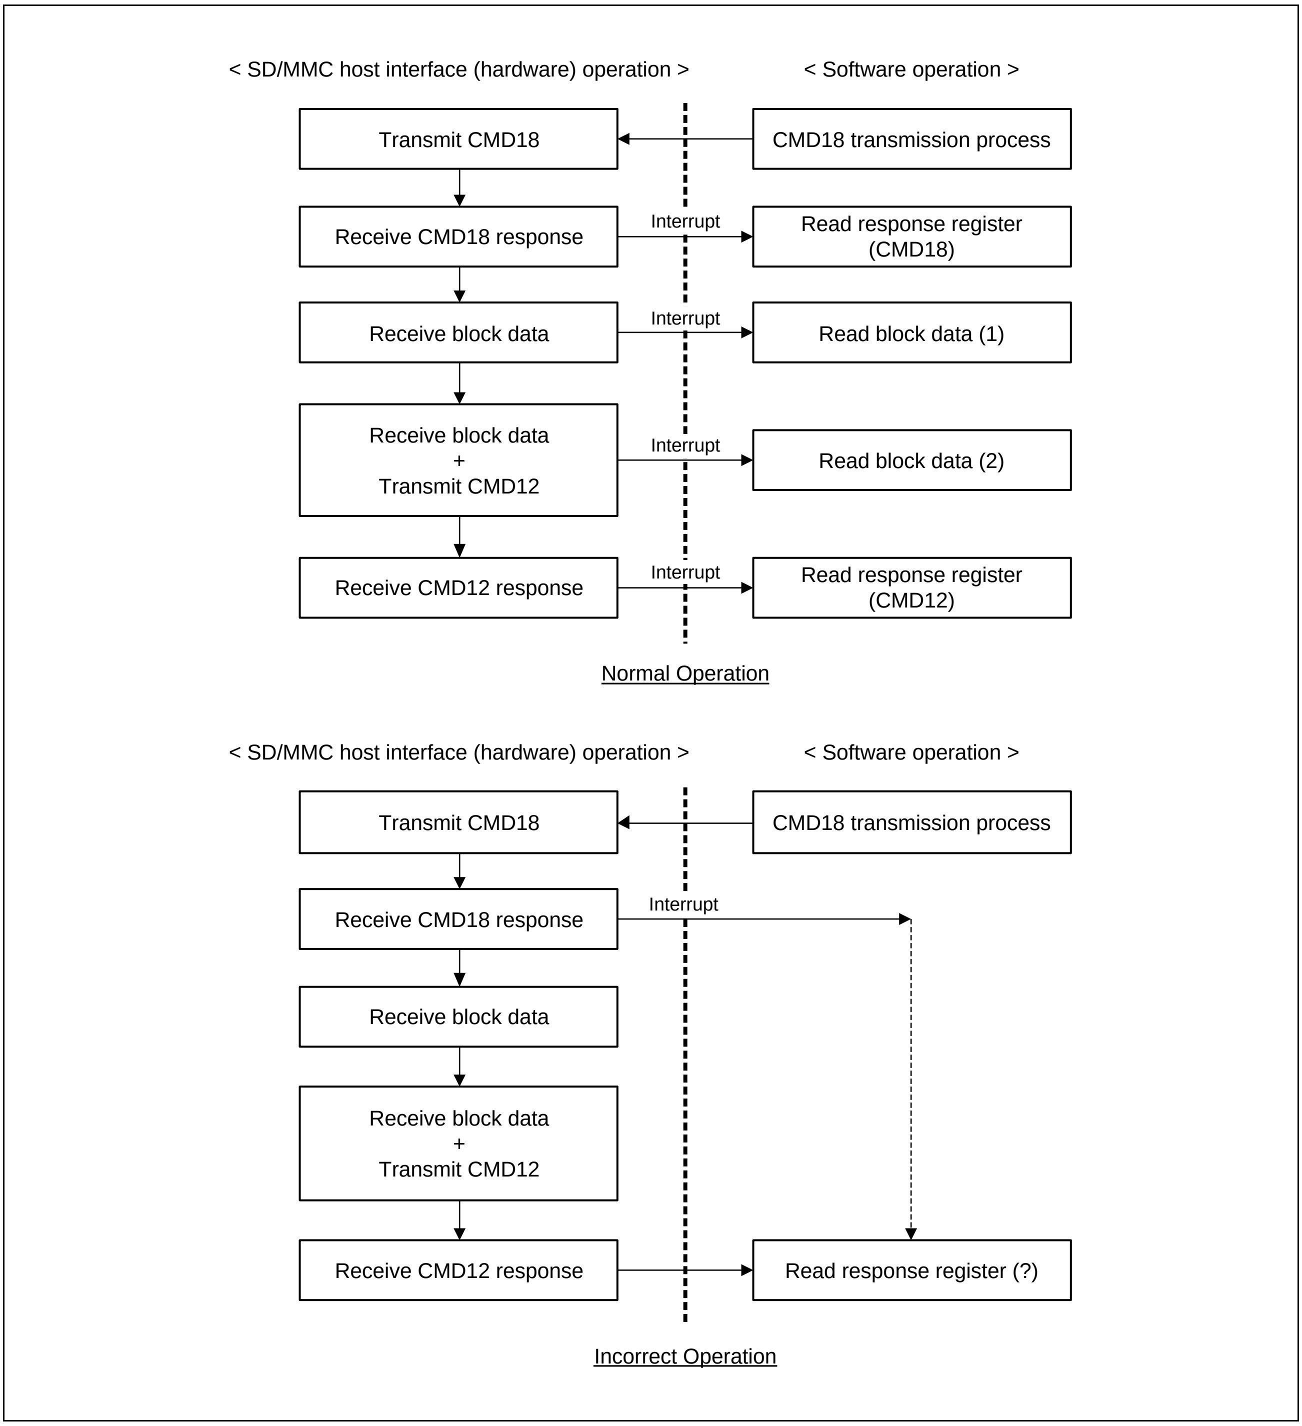

Figure 40.28 Flowcharts for Multiple Block Read Operation (Two Blocks)

(3) Automatic Control of SDCLK Output

In the SD Card standard, 74 cycles of SDCLK must be output before initialization of the card. For this reason, use automatic control of SDCLK output after 74 cycles of SDCLK have been output. Furthermore, if automatic control of SDCLK output was in use, SDCLK output is stopped on completion of the sequence for a communications error or timeout. Thus, in cases where state transitions within the SD card are necessary and so on after completion of the sequence, release automatic control of SDCLK output and restart supply of SDCLK to the SD card.

(4) Control of the C52PUB Setting for Multiple Block Write

If the C52PUB bit in SDIO_MODE is set to 1 during a sequence of multiple block write due to CMD53, CMD52 is not issued until SD_BUF becomes empty. For this reason, set the C52PUB bit after suspending writing to SD_BUF by following the appropriate procedure below.

- When DMA transfer is not in use

1. Before setting the C52PUB bit, suspend writing to SD_BUF by making the setting in SD_INFO2 to disable BWE interrupts.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by making the setting in SD_INFO2 to enable BWE interrupts.

- When DMA transfer is in use

1. Every time DMA transfer of the value set in SD_SIZE × n blocks (where n = 1, 2, ...) proceeds, suspend writing to SD_BUF by DMA transfer before the C52PUB bit is set.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by DMA transfer.

(5) Notes on SD_CLK_CTRL Register Settings

When the SCLKDIVEN bit in SD_INFO2 is 0, SD_CLK_CTRL cannot be written to. Before writing to SD_CLK_CTRL, be sure to check that the SCLKDIVEN bit in SD_INFO2 is 1.

(6) Restrictions on specifications

1. The SDIO suspend/resume is not supported.
2. The SPI bus is not supported.
3. The shared bus and 8-bit SD bus for embedded SDIO are not supported.
4. The stream transfer for MMC cards is not supported.

(7) STP bit setting during multiple block read

During execution of multiple block read with automatic CMD12 execution by setting the SEC bit in SD_STOP to 1, even if the STP bit in SD_STOP is set to 1 to forcibly stop the execution, the command sequence may not stop depending on the timing of setting the STP bit.

To avoid this, when setting the STP bit in SD_STOP to 1 during multiple block transfer, clear the SEC bit in SD_STOP to 0 at the same time. (Even when the SCLKDIVEN bit in SD_INFO2 is 0, change the SEC bit from 1 to 0.)

When the command sequence has not stopped because the SEC bit was not cleared to 0, the command sequence can be stopped by clearing the SDRST bit in SOFT_RST to 0.

When forcibly terminating the CMD53 multiple block transfer through the IOABT bit in SDIO_MODE, be sure to leave the SEC bit in SD_STOP as 1.

40.6 Sampling Clock Controller (SCC)

40.6.1 Features

This module controls a sampling clock (hereafter referred to as the SCC sampling clock) that is used for SD UHS-I/SDR104 and MMC HS200. When this module is used with the LSI, SD UHS-I/SDR104 and MMC HS200 can be supported.

40.6.2 SCC Block Diagram

Figure 40.29 shows a block diagram of the sampling clock controller.

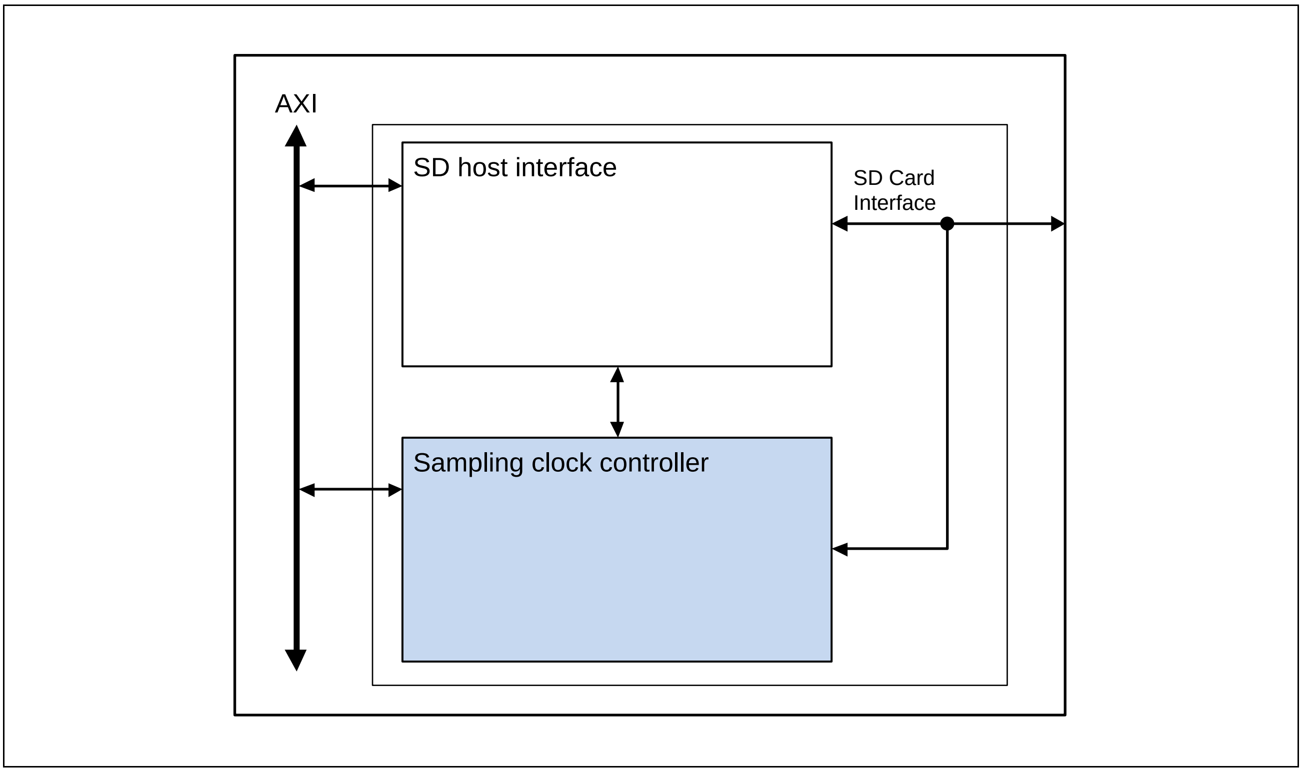

Figure 40.29 Block Diagram of the Sampling Clock Controller

40.6.3 SCC Register Configuration

Table 40.10 shows the SCC registers. Regarding the base address of registers as follows, refter to **Section 40.1.3**.

Channel 0: H’0_11C0_1000 (Cortex-A55)

Channel 0: H’41C0_1000 (Cortex-M33 Non-Secure)
H’51C0_1000 (Cortex-M33 Secure)

Channel 1: H’0_11C1_1000 (Cortex-A55)

Channel 1: H’41C1_1000 (Cortex-M33 Non-Secure)
H’51C1_1000 (Cortex-M33 Secure)

Table 40.10 Register Configuration

Name	Abbreviation	Address [9:0]	Access Size
Initial setting register	SCC_DTCNTL	H’1000	32/64
Sampling clock position setting register	SCC_TAPSET	H’1008	32/64
Hardware adjustment register 1	SCC_DT2FF	H’1010	32/64

Hardware adjustment register 2	SCC_TMPPORT	H’1038	32/64

40.7 SCC Register Descriptions

40.7.1 Initial Setting Register (SCC_DTCNTL)

Bit	Bit Name	Initial Value	R/W	Description
63 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
23 to 16	TAPNUM7 to TAPNUM0	H’08	R/W	When bits DIV7 to DIV0 in the SD_CLK_CTRL register are H’FF (1: 1 mode), set these bits to H’08.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	TAPEN	0	R/W	SCC Sampling Clock Operation Enable 0: SCC sampling clock operation is disabled. 1: SCC sampling clock operation is enabled.

40.7.2 Sampling Clock Position Setting Register (SCC_TAPSET)

Bit	Bit Name	Initial Value	R/W	Description
63 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
7 to 0	TAPSET7 to TAPSET0	H'00	R/W	SCC Sampling Clock Position ● Set the tuning result in the range from 0 to TAPNUM-1.

40.7.3 Sampling Clock Selection Register (SCC_CKSEL)

Bit	Bit Name	Initial Value	R/W	Description
63 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	DTSEL	0	R/W	Sampling Clock Selection 0: An SCC sampling clock is not used (for other than SDR104 and HS200). 1: An SCC sampling clock is used (for SDR104 or HS200). ● For SDR104 or HS200, set DTSEL to 1. DIV[7:0] in the SD_CLK_CTRL register to H’FF (1:1 mode). ● When this bit is switched, stop the SD clock output from the SD/MMC host interface (set SCLKEN in SD_CLK_CTRL to 0).

40.7.4 Sampling Clock Position Correction Register (SCC_RVSCNTL)

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 8	TAPSEL7 to TAPSEL0	H'00	R	SCC Sampling Clock Position Display ● Displays the SCC sampling clock position selected by hardware. ● After RVSEN has been set to 1, the value may differ from that of TAPSET.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1	RVSW	0	R/W	This bit is read as 0. The write value should be 1.
0	RVSEN	0	R/W	SCC Sampling Clock Position Correction Enable 0: SCC sampling clock position correction is disabled. 1: SCC sampling clock position correction is enabled. ● When RVSEN is set to 1 after tuning has been performed, this module corrects the SCC sampling clock position each time of a command sequence of the SD/MMC host interface. ● However, when RVSERR is 1, this module does not correct the SCC sampling clock position. ● While tuning is being performed, set RVSEN to 0.

40.7.5 Sampling Clock Position Correction Request Register (SCC_RVSREQ)

Bit	Bit Name	Initial Value	R/W	Description
63 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2	RVSERR	0	R/W	SCC Sampling Clock Position Correction Error 0: There is no correction error. 1: There is a correction error. ● If this bit is set to 1 after a command sequence, write 0 to this bit and perform tuning again. ● Ignore this bit while tuning is being performed. ● Writing 1 to this bit is disabled and writing 0 to this bit is only enabled.
1	REQTAPUP	0	R/W	SCC Sampling Clock Position Positive Direction Correction Request 0: There is no correction request. 1: There is a correction request. ● If this bit is set to 1 after a command sequence, write 0 to this bit and rewrite TAPSET in the positive direction (when TAPSEL = TAPNUM-1, set 0 to TAPSET). ● When RVSEN is 1, this bit is disabled (this bit is not set to 1). ● Writing 1 to this bit is disabled and writing 0 to this bit is only enabled.
0	REQTAPDWN	0	R/W	SCC Sampling Clock Position Negative Direction Correction Request 0: There is no correction request. 1: There is a correction request. ● If this bit is set to 1 after a command sequence, write 0 to this bit and rewrite TAPSET in the negative direction (when TAPSEL = 0, set TAPNUM-1 to TAPSET). ● When RVSEN is 1, this bit is disabled (this bit is not set to 1). ● Writing 1 to this bit is disabled and writing 0 to this bit is only enabled.

40.7.6 Hardware Adjustment Register 1 (SCC_DT2FF)

This register makes a setting that SD_DATA, which has been fetched by the sampling clock at each TAP position, is used in the appropriate timing.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 8	DT2NE	H’03	R/W	Hardware Adjustment 2 This is a setting register for adjusting the timing inside the IP when using Tuning. When using Tuning, set H’02 to this bit, make the setting before setting 1 in SCC_CKSEL [0] .DTSEL.
7 to 0	DT2NS	H’00	R/W	Hardware Adjustment 1 This is a setting register for adjusting the timing inside the IP when using Tuning. When using Tuning, set H’07 to this bit., make the setting before setting 1 in SCC_CKSEL [0] .DTSEL.

40.7.7 Sampling data comparison register (SCC_SMPCMP)

Data comparison register indicates the result of the comparison of the sampling data. The subject of the comparison is the before and the behind TAP.

Bit	Bit Name	Initial Value	R/W	Description
63 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
24 to 16	CMPNGU	All 0	R/W	Comparison of sampling data with the previous TAP Clock. Bit 16-23 is the comparison result of data 0-7. Bit 24 is the comparison result of CMD. 0: Match 1: Mismatch < Clear conditions.> The start of the command sequence Write to SCC_TAPSET register
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8 to 0	CMPNGD	All 0	R/W	Comparison of sampling data with the after TAP Clock. Bit 0-7 is the comparison result of data 0-7. Bit 8 is the comparison result of CMD. 0: Match 1: Mismatch < Clear conditions.> The start of the command sequence Write to SCC_TAPSET register

40.7.8 Hardware adjustment register 2 (SCC_TMPPORT)

This register makes a setting that SD_DATA, which has been fetched by the sampling clock at each TAP position, is used in the appropriate timing.

Bit	Bit Name	Initial Value	R/W	Description
63 to16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	TMPOUT	H’0000	R/W	Hardware adjustment 3 When using the delay tuning mechanism, set the following values. When TAPNUM = 8, set H’0000 to these bits. When operating with other than SDR104 / HS200, this register adjusts the clock delay of the Flip Flop that latches the received data from the outside of the chip. For this product, set H’0000 when transferring at 3.3V, and set H’0001 when transferring at 1.8V.

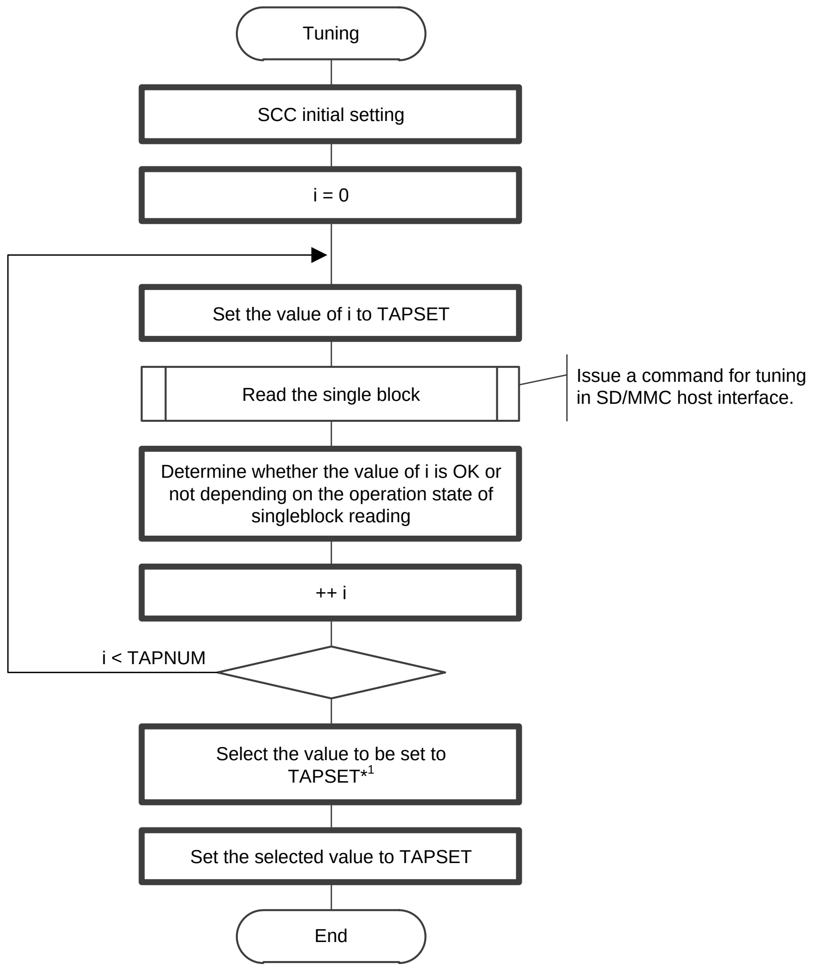
40.8 Usage Example of SCC

40.8.1 Tuning

SCC is tuned by using operation of single-block reading.

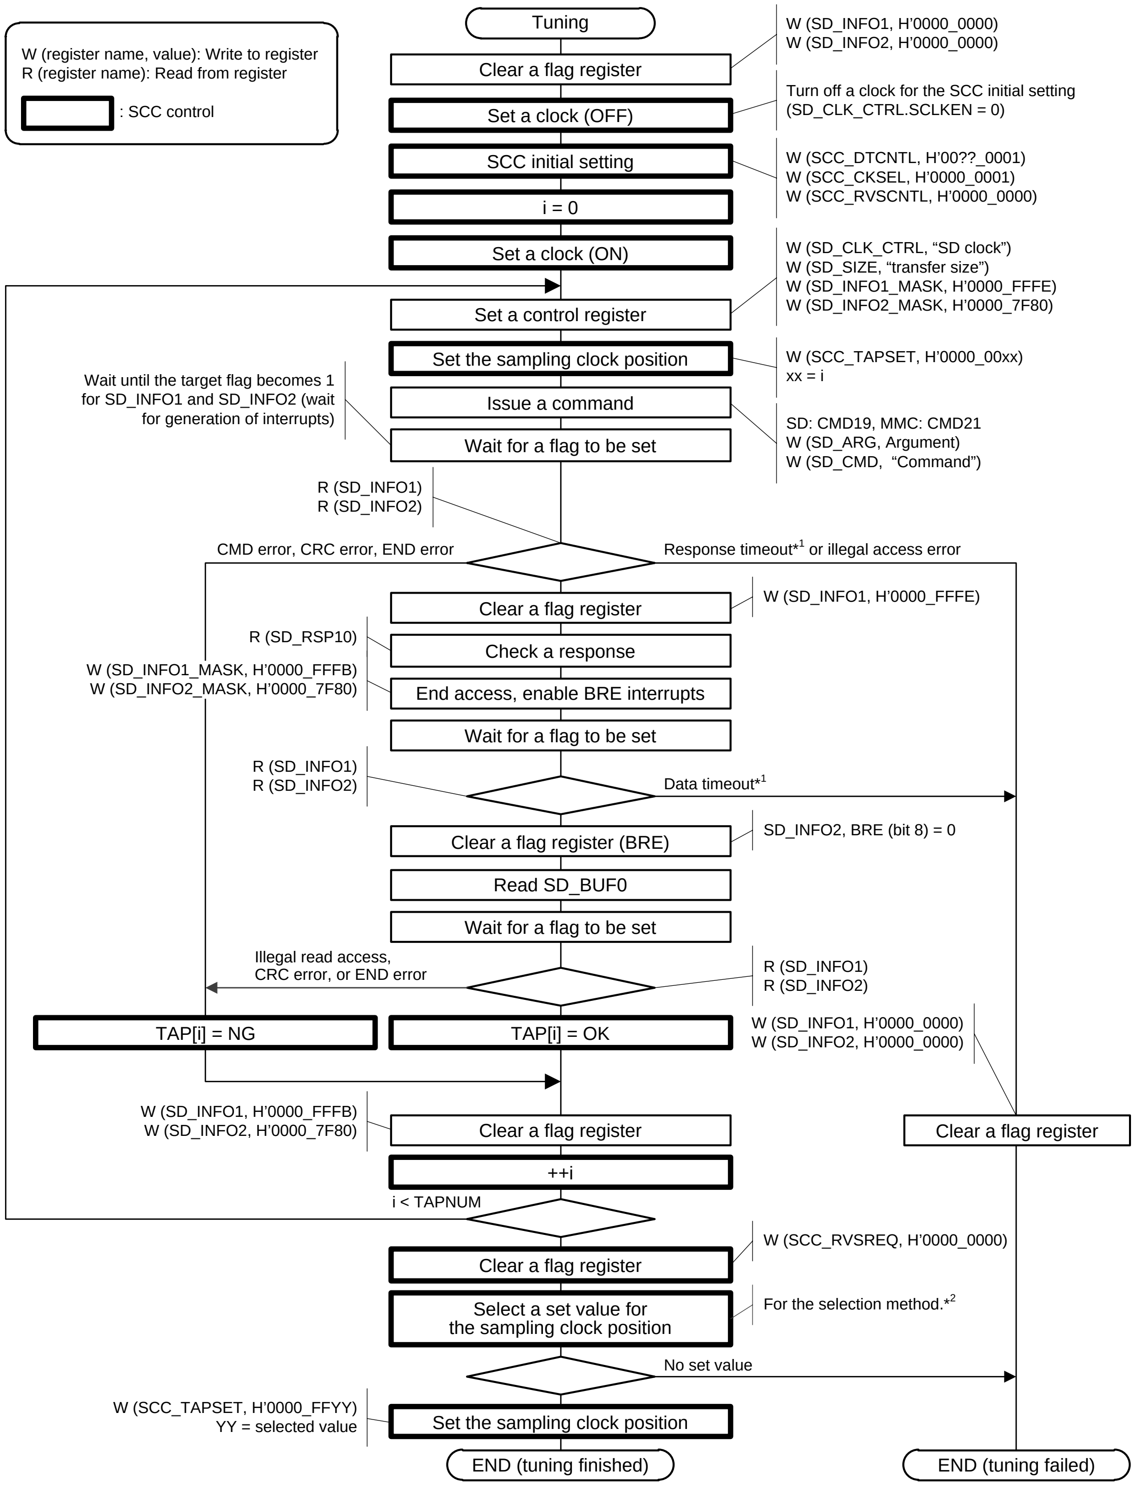
As shown in **Figure 40.30**, check whether the single-block read command normally ends when the sampling clock position is changed from 0 to TAPNUM-1 and save the result. After checking, confirm that there exists the range which has three or more continuous normal ends (OK). Then, the median value within the continuous range is determined as the final adjustment value.

Figure 40.31 and **Table 40.11** show the detailed tuning flow and the method how to select the sampling clock position (example when TAPNUM = 8).



Note 1. See the example shown in **Table 40.11**.

Figure 40.30 Example of Tuning Flow (Outline)



Note 1. If all of the TAP[i] has become "NG".

Note 2. See **Table 40.11**.

Figure 40.31 Example of Tuning Flow (Detailed)

Table 40.11 Example of the Method How to Select the Sampling Clock Position (when TAPNUM = 8)

Item	i	Case 1	Case 2	Case 3	Case 4	Case 5*[1]
TAP[i]	0	NG	OK	NG	OK	OK
	1	OK	OK	NG	NG	OK
	2	OK	NG	OK	NG	OK
	3	OK(←)	NG	OK	NG	OK
	4	OK	NG	NG	NG	OK
	5	OK	OK	NG	OK	OK
	6	NG	OK	NG	OK(←)	OK
Max. value→	7	NG	OK(←)	NG	OK	OK
	(0)	NG	OK	NG	OK	OK
	(1)	OK	OK	NG	NG	OK
	(2)	OK	NG	OK	NG	OK
	(3)	OK	NG	OK	NG	OK
	(4)	OK	NG	NG	NG	OK
	(5)	OK	OK	NG	OK	OK
	(6)	NG	OK	NG	OK	OK
	(7)	NG	OK	NG	OK	OK
Selected value		i = 3	i = 7	Fail	i = 6 or 7	i = 0 to 7

Remarks: (←): Example of selection, (x): repeated display of index x of TAP[x]

(a) The sampling clock position is selected by considering a margin in the range which has three or more continuous 'TAP[i] = OK'.

(b) The sampling clock position is repeated from 0 after the maximum value (TAPNUM-1). In case 2 above, that position is continued in the order of 5→6→7→0→1.

Note 1. If all of the TAP [i] is OK, the sampling clock position is selected by identifying the change point of data. Change point of the data can be found in the value of SCC_SMPCMP register. Usage example is **Section 40.8.3, Change point of the input data**.

40.8.2 Sampling Clock Position Correction after Tuning

After tuning, correction of the sampling clock position may be required when a command is issued.

There are manual and automatic correction methods. After a command sequence, if the CMD, CRC, END error or time out occurs or the correction error occurs, tuning will be performed again. The following shows examples of manual and automatic correction methods.

(1) Manual correction of the sampling clock position

Figure 40.32 shows the flow of manual correction of the sampling clock position. **Table 40.12** shows set values determined when correction is required (when TAPNUM = 8).

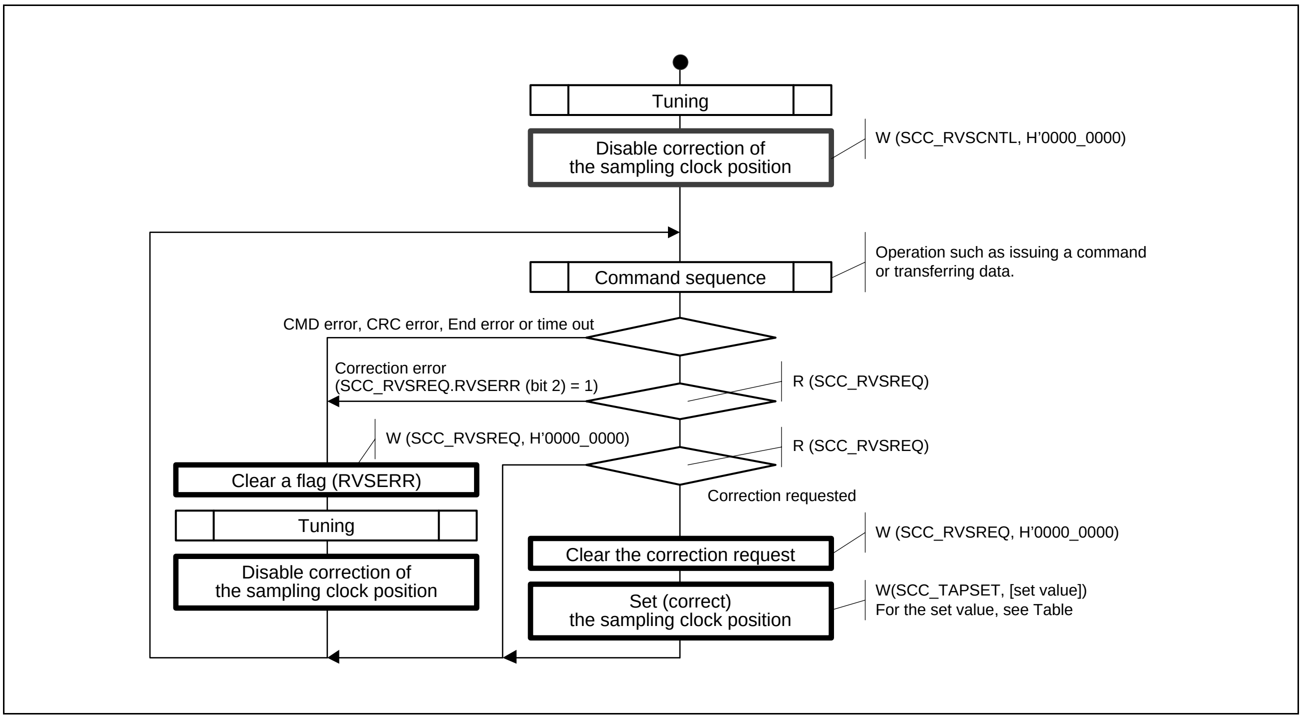


Figure 40.32 Flow of Manual Correction of the Sampling Clock Position (Example)

Table 40.12 Set Values for TAPSET when Correction is Required (when TAPNUM = 8)

No.	Current value of TAPSET	Value set to TAPSET when REQTAPUP = 1	Value set to TAPSET when REQTAPDWN = 1
1	0	1	7
2	1	2	0
3	2	3	1
4	3	4	2
5	4	5	3
6	5	6	4
7	6	7	5
8	7	0	6

Note: As is the case in the tuning selection method, the sampling clock position is 0 after the maximum value (TAPNUM-1).

(2) Automatic correction of the sampling clock position

Figure 40.33 shows the flow of automatic correction of the sampling clock position.

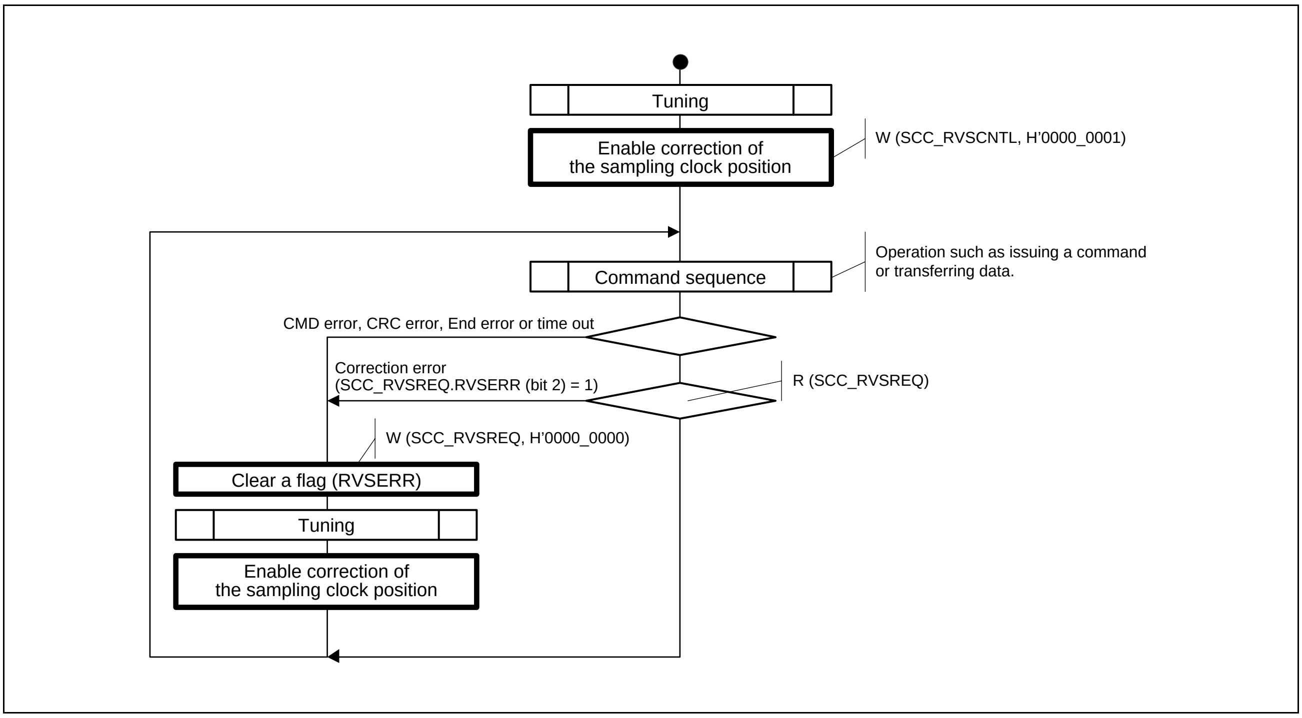

Figure 40.33 Flow of Automatic Correction of the Sampling Clock Position (Example)

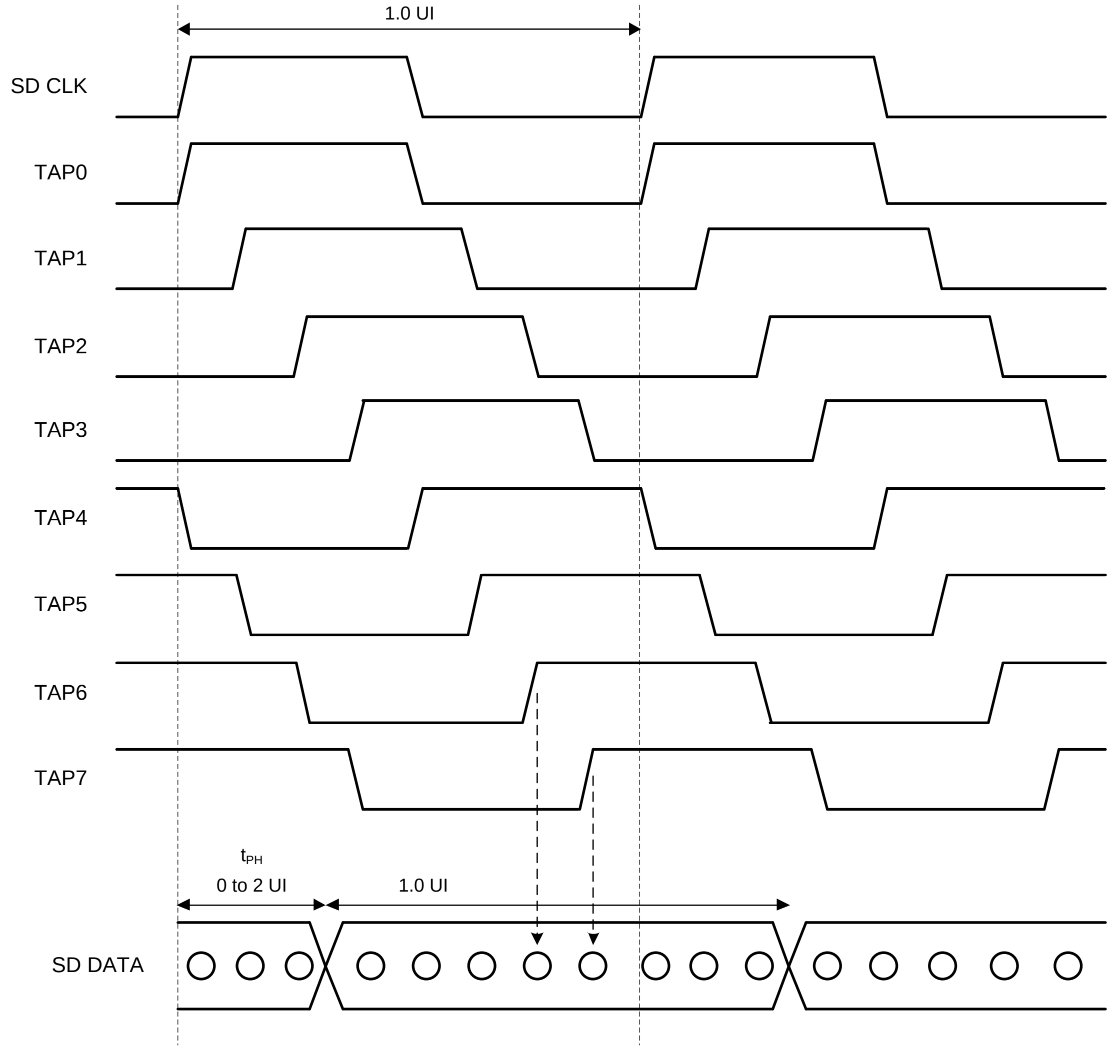
40.8.3 Change point of the input data

Tuning captures the data by the TAP clock selected. However, also captures the data by the previous TAP clock and the behind the TAP clock at the same time. This result is reflected in the sampling data comparison register (SCC_SMPCMP). Point of mismatch before and after the selected TAP clock is the changing point of the data. In this example, it is desirable to set as TAP6 or TAP7.



