Rev.1.45 Jan, 2024

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.
   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.
   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (“Vulnerability Issues”). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

Trademarks

Renesas and the Renesas logo are trademarks of Renesas Electronics Corporation. All trademarks and registered trademarks are the property of their respective owners.

Trademarks (continued)

For the “Cortex” notation, it is used as follows;
— Arm® Cortex®-A55
— Arm® Cortex®-M33
Note that after this page, they may be noted as Cortex-A55 and Cortex-M33 respectively.

Examples of trademark or registered trademark used in the RZ/G series, 2nd Generation User’s Manual: Hardware;
AMBA®: AMBA is a registered trademark of Arm Limited.
CoreLink™: CoreLink is a trademark of Arm Limited.
CoreSight™: CoreSight is a trademark of Arm Limited.
Mali™: Mali is a trademark of Arm Limited.
TrustZone ®: TrustZone is a registered trademark of Arm Limited.
HyperFlash™: HyperFlash is a trademark of Cypress Semiconductor Corporation.
MIPI®: MIPI is a registered trademark of MIPI Alliance, Inc.
Neon™: Neon is a trademark of Arm Limited.
OpenGL ES™: OpenGL ES is a trademark of Khronos Group, Inc.
DynamIQ™: DynamIQ is a trademark of Arm Limited.
OctaFlash™: OctaFlash is a trademark of Macronix International Co., Ltd.
eMMC™: eMMC is a trademark of MultiMediaCard Association.

Note that in each section of the Manual, trademark notation of ® and TM may be omitted.
All other trademarks and registered trademarks are the property of their respective owners.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.
2. Processing at power-on
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.
3. Input of signal during power-off state
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.
4. Handling of unused pins
   Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.
5. Clock signals
   After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.
6. Voltage application waveform at input pin
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).
7. Prohibition of access to reserved addresses
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.
8. Differences between products
   Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Table of Contents

6. System Controller (SYSC) 165

7. Clock Pulse Generator (CPG) 233

18. General PWM Timer (GPT)....1024

1. Overview

1.1 Introduction

The RZ/G2L and RZ/G2LC includes:

- RZ/G2L RZ/G2LC
  - 1.2 GHz Arm® Cortex®-A55 Dual / Single MPCore cores,
  - 200-MHz Arm® Cortex®-M33 core,
  - 500-MHz Arm® Mali™-G31,
  - Memory controller for DDR4-1600 / DDR3L-1333 with 16 bits,
  - Video processing unit,
  - USB2.0 host / function interface,
  - Gigabit Ethernet interface,
  - SD card host interface,
  - CAN interface,
  - Sound interface.

- RZ/G2L
  - 1 channel MIPI DSI interface or 1channel parallel output interface selectable,
  - 1 channel MIPI CSI-2 input interface or 1channel parallel input interface selectable

- RZ/G2LC
  - 1 channel MIPI DSI interface,
  - 1 channel MIPI CSI-2 input interface

NOTE

Arm and Cortex are registered trademark of Arm Limited. All other brands or product names are the property of their respective holders.

1.2 List of Specifications

1.2.1 CPU Core

Item	Description
System CPU Cortex-A55	[RZ/G2L RZ/G2LC] ● Arm Cortex-A55 Dual / Single MPCore 1.2 GHz ● L1 I-cache 32 Kbytes (Parity) / D-cache 32 Kbytes (ECC) ● L2 cache 0 Kbyte ● L3 cache 256 Kbytes (ECC) ● Arm® NEON™ / FPU supported ● Cryptographic Extension supported ● Arm® v8.2-A architecture
System CPU Cortex-M33	[RZ/G2L RZ/G2LC] ● Arm Cortex-M33 Processor 200 MHz ● Security Extension supported ● Arm® v8-M architecture
Boot	[RZ/G2L RZ/G2LC] ● 6 boot modes Boot Mode 0: Booting from eSD Boot Mode 1: Booting from eMMC (1.8 V) Boot Mode 2: Booting from eMMC (3.3 V) Boot Mode 3: Booting from a serial flash memory (Single / Quad / Octal) connected to the SPI Multi I/O bus space (1.8 V) Boot Mode 4: Booting from a serial flash memory (Single / Quad) connected to the SPI Multi I/O bus space (3.3 V) Boot Mode 5: Booting from SCIF download
Debug Interface	[RZ/G2L RZ/G2LC] ● Arm® CoreSight™ architecture ● JTAG / SWD interface supported ● ETF 16 Kbytes for program flow trace (each cluster) ● JTAG Disable supported

1.2.2 CPU Peripheral

Item	Description
Clock Pulse Generator (CPG)	[RZ/G2L RZ/G2LC] ● Generates the clocks from external clock (EXCLK 24 MHz). Maximum Arm Cortex-A55 clock: 1.2 GHz Maximum Arm Cortex-M33 clock: 200 MHz Maximum DDR clock: 666 MHz (DDR3L-1333), 800 MHz (DDR4-1600) Maximum 3DGE clock: 500 MHz Maximum VCP clock: 200 MHz Maximum AXI-bus clock: 200 MHz Maximum APB-bus clock: 100 MHz ● SSC (Spread Spectrum Clock) supported
Direct Memory Access Controller (DMAC)	[RZ/G2L RZ/G2LC] ● 2 modules, 16 channels per module ● Transfer request: On-chip peripheral request / auto request (software trigger) ● A specific DMA transfer interval can be specified to adjust the bus occupancy. ● LINK mode (DMA transfer under descriptor control) supported ● Transfer information can be automatically reloaded
Interrupt Controller	[RZ/G2L RZ/G2LC] ● Arm® CoreLink™ Generic Interrupt Controller (GIC-600) for Arm Cortex-A55 ● Nested Vectored Interrupt Controller (NVIC) for Arm Cortex-M33 ● External Interrupt pins (NMI, IRQ7 to IRQ0*1, TINT31-0) ● On-chip peripheral Interrupts: Priority level set for each module *Note 1.* [RZ/G2LC] IRQ0,1,4-7 are available.
Message Handling Unit (MHU)	[RZ/G2L RZ/G2LC] ● Message handling function between Arm Cortex-A55 and Arm Cortex-M33 ● Assert interrupt to inform message and response from/to Arm Cortex-A55, Cortex-M33
General-purpose I/O (GPIO)	[RZ/G2L RZ/G2LC] ● General-purpose I/O ports
Thermal Sensor Unit (TSU)	[RZ/G2L RZ/G2LC] ● 1 channel

1.2.3 Internal Memory

Item	Description
On-chip RAM	[RZ/G2L RZ/G2LC] ● RAM of 128 Kbytes (ECC)

1.2.4 External Memory Interface

Item	Description
External Bus Controller for DDR3L / DDR4 SDRAM (DDR)	[RZ/G2L RZ/G2LC] ● Support DDR3L-1333 / DDR4-1600 ● Bus Width: 16-bit ● In line ECC supported (Support error detection interrupt) ● Memory Size: Up to 4 Gbyes ● Auto Refresh supported
SPI Multi I/O Bus Controller	[RZ/G2L] ● 1 channel (8-bit Double data rate) ● Up to 2 serial flash memories with multiple I/O bus sizes (single / quad) can be connected ● Connectable with 1 Octal-SPI flash memory ● Connectable with 1 HyperFlash memory ● External address space read mode (built-in read cache) ● SPI operation mode ● Maximum Clock Frequency: – 50 MHz (Quad-SPI DDR) – 66 MHz (Quad-SPI SDR) – 100 MHz (Octal-SPI, HyperFlash) [RZ/G2LC] ● 1 channel (4-bit Double data rate) ● 1 serial flash memories with multiple I/O bus sizes (single / quad) can be connected ● External address space read mode (built-in read cache) ● SPI operation mode ● Maximum Clock Frequency: 50 MHz (Quad-SPI DDR), 66 MHz (Quad-SPI SDR)
SD Card Host Interface / Multimedia Card Interface (SD/MMC)	[RZ/G2L RZ/G2LC] ● 2 channels ● Channel 0 supports SDHI / e-MMC (boot supported) ● Channel 1 supports SDHI ● SD memory I/O card interface (1-bit / 4-bit SD bus) ● SD, SDHC and SDXC SD memory card access supported ● Compliant with SD 3.0 ● Default, high-speed, UHS-I/SDR50, SDR104 transfer modes supported ● Error check function: CRC7 (Command/response), CRC16 (Data) ● Card detection function, write protect supported ● MMC interface (1-bit / 4-bit / 8-bit MMC bus) ● e-MMC device access supported ● Compliant with eMMC 4.51 ● High-speed, HS200 transfer modes supported

1.2.5 Graphics Unit

Item	Description
3D Graphics Engine (3DGE)	[RZ/G2L RZ/G2LC] ● Arm Mali-G31 ● One single-pixel shader core ● 8 Kbytes L2 Cache ● OpenGL ES1.1 / 2.0 / 3.0 / 3.1 and 3.2 Supported ● OpenCL 2.0 Full Profile Supported

1.2.6 Video Processing Unit

Item	Description
Video Codec Processor (VCP)	[RZ/G2L] ● H.264 codec module ● Encoding / Decoding support – H.264 / AVC (High Profile / Main Profile / Baseline Profile) – H.264 / MVC (Stereo High Profile) ● Maximum pixel rate: 1920 × 1080 × 30 fps ● Color format (input in encoding): YcbCr 4:2:0 semi-planar supported ● Color format (output in decoding): YcbCr 4:2:0 semi-planar supported
Image Scaling Unit (ISU)	[RZ/G2L RZ/G2LC] ● Scaling down function with bilinear interpolation ● Input image Size (max): 5M (2800 × 2047) ● Output image Size (max): Full HD (1920 × 1080) ● Support Color format Conversion ● RGB / ARGB / YcbCr422 / YcbCr420 / RAW (Grayscale)

1.2.7 Camera Interfaces

Item	Description
MIPI CSI-2 Interface	[RZ/G2L RZ/G2LC] ● 1 channel ● The number of Lane: 1-/2-/4-lane ● Support 5MP, 30 fps (RAW12) ● Maximum Bandwidth: 1.5 Gbps per lane ● Select 1 VC from 4 VC (virtual channel) supported ● Support Input Image Data Formats: – YUV420 8-bit / 10-bit – Legacy YUV420 8-bit – YUV420 8-bit / 10-bit (Chroma Shifted Pixel Sampling) – YUV422 8-bit / 10-bit – RGB444 / RGB555 / RGB565/ RGB666 / RGB888 – RAW6 / RAW7 / RAW8 / RAW10 / RAW12 / RAW14 / RAW16 / RAW20 ● Generic short packet code 1 / 2 / 3 / 4 / 5 / 6 / 7 / 8 ● Generic long packet data type 1 / 2 / 3 / 4 ● User Defined 8-bit data type 1 / 2 / 3 / 4 / 5 / 6 / 7 / 8
Parallel Input Interface	[RZ/G2L] ● 1 channel ● Support ITU-R BT.656 Interface (Interlace supported, YcbCr422 8-bit / 10-bit) ● Support HD – 30 fps (YCbCr422 Interleave), 60 fps (YCbCr422 Y/CbCr separate data, binary data) – Maximum input pixel frequency: 108 MHz ● Support Input Data Format: – YcbCr422 8-bit / 10-bit – Binary data 16-bit ● VSYNC / HSYNC / FIELD timing signal supported

Item	Description
RZ/G2L MIPI CSI-2 / Parallel to AXI Bridge Module RZ/G2LC MIPI CSI-2 to AXI Bridge Module	[RZ/G2L] ● 1 channel (MIPI CSI-2 Input or Parallel Input) ● Support Image Processing: – Clipping – Frame Sampling – LUT – Color format conversion – Color space conversion – Demosaicing – Linear Matirix – Statistics ● Support Color Formats for Image Processing: – YUV422 8-/10-bit – RGB565 / RGB666 / RGB888 – RAW8 / 10 / 12 / 14 / 16 (Clipping and Frame Sampling only) ● Support Output Data Formats: – YCbCr422 8-bit (Interleave/Semi planar, Interlace/Progressive) – YCbCr420 8-bit (Interleave, Interlace) – Y-Only – RGB888 / ARGB8888 – RAW8 / 10 / 12 / 14 / 16 (without Image Processing) – MIPI CSI-2 V2.1 Recommended Memory storage data (without Image Processing) [RZ/G2LC] ● 1 channel (MIPI CSI-2 Input) ● Support Image Processing: – Clipping – Frame Sampling – LUT – Color format conversion – Color space conversion – Demosaicing – Linear Matirix – Statistics ● Support Color Formats for Image Processing: – YUV422 8/10-bit – RGB565 / RGB666 / RGB888 – RAW8 / 10 / 12 / 14 / 16 (Clipping and Frame Sampling only) ● Support Output Data Formats: – Y-Only – RGB888 / ARGB8888 – RAW8/10/12/14/16 (without Image Processing) – MIPI CSI-2 V2.1 Recommended Memory storage data (without Image Processing)

1.2.8 Display Interface

Item	Description
LCD Controller	[RZ/G2L] ● 1 channel (MIPI DSI output or Parallel output) [RZ/G2LC] ● 1 channel (MIPI DSI output) [RZ/G2L RZ/G2LC] ● 2 planes blending (can blend 2 different size images) ● Support Image Processing: – Dither processing (RGB666) – Clipping – RGB Gamma Correction LUT ● Support Input Data Format: – RGB565 / RGB666 / RGB888 – ARGB1555 / ARGB4444 / ARGB8888 – YcbCr444 8-bit / YcbCr422 8-bit / YcbCr420 8-bit
MIPI DSI Interface	[RZ/G2L RZ/G2LC] ● 1 channel ● The number of Lane: 4-lane ● Support up to Full HD (1920 × 1080), 60 fps (RGB888) ● Maximum Bandwidth: 1.5 Gbps per lane ● Support Output Data Format: – RGB666 / RGB888
Parallel Output Interface	[RZ/G2L] ● 1 channel ● Support WXGA (1280 × 800), 60 fps ● Support Output Data Format: – RGB666 / RGB888 ● CLK / HD / VD timing signal supported

1.2.9 Sound Interface

Item	Description
Serial Sound Interface (SSI)	[RZ/G2L] ● 4 channels bidirectional serial transfer [RZ/G2LC] ● 3 channels bidirectional serial transfer [RZ/G2L RZ/G2LC] ● 2 external clock sources available ● Full Duplex communication (channel 0, 1, and 3) ● Support of I2S / Monaural / TDM audio formats ● Support of master and slave functions ● Generation of programmable word clock and bit clock ● Multi-channel formats ● Support of 8, 16, 18, 20, 22, 24, and 32-bit data formats ● Support of 32-stage FIFO for transmission and reception ● Support of LR-clock continue function in which the LR-clock signal is not stopped
Sampling Rate Converter (SRC)	[RZ/ G2L RZ/G2LC] ● 1 channel ● Data format: 16-bit (stereo / monaural) ● Sampling Rate Input: Selectable from 8 kHz, 11.025 kHz, 12 kHz, 16 kHz, 22.05 kHz, 24 kHz, 32 kHz, 44.1 kHz, 48 kHz Output: Selectable from 8 kHz*, 16 kHz*, 32 kHz, 44.1 kHz, 48 kHz (*: can select in 44.1 kHz input mode) ● SNR: More than or equal to 80 db

1.2.10 Storage and Network

Item	Description
USB2.0 Host / Function (USB)	[RZ/G2L RZ/G2LC] ● 2 channels (ch0: Host-Function ch1: Host only) ● Compliance with USB2.0 ● Supports On-The-Go (OTG) Function ● Supports Battery Charging Function ● Internal dedicated DMA
Gigabit Ethernet Interface (GbE)	[RZ/G2L] ● 2 channels [RZ/G2LC] ● 1 channel [RZ/G2L RZ/G2LC] ● Supports transfer at 1000 Mbps and 100 Mbps, 10 Mbps ● Supports filtering of Ethernet frames ● Supports interface conforming to IEEE802.3 PHY RGMII (Reduced Gigabit Media Independent Interface) ● Supports interface conforming to IEEE802.3 PHYMII (Media Independent Interface)
CANFD Interface (RS-CANFD)	[RZ/G2L RZ/G2LC] ● 2 channels ● ISO 11898-1 (2003) compliant ● CAN-FD ISO 11898-1 (CD2014) compliant ● Message buffer – Up to 64 × 2-channel receive message buffer: Shared among all channels – 16 transmit message buffers per channel

1.2.11 Timer

Item	Description
Multi-function Timer Pulse Unit 3 (MTU3a)	[RZ/G2L] ● 9 channels (16 bits × 8 channels, 32 bits × 1 channel) [RZ/G2LC] ● 8 channels (16 bits × 7 channels, 32 bits × 1 channel) [RZ/G2L RZ/G2LC] ● Module clock frequency (P0ϕ): 100 MHz ● Maximum 28 lines of pulse inputs/outputs and 3 lines of pulse inputs ● 14 types of count clocks selectable ● Input capture function ● 39 outputs compare and input capture registers ● Counter clear operation (Simultaneous counter clearing by Compare match or Input capture is available) ● Simultaneous writing to multiple timer counters (TCNT) ● Synchronous input/output of each register due to synchronous operation of the counter ● Buffered operation ● Cascade-connected operation ● 43 types of interrupt sources ● Automatic transfer of register data ● Pulse output modes Toggle, PWM, complementary PWM, and reset-synchronized PWM modes ● Synchronization of multiple counters ● Phase counting mode – 16-bit mode (channel 1 and 2) – 32-bit mode (channel 1 and 2) ● Counter function of dead time compensation ● Digital filter functions for the input capture and external count clock pin
Port Output Enable 3 (POE3)	[RZ/G2L RZ/G2LC] ● Control of the high-impedance state of the MTU3a waveform output pins ● Activation with four input pins ● Activation on detection of short-circuited outputs (detection of simultaneous PWM output to the active level) ● Activation by register write ● Additional programming of output control target pins is possible.