Note: After recognizing the changing point of the input data, need to set the TAP clock.

Figure 40.34 Example, All taps is OK.

Figure 40.34 shows change point of data between TAP2 and TAP3. Change point of the data can be confirmed by sampling data comparison register (SCC_SMPCMP). When the tuning of TAP2 or TAP3, CMPNGU bit of sampling data comparison register indicates a mismatch. As the width of the input data is 1 (UI), select TAP6 or TAP7 which is the median of next TAP3 from TAP3.

41. General Purpose Input Output Port (GPIO)

This LSI can use up to 123 general-purpose I/O ports.

Each port of the general-purpose I/O port is multiplexed with the terminal of the peripheral function, and either the general-purpose I/O port function or the peripheral function can be selected by setting the register.

41.1 Features

41.1.1 General Purpose Input Output Port (GPIO)

General-purpose input/output ports (GPIOs) provide general-purpose ports that can be configured as inputs or outputs.

When set as an output, it can be written to an internal register to control the state driven by the output pin. When set as an input, you can read the state of the input by reading the state of the internal registers. You can also generate interrupts using the GPIO input pin.

- GPIO Output Control (Port Register [Pn])
- GPIO Input, Output Enable (Port Mode Register [PMn])
- GPIO Input Monitor (Port Input Register [PINn])
- Interrupt used the GPIO input (Interrupt Enable Control Register[ISEL])

Also, it able to control the following on some ports

- IO voltage mode control for each port
- Buffer drive ability control for each port
- Slew Rate Switching for each port
- Pull Up / Pull down Switching for each port
- Digital noise filter control for each port

41.1.2 Port Function Control

Switching of each port function can be controlled by the following register settings.

- GPIO function and peripheral function selection (Port Mode Control Register[PMCn])
- Selection of each peripheral function (Port Function Control Register[PFCm]) [Function0 to 5]

NOTE

Please refer to another file for the pin function for the peripheral functions that can be selected.
Please refer to above excel file for the“Pin function list” described in each chapter.

Do not select the same peripheral function for multiple different external terminals.

41.1.3 Special Purpose Port Function Control

The settings of the following specific ports can be controlled by registers.

- IO voltage mode control for each port
- Buffer drive ability control for each port
- Slew Rate Switching for each port
- Digital noise filter control for each port
- Ether MII / RGMII mode control

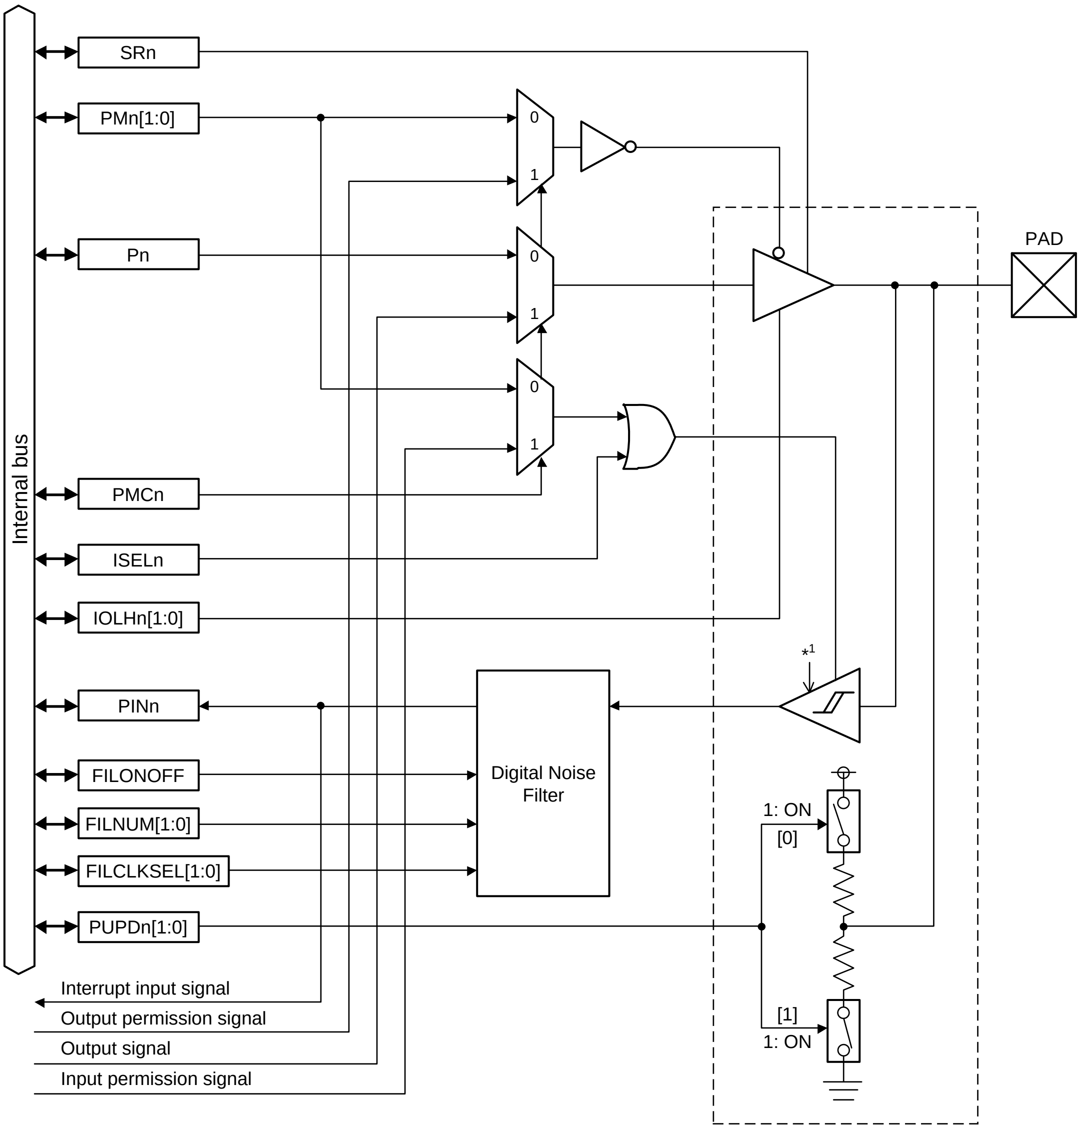
The specific ports shown below are targeted.

- Target Functions: Ether ch0/ch1, SDHI ch0/ch1, QSPI、RIIC
- Target Signals: NMI, TMS/SWDIO, TDO, WDTOVF_PERROUT#, AUDIO_CLK1, AUDIO_CLK2

41.1.4 General Purpose Input Output Port Configuration

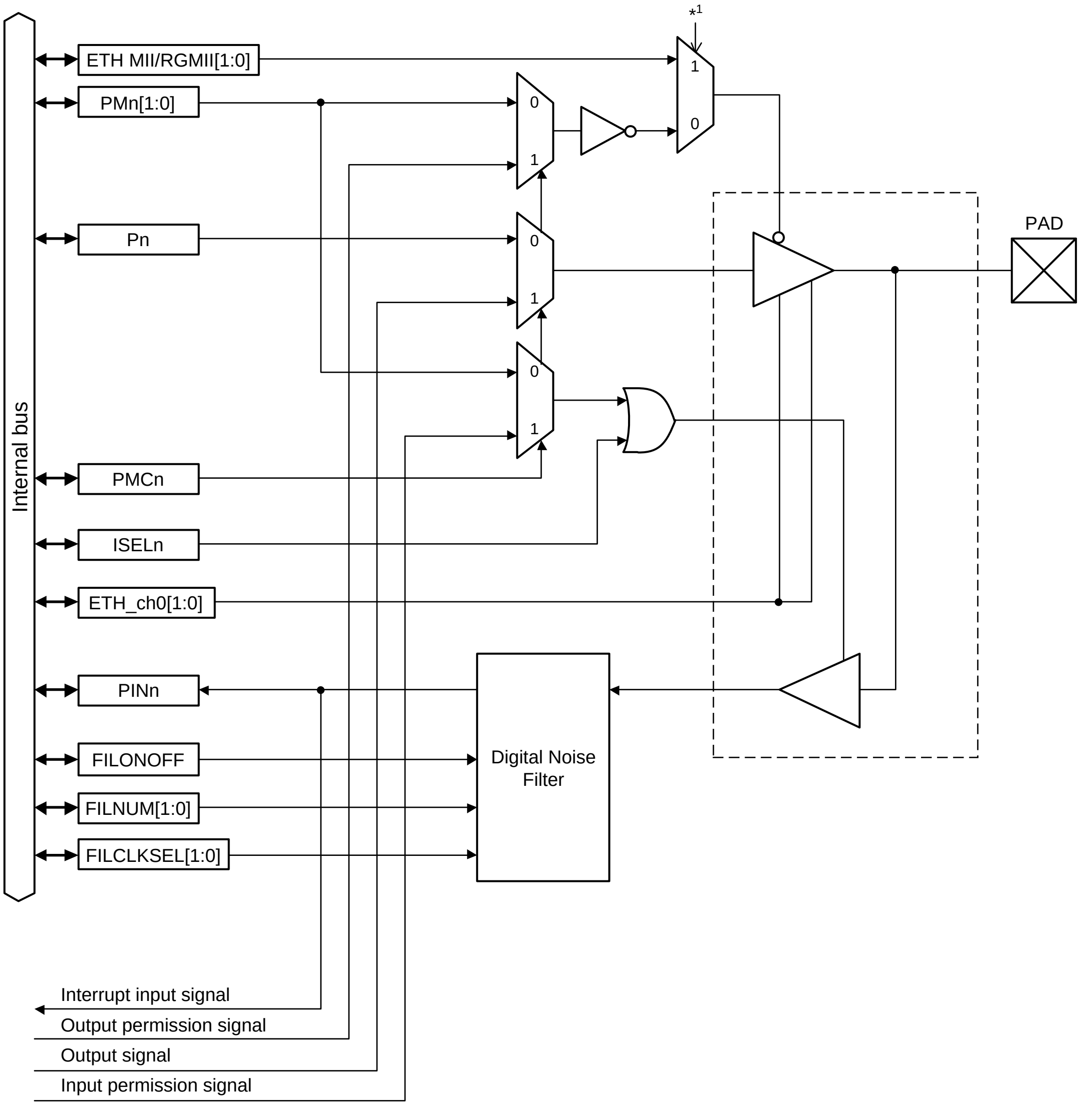
The configuration of the general-purpose I/O port is shown in **Figure 41.1** to **Figure 41.5**.

In addition, the configuration of the multiplexed Ether ch0 / ch1 is also included in the configuration diagram of the general-purpose I/O port.



Note 1. When RIIC * is selected as the peripheral module, SMT = 1 and the Schmitt trigger circuit is enabled.

Figure 41.1 P0_0 to P19_1, P38_0 to P48_4 (Multiplexed peripheral functions)



Note 1. When ETH0 is selected as the peripheral module, the ETH MII / RGMII register output is selected.

Figure 41.2 P20_0 (Multiplexed Ether ch0)

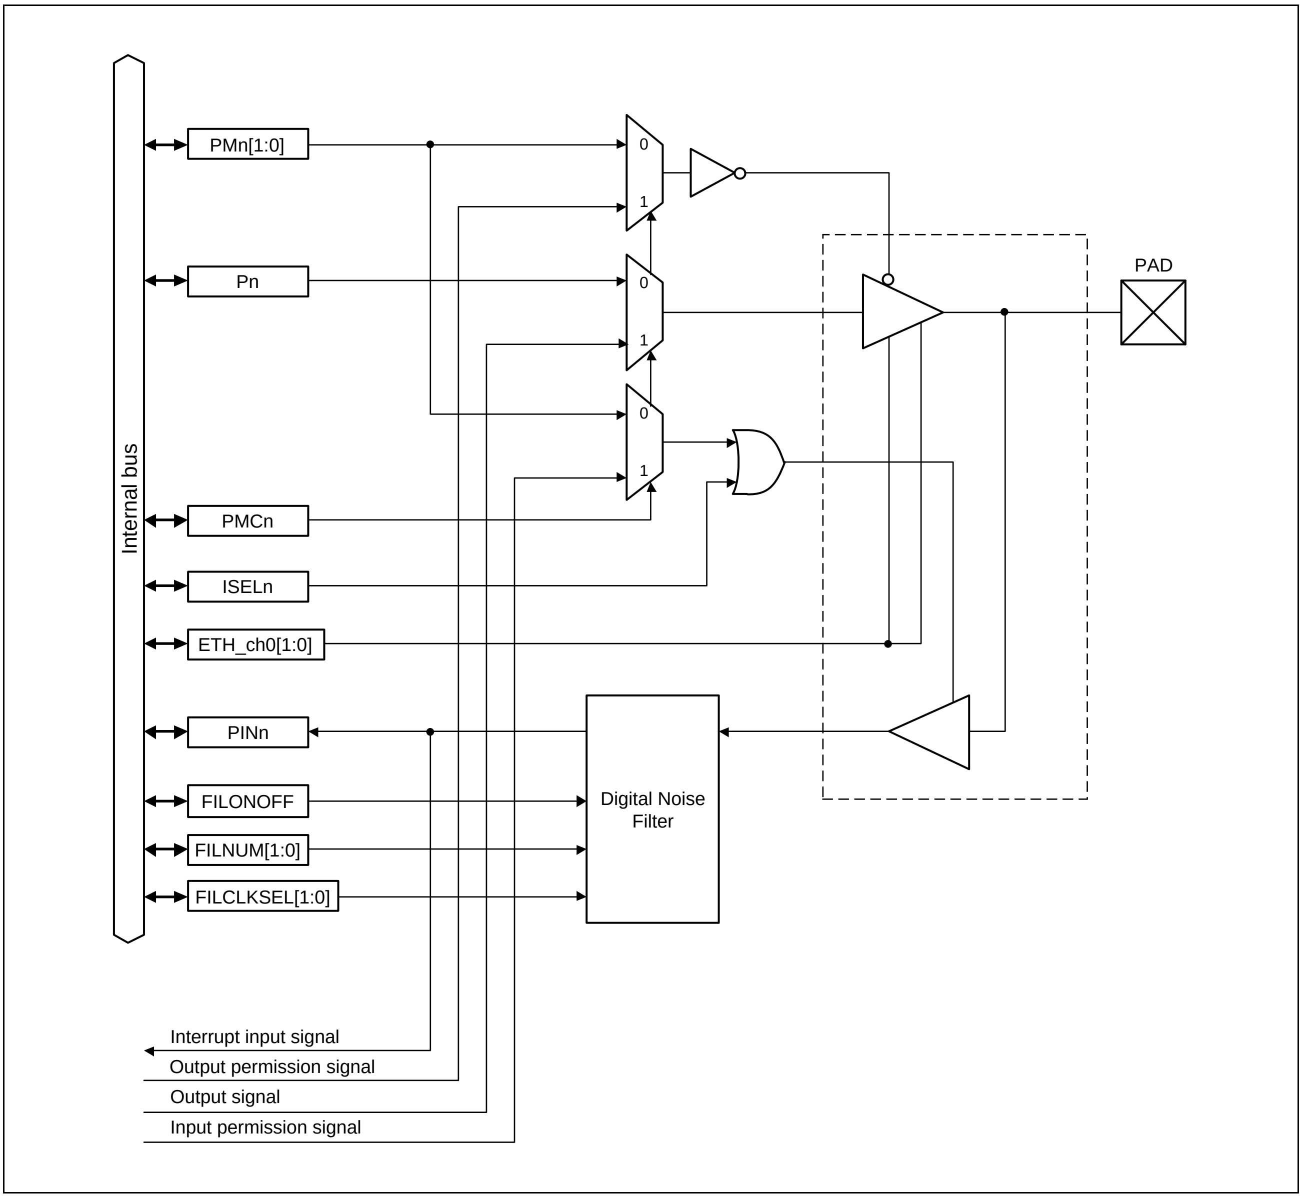


Figure 41.3 P20_1 to P28_1 (Multiplexed Ether ch0)

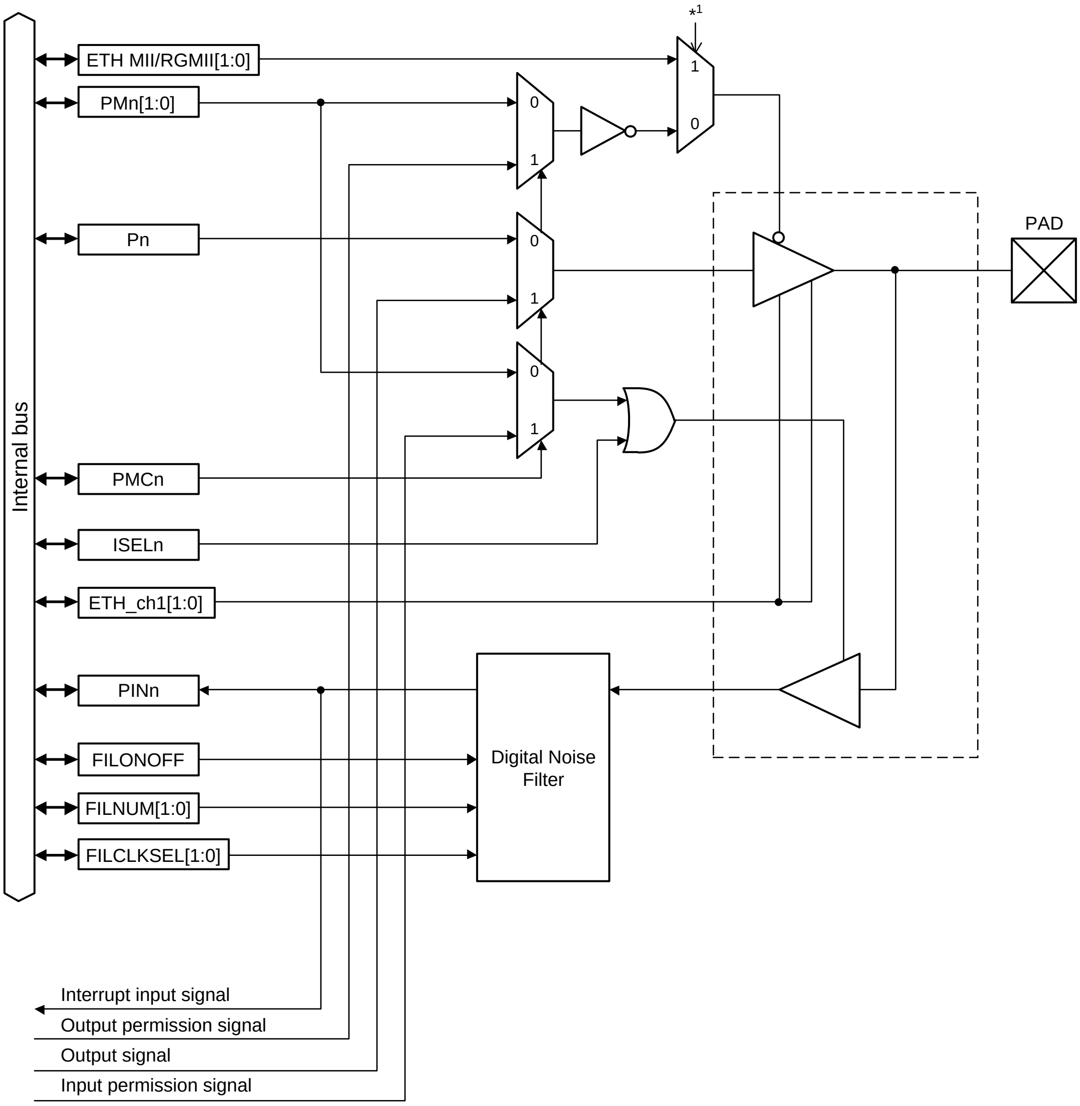

Note 1. When ETH1 is selected as the peripheral module, the ETH MII / RGMII register output is selected.

Figure 41.4 P29_0 (Multiplexed Ether ch1)

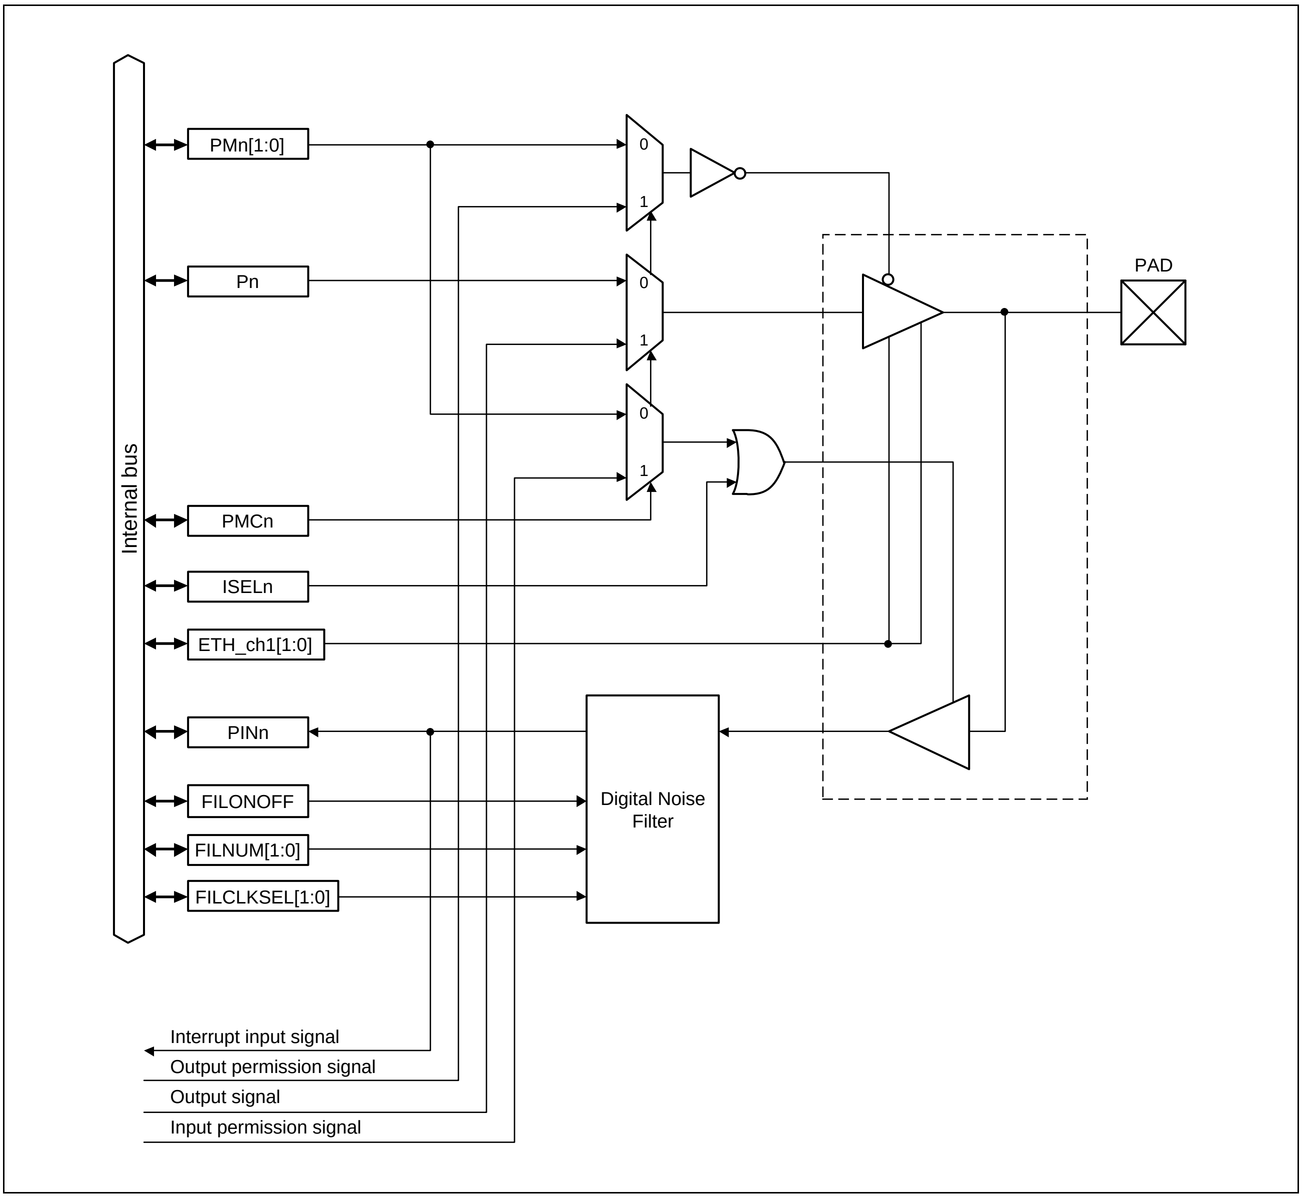

Figure 41.5 P29_1 to P37_2 (Multiplexed Ether ch1)

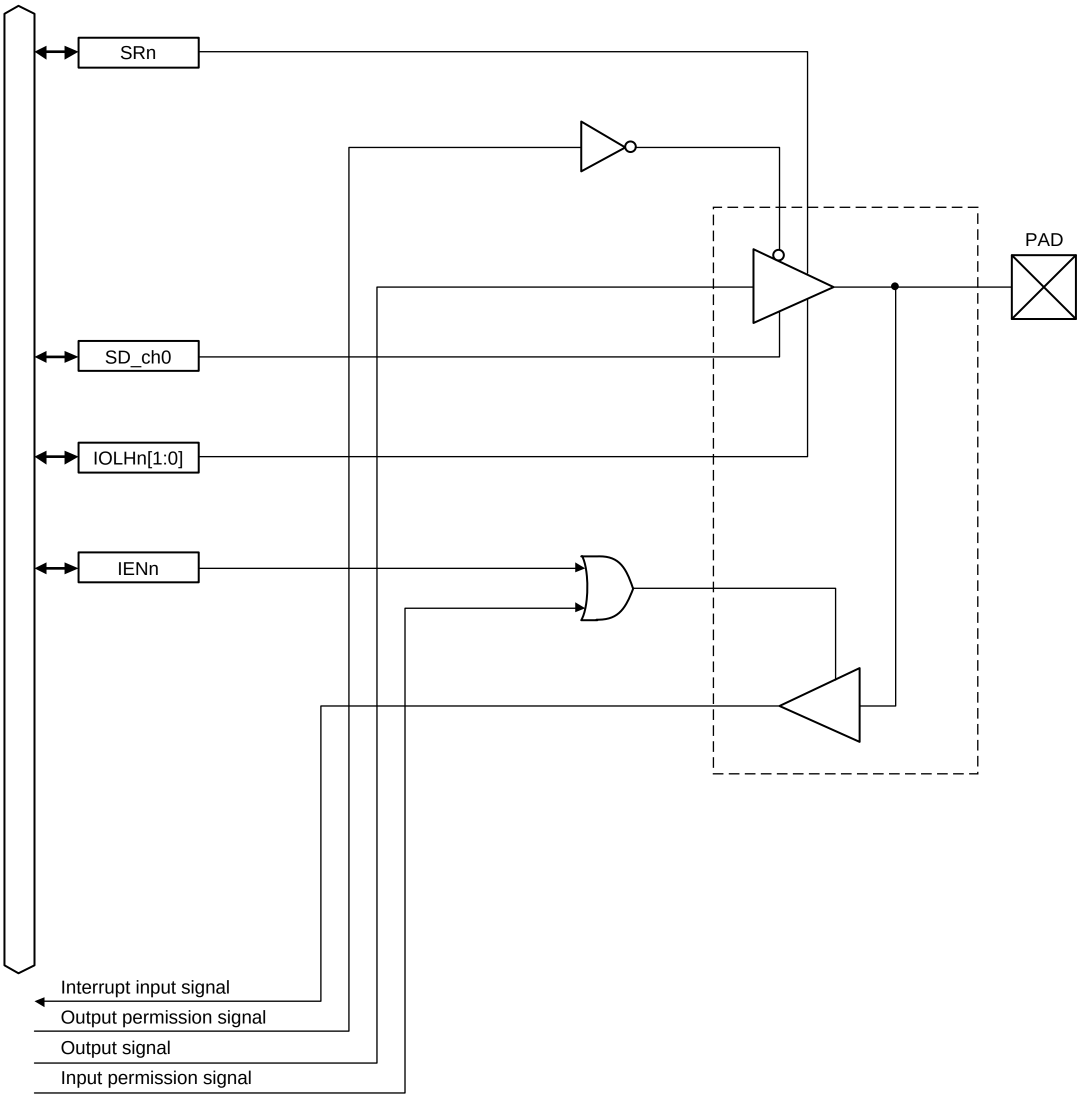
41.1.5 Special purpose port Configuration

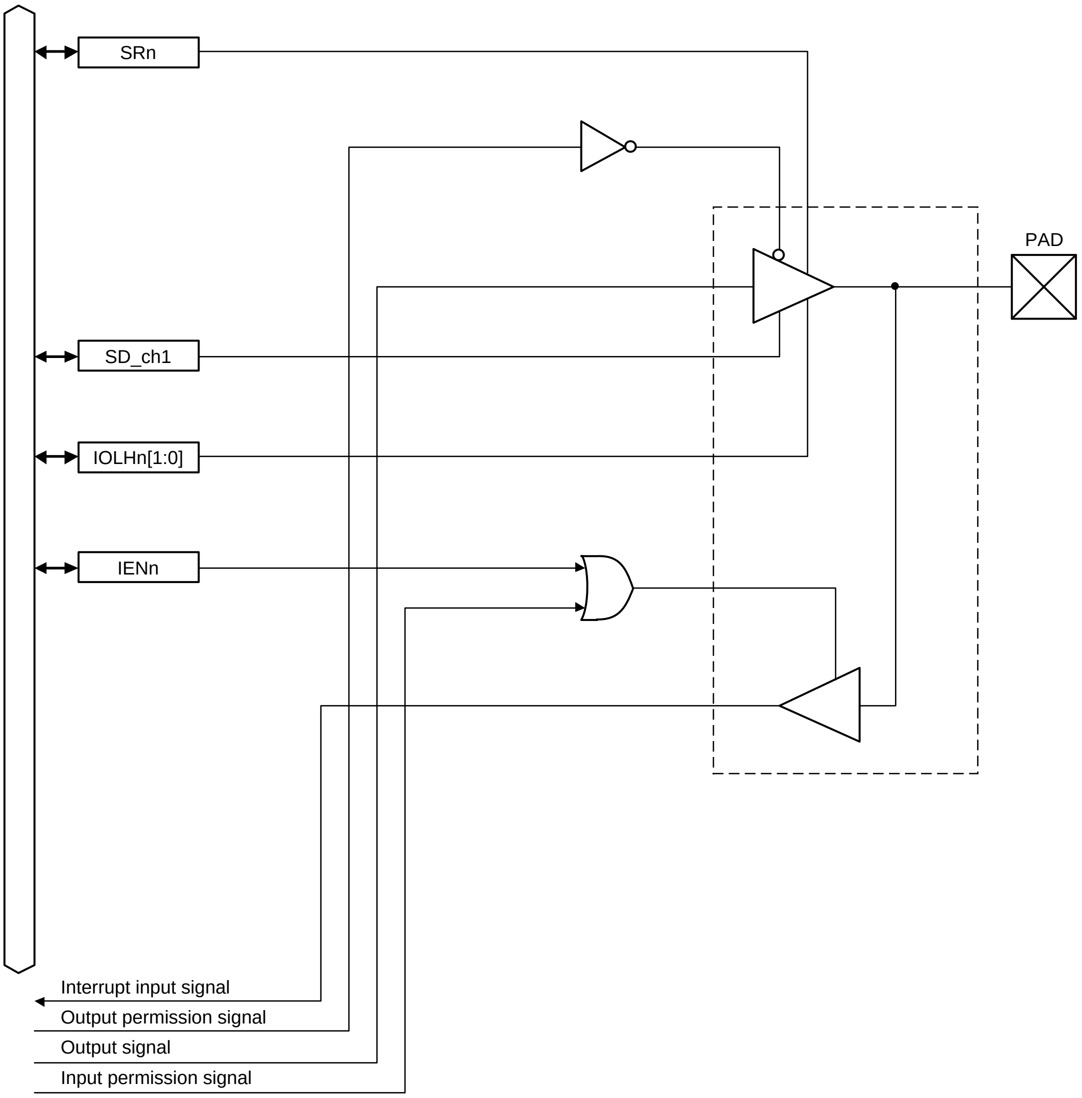
The functions and the signal of configurations shown below are shown in **Figure 41.6** to **Figure 41.13**.

- Target Functions: SDHI ch0, SDHI ch1, QSPI, RIIC
- Target Signals: NMI, TMS/SWDIO, TDO, WDTOVF_PERROUT#, AUDIO_CLK1, AUDIO_CLK2



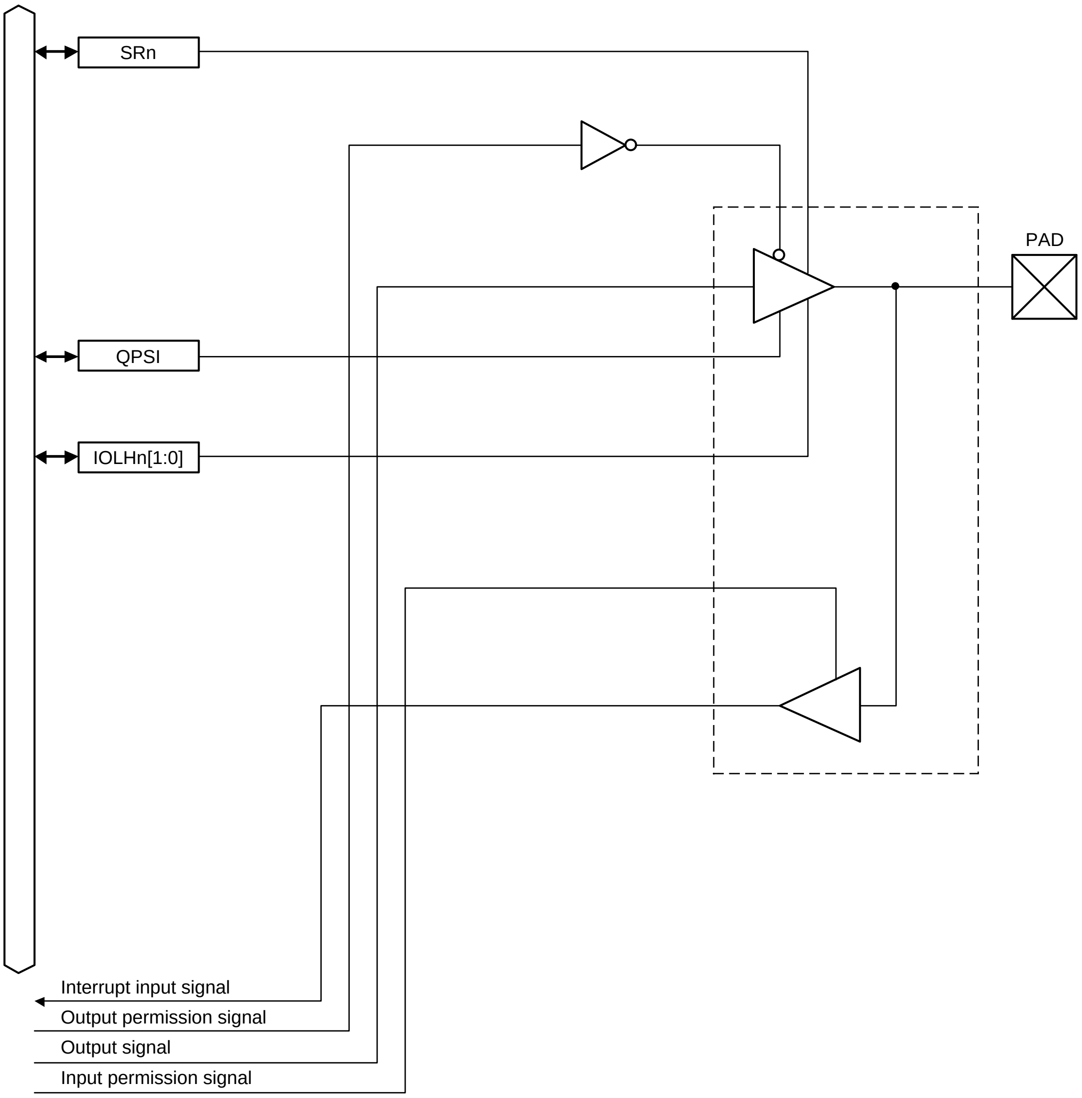
Note: The IENn and PUPDn registers do not exist at the SD0_CLK and SD0_RST# pins.

Figure 41.6 SDHI ch0 (SD0_CLK, SD0_CMD, SD0_RST#, SD0_DATA[7:0])



Note: The IENn and PUPDn registers do not exist at the SD1_CLK pin.

Figure 41.7 SDHI ch1 (SD1_CLK, SD1_CMD, SD1_DATA[3:0])



Note: The PUPDn register does not exist at the QSPI0_SPCLK, QSPI0_SSL, QSPI1_SPCLK, QSPI_RESET #, and QSPI_WP # pins.

Figure 41.8 QSPI (QSPI0_SPCLK, QSPI0_IO[3:0], QSPI0_SSL, QSPI1_SPCLK, QSPI1_IO[3:0], QSPI1_SSL, QSPI_RESET#, QSPI_WP#, QSPI_INT#)

41.2 Register Configuration

The base address is shown below.

Base address: H’0_1103_0000 (Cortex-A55 Address Space)
Base address: H’4103_0000 (Cortex-M33 Address Space Non-Secure)
Base address: H’5103_0000 (Cortex-M33 Address Space Secure)

The register addresses shown in the following chapters will be offset addresses from the above base address.

NOTE

Access to areas for which Offset address is not defined in the register map is prohibited.

Please align the addresses according to the access size.

41.2.1 Port Register (Pn)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size

41.3 Register Descriptions

41.3.1 Port Register (Pn)

The Pn register sets the GPIO output value.

For the offset address, refer to **Section 41.2.1, Port Register (Pn)**.

Bit	7	6	5	4	3	2	1	0
	P7	P6	P5	P4	P3	P2	P1	P0
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	P7	0b	R/W	These bits set the value of the GPIO pin. (P7 to P0) 0b: Low is output. 1b: High is output. Please refer to the table below for the correspondence of each terminal.
6	P6	0b	R/W	
5	P5	0b	R/W	
4	P4	0b	R/W	
3	P3	0b	R/W	
2	P2	0b	R/W	
1	P1	0b	R/W	
0	P0	0b	R/W

41.3.5 Port Input Register (PINn)

The PINn register is a read-only register to monitor input values of input pins.

For the offset address, refer to **Section 41.2.5, Port Input Register (PINn)**.

Bit	7	6	5	4	3	2	1	0

41.3.6 Interrupt Enable Control Register (ISEL)

The ISEL register controls whether to enable or disable interrupts.

The pin set as the GPIO input port can be used as an external interrupt input. Controls whether this feature is enabled or disabled. When enabled, this pin can be used as an interrupt by setting the interrupt controller.

For the offset address, refer to **Section 41.2.6, Interrupt Enable Control Register (ISEL)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

41.3.10 Write protected register (PWPR)

The PWPR register sets write permission / prohibition for the PFC register and the PFCWE bit of this register.

For the offset address, refer to **Section 41.2.10, Write protected register (PWPR)**.

Bit	7	6	5	4	3	2	1	0
	BOWI	PFCWE	—	—	—	—	—	—
Initial Value	1	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	BOWI	1b	R/W	1b: Writing a value to the PFCWE bit disabled 0b: Writing a value to the PFCWE bit enabled
6	PFCWE	0b	R/W	1b: Writing a value to the PFC register enabled 0b: Writing a value to the PFC register disabled
5 to 0	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.

41.3.11 Digital Noise Filter Switching Register (FILONOFF)

This register controls whether the digital noise filter is enabled / disabled for GPIO input pin and NMI pin.

For the offset address, refer to **Section 41.2.11, Digital Noise Filter Switching Register (FILONOFF)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

The operation of the digital noise filter will be explained using a timing chart using the external terminal P0_0 as an example.

(1) When the digital noise filter is disabled (FILONOFF = 0)

The timing chart of FILONOFF = 0 (OFF), FILNUM [1: 0] = “00” (FF4 stage), FILCLKSEL [1: 0] = “00” (without frequency division) is shown below.

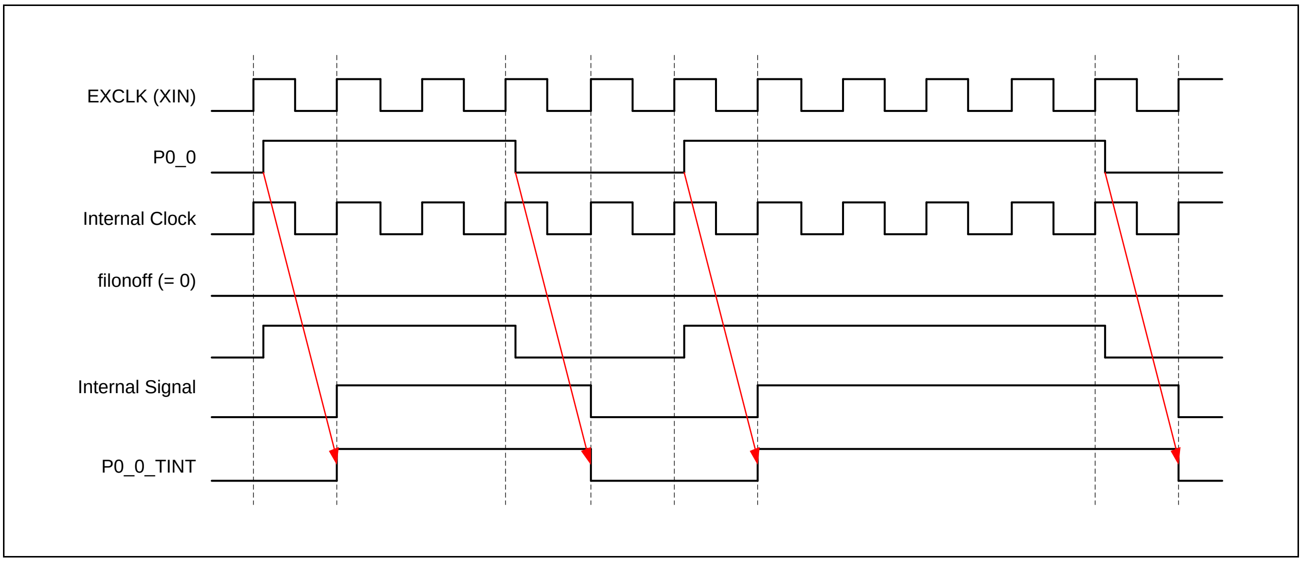

Figure 41.14 Digital noise filter (FILONOFF = 0) timing chart

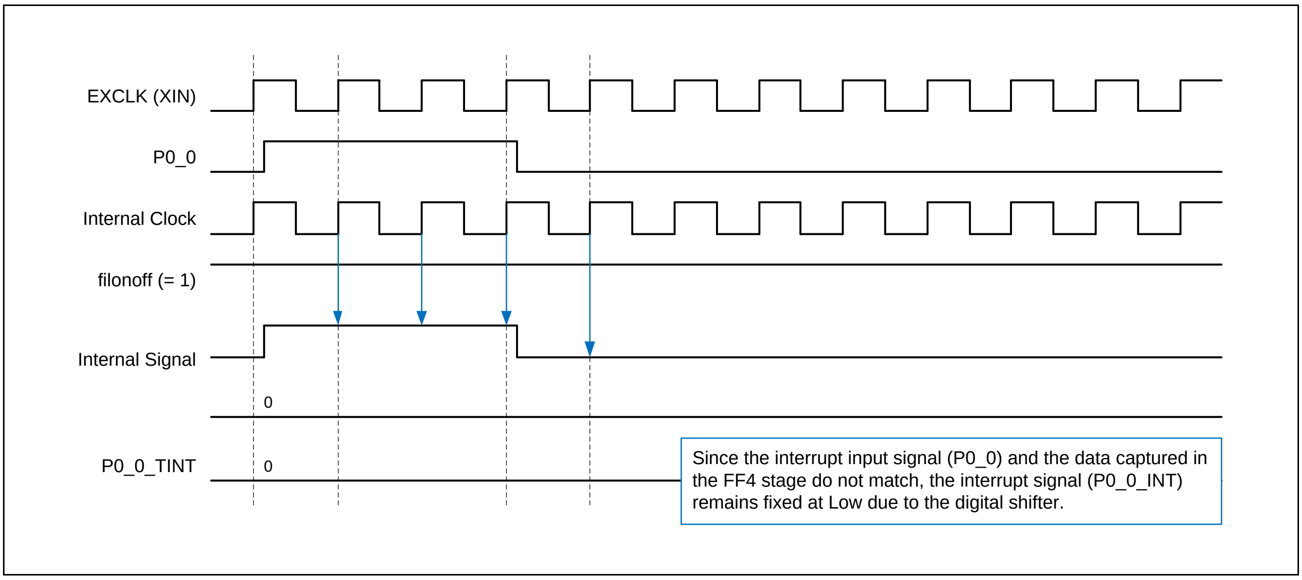
The signal at the external terminal (P0_0) is not filtered regardless of the number of stages set in the FILNUM register.

The digital noise filter circuit inserts one stage of FF in the output of a digital noise filter.

Therefore, the external terminal (P0_0) signal is propagated internally with a delay of one cycle. (EXCLK (XIN)).

(2) When the digital noise filter is enabled (FILONOFF = 1)

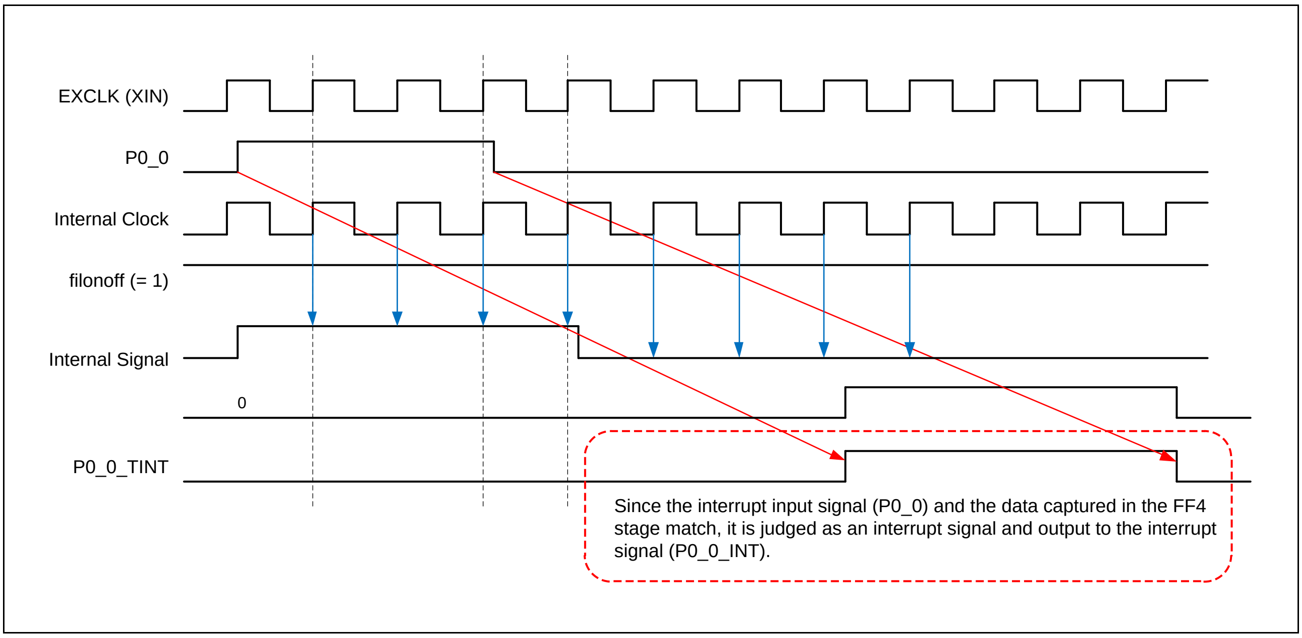
The timing chart of FILONOFF = 1 (ON), FILNUM [1: 0] = “00” (FF4 stage), FILCLKSEL [1: 0] = “00” (without frequency division) is shown below.



Since the interrupt input signal (P0_0) and the data captured in the FF4 stage do not match, the interrupt signal (P0_0_INT) remains fixed at Low due to the digital shifter.

Figure 41.15 Digital noise filter (FILONOFF = 1) Timing chart (1)

The signal of the external terminal (P0_0) is filtered, if even one signal captured by each FF for the number of FF stages set in the FILNUM register does not match.



Since the interrupt input signal (P0_0) and the data captured in the FF4 stage match, it is judged as an interrupt signal and output to the interrupt signal (P0_0_INT).

Figure 41.16 Digital noise filter (FILONOFF = 1) Timing chart (2)

The external terminal (P0_0) signal is the signal captured by each FF for the number of FF stages set in the FILNUM register. If they all match, no filtering is done.

The digital noise filter circuit outputs to the interrupt signal with a delay of FILTER_CYCLE.

[FILTER_CYCLE Calculation]

FILTER_CYCLE = FILNUM_FF + $FILTER_FF

FILNUM_FF: Number of FF stages set in the FILNUM register @EXCLK(XIN)
FILTER_FF: FF 2 stage in digital noise filter @EXCLK(XIN) + Digital noise filter output FF 1 stage @EXCLK(XIN)

Note: One stage of FF is inserted in the final stage of the digital noise filter circuit. Therefore, interrupt signals less than 1CLK @ EXCLK (XIN) may be removed regardless of whether the digital noise filter is enabled or disabled.

41.3.14 Ether ch0 Voltage Mode Control Register (ETH_ch0)

This register is sets the IO voltage mode control of Ether ch0.

For the offset address, refer to **Section 41.2.14, Ether ch0 IO Voltage Mode Control Register (ETH_ch0)**.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ETH0_2.5V_PVDD	ETH0_1.8V_PVDD
Initial Value	—	—	—	—	—	—	0	0
R/W	R	R	R	R	R	R	R/W	R/W

<table>
<tr><th>Bit</th><th>Bit Name</th><th>Initial Value</th><th>R/W</th><th>Description</th></tr>
<tr><td>7 to 2</td><td>—</td><td>—</td><td>R</td><td>Reserved
When read, the initial value is read. The written value will be ignored.</td></tr>
<tr><td>1</td><td>ETH0_2.5V_PVDD</td><td>0b</td><td>R/W</td><td rowspan="2">These bits set the IO voltage mode.<table><tr><th>Bit 1</th><th>Bit 0</th><th>IO Voltage</th></tr><tr><td>0</td><td>0</td><td>3.3V (Initial value)</td></tr><tr><td>0</td><td>1</td><td>1.8V</td></tr><tr><td>1</td><td>0</td><td>2.5V</td></tr><tr><td>1</td><td>1</td><td>Setting prohibited</td></tr></table></td></tr>
<tr><td>0</td><td>ETH0_1.8V_PVDD</td><td>0b</td><td>R/W</td></tr>
</table>

- For the IO voltage mode of P20_0 to P28_1, set the above register according to the voltage mode of the external device to be connected.
- At Function1, the Ether ch0 function is selected, so set the value of this register according to the power supply voltage (PVDD182533_0) to be used.

  When Function2 to Function5, a function other than Ether ch0 is selected, so set the value of this register to IO voltage mode (3.3v).

  For each peripheral function, refer to Function0 to Function5 in the Pin function List.

  For Function2 to Function5, only 3.3V can be set.

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3V and the register is set to 1.8V, the reliability of this LSI will be affected.

41.3.15 Ether ch1 Voltage Mode Control Register (ETH_ch1)

This register sets the IO voltage mode control for Etherch1.

For the offset address, refer to **Section 41.2.15, Ether ch1 IO Voltage Mode Control Register (ETH_ch1)**.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ETH1_2.5V_PVDD	ETH1_1.8V_PVDD
Initial Value	—	—	—	—	—	—	0	0
R/W	R	R	R	R	R	R	R/W	R/W

<table>
<tr><th>Bit</th><th>Bit Name</th><th>Initial Value</th><th>R/W</th><th>Description</th></tr>

<tr><td>0</td><td>1</td><td>1.8V</td></tr>
<tr><td>1</td><td>0</td><td>2.5V</td></tr>
<tr><td>1</td><td>1</td><td>Setting prohibited</td></tr>
</table></td></tr>
<tr><td>0</td><td>ETH1_1.8V_PVDD</td><td>0b</td><td>R/W</td></tr>
</table>

- For the IO voltage mode of P29_0 to P37_2, set the above register according to the voltage mode of the external device to be connected.
- At Function1, the Ether ch1 function is selected, so set the value of this register according to the power supply voltage (PVDD182533_1) to be used.

  When Function2 to Function5, a function other than Ether ch1 is selected, so set the value of this register to IO voltage mode (3.3v).

  For each peripheral function, refer to Function0 to Function5 in the Pin function List.

  For Function2 to Function5, only 3.3V can be set.

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3V and the register is set to 1.8V, the reliability of this LSI will be affected.

41.3.16 Ether MII/RGMII Mode Control Register (ETH MII/RGMII)

This register can be selected “MII” or “RGMII” of Ether.

This register is valid only for Function1

For the offset address, refer to **Section 41.2.16, Ether MII/RGMII Mode Control Register (ETH MII/RGMII)**.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ETH1_ mode	ETH0_ mode
Initial Value	—	—	—	—	—	—	1	1
R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
1	ETH1_mode	1b	R/W	Ether MII or RGMII can be selected by setting this register. 0b = RGMII The Direction of the IO buffer is Output. 1b = MII(Initial value) The Direction of the IO buffer is Input.
0	ETH0_mode	1b	R/W	

Note: By setting this register, the direction of some pins when using Ether’s MII or RGMII can be selected. Refer to **Section 30, Gigabit Ethernet Interface** chapter for switching between MII and RGMII of Ether.

Note: In RGMII mode, set the external terminals shown below to port mode (PMCn = 0) and I/O disabled (PMn = 00b).

Ether ch0		Ether ch1	
Terminal name Function0	Terminal name Function1	Terminal name Function0	Terminal name Function1
P23_0	ET0_TX_COL	P32_0	ET1_TX_COL
P23_1	ET0_TX_CRS	P33_1	ET1_TX_CRS
P27_0	ET0_RX_ERR	P36_0	ET1_RX_ERR

41.3.17 SD ch0 IO Voltage Mode Control Register (SD_ch0)

This register sets the IO voltage mode control of SD ch0.

For the offset address, refer to **Section 41.2.17, SD ch0 IO Voltage Mode Control Register (SD_ch0)**.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SD0_PVDD
Initial Value	—	—	—	—	—	—	—	0[*1]
R/W	R	R	R	R	R	R	R	R/W[*1]

Note 1. In Boot Mode1 and Boot Mode2, R/W is R (Read Only).

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
0	SD0_PVDD	0b[*1]	R/W	This bit sets the IO voltage mode. 1b: I/O domain voltage ≤ 1.8V 0b: I/O domain voltage ≥ 3.3V (Initial value)[*1]

Note 1. The initial value of this register

- The IO voltage mode of SD0_CLK, SD0_CMD, SD0_DATA [7-0], SD0_RST# is set by selecting each mode of this register and MD_BOOT [2: 0].
  - When Boot Modes 1 and 2 are not selected: This register can be Read/Write (R/W). The initial value is the above value.
  - When Boot Modes 1 and 2 are selected: This register is Read Only (R), and the voltage mode of the selected device is as follows.

MD_BOOT[2:0]			Mode	Selection function	Selection Device	Control method
0	0	1	Boot Mode 1	SDHI0	eMMC(1.8V)	By Hardware
0	1	0	Boot Mode 2	SDHI0	eMMC(3.3V)	By Hardware
Other			SD_ch0 Control by Register			

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3V and the register is set to 1.8V, the reliability of this LSI will be affected.

41.3.18 SD ch1 IO Voltage Mode Control Register (SD_ch1)

This register sets the IO voltage mode control of SD ch1.

For the offset address, refer to **Section 41.2.18, SD ch1 IO Voltage Mode Control Register (SD_ch1)**.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SD1_PVDD
Initial Value	—	—	—	—	—	—	—	0
R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
0	SD1_PVDD	0b	R/W	This bit sets the IO voltage mode. 1b: I/O domain voltage ≤ 1.8V 0b: I/O domain voltage ≥ 3.3V (Initial value)

Note: The IO voltage mode of SD1_CLK, SD1_CMD, SD1_DATA [3-0] is set by this register.

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3V and the register is set to 1.8V, the reliability of this LSI will be affected.

41.3.19 QSPI IO Voltage Mode Control Register (QSPI)

This register sets the IO voltage mode control of QSPI.

For the offset address, refer to **Section 41.2.19, QSPI IO Voltage Mode Control Register (QSPI)**.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	QSPI_PVDD
Initial Value	—	—	—	—	—	—	—	0[*1]
R/W	R	R	R	R	R	R	R	R/W[*1]

Note 1. In Boot Mode3 and Boot Mode4, R/W is R (Read Only).

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
0	QSPI_PVDD	0b[*1]	R/W	This bit sets the IO voltage mode. 1b: I/O domain voltage ≤ 1.8V 0b: I/O domain voltage ≥ 3.3V (Initial value)[*1]

Note 1. The initial value of this register

- The IO voltage of QSPI0_SPCLK, QSPI0_IO[3-0], QSPI0_SSL, QSPI1_SPCLK, QSPI1_IO [3-0], QSPI1_SSL, QSPI_RESET#, QSPI_WP#, QSPI_INT# is set by each mode of this register and MD_BOOT[2: 0].
  - When Boot Modes 3 and 4 are not selected: This register can be Read/Write (R/W). The initial value is the above value.
  - When Boot Modes 3 and 4 are selected: This register is Read Only (R), and the voltage mode of the selected device is as follows.

MD_BOOT[2:0]			Mode	Selection Function	Selection Device	Control method
0	1	1	Boot Mode 3	SPI Multi I/O Bus Controller	Single/Quad/Octal(1.8V)	By Hardware
1	0	0	Boot Mode 4		Single/Quad(3.3V)	By Hardware
Other			QSPI Control by register			

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 1.8V and the register is set to 3.3V, the reliability of this LSI will be affected.

41.3.20 Input Enable Control Register (IEN)

This register is a register that controls the input of the special purpose port.

For the offset address, refer to **Section 41.2.20, Input Enable Control Register (IEN)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	IEN3	—	—	—	—	—	—	—	IEN2

41.4 Operation

The operating procedure for the general-purpose I/O port function and the operating procedure for peripheral functions are shown below.

41.4.1 Operation for GPIO Function

(1) Set the PMCn register to “0” (initial value = 0).

(2) Set the GPIO input / output with the PMn register.

(3) Set the GPIO output value in the Pn register.

(4) The input value of the input terminal can be detected by the PINn register.

(5) When setting the interrupt input using the GPIO input pin, set the ISEL register to “1”.

- Set the FILONOFF, IOLH, SR, and PUPD registers between (1) and (2) as necessary.
- Set the FILONOFF register when using GPIO to set a digital noise filter for interrupt input and GPIO input.
- Set the FILNUM and FILCLKSEL registers according to the purpose of use.

41.4.2 Operation for Peripheral Function

(1) Set the PMCn register to “1” (initial value = 0).

(2) Set the PWPR register to allow writing to the PFCm register.

After setting the PWPR.B0WI bit to “0” (initial value = 1), set the PWPR.PFCWE bit to “1” (initial value = 0).

Select the required function from Functions 1-5. (Hereafter, Function1 setting example)

(3) Set PFCm = 001b and switch to Function1.

(4) Set the PFCm register to write-protected. After setting the PWPR.PFCWE bit to “0”, set the PWPR.B0WI bit to “1”.

- Set the FILONOFF, IOLH, SR, and PUPD registers between (1) and (2) as necessary.
- Set the FILONOFF register when using GPIO to set a digital noise filter for the IRQ[0-7].
- Set the FILNUM and FILCLKSEL registers according to the purpose of use. And also, the NMI input can set the noise filter by the same registers.

42. Low Power Mode

This chapter describes the lower mode of this LSI.

42.1 Overview

This LSI has three modes of low power consumption shown in the following table.

These three modes work independently.

Table 42.1 Low Power Mode

Low Power Mode	Description	Return factor
Module Standby Mode	Stop the clock of specific peripheral module by setting the CPG register. Refer to **Section 42.2, Module Standby Mode** for detail.	CPG register setting
Cortex-M33 Sleep Mode	Put Cortex-M33 into a low power state by issuing a WFI instruction. The SLEEPDEEP bit of SCR register should be set to 1. Refer to **Section 3.4.4, Cortex-M33 Sleep Mode** and **Section 42.3, Cortex-M33 Sleep Mode** for detail.	Interrupt SysTick Timer
Cortex-A55 Sleep Mode	Put Cortex-A55 into a low power state by issuing a WFI instruction. The WFI instruction can be issued each core. Refer to **Section 2.3.1, Cortex-A55 Sleep Mode** and **Section 42.4, Cortex-A55 Sleep Mode** for detail.	Interrupt

Note: When a system reset is applied, the LSI is released from the low power mode and initialized.

42.2 Module Standby Mode

42.2.1 Overview

The Module Standby Mode is a mode that requests the clock stop of the module specified by the master.

The purpose of this mode is to reduce power consumption by stopping unnecessary functions.

The master which can request the clock stop is Cortex-A55*[1] and Cortex-M33. So, Cortex-A55 and Cortex-M33 cannot be placed in the Module Standby Mode. To reduce the power consumption in the CPUs, use the CPU sleep modes to be described later.

Note 1. In case of Cortex-A55 dual core product, the master is Cortex-A55 core0 and Cortex-A55 core1.

This mode is implemented by stopping the clock supply by the CPG register and switching the MSTOP signal of the bus through CPG register settings.

If the master accesses a module that has the clock stopped and the MSTOP bit set, a bus error will occur.

The following registers are used in the Module Standby Mode.

Table 42.2 Module Standby Mode related registers

Register name	Abbreviation	Description
Clock Control Register	CPG_CLKON_***	The detail information of each register is described in **Section 6, System Controller (SYSC)** and **Section 7, Clock Pulse Generator (CPG)**. The usage of these registers is described in **Section 42.2.2, Operation**.
MSTOP Register	CPG_BUS_***_MSTOP CPG_MHU_STOP	
GPU Lowpower Sequence Control Register	SYS_LP_GPU_CTL	

The following figure shows the block connection overview related Module Standby Mode.

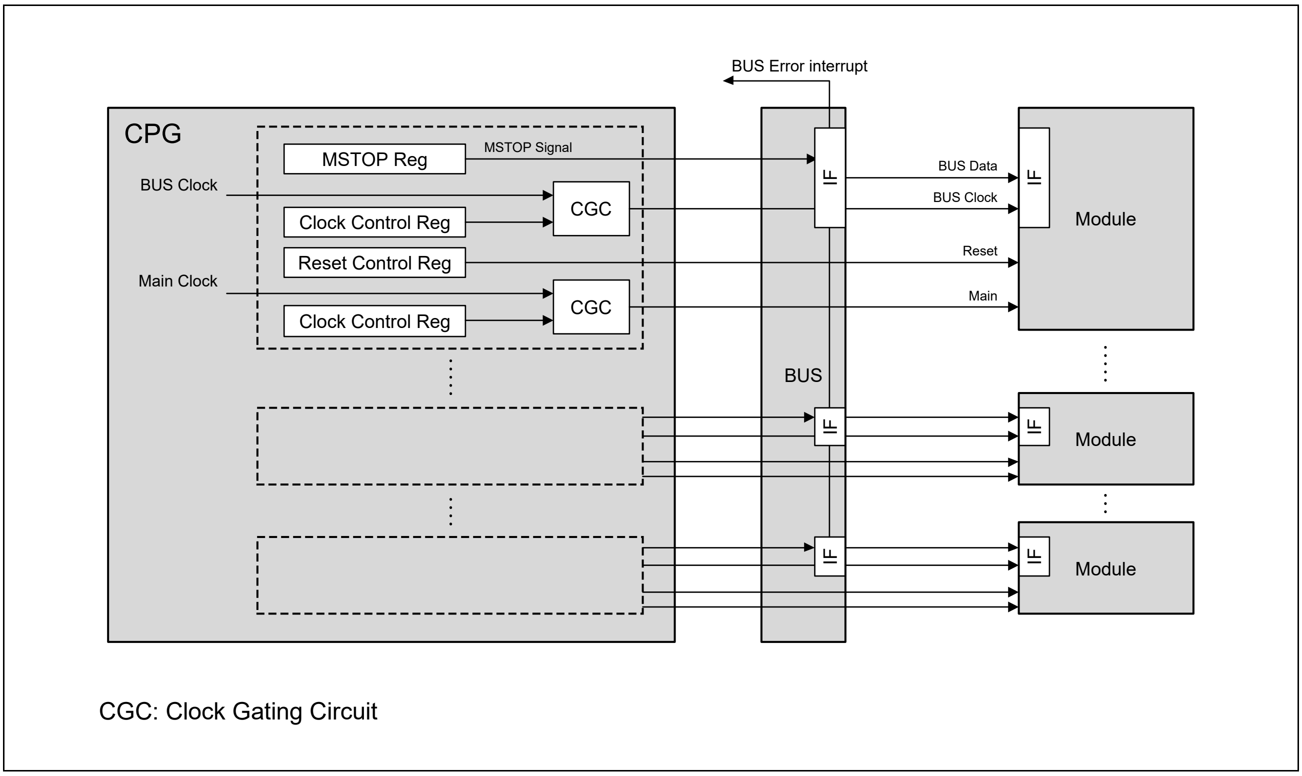

Figure 42.1 Block connection overview for Module Standby Mode

42.2.2 Operation

The following chart shows the procedure to enter and return from the Module Standby Mode.

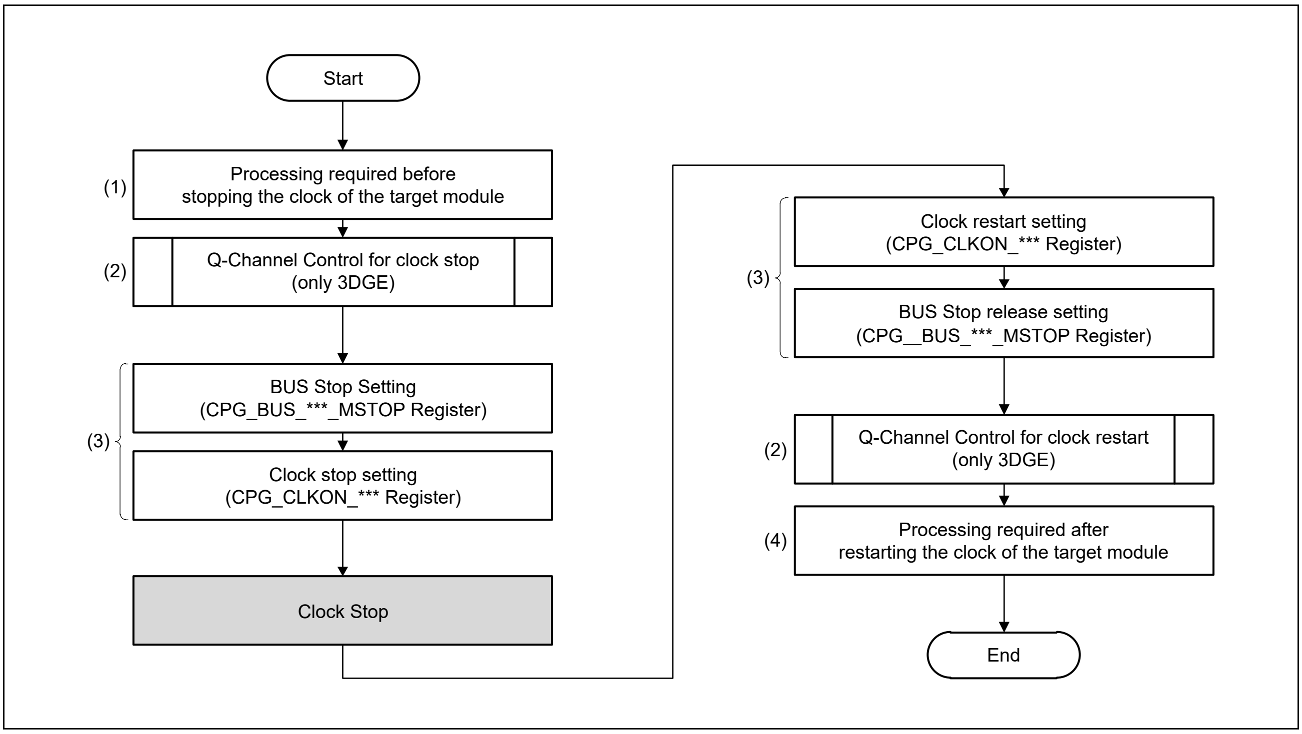

Figure 42.2 Module Standby Mode procedure

(1) Depend on the module, there may be a request to stop during communication, image processing, and various processing. In this case, if the managed CPU can be stopped unilaterally for each module, a stop request is immediately issued to the CPG. For those that cannot be stopped until a certain process is completed, after confirming that the managed CPU has stopped for each module, a stop request is made to the CPG.

(2) 3DGE requires Q-channel control before stopping and restarting the clock. Refer to **Section 42.2.2.2, Q-Channel control for 3DGE** regarding with the detail procedure.

(3) Refer to **Section 42.2.2.1, Setting of Clock control and MSTOP register** regarding to the setting of Clock Control Register and MSTOP Register.

(4) Whether the reset control is required depends on the module; check the specifications of the target module. Set the reset control register to 0 to enter the reset state. Set 1 for the release from the reset state.

42.2.2.1 Setting of Clock control and MSTOP register

The following table shows the combination of the Clock Control register and the MSTOP register to stop the clock of the target module.

The Module Standby Mode can be applied only to the modules shown in the table below.

- When entering the Module Standby Mode:

  Set the MSTOP Register bit of the target module to 1.
  Set the Clock Control Register bit of the target module to 0.

- When exiting the Module Standby Mode:

  Set the MSTOP Register bit of the target module to 0.
  Set the Clock Control Register bit of the target module to 1.

Table 42.3 Registers for Module Standby Mode (1/2)

ADC	ADC	[1:0]	MCPU2	[14]
TSU	TSU	[0]	MCPU2	[15]

Note 1. CPG_MHU_STOP itself is the register name.

Note 2. The clock for USB2.0 PHY can only be stopped when the clock for USB2.0 ch0 and ch1 are stopped.

42.2.2.2 Q-Channel control for 3DGE

3DGE requires Q-Channel control before stopping and restarting the clock.

Refer to AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces regarding with the Q-Channel.

3DGE has five Q-Channels as following figure.

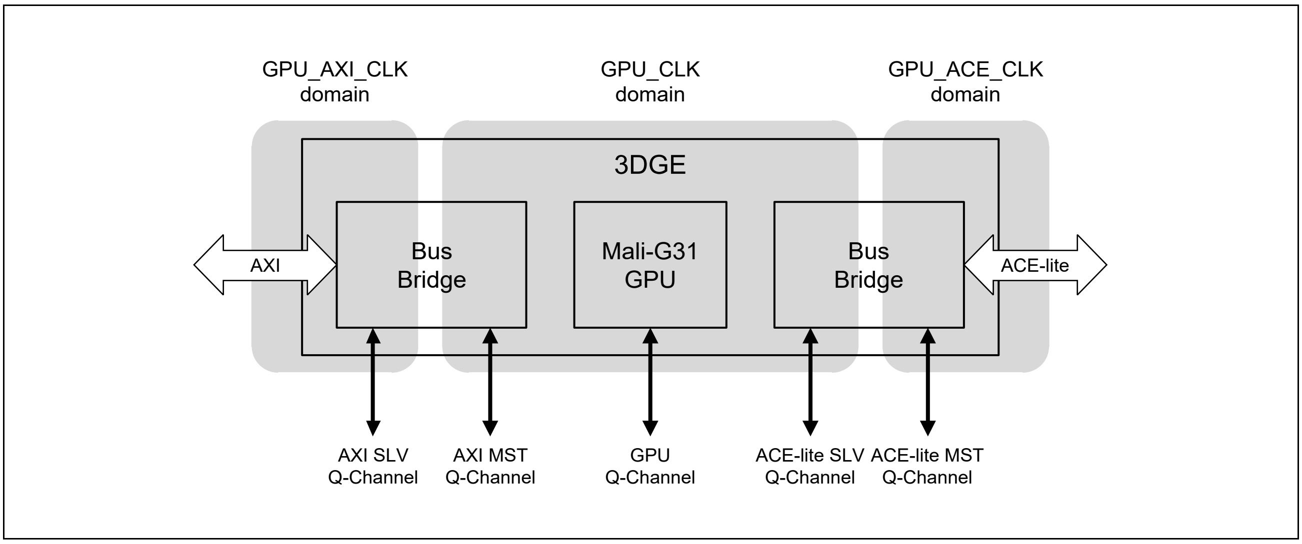

Figure 42.3 3DGE Q-Channel

Five Q-Channels are controlled by SYS_LP_GPU_CTL register.

Refer to **Section 6, System Controller (SYSC)** for detail.

The correspondence of SYS_LP_GPU_CTL bit and Q-Channel signal is below.

- SYS_LP_GPU_CTL[28:24] indicates the status of QDENY signals.
- SYS_LP_GPU_CTL[20:16] indicates the status of QACCEPTn signals.
- SYS_LP_GPU_CTL[12:8] controls QREQn signals.
- SYS_LP_GPU_CTL[4:0] indicates the status of QACTIVE signals.

Q-Channel Control for clock stop.

The procedure of Q-Channel control for clock stop is as follows.

(1) Confirm whether the QACTIVE signals of five Q-Channels are all 0.

(2) Set the QREQn signals of five Q-Channels to all 0.
Confirm the QACCEPTn signals and QDENY signals of five Q-Channels are all 0. Confirm whether the QACTIVE signal of AXI4 SLV Q-Channel is 0 again just in case. Now it is possible to stop clock. The only GPU CLK can be stopped.

(3) If the QACCEPTn signals and the QDENY signals of five Q-Channels are not all 0, that means it is impossible to stop clocks.
In this case, the QREQn signals of five Q-Channels are all returned to 1 to return to the step (1) again.

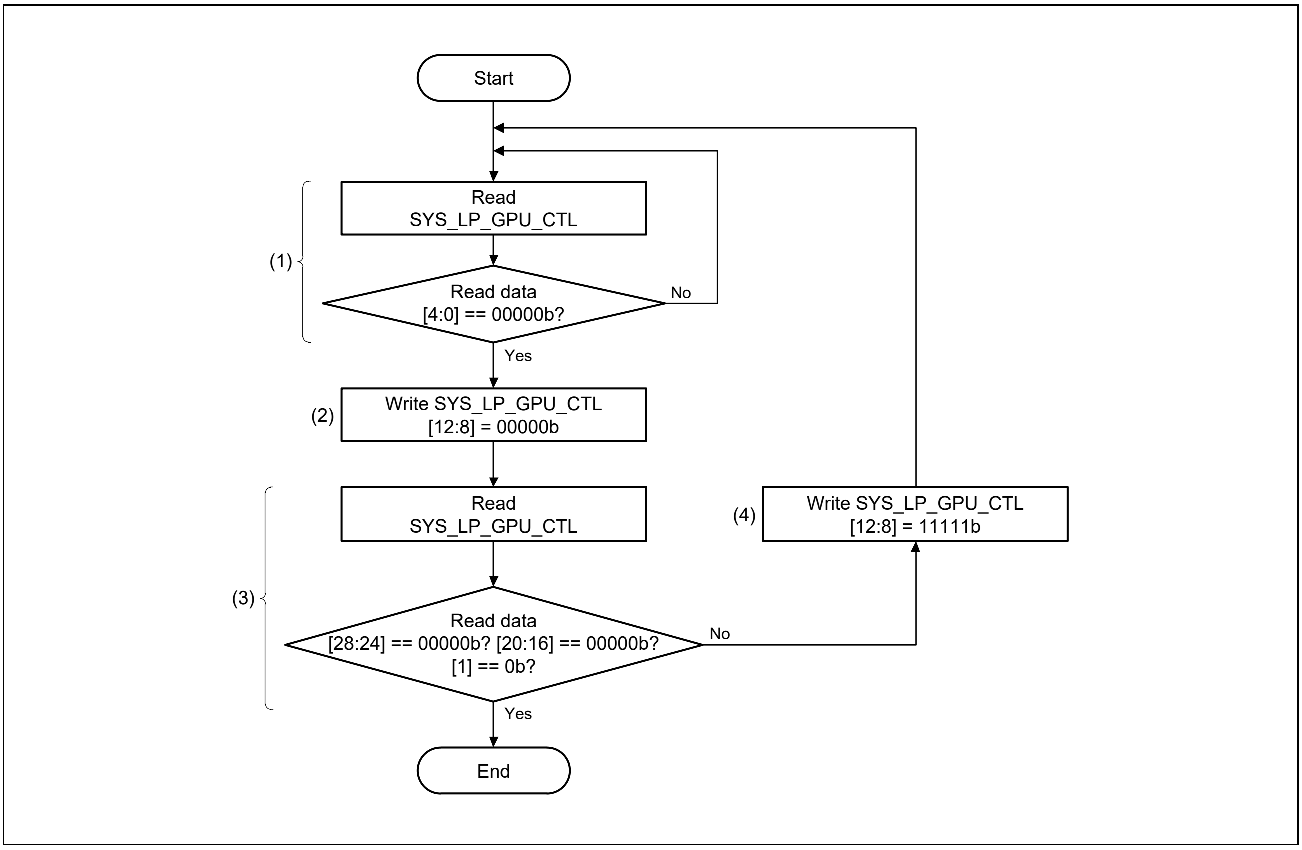

Figure 42.4 3DGE Q-Channel Control for clock stop

Q-Channel control for clock restart.

The procedure of Q-Channel control of clock is as follows.

(1) After the clock is restarted, return the QREQn signals of five Q-Channels to 1.

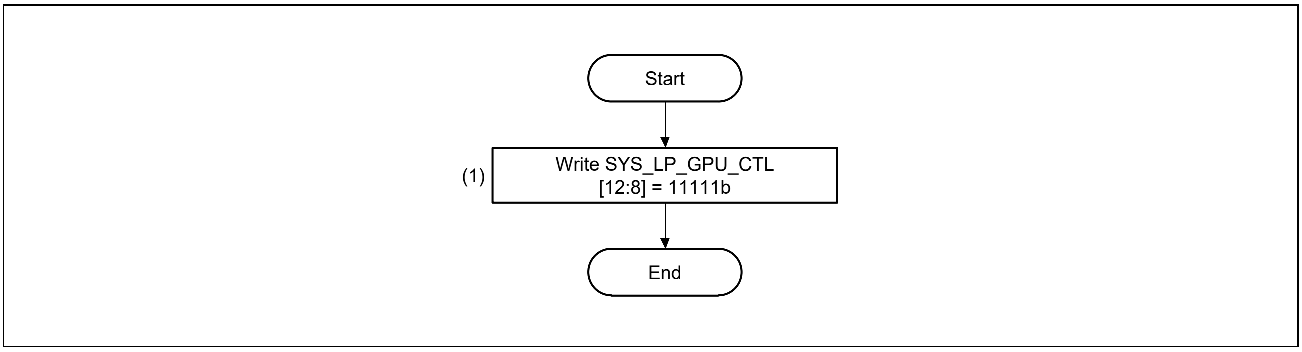

Figure 42.5 3DGE Q-Channel Control for clock restart

42.3 Cortex-M33 Sleep Mode

42.3.1 Overview

Refer to **Section 3.4.4, Cortex-M33 Sleep Mode** for detail.