Item	Description
General PWM Timer (GPT)	[RZ/G2L] ● 32 bits × 8 channels [RZ/G2LC] ● 32 bits × 6 channels [RZ/G2L RZ/G2LC] ● Counting up or down (sawtooth wave), counting up and down (triangular wave) selectable for all channels ● Independent selectable for each channel ● 2 input/output pins per channel ● 2 output compare / input capture registers per channel ● For the 2 output compare / input capture registers of each channel, 4 registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use ● In output compare operation, buffer switching can be at peaks or troughs, enabling the generation of laterally asymmetrically PWM waveforms ● Registers for setting up frame intervals on each channel (with capability for generating interrupts on overflow or underflow) ● Generation of dead times in PWM operation ● Synchronous start / stop / clear of counters on arbitrary channels ● Starting, stopping, and clearing up/down counters in response to a maximum of eight events ● Starting, stopping, and clearing up/down counters in response to input level comparison ● Starting, stopping, and clearing up/down counters in response to a maximum of four external triggers ● Output pin invalidation functions due to dead time error or detection of short circuit between output pins ● Digital filter functions for the input capture and external trigger pins
Port Output Enable for GPT (POEG)	[RZ/G2L RZ/G2LC] ● Output prohibition control of the GPT waveform output pin ● Activation with up to four input pins ● Activation by dead time error detection or output short detection ● Activation by register write
Watchdog Timer (WDT)	[RZ/G2L RZ/G2LC] ● 3 channels ● A counter overflow can reset the LSI ● CPU parity error can reset the LSI
General Timer (GTM)	[RZ/G2L RZ/G2LC] ● 32 bits × 3 channels ● Two operating modes – Interval timer mode – Free-running comparison mode

1.2.12 Peripheral Module

Item	Description
I2C Bus Interface (I2C)	[RZ/G2L RZ/G2LC] ● 4 channels ● Master mode and slave mode supported ● Support for 7-bit and 10-bit slave address formats ● Support for multi-master operation ● Timeout detection
Serial Communication Interface with FIFO (SCIFA)	[RZ/G2L] ● 5 channels [RZ/G2LC] ● 4 channels [RZ/G2L RZ/G2LC] ● Clock synchronous mode or asynchronous mode selectable ● Simultaneous transmission and reception (full-duplex communication) supported ● Dedicated baud rate generator ● Separate 16-byte FIFO registers for transmission and reception ● Modem control function (channel 0, 1, and 2 in asynchronous mode)
Serial Communication Interface (SCIg)	[RZ/G2L RZ/G2LC] ● 2 channels ● Clock synchronous mode, asynchronous mode, or smart card interface mode is selectable ● Simultaneous transmission and reception (full-duplex communication) supported ● Dedicated baud rate generator ● LSB first / MSB first selectable ● Modem control function ● Encoding and decoding of IrDA communications waveforms in accord with version 1.0 of the IrDA standard (on channel 0)
Renesas Serial Peripheral Interface (RSPI)	[RZ/G2L RZ/G2LC] ● 3 channels ● SPI operation ● Master mode and slave mode supported ● Programmable bit length, clock polarity, clock phase can be selected ● Consecutive transfers ● LSB first / MSB first selectable

1.2.13 Security

Item	Description
Trusted Secure IP (TSIP) [option]	[RZ/G2L RZ/G2LC] ● Security algorism – Common key encryption: AES – Non-common key encryption: RSA, ECC ● Other features – TRNG (true-random number generator) – Hash value generation: SHA-1, SHA-224, SHA-256, GHASH – Support of Unique ID
One Time Programmable memory (OTP)	[RZ/G2L RZ/G2LC] ● A nonvolatile memory that can be written only once ● Security setting, authentication setting are possible ● Support one time read function (512 bytes)

1.2.14 Analog

Item	Description
A/D Converter (ADC)	[RZ/G2L] ● 8 channels ● Resolution: 12-bit ● Input Range: 0 V ~ 1.8 V ● Conversion Time: 1 µs ● Operation Mode: Select mode / scan mode ● Conversion Mode: Single mode / repeat mode ● Condition for A/D conversion start – Software trigger – Asynchronous trigger: External trigger supported – Synchronous trigger: MTU and PWM timer

1.2.15 Others

Item	Description
Boundary Scan	[RZ/G2L RZ/G2LC] ● Boundary scan based on IEEE 1149.1 via JTAG interface is supported. Note that some module pins are not available on this boundary scan.

1.2.16 Power Supply Voltage

Item	Description
Power supply voltage	[RZ/G2L RZ/G2LC] ● V_{DD}, PLLn_DV_{DD11} (n = 23, 5): 1.05 to 1.15 V ● DDR_V_{DDQ}: 1.14 to 1.26 V (DDR4) / 1.283 to 1.45 V (DDR3L) ● V_{DD18}, ADC_AV_{DD18}, PLLn_AV_{DD18} (n = 1, 23, 4, 5, 6): 1.62 to 1.98 V ● OTP_V_{DD18}, USB_V_{DD18}, CSI_V_{DD18}, DSI_V_{DD18}: 1.65 to 1.95 V ● PV_{DD}: 2.97 to 3.63 V ● USB_V_{DD33}: 3.00 to 3.60 V ● SDn_PV_{DD} (n = 0, 1), SPI_PV_{DD}: 2.97 to 3.63 V / 1.70 to 1.95 V ● $PV_{DD182533}$: 2.97 to 3.63 V / 2.25 to 2.75 V / 1.62 to 1.98 V

1.2.17 Temperature Range

Item	Description
Temperature range	[RZ/G2L RZ/G2LC] ● T_a: −40°C to +85°C*[1] ● T_j: −40°C to +125°C

Note 1. If wider temp is required than this range, use case has to be investigated.

1.2.18 Quality level

Item	Description
Quality level	[RZ/G2L RZ/G2LC] ● Industrial usage, etc.

1.2.19 Package

Item	Description
Package	[RZ/G2L] ● 551-pin BGA, 21-mm square, 0.8-mm pitch ● 456-pin BGA, 15-mm square, 0.5-mm pitch [RZ/G2LC] ● 361-pin BGA, 13-mm square, 0.5-mm pitch

1.3 Product Lineup

Table 1.1 Product Lineup

Group	Package	Part Number	CPU	Security*[1]
RZ/G2L	21 mm BGA	R9A07G044L28GBG	2× Cortex-A55, 1× Cortex-M33	Available
		R9A07G044L18GBG	1× Cortex-A55, 1× Cortex-M33	
		R9A07G044L24GBG	2× Cortex-A55, 1× Cortex-M33	Not supported
		R9A07G044L14GBG	1× Cortex-A55, 1× Cortex-M33	
	15 mm BGA	R9A07G044L27GBG	2× Cortex-A55, 1× Cortex-M33	Available
		R9A07G044L17GBG	1× Cortex-A55, 1× Cortex-M33	
		R9A07G044L23GBG	2× Cortex-A55, 1× Cortex-M33	Not supported
		R9A07G044L13GBG	1× Cortex-A55, 1× Cortex-M33	
RZ/G2LC	13 mm BGA	R9A07G044C26GBG	2× Cortex-A55, 1× Cortex-M33	Available
		R9A07G044C16GBG	1× Cortex-A55, 1× Cortex-M33	
		R9A07G044C22GBG	2× Cortex-A55, 1× Cortex-M33	Not supported
		R9A07G044C12GBG	1× Cortex-A55, 1× Cortex-M33	

Note 1. The product with security function supports the following features.

- — Crypto Extension (Cortex-A55 configuration)
- — Trusted Secure IP
- — Trust Zone
- — Secure Software PKG
- — Secure Boot
- — Secure Debug
- — HW Key protection
- — True Random Generator
- — Trusted Execution Environment (TEE)

Note: RZ/G2LC specification is not written in individual chapters later.
Regarding *RZ/G2LC specification*, see *Section 1, Overview*.

2. System CPU Cortex-A55

The Cortex-A55 system CPU is a core block equipped with single Cortex-A55 core or dual Cortex-A55 cores. For details on the functions including interrupts of the Cortex-A55, see the Arm® Cortex®-A55 Core Technical Reference Manual and related documents in **Section 2.4**. For details of interrupt type and control, see the chapter on Interrupt Controller.

2.1 Features

The Cortex-A55 incorporates an extensively redesigned microarchitecture system that improves performance across the board while being very competitive in area and power efficiency.

Table 2.1 Function Summary

	Description
CPU	● 1.2 GHz Single Cortex-A55 r2p0 (Armv8-A) core or dual Cortex-A55 r2p0 (Armv8-A) cores
Cache memory	● L1$ (I/D) = 32 KB(Parity) / 32 KB (ECC) ● L2$ = None ● L3$ = 256 KB (ECC)

Table 2.2 Core Configuration

	Value	Description
L1 instruction cache size	32 KB	L1 instruction cache = 32 KB (Parity)
L1 data cache size	32 KB	L1 data cache = 32 KB (ECC)
L3 cache size	256 KB	L3 cache = 256KB (ECC), Shared with Dual cores
ECC or parity core cache protection	Included	Support for core cache ECC
Advanced SIMD and floating-point support (including dot product instruction support)	Included	Support for NEON™ FPU engine
Cryptographic extension	Included (option)	Support for cryptography engine
Big endian	N/A	Not supported

2.2 Resets

Table 2.3 shows the supported types of reset and the areas that are reset by the respective types. For the procedures of handling the individual resets, see **Section 2.2.1** and the subsequent parts. See the Arm® DynamIQ™ Shared Unit Technical Reference Manual and Arm® Cortex®-A55 Core Technical Reference Manual.

Table 2.3 Areas to be Reset

Reset Function	Areas to be Reset
Cold reset	Entire area
Cluster warm reset	Entire area of the cluster except for the debug, RAS, and ETM registers + core 0 (and core 1 in dual-core devices)
Core warm reset	Entire area of the target core except for the debug, RAS, and ETM registers
Debug reset	DebugBlock

The P-Channels can be used to control safety in resetting. For details on the P-Channels, see the AMBA® Low Power Interface Specification Arm® Q-Channel and P-Channel Interfaces. For details on registers for controlling the P-Channel and reset pins, see the chapter on the clock pulse generator (CPG). **Table 2.4** shows the supported power modes for each P-Channel. Transitions to power modes other than those listed in the table below are not supported.

Table 2.4 Supported Power Modes

PSTATE	Power Mode
CLUSTERPSTATE[6:0]	● 100_1000b (ON) ● 000_0000b (OFF)
COREPSTATE0[5:0]	● 00_1000b (ON) ● 00_0001b (OFF_EMU) ● 00_0000b (OFF)
COREPSTATE1[5:0]	● 00_1000b (ON) ● 00_0001b (OFF_EMU) ● 00_0000b (OFF)

Reset address vector can be set by below Reset Vector Address Configuration Registers. For details, see the chapter of System Controller.

CA55 Core0 Reset Vector Address High/Low Configuration Register:
SYS_CA55_CFG_RVAH0 / SYS_CA55_CFG_RVAL0

CA55 Core1 Reset Vector Address High/Low Configuration Register:
SYS_CA55_CFG_RVAH1 / SYS_CA55_CFG_RVAL1

To change reset vector address, follow the procedure below.

1. Store codes to new reset address.
2. Write the new reset address to CA55 Reset Vector Address Configuration Registers.
3. Issue reset to target core(s).

2.2.1 Cold Reset

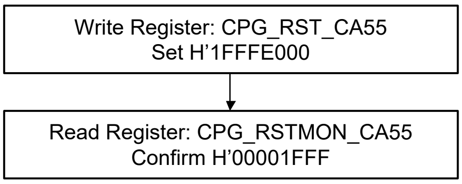
A cold reset is applied at any of the following cases.

(a) The sequence of a power-on reset by the CPG is executed.

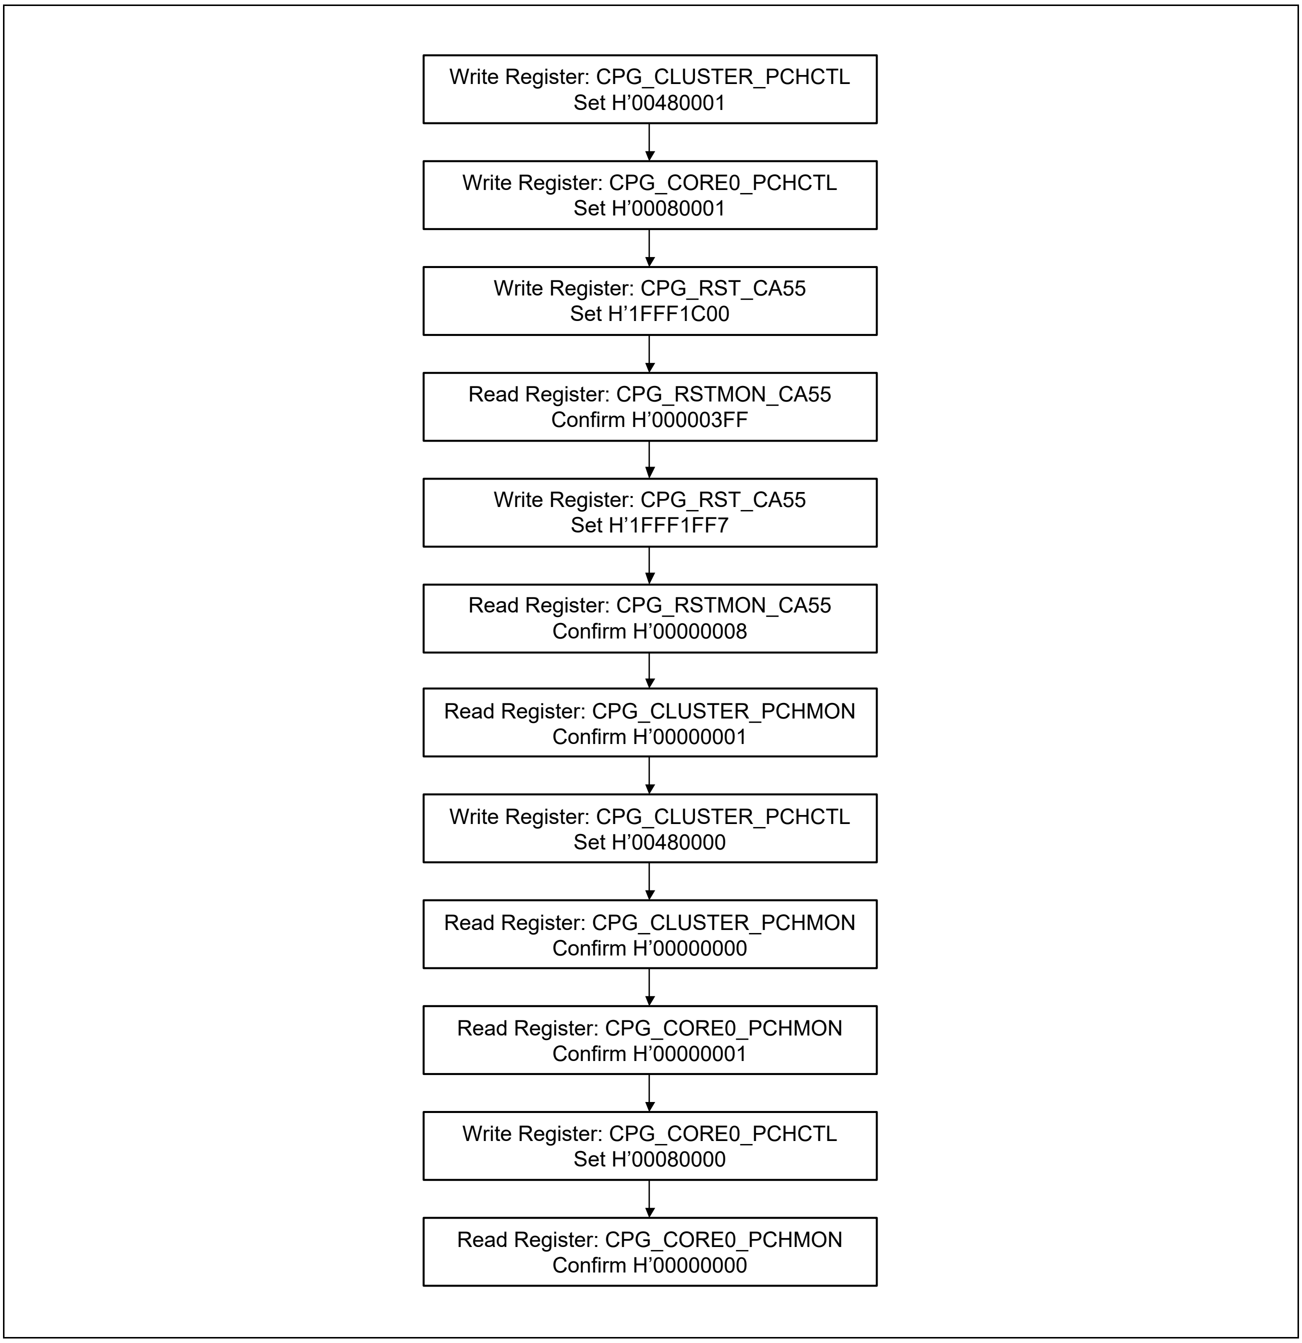
(b) The WDT counter has overflowed or a non-correctable error has been detected.