The following table shows the registers related to the Cortex-M33 Sleep Mode.

Refer to **Section 6, System Controller (SYSC)** for detail.

Table 42.4 Cotrex-M33 Sleep Mode related registers

Register name	Abbreviation	Bit name
Lowpower Sequence Control Register1	SYS_LP_CTL1	bit[28]: CM33SLEEP_ACK bit[12]: CM33SLEEP_REQ
Lowpower Sequence Control Register5	SYS_LP_CTL5	bit[10]: CM33SLEEP_F
Lowpower Sequence Control Register6	SYS_LP_CTL6	bit[10]: CM33SLEEP_E
Lowpower Sequence Control Register7	SYS_LP_CTL7	bit[0]: IM33_MASK

42.3.2 Operation

This section shows an example procedure.

The following figure is one exmple how to use the SYSC registers. The SYS_LP_CTL1, the SYS_LP_CTL5 and the SYS_CTL6 registers can be used to share the transition state of Cortex-M33 with Cotrex-A55. Refering to these registers, Cortex-A55 can peform processing if need when Cortex-M33 enters and exits the Cortex-M33 Sleep Mode.

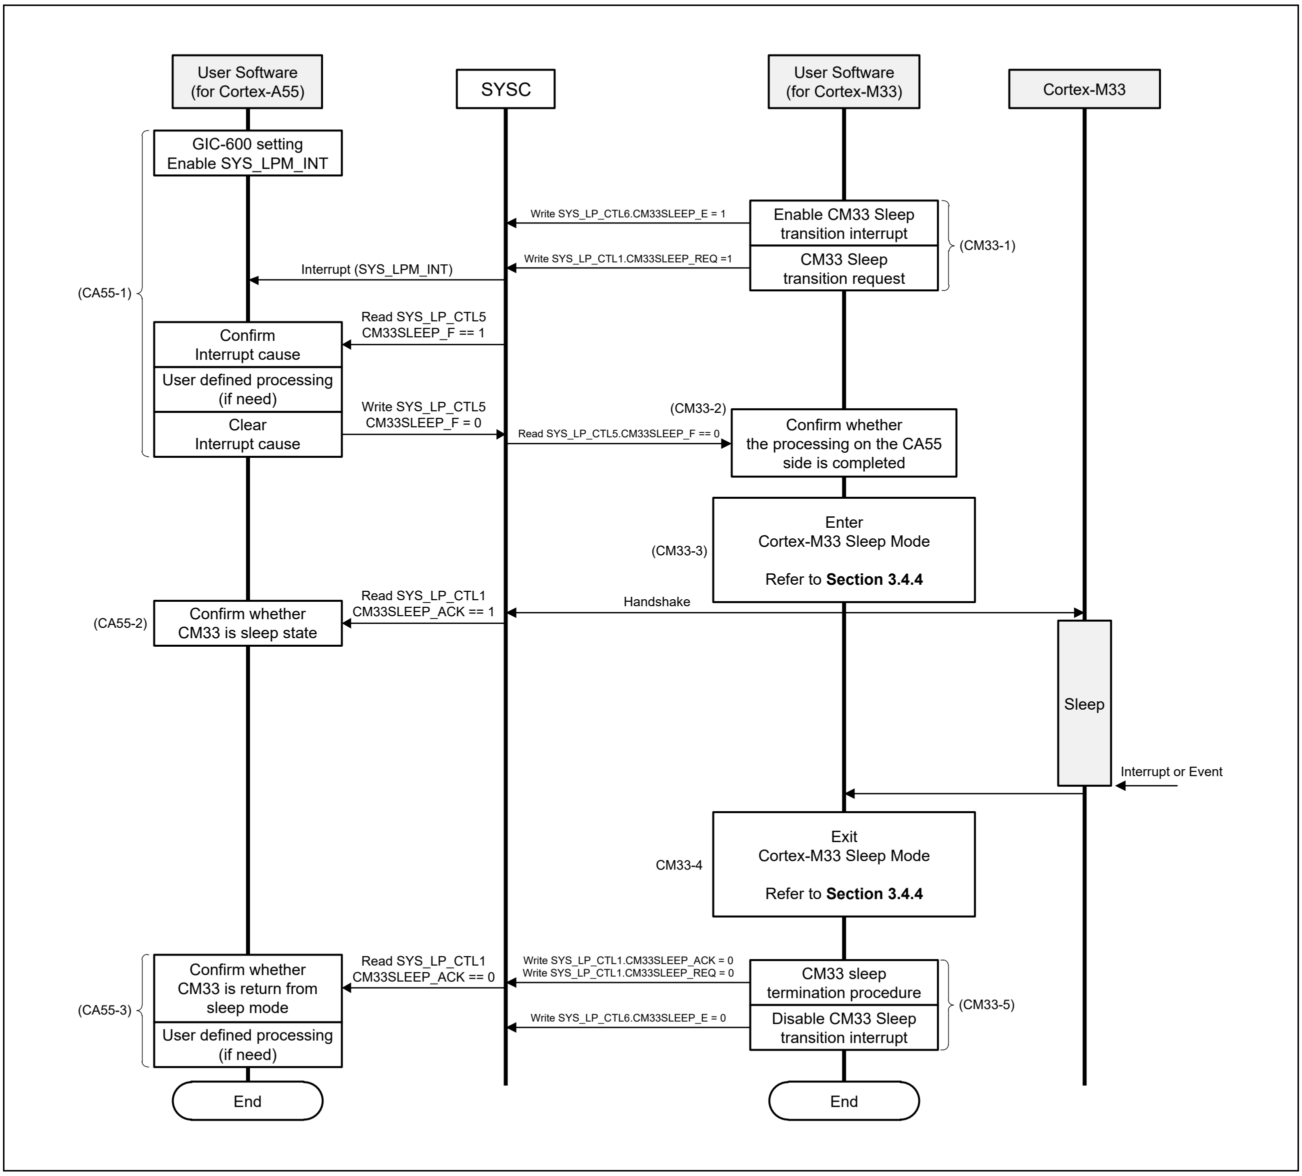

Figure 42.6 The example procedure how to use the SYSC registers (Cortex-M33 Sleep Mode)

(CM33-1) Set the CM33SLEEP_E bit of the SYS_LP_CTL6 register to 1 to enable the transition request interrupt to the Cortex-M33 Sleep Mode.
Setting the CM33SLEEP_REQ bit of the SYS_LP_CTL1 register to 1 causes a SYS_LPM_INT interrupt.
The CM33SLEEP_F bit of the SYS_LP_CTL5 register is set to 1 as an interrupt cause.

(CA55-1)	When a SYS_LPM_INT interrupt is detected, the SYS_LP_CTL5 register is read to check the interrupt cause. (Enable the SYS_LPM_INT interrupt on the GIC in advance.) By confirming that the CM33SLEEP_F bit is 1, the software on Cortex-A55 can know that Cortex-M33 is about to transition to Sleep Mode. Perform the process required when Cotrex-M33 is the sleep mode. (if need) And then clear the CM33SLEEP_F bit of the SYS_LP_CTL5 register.
(CM33-2)	Read the SYS_LP_CTL5 register. By confirming that the CM33SLEEP_F is cleared, the software on Cortex-M33 can confirm that the processing on Cortex-A55 side is completed.
(CM33-3)	Enter the Cortex-M33 Sleep Mode. Refer to **Section 3.4.4, Cortex-M33 Sleep Mode** procedure (1) to (7).
(CA55-2)	Read SYS_LP_CTL1 register. By confirming that the CM33SLEEP_ACK bit is 1, the software on Cortex-A55 can confirm that Cortex-M33 completed transiting to the sleep mode.
(CM33-4)	Exit the Cortex-M33 Sleep Mode. Refer to **Section 3.4.4, Cortex-M33 Sleep Mode** procedure (8) to (12).
(CM33-5)	Clear the CM33SLEEP_ACK bit of the SYS_LP_CTL1 register to indicate returning from the sleep mode. Clear the CM33SLEEP_REQ bit of the SYS_LP_CTL1 register to release the Cortex-M33 sleep mode transition request. Set the CM33SLEEP_E bit of the SYS_LP_CTL6 register to 0 to disable the transition request interrupt to the Cortex-M33 Sleep Mode.
(CA55-3)	Read SYS_LP_CTL1 register. By confirming that the CM33SLEEP_ACK bit is cleared, the software on Cortex-A55 can confirm that Cortex-M33 completed returning from the sleep mode. Perform the process required when Cotrex-M33 returned from the sleep mode. (if need)

42.4 Cortex-A55 Sleep Mode

42.4.1 Overview

Refer to **Section 2.3.1, Cotrex-A55 Sleep Mode** for detail.

The following table shows the registers related to the Cortex-A55 Sleep Mode.

Refer to **Section 6, System Controller (SYSC)** for detail.

Table 42.5 Cotrex-A55 Sleep Mode related registers

Register name	Abbreviation	Bit name
Lowpower Sequence Control Register1	SYS_LP_CTL1	bit[25:24]: CA55SLEEP_ACK[1:0] bit[9:8]: CA55SLEEP_REQ[1:0]
Lowpower Sequence Control Register2	SYS_LP_CTL2	bit[0]: CA55_STBYCTL
Lowpower Sequence Control Register5	SYS_LP_CTL5	bit[9]: CA55SLEEP1_F bit[8]: CA55SLEEP0_F
Lowpower Sequence Control Register6	SYS_LP_CTL6	bit[9]: CA55SLEEP1_E bit[8]: CA55SLEEP0_E

42.4.2 Operation

This section shows an example procedure.

The following figure is one exmple how to use the SYSC registers. The SYS_LP_CTL1, the SYS_LP_CTL5 and the SYS_CTL6 registers can be used to share the transition state of Cortex-A55 with Cotrex-M33. Refering to these registers, Cortex-M33 can peform processing if need when Cortex-A55 enters and exits the Cortex-A55 Sleep Mode.

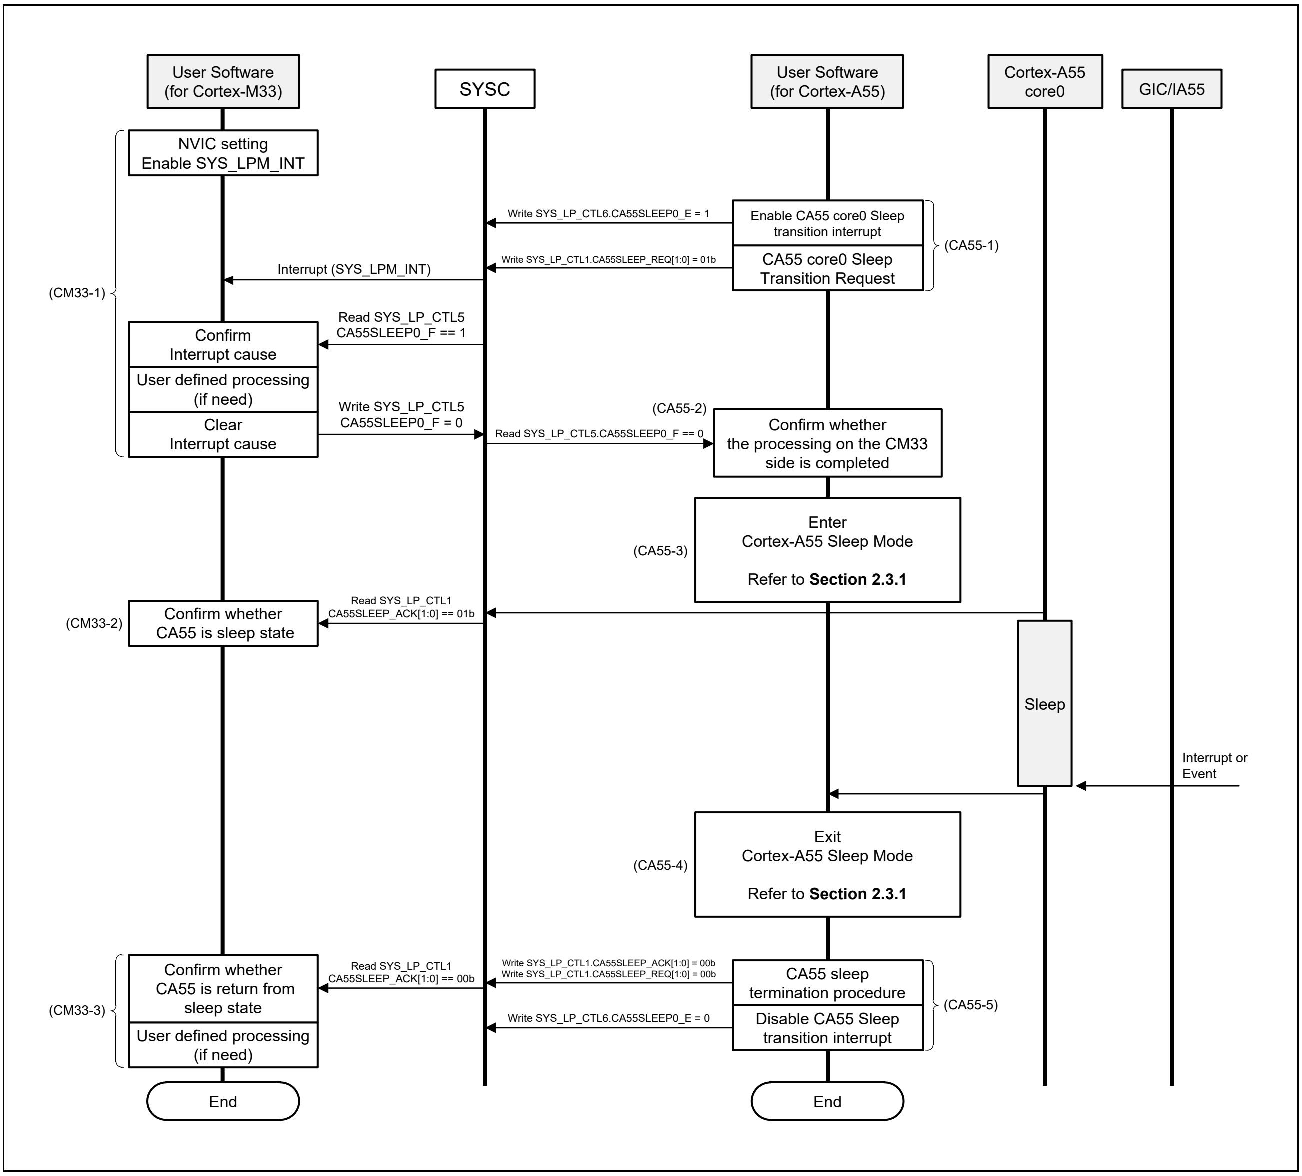

Figure 42.7 The example procedure how to use the SYSC registers (Cortex-A55 Sleep Mode)

(CA55-1) Set the CA55SLEEP0_E bit of the SYS_LP_CTL6 register to 1 to enable the transition request interrupt to the Cortex-A55 Sleep Mode (core0).
Setting the CA55SLEEP_REQ[1:0] bit of the SYS_LP_CTL1 register to 01b causes a SYS_LPM_INT interrupt.
The CA55SLEEP0_F bit of the SYS_LP_CTL5 register is set to 1 as an interrupt cause.

(CM33-1) When a SYS_LPM_INT interrupt is detected, the SYS_LP_CTL5 register is read to check the interrupt cause. (Enable the SYS_LPM_INT interrupt on the NVIC in advance.)
By confirming that the CA55SLEEP0_F bit is 1, the software on Cortex-M33 can know that Cortex-A55 core0 is about to transition to Sleep Mode.
Perform the process required when Cotrex-A55 is the sleep mode. (if need)
And then clear the CA55SLEEP0_F bit of the SYS_LP_CTL5 register.

(CA55-2) Read the SYS_LP_CTL5 register.
By confirming that the CA55SLEEP0_F is cleared, the software on Cortex-A55 can confirm that the processing on the Cortex-M33 side is completed.

(CA55-3) Enter the Cortex-A55 Sleep Mode.
Refer to **Section 2.3.1, Cortex-A55 Sleep Mode** procedure (1) to (3).

(CM33-2) Read SYS_LP_CTL1 register.
By confirming that the CA55SLEEP_ACK[1:0] bit is 01b, the software on Cortex-M33 can confirm that Cortex-A55 core0 completed transiting to the sleep mode.

(CA55-4) Exit the Cortex-A55 Sleep Mode.
Refer to **Section 2.3.1, Cortex-A55 Sleep Mode** procedure (4) to (6).

(CA55-5) Clear the CA55SLEEP_ACK[1:0] bit of the SYS_LP_CTL1 register to indicate returning from the sleep mode.
Clear the CA55SLEEP_REQ[1:0] bit of the SYS_LP_CTL1 register to release the Cortex-A55 sleep mode transition request.
Set the CA55SLEEP_E bit of the SYS_LP_CTL6 register to 0 to disable the transition request interrupt to the Cortex-CA55 Sleep Mode.

(CM33-3) Read SYS_LP_CTL1 register.
By confirming that the CA55SLEEP_ACK[1:0] bit is cleared, the software on Cortex-M33 can confirm that Cortex-A55 completed returning from the sleep mode.
Perform the process required when Cotrex-A55 returned from the sleep mode. (if need)

43. Debug Interface

43.1 Overview

This LSI has a debug interface for boundary scan function and debug support for Cortex-A55 and Cortex-M33.

43.1.1 Features

The functions of the debug interface of this LSI are shown below.

- Debug Interface
  - Support JTAG and SWD

- Debugger control function (DAP function)
  - Direct control of IP without going through CPU by switching Access Port (AP)

- Trace data support
  - Cortex-A55 trace output
  - Cortex-M33 trace output
  - Buffer function of trace data by ETF
  - Trace data output to system bus by using ETR

- Boundary Scan
  - Connection test between this LSI and other LSIs on the user board

- Other functions
  - Interlocking operation of Cortex-A55, Cortex-M33, system counter (SYC), watchdog timer, general timer (GTM), and debug component by cross trigger
  - Support WDT counter stop control function
  - Add time information to trace data by Time Stamp (24MHz operation)

43.1.2 Block Diagram

Figure 43.1 shows the block diagram of the debug interface, and **Figure 43.2** shows the block diagram of the Core Sight System (CST).

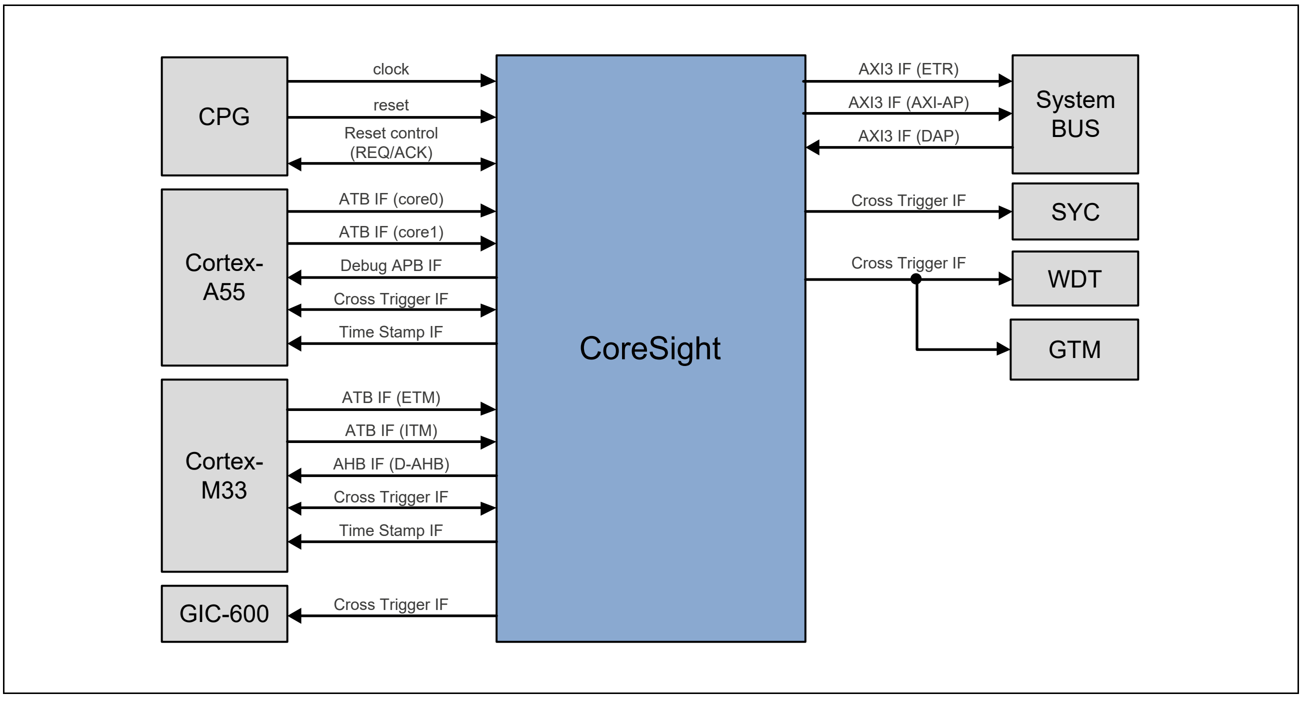

Figure 43.1 Debug System Block Diagram

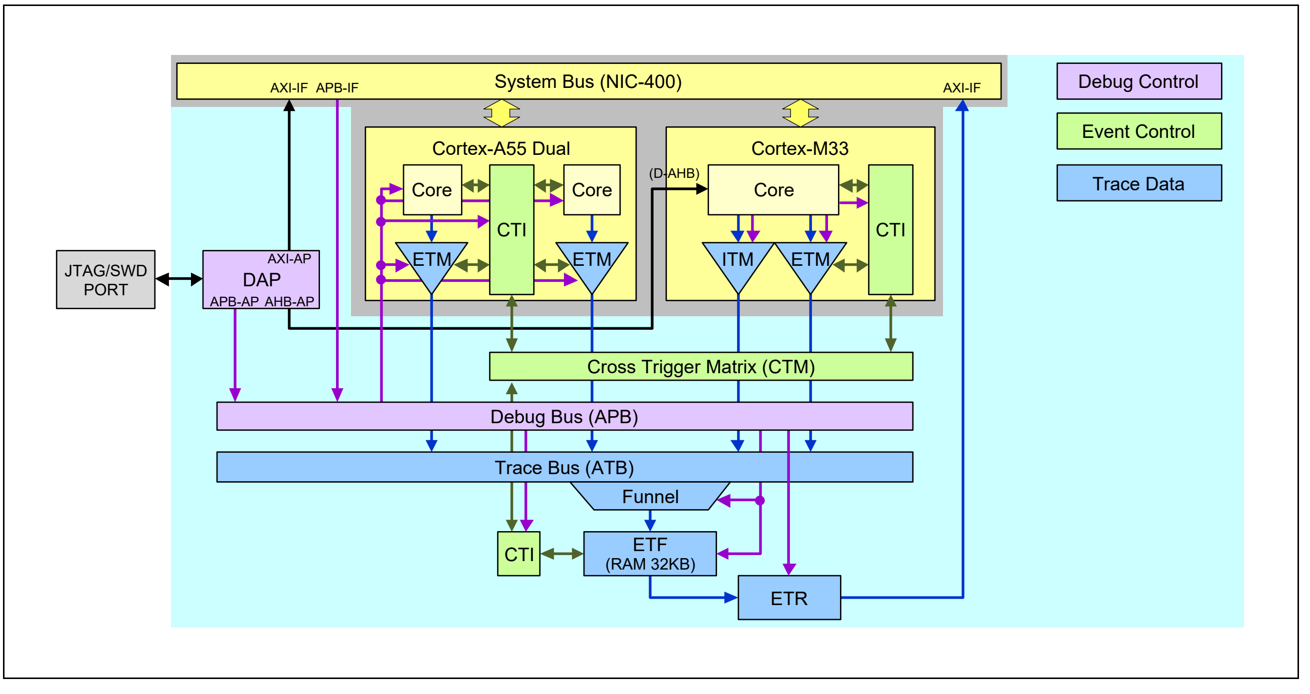

Figure 43.2 Core Sight System Block Diagram

- Debug Bus (APB)

  Bus used for controlling debug functions and acquiring debug data (register values and trace data in On-Chip Buffer)

  - DAP: Debug Access Port

- Cross Trigger Matrix (CTM)

  Functions required for co-debugging triggered by mutual events between CPU and Component

  - CTI: Cross Trigger Interface

- Trace Bus (ATB)

  A data bus which the trace data output by ETM flows

  - ETM: Embedder Trace Macrocell
  - ETR: Embedder Trace Router
  - ETF: Embedder Trace FIFO
  - Funnel: Trace data merge function

For details on ETM, ETR, and ETF, refer to “CoreSight Trace Memory Controller Technical Reference Manual”.

43.1.3 External Pins

- JTAG pins

The debug interface supports JTAG IF and SWD IF. **Table 43.1** shows the JTAG pins and their functions.

Table 43.1 JTAG Pins

Pin Name	I/O	Function		Name
		JTAG IF	SWD IF	
TCK/SWDCLK	Input	TCK	SWCLK	Test clock, Serial wire clock
TMS/SWDIO	Input, Input/Output	TMS	SWDIO	Test mode select, Serial wire data input/output
TDI	Input	TDI	—	Test data input
TDO	Output	TDO	—	Test data output
TRST#	Input	TRST	—	Test reset

- DEBUGEN pins

Table 43.2 shows the functions of the DEBUGEN pin.

Table 43.2 DEBUGEN Pins

Pin Name	I/O	Function
DEBUGEN	Input	Switches between normal operation and debug operation. 0: Normal operation 1: Debug operation

The DEBUGEN value must be fixed before releasing the power-on reset (PRST#). **Table 43.3** shows the difference in operation between normal operation and debug operation.

Table 43.3 Difference in Operation by DEBUGEN

	Normal Operation (DEBUGEN＝0)	Debug Operation (DEBUGEN＝1)	Related Module
Debug function module (CoreSight (other than DAP))	Boot impossible (Reset state)	Boot (Refer **Section 43.6.1** for reset condition and range)	CPG (Reset control)

- BSCANP pins

Table 43.4 shows the functions of the BSCANP pin.

Table 43.4 BSCANP Pins

Pin Name	I/O	Function
BSCANP	Input	Switches between normal operation and boundary scan test mode. 0: Normal operation 1: Boundary scan test mode

Boundary scan test mode is a mode in which a connection test is performed between the terminals of this LSI and other ICs connected on the customer's board and is performed when BSCANP = 1.

The actual access is controlled by the 5 terminals of JTAG when BSCANP = 1.

Table 43.5 shows the operation modes of this LSI according to the values of the DEBUGEN pin and BSCANP pin.

Table 43.5 Operating Mode

Pin Name		
BSCANP	DEBUGEN	Operating Mode
0	0	Normal operation
0	1	Debug operation
1	*	Boundary scan test mode

43.1.4 Treatment of Unused Pins

When the external terminal of the debug interface is not used, handle it as shown in **Table 43.6**.

Table 43.6 Handling of Unused Pins

Pin Name	Handle*[1]
TCK/SWDCLK	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level)
TMS/SWDIO	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level)
TDI	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level)
TDO	Open-circuit
TRST#*[2]	Fix this pin at a low level (pull down or connect to the ground level)
DEBUGEN	Fix this pin at a low level (pull down or connect to the ground level)
BSCANP	Fix this pin at a low level (pull down or connect to the ground level)

Note 1. Mount the pull-up/pull-down resistors on the board side

Note 2. TRST# should be fixed at low level in non-debug mode, and TRST# should be changed from low level to high level in debug mode.

43.2 Address Space

The CoreSight of this LSI has a 4 MB debug system address space. The address space of the debug system is shown in **Table 43.7**.

Table 43.7 Address Space of the Debug System

Address	Component*[1]
CoreSight Debug Components (Overall Address Space of this LSI)	
H'0_10C0_0000 ~ H'0_10C0_FFFF	CoreSight: ROM table
H'0_10C1_0000 ~ H'0_10C1_FFFF	CoreSight: Timestamp generator
H'0_10C2_0000 ~ H'0_10C2_FFFF	CoreSight: ETF
H'0_10C3_0000 ~ H'0_10C3_FFFF	CoreSight: ETR
H'0_10C4_0000 ~ H'0_10C4_FFFF	CoreSight: Trace Funnel
H'0_10C5_0000 ~ H'0_10C5_FFFF	CoreSight: CTI0
H'0_10C6_0000 ~ H'0_10C6_FFFF	CoreSight: CTI1
H'0_10C7_0000 ~ H'0_10CE_FFFF	CoreSight: Reserved
H'0_10CF_0000 ~ H'0_10CF_FFFF	CoreSight: Reserved
Reserved	
H'0_10D0_0000 ~ H'0_10DF_FFFF	Reserved
Cortex-A55 Debug Components (Overall Address Space of this LSI)	
H'0_10E0_0000 ~ H'0_10E0_FFFF	Cortex-A55: ROM table
H'0_10E1_0000 ~ H'0_10E1_FFFF	Cortex-A55: Core0 Debug
H'0_10E2_0000 ~ H'0_10E2_FFFF	Cortex-A55: Core0 CTI
H'0_10E3_0000 ~ H'0_10E3_FFFF	Cortex-A55: Core0 PMU
H'0_10E4_0000 ~ H'0_10E4_FFFF	Cortex-A55: Core0 ETM
H'0_10E5_0000 ~ H'0_10ED_FFFF	Reserved
H'0_10EE_0000 ~ H'0_10EE_FFFF	Cortex-A55: DSU CTI
H'0_10EF_0000 ~ H'0_10F0_FFFF	Reserved
H'0_10F1_0000 ~ H'0_10F1_FFFF	Cortex-A55: Core1 Debug
H'0_10F2_0000 ~ H'0_10F2_FFFF	Cortex-A55: Core1 CTI
H'0_10F3_0000 ~ H'0_10F3_FFFF	Cortex-A55: Core1 PMU
H'0_10F4_0000 ~ H'0_10F4_FFFF	Cortex-A55: Core1 ETM
H'0_10F5_0000 ~ H'0_10FF_FFFF	Cortex-A55: Reserved
Cortex-M33 Debug Components (Cortex-M33 Address Space)	
H'E000_0000 ~ H'E000_0FFF	Cortex-M33: ITM
H'E000_1000 ~ H'E000_1FFF	Cortex-M33: DWT
H'E000_2000 ~ H'E000_2FFF	Cortex-M33: FPB
H'E000_3000 ~ H'E000_DFFF	Cortex-M33: Reserved
H'E000_E000 ~ H'E000_EFFF	Cortex-M33: Secure SCS
H'E000_F000 ~ H'E002_DFFF	Cortex-M33: Reserved
H'E002_E000 ~ H'E002_EFFF	Cortex-M33: Non-Secure SCS
H'E002_F000 ~ H'E004_0FFF	Cortex-M33: Reserved
H'E004_1000 ~ H'E004_1FFF	Cortex-M33: ETM
H'E004_2000 ~ H'E004_2FFF	Cortex-M33: CTI
H'E004_3000 ~ H'E00F_EFFF	Cortex-M33: Reserved
H'E00F_F000 ~ H'E00F_FFFF	Cortex-M33: ROM Table

Note 1. Access to the Reserved area is prohibited. Operation is not guaranteed when accessed.

NOTE

- The CoreSight Debug Components area and Cortex-A55 Debug Components area can be accessed via the system bus and APB-AP.
  APB-AP is connected to port-0 of DAP. For the port configuration of DAP, refer to **Section 43.6.2, DAP**.
- The Cortex-M33 Debug Components area is accessible via AHB-AP.
  The AHB-AP for the area access is connected to port-2 of the DAP. For the port configuration of DAP, refer to **Section 43.6.2, DAP**.
- Each component is placed on a 64KB address boundary according to the ARMv8 Debug memory map. As an entity, the first 4 KB is valid.

43.3 Register Descriptions

43.3.1 ID Register (BSID)

The BSID register is a 32-bit register that cannot be accessed from the CPU. When the BSCANP pin is 1, it can be read from the TDO pin by setting the IDCODE command on the TAP controller. It cannot be written.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BSID[31:16]															
Initial Value	0	0	0	1	1	0	0	0	0	1	0	0	0	0	0	1
R/W	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSID[15:0]															
Initial Value	1	1	0	0	0	1	0	0	0	1	0	0	0	1	1	1
R/W	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BSID[31:0]	H'1841_C447	—	This is the ID register specified in JTAG. The upper 4 bits (bit31-28) may change depending on the chip version.

43.3.2 Other Registers

For details on each register other than the BSID register, refer to "ARM CoreSight SoC-400 Technical Reference Manual" and "CoreSight Trace Memory Controller Technical Reference Manual".

43.4 Debug Connection

43.4.1 Debug Connection Mode

There are the following four modes for the debug connection method of this LSI.

Authentication Mode	Method
No authentication	Allow access from the debugger without authentication (initial setting)
SEC authentication*[1]	Allow access from the debugger after authentication is OK. (authentication method is security authentication by security IP)
Authentication refusal*[1]	Block access from the debugger

Note 1. SEC authentication and Authentication refusal can only be authenticated with secure products.

For SEC authentication modes, enter the authentication code from the debugger is needed.

For information on the authentication function of secure products, please contact our sales.

43.5 Debug Access Range

The debug access range by CoreSight is for all slaves as well as Cortex-A55. For details, refer to **Section 5.3, Accessible Areas**.

43.6 Operation

43.6.1 Debug Related Reset

Please refer to **Section 7.3.2.1, Range of Reset Application** for debug-related reset and reset range.

43.6.2 DAP

DAP is equipped with SWJ-DP as Debug Port (DP) and APB-AP, AXI-AP, AHB-AP as Access Port (AP).

The DAP port numbers are shown in **Table 43.8**. Indicates the correspondence between the port number specified in the DP SELECT register and the AP, and its usage.

Table 43.8 DAP Port Number

Port number	AP	Usage
Port-0	APB-AP	Debug Component recognition and settings
Port-1	AXI-AP	System IP control (access to system bus)
Port-2	AHB-AP	Cortex-M33 settings

43.6.3 Trace

43.6.3.1 Data Flow

In CoreSight, all trace data is aggregated once by Trace Funnel, and stored in ETF, or output to the system bus via ETR in the subsequent stage. Setting this port number to the Trace Funnel according to the route of the trace data is needed. The Trace Funnel port numbers are shown in **Table 43.9**.

Table 43.9 Trace Funnel Port Number

Port Number	Source Components
Port-0	CA55: Core0 ETM
Port-1	CA55: Core1 ETM
Port-2	CM33: ITM
Port-3	CM33: ETM

43.6.3.2 Timestamp

If time information want to be included in the trace data, the Timestamp Generator can be used. The timestamp replicator port numbers are shown in **Table 43.10**. The Timestamp Generator runs on a 24-MHz clock.

Table 43.10 Timestamp Replicator Port Number

Port Number	Target Components
Port-0	CA55: Core0/1 ETM
Port-1	CM33

43.6.4 Cross Trigger

The CTI (Cross Trigger Interface) implemented in CoreSight, Cortex-A55, and Cortex-M33 is used to communicate debug events.

43.6.4.1 CoreSight Cross Trigger Connectiion

CoreSight has two CTIs. The connection specifications are shown in **Table 43.11** to **Table 43.14**.

Table 43.11 CoreSight CTI0 Trigger Input

Trigger Output Bit	Destination Components	Description
[7]	Cortex-M33: ETM	ETM Event Input 3
[6]	Cortex-M33: ETM	ETM Event Input 2
[5]	Cortex-M33: ETM	ETM Event Input 1
[4]	Cortex-M33: ETM	ETM Event Input 0
[3]	Cortex-M33: System	Interrupt request 1
[2]	Cortex-M33: System	Interrupt request 0
[1]	Cortex-M33: Processor	Processor Restart
[0]	Cortex-M33: Processor	Processor debug request

43.6.5 WDT Counter Stop Control

This LSI has a WDT counter stop control function linked with a debug event to prevent an unintended reset by WDT during debug operation. When a debug event occurs, CoreSight asserts the WDT counter stop request signal, controls the WDT counter stop signal (CNTSTOP), and stops counting. The target WDT is all WDT. For details on the WDT count stop function, refer to **Section 6.4.2, WDT Stop control function**.

43.6.6 GTM Counter Stop Control

This LSI has a GTM counter stop control function linked with debug events to prevent unintended GTM counts during debug operation. When a debug event occurs, CoreSight asserts a GTM counter stop request signal to stop the GTM count.

43.6.7 SYC Counter Stop Control

This LSI has a SYC counter stop control function linked with debug events to prevent unintended SYC counts during debug operation. When a debug event occurs, CoreSight asserts a SYC counter stop request signal to stop the SYC count.

44. Thermal Sensor Unit (TSU)

This LSI chip incorporates a thermal sensor unit (TSU) that measures the temperature inside the LSI.

44.1 Overview

44.1.1 Features

- This LSI has a single TSU.
- The thermal sensor in this unit measures temperatures in the range from −40°C to 125°C with an accuracy of ±3°C.
- The TSU repeats measurement at 20-µs intervals, and automatically updates the results of measurement.

44.1.2 Block Diagram

Figure 44.1 is a block diagram of the TSU.

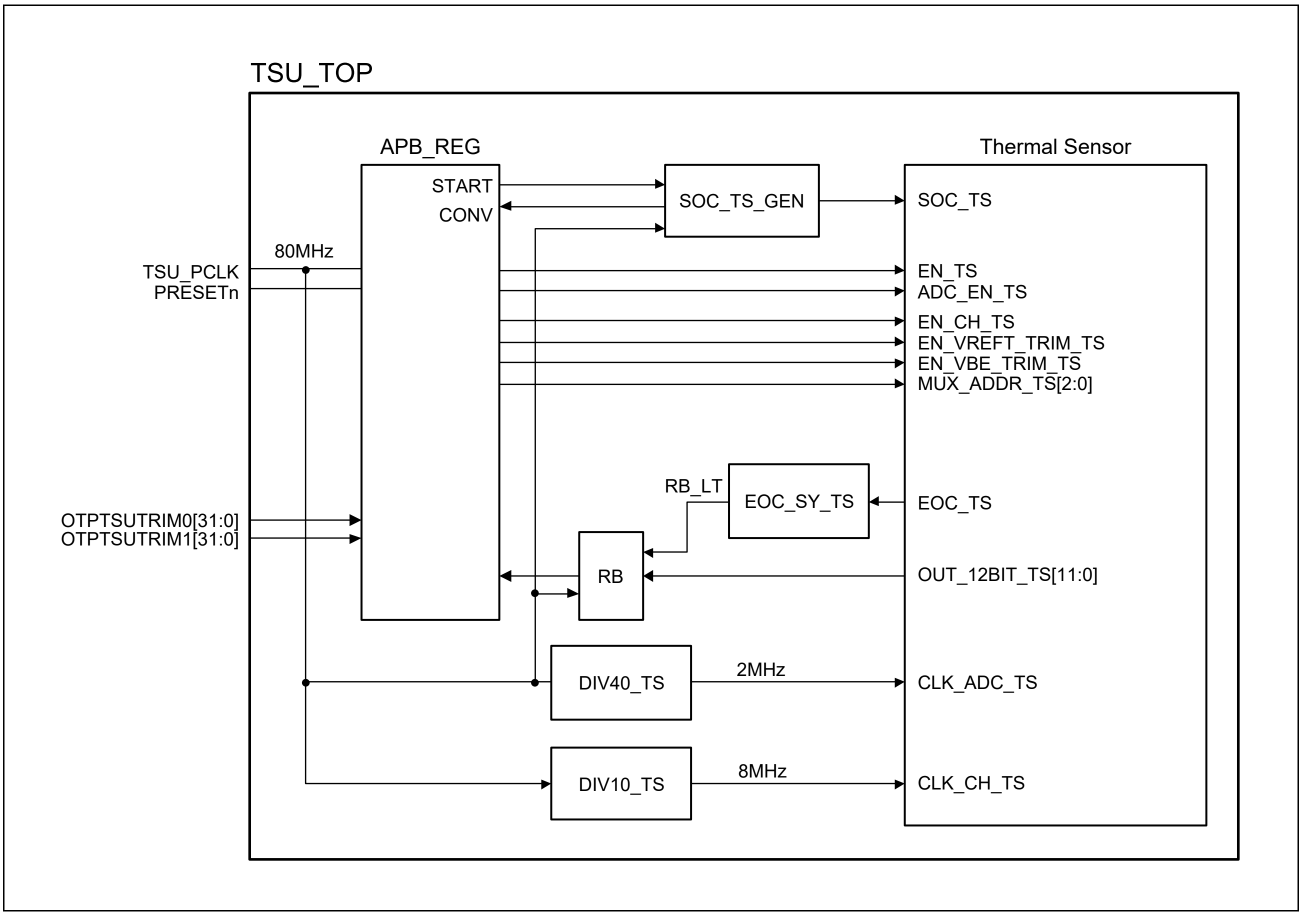

Figure 44.1 Block Diagram of the TSU

The TSU consists of the following blocks.