(c) Software control by the Cortex-M33 system CPU is applied.

For details on (a) and (b) reset, see the chapters on the clock pulse generator (CPG) and watchdog timer (WDT), respectively. To apply a cold reset by case c reset, follow the procedure below.



To release cold reset and start core 0 by case c reset, follow the procedure below.



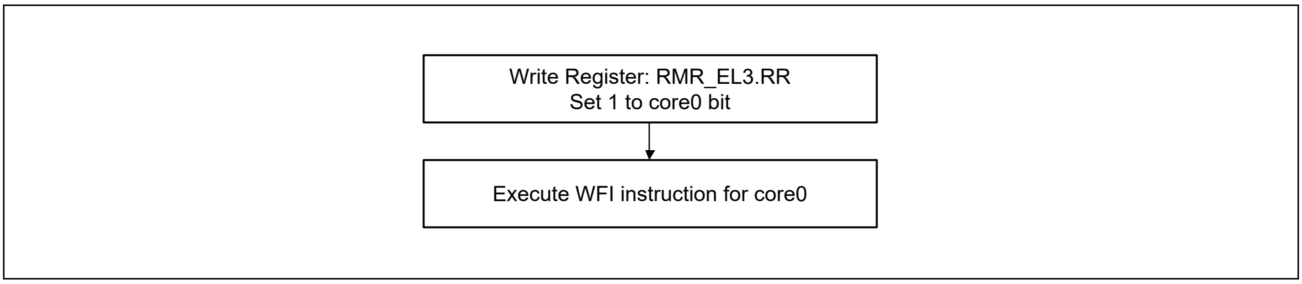
Procedure to start core 1 after having started core 0 is the same as that in the power-on reset sequence. For details, see the chapter on the clock pulse generator (CPG).

2.2.2 Core Warm Reset

There are the two types of core warm reset: internal and external resets. The former requires software control by the Cortex-A55 system CPU itself and the latter requires software control by the Cortex-A55 and Cortex-M33 system CPUs. Though the Cortex-A55 system CPU handles an internal reset in the same way as an external reset, if you intend to reset a single core, we recommend using an internal reset because handling this requires fewer steps than an external reset. An external reset is mainly used as part of a cluster warm reset, which is described in **Section 2.2.3**.

To apply an internal reset to core 0, follow the procedure below.

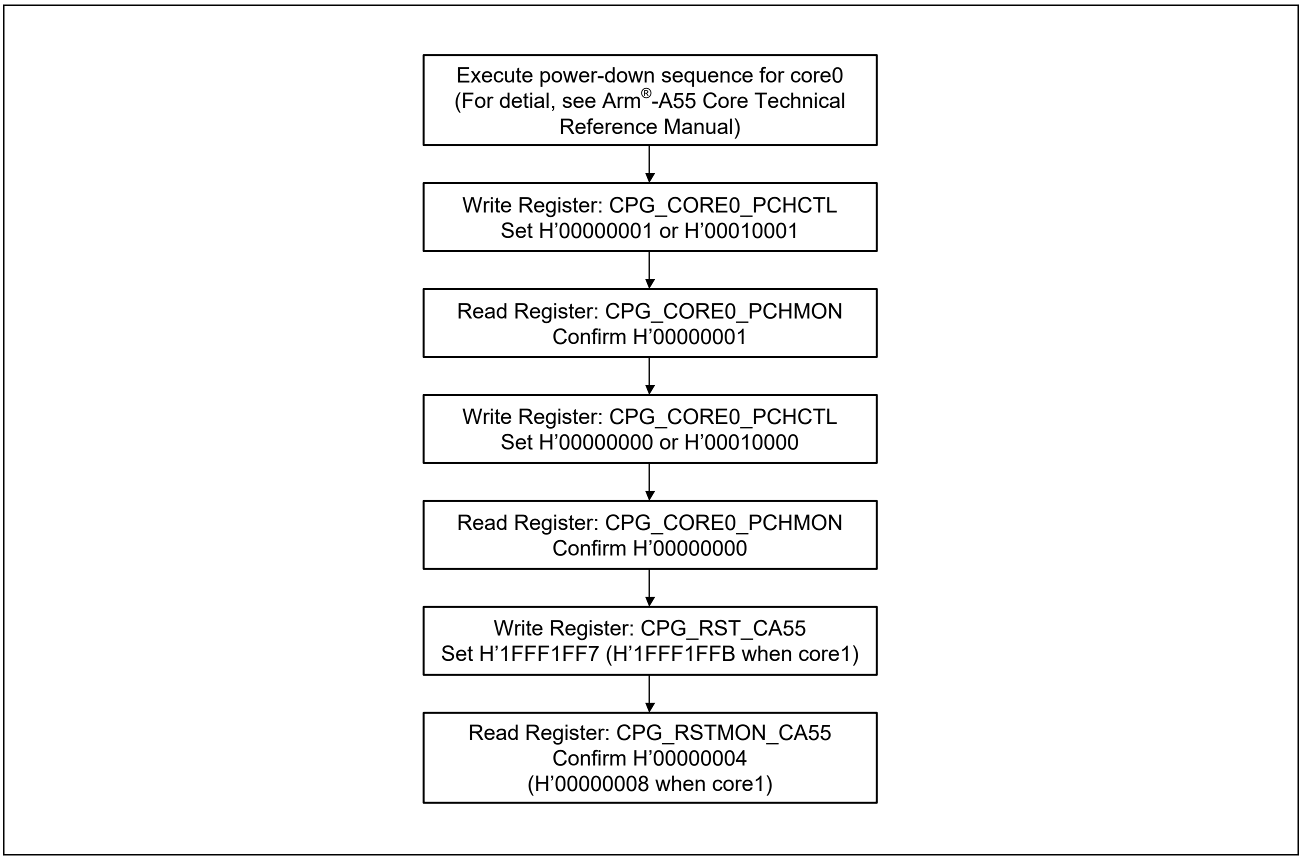
To apply an internal reset to core 1, read “core 0” as “core 1” in the sentences below.



Release from an internal reset is automatic following application of the reset. No specific processing is required. For details, see the Arm® DynamIQ™ Shared Unit Technical Reference Manual and Arm® Cortex®-A55 Core Technical Reference Manual.

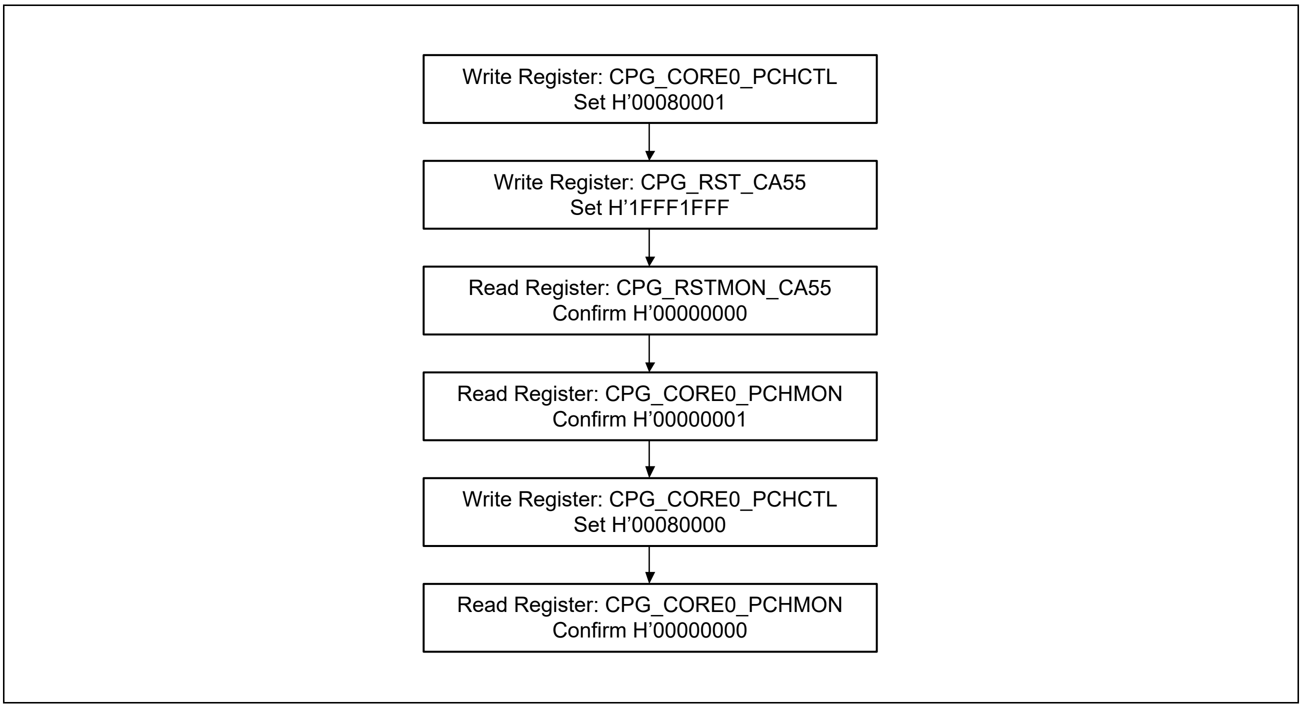
To apply an external reset to core 0, follow the procedure below.

To apply an external reset to core 1, read “core 0” as “core 1” in the sentences below.



To release core 0 from the core warm reset state and start the core, follow the procedure below.

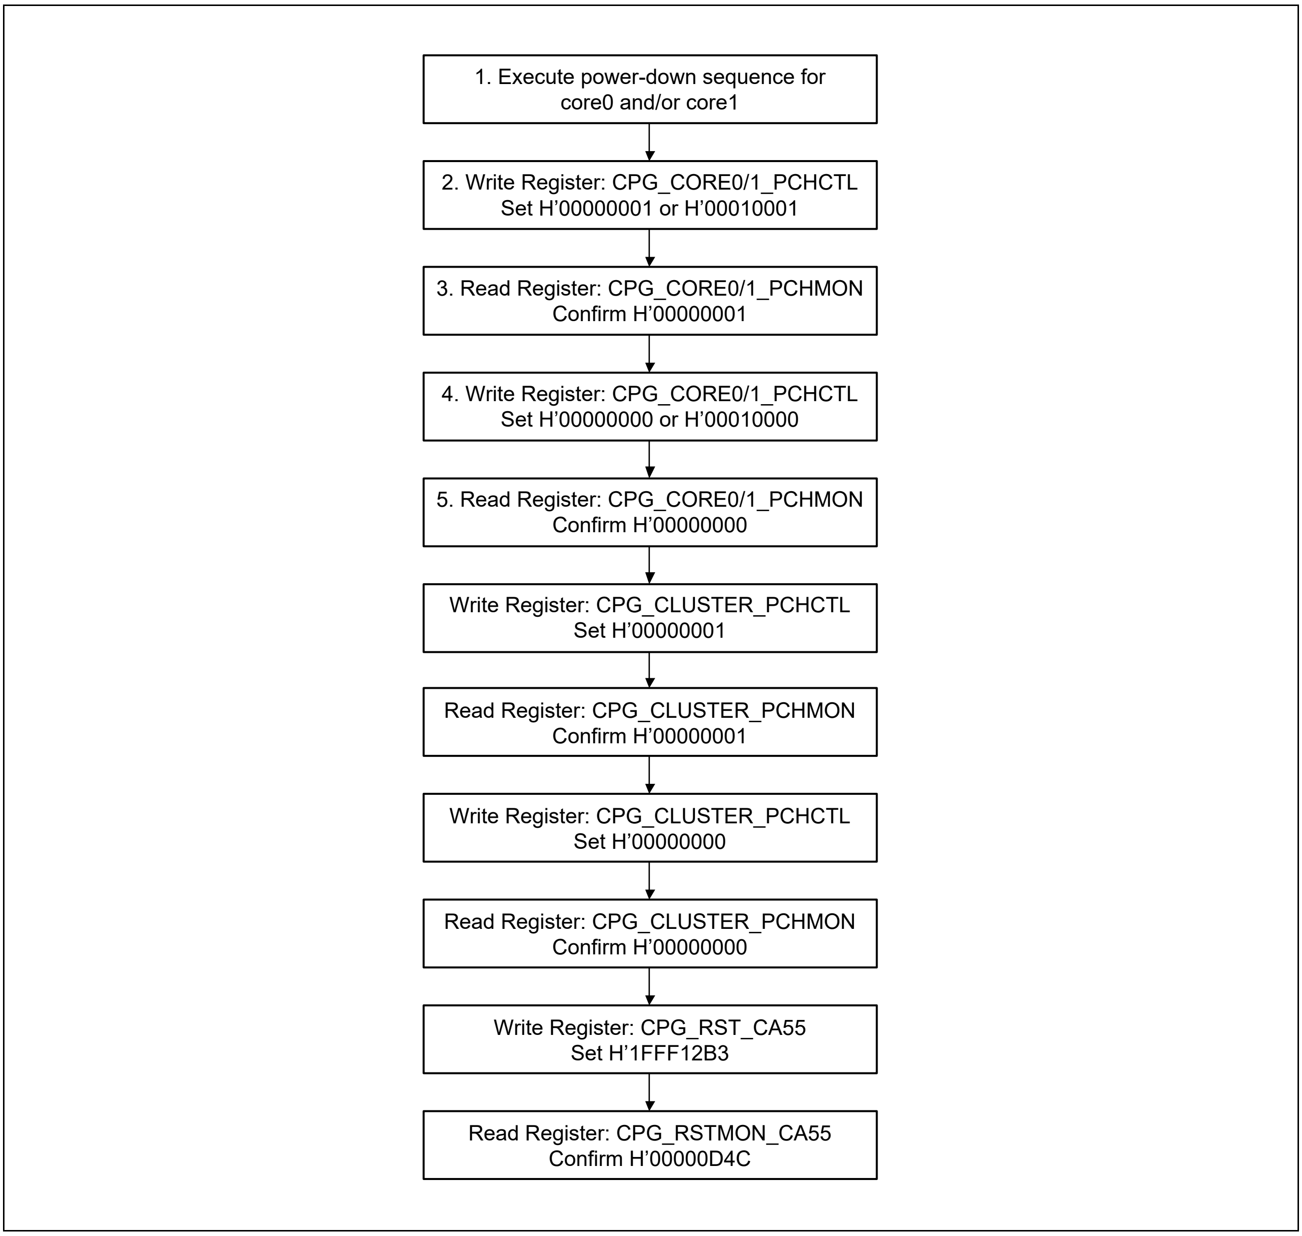
To start core 1, read “core 0” as “core 1” in the sentences below.



2.2.3 Cluster Warm Reset

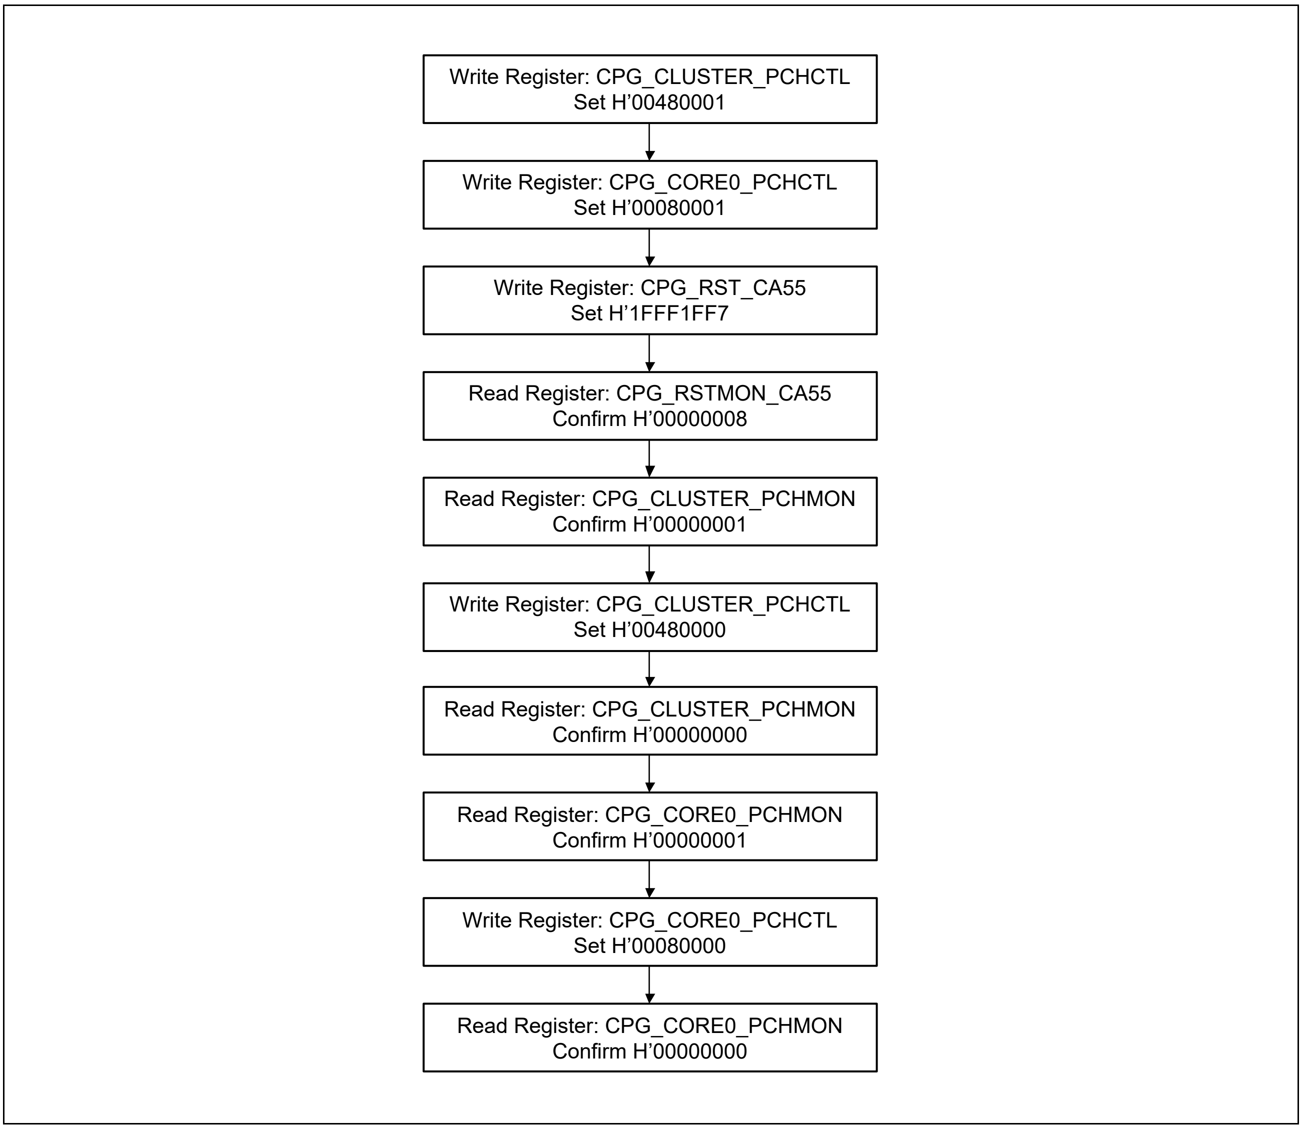
This reset requires software control by the Cortex-A55 and Cortex-M33 system CPUs.

To apply this reset for core0 and/or core1, follow the procedure below.



To release from the cluster warm reset state and start core 0, follow the procedure below.

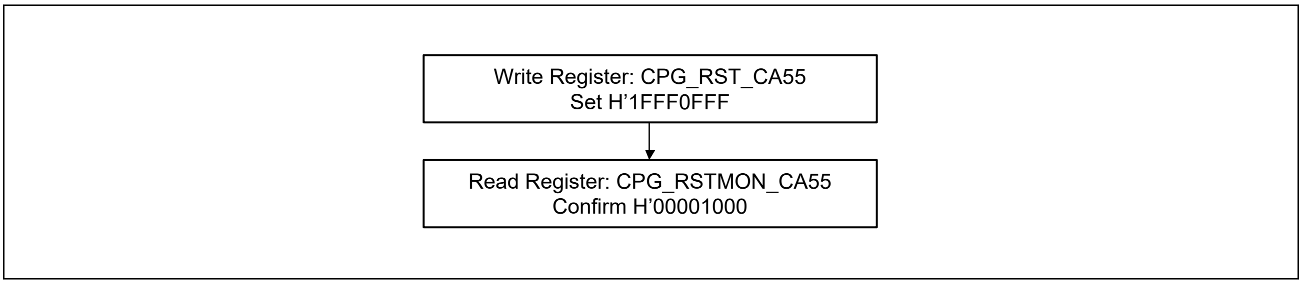
The procedure to start core 1 after having started core 0 is the same as that in the power-on reset sequence. For details, see the chapter on the clock pulse generator (CPG).



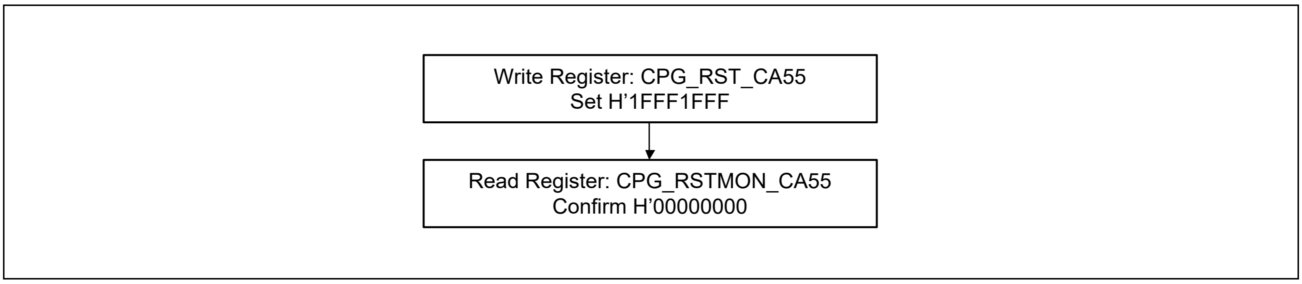
2.2.4 Debug Reset

Debug resets can only be applied under software control.

To apply a debug reset, follow the procedure below.



To release from the debug reset state, follow the procedure below.

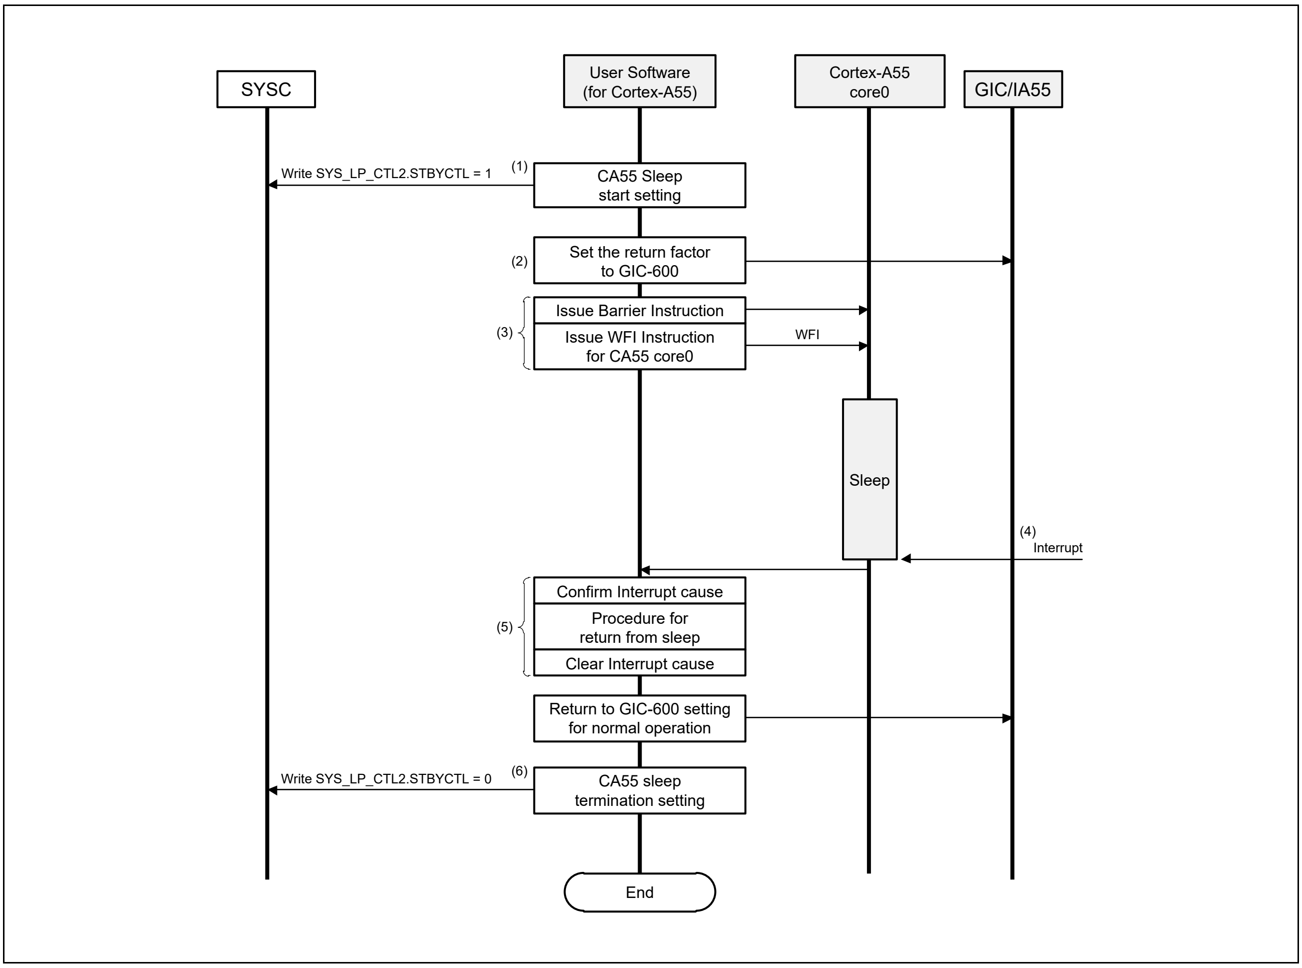


2.3 Low Power Consumption Mode

2.3.1 Cortex-A55 Sleep Mode

Cortex-A55 Sleep Mode of this LSI is a low power consumption mode obtained by having a core execute the WFI instruction. For details on the WFI instructions, see the Arm® Cortex®-A55 Core Technical Reference Manual and Arm® DynamIQ Shared Unit Technical Reference Manual.

The following procedure is the example sequence of a transition to Cortex-A55 Sleep Mode (core0).



(1) Set the STBYCTL bit of the SYS_LP_CTL2 register to 1 to start the Cortex-A55 Sleep Mode.

(2) Set the return factor to GIC. Enables only the interrupts used for return from the sleep mode and disables the interrupts used for the normal operation.

(3) Issue Barrier instruction.
Issue the WFI instruction for Cortex-A55 core0. The Cortex-A55 core0 is put into the sleep mode.

(4) Return from the sleep mode when the event occurs or the interrupt set in GIC occurs.

(5) Confirm the interrupt cause and perform the processing required for returning from the sleep mode.
And then clear the interrupt cause.
Set the end of interrupt to GIC.
Set the interrupt causes for the normal operation to GIC.

(6) Clear the STBYCTL bit of the SYS_LP_CTL2 register.

2.4 Function Reference

For details on the functions of the DynamIQ™ Shared Unit and Cortex-A55, see the documents listed below.

- Arm® DynamIQ Shared Unit Technical Reference Manual
- Arm® Cortex®-A55 Core Technical Reference Manual
- Arm® Cortex®-A55 Core Advanced SIMD and Floating-point Support Technical Reference Manual
- Arm® Cortex®-A55 Core Cryptographic Extension Technical Reference Manual

For details on clock and the controls, see the chapter on the clock pulse generator (CPG).

3. System CPU Cortex-M33

The Cortex-M33 system CPU is a core block equipped with an Arm Cortex-M33 CPU.

For details on the functions of the Cortex-M33, see the Arm® Cortex®-M33 Processor Technical Reference Manual.

Refer to **5.2.2, Cortex-M33 Address Space** in section 5 Internal BUS for CM33 address space.

3.1 Features

The Cortex-M33 processor is a highly energy-efficient processor that is intended for a microcontroller and deeply embedded applications. The processor is based on the Armv8-M architecture. For details on the functions of the Cortex-M33, see the Arm® Cortex®-M33 Processor Technical Reference Manual.

Table 3.1 Cortex-M33 Configuration

Description	Configuration
CPU	Cortex-M33 r0p4 (ARMv8-M)
Floating-point	No floating-points
DSP extension	No Armv8-M DSP extension
Security extension	Armv8-M security extension
Non-secure protected memory regions	16 regions
Secure protected memory regions	16 regions
Security attribution unit (SAU)	8 regions
Interrupts	480 interrupts
Number of bits of interrupt priority	8 bits are supported. 256 levels of priority are implemented.
Debug watchpoints and breakpoints	Full set 4 data watchpoint comparators and 8 breakpoint comparators
ITM and data watchpoint and trace (DWT) trace functionality	Complete ITM and DWT trace
Embedded trace macrocell (ETM)	ETM instruction execution trace
Micro trace buffer (MTB)	MTB is not supported.
Cross trigger interface (CTI)	CTI is included.
Wakeup interrupt controller (WIC)	WIC is included.
External coprocessor interface	Coprocessor hardware is not supported.

3.2 Address Space

For details on the address space, refer to the Arm® Cortex®-M33 Processor Technical Reference Manual.

3.2.1 IDAU Setting

The Cortex-M33 system CPU uses the IDAU. **Table 3.2** shows the security attributes assigned by the IDAU.

Table 3.2 IDAU Security Attributes

Area No.	Security Attribute	Lower Limit of Address Range	Upper Limit of Address Range
0	Non-secure	H’0000_0000	H’0FFF_FFFF
1	Secure	H’1000_0000	H’1FFF_FFFF
2	Non-secure	H’2000_0000	H’2FFF_FFFF
3	Secure	H’3000_0000	H’3FFF_FFFF
4	Non-secure	H’4000_0000	H’4FFF_FFFF
5	Secure	H’5000_0000	H’5FFF_FFFF
6	Non-secure	H’6000_0000	H’6FFF_FFFF
7	Secure	H’7000_0000	H’7FFF_FFFF
8	Non-secure	H’8000_0000	H’8FFF_FFFF
9	Secure	H’9000_0000	H’9FFF_FFFF
10	Non-secure	H’A000_0000	H’AFFF_FFFF
11	Secure	H’B000_0000	H’BFFF_FFFF
12	Non-secure	H’C000_0000	H’CFFF_FFFF
13	Secure	H’D000_0000	H’DFFF_FFFF
14	Non-secure	H’E000_0000	H’EFFF_FFFF
15	Secure	H’F000_0000	H’FFFF_FFFF

3.3 Register Descriptions

For details on registers, refer to the Arm® Cortex®-M33 Processor Technical Reference Manual.

For the device-specific Cortex-M33 system CPU control registers, see the section on the system controller (SYSC).

3.4 Description of Functions

For the registers and functions of Cortex-M33, refer to the Arm® Cortex®-M33 Processor Technical Reference Manual and Arm®v8-M Architecture Reference Manual.

3.4.1 Startup Sequence

The startup sequence of the Cortex-M33 system CPU is shown in the figure below.

It is designed to execute by other processor (Cortex-A55) for the function and sequence of Cortex-M33 control here.