- APB_REG
- Thermal Sensor
- DIV40_TS and DIV10_TS
- SOC_TS_GEN
- EOC_SY_TS
- Read Buffer (RB)

44.1.2.1 APB_REG

- The APB_REG block provides an external interface for the TSU.
- This block contains control and status registers for the thermal sensor.

44.1.2.2 Thermal Sensor

- The thermal sensor block includes the internal probe, A/D converter and other items.
- The thermal sensor generates 12-bit digital values corresponding to the temperature and outputs them through the OUT_12BIT_TS[11:0] port.

44.1.2.3 DIV40_TS and DIV10_TS

- The TSU operates with the TSU_PCLK clock (80 MHz).
- The DIV40_TS block is a divide-by-40 divider which divides TSU_PCLK to generate a 2-MHz clock frequency to be supplied to the A/D converter in the thermal sensor as CLK_ADC_TS.
- The DIV10_TS block is a divide-by-10 divider which divides TSU_PCLK to generate an 8-MHz clock frequency to be supplied to the thermal sensor core as CLK_CH_TS.

44.1.2.4 SOC_TS_GEN

- The SOC_TS_GEN block generates the SOC_TS signal to be supplied to the thermal sensor for control over the timing of its operations.
- The SOC_TS_GEN block generates the SOC_TS signal every 20 µs. This is triggered by the START signal from the APB_REG block.
- The SOC_TS_GEN block generates the CONV signal that indicates the operating state of the thermal sensor. The value of the CONV signal can be read through the APB_REG block.

44.1.2.5 EOC_SY_TS

- The EOC_SY_TS block detects the EOC_TS signal from the thermal sensor and generates the RB_LT signal in synchronization with TSU_PCLK.
- The EOC_TS signal indicates the end of A/D conversion of the voltage for the temperature measured by the thermal sensor.

44.1.2.6 Read Buffer (RB)

- The RB block captures the 12-bit digital value from the OUT_12BIT_TS[11:0] port terminals of the thermal sensor in a register. This is triggered by the RB_LT signal from the EOC_SY_TS block. This value corresponds to the measured temperature.
- The value captured in the RB block can be read from the TSU through the APB_REG block.

44.1.3 External Pins

The TSU has no external pins.

44.1.4 Interrupts

The TSU has no interrupts.

44.2 Register Configuration

This section describes the registers for use in controlling the TSU.

Base Address: H’0_1005_9400 (Cortex-A55 Address Space)
Base Address: H’4005_9400 (Cortex-M33 Address Space Non-Secure)
Base Address: H’5005_9400 (Cortex-M33 Address Space Secure)

44.2.1 List of Register

Table 46 1 lists the TSU registers. All registers are accessible in 32-bit units.

Table 44.1 List of the TSU Registers

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
Sensor Mode Register	TSU_SM	R/W	H’0000_0000	H’00	32
Sensor Trigger Register	TSU_ST	R/W	H’0000_0000	H’04	32
Sensor ADC Data Register	TSU_SAD	R	H’0000_0000	H’0C	32
Sensor Status Register	TSU_SS	R	H’0000_0000	H’10	32
TSU OTP Calibration Register 0	OTPTSUTRIM0_REG	R	—	H’18	32
TSU OTP Calibration Register 1	OTPTSUTRIM1_REG	R	—	H’1C	32

44.3 Register Descriptions

44.3.1 Sensor Mode Register (TSU_SM)

This register is used to specify the operating mode of the thermal sensor.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADC_EN_TS	ADC_EN_TS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	ADC_EN_TS	0b	R/W	These bits specify the operating mode of the thermal sensor.
0	EN_TS	0b	R/W	

ADC_EN_TS	EN_TS	Operating mode of the thermal sensor
0b	0b	Power-saving mode
0b	1b	ADC power-saving mode
1b	0b	Power-saving mode
1b	1b	Normal operating mode

44.3.2 Sensor Trigger Register (TSU_ST)

This register is used to start and stop the cycles of A/D conversion by the thermal sensor. The A/D conversion is repeated at 20-µs intervals once the conversion is started.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RSV	START
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	RSV	0b	R/W	The software may use this bit as a note. The written value is read.
0	START	0b	R/W	This bit starts and stops the cycles of A/D conversion by the thermal sensor. 0b: Stops the A/D conversion*[2] 1b: Starts the A/D conversion*[1]

Note 1. Before setting the START bit to 1b, be sure to set the TSU_SM register. Specifically, set the TSU_SM register, wait for 60 µs, and then set the START bit to 1b.

Note 2. When the START bit is to be set to 0b, be sure to read the A/D-converted value before making the setting.

44.3.3 Sensor ADC Data Register (TSU_SAD)

This register holds the digital value after A/D conversion of the voltage from the thermal sensor.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	OUT_12BIT_TS											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	OUT_12BIT_TS	H'000	R	These bits hold the digital value after A/D conversion of the voltage from the thermal sensor. The value is 12-bit unsigned.

44.3.4 Sensor Status Register (TSU_SS)

This register indicates the state of A/D conversion in the thermal sensor.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CONV
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CONV	0b	R	These bits indicate the state of A/D conversion in the thermal sensor. 0b: A/D conversion is stopped. 1b: A/D conversion is ongoing.

44.3.5 TSU OTP Calibration Register 0 (OTPTSUTRIM0_REG)

This register holds the correction value for calibration to be used in calculating the temperature

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OTPTSUTRIM0_EN	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	OTPTSUTRIM0											
Initial Value	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	OTPTSUTRIM0_EN	—	R	This bit indicates whether [11:0] OTPTSUTRIM0 is valid or invalid. 0b: [11:0] OTPTSUTRIM0 is invalid. 1b: [11:0] OTPTSUTRIM0 is valid.
30 to 12	—	—	R	Reserved When read, the value is indefinite value. The written value will be ignored.
11 to 0	OTPTSUTRIM0	—	R	These bits hold the correction value for calibration to be used in calculating the temperature.

44.3.6 TSU OTP Calibration Register 1 (OTPTSUTRIM1_REG)

This register holds the correction value for calibration to be used in calculating the temperature.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OTPTSUTRIM1_EN	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	OTPTSUTRIM1											
Initial Value	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	OTPTSUTRIM1_EN	—	R	This bit indicates whether [11:0] OTPTSUTRIM1 is valid or invalid. 0b: [11:0] OTPTSUTRIM1 is invalid. 1b: [11:0] OTPTSUTRIM1 is valid.
30 to 12	—	—	R	Reserved When read, the value is indefinite value. The written value will be ignored.
11 to 0	OTPTSUTRIM1	—	R	These bits hold the correction value for calibration to be used in calculating the temperature.

44.4 Operation

44.4.1 Procedure for Starting the A/D Conversion

This section describes the procedure for starting the A/D conversion. Follow this procedure to acquire the A/D converted values for the measured temperatures.

1. Start supplying the clock to the TSU.
2. Release the TSU from the reset state.
3. Set the EN_TS and ADC_EN_TS bits in the TSU_SM register to 1b to place the thermal sensor in the normal operating mode.
4. Wait for 60 µs, leaving the value of the START bit as 0b.
5. Set the START bit in the TSU_ST register to 1b. The thermal sensor then starts the cycles of A/D conversion and the CONV bit in the TSU_SS register indicates 1b.
6. Once 20 µs have passed, the first A/D converted value from the thermal sensor is automatically stored in the TSU_SAD register. The value in that register is then updated every 20 µs. Reading the TSU_SAD register returns the latest A/D converted value.

CAUTION

Ensure that the setting of START is 1b when reading an A/D converted value from the TSU_SAD register.

44.4.2 Procedure for Stopping the A/D Conversion

This section describes the procedure for stopping the A/D conversion.

1. Set the START bit in the TSU_ST register to 0.
2. Poll the CONV bit in the TSU_SS register until it indicates 0b (A/D conversion has stopped).
3. Once you have confirmed that conversion has stopped, set the EN_TS and ADC_EN_TS bits in the TSU_SM register to 0b to place the thermal sensor in the power-saving mode.

CAUTION

If you intend to restart the A/D conversion after having stopped it, start from step 3 in **Section 44.4.1, Procedure for Starting the A/D Conversion**.

44.4.3 Confirming the State of the A/D Conversion by Monitoring the CONV Bit

The A/D conversion by the TSU can be started and stopped by the START bit in the TSU_ST register. However, the timing of stopping the A/D conversion by the thermal sensor is not synchronous with the START bit being set to 0 (stopping the A/D conversion). Monitor the CONV bit in the TSU_SS register to confirm that the A/D conversion by the thermal sensor has stopped.

44.4.4 Procedure for Measuring the Temperature

To calculate the temperature Tj, read registers TSU_SAD, OTPTSUTRIM0_REG, and OTPTSUTRIM1_REG, and follow the procedure below.

1. Read the value of the TSU_SAD register eight times every at least 20 µs. The read values are defined as TSCode[0] to TSCode[7].

2. Calculate the average of the values read, TSCodeAVE, by using the following formula.

$$\mathrm{TSCodeAVE} = \frac{(\mathrm{TSCode}[0]\ +\ \cdots\ +\ \mathrm{TSCode}[7])}{8}$$

3. Apply curvature correction and calculate DSENSOR by using the following formula.

$$\mathrm{DSENSOR} = \frac{\mathrm{TSCodeAVE}}{(1\ +\ \mathrm{TSCodeAVE}\ \times\ 0.000013)}$$

4. Read the correction values for use in calibration from registers OTPTSUTRIM0_REG and OTPTSUTRIM1_REG and use the following formula to calculate Tj.

$$\mathrm{Tj} = (\mathrm{DSENSOR}\ -\ \mathrm{OTPTSUTRIM1}) \times \left(\frac{165}{(\mathrm{OTPTSUTRIM0}\ -\ \mathrm{OTPTSUTRIM1})}\right) - 40$$

44.5 Usage Note

When the START bit in the TSU_ST register is to be set to 0b, be sure to read the A/D-converted value in the TSU_SAD register before making the setting.

45. Trusted Secure IP

This LSI incorporates a Trusted Secure IP module to provide security functions. The module consists of an access management circuit, encryption engine, and random number generator. In combination with the Trusted Secure IP driver, the Trusted Secure IP can prevent eavesdropping (confidentiality), falsification of information (integrity), and impersonation (authenticity).

Key information to be used in encrypting and decrypting data is only stored within the Trusted Secure IP, and any external access can be shut out to obtain a system with strong security.

45.1 Overview

Table 45.1 summarizes the specifications of the Trusted Secure IP. **Figure 45.1** shows a block diagram of the Trusted Secure IP.

Table 45.1 Specifications of Trusted Secure IP (1/2)

Item	Description
Access control	Access management circuit ● In case of irregular access to the Trusted Secure IP due to a falsified program or runaway execution of a program, this circuit blocks all subsequent access and stops the output of data from the Trusted Secure IP.
Encryption engine	AES: Compliant with NIST FIPS PUB 197 algorithm ● Key sizes: 128, 192, or 256 bits ● Block sizes: 128 bits ● Block cipher mode of operation – ECB, CBC, CTR: Compliant with NIST SP 800-38A – CMAC: Compliant with NIST SP 800-38B – CCM: Compliant with NIST SP 800-38C – GCM: Compliant with NIST SP 800-38D – XTS: Compliant with NIST SP 800-38E – GCTR ● Number of cycles for execution*1 – ECB, CBC, CTR, CMAC, GCTR, XTS: 11 cycles of P1ϕ for 128-bit keys, 13 cycles of P1ϕ for 192-bit keys, 15 cycles of P1ϕ for 256-bit keys – CCM: 22 cycles of P1ϕ for 128-bit keys, 26 cycles of P1ϕ for 192-bit keys, 30 cycles of P1ϕ for 256-bit keys AES-GCM AES-GCM is realized by combining AES-GCTR and GHASH.

Table 45.1 Specifications of Trusted Secure IP (2/2)

Item	Description
Encryption engine	RSA ● Key sizes: Up to 4096 bits ● Block sizes: Up to 4096 bits ● Number of cycles for execution*[1] – Approximately 64,000 cycles (Encryption) / 13,000,000 cycles (Decryption) of P1ϕ. HASH ● Support for SHA1, SHA224/SHA256, GHASH ● Block sizes: 512 bits ● Number of cycles for execution*[1] – SHA1: 80 cycles of P1ϕ – SHA224/SHA256: 64 cycles of P1ϕ – GHASH: 9 cycles of P1ϕ ECC ● Compatible with ECDSA and ECDH ● Data block length: 256 bits
Encryption engine	Key management ● Keys are only valid within the Trusted Secure IP. ● Only key generation information is output from the Trusted Secure IP. ● Keys can be regenerated by the input of key generation information to the Trusted Secure IP. Endian ● Big or little
Generation of random numbers	32-bit true random number generator ● The Trusted Secure IP driver can assemble 32-bit true random numbers to generate 128- or 256-bit true random numbers. ● The generated 128-bit and 256-bit true random numbers are used as keys in encrypting and decrypting data.
Unique ID	● An ID unique to the LSI (unique ID) is accessible from the access management circuit through the dedicated bus. ● Combining the unique ID with the key generation information prevents the illicit copying of data to another LSI.
Interrupt sources	10
Low power consumption	Setting of the module stop state is possible.

Note 1. This does not include the overhead for calling functions of the Trusted Secure IP driver.

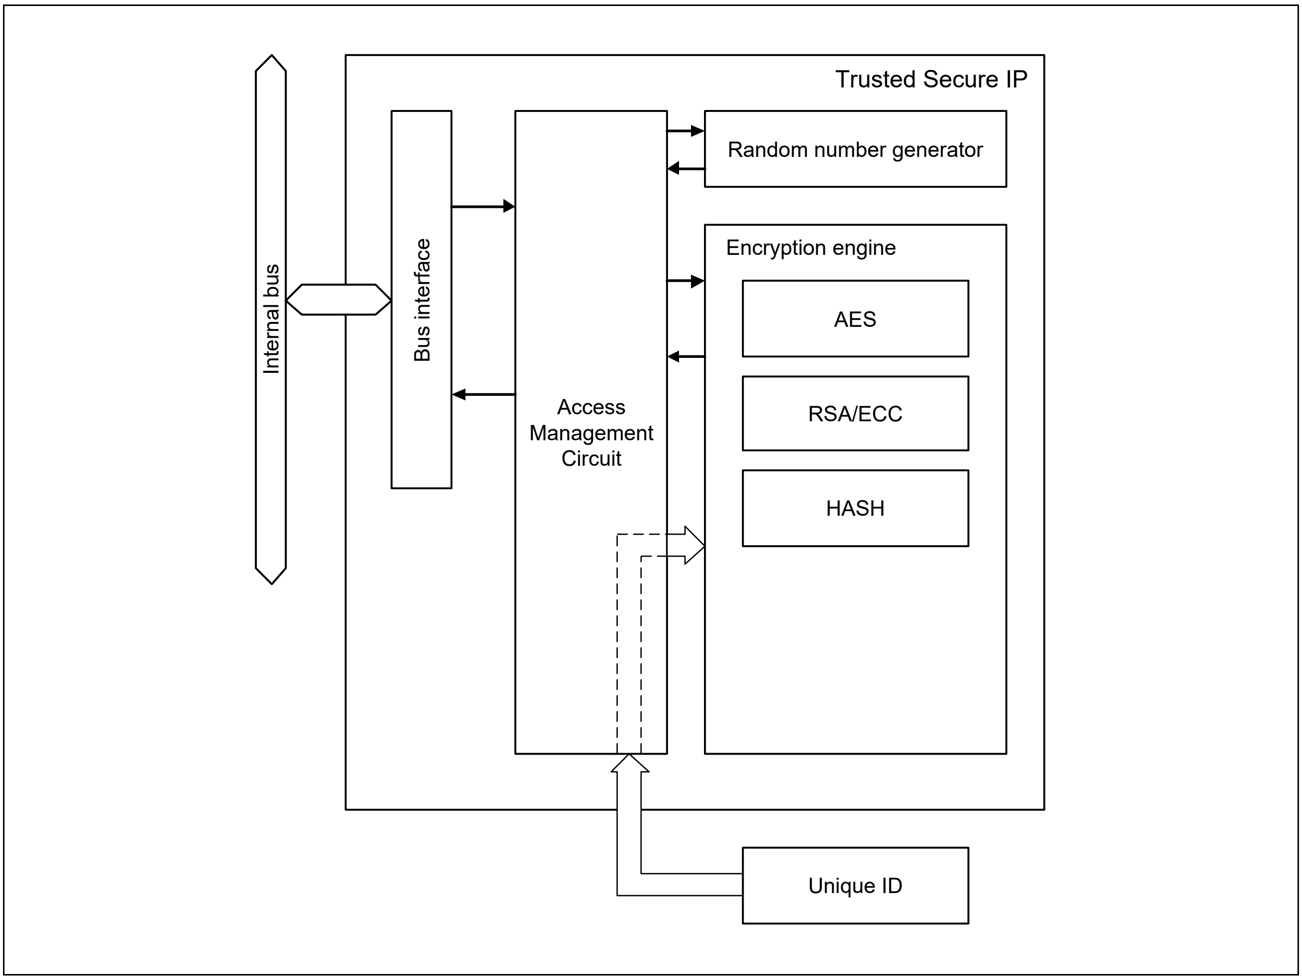

Figure 45.1 Trusted Secure IP Block Diagram

45.2 Operation

45.2.1 Operating Modes and State Transitions

Figure 45.2 shows the state transitions of the Trusted Secure IP.

Use of the Trusted Secure IP security functions is only possible through use of the Trusted Secure IP driver provided by Renesas Electronics, in accordance with the state transitions as shown in the figure below.

When irregular access to the Trusted Secure IP (access that violates the defined procedure) due to a falsified program or a program entering runaway execution, etc. is attempted, the access management circuit does not accept any subsequent access and stops the output of any data from the Trusted Secure IP.

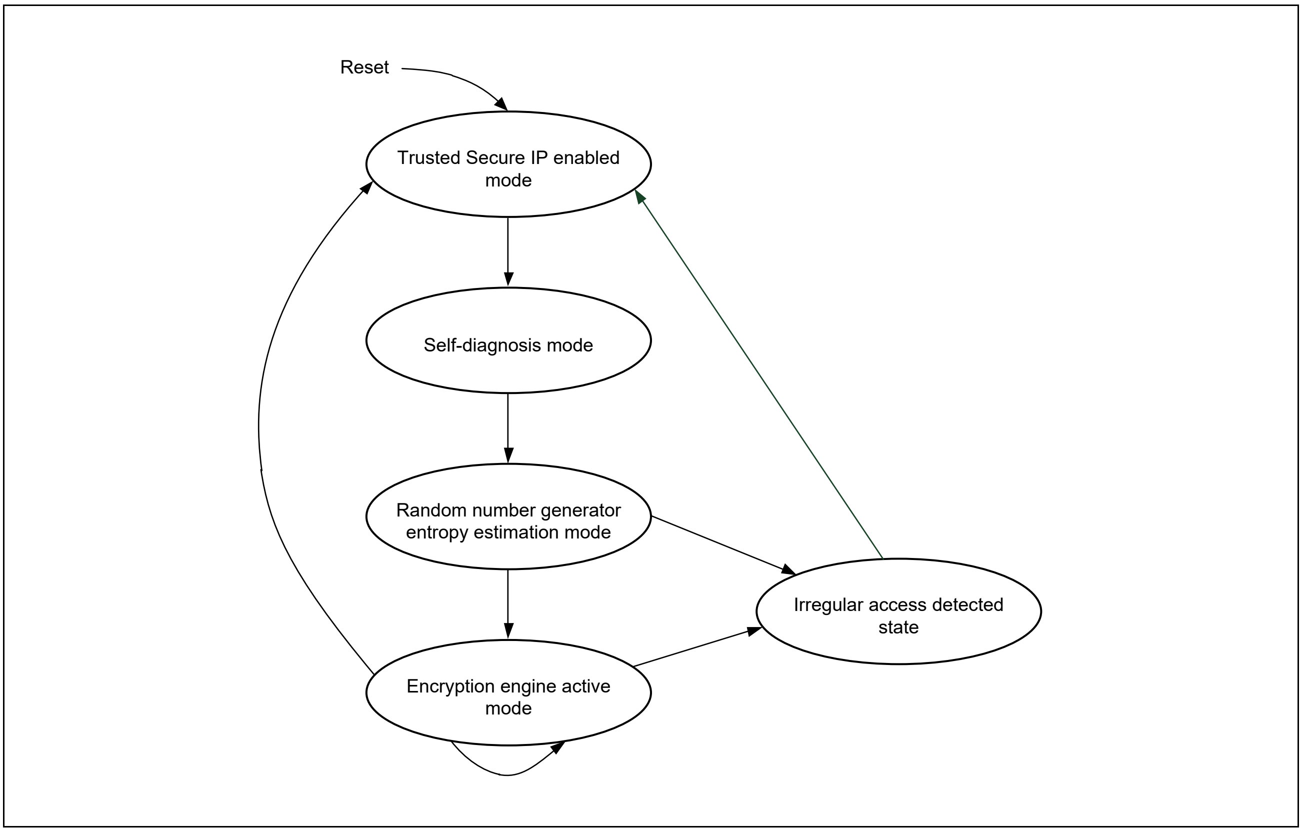

Figure 45.2 Trusted Secure IP Operating Modes and State Transitions

Many of the security functions that the Trusted Secure IP offers are applicable only in the encryption engine active mode. The operations that can be performed in this mode are given below.

(1) Key Installation

(2) Encryption and decryption

(3) Key generation

(4) Random number generation

45.2.2 Encryption Engine

Figure 45.3 shows processes of the encryption engine integrated in the Trusted Secure IP.

The encryption engine, using the key generation information, performs plaintext to ciphertext encryption and ciphertext to plaintext decryption by hardware.

In no part of the encryption or decryption process, is key data or intermediate data ever exposed outside of the Trusted Secure IP.

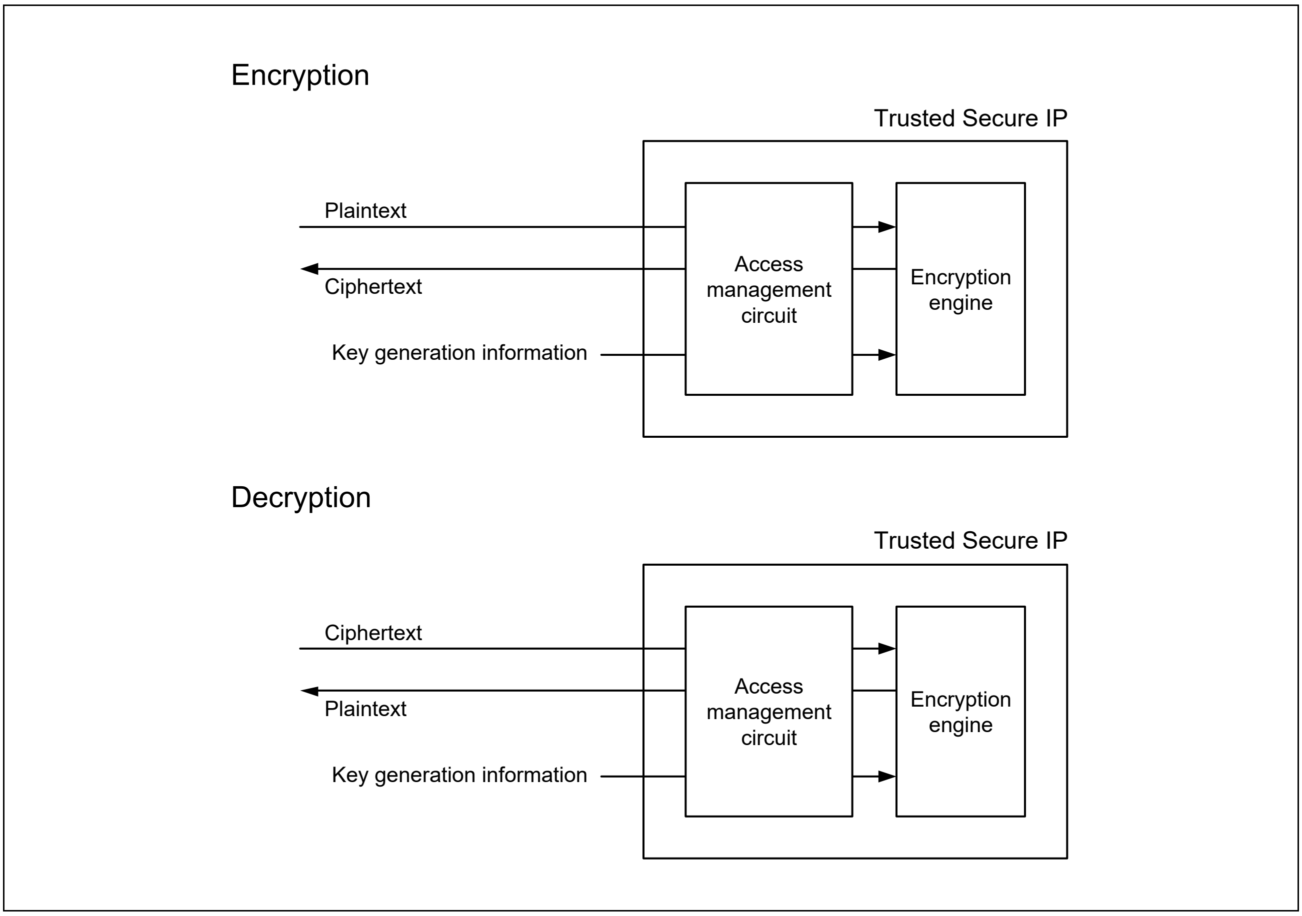

Figure 45.3 Encryption and Decryption processes by Encryption Engine

45.2.3 Key Installation

The key installation is the operation that safely converts the user key to the key generation information and stores it in flash memory. The procedure for installing the key data is given below.

(1) The user uses the key (Key-2) used for encrypting the user key to encrypt the user key (Key-1) producing eKey-1.

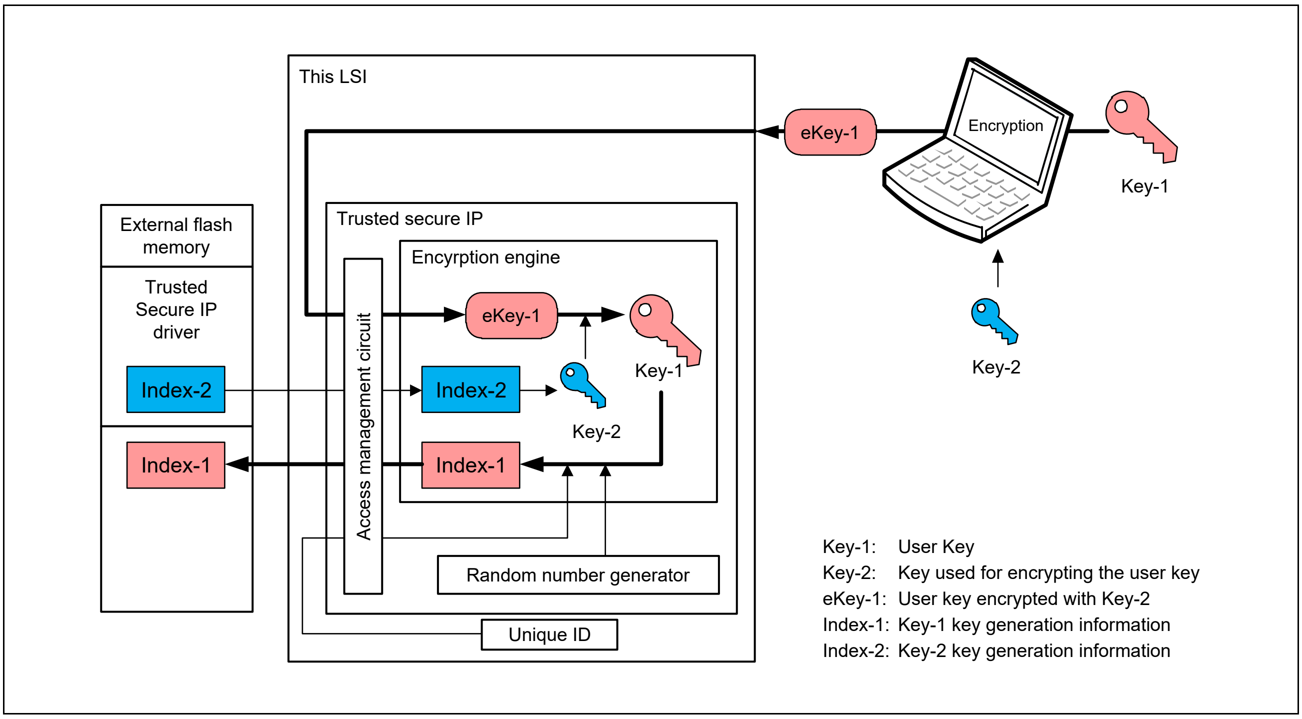
(2) The user sends the encrypted user key (eKey-1) to the Trusted Secure IP.

(3) The key generation information of the Key-2 (Index-2) contained in the Trusted Secure IP driver is used to recover the Key-2, which is then used to decrypt the user key.

(4) The user key is converted to user key generation information (Index-1) using the unique ID and a random number, and stored in flash memory.

The installation process and flow chart are given in **Figure 45.4** and **Figure 45.5**, respectively.

Once the key data is installed, the user key generation information (Index-1) can then be used to perform encryption or decryption.



Key-1: User Key
Key-2: Key used for encrypting the user key
eKey-1: User key encrypted with Key-2
Index-1: Key-1 key generation information
Index-2: Key-2 key generation information

Figure 45.4 Key Installation Process

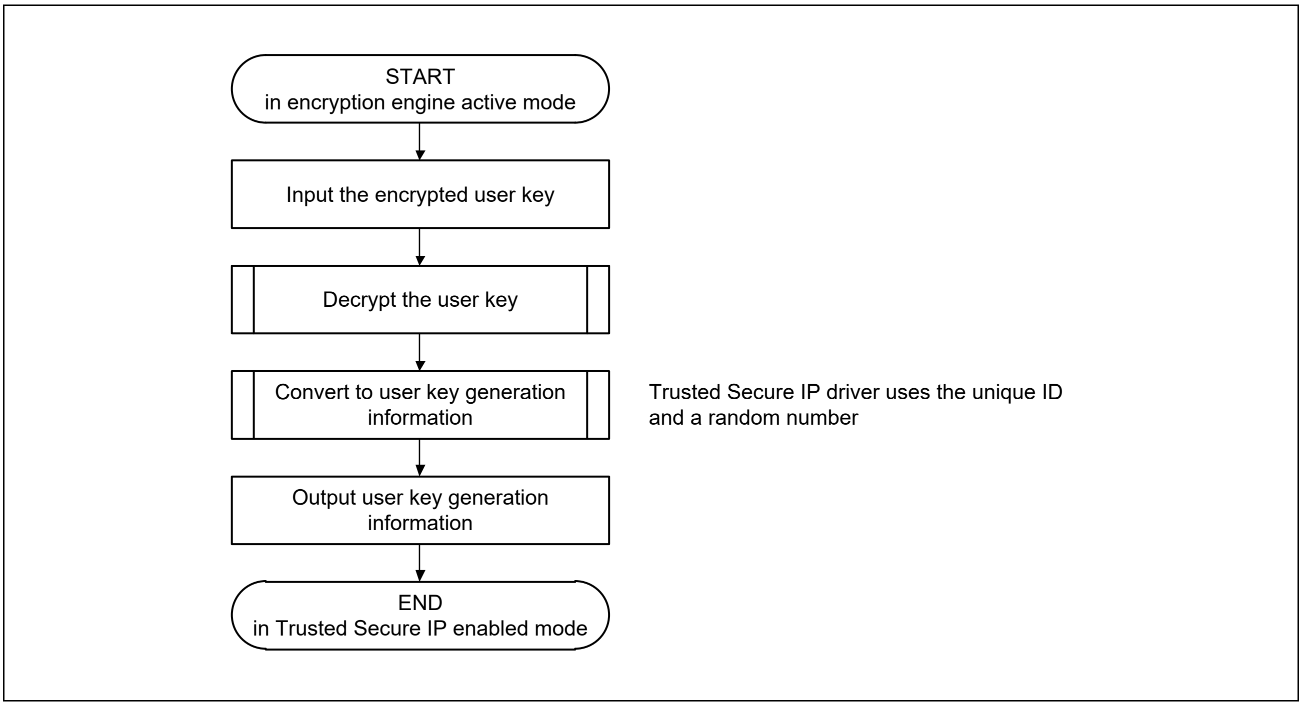


Figure 45.5 Key Installation Flow Chart

45.2.4 Encryption and Decryption

The procedures for encrypting and decrypting data are given below.

(1) Input the key generation information into the Trusted Secure IP, and recover the key data.

(2) Input the data to encrypt or decrypt into the Trusted Secure IP. This converts plaintext into ciphertext, and ciphertext into plaintext.

(3) Read the converted data.

The encryption engine has an input buffer and an output buffer, enabling encryption/decryption to proceed in parallel with data input/output.

Figure 45.6, **Figure 45.7**, and **Figure 45.8** show the timing diagram, encryption flow, and decryption flow, respectively.

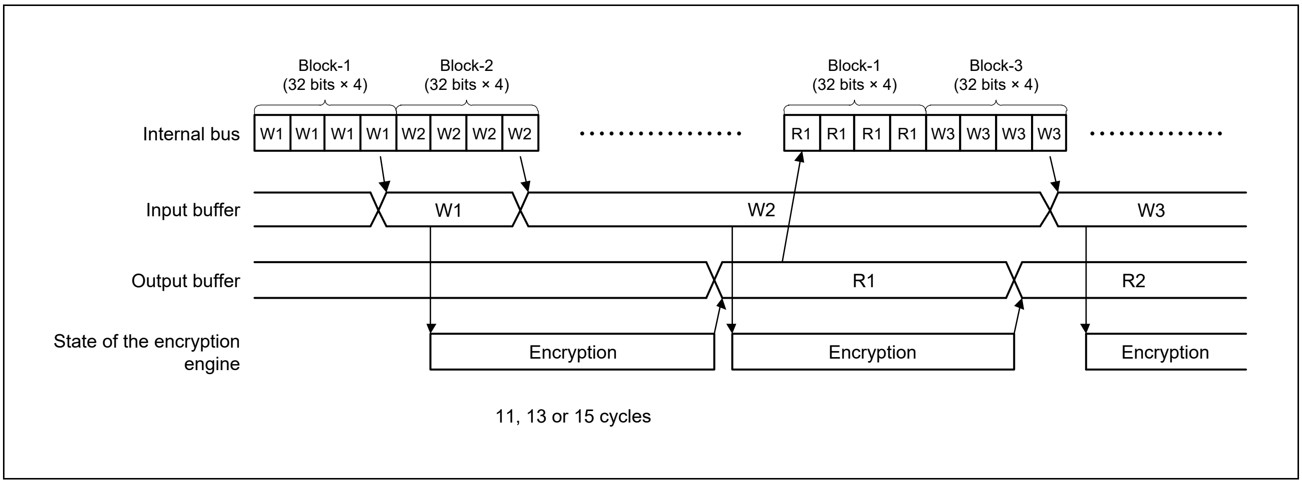

Figure 45.6 Encryption and Decryption Timing Diagram

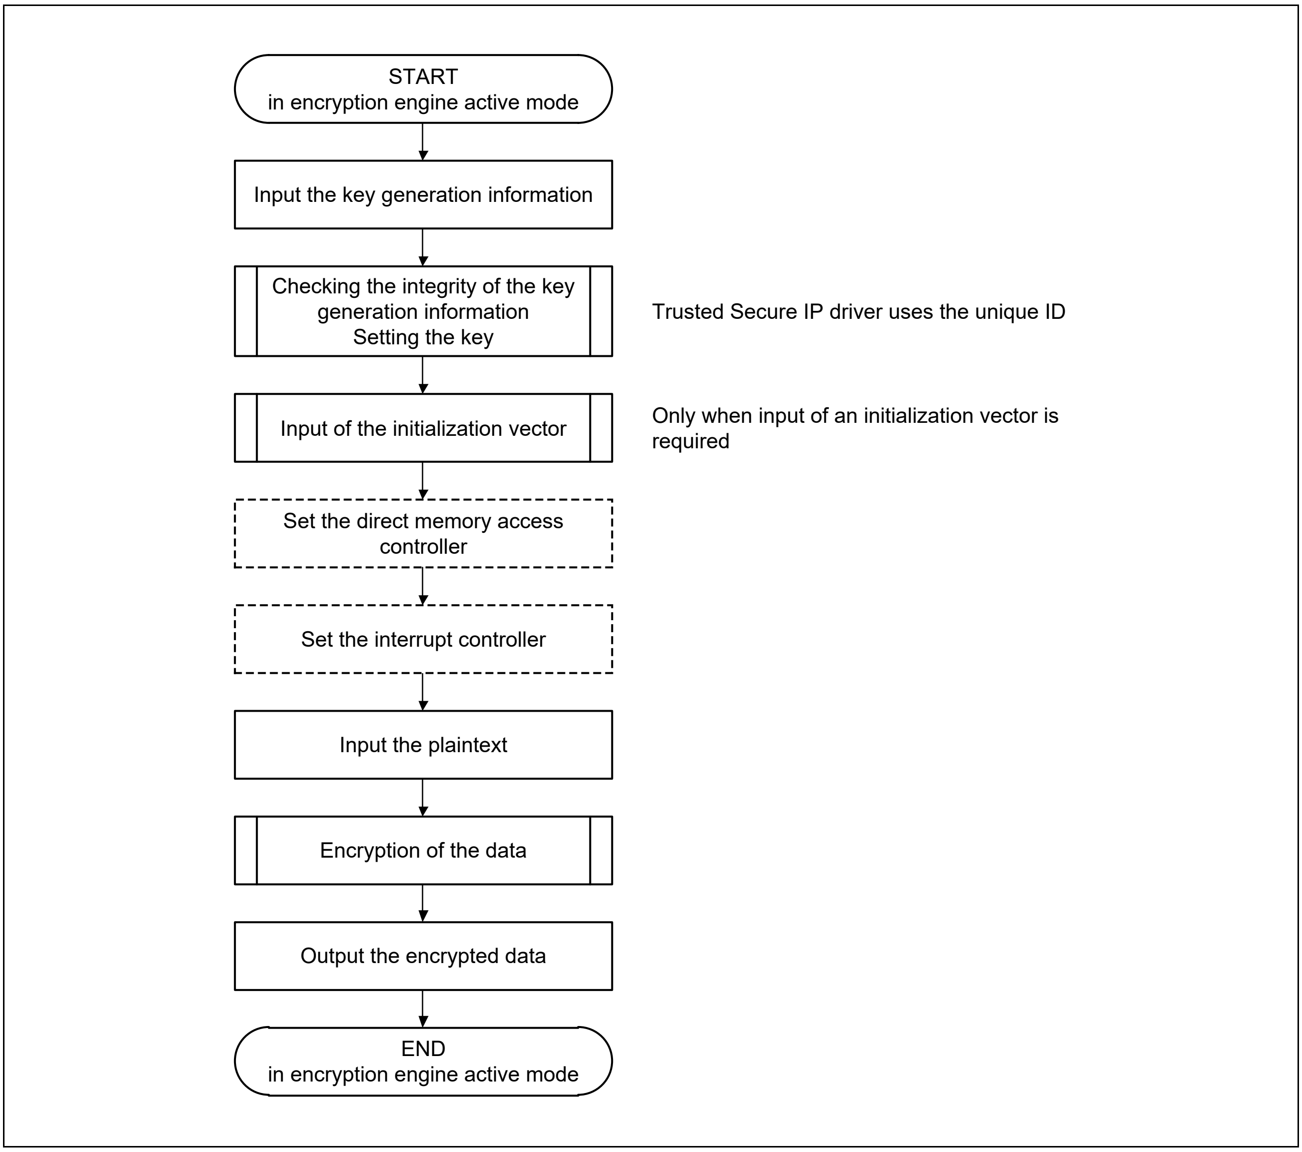

Figure 45.7 Encryption Flow Chart

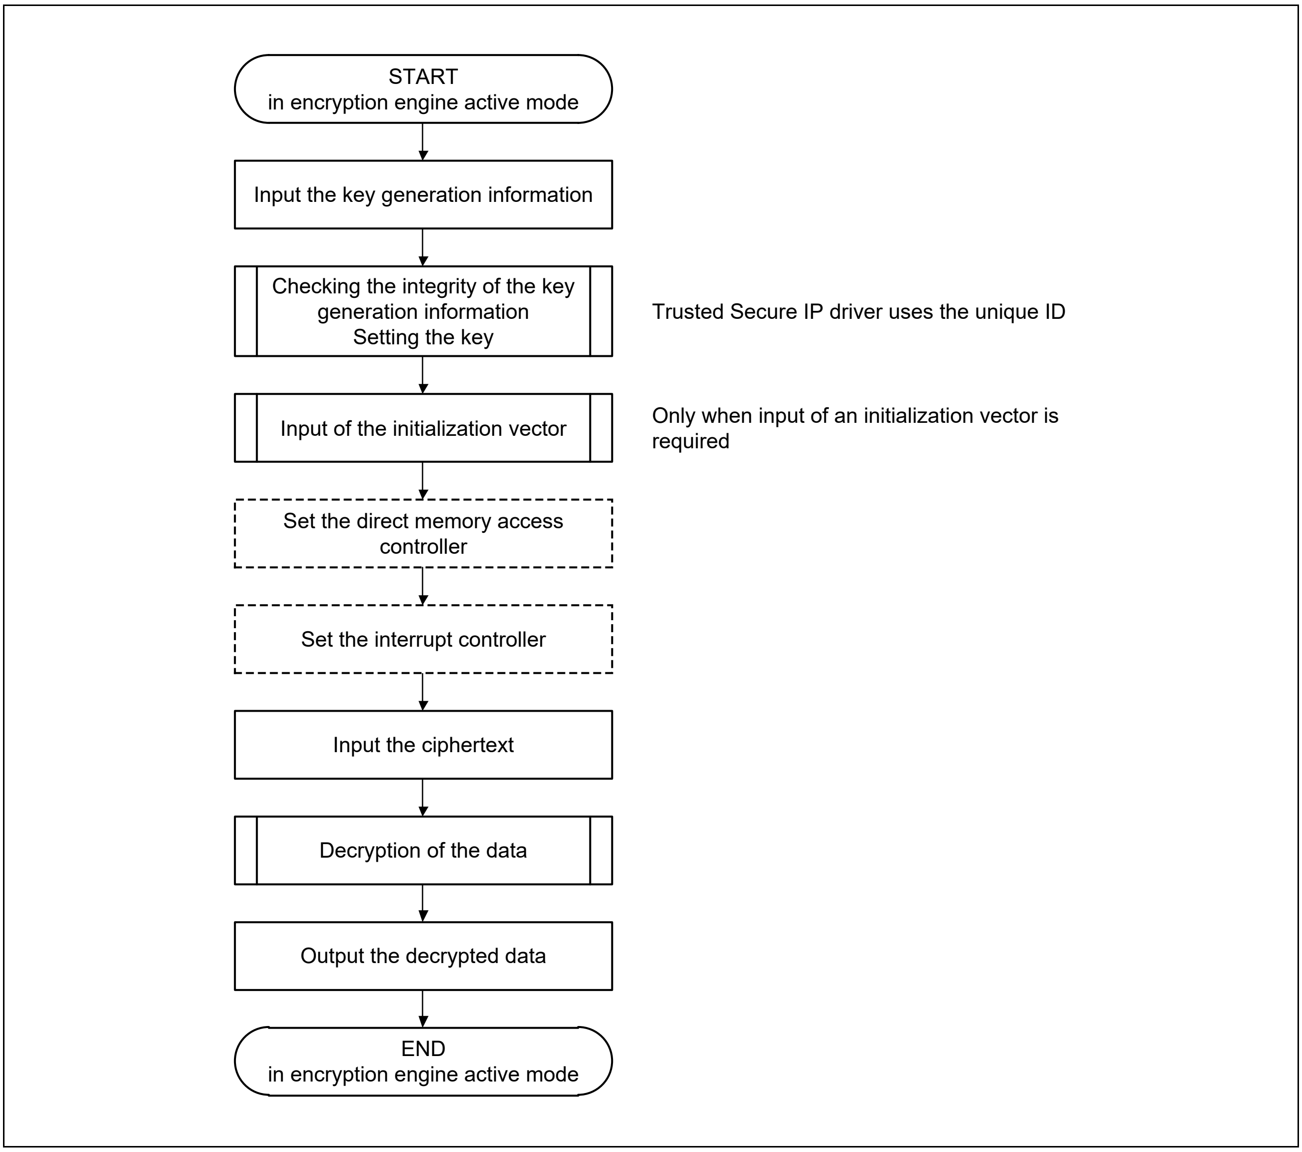

Figure 45.8 Decryption Flow Chart

45.2.5 Generating Key Generation Information (by Using Random Numbers)

Figure 45.9 shows the generating flow for the key generation information by using random numbers.

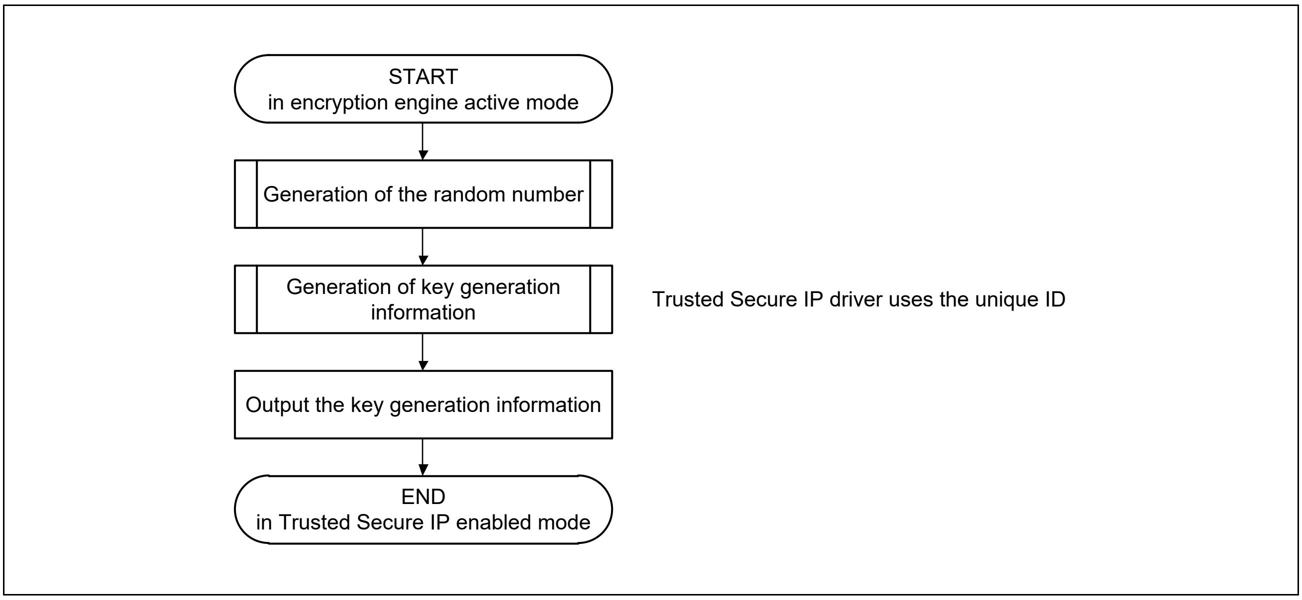

Figure 45.9 Key Generation Information Generating Flow Chart (Using Random Numbers)

45.2.6 Random Number Generation

Figure 45.10 shows the random number generation flow.

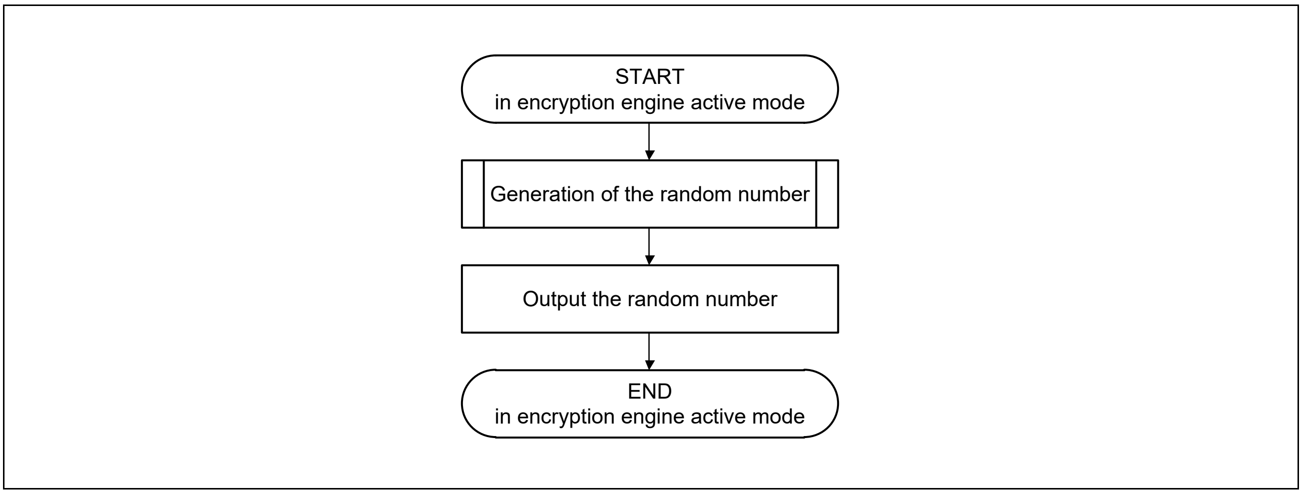

Figure 45.10 Random Number Generation Flow Chart

45.3 Interrupt

Table 45.2 lists the interrupt sources.

Trusted Secure IP driver uses interrupts caused by these interrupt sources. Do not change the setting of the interrupt controller corresponding to these interrupt sources.

Table 45.2 Trusted Secure IP Interrupt Sources

Name	Interrupt Source
PROC_BUSY	Procedure completion interrupt
ROMOK	Falsification detection interrupt
LONG_PLG	Calculation completion interrupt
WRRDY0	Write ready 0
WRRDY1	Write ready 1
WRRDY4	Write ready 4
RDRDY0	Read ready 0
RDRDY1	Read ready 1
IWRRDY	Integration write ready
IRDRDY	Integration read ready

45.4 Usage Notes

45.4.1 Trusted Secure IP Driver

Use of the Trusted Secure IP requires the Trusted Secure IP driver provided by Renesas Electronics. Please contact our sales office for information regarding the Trusted Secure IP driver.

48. Electrical Characteristics

48.1 Absolute Maximum Ratings

Table 48.1 Absolute Maximum Ratings

Item		Symbol	Value	Unit
Power supply voltage (3.3 V)		PV_{DD} USB_V_{DD33}	−0.5 to +3.8	V
Power supply voltage (1.8-V/3.3-V switchable)		SD0_PV_{DD} SD1_PV_{DD} SPI_PV_{DD}	−0.5 to +3.8	V
Power supply voltage (1.8-V/ 2.5-V/ 3.3-V switchable)		$PV_{DD182533\_0/1}$	−0.5 to +3.8	V
Power supply voltage (1.8 V)		V_{DD18} PLL1_AV_{DD18} PLL23_AV_{DD18} PLL4_AV_{DD18} PLL5_AV_{DD18} PLL6_AV_{DD18} CSI_V_{DD18} DSI_V_{DD18} USB_V_{DD18} ADC_AV_{DD18} OTP_V_{DD18}	−0.5 to +2.5	V
DDR power supply voltage (DDR4/ DDR3L switchable)		DDR_V_{DDQ}	−0.5 to +2.5	V
Power supply voltage (1.1-V)		V_{DD} PLL23_DV_{DD11} PLL5_DV_{DD11}	−0.5 to +1.5	V
Input voltage	3.3-V I/O input pins	—	−0.3 to 3.3-V power supply (PV_{DD}, USB_V_{DD33}) + 0.3	V
	1.8-V/3.3-V switchable I/O input pins	—	−0.3 to 1.8-V/3.3-V switchable power supply (SD0_PV_{DD}, SD1_PV_{DD}, SPI_PV_{DD}) + 0.3	V
	1.8-V/2.5-V/3.3-V switchable I/O input pins	—	−0.3 to 1.8-V/2.5-V/3.3-V switchable power supply ($PV_{DD182533\_0.1}$) + 0.3	V
	1.8-V I/O input pins	—	−0.3 to 1.8-V power supply (V_{DD18}, CSI_V_{DD18}, USB_V_{DD18}) + 0.3	V
Operating temperature	Ambient temperature	T_a	−40°C to +85°C*1	°C
	Junction temperature	T_j	−40°C to +125°C	°C
Storage temperature	Ambient temperature	T_{stg}	−40°C to +150°C	°C

Note 1. If wider temp is required than this range, use case has to be investigated.

48.2 Power Supply

Table 48.2 Power Supply

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
Power supply voltage (3.3 V)	PV_{DD}	2.97	3.30	3.63	V	—
Power supply voltage (1.8 V)	V_{DD18}, ADC_AV_{DD18}	1.62	1.80	1.98	V	—

48.3 Power-On/Power-Off Sequence

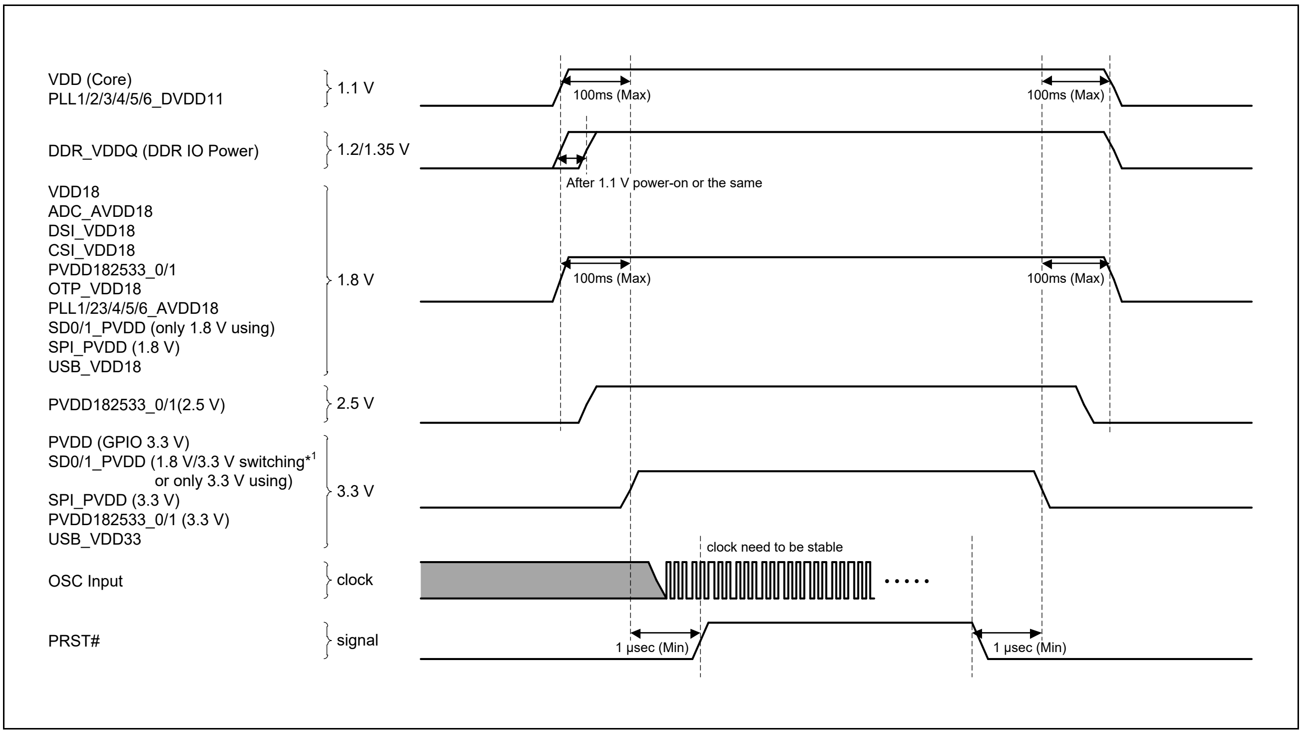

Figure 48.1 Power-On/Power-Off Sequence

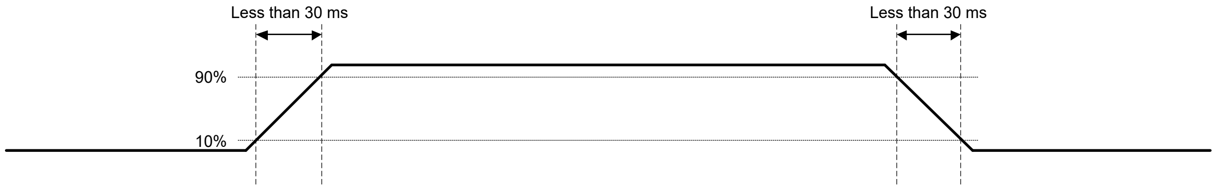
NOTES

1. Turn on 3.3 V after 1.1 V/1.8 V.

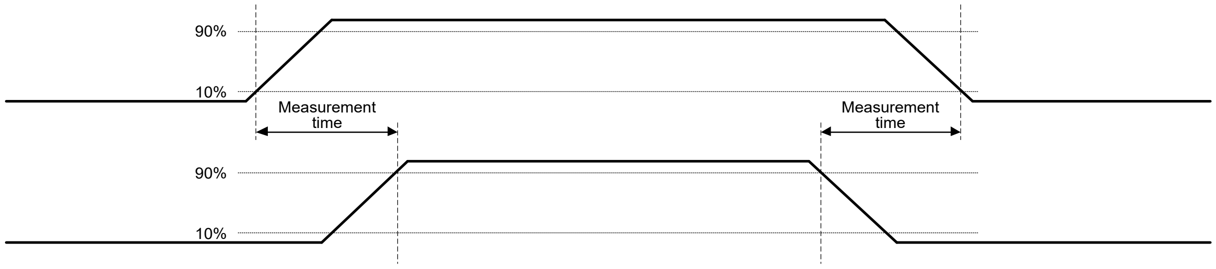
   Note 1. About SD0/1_PV$_{DD}$, especially in the case of switching between 1.8 V and 3.3 V at same power rail, 1.8-V power-on/off timing can also follow 3.3-V power rail sequence as shown in the **Figure 48.1**.

2. Turn on the DDR IO power supply at the same time as or after the 1.1-V power supply.
3. From first power rising start to last power rising end must be within 100 ms.
4. The power-off sequence is the reverse of the power-on sequence
   (PRST# → Low ⇨ 3.3 V = OFF ⇨ Other = OFF)
5. PRST# should be changed from Low to High after the 3.3-V power supply is turned on, after 1 µsec, and after the input clock from the oscillator stabilizes.
6. Refer to SD0/1_PV$_{DD}$ when connecting eMMC.



Note: The rise/fall time of each power supply should be within 30 msec.
Start point / end point of rising / falling time of each power supply should be 10% or 90% level of each power supply.

Figure 48.2 Power Up Time/Power Down Time (1)



Note: In case of there is restriction of sequence between different power supply, measurement time is starting point that is 10% of earlier rising power voltage level to end point that is 90% of later rising power voltage level, and starting point that is 90% of earlier falling power voltage level to end point that is 10% of later falling power voltage level.

Figure 48.3 Power Up Time/Power Down Time (2)

48.4 DC Characteristics

Table 48.3 DC Characteristics (1) [3.3-V I/O]

Item		Symbol	Min.	Typ.	Max.	Unit	Remarks
High-level input voltage		V_{IH}	2	—	PV_{DD} + 0.3	V	
Low-level input voltage		V_{IL}	−0.3	—	0.8	V	
Hysteresis threshold ↑		V_T+	0.9	—	2.1	V	
Hysteresis threshold ↓		V_T−	0.7	—	1.9	V	
Input hysteresis voltage		V_{HYS}	0.306	—	0.420	V	
Output logic high voltage	(I_{OH} = –2mA)	V_{OH}	PV_{DD} – 0.4	—	PV_{DD}	V	
	(I_{OH} = –4mA)						
	(I_{OH} = –8mA)						
	(I_{OH} = –12mA)						
Output logic low voltage	(I_{OL} = 2mA)	V_{OL}	0	—	0.4	V	
	(I_{OL} = 4mA)						
	(I_{OL} = 8mA)						
	(I_{OL} = 12mA)						
Weak pull-up resistor (input mode)		R_{UP}	7K	—	100K	Ω	
Weak pull-down resistor (input mode)		R_{DN}	7K	—	100K	Ω	

Note 1. Schmitt can be used at only RIIC mode.

Table 48.4 DC Characteristics (2) [1.8-V I/O]

Item		Symbol	Min.	Typ.	Max.	Unit	Remarks
High-level input voltage		V_{IH}	0.65 × V_{DD18}	—	V_{DD18} + 0.3	V	
Low-level input voltage		V_{IL}	−0.3	—	0.35 × V_{DD18}	V	
Output logic high voltage	(I_{OH} = –2mA)	V_{OH}	V_{DD18} – 0.4	—	V_{DD18}	V	
	(I_{OH}= –4mA)						
	(I_{OH} = –8mA)						
	(I_{OH} = –12mA)						
Output logic low voltage	(I_{OL} = 2mA)	V_{OL}	0	—	0.4	V	
	(I_{OL} = 4mA)						
	(I_{OL} = 8mA)						
	(I_{OL} = 12mA)						

Table 48.5 DC Characteristics (3) [3.3-V Input]

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
High-level input voltage	V_{IH}	2.3	—	PV_{DD} + 0.3	V	
Low-level input voltage	V_{IL}	−0.3	—	0.8	V	
Hysteresis threshold ↑	V_T+	0.9	—	2.1	V	
Hysteresis threshold ↓	V_T−	0.7	—	1.9	V	
Input hysteresis voltage	V_{HYS}	0.306	—	0.420	V	

Table 48.6 DC Characteristics (4) [1.8-V Input]

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
High-level input voltage	V_{IH}	0.65 × V_{DD18}	—	V_{DD18} + 0.3	V	
Low-level input voltage	V_{IL}	−0.3	—	0.35 × V_{DD18}	V	

Table 48.7 DC Characteristics (5) [RGMII/MII]

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
Power supply voltage	$PV_{DD182533\_n}$	2.97	3.3	3.63	V	3.3-V RGMII/MII
Input logic high	V_{IH}	2.6	—	—	V	
Input logic low	V_{IL}	—	—	0.7	V	
Output logic high voltage @ 7.7 mA	V_{OH}	2.1	—	3.6	V	
Output logic low voltage @ 9.3 mA	V_{OL}	0	—	0.5	V	
Power supply voltage	$PV_{DD182533\_n}$	2.25	2.5	2.75	V	2.5-V RGMII/MII
Input logic high	V_{IH}	1.9	—	—	V	
Input logic low	V_{IL}	—	—	0.7	V	
Output logic high voltage	V_{OH}	2.0	—	$PV_{DD182533\_n}$	V	
Output logic low voltage	V_{OL}	V_{SS}	—	0.4	V	
Power supply voltage	$PV_{DD182533\_n}$	1.62	1.8	1.98	V	1.8-V RGMII/MII
Input logic high	V_{IH}	0.7 × $PV_{DD182533\_n}$	—	$PV_{DD182533\_n}$ + 0.3	V	
Input logic low	V_{IL}	$PV_{DD182533\_n}$ − 0.3	—	0.3 × $PV_{DD182533\_n}$	V	
Output logic high @ I_{OH} = 100 µA	V_{OH}	0.85 × $PV_{DD182533\_n}$	—	$PV_{DD182533\_n}$	V	
Output logic low @ I_{OL} = 100 µA	V_{OL}	V_{SS}	—	0.15 × $PV_{DD182533\_n}$	V	

Note: n = 0, 1

Table 48.8 DC Characteristics (6) [3.3 V I/O (SD, QSPI)]

Item		Symbol	Min.	Typ.	Max.	Unit	Remarks
High-level input voltage		V_{IH}	0.625 × SDn_PV_{DD}	—	SDn_PV_{DD} + 0.3	V	
Low-level input voltage		V_{IL}	SDn_PV_{DD} − 0.3	—	0.25 × SDn_PV_{DD}	V	
Output logic high voltage	(× 0.5)	V_{OH}	0.75 × SDn_PV_{DD}	—	SDn_PV_{DD}	V	
	(× 0.75)						
	(× 1.0)						
	(× 1.5)						
Output logic low voltage	(× 0.5)	V_{OL}	0	—	0.125 × SDn_PV_{DD}	V	
	(× 0.75)						
	(× 1.0)						
	(× 1.5)						

Table 48.9 DC Characteristics (7) [1.8 V I/O (SD, QSPI)]

Item		Symbol	Min.	Typ.	Max.	Unit	Remarks
High-level input voltage		V_{IH}	1.27	—	2.00	V	
Low-level input voltage		V_{IL}	SDn_PV$_{DD}$ − 0.3	—	0.58	V	
Output logic high voltage	(× 0.5)	V_{OH}	0.7 × SDn_PV$_{DD}$	—	SDn_PV$_{DD}$	V	
	(× 0.75)						
	(× 1.0)						
	(× 1.5)						
Output logic low voltage	(× 0.5)	V_{OL}	0	—	0.3 × SDn_PV$_{DD}$	V	
	(× 0.75)						
	(× 1.0)						
	(× 1.5)						

Table 48.10 DC Characteristics(8) [I^{2}C Open Drain 3.3 V I/O]

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
External pull-up supply	V_{VDDP}	2.7	—	PV$_{DD}$	V	
Input high voltage	V_{IH}	0.7 × V_{VDDP}	—	V_{VDDP} + 0.5	V	
Input Low Voltage	V_{IL}	−0.5	—	0.3 × V_{VDDP}	V	
Low level output current	I_{OL}	20	—	—	mA	V_{OL} = 0.4 V
Low level output voltage	V_{OL}	—	—	0.4	V	V_{VDDP} > 2 V
Input hysteresis	V_{HYST}	0.1 × V_{VDDP}	—	—	mV	

Table 48.11 DC Characteristics (9) [1.2-V Input (DDR4)]

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
DC input high level	V_{IH}(DC)	V_{REF} + 0.068	—	—	V	
DC input low level	V_{IL}(DC)	—	—	V_{REF} − 0.068	V	
AC input high level	V_{IH}(AC)	V_{REF} + 0.093	—	—	V	
AC input Low level	V_{IL}(AC)	—	—	V_{REF} − 0.093	V	
DC differential input high	V_{IHdiff}	0.136	—	—	V	
DC differential input low	V_{ILdiff}	—	—	−0.136	V	
AC differential input high	V_{IHdiff}(AC)	2 × (V_{IH}(AC) − V_{REF})	—	—	V	
AC differential input low	V_{ILdiff}(AC)	—	—	2 × (V_{REF} − V_{IL}(AC))	V	
Differential input cross point voltage relative to 0.8 × V_{DDIO} for DQS	V_{IX}(DQS)	−0.15	—	0.06	V	

Table 48.12 DC Characteristics (10) [1.35-V Input (DDR3L)]

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
DC input high level	V_{IH}(DC)	V_{REF} + 0.09	—	—	V	
DC input low level	V_{IL}(DC)	—	—	V_{REF} − 0.09		V_{REF} =0.5 x DDR_V_{DDQ}
AC input high level	V_{IH}(AC)	V_{REF} + 0.135	—	—	V	
AC input low level	V_{IL}(AC)	—	—	V_{REF} − 0.135	V	V_{REF} =0.5 x DDR_V_{DDQ}
DC differential input high	V_{IHdiff}	0.18	—	—	V	
DC differential input low	V_{ILdiff}	—	—	−0.18	V	
AC differential input high	V_{IHdiff}(AC)	2 × (V_{IH}(AC) − V_{REF})	—	—	V	
AC differential input low	V_{ILdiff}(AC)	—	—	2 × (V_{REF} − V_{IL}(AC))	V	V_{REF} =0.5 x DDR_V_{DDQ}
Differential input cross point voltage relative to 0.5 × DDR_VDDQ for DQS	V_{IX}(DQS)	−0.075	—	0.075	V	

Table 48.13 DC Characteristics (11) [1.2-V Output (DDR4)]

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
DC output high measurement level (for IV curve linearity)	V_{OH}(DC)	—	1.1 × DDR_V_{DDQ}	—	V	The swing of ± 0.15 × DDR_V_{DDQ} is based on approximately 50% of the static single-ended output peak-to-peak swing with a driver impedance of 40Ω and an effective test load of 50Ω to V_{TT} = DDR_V_{DDQ}.
DC output mid measurement level (for IV curve linearity)	V_{OM}(DC)	—	0.8 × DDR_V_{DDQ}	—	V	
DC output low measurement level (for IV curve linearity)	V_{OL}(DC)	—	0.5 × DDR_V_{DDQ}	—	V	
AC output high measurement level (for output slew rate)	V_{OH}(AC)	—	0.85 × DDR_V_{DDQ}	—	V	
AC output low measurement level (for output slew rate)	V_{OL}(AC)	—	0.55 × DDR_V_{DDQ}	—	V	

Table 48.14 DC Characteristics (12) [1.35-V Output (DDR3L)]

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
DC output high measurement level (for IV curve linearity)	V_{OH}(DC)	—	0.8 × DDR_V_{DDQ}	—	V	The swing of ± 0.1 × DDR_V_{DDQ} is based on approximately 50% of the static single-ended output high or low swing with a driver impedance of 40Ω and an effective test load of 25Ω to V_{TT} = DDR_V_{DDQ}/2.
DC output mid measurement level (for IV curve linearity)	V_{OM}(DC)	—	0.5 × DDR_V_{DDQ}	—	V	
DC output low measurement level (for IV curve linearity)	V_{OL}(DC)	—	0.2 × DDR_V_{DDQ}	—	V	
AC output high measurement level (for output slew rate)	V_{OH}(AC)	—	VTT + 0.1 × DDR_V_{DDQ}	—	V	
AC output low measurement level (for output slew rate)	V_{OL}(AC)	—	VTT − 0.1 × DDR_V_{DDQ}	—	V	

Table 48.15 DC Characteristics (13) [DDR4 Cross Point Voltage for Differential Output Signals (CK/DQS)]

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
Differential output cross point voltage relative to 0.67 × DDR_VDDQ	V_{OX}(CK/DQS)	−0.06	—	0.06	V	

Table 48.16 DC Characteristics (14) [DDR3L Cross Point Voltage For Differential Output Signals (CK/DQS)]

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
Differential output cross point voltage relative to 0.5 × DDR_VDDQ	V_{OX}(CK/DQS)	−0.1	—	0.1	V	

Table 48.17 DC Characteristics (15) [USB 2.0]

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
Input levels for low/full speed						
High (driven)	V_{IH}	2.0	—	—	V	
Low	V_{IL}	—	—	0.8	V	
Differential input sensitivity	V_{DI}	0.2	—	—	V	
Differential common mode range	V_{CM}	0.8	—	2.5	V	
Input levels for high speed						
High-speed squelch detection threshold (differential signal amplitude)	V_{HSSQ}	100	—	150	mV	
High-speed data signaling common mode voltage range (guideline for receiver)	V_{HSCM}	−50	—	500	mV	
Output levels for low/full speed						
Low	V_{OL}	0.0	—	0.3	V	
High (driven)	V_{OH}	2.8	—	3.6	V	
Output signal crossover voltage	V_{CRS}	1.3	—	2.0	V	
Output levels for high-speed						
High-speed idle level	V_{HSOI}	−10.0	—	10.0	mV	
High-speed data signaling high	V_{HSOH}	360	—	440	mV	
High-speed data signaling low	V_{HSOL}	−10.0	—	10.0	mV	
Chirp J level (differential voltage)	V_{CHIRPJ}	700	—	1100	mV	
Chirp K level (differential voltage)	V_{CHIRPK}	−900	—	−500	mV	

Table 48.18 DC Characteristics (16) [ADC]

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
Resolution	—	—	12	—	Bit	
Analog input channel	—	—	—	8	Channel	
Analog input range	AIN	V_{SS}	—	ADC_AV_{DD18}	V	
Differential non-linearity	DNL	—	—	±3.0	LSB	
Integral non-linearity	INL	—	—	±6.0	LSB	

Table 48.19 DC Characteristics (17) [Current Consumption]

Item	Power rail symbol	Max Current	Unit	Remarks
Power Supply voltage(3.3V)	PV_{DD}	620	mA	PV_{DD}=3.6V
Power Supply voltage(1.8V)	V_{DD18}	30	mA	V_{DD18}=1.98V

	ETH_RXER setup time	t_{RERs}	10	—	ns	
	ETH_RXER hold time	t_{RERh}	10	—	ns	

Note: I/O driving ability: 8 mA
CL = 8 pF

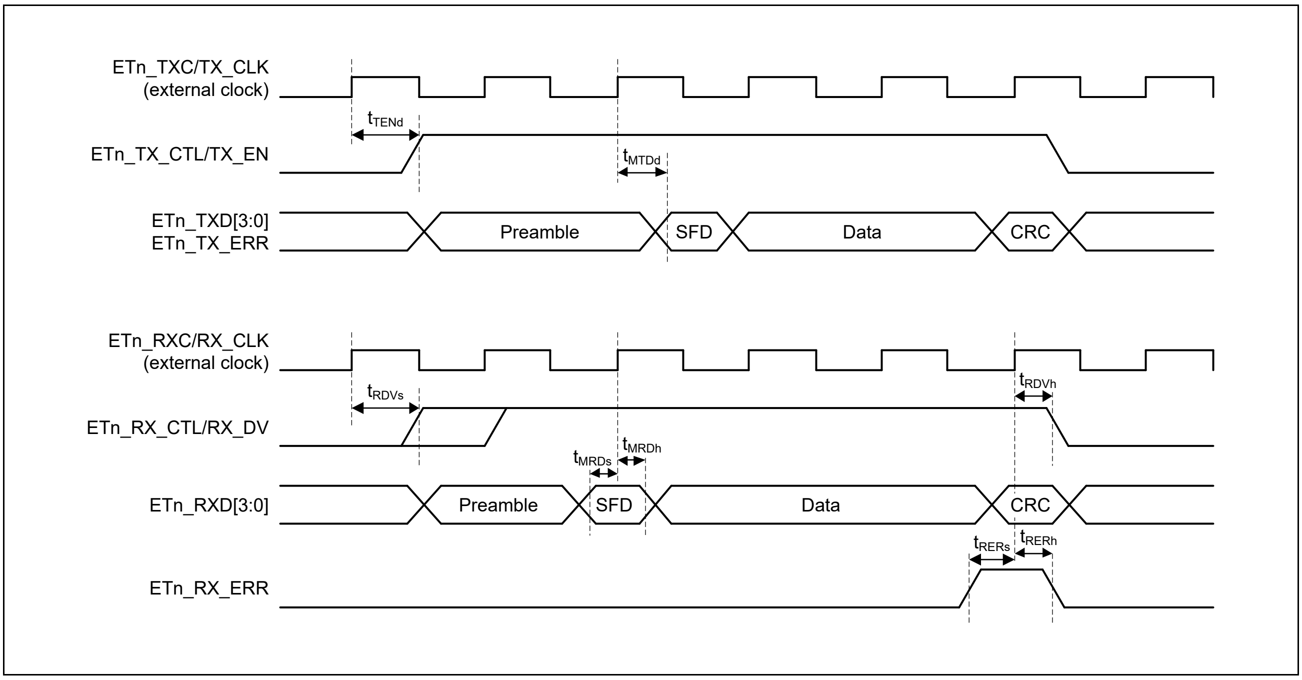

Figure 48.19 MII Transmission Timing

Validated with IEEE802.3 regulation.

The propagation delay for each twisted pair, measured from the MII connector to the PHY, shall not exceed 2.5 ns.

The variation in the propagation delay of the twisted pairs in a given cable bundle, measured from the MII connector to the PHY, shall not exceed 0.1 ns.

48.5.7.2 Ethernet-IF (Ether RGMII)

Table 48.32 Ethernet-IF Access Timing (Ether RGMII)

Item		Symbol	Min.	Typ.	Max.	Unit	capaci-tance	Remarks	Figures
Ether RGMII	Data to clock output skew @ transmitter	T_{skewT}	−500	0	500	ps	8 pF	Tx RGMII	**Figure 48.20**
	Data to clock input skew @ receiver	T_{skewR}	1	1.8	2.6	ns	8 pF		
	Data to clock output setup @ transmitter integrated delay	T_{setupT}	1.2	2.0	—	ns	8 pF	Rx RGMII-ID	**Figure 48.21**
	Clock to data output hold @ transmitter integrated delay	T_{holdT}	1.2	2.0	—	ns	8 pF		
	Data to clock input setup setup @ receiver integrated delay	T_{setupR}	1.0	2.0	—	ns	8 pF	Rx RGMII-ID	**Figure 48.21**
	Data to clock input setup hold @ receiver integrated delay	T_{holdR}	1.0	2.0	—	ns	8 pF		
	Clock cycle duration*2	T_{cyc}	7.2	8	8.8	ns	8 pF	—	—
	Duty cycle for gigabit	Duty_G	40*1	50	60*1	%	8 pF		
	Duty cycle for 10/100T	Duty_T	40*1	50	60*1	%	8 pF		
	Rise/fall time (20-80%)	T_r/T_f	—	—	0.75	ns	8 pF		

Note 1. Relaxed from regulation of RGMII.

Note 2. For 10Mbps and 100Mbps, T_{cyc} will scale to 400ns ±40ns and 40ns ±4ns respectively.