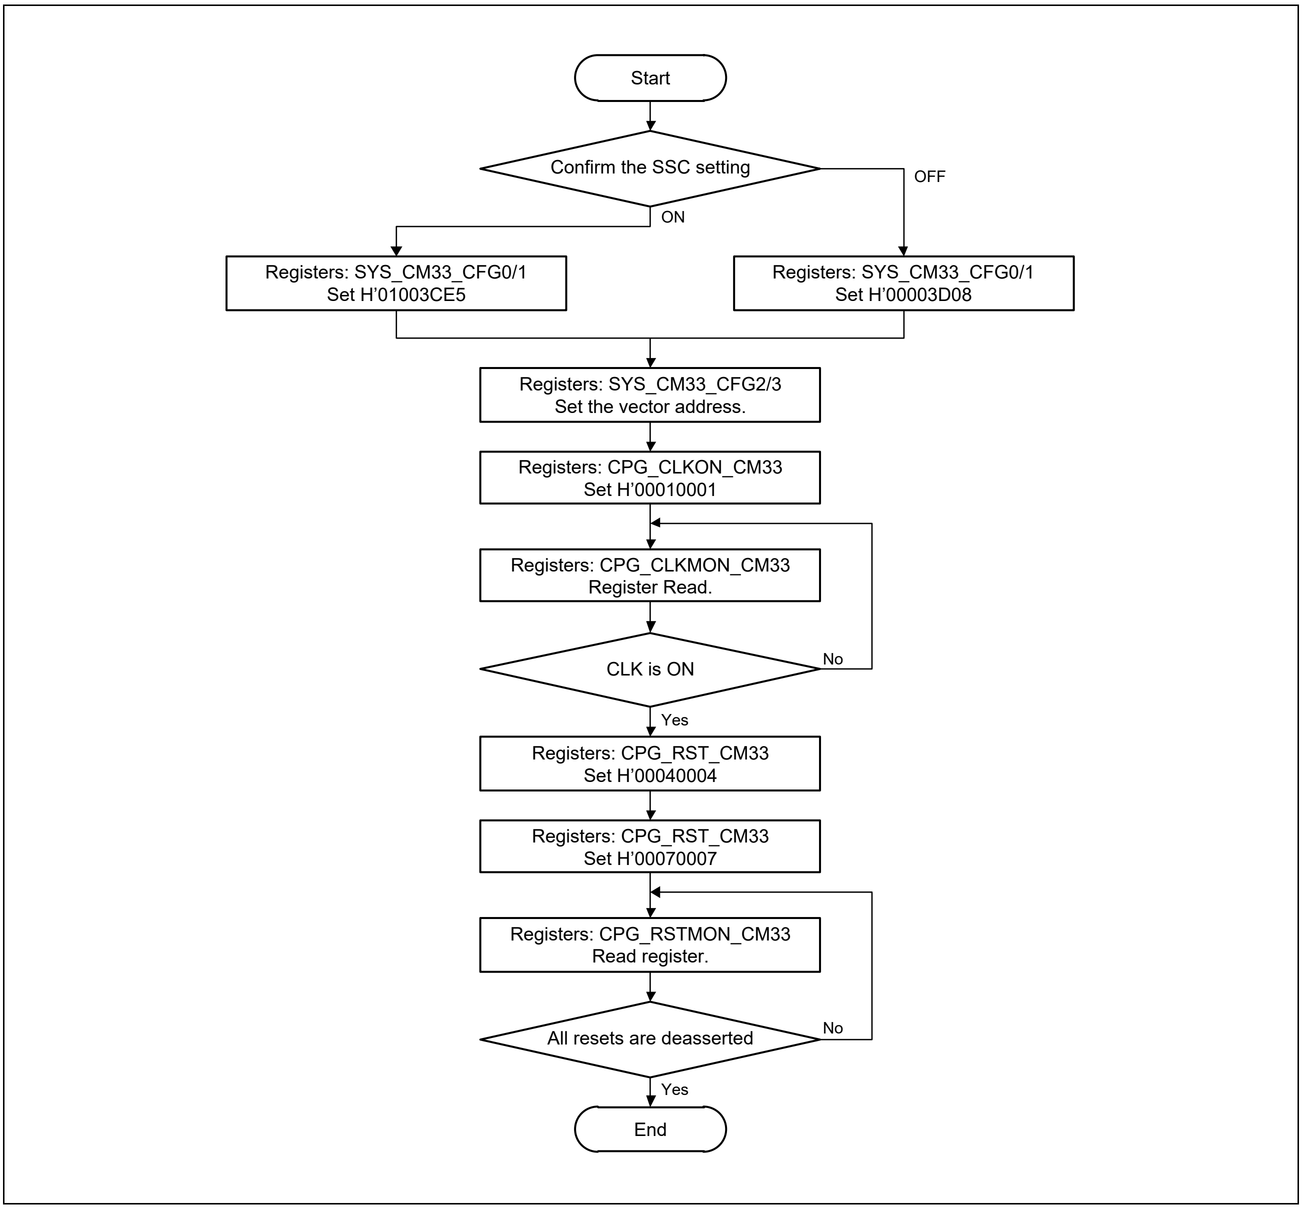


Figure 3.1 Startup Sequence

3.4.2 Control by the SYSC

In this LSI, the system controller (SYSC) is used to control the functions of the Cortex-M33 system CPU. For details of SYSC registers, see the section on the system controller (SYSC).

Table 3.3 List of Functions Controlled by the SYSC

No.	Description
1	Cortex-M33 control registers ● CM33 Config registers (SysTick timer, reset vector address): (SYS_CM33_CFGx), ● Low-power Sequence CM33 Control Register0: (SYS_LP_CM33CTL0)
2	Warm reset request Cooperation with the SYSC is necessary for executing a warm reset. For details, see **Section 3.4.3**.
3	Control of low power consumption function The Cortex-M33 system CPU supports two low power modes . For details on how to control Cortex-M33 Sleep Mode, see **Section 3.4.4**.

3.4.3 Warm Reset

When executing a warm reset, the WFI instruction is used to guarantee that no transaction is issued.

The warm reset sequence is shown below. For a details of SYSC registers, see the section on the system controller (SYSC).

1. Set the SYSRESETREQ bit in the Cortex-M33 register AIRCR to 1.
2. Confirm that the value of the SYSRESETREQ bit in the SYSC register SYS_LP_CM33CTL0 is 1.
3. Set the IM33_MASK bit in the SYSC register SYS_LP_CTL7 to 1.
4. Issue a WFI instruction.*[1]

The above procedure is used to execute a warm reset. Clearing the IM33_MASK bit and release from the warm reset state are controlled by hardware.

Note 1. If the WFE instruction is executed during a warm reset in this LSI, correct operation cannot be guaranteed.

3.4.4 Cortex-M33 Sleep Mode

In this LSI, the sleep mode for the Cortex-M33 system CPU is Cortex-M33 Sleep Mode. In this mode, some modules (SysTick timers, NVIC, etc.) of the core can operate.

The following procedure is the example sequence of a transition to Cortex-M33 Sleep Mode.

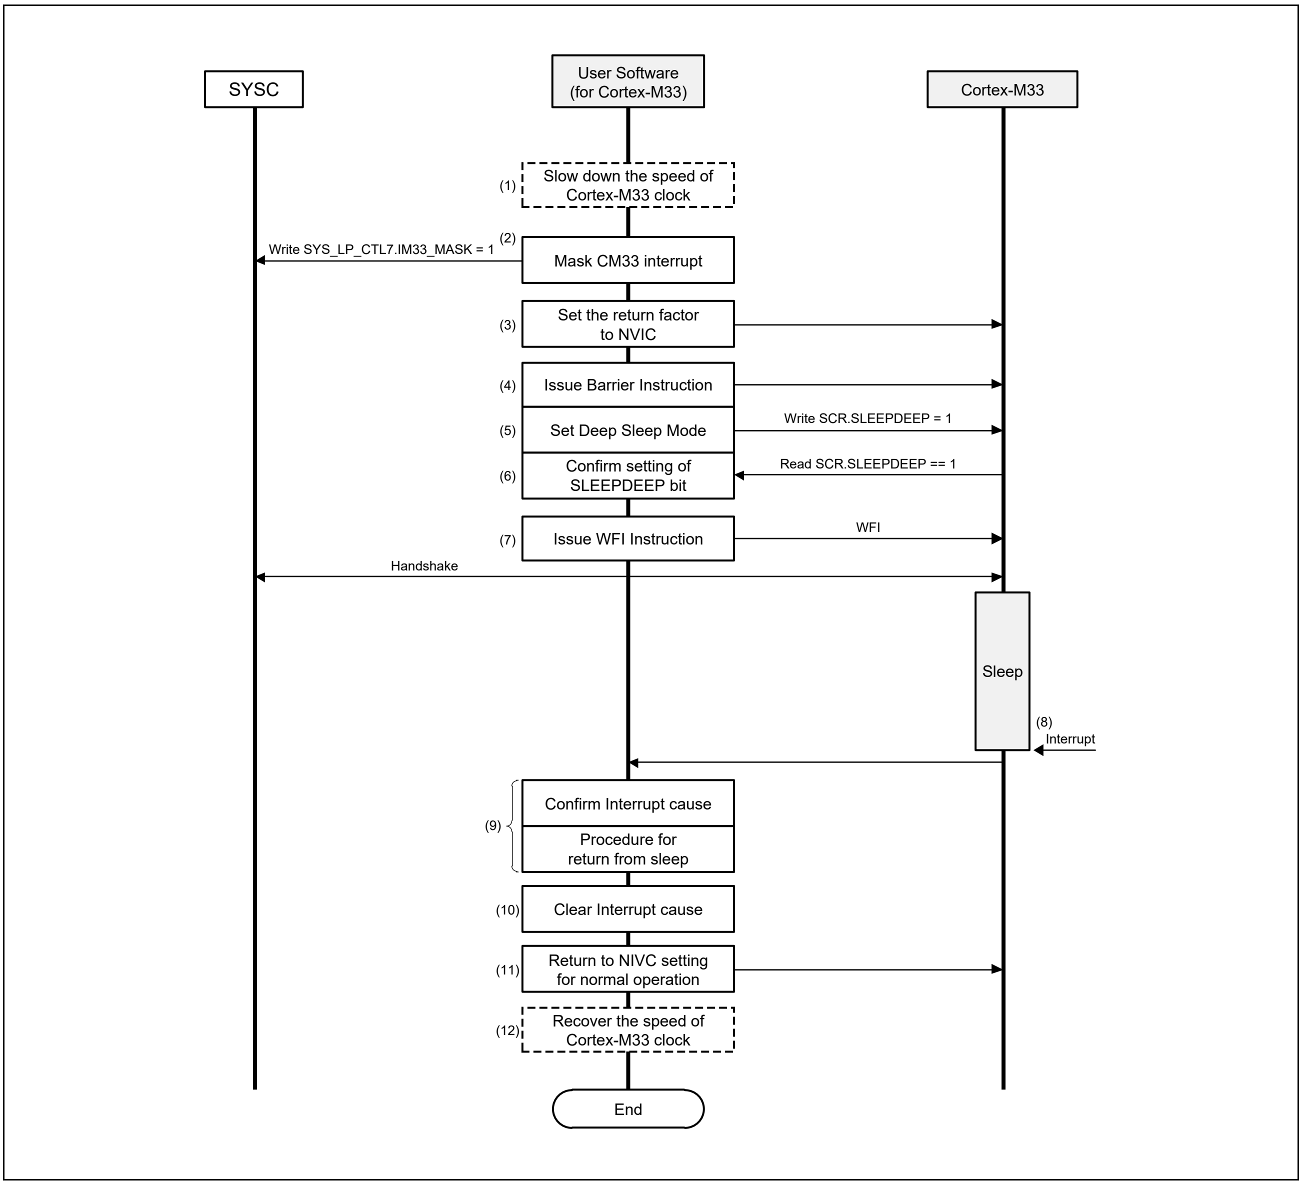

Figure 3.2 Cortex-M33 Sleep Mode procedure

(1) Slow down the speed of Cortex-M33 clock.*[1]

(2) Set the IM33_MASK bit of the SYS_LP_CTL7 register to 1.
Interrupts to IM33 are masked and interrupts from IM33 to Cortex-M33 are not accepted.
The IM33_MASK bit is automatically cleared after completing the transition to Cortex-M33 Sleep Mode.
Refer to the SYS_LP_CTL7 register in the SYSC section.

(3) Set the return factor to NVIC. Enables only the interrupts used for return from Cortex-M33 Sleep Mode and disables the interrupts used for the normal operation.*[2]

(4) Issue Barrier instruction.

(5) Set the SLEEPDEEP bit of the SCR register in Cortex-M33 to 1.*3

(6) Read SCR register to confirm whether the SLEEPDEEP bit is set to 1.

(7) Issue a WFI instruction to enter Cortex-M33 Sleep Mode.

(8) Return from Cortex-M33 Sleep Mode when the event ocurrs or the interrupt set in NVIC occurs.

(9) Confirm the interrupt cause and perform the processing required for returning from Cortex-M33 Sleep Mode.*2

(10) And then clear the interrupt cause.*2

(11) Set the interrupt causes for the normal operation to NVIC.*2

(12) Recover the speed of Cortex-M33 clock.*1

Note 1. Switching clock (I2ϕ, all Cortex-M33 clock systems) frequency is controlled by software in this LSI.
Refer to the CPG_PL3B_DDIV register in the CPG section.
Note that the step of slowing down clock (I2ϕ) is not mandatory.

Note 2. See Arm® Cortex®-M33 Processor Technical Reference Manual for NVIC.

Note 3. To make SLEEPDEEP bit 1 in the case of non-secure mode, SLEEPDEEPS bit is required to be 0. See Armv8-M Architecture Reference Manual for details.

3.4.5 SysTick Timers

The SysTick timers in the Cortex-M33 are described below.

- There is one Secure SysTick timer and one Non-secure SysTick timer.
- The count cycle of SysTick timers is common to Secure and Non-secure.
- A reference clock for counting by a SysTick timer is implemented in this LSI.
- Though the cycle of the reference clock is constant regardless of the clock(I2ϕ) cycle, the accuracy is degraded when the clock(I2ϕ) frequency is switched. Therefore, the accuracy of counting is not guaranteed when there is clock(I2ϕ) frequency switchover.
- The configuration of SysTick timers can be set in the SYSC registers SYS_CM33_CFG0 and SYS_CM33_CFG1*[1]. Before the Cortex-M33 system CPU is started up, set the following values in accordance with the PLL3 SSCG being turned on or off*[2]. SSCG clock is used for SysTick timer when turned on.

  When turned on: H’01003CE5
  When turned off: H’00003D08

The above settings are reflected in the Cortex-M33 register SYST_CALIB*[3]. The settings of the 24 lower-order bits and the 25th bit are reflected in the TENMS and SKEW bits, respectively. When the SSCG is ON, set the SKEW bit to 1. The setting of the 26th bit is reflected in the NOREF bit. Set the bit to 0 because a reference clock is implemented in this LSI.

Note 1. The register settings are reflected after release from the cold reset state.
Note 2. For details on turning on and off the SSCG, see the section on the clock pulse generator (CPG).
Note 3. For details on the SYST_CALIB register, refer to the Arm®v8-M Architecture Reference Manual.

3.4.6 Restrictions of Functions

The Cortex-M33 system CPU has some restrictions on the functions due to specification of this LSI. **Table 3.4** lists the restrictions on the functions.

Table 3.4 List of Restrictions of Functions

No.	Description
1	WFE instruction is not supported in a warm reset. In this LSI, operation of the WFE instruction is not guaranteed while a warm reset is being executed.
2	SysTick timer accuracy Though the clock(I2ϕ) frequency can be switched dynamically in this LSI, the timer accuracy cannot be guaranteed when there is a dynamic frequency switchover during the measurement period.

4. Boot Mode

4.1 Overview

This LSI has six boot modes.

Boot mode 0: Booting from eSD*[1]

Boot mode 1: Booting from 1.8-V eMMC*[2]

Boot mode 2: Booting from 3.3-V eMMC*[2]

Boot mode 3: Booting from the 1.8-V Single, Quad, or Octal*[3] serial flash memory connected to the SPI multi I/O bus space

Boot mode 4: Booting from the 3.3-V Single or Quad serial flash memory connected to the SPI multi I/O bus space

Boot mode 5: Booting from the program downloaded through the serial communications with FIFO (SCIF)

Note 1. Embedded SD (eSD) defined in the SD Specification Part 1 eSD Addendum (Version 2.10)

Note 2. eMMC supporting the boot operation mode prescribed in JEDEC STANDARD JESD84 A44 (MMCA 4.4)

Note 3. OctaFlash™ memory is supported as boot device, but HyperFlash™ memory is not supported as boot device in this LSI.

NOTES

- Boot operation is only possible with Cortex-A55 (AArch64).
- Boot operation is not possible with Cortex-M33.

Once this LSI is released from the system reset state, the clock pulse generator (CPG) executes a specified sequence, and then Cortex-A55 Core 0 is started first to boot from the device selected according to the settings through the MD_BOOT2 to MD_BOOT0 pins. The values of the MD_BOOT2 to MD_BOOT0 pins are read once the LSI is released from the system reset state. After the LSI is booted up, the user program should enable or disable the operation of Cortex-A55 Core 0, Cortex-A55 Core 1, and Cortex-M33 as required.

The CPG_PL1_DDIV register must be set when the user program starts.

Table 4.1 Selection of Boot Mode

MD_BOOT2 to MD_BOOT0			Boot Mode	Interface Module	Connected Device	Reference Section
0	0	0	Boot mode 0	SDHI0	eSD (3.3 V at startup)	**4.2.1**
0	0	1	Boot mode 1	SDHI0	1.8-V eMMC	**4.2.2**
0	1	0	Boot mode 2	SDHI0	3.3-V eMMC	**4.2.3**
0	1	1	Boot mode 3	SPIBSC	1.8-V Single, Quad, or Octal serial flash memory	**4.2.4**
1	0	0	Boot mode 4	SPIBSC	3.3-V Single or Quad serial flash memory	**4.2.5**
1	0	1	Boot mode 5	SCIF0	Downloading through SCIF	**4.2.6**
1	1	0	Reserved	—	Reserved	—
1	1	1	Reserved	—	Reserved	—

4.2 Operation

4.2.1 Boot Mode 0 (eSD)

Table 4.2 shows the interface signals used for connection with the external device in boot mode 0 (eSD). This LSI supports the embedded SD (eSD) defined in the SD Specification Part 1 eSD Addendum (Version 2.10).