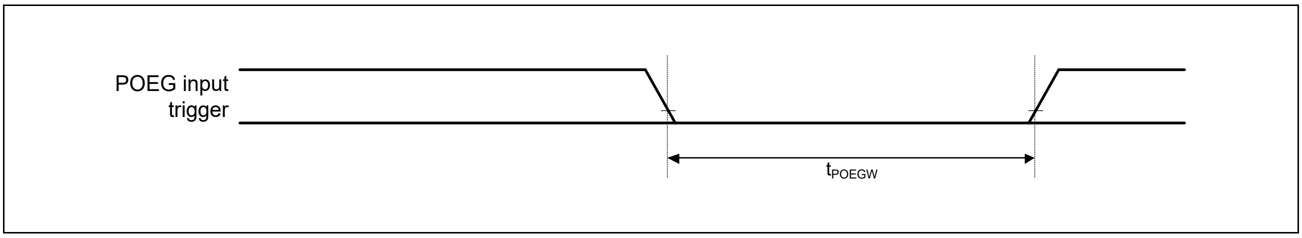

Figure 48.43 POEG Input Trigger Timing

48.5.17 I^{2}C Bus Interface Access Timing

Table 48.42 I^{2}C Bus Interface Timing

			Standard Mode (Sm)		Fast Mode (Fm)		Fast Mode Plus (Fm+)		
Item	Symbol	I/O	Min.	Max.	Min.	Max.	Min.	Max.	Unit
SCL clock frequency	f_{CLK}	I/O	0	100	0	400	0	1000	kHz
Bus free time (between stop and start condition)	t_{BUF}	I/O	4.7	—	1.3	—	0.5	—	μs
Hold time*1	$t_{HD:STA}$	I/O	4.0	—	0.6	—	0.26	—	μs
Low period of SCL clock	t_{LOW}	I/O	4.7	—	1.3	—	0.5	—	μs
High period of SCL clock	t_{HIGH}	I/O	4.0	—	0.6	—	0.26	—	μs
Setup time for start / restart condition	$t_{SU:STA}$	I/O	4.7	—	0.6	—	0.26	—	μs
Data hold time (I^{2}C bus device)	$t_{HD:DAT}$	I/O	0*2	—	0*2	—	0	—	μs
Data setup time	$t_{SU:DAT}$	I/O	250	—	100*3	—	50	—	ns
SDA and SCL signal rise time	t_R	Input	—	1000	20	300	—	120	ns
SDA and SCL signal fall time*3	t_F	Input	—	300	20 × (PV_{DD}/ 5.5 V)	300	20 × (PV_{DD}/ 5.5 V)	120	ns
		Output	—	300	20 × (PV_{DD}/ 5.5 V)*6	300*6	20 × (PV_{DD}/ 5.5 V)*7	120*7	ns
Setup time for STOP condition	$t_{SU:STO}$	I/O	4.0	—	0.6	—	0.26	—	μs
Capacitive load for each bus line	C_b	—	—	400*4	—	400*4	—	550*4	pF
Pulse width of spikes that must be suppressed by the input filter	t_{SP}	Input	—	—	0	50*5	0	50*5	ns

Note: In the above table and subsequently, SCL and SDA refer to the RIICnSCL and RIICnSDA signals, respectively.

Note: AC access timing condition: drive ability 4mA, output load 400pF, slew rate = slow

Note 1. The first clock pulse is generated on the SCL line after the start condition has been issued and the hold time has elapsed.

Note 2. This module requires a minimum of 300 ns hold time internally for the SDA signal to handle the period over which the falling edge of SCL has not reached a defined level (time until the CnSCL signal reaches V_{IL} (max.) from V_{IH} (min.)).

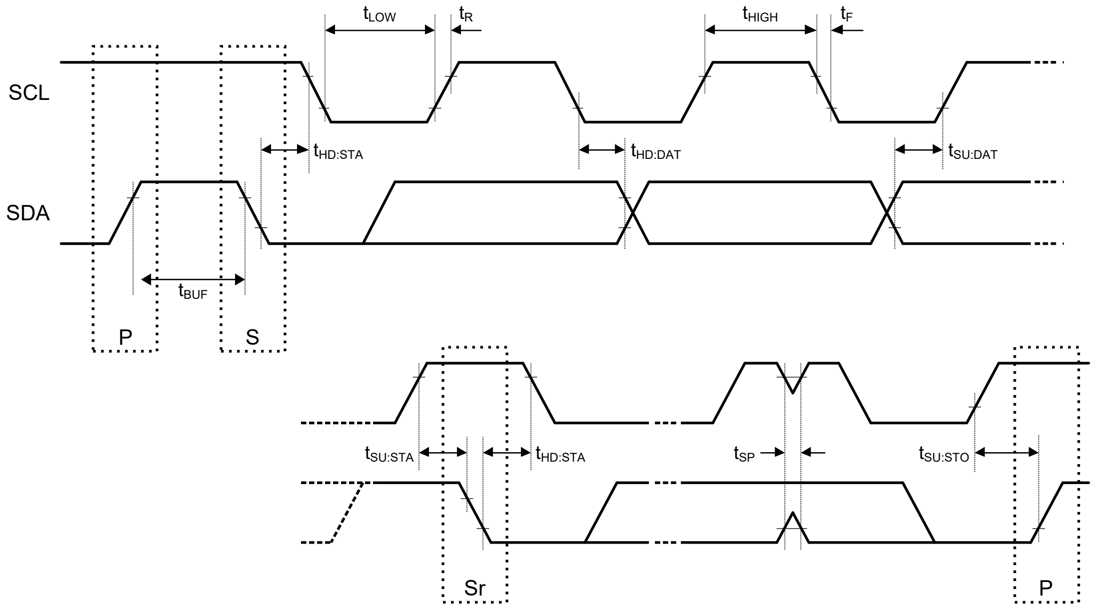
Note 3. The fast-mode I^{2}C bus device can be used in the standard mode I^{2}C bus system. In this case, the minimum value of the data setup time ($t_{SU:DAT}$ (min.) 250 [ns]) must be satisfied.
If the system does not extend the low period of SCL clock (t_{LOW}), this condition is automatically satisfied. If the system extends the low period of SCL clock (t_{LOW}), transmit the subsequent data bit to the SDA line before the SCL line is released (t_R (max.) + $t_{SU:DAT}$ (min.) = 1000 + 250 = 1250 [ns]: (standard mode I^{2}C bus specification)).

Note 4. Total capacitance of one bus line. The allowable maximum bus capacitance may differ from this specification, depending on the actual operating voltage and frequency of an application. For techniques to cope with a large bus capacitance, see the I^{2}C bus specification provided by NXP Semiconductors.

Note 5. Noise is removed by the analog and digital input filters. The level of noise reduction of the digital input filter is determined by the period of internal reference clock (IICϕ) and the NF[1:0] bits in RIICnMR3. For details, refer to **Section 26, I^{2}C Bus Interface**.

Note 6. External pull-up resistor is required 1077Ω to 1770Ω when using RIIC ch2 or RIIC ch3.

Note 7. External pull-up resistor is required 240Ω to 257Ω when using RIIC ch2 or RIIC ch3.



Note: P: Stop condition
S: Start condition
Sr: Start condition for retransmission

Figure 48.44 Input/Output Timing

48.5.18 Serial Communications Interface with FIFO (SCIFA) Access Timing

Table 48.43 SCIFA Timing

Item			Symbol	Min.	Max.	Unit	Figures
SCIFA	Input clock cycle	Asynchronous	t_{Scyc}	4	—	t_{p1cyc}*1	**Figure 48.45**
		Clocked synchronous		12	—		
	Input clock pulse width		t_{SCKW}	0.4	0.6	t_{p1cyc}*1	
	Input clock rise time		t_{SCKr}	—	5	ns	
	Input clock fall time		t_{SCKf}	—	5	ns	
	Output clock cycle	Asynchronous*2	t_{Scyc}	8	—	t_{p1cyc}*1	
		Clocked synchronous		4	—		
	Output clock pulse width		t_{SCKW}	0.4	0.6	t_{p1cyc}*1	
	Output clock rise time		t_{SCKr}	—	9	ns	
	Output clock fall time		t_{SCKf}	—	9	ns	
	Transmit data delay time	Internal clock	t_{TXD}	−10	10	ns	**Figure 48.46**
		External clock		3 × t_{p1cyc}*1	4 × t_{p1cyc}*1 + 20		
	Receive data setup time	Internal clock	t_{RXS}	3 × t_{p1cyc}*1 + 20	—	ns	
		External clock		t_{p1cyc}*1 + 10	—		
	Receive data hold time	Internal clock	t_{RXH}	−3 × t_{p1cyc}*1	—	ns	
		External clock		2 × t_{p1cyc}*1 + 10	—		

Note: AC access timing condition: drive ability 12mA, output load 30pF, slew rate = fast

Note 1. t_{p1cyc} indicates peripheral clock means SCIFn_CLK_PCK (P0ϕ) (n = 0 to 4).

Note 2. When the SEMR.ABCS0 and SEMR.BGDM bits are set to 1.

REVISION HISTORY	RZ/G2L Group, RZ/G2LC Group User’s Manual: Hardware

		Description	
Rev.	Date	Page	Summary
1.00	Sep 7, 2021	—	First edition issued
1.10	Apr 26, 2022	All	Binary notation, unified to ****b; Hexadecimal notation, unified to H’****
		3	Arm® Cortex®-A53 → Arm® Cortex®-M33
		1. Overview	
		71	1.2.2 CPU Peripheral Description of Clock Pulse Generator (CPG), modified (EXTAL → EXCLK)
		75	1.2.9 Sound Interface Serial Sound Interface (SSI), modified under [RZ/G2LC] (2 channels bidirectional serial transfer → 3 channels bidirectional serial transfer)
		77	1.2.11 Timer Description of Multi-function Timer Pulse Unit 3 (MTU3a), modified (P1ϕ → P0ϕ)
		7	1.2.12 Peripheral Module Serial Communication Interface with FIFO (SCIFA), modified under [RZ/G2LC] (3 channels → 4 channels)
		79	1.2.13 Security Trusted Secure IP (TSIP) [option]: ECC is added to Security algorism
		2. System CPU Cortex-A55	
		92	2.3.1 Cortex-A55 Sleep Mode The description of (3), modified (Cotex-A55 → Cortex-A55)
		3. System CPU Cortex-M33	
		100	3.4.4 Cortex-M33 Sleep Mode Note 3, added
		5. LSI Internal Bus	
		142 to 144	Table 5.1 Detailed Address Space The Space column of the following start addresses, modified (Start Address: H’0_4000_0000, H’0_2000_0000, H’0_1183_0000, H’0_1182_0000, H’0_1181_0000, H’0_1180_0000, H’0_1141_0000, H’0_1140_0000, H’0_1086_0000, H’0_1085_0000, H’0_1004_7000, H’0_1004_0000, H’0_0002_0000, H’0_0001_0000)
		139	5.1.2 Block Diagram of LSI Internal Bus The description of ACPU bus, modified
		140	Figure 5.1 Configuration of LSI Internal Bus: The blocks of MPU, Internal Memory, and Debug, modified
		146 to 151	Table 5.2 Detailed Address Space of Cortex-M33 The Space column of the following start addresses, modified (Start Address: H’9000_0000, H’8000_0000, H’7000_0000, H’6000_0000, H’5183_0000, H’5182_0000, H’5181_0000, H’5180_0000, H’5141_0000, H’5140_0000, H’5086_0000, H’5085_0000, H’5004_7000, H’5004_0000, H’4183_0000, H’4182_0000, H’4181_0000, H’4180_0000, H’4141_0000, H’4140_0000, H’4086_0000, H’4085_0000, H’4004_7000, H’4004_0000, H’3002_0000, H’3001_0000, H’2002_0000, H’2001_0000, H’1002_0000, H’1001_0000, H’0002_0000, H’0001_0000)
		152	5.3 Accessible Areas: The description, modified
		152, 153	Table 5.3 Accessible Areas The unit names in the Slave Unit and Master Unit columns, modified
		152	Table 5.3 Accessible Areas (1/2): Master Unit, modified (CRU [Video, Statistics] → CRU [Video])
		155	Table 5.4 List of Register Bits for Use in Re-setting of Security Attributes Read Access Control Bits of SYS_MSTACCCTL4, modified

Rev.	Date	Description Page	 Summary
1.10	Apr 26, 2022	6. System Controller (SYSC)	
		202	6.3.42 LSI Device ID Register (SYS_DEVID) The table of bits: Note, added to Description of the bit position 27 to 0
		7. Clock Pulse Generator (CPG)	
		230	Table 7.1 List of functions Specification of PLL control, modified
		236	7.2.2 Register classification: The description, modified
		280	7.2.4.27 Division Ratio Setting (PLL5) Register (CPG_PL5_SDIV) The Mode column in the table listed in Note, modified; Note 1, added
		479, 480	7.2.4.202 MSTOP Register REG0 (CPG_BUS_REG0_MSTOP) The bit chart: The bit names and R/W of the bits 16 and 0, modified; The table of bits: Bit Name, R/W, and Description of the bits 16 and 0, modified
		492	Table 7.12 Range of Reset Application (2/2) JTAG Interface of No.16, modified (Reset → Released)
		8. Interrupt Controller	
		540	8.6.4 IRQ Interrupt Type Selection Register (IITSR) The table of bits: Description of the bits 2n+1 to 2n, modified
		552	8.6.17 Bus Error Interrupt Status Control Register1 (BEISR1): The table of bits: The bit of BESTATn, modified (n → n-32)
		564	8.8.1 Precaution when use the peripheral modules which can initiate DMA Controller.: The description, modified (the referred section numbers, modified)
		9. DDR3L/DDR4 SDRAM Memory Controller (MEMC)	
		565	Table 9.1 DDR3L/DDR4 SDRAM Memory Controller (MEMC) features: Low power, deleted
		566	Figure 9.1 Block Diagram, modified (MC (cadence_mc_controller) → MC)
		10. On-chip RAM	
		569	The description, modified
		14. Direct Memory Access Controller	
		649	The section title, modified (14.4.16 MA Status EN Register → 14.4.16 DMA Status EN Register)
		652	The section title, modified (14.4.19 MA Status END Register → 14.4.19 DMA Status END Register)
		16. Multi-Function Timer Pulse Unit 3 (MTU3a)	
		932	Figure 16.121 Buffer Operation Timing (Compare Match) The waveform of TGRA, TGRB, modified
		933	Figure 16.123 Buffer Operation Timing (When TCNT Cleared) The waveforms of Buffer transfer signal and TGRA, TGRB, TGRE, modified
		21. Watchdog Timer (WDT)	
		1252	Table 21.6 WDT Reset Target by CPG_WDTRST_SEL Register CPG_WDTRST_SEL[3] and CPG_WDTRST_SEL[7], modified to Reserved
		22. Serial Communications Interface with FIFO (SCIFA)	
		1255	Table 22.1 Specifications of SCIFA Description of Channel, modified
		1292	Figure 22.4 Sample Flowchart for Transmitting Serial Data in Asynchronous Mode Note 1, modified
		25. SPI Multi I/O Bus Controller	
		1460	Table 25.1 Pin Configuration Note 3, added

Rev.	Date	Description	
		Page	Summary
1.10	Apr 26, 2022	27. Serial Sound Interface (SSIF-2)	
		1628	Table 27.1 Features of SSIF-2 Description of Number of interfaces, modified
		1630	Figure 27.2 SSIF-2 Block Diagram AUDIO_CLK → AUDIO_CLK1; AUDIO_X1 → AUDIO_CLK2
		1672	Figure 27.27 Set timing and clear timing of TDE The waveform of TDE, modified
		1673	Figure 27.28 Set timing and clear timing of RDF The waveforms of Write point of receive FIFO, Read point of receive FIFO, Receive FIFO data full number, and RDF, modified
		1695	Figure 27.46 Continuation of the Data Communication State The waveform of Communication state, modified
		30. Gigabit Ethernet Interface	
		2077	Table 30.3 Register Base Address, modified
		2077	Table 30.4 Configuration of DMAC-related Registers (From H'000 to H'4FF) (1/2) Product Specific Register (PSR), deleted
		2082	30.4.1.1 DMAC Mode Register (CCC) The bit chart: R/W of the bit 20 (BOC), modified (R → R/W)
		2082	30.4.1.1 DMAC Mode Register (CCC) The table of bits: R/W of the bits 24 to 21, modified (R/W → R); Description of the bits 31 to 26, modified
		2085	30.4.1.3 Descriptor Base Address Load Request Register (DLR) The bit chart: Initial Value of the bit 4 (LBA4) and the bit 0 (LBA0), modified (0 → 1)
		2086 to 2087	30.4.1.4 DMAC Status Register (CSR) The table of bits: R/W of the bit 21 (TDUO) and the bit 16 (TPO), modified (R/W → R); R/W of the bit 10 (RCSI), the bit 9 (RDFDM), and the bit 8 (DTS), modified (— → R); R/W of the bits 3 to 0 (OPS), modified (R/W → R)
		—	30.4.1.7 Reserved, deleted
		2093	30.4.1.8 Reception Truncation Configuration Register I (RTC) The bit chart: Initial Value of the bit 14, modified (0 → 1); The table of bits: Initial Value of the bits 14 to 0 (MFL), modified (B'000 → H'7FFC)
		2097	30.4.1.11 Transmit Status Register (TSR) The bit chart: R/W of the bits 31 to 29, modified (R/W → R); The table of bits: Description of the bits 31 to 29, modified
		2098	30.4.1.12 MAC status FIFO Access Register (MFA) The bit chart: R/W of the bits 25 to 16 (MST) and the bits 9 to 0 (MSV), modified (R/W → R)
		2112	30.4.1.24 Receive Interrupt Enable Register 0 (RIE0) The table of bits: Initial Value of the bit 0 (FRS), modified (B'000 → 0b)
		2121	30.4.1.35 Receive Interrupt Control Register 3 (RIC3) The table of bits: Initial Value of the bit 0 (RDPE), modified (B'000 → 0b)
		2133	30.4.1.43 Interrupt Summary Status Register (ISS) The bit chart: R/W of the bits 31 to 14, the bits 12 to 10, and the bits 7, 6, 2, and 0, modified (R/W → R)
		2144	30.4.2.8 In-Band Status set register (CXR31) The bit chart: R/W of the bits 31 to 16, modified (R/W → R); The table of bits: Description of the bits 31 to 4, modified
		2150	30.4.2.12 PHY interface indicate register (CXR36) The table of bits: R/W of the bits 1 to 0 (STS_XMII), modified (R/W → R)
		2156	30.4.2.19 E-MAC operating mode register 2 (CXR2D) The table of bits: R/W of the bits 3 to 0, modified (R/W → R); The table of bits: Description of the bits 31 to 6 and 3 to 0, modified

Rev.	Date	Description

		2950, 2951	Table 35.4 Register Configuration of MIPI CSI-2 LINK The Address column, modified
		2952	35.1.6.1 Module Configuration Register (CSI2nMCG) The bit chart: Initial Value of the bit 10, modified (0 → 1); The table of bits: Initial Value of the bits 11 to 8 (SDLN), modified (H'0 → H'4)
		2969	35.1.6.17 Virtual Channel (M) Status Register (CSI2nVCST(M)) The bit chart: R/W of the bits 31 to 16, modified (R/W → R)
		2985	35.1.6.30 D-PHY Timing Register 0 (CSIDPHYTIM0) The bit chart: Initial Value of the bit 16 (T_INIT), modified (1 → 0); Initial Value of the bits 13, 10 to 8, and 4 (T_INIT), modified (0 → 1); The table of bits: Initial Value of the bits 18 to 0 (T_INIT), modified (H'10000 → H'0_2710)
		2990	(2) Generic Short Packet Data Type Code: The description, modified
		2991	Figure 35.5 Generic Short Packet Receive Processing, modified
		2997	35.2.1.1 Features Image format conversion (YCbCr422 → YCbCr420): The description, added
		3007	35.2.3.3 CRU Interrupt Status Register (CRUnINTS) The table of bits: Description of the bits 20 (CES), 19 (WIS), 18 (SIS), 17 (EFS), 16 (SFS), 3 (FEOVWS), 2 (DECES), 1 (SLVES), and 0 (FOS), modified
		3027	35.2.3.34 CRU Image Processing Main Control Register (ICnMC) The bit chart: Initial Value of the bit 13 (CLP), modified (0 → 1); The table of bits: Initial Value of the bits 13 to 12 (CLP), modified (B'01 → B'11)
		3041	35.2.3.47 CRU Output Image Format Register (ICnDMR) The table of bits: Description of the bits 6 to 4 (YCMODE), modified
		3059, 3060	Table 35.12 Input Format and Image Processing The columns with "—" in the column heading, deleted
		3081	Figure 35.33 Reception Start Flow for the MIPI CSI-2 Input Note 1 and Note 2, added
		3082	Figure 35.34 Initializing the D-PHY (MIPI CSI-2 Input) DPHYTIM0 → CSIDPHYTIM0; DPHYTIM1 → CSIDPHYTIM1; DPHYCTRL0 → CSIDPHYCTRL0; The description in the third box from the top, modified (DPHYTIM0 and DPHYTIM1 → CSIDPHYTIM0; CSIDPHYTIM1 and CSIDPHYSKW0)
		3084	Figure 35.36 Initializing Image Processing (MIPI CSI-2 Input) The description in the tenth box from the top, modified ([YUV? RGB conversion to be performed?] → [YUV → RGB conversion to be performed?]); The description at the right side of the tenth box from the top, modified ([N (RGB? YUV conversion)] → [N (RGB → YUV conversion)]); Note, modified
		3086	Figure 35.38 Initializing the LINK (MIPI CSI-2 Input) The descriptions in the second box and the last box from the bottom, modified
		3089	Figure 35.41 Stopping the D-PHY (MIPI CSI-2 Input) DPHYCTRL0 → CSIDPHYCTRL0
		3090	Figure 35.42 Stopping Image Processing Reception (MIPI CSI-2 Input) AMnAXISTPL → AMnAXISTP; FIFOPOINTER_Y → FIFORPNTR_Y; FIFOPNTR → FIFOWPNTR; FIFOPOINTER_UV → FIFORPNTR_UV; FIFWPNTR[7:1] → FIFOWPNTR[7:1]
		3093	Figure 35.44 Flow for Changing the Frame Synchronization Settings (by Using the DMAC) The description in the third box from the top, modified

Rev.	Date	Description Page	 Summary
1.10	Apr 26, 2022	3096	Figure 35.47 Initializing Image Processing (Parallel Input) The description in the ninth box from the top, modified ([YUV? RGB conversion to be performed?] → [YUV → RGB conversion to be performed?]); The description at the right side of the ninth box from the top, modified ([N (RGB? YUV conversion)] → [N (RGB → YUV conversion)])
		3099	Figure 35.50 Stopping Image Processing Reception (Parallel Input) AMnAXISTPL → AMnAXISTP; FIFOPOINTER_Y → FIFORPNTR_Y; FIFOPNTR → FIFOWPNTR; FIFOPOINTER_UV → FIFORPNTR_UV; FIPOPNTR → FIPOWPNTR; FIFWPNTR[7:1] → FIFOWPNTR[7:1]
		3100	Figure 35.51 Flow for Stopping the Pattern Generator AMnAXISTPL → AMnAXISTP
		36. Image Scaling Unit (ISU)	
		3133	Figure 36.39 Normalization for YCbCr/YUV420 Format, modified
		3137	36.2 Register Configuration: The description, modified
		3137	36.2.1 System Management Register The Address column in the table, modified
		3141	36.3.3 FM Frame Control Registers (ISU_FM_FRCON) The table of bits: Description of the bit 0 (START), modified
		3142	36.3.4 FM Module Stop Registers (ISU_FM_STOP) The table of bits: Description of the bit 0 (STOP), modified
		3156	36.3.19 RPF Source TEST Data Registers 1 (ISU_RPF_SRC_TD1) The bit chart: Bit Name of the bit 18, modified (GRADA_B → GRADA_R); Bit Name of the bit 16, modified (GRADA_R → GRADA_B)
		3157	36.3.20 RPF Source TEST Data Registers 2 (ISU_RPF_SRC_TD2) The bit chart: Bit Name of the bits 23 to 16, modified (INIT_B[7:0] → INIT_R[7:0]); Bit Name of the bits 7 to 0, modified (INIT_R[7:0] → INIT_B [7:0])
		3170	36.3.36 WPF Color Collection MUL Coefficient Registers2 (ISU_WPF_MUL2) The bit chart: Bit Name of the bits 29 to 16, modified (K13 → K12); Bit Name of the bits 13 to 0, modified (K12 → K13) The table of bits: Bit Name of the bits 29 to 16, modified (K13 → K12); Bit Name of the bits 13 to 0, modified (K12 → K13) The table of bits: Description of the bits 29 to 16, modified (K13 → K12); Description of the bits 13 to 0, modified (K12 → K13)
		3171	36.3.38 WPF Color Collection MUL Coefficient Registers4 (ISU_WPF_MUL4) The bit chart: Bit Name of the bits 29 to 16, modified (K23 → K22); Bit Name of the bits 13 to 0, modified (K22 → K23) The table of bits: Bit Name of the bits 29 to 16, modified (K23 → K22); Bit Name of the bits 13 to 0, modified (K22 → K23) The table of bits: Description of the bits 29 to 16, modified (K23 → K22); Description of the bits 13 to 0, modified (K22 → K23)
		3172	36.3.40 WPF Color Collection MUL Coefficient Registers6 (ISU_WPF_MUL6) The bit chart: Bit Name of the bits 29 to 16, modified (K33 → K32); Bit Name of the bits 13 to 0, modified (K32 → K33) The table of bits: Bit Name of the bits 29 to 16, modified (K33 → K32); Bit Name of the bits 13 to 0, modified (K32 → K33) The table of bits: Description of the bits 29 to 16, modified (K33 → K32); Description of the bits 13 to 0, modified (K32 → K33)
		3183, 3184	36.4.3 Setting the vertical size, start position and reduction factor, added
		xxxx	Figure 36.45 Schematic Diagram of IP Conversion, modified
		3184	Table 36.12 Image Size Conversion Example 1 Description of Processing method, modified
		3196	Figure 36.52 Image Size Conversion Example 4 0x5020_0000 → H’5000_0000

Rev.	Date	Description	
		Page	Summary
1.10	Apr 26, 2022	40. SD/MMC Host Interface	
		3213	40.1.1 Features DDR50, deleted from the supported transfer modes; SD clock (SD_CLK) frequency, modified
		3234	40.2.10 SD Clock Control Register (SD_CLK_CTRL) The table of bits: Description of the bits 7 to 0, modified (P1ϕ → (SDxϕ /4)); (x = 0,1), added
		3297	40.6.3 SCC Register Configuration: The description, modified
		41. General Purpose Input Output Port (GPIO)	
		3309	41.1.3 Special Purpose Port Function Control Target Signals, modified (TDO/SWO, WDTOVF_PERROUT → TDO, WDTOVF_PERROUT#)
		3310	Figure 41.1 P0_0 to P19_1, P38_0 to P48_4 (Multiplexed peripheral functions), modified
		3315	41.1.5 Special purpose port Configuration Target Signals, modified (TDO/SWO, WDTOVF_PERROUT → TDO, WDTOVF_PERROUT#)
		3320	The title of the figure, modified (41.12 (12) TDO/SWO, WDTOVF_PERROUT → 41.12 (12) TDO, WDTOVF_PERROUT#)
		3352	41.3.7 Driving Ability Control Register (IOLH) The table of bits: Description of the bits 25, 24, 17, 16, 9, 8, 1, and 0, modified ((IOLH7 to IOHL0) → (IOLH4 to IOLH0))
		3367	41.3.14 Ether ch0 Voltage Mode Control Register (ETH_ch0) The description, modified ((ETHER0_P VDD) → (PVDD182533_0))
		3368	41.3.15 Ether ch1 Voltage Mode Control Register (ETH_ch1) The description, modified ((ETHER1_P VDD) → (PVDD182533_1))
		3369	41.3.16 Ether MII/RGMII Mode Control Register (ETH MII/RGMII) The bit chart: Bit Name of the bit 1, modified (P29_0 → ETH1_mode); Bit Name of the bit 0, modified (P20_0 → ETH0_mode) The table of bits: Bit Name of the bit 1, modified (P29_0 → ETH1_mode); Bit Name of the bit 0, modified (P20_0 → ETH0_mode)
		42. Low Power Mode	
		3380	Table 42.3 Registers for Module Standby Mode (2/2) Target module for Module Standby Mode: USB2.0 ch0/ch1, deleted; USB2.0 PHY, added; Note 2, added
		43. Debug Interface	
		3395	Table 43.6 Handling of Unused Pins: Note 2, added
		44. Thermal Sensor Unit (TSU)	
		3406	Figure 44.1 Block Diagram of the TSU, modified
		3409	44.2 Register Configuration The description, modified (Cortex-A33 → Cortex-M33)
		3414	44.3.5 TSU OTP Calibration Register 0 (OTPTSUTRIM0_REG) The bit chart: Bit Name of the bit 31, modified (OTPTSUTRIM0 → OTPTSUTRIM0_EN); Bit Name of the bits 30 to 12, modified (OTPTSUTRIM0 → —) The table of bits: Bit Name of the bit 31, modified (OTPTSUTRIM0 → OTPTSUTRIM0_EN); Bit Name of the bits 30 to 12, modified (OTPTSUTRIM0 → —) The table of bits: Description of the bits 31 to 12, modified
		3415	44.3.6 TSU OTP Calibration Register 1 (OTPTSUTRIM1_REG) The bit chart: Bit Name of the bit 31, modified (OTPTSUTRIM1 → OTPTSUTRIM1_EN); Bit Name of the bits 30 to 12, modified (OTPTSUTRIM1 → —) The table of bits: Bit Name of the bit 31, modified (OTPTSUTRIM1 → OTPTSUTRIM1_EN); Bit Name of the bits 30 to 12, modified (OTPTSUTRIM1 → —) The table of bits: Description of the bits 31 to 12, modified

Rev.	Date	Description	
		Page	Summary
1.10	Apr 26, 2022	45. Trusted Secure IP	
		3419	Table 45.1 Specifications of Trusted Secure IP (1/2) Description of Encryption engine, modified (ECC, added)
		3421	Figure 45.1 Trusted Secure IP Block Diagram: ECC, added
		48. Electrical Characteristics	
		3436	Table 48.3 DC Characteristics (1) [3.3-V I/O] Weak pull-up resistor (input mode) and Weak pull-down resistor (input mode), added
		3436	Table 48.4 DC Characteristics (2) [1.8-V I/O] PV_{DD18} → V_{DD18}
		3436	Table 48.6 DC Characteristics (5) [1.8-V Input] PV_{DD18} → V_{DD18}
		3437	The title of the table, modified (48.7 DC Characteristics (6) [RGMII] → 48.7 DC Characteristics (6) [RGMII/MII]); VDV_{DD} → $PV_{DD182533\_n}$; VDV_{SS} → V_{SS}; RGMII → RGMII/MII
		3442	48.5 AC Characteristics: Conditions, modified
		3442	Table 48.20 Clock Timing Table EXTAL → EXCLK
		3442	The title of the figure, modified (48.4 EXTAL, AUDIO_CLK1 and AUDIO_CLK2 Clock Input Timing → 48.4 EXCLK, AUDIO_CLK1 and AUDIO_CLK2 Clock Input Timing); EXTAL → EXCLK
		3443	Figure 48.5 Power-On Oscillation Settling Time TRST#, deleted
		3453	Table 48.30 Ethernet-IF Access Timing (Ether MII) Note, modified
		3454	Table 48.31 Ethernet-IF Access Timing (Ether RGMII) Rise/fall time → Rise/fall time (20-80%); The units of Duty_G and Duty_T, modified (ns → %); Note 2, added
		3461	The order to list the figures, modified (Figure 48.33 Reset Input Timing 2 → Figure 48.32 Reset Input Timing 2; Figure 48.32 Interrupt Signal Input Timing → Figure 48.33 Interrupt Signal Input Timing)
		3463	Table 48.35 SSIF-2 Timing Note, added
		3465	Table 48.36 CAN-FD Interface Timing Note → Note 1; Note, added
		3466	Table 48.37 MTU3a Timing Note → Note 1; Note, added
		3467	Table 48.39 GPT Timing Note, added
		3469	Table 48.41 I2C Bus Interface Timing Note, added; Note 5, modified
		3471	Table 48.42 SCIFA Timing Note, added; Unit, modified (t_{SEcyc} → t_{p1cyc})
		3473	Table 48.43 SCI Timing Note, added; Unit, modified (t_{SEcyc} → t_{p1cyc})
		3475	Table 48.44 Renesas Serial Peripheral Interface Timing Note, added
1.20	Sep 26, 2022	4. Boot Mode	
		105	4.1 Overview: Note added for starting the user program

Rev.	Date	Description	
		Page	Summary
1.20	Sep 26, 2022	7. Clock Pulse Generator (CPG)	
		515	7.4.6 Procedure for Switching the Division Ratio of the Dynamic Switching Frequency Dividers: The description “Division ratio setting (PLL1) register (CPG_PL1_DDIV)”, added
		34. MIPI DSI	
		2919	34.3.2.2 DSI D-PHY Timing Register 0 (DSIDPHYTIM0): The description on bits 18 to 0 (T_INIT), modified. Note 1, added.
		2919	Table 34.6 Recommended Setting Values of the DSI D-PHY Timing Register, added
		2920	34.3.2.3 DSI D-PHY Timing Register 1 (DSIDPHYTIM1): The description on bits 31 to 24 (THS_PREPARE) and bits 23 to 16 (TCLK_PREPARE), modified. Note 1, added.
		2921	34.3.2.4 DSI D-PHY Timing Register 2 (DSIDPHYTIM2): The description on bits 31 to 24 (TCLK_TRAIL), bits 23 to 16 (TCLK_POST), bits 15 to 8 (TCLK_PRE), and bits 7 to 0 (TCLK_ZERO), modified. Note 1, added.
		2922	34.3.2.5 DSI D-PHY Timing Register 3 (DSIDPHYTIM3): The description on bits 31 to 24 (TLPX), bits 23 to 16 (THS_EXIT), bits 15 to 8 (THS_TRAIL), and bits 7 to 0 (THS_ZERO), modified. Note 1, added.
		35. Camera Data Receiving Unit (CRU)	
		2962	Table 35.2 Supported Image Format and Maximum Transfer Rate: No.12, ICnMC.ICTHR (the column), deleted
		2967	35.1.6.2 Module Control Register 0 (CSI2nMCT0): The R/W attribute and description on bit 20, modified
		2976	35.1.6.12 Receive Status Clear Register (CSI2nRXSC): The R/W attribute on bit 24, modified
		2977	35.1.6.13 Receive Interrupt Enable Register (CSI2nRXIE): The R/W attribute on bit 24, modified
		2980	35.1.6.15 Data Lane (N) Status Clear Register (CSI2nDLSC(N)): The R/W attribute on bits 19, 18, 11, 10, 9, and 8, modified
		2981	35.1.6.16 Data Lane (N) Interrupt Enable Register (CSI2nDLIE(N)): The R/W attribute and description on bits 19, 18, 11, 10, 9, and 8, modified
		2993	35.1.6.23 Generic Short Packet Control Register (CSI2nGSCT): The R/W attribute and description on bit 17, modified
		2998	35.1.6.29 D-PHY Control Register 0 (CSIDPHYCTRL0): The R/W attribute on bit 16, 8, and 2, modified
		2999	Table 35.7 Recommended Setting Values of the D-PHY Timing Register: The transmission rate for No. 3 to 6, modified
		3010, 3011	35.2.1.1 Features: The description on the operating ranges, output data format (type), image format conversion, and conversion by using a lookup table (LUT), modified
		3012	Figure 35.8 Block Diagram of the Image Processing Module, modified
		3013	35.2.1.3, (1) Parallel Data Input Timing: The description of the example settings in Figure 35.9 and Figure 35.10, added
		3019	35.2.3.1 CRU Control Register (CRUnCTRL): The R/W attribute and description on bit 1, modified
		3020	35.2.3.2 CRU Interrupt Enable Register (CRUnIE): The R/W attribute and description on bits 31 to 29, and 11 to 8, modified
		3022	35.2.3.3 CRU Interrupt Status Register (CRUnINTS): The R/W attribute and description on bits 31 to 29, and 11 to 8, modified
		3034	35.2.3.24 Memory Bank Enable Register for CRU Image Data (AMnMBVALID): The description on bits 7 to 0 (MBVALID[7:0]), modified
		3035	35.2.3.26 AXI Master Transfer Setting Register for CRU Image Data (AMnAXIATTR): The R/W attribute and description on bits 27 to 24, 22 to 16, 13 to 12, 9 to 8, and 6 to 4, modified. The description on bits 3 to 0 (AXILEN[3:0]), modified.