Table 4.2 External Interface Signals Used in Boot Mode 0

Interface Module	Pin Name	I/O	Function	Pin Type
SDHI/eMMC (SDHI0)	SD0_CLK	Output	SD clock	Dedicated pins
	SD0_CMD	Input/output	SD command or response	
	SD0_DATA0	Input/output	SD data 0	
	SD0_DATA1	Input/output	SD data 1	
	SD0_DATA2	Input/output	SD data 2	
	SD0_DATA3	Input/output	SD data 3	
	SD0_CD	Input	SD card detection	Multiplexed pins
	SD0_WP	Input	SD write protection	

4.2.1.1 External Connections

Figure 4.1 shows the connections with the eSD device.

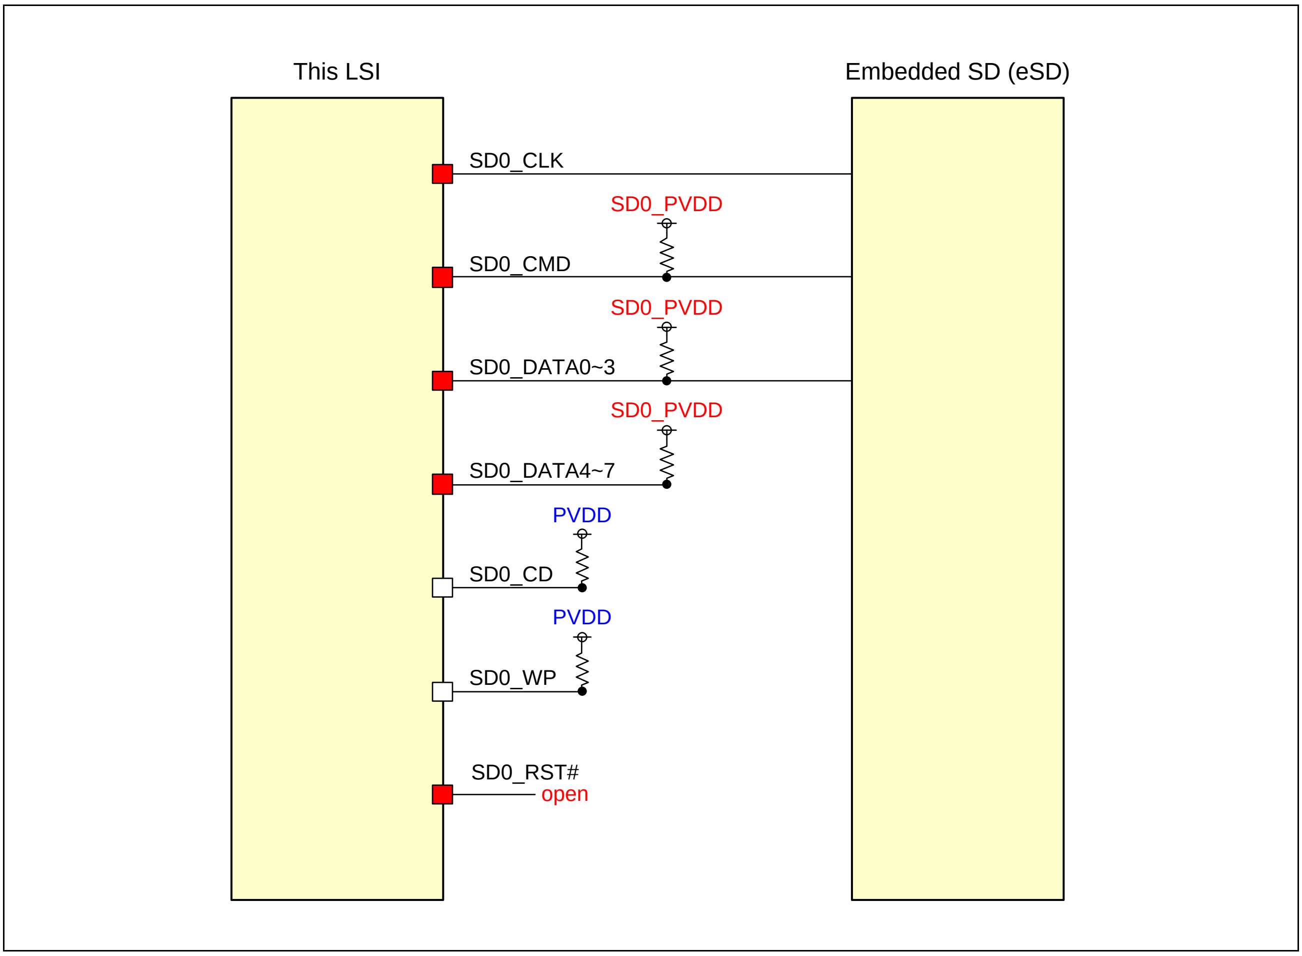

Figure 4.1 Connections in Boot Mode 0

4.2.1.2 Overview of Operation

This mode is used to boot this LSI from the user program stored in the eSD device. The operating voltage is set to 3.3 V and the width of the data bus connected to the eSD device is fixed to four bits in this mode. SDHI0 used as the interface controller in this mode is placed in the module standby mode at the startup of the LSI. Once SDHI0 is released from the module standby mode, the boot program in this LSI sets up the CPG so that the frequency of the external output clock becomes 16.6 MHz, initializes SDHI0, and then begins the booting process with the I/O buffers set to the maximum driving ability.

4.2.1.3 Operation of Booting from eSD

In boot mode 0 (booting from eSD), this LSI is booted from the loader program in the eSD device connected to channel 0 of the SD host interface (SDHI) as follows.

The boot program executes the following processing to access the eSD device.

1. Setting up the necessary peripheral modules (SDHI channel 0 and GPIO)
2. Mounting the eSD device
3. Issuing a read command to the eSD device through the SDHI to obtain the size of the loader program data from sector 1 of the selected partition

After obtaining the size of the loader program data, the SDHI issues a read command to the eSD device to transfer the loader program from sector 8 of the selected partition to the addresses H’0_0001_2000 to H’0_0002_EFFF of the on-chip RAM for the obtained data size.

Then, execution branches to the start address (H’0_0001_2000) of the loader program transferred to the on-chip RAM to execute the loader program that was stored in the eSD device.

If the boot program has failed to read data, it reads data from a reserved area. If reading has failed for all reserved areas, the boot program enters fail-safe mode (SCIF downloading mode). If the fail-safe processing has failed, execution enters an infinite loop in the on-chip ROM and the boot processing is terminated.

4.2.1.4 Allocation of the Loader Programs in the eSD Device

(1) Allocation in eSD V2.0 (Single Partition)

Figure 4.2 shows the allocation of the loader program size blocks and loader programs in the eSD device conforming to the eSD V2.0 standard. To prevent read-disturb errors, up to seven loader program size blocks and loader programs can be multiplexed and written to the eSD device.

The loader program size blocks are allocated to sectors 1 to 7. In a loader program size block, the loader program size is stored in the first four bytes and the signature H'AA55 is stored in the last two bytes. **Figure 4.3** shows the structure of the loader program size data. Be sure to store the loader program size in 4-byte little endian.

The following describes the operation of transferring the loader program.

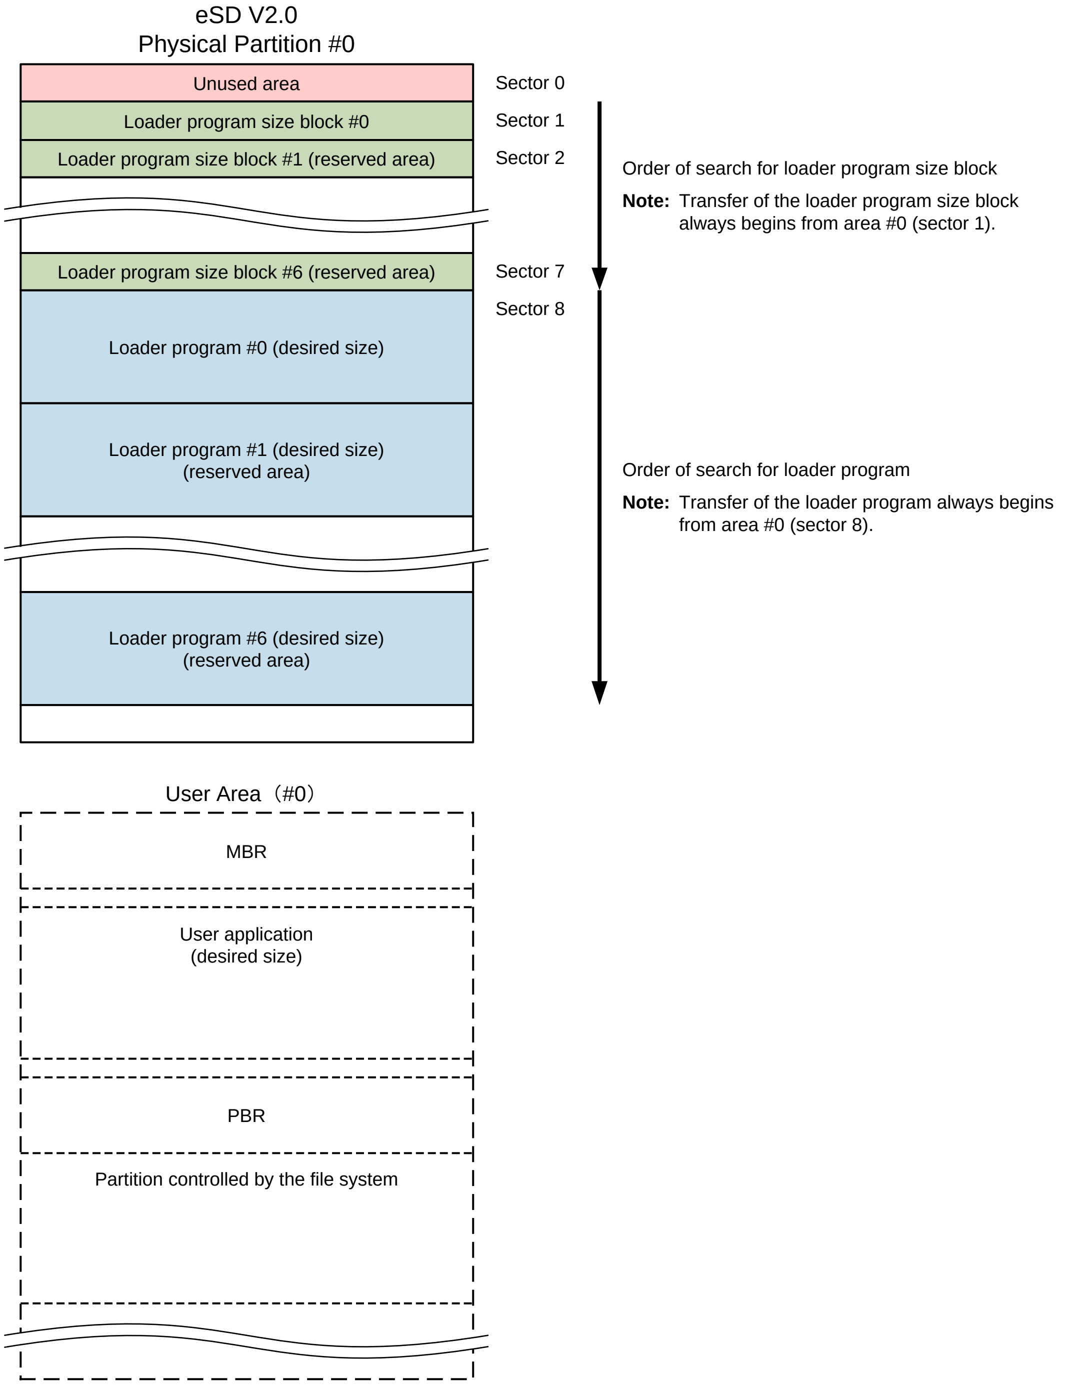
(1) The loader program size block is transferred from sector 1 in physical partition #0 of the eSD device to the on-chip RAM.
If a communication error occurs during data transfer, read access is retried up to three times per area. If the retry processing is repeated three times during the transfer of the loader program size block in a single area, another loader program size block is transferred from the next multiplexed area.

(2) The signature in the transferred loader program size block is checked. When the signature matches the expected value (H'AA55), the size of the loader program data is obtained from the loader program size block and the processing for transferring the loader program is executed.
If the signature does not match the expected value, another loader program size block is transferred from the next multiplexed area.

(3) The transfer of the loader program begins from sector 8 in physical partition #0 of the eSD device. The loader program is transferred to the on-chip RAM for the obtained loader program size.
If a communication error occurs during data transfer, read access is retried up to three times per area. If the retry processing is repeated three times during the loader program transfer in a single area, another loader program is transferred from the next multiplexed area.

NOTE

Even when the loader size block is transferred from a multiplexed (reserved) area, the transfer of the loader program always begins from the area for loader program #0.



Note 1. Write the same data to loader program size block areas #0 to #6.

Note 2. Write the same data to loader program areas #0 to #6.

Note 3. The start sector location of the loader program is calculated as follows.
8 + obtained size (number of sectors) × n

Figure 4.2 Allocation of Loader Programs in the eSD Device Conforming to the eSD V2.0 Standard

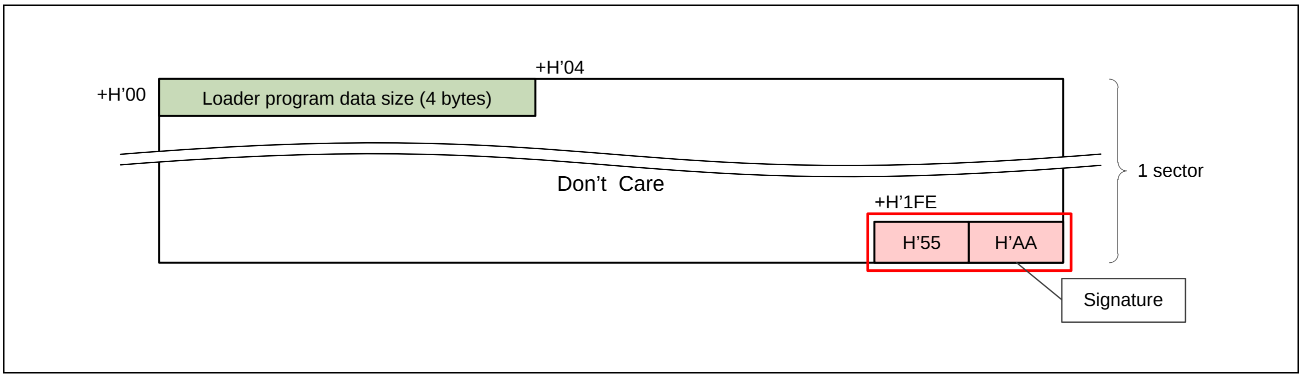


Figure 4.3 Structure of the Loader Program Size Block

NOTE

Store the loader program data size in 4-byte little endian.

(2) Allocation in eSD V2.1 (Multi Partitions)

Figure 4.4 shows the allocation of the loader program size blocks and loader programs in the eSD device conforming to the eSD V2.1 standard. To prevent read-disturb errors, up to seven loader program size blocks and loader programs can be multiplexed and written to the eSD device

The specifications and allocation of loader program size blocks are the same as those in eSD V2.0. For the structure of the loader program size block, see **Figure 4.3**.

The following describes the operation of transferring the loader program.

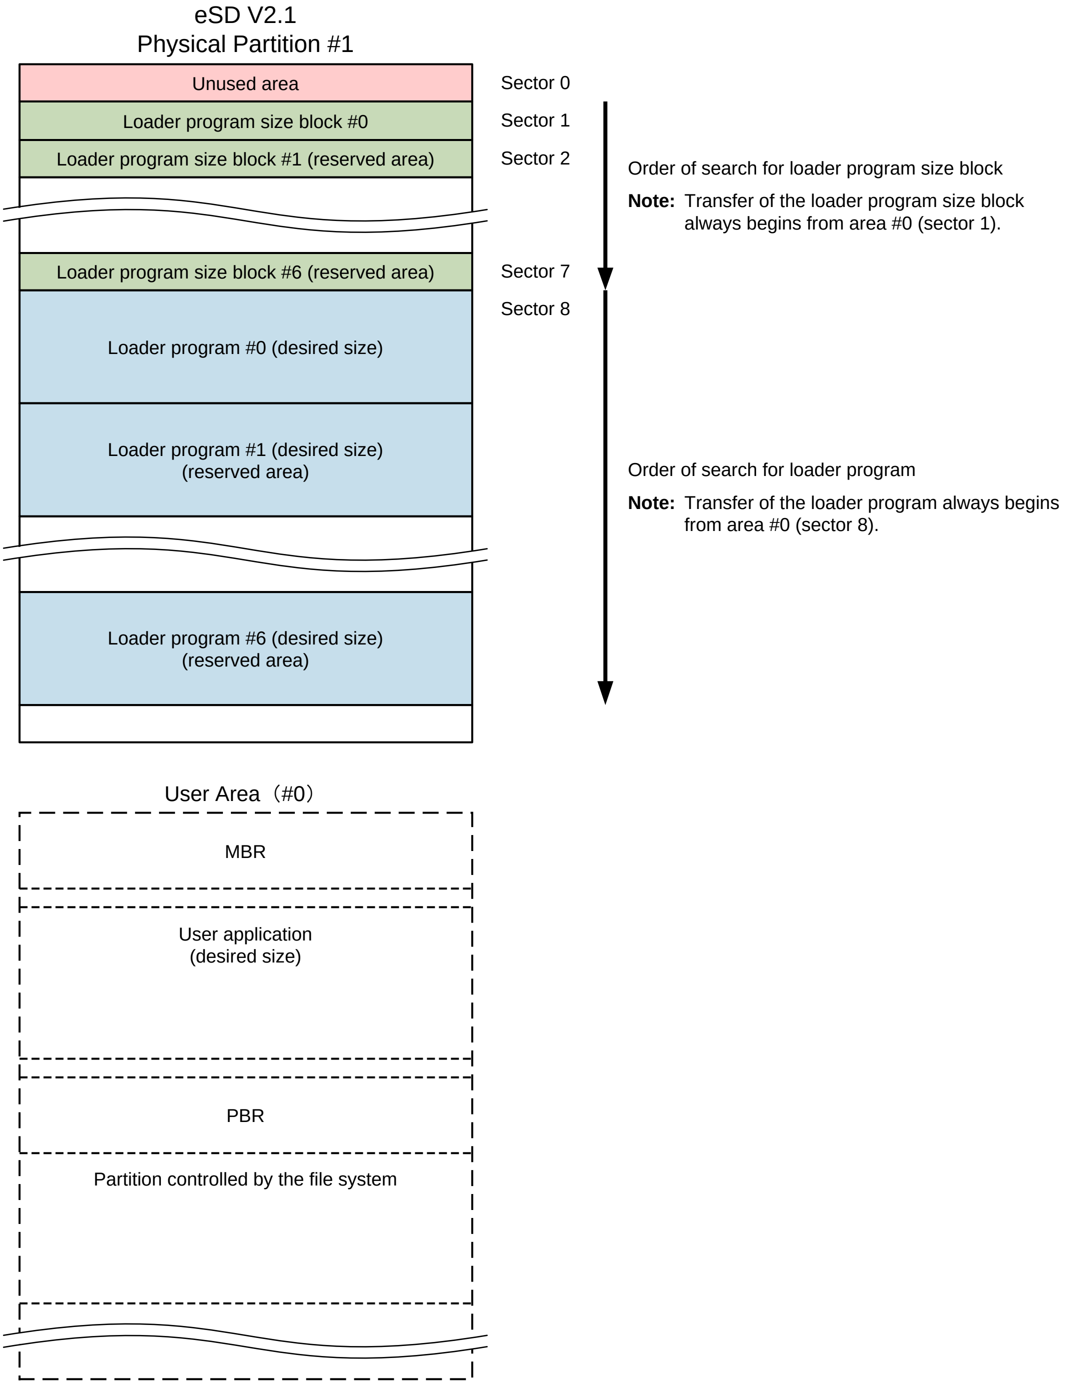
(1) The loader program size block is transferred from sector 1 in physical partition #1 of the eSD device to the on-chip RAM.
If a communication error occurs during data transfer, read access is retried up to three times per area. If the retry processing is repeated three times during the transfer of the loader program size block in a single area, another loader program size block is transferred from the next multiplexed area.

(2) The signature in the transferred loader program size block is checked. When the signature matches the expected value (H'AA55), the size of the loader program data is obtained from the loader program size block and the processing for transferring the loader program is executed. If the signature does not match the expected value, another loader program size block is transferred from the next multiplexed area.

(3) The transfer of the loader program begins from sector 8 in physical partition #1 of the eSD device. The loader program is transferred to the on-chip RAM for the obtained loader program size.
If a communication error occurs during data transfer, read access is retried up to three times per area. If the retry processing is repeated three times during the loader program transfer in a single area, another loader program is transferred from the next multiplexed area.

NOTE

Even when the loader size block is transferred from a multiplexed (reserved) area, the transfer of the loader program always begins from the area for loader program #0.



Note 1. Write the same data to loader program size block areas #0 to #6.

Note 2. Write the same data to loader program areas #0 to #6.

Note 3. The start sector location of the loader program is calculated as follows.
8 + obtained size (number of sectors) × n

Figure 4.4 Allocation of Loader Programs in the eSD Device Conforming to the eSD V2.1 Standard

(3) How to Distinguish between eSD V2.0 (Single Partition) and V2.1 (Multi Partitions)

This boot program first assumes that an eSD device supporting multi partitions is connected and begins loader program transfer from physical partition #1. If an error regarding a command for multi partitions shown in the following table occurs, the boot program assumes that an eSD device with a single partition is connected and transfers the loader program from physical partition #0.

Table 4.3 Errors Regarding Commands for Multi Partitions

No.	Issued Command	Command Function	Error	Remarks
1	CMD43 (SELECT_PARTITION)	Selects physical partition #1.	Multi partitions are not supported.	
2	CMD45 (QUERY_PARTITION)	Obtains the physical partition ID.	The specified partition does not exist.	

4.2.1.5 Note

The shared bus and 8-bit SD bus of the embedded SDIO cannot be used in this mode.

4.2.2 Boot Mode 1 (1.8-V eMMC)

Table 4.4 shows the interface signals used for connection with the external device in boot mode 1 (eMMC). This LSI supports the eMMC that operates in the boot operation mode prescribed in JEDEC STANDARD JESD84 A44 (MMCA 4.4).

Table 4.4 External Interface Signals Used in Boot Mode 1

Interface Module	Pin Name	I/O	Function	Pin Type
SDHI/eMMC (SDHI0)	SD0_CLK	Output	eMMC clock	Dedicated pins (1.8 V)
	SD0_CMD	Input/output	eMMC command or response	
	SD0_DATA0	Input/output	eMMC data 0	
	SD0_DATA1	Input/output	eMMC data 1	
	SD0_DATA2	Input/output	eMMC data 2	
	SD0_DATA3	Input/output	eMMC data 3	
	SD0_DATA4	Input/output	eMMC data 4	
	SD0_DATA5	Input/output	eMMC data 5	
	SD0_DATA6	Input/output	eMMC data 6	
	SD0_DATA7	Input/output	eMMC data 7	
	SD0_CD	Input	SD card detection	
	SD0_WP	Input	SD write protection	
	SD0_RST#	Output	eMMC reset	

4.2.2.1 External Connections

Figure 4.5 shows the connections with the eMMC device. The boot program in this LSI does not monitor the state of the SD0_CD and SD0_WP pins.

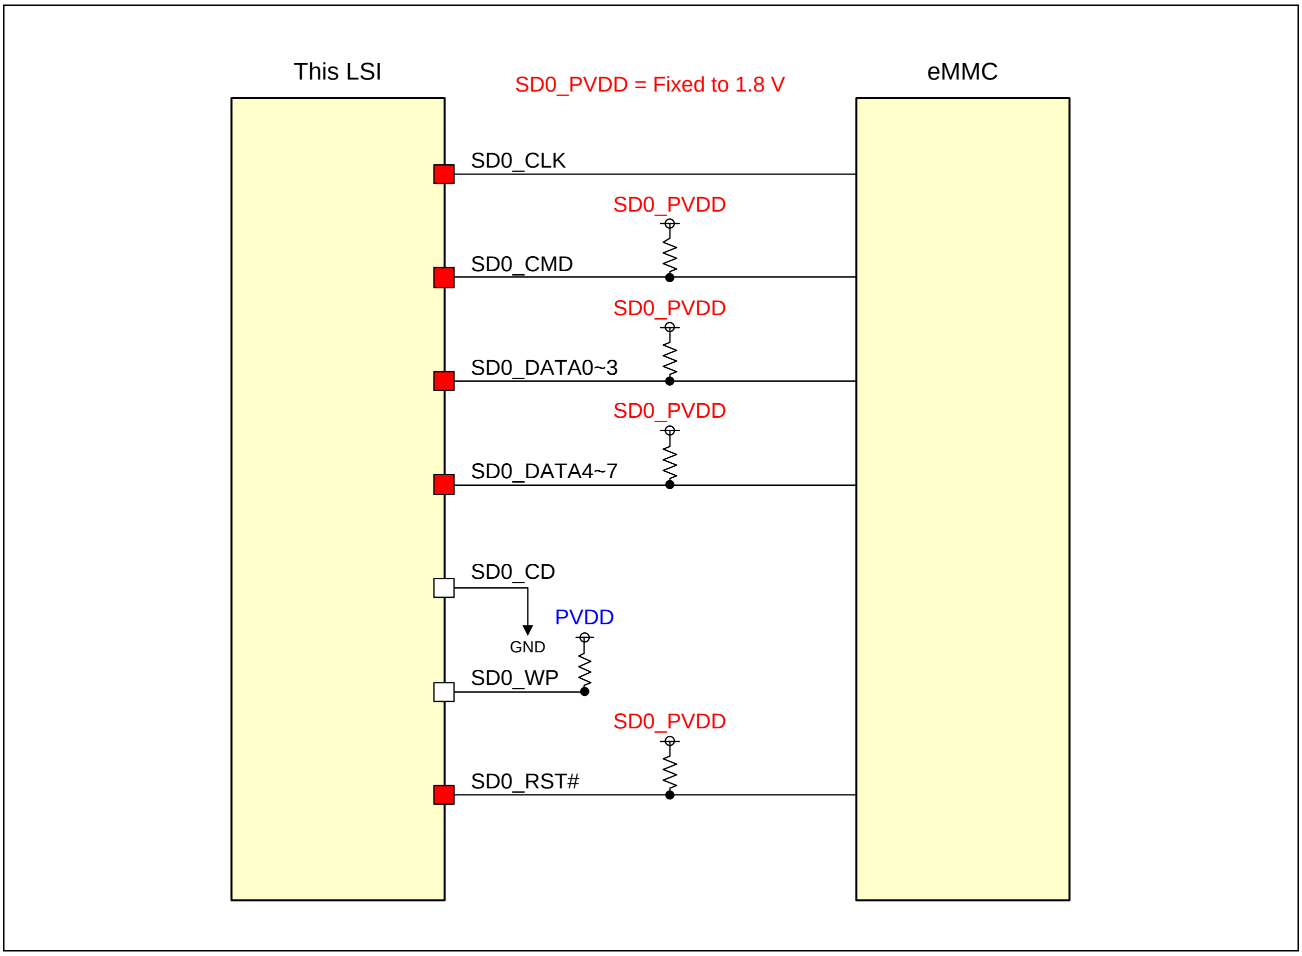


Figure 4.5 Connections in Boot Mode 1

4.2.2.2 Overview of Operation

This mode is used to boot this LSI from the user program stored in the eMMC device. The operating voltage is set to 1.8 V and the width of the data bus connected to the eMMC device is fixed to eight bits in this mode. SDHI0 used as the interface controller in this mode is placed in the module standby mode at the startup of the LSI. Once SDHI0 is released from the module standby mode, the boot program in this LSI sets up the CPG so that the frequency of the external output clock becomes 16.6 MHz, initializes SDHI0, and then begins the booting process.

4.2.2.3 Operation of Booting from 1.8-V eMMC

In boot mode 1 (booting from 1.8-V eMMC), this LSI is booted from the loader program in the 1.8-V eMMC device connected to channel 0 of the SD host interface (SDHI) as follows.

The boot program executes the following processing to access the eMMC device.

1. Setting up the necessary peripheral modules (SDHI channel 0 and OSTM channel 0)
2. Starting the alternative boot operation mode of the eMMC device
   Read access begins from sector 0 of the partition selected by the [179] field (PARTITION_CONFIG) of the extended CSD (EXT_CSD) register in the eMMC device. For details, refer to **Section 4.2.2.5** and **Section 4.2.2.5(1)**.
3. Dummy reading from sector 0 and obtaining the size of the loader program data from sector 1

After the size of the loader program data is obtained, the loader program is transferred from sector 2 to the addresses H’0_0001_2000 to H’0_0002_EFFF of the on-chip RAM for the obtained data size.

Then, execution branches to the start address (H’0_0001_2000) of the loader program transferred to the on-chip RAM to execute the loader program that was stored in the eMMC device.

If the boot program has failed to read the loader program, it enters fail-safe mode (SCIF downloading mode). If the fail-safe processing has failed, execution enters an infinite loop in the on-chip ROM and the boot processing is terminated.

Note that the data bus width is set to eight bits for booting from the eMMC device.

4.2.2.4 Allocation of the Loader Program in the eMMC Device

Figure 4.6 shows the allocation of the loader program in the eMMC device conforming to the MMCA 4.4 standard.

In the loader program size block, the loader program size is stored in the first four bytes and the signature H’AA55 is stored in the last two bytes. **Figure 4.7** shows the structure of the loader program size data. Be sure to store the loader program size in 4-byte little endian.

The transfer of the loader program begins from the first address (sector 0) of the boot partition. A dummy read from sector 0 is done, and then the size of the loader program data is obtained from the data read from sector 1. The loader program is transferred from sector 2 to the addresses H’0_0001_2000 to H’0_0002_EFFF of the on-chip RAM for the obtained loader program size.