		Description	
Rev.	Date	Page	Summary
1.20	Sep 26, 2022	3043 to 3045	35.2.3.34 CRU Image Processing Main Control Register (ICnMC): The R/W attribute and description on bits 25 to 24, and 15, modified. The description on bits 13 to 12 (CLP[1:0]), modified. The R/W attribute and description on bit 7, modified. The description and note on bit 6 (LUTTHR), modified. The note on bit 5 (CSCTHR), modified. The R/W attribute and description on bits 4 to 3, modified. The note on bit 2 (CLPTHR), modified. The note on bit 1 (DECTHR), modified. The bit name (ICTHR → Reserved) and description on bit 0, modified.
		3045	Figure 35.11 Bypass Setting of Each Function, modified
		3050	35.2.3.40 CRU Parallel I/F Control Register (ICnPIFC): The description on bit 14 (ENPOL) and bit 13 (VSPOL), modified. Note 1 was modified and Note 2 and Note 3 were added for bits 10 to 8 (ITL[2:0]).
		3062	35.2.3.54 CRU RGB → YCbCr Color Space Conversion Y Coefficient 3 Register (ICnYCCR3): The R/W attribute and description on bits 31 and 16, modified
		3064	35.2.3.57 CRU RGB → YCbCr Color Space Conversion Cb Coefficient 3 Register (ICnCBCCR3): The R/W attribute and description on bits 31 and 16, modified
		3066	35.2.3.60 CRU RGB → YCbCr Color Space Conversion Cr Coefficient 3 Register (ICnCRCCR3): The R/W attribute and description on bits 31 and 16, modified
		3074	Table 35.12 Input Format and Image Processing (1/2), modified: All Bypassed (ICnMC.ICTHR = 1) (the column), deleted. MIPI CSI-2 Recommended Memory Storage Format (the column), added. Parallel User-defined binary 16-bit (progressive) (the column), added
		3075, 3076	Table 35.12 Input Format and Image Processing (2/2), modified: All Bypassed (ICnMC.ICTHR = 1) (the column), deleted. MIPI CSI-2 Recommended Memory Storage Format (the column), added. Parallel User-defined binary 16-bit (progressive) (the column), added. Note 2 and Note 3, added.
		3077	Table 35.13 Image Output Formats (1/2), modified: MIPI CSI-2 Recommended Memory Storage Format, Parallel User-defined binary 16-bit (progressive), added
		3078	Table 35.13 Image Output Formats (2/2), modified: MIPI CSI-2 Recommended Memory Storage Format, Parallel User-defined binary 16-bit (progressive), added
		3083	35.2.4.3, (3) Image Data Transfer Destination Address (Storage in Interlaced Mode), (d) Memory bank write order by CAM_FIELD pin input and ICnPIFC.ITL[2] register setting: Added
		3085	35.2.4.5 Parallel User-defined binary 16-bit (progressive), added
		3085	35.2.4.6 RGB565/RGB666 to RGB888, added
		3085	35.2.4.7 MIPI CSI-2 Recommended Storage format, added
		3088	35.2.4.11 Data Clipping: The description for YCbCr-10bit, added
		3102	Figure 35.36 Initializing Image Processing (MIPI CSI-2 Input): “ICnMC.ICTHR” in “Set modes”, deleted
		3113	Figure 35.47 Initializing Image Processing (Parallel Input): “ICnMC.ICTHR” in “Set modes”, deleted
1.30	May 12, 2023	All	Hexadecimal notation, unified to H'xx
		1. Overview	
		71	1.2.2 CPU Peripheral: Interrupt Controller: Note 1, added
		78	1.2.11 Timer: General PWM Timer (GPT): The number of channels for [RZ/G2LC], changed
		79	1.2.12 Peripheral Module: Renesas Serial Peripheral Interface (RSPI): The description on the maximum transfer rate, deleted
		2. System CPU Cortex-A55	
		83	Table2.2 Core Configuration: AArch32, deleted
		3. System CPU Cortex-M33	
		102	3.4.4 Cortex-M33 Sleep Mode: The location of *^{3}, modified
		4. Boot Mode	
		105	4.1 Overview: Note, added

Rev.	Date	Description	
		Page	Summary
1.30	May 12, 2023	6. System Controller (SYSC)	
		173	6.3.3 Master Access Control Register 2 (SYS_MSTACCCTL2): The bit name of bits 19, 11, and 3, modified
		203	6.3.41 LSI Mode Signal Register (SYS_LSI_MODE): Bit 16, changed (Reserved → the STAT_SEC_EN bit)
		204	6.3.42 LSI Device ID Register (SYS_LSI_DEVID): The section title, modified
		7. Clock Pulse Generator (CPG)	
		242	Table 7.5 Register list (4/5): Monitor Register SYC (CPG_RSTMON_SYC): The initial value and the address, modified
		—	Table 7.5 Register list (4/5): Enable Pin Control Register GTM (CPG_EN_GTM), deleted
		243	Table 7.5 Register list (5/5): Clock Control Register MBUS (CPG_CLKON_MBUS) and Clock Monitor Register MBUS (CPG_CLKMON_MBUS), added
		250	7.2.4.3 PLLn (SSCG) Output Clock Setting Register 2 (CPG_SAMPLLn_CLK2): Note 3, added
		257	7.2.4.9 PLL5 (SSCG) Standby Control Register (CPG_SIPLL5_STBY): The description of the register, modified; Note on enabling PLL5, added
		259	7.2.4.10 PLL5 (SSCG) Output Clock Setting Register 1 (CPG_SIPLL5_CLK1): Bit 24 (REFDIV_WEN), bit 20 (POSTDIV2_WEN), and bit 16 (POSTDIV1_WEN), changed to reserved bits
		265	7.2.4.14 PLL5 (SSCG) Output Clock Setting Register 5 (CPG_SIPLL5_CLK5): The calculation formulae for FOUTVCO and FOUTPOSTDIV, added
		272	7.2.4.19 Division Ratio Setting (PLL3B) Register (CPG_PL3B_DDIV): The description of bits 2 to 0 (DIVPL3CLK200FIX_SET): Note, added
		310	7.2.4.51 Clock Control Register CRU (CPG_CLKON_CRU): Bit 20 (CLK4_ONWEN) and bit 4 (CLK4_ON), changed to reserved bits
		355	7.2.4.91 Clock Monitor Register CRU (CPG_CLKMON_CRU): Bit 20(CLK4_ONWEN) and bit 4(CLK4_ON), changed to reserved bits
		—	7.2.4.187 Enable Pin Control Register GTM (CPG_EN_GTM), deleted
		457	7.2.4.187 WDT Reset Selector Register (CPG_WDTRST_SEL): Bit 26 (WDTRSTSEL10_WEN), bit 25 (WDTRSTSEL9_WEN), bit 24 (WDTRSTSEL8_WEN), bit 22 (WDTRSTSEL6_WEN), bit 21 (WDTRSTSEL5_WEN), bit 20 (WDTRSTSEL4_WEN), bit 18 (WDTRSTSEL2_WEN), bit 17 (WDTRSTSEL1_WEN), and bit 16 (WDTRSTSEL0_WEN), changed to reserved bits
		488	7.2.4.207 Clock Control Register MBUS (CPG_CLKON_MBUS), added
		489	7.2.4.208 Clock Monitor Register MBUS (CPG_CLKMON_MBUS), added
		494	Table 7.12 Range of Reset Application (1/2): No. 13: WDT (Reset for WDTOVF Register), changed (Reset → Released)
		518	7.4.7 Procedure for Switching Clocks by the Dynamic Switching Frequency Selectors: 2) Setting the switching of the clock output from SEL_PLL4: Setting of clocks switching: The description, modified
		519	7.4.8 Procedure for Switching Clocks by the Static Switching Frequency Dividers and Selectors (Procedure for Switching Source Clocks): Note 1 and Note 2, added
		8. Interrupt Controller	
		557, 558	8.6.18 ECCRAM Error Interrupt Status Control Register0 (EREISR0): Bit in the table of bits, modified
		559, 560	8.6.19 ECCRAM Error Interrupt Status Control Register1 (EREISR1): Bit in the table of bits, modified
		10. On-chip RAM	
		573	The description (bit), modified
		16. Multi-Function Timer Pulse Unit 3 (MTU3a)	
		901	Figure 16.82 Example of Output Phase Switching through UF, VF, and WF Bit Settings (2): The setting values, modified

Rev.	Date	Description: Page	Description: Summary
1.30	May 12, 2023	19. Port Output Enable for GPT (POEG)	
		1205	19.2.1 POEG Group n Setting Register (POEGGn) (n = A to D): Bit chart: Bit16: The bit name, modified
		1209	19.3.2 Output-Disable Requests from the GPT: The reference, modified
		21. Watchdog Timer (WDT)	
		1255	Table 21.6 WDT Reset Target by CPG_WDTRST_SEL Register: The lines for Reserved, deleted
		22. Serial Communications Interface with FIFO (SCIFA)	
		1318	Figure 22.24 Receive Data Sampling Timing in Asynchronous Mode: Receive data (RXD), modified
		23. Serial Communications Interface (SCIg)	
		1321	Figure 23.1 Block Diagram of SCIg (SCI0 and SCI1): The pin name, modified (RTSn#/ → RTSn#, CTSn#/ → CTSn#)
		1390	Figure 23.33 Receive Data Sampling Timing in Smart Card Interface Mode (When Clock Frequency is 372 Times the Bit Rate): Receive data (RXDn), modified
		24. Renesas Serial Peripheral Interface	
		1425	Table 24.3 Relationship between SPBR and BRDV1 and BRDV0 Settings: The location of *^{1}, modified. The bit rate for SPBR(n) = 0, modified.
		1435	Table 24.4 Relationship between Modes and SPCR and Description of Each Mode: Master (SPI Operation) for Transfer rate (in Mode), modified
		25. SPI Multi I/O Bus Controller	
		1537	Figure 25.29 (2) Flow of Timing Adjustment when the Serial Flash Memory is Connected (DDR Mode): The figure title, modified. 13-step timing setting → 8-step timing setting. The values for y zz x, modified
		1538	Figure 25.30 (3) Example of Timing Adjustment when the Serial Flash Memory is Connected (DDR Mode): The title, modified
		26. I^{2}C Bus Interface	
		1550	26.3.1 RIICnCR1 − I^{2}C Bus Control Register 1: The description of bit 3 (SCLO), modified (SDA Output Control → SCL Output Control)
		1603	Figure 26.15 Example of Slave Transmission Flowchart: The judgement, modified (ansmitted? → All data transmitted?)
		30. Gigabit Ethernet Interface	
		2122	30.4.1.21 Error Interrupt Disable Register (EID): The description (register name), modified
		32. USB2.0	
		2377	Table 32.6 USBPHY Control Register List: VBUSEN control register, added
		2381	32.3.4 VBUSEN control register (VBENCTL), added
		32A. USB 2.0 Host Module	
		2392	32A.1.2.3 OTG function: The description of the OTG_PERI bit, modified
		2439	32A.2.4.3, (3) USBINTR Register: The section title, modified
		2464	32A.2.4.5, (1) Common Control Register: The description of bit 31 (OTG_PERI), modified
		2465	32A.2.4.5, (2) OTG-BC Interrupt Status Register: Bit 3 (VBSTAINT_STA) and bit 2 (VBSTACHG_STA), changed to reserved bits
		2466	32A.2.4.5, (3) OTG-BC Interrupt Enable Register: Bit 3 (VBSTAINT_EN) and bit 2 (VBSTACHG_EN), changed to reserved bits
		2467	32A.2.4.5, (4) VBUS Control Register: Bit 0: changed (Reserved → the VBOUT bit)
		2468	32A.2.4.5, (5) Line Control Port 1 Register: Bits 25 and 24 (VDPMLLVL[1:0]), changed to reserved bits
		2476	32A.4.2.3 U2H_EHCI_INT assertion source and control: [Interrupt enable control by register]: The description (bit), modified. [Interrupt source]: The row of bit [17], deleted. The description of bit[16] and bit[2], modified

Rev.	Date	Description	
		Page	Summary
1.30	May 12, 2023	2478	32A.4.2.5 U2H_OBINT assertion source and control: [Interrupt enable control by register]: The description (bits), modified; [Interrupt source]: The rows of bit [3], bit [2], deleted; The description of the VBUSIN pin for Interrupt Source (1, 2), deleted; [Clearing the interrupt]: The description (bits), modified
		2486	32A.8.3 Port Power (VBUS) control specifications: The description, modified
		33. LCDC	
		2675	Table 33.1 Sub modules in FCPVD: The description of COMP, modified
		2687	Table 33.6 FCPVD Register Configuration: FCPVD configuration register 0, FCP reset register, and FCP status register, deleted
		2691	Table 33.8 DU Register Configuration: DU Display I/F Timing Register 5, deleted
		—	33.3.1.2 FCPVD Configuration Register 0 (FCP_CFG0), deleted
		—	33.3.1.3 FCP Reset Register (FCP_RST), deleted
		—	33.3.1.4 FCP Status Register (FCP_STA), deleted
		2702	33.3.2.4, (7) Software Reset Register (VI6_SRESET): Note 5, deleted
		2725	Figure 33.7 Chrominance Interpolation Methods Selectable through CIPM Setting: VSP → VSPD
		2789	33.3.2.10, (4) Color Information Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_COL): The description (unit), modified
		2805	33.3.3.8 DU Display I/F Timing Register 3 (DU_DITR3): The description of bits 11 to 0 (HSA), modified
		2806	33.3.3.9 DU Display I/F Timing Register 4 (DU_DITR4): The description of bits 28 to 16 (HFP), and bits 12 to 0 (HBP), modified
		—	33.3.3.10 DU Display I/F Timing Register 5 (DU_DITR5), deleted
		2807	33.3.3.10 DU Module Control Register 1 (DU_MCR1), Bit 8 (UPD_SZ), changed to a reserved bit
		—	33.4.1(a) FCPVD initialization, deleted
		—	33.4.1(c) To stop image process immediately, deleted
		2811	33.4.2 Reset Operation: The description, modified
		—	33.4.2.1 Software Reset, deleted
		2811	33.4.3 Registers to set fixed value: The description of [11], added
		2816	Table 33.31 Definition of a Function for Simple Description: Syntax; I = 0; i<num_bits; i++) → i = 0; i<num_bits; i++)
		2825	33.4.8.1 Operation flow of VSPD and DU: The description, modified (VSP2 → VSPD)
		2826	Figure 33.40 Updating display list at arbitrary timing: VSP2 → VSPD
		2826	Figure 33.41 Controlling Two Register Planes Using a Display List: The description, added; VSP1 → VSPD, VSP → VSPD
		2827	Figure 33.42 Input/output Size for Each Module in a Sample DPR Connection: VSP → VSPD
		—	Figure 33.41 Setting flow to stop VSPD linked with DU, deleted
		34. MIPI DSI	
		2844	34.3.1.3 Tx Set Register (TXSETR): The description of bits 17 and 16 (NUMLANECAP), modified
		35. Camera Data Receiving Unit (CRU)	
		2961	Table 35.4 Register Configuration of MIPI CSI-2 LINK: The table header, modified (Address → Offset Address)
		3066	35.2.3.63 CRU Lookup Table Pointer Register (ICnLUTP): Bits 29 to 20: Bit Name: LTYPR[9:0] → LTCRPR[9:0]; The description, modified. Bits 9 to 0: Bit Name: LTCRPR[9:0] → LTYPR[9:0]; The description, modified
		3067	35.2.3.64 CRU Lookup Table Data Register (ICnLUTD): Bits 23 to 16: Bit Name: LTYDT[7:0] → LTCRDT[7:0]; The description, modified. Bits 7 to 0: Bit Name: LTCRDT[7:0] → LTYDT[7:0]; The description, modified

Rev.	Date	Description	
		Page	Summary
1.30	May 12, 2023	3085	35.2.4.10 Data Arrange: The description, modified
		3086	35.2.4.12, (1) RGB to YCbCr: Register Settings: The register settings, modified
		3092	35.2.4.16, (5) Generated Image Data Example (in the Case of Pattern Generation): The description (the setting values for TIPTNV1[3:0]), modified
		36. Image Scaling Unit (ISU)	
			All: collection → correction
		3118	Table 36.2 Descriptor Format: Item: Setting Range of Register Address 2, 3, 4, modified
		3124	Table 36.5 Output Image Setting: The register of No. (1), (2), modified. The variation for No. (4), modified
		3126	36.1.3.2 Formatter: The section title, modified (Data Extraction → Formatter). The description, modified
		3129	36.1.3.3 Data Extraction: The section title, modified (Formatter → Data Extraction). The description, modified
		3141	Figure 36.32 Color Correction Equation, modified
		3149	Figure 36.43 Data Swap Correction: The byte address, modified (RD_SWAP_*** → WD_SWAP_***)
		3161	36.3.8 AXI FIFO Capability Registers (ISU_AXI_FIFO_CAP): The initial values of bits 30 to 24 (SCAP_PL0[6:0]), and bits 14 to 8 (DCAP_PL0[6:0]), modified
		3166	36.3.15 RPF Source Image Format Registers (ISU_RPF_FMT): The reference, modified; Bit 5 to 0 in the table of bits, modified
		3167	36.3.16 RPF Source Image UV Format Registers (ISU_RPF_UVBIN): The reference, modified
		3168	36.3.18 RPF Source ALPHA Data Selection Registers (ISU_RPF_ALPH_SEL): The reference, modified
		3181	36.3.33 WPF Destination Image Format Registers (ISU_WPF_FMT): The reference, modified
		3193	36.3.49 AXI Max Burst Length Registers (ISU_AXI_BLEN): Bit 19 to 16(ARLEN_MAX[3:0]): The initial value of bits 3 to 0 (AWLEN_MAX[3:0]), modified
		3194	Table 36.11 Explanation for ISU FM Frame Control Registers (ISU_FM_FRCON): The table title, modified
		3194	Figure 36.44 Relationship Between Register ISU_FM_FRCON Setting and Frame Processing Mode: The figure title, modified
		3199	Table 36.12 Image Size Conversion Example 1: The description of Input format and Output format, modified
		3204	Table 36.16 Image Size Conversion Example 2: The description of Input format, Output format, and Output stride, modified
		3208	Table 36.20 Image Size Conversion Example 3: The description of Input format, Output format, and Output stride, modified
		3212	Table 36.25 Image Size Conversion Example 4 (Register Settings): The comment of ISU_RPF_FMT, modified
		3215	36.5.3.2 YCbCr422 → ARGB8888: The conversion formula from YCbCr422 to RGB, modified
		3217	36.5.3.3 BGR888 → YCbCr422: The section title, modified
		3217	Table 36.30 Color Format Conversion Example 3: The description of Input stride, modified
		40. SD/MMC Host Interface	
		3228	40.1.1 Features: The channels, added. NOTE, deleted.
		3234	40.2.2 Command Argument Register (SD_ARG): SD_ARG: Bits 63 to 32 (Reserved), added. SD_ARG1: Bits 63 to 16 (Reserved), added
		3238	40.2.5 SD Card Response Registers (SD_RSP): SD_RSP5, modified (31 to 16 (Reserved) → 63 to 16 (Reserved))
		3249	40.2.10 SD Clock Control Register (SD_CLK_CTRL): The description of bits 7 to 0 (DIV7 to DIV0), modified

		Description	
Rev.	Date	Page	Summary
1.30	May 12, 2023	3252	40.2.12 SD Card Access Control Option Register (SD_OPTION): The description of bit 15 (WIDTH), modified
		3261	40.2.23 SD Interface Mode Setting Register (SDIF_MODE): The description (mode), modified. Bit 0 (DDR), changed to a reserved bit
		—	Figure 40.4 SDDAT in 4-Bit Width DDR Mode, deleted
		—	Figure 40.6 SDDAT in 8-Bit Width DDR Mode, deleted
		3271	40.3.1, (2) Bus Signal Voltage Switch: The description of (4), modified
		3273	Figure 40.7 SD Card Detect with SDDAT3: The card detect, modified (2P1ϕ → SDxϕ/2 (x = 0, 1))
		3307	Table 40.9 Example of SD_CMD Register Setting (MMC): The remark of CMD21, deleted
		3312	40.6.3 SCC Register Configuration: Base Address of Cortex-M33, added
		42. Low Power Mode	
		3395	Table 42.3 Registers for Module Standby Mode: The register name, modified (OSTM → GTM)
		45. Trusted Secure IP	
		3436	Table 45.1 Specifications of Trusted Secure IP: RSA for Encryption engine: Number of cycles for execution, added
		48. Electrical Characteristics	
		3450	Figure 48.1 Power-On/Power-Off Sequence, modified (PVDD182533 → PVDD182533_0/1, PLL1/2/3/4/5/6_AVDD18 → PLL1/23/4/5/6_AVDD18)
		3456	Table 48.18 DC Characteristics (16) [ADC]: The Max. value of Analog input channel, changed
		3459	Figure 48.5 Power-On Oscillation Settling Time: CPUHOLD、SEC_EN, deleted
		3460	48.5.2.1 SDHI Access Timing (SDR 3.3-V): NOTE, modified
		3460	Table 48.21 SDHC AC Access Timing (SDR at 3.3-V Operation): The notation of Symbol, modified (T*** → t***)
		3476	Figure 48.28 Timing for Switching the Buffers On and Off, modified (t_{SOFF} → t_{BOFF})
		3490	48.5.19 Serial Communications Interface (SCIg) Access Timing: The section title, modified (SCI → SCIg)
		3490	Table 48.44 SCIg Timing: The table title, modified (SCI → SCIg)
		3492	Table 48.45 Renesas Serial Peripheral Interface Timing: The max. value of Data output delay time (t_{OD}), modified
		3495	Table 48.46 A/D Converter Timing: The unit of ADC Trigger Input Pulse Width, modified
1.40	Sep 29, 2023	1. Overview	
		75	1.2.7 Camera Interfaces: [RZ/G2L] Support Image Processing, modified
		75	1.2.7 Camera Interfaces: [RZ/G2LC] Support Image Processing, modified
		3. System CPU Cortex-M33	
		100	Table 3.3 List of Functions Controlled by the SYSC: The description, modified (Lowpower → Low-power)
		5. LSI Internal Bus	
		154, 155	Table 5.3 Accessible Areas: “CRU [Video]” under the top header “Master Unit” modified to “CRU [Video, Statistics]”
		155	Table 5.3 Accessible Areas (2/2): Slave Unit, changed (TZC (SRAM CPU) → TZC (SRAM ACPU)); TZC (SRAM MCPU), added
		6. System Controller (SYSC)	
		178	6.3.5 Master Access Control Register 4 (SYS_MSTACCCTL4): Bit 27, changed (Reserved → CRU_ST_AWSEL); Bit 25, changed (Reserved → CRU_ST_AWNS); Bit 24, changed (Reserved → CRU_ST_AWPU). The R/W attribute and description on bits 27, 25 and 24, changed
		193	6.3.23 WDT0 Control Register (SYS_WDT0_CTRL): The bit chart: R/W of bit 16, modified

Rev.	Date	Description	
		Page	Summary
1.40	Sep 29, 2023	194	6.3.24 WDT1 Control Register (SYS_WDT1_CTRL): The bit chart: R/W of bit 16, modified
		195	6.3.25 WDT2 Control Register (SYS_WDT2_CTRL): The bit chart: R/W of bit 16, modified
		222	6.3.57 SYS_LP_CA55CK_CTL1: The table of bits: The initial value of bit 0, modified (— → 0b)
		7. Clock Pulse Generator (CPG)	
		245	Table 7.5 Register list: Note 1, modified
		8. Interrupt Controller	
		566	Table 8.6 BEISR1 Bus Error Mapping: The descriptions of BESTAT32 and BESTAT33, changed
		12. Message Handling Unit (MHU)	
		590	Table 12.4 Register attributes: Entries under the “Description” column, modified
		592	Table 12.5 List of Registers (2/4): The offset address, modified (H’0820 (Reserved) → H’082C (Reserved))
		600	12.4.36 Non secure response transmission interrupt Clear register (CA55 Core1 -> CM33): The description, modified (<n>=0-5 → <n=0-5>)
		609	12.4.84 Secure response transmission interrupt Clear register (CA55 Core1 -> CM33): The description, modified (<n>=0-5 → <n=0-5>)
		610	Figure 12.2 Hardware configuration, modified (Message/Response store Area → Message/Response stored Area); typo corrected (trasmit → transmit)
		16. Multi-Function Timer Pulse Unit 3 (MTU3a)	
		722	Table 16.2 MTU Functions (2/2): Interrupt sources of MTU0, modified (Compare match0E → Compare match 0E, Compare match0F → Compare match 0F)
		809	16.2.35, (2) MTU7.TADCR: Address(es), modified (MTU7, TADCR → MTU7.TADCR)
		925	Figure 16.106 Motor Control Circuit Example, modified
		18. General PWM Timer (GPT)	
		All	Hexadecimal notation unified
		1086	18.2.21 General PWM Timer Cycle Setting Register (GTPR): The bit chart: R/W attributes, added
		1095	Figure 18.3 Example setting for a periodic count operation in up-counting by the count clock: The description of processing [Set count direction], modified
		1188	18.7.3 GTIOC Pin Output Negate Control: The description, modified (selected disable output request → selected output disable request)
		21. Watchdog Timer (WDT)	
		All	Typo corrected (eElapsed → Elapsed)
		22. Serial Communications Interface with FIFO (SCIFA)	
		1320	22.8.6 Receive Data Sampling Timing and Receive Margin in Asynchronous Mode: [Equation 1], modified
		23. Serial Communications Interface (SCIg)	
		1326	23.2.2 Receive Data Register (RDR): The bit chart: R/W attributes, added
		1327	23.2.3 Receive Data Register H, L, HL (RDRH, RDRL, RDRHL): The bit chart: R/W attributes, added
		1328	23.2.4 Transmit Data Register (TDR): The bit chart: R/W attributes, added
		1329	23.2.5 Transmit Data Register H, L, HL (TDRH, TDRL, TDRHL): The bit chart: R/W attributes, added
		1330	23.2.7, (1) Non-Smart Card Interface Mode (SCMR.SMIF = 0): The bit chart: R/W attributes, added; The table of bits: Initial Value, added
		1332	23.2.7, (2) Smart Card Interface Mode (SCMR.SMIF = 1): The bit chart: R/W attributes, added; The table of bits: Initial Value, added
		1333	Table 23.4 Combinations of the SCMR.BCP2 Bit and SMR.BCP[1:0] Bits: Note 1, modified

Rev.	Date	Description	
		Page	Summary
1.40	Sep 29, 2023	1334	23.2.8, (1) Non-Smart Card Interface Mode (SCMR.SMIF = 0): The bit chart: R/W attributes, added; The table of bits: Initial Value, added
		1337	23.2.8, (2) Smart Card Interface Mode (SCMR.SMIF = 1): The bit chart: R/W attributes, added; The table of bits: Initial Value, added
		1339	23.2.9, (1) Non-Smart Card Interface Mode (SCMR.SMIF = 0): The bit chart: R/W attributes, added; The table of bits: Initial Value, added
		1342	23.2.9, (2) Smart Card Interface Mode (SCMR.SMIF = 1): The bit chart: R/W attributes, added; The table of bits: Initial Value, added
		1345	23.2.10 Smart Card Mode Register (SCMR): The bit chart: R/W attributes, added; The table of bits: Initial Value, added
		1346	Table 23.5 Combinations of the SCMR.BCP2 Bit and SMR.BCP[1:0] Bits: Note 1, modified
		1347	23.2.11 Bit Rate Register (BRR): The bit chart: R/W attributes, added
		1349	Table 23.12 BRR Settings for Various Bit Rates (Clock Synchronous Mode): Note, modified (transmitting/receiving → transmitting or receiving)
		1351	23.2.12 Modulation Duty Register (MDDR): The bit chart: R/W attributes, added
		1352	23.2.13 Serial Extended Mode Register (SEMR): The bit chart: R/W attributes, added; The table of bits: Initial Value, added
		1354	23.2.14 Noise Filter Setting Register (SNFR): The bit chart: R/W attributes, added; The table of bits: Initial Value, added
		1355	23.2.15 Extended function control register (SECR): The bit chart: R/W attributes, added; The table of bits: Initial Value, added
		27. Serial Sound Interface (SSIF-2)	
		1655	Figure 27.8 Alignment Setting of Placement Data in Transmission, modified (010 to 100 → 010 to 101)
		1656	Figure 27.9 Alignment Setting of Placement Data in Reception, modified (010 to 100 → 010 to 101)
		1661, 1664, 1666, 1668	27.4.1.2 Status Register (SSISR): TUIRQ Bit, TOIRQ Bit, RUIRQ Bit, and ROIRQ Bit: [Clearing condition], modified (When either the following → When either of the following)
		1669	Figure 27.18 ROIRQ Setting Timing: The waveform of SSIn_RCK, modified
		1675	Figure 27.22 Timing chart when it begins to communicate master from system reset: The place of the description of “BCK output enable”, modified
		1695	27.4.1.8 Status Control Register (SSISCR): Hexadecimal notation, unified
		1719	Figure 27.57 Procedure to Resume Communication (CPU Procedure): The place of the description of processing “Writing transmit data to FIFO”, modified
		30. Gigabit Ethernet Interface	
		2147	30.4.1.42 Common Interrupt Enable register (CIE): The table of bits: The descriptions of bit 8 and bit 0, modified
		2198	30.4.3.2 Tx Frame Checksum Enable register (CSR1): The table of bits: The initial value of bit 23, modified
		2200	30.4.3.3 Rx Frame Checksum Enable register (CSR2): The table of bits: The initial Value of bit 23, modified
		2240	30.4.3.37 ARPREQ/Neighbor Solicitations Receive Interrupt Status register (CSFR40): The table of bits, modified (31 to 13 → 31 to 3)
		2276	30.5.6.1, (1) Reception Handling: The description, modified
		2286	Figure 30.31 Supported Frame of IPv4, modified (ICMP/TCP/UDPTCP Data → ICMP/TCP/UDP Data)
		2291	Figure 30.36 Received Frame Filtering Flow (Part3), modified (v4_udp_pt_flg → v6_udp_pt_flg)
		2292	Figure 30.37 Received Frame Filtering Flow (Part4), modified (v4_udp_pt_flg → v6_udp_pt_flg)
		2297	Figure 30.41 Overview of Filtering and Interrupt, modified (xxx_flg → yyy_flg)

Rev.	Date	Description	
		Page	Summary
1.40	Sep 29, 2023	2310	Table 30.20 Interrupt of DMAC: The internal trigger of the interrupt flag bit RIS2.RFFF, modified
		2312	30.5.13.1 Set Up Procedure: The description of action “E-MAC.CXR35”, modified (registor → register)
		32. USB2.0	
		2384	32.3.5 Connection control register (CON_CTRL): The table of bits: The description of bit 4, modified
		2387	32.4.2.1 USB/PHY related pins: The sections for reference, modified
		2389	32.4.3.2 Resume from Direct power down mode: Notation unified (us → µs)
		32A. USB 2.0 Host Module	
		All	Offset values deleted from the section titles
		2397	32A.2.3 Register Overview: The initial value of register HcRhDescriptorB, modified
		2400	32A.2.4.1, (2) HcControl Register: The table of bits: The description of bit 9, modified
		2414	32A.2.4.1, (11) HcBulkHeadED Register: The table of bits: The description of bits 31 to 4, modified (Bulk Head ED → BulkHead ED)
		2423	32A.2.4.1, (19) HcRhDescriptorA Register: The table of bits: The description of bits 7 to 0, modified (Down stream → Downstream)
		2424	32A.2.4.1, (20) HcRhDescriptorB Register: The table of bits: The initial value of bit 17, modified (0 → 1)
		2459, 2460	32A.2.4.4, (6) Suspend Control Register: The bit chart: R/W of bit 22, modified. The table of bits: The description of bit 0, modified (Disable status → disabled status)
		2472	32A.2.4.5, (6) BC Control Port 1 Register: The table of bits: R/W of bit 5 (DCPMODE), modified (R → R/W)
		2488	32A.8.3 Port Power (VBUS) control specifications: The section for reference, modified
		32B. USB 2.0 Function Module	
		2501	Table 32B.3 List of Registers (3/3): The register name of the symbol “DSCITVL”, modified (Descriptor Interval → Descriptor Interval Register)
		2512	32B.2.7.3 CFIFO Port Select Register [CFIFOSEL] <Address: H’020>: The table of bits: The initial value of bit 11 and bit 10 (MBW), modified (0 → All 0)
		2574	32B.2.22.1 Peripheral L1 Control Register 1 [PL1CTRL1] <Address: H’144>: The bit chart: R/W of bit 14 (L1EXTMD), added.
		2609	32B.8.7.1 DMA Status SUS Register [DSTAT_SUS] <Address: H’720>: The bit chart: The bit names of bit 1 and bit 0, modified (TC1 → SUS1, TC0 → SUS0)
		35. Camera Data Receiving Unit (CRU)	
		All	Hexadecimal notation of initial values in the table of bits, modified
		2959	(1) MIPI CSI-2: The description, modified (data → signal)
		2959	Figure 35.1 Block Diagram of CRU, modified
		3008	35.2.1 Overview: The description, modified
		3009	35.2.1.1 Features: The descriptions of Demosaicing, Statistics, and Linear Matrix, added; The descriptions of FIFO and AXI master, changed
		3010	Figure 35.8 Block Diagram of the Image Processing Module, modified
		3010	Table 35.9 Parallel Input Pins: The description of CAM_DATA15 to CAM_DATA0, modified
		3012, 3013	Table 35.10 Parallel Input Format Correspondence Table: Item “ITU-R BT.656”, added; Note 1, added
		3015, 3016	Table 35.11 Register Configuration of the Image Processing Module: Registers related to CRU Statistics, AXI-SD Master, and CRU Linear Matrix, added
		3019	35.2.3.2 CRU Interrupt Enable Register (CRUnIE): Bit 11, changed: (Reserved → SDFEOVWE); Bit 10, changed (Reserved → SDDECEE); Bit 9, changed (Reserved → SDSLVEE); Bit 8, changed (Reserved → SDFOE). The R/W attribute and description on bits 11 to 8, changed

Rev.	Date	Description	
		Page	Summary
1.40	Sep 29, 2023	3021	35.2.3.3 CRU Interrupt Status Register (CRUnINTS): Bit 11, changed (Reserved → SDFEOVWS); Bit 10, changed (Reserved → SDDECES); Bit 9, changed (Reserved → SDSLVES); Bit 8, changed (Reserved → SDFOS). The R/W attribute and description on bits 11 to 8, changed
		3024	35.2.3.7 Memory Bank 1 Base Address (Higher) Register for CRU Image Data (AMnMB1ADDRH): The description of bit 2 (reserved), modified
		3025	35.2.3.9 Memory Bank 2 Base Address (Higher) Register for CRU Image Data (AMnMB2ADDRH): The description of bit 2 (reserved), modified
		3026	35.2.3.11 Memory Bank 3 Base Address (Higher) Register for CRU Image Data (AMnMB3ADDRH): The description of bit 2 (reserved), modified
		3027	35.2.3.13 Memory Bank 4 Base Address (Higher) Register for CRU Image Data (AMnMB4ADDRH): The description of bit 2 (reserved), modified
		3028	35.2.3.15 Memory Bank 5 Base Address (Higher) Register for CRU Image Data (AMnMB5ADDRH): The description of bit 2 (reserved), modified
		3029	35.2.3.17 Memory Bank 6 Base Address (Higher) Register for CRU Image Data (AMnMB6ADDRH): The description of bit 2 (reserved), modified
		3030	35.2.3.19 Memory Bank 7 Base Address (Higher) Register for CRU Image Data (AMnMB7ADDRH): The description of bit 2 (reserved), modified
		3031	35.2.3.21 Memory Bank 8 Base Address (Higher) Register for CRU Image Data (AMnMB8ADDRH): The description of bit 2 (reserved), modified
		3040	35.2.3.32 Memory Bank 1 Base Address Lower Register for CRU Statistics Data (AMnSDMB1ADDRL), added
		3040	35.2.3.33 Memory Bank 1 Base Address Higher Register for CRU Statistics Data (AMnSDMB1ADDRH), added
		3041	35.2.3.34 Memory Bank 2 Base Address Lower Register for CRU Statistics Data (AMnSDMB2ADDRL), added
		3041	35.2.3.35 Memory Bank 2 Base Address Higher Register for CRU Statistics Data (AMnSDMB2ADDRH), added
		3042	35.2.3.36 Memory Bank 3 Base Address Lower Register for CRU Statistics Data (AMnSDMB3ADDRL), added
		3042	35.2.3.37 Memory Bank 3 Base Address Higher Register for CRU Statistics Data (AMnSDMB3ADDRH), added
		3043	35.2.3.38 Memory Bank 4 Base Address Lower Register for CRU Statistics Data (AMnSDMB4ADDRL), added
		3043	35.2.3.39 Memory Bank 4 Base Address Higher Register for CRU Statistics Data (AMnSDMB4ADDRH), added
		3044	35.2.3.40 Memory Bank 5 Base Address Lower Register for CRU Statistics Data (AMnSDMB5ADDRL), added
		3044	35.2.3.41 Memory Bank 5 Base Address Higher Register for CRU Statistics Data (AMnSDMB5ADDRH), added
		3045	35.2.3.42 Memory Bank 6 Base Address Lower Register for CRU Statistics Data (AMnSDMB6ADDRL), added
		3045	35.2.3.43 Memory Bank 6 Base Address Higher Register for CRU Statistics Data (AMnSDMB6ADDRH), added
		3046	35.2.3.44 Memory Bank 7 Base Address Lower Register for CRU Statistics Data (AMnSDMB7ADDRL), added
		3046	35.2.3.45 Memory Bank 7 Base Address Higher Register for CRU Statistics Data (AMnSDMB7ADDRH), added
		3047	35.2.3.46 Memory Bank 8 Base Address Lower Register for CRU Statistics Data (AMnSDMB8ADDRL), added
		3047	35.2.3.47 Memory Bank 8 Base Address Higher Register for CRU Statistics Data (AMnSDMB8ADDRH), added
		3048	35.2.3.48 Memory Bank Enable Register for CRU Statistics Data (AMnSDMBVALID), added

Rev.	Date	Description	
		Page	Summary
1.40	Sep 29, 2023	3049	35.2.3.49 Memory Bank Status Register for CRU Statistics Data (AMnSDMBS), added
		3050	35.2.3.50 AXI-SD Master Transfer Setting Register (AMnSDAXIATTR), added
		3051	35.2.3.51 AXI-SD Master FIFO Setting Register (AMnSDFIFO), added
		3051	35.2.3.52 AXI-SD Master Transfer Re-Start (AMnSDFIFOTRST), added
		3052	35.2.3.53 AXI-SD Master FIFO Pointer Register (AMnSDFIFOPNTR), added
		3053	35.2.3.54 AXI-SD Master Transfer Stop Register (AMnSDAXISTP), added
		3053	35.2.3.55 AXI-SD Master Transfer Stop Status Register (AMnSDAXISTPACK), added
		3056 to 3058	35.2.3.58 CRU Image Processing Main Control Register (ICnMC): Bits 25 and 24, changed (Reserved → RAWSTTYP[1:0]); The R/W attribute and description, changed. Bit 7, changed (Reserved → STITHR); The R/W attribute and description, changed. Bit 4, changed (Reserved → LMXTHR); The R/W attribute and description, changed. Bit 3, changed (Reserved → DEMTHR); The R/W attribute and description, changed. Bit 5 (CSCTHR): The description, modified.
		3059	35.2.3.58, (1) Bypass Setting for Each Function: The description, modified
		3059	Figure 35.11 Bypass Setting of Each Function, modified
		3063	35.2.3.64 CRU Linear Matrix Offset Register (ICnLMXOF), added
		3064	35.2.3.65 CRU Linear Matrix R Coefficient 1 Register (ICnLMXRC1), added
		3065	35.2.3.66 CRU Linear Matrix R Coefficient 2 Register (ICnLMXRC2), added
		3066	35.2.3.67 CRU Linear Matrix G Coefficient 1 Register (ICnLMXGC1), added
		3067	35.2.3.68 CRU Linear Matrix G Coefficient 2 Register (ICnLMXGC2), added
		3068	35.2.3.69 CRU Linear Matrix B Coefficient 1 Register (ICnLMXBC1), added
		3069	35.2.3.70 CRU Linear Matrix B Coefficient 2 Register (ICnLMXBC2), added
		3070	35.2.3.71 CRU Statistics Control 1 Register (ICnSTIC1), added
		3071	35.2.3.72 CRU Statistics Control 2 Register (ICnSTIC2), added
		3084	35.2.3.87 CRU RGB → YCbCr Color Space Conversion Y Coefficient 3 Register (ICnYCCR3): Bit 16, changed (Reserved → YCLCEN); The R/W attribute and description, changed
		3086	35.2.3.90 CRU RGB → YCbCr Color Space Conversion Cb Coefficient 3 Register (ICnCBCCR3): Bit 16, changed (Reserved → CBCLCEN); The R/W attribute and description, changed
		3088	35.2.3.93 CRU RGB → YCbCr Color Space Conversion Cr Coefficient 3 Register (ICnCRCCR3): Bit 16, changed (Reserved → CRCLCEN); The R/W attribute and description, changed
		3096 to 3098	Table 35.12 Input Format and Image Processing: The rows of functions Demosaicing, Linear Matrix, and Statistics, added
		3099, 3100	Table 35.13 Image Output Formats: The register settings of "RAW" and "MIPI CSI-2 Recommended Memory Storage Format", modified
		3101	Table 35.14 Statistics Output Formats, added
		3107	35.2.4.3, (4) Statistics Data Transfer Destination Address (Statistics Data Storage Destination), added
		3109	35.2.4.7, (1) Mode Setting, modified
		3112	35.2.4.10 Demosaicing, added
		3114	35.2.4.11 Linear Matrix, added
		3116	35.2.4.14, (1) RGB to YCbCr: The description, modified. Register Settings, modified
		3119	35.2.4.18 Statistics, added
		3132	Table 35.18 Interrupt Sources, Registers, and Interrupt Signals to the Interrupt Controller: Statistics-related interrupts and errors for axi_mst_err_int, added
		3138	Figure 35.48 Initializing the AXI Master (MIPI CSI-2 Input), modified
		3139, 3140	Figure 35.49 Initializing Image Processing (MIPI CSI-2 Input), modified
		3146	Figure 35.55 Stopping Image Processing Reception (MIPI CSI-2 Input), modified

Rev.	Date	Description	
		Page	Summary
1.40	Sep 29, 2023	3147	35.3.3 Frame Synchronization Settings: The description, modified
		3147	Figure 35.56 Flow for Changing the Frame Synchronization Settings (by Setting Registers), modified
		3148	Figure 35.57 Flow for Changing the Frame Synchronization Settings (by Using the DMAC), modified
1.45	Jan 31, 2024	34. MIPI DSI	
		2840, 2841	Table 34.3 Resister list (2/3), (3/3): The access size of the SQCHxDSCyAR, SQCHxDSCyBR, SQCHxDSCyCR, and SQCHxDSCyD registers, modified
		2912	34.3.1.59 Sequence Channel x Descriptor y-A Register (SQCHxDSCyAR): The description on the reserved bits (bit 31, bit 30), modified
		2914	34.3.1.60 Sequence Channel x Descriptor y-B Register (SQCHxDSCyBR): The description on the reserved bits (bit 31 to bit 26, bit 23 to bit 0), modified
		2915	34.3.1.61 Sequence Channel x Descriptor y-C Register (SQCHxDSCyCR): The description on the reserved bits (bit 23, bit 21 to bit 0), modified
		2933	Figure 34.9 Single Packet Transfer: The description of the SQCHxDSCyBR.STT bit and the SQCHxDSCyBR.REPEAT bit, deleted
		2935	Figure 34.10 Single Packet Receive: The description of the SQCHxDSCyBR.STT bit and the SQCHxDSCyBR.REPEAT bit, deleted
		2936	Figure 34.11 Trigger transmission: The description of the SQCHxDSCyBR.STT bit and the SQCHxDSCyBR.REPEAT bit, deleted