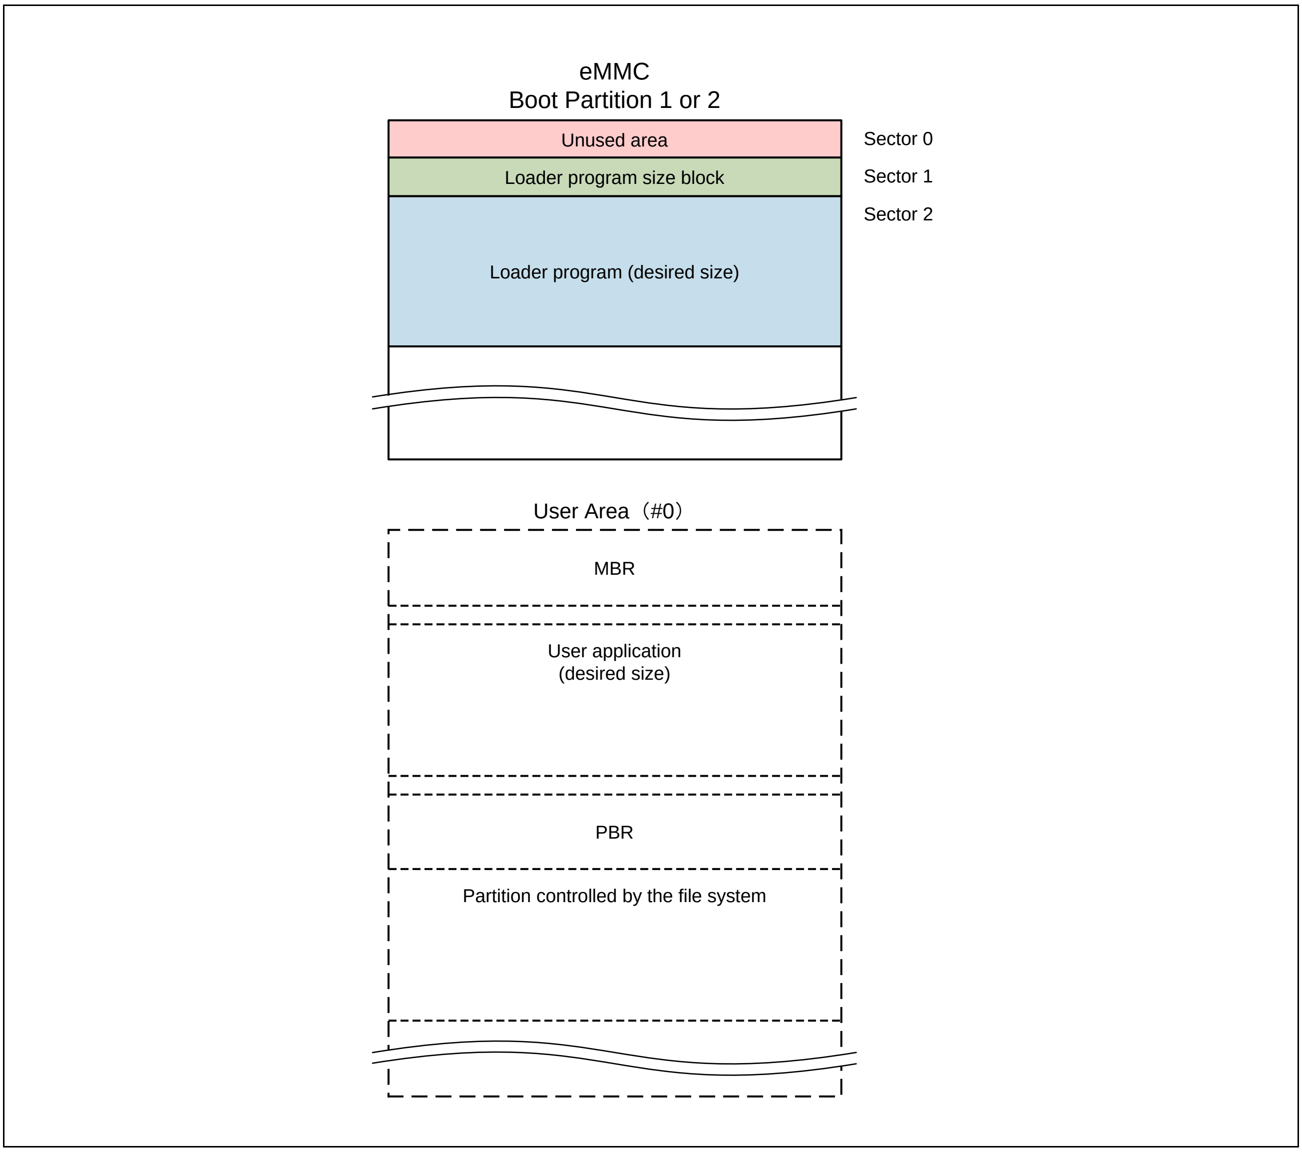

Figure 4.6 Allocation of Loader Program in the eMMC Device

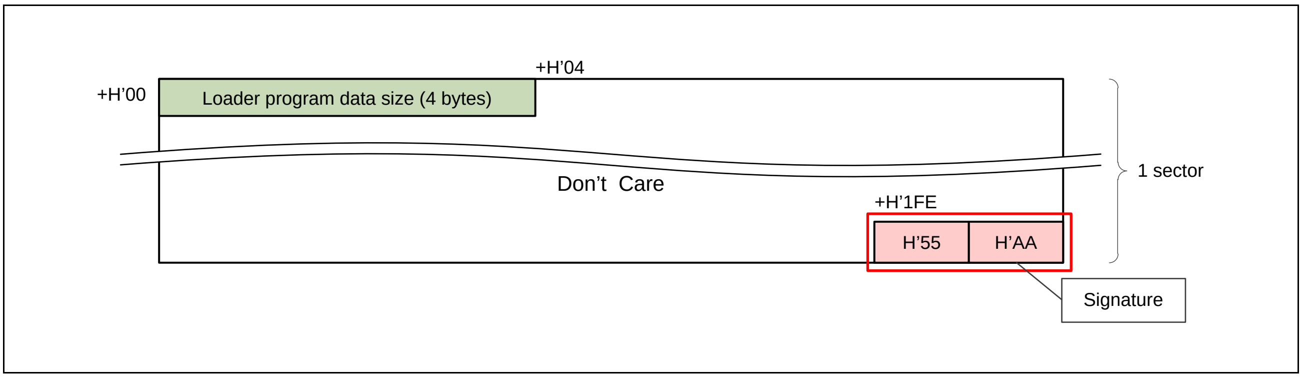

Figure 4.7 Structure of the Loader Program Size Block

In the eMMC device, the loader program is read from the partition specified by the BOOT_PARTITION_ENABLE bits in the PARTITION_CONFIG (ECSD[179]) field of the extended CSD register. Write the loader program to the partition selected by this register. **Table 4.5** shows the specifications of the extended CSD register.

Table 4.5 Specifications of the Extended CSD Register

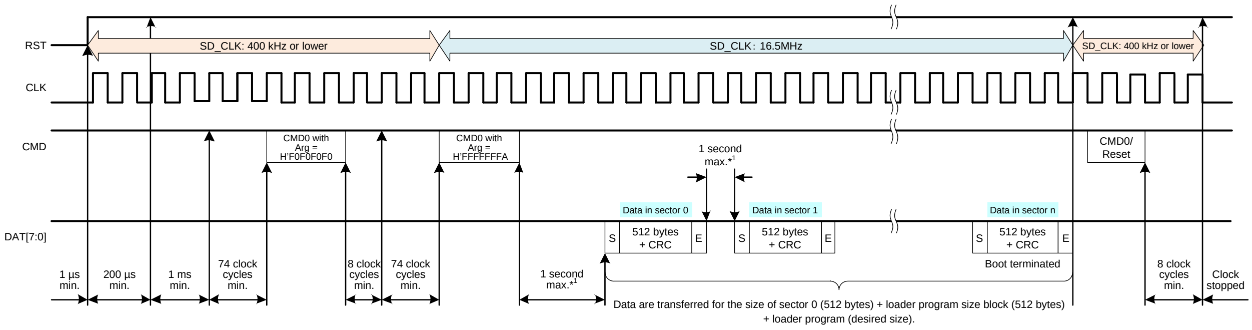
No.	Field Name	Bit Name	Setting	Remarks
1	PARTITION_CONFIG (ECSD[179])	BOOT_PARTITION_ENABLE bits [5:3]	H'0: Device not boot enabled (default) H'1: Boot partition 1 enabled for boot H'2: Boot partition 2 enabled for boot H'7: User area enabled for boot	

Allocate partitions as follows.

- Store the loader program in boot partition 1.
- Store the application program in boot partition 2.
- Allocate the user area to a partition controlled by the file system.

4.2.2.5 Alternative Boot Operation

Figure 4.8 shows the alternative boot operation to read the loader program. This boot program sets up the registers in SDHI channel 0 so that the SDHI operates with an 8-bit bus width when booting from the eMMC device. On the eMMC device side, the data bus width in the alternative boot operation is determined by the setting of the BOOT_BUS_WIDTH[177] field in the extended CSD register. To boot up from the eMMC device correctly, set up the extended CSD register in the eMMC device as shown in **Table 4.6** when writing a program to the eMMC device.



- This CPU accesses the eMMC device with a data bus width of 8 bits in the alternative boot operation. The data bus width of the eMMC device can be specified in the BOOT_BUS_WIDTH[177] field of the extended CSD register. When writing a loader program to the eMMC device, specify the 8-bit bus width in this field.
- The eMMC device sequentially outputs data from sector 0 of the partition selected in the PARTITION_CONFIG[179] field of the extended CSD register in the alternative boot operation.
- This CPU does not detect Boot Ack.
  The output of Boot Ack from the eMMC device can be specified in the PARTITION_CONFIG[179] field. Be sure to stop the output of Boot Ack by using this field.

Note 1. For a maximum of one second, the BRE, ERR3, and ERR1 bits of the SD_INFO2 register are polled to check whether data have been received, a timeout has occurred, and a CRC error has occurred, respectively.
<Normal operation>
SD_INFO2.BRE = 1
Data are transferred from SD_BUF to the on-chip RAM.
<Error>
CRC error: SD_INFO2.ERR1 = 1
The loader program is read from a reserved area.
Timeout error: SD_INFO2.ERR3 = 1
Execution of the boot program for eMMC is terminated.

Figure 4.8 Alternative Boot Operation to Read the Loader Program

Table 4.6 Setting of the Data Bus Width in Alternative Boot Operation

Field in Extended CSD Register of eMMC Device	Setting
BOOT_BUS_WIDTH [177]	Bits 1 and 0: BOOT_BUS_WIDTH = 10b (The bus width is set to 8 bits in alternative boot operation.)

(1) Partitions

An eMMC device has multiple partitions (**Figure 4.9**). The partition used for booting can be specified in the PARTITION_CONFIG[179] field of the extended CSD (EXT_CSD) register. To boot up correctly, specify the boot partition in the extended CSD (EXT_CSD) register of the eMMC device as shown in **Table 4.7** when writing a program to the eMMC device.

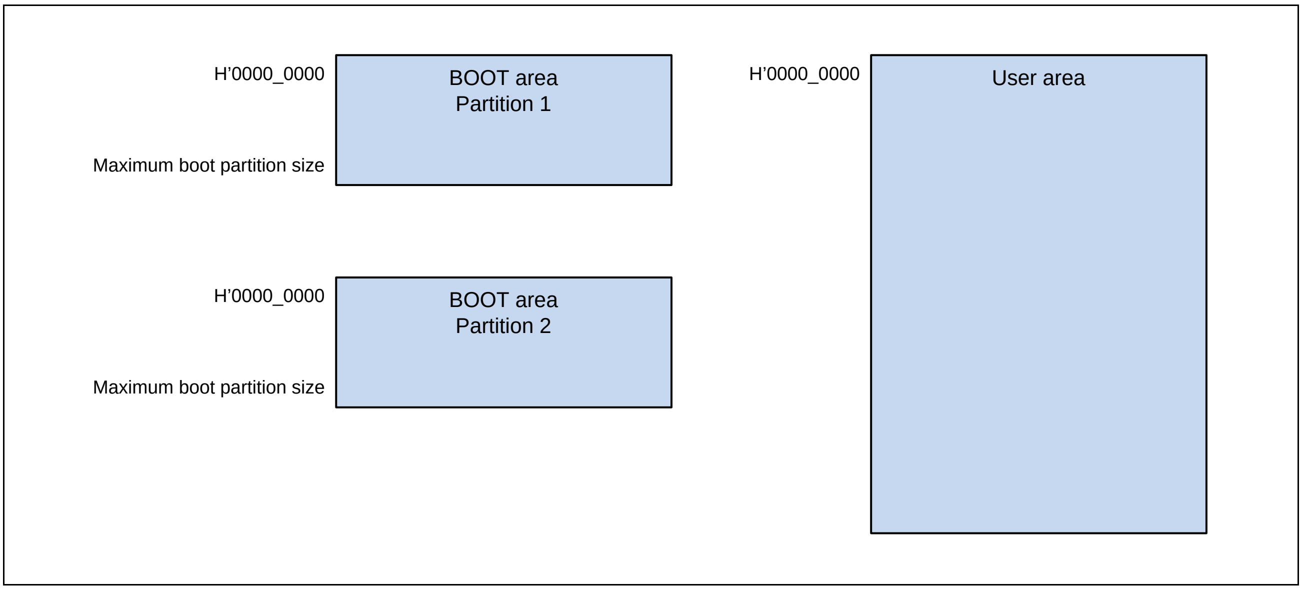


Figure 4.9 Partitions in the eMMC Device

Table 4.7 Boot Partition Setting in the Alternative Boot Operation

Field in Extended CSD Register of eMMC Device	Setting
PARTITION_CONFIG [179]	• Set bit 6 (BOOT_ACK) to 0b (the eMMC device does not output a boot acknowledge in the alternative boot operation). • Specify the boot partition in bits 5 to 3 (BOOT_PARTITION_ENABLE). 000b: Booting is disabled. 001b: Booting from sector 0 in boot partition 1 in the boot operation. 010b: Booting from sector 0 in boot partition 2 in the boot operation. 011b to 110b: Reserved 111b: Booting from sector 0 in the user area in the boot operation.

4.2.2.6 Notes

- This mode does not support booting from an MMC card.
- The width of the data bus is fixed to eight bits; 1-bit or 4-bit data bus cannot be used in this mode.

4.2.3 Boot Mode 2 (3.3-V eMMC)

Table 4.8 shows the interface signals used for connection with the external device in boot mode 2 (eMMC). This LSI supports the eMMC that operates in the boot operation mode prescribed in JEDEC STANDARD JESD84 A44 (MMCA 4.4).

Table 4.8 External Interface Signals Used in Boot Mode 2

Interface Module	Pin Name	I/O	Function	Pin Type
SDHI/eMMC (SDHI0)	SD0_CLK	Output	eMMC clock	Dedicated pins (3.3 V)
	SD0_CMD	Input/output	eMMC command or response	
	SD0_DATA0	Input/output	eMMC data 0	
	SD0_DATA1	Input/output	eMMC data 1	
	SD0_DATA2	Input/output	eMMC data 2	
	SD0_DATA3	Input/output	eMMC data 3	
	SD0_DATA4	Input/output	eMMC data 4	
	SD0_DATA5	Input/output	eMMC data 5	
	SD0_DATA6	Input/output	eMMC data 6	
	SD0_DATA7	Input/output	eMMC data 7	
	SD0_CD	Input	SD card detection	
	SD0_WP	Input	SD write protect	
	SD0_RST#	Output	eMMC reset	

4.2.3.1 External Connections

Figure 4.10 shows the connections with the eMMC device. The boot program in this LSI does not monitor the state of the SD0_CD and SD0_WP pins.

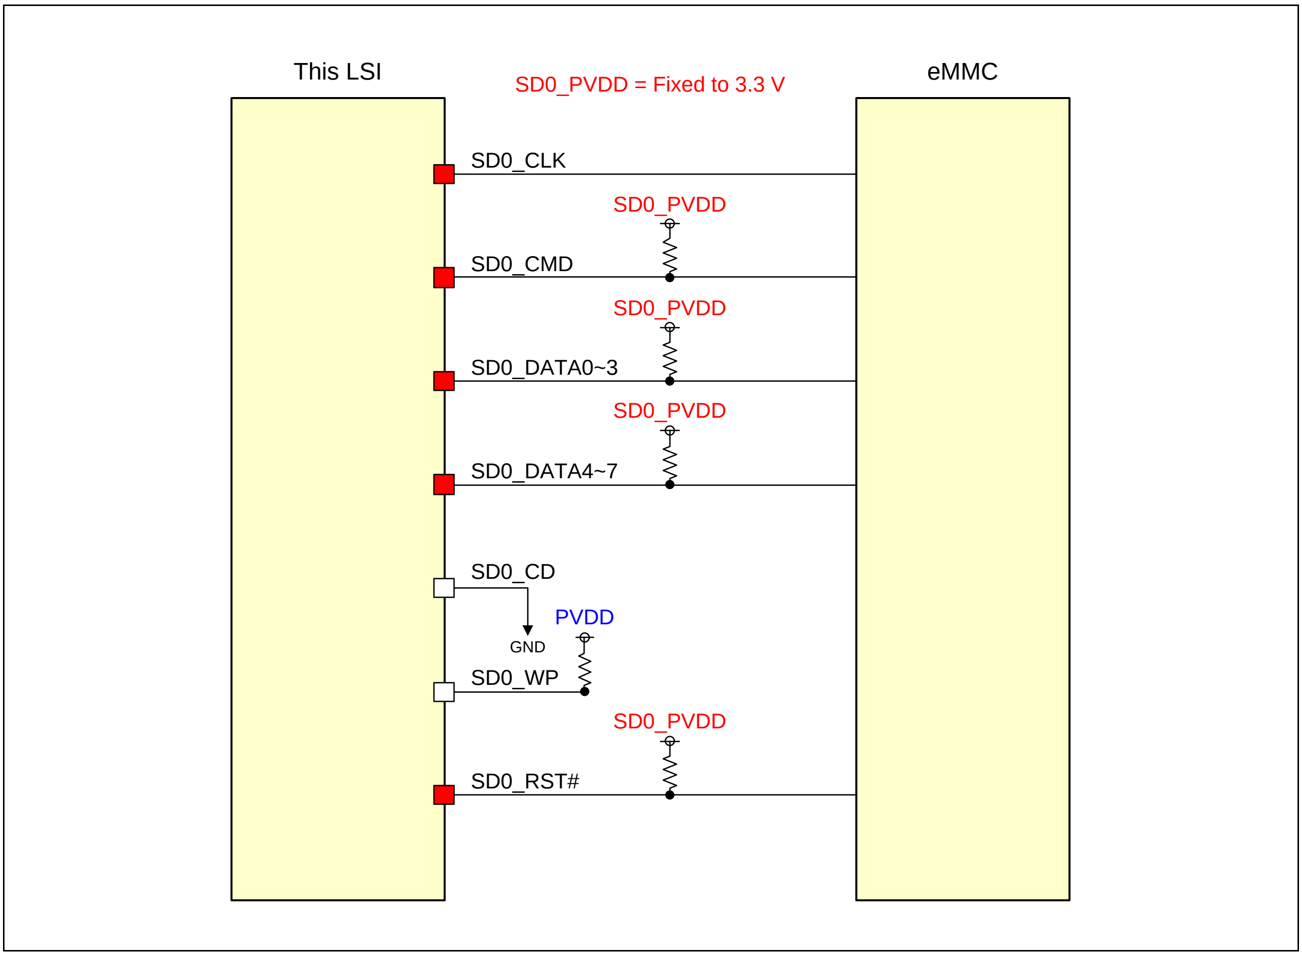

Figure 4.10 Connections in Boot Mode 2

4.2.3.2 Overview of Operation

This mode is used to boot this LSI from the user program stored in the eMMC device in the same way as boot mode 1. This mode only differs from boot mode 1 in that the external device operates at 3.3 V. The operating voltage is set to 3.3 V in this mode.

4.2.3.3 Operation of Booting from 3.3-V eMMC

Boot mode 2 (booting from 3.3-V eMMC) only differs from boot mode 1 (booting from 1.8-V eMMC) in the setting of supplied voltage as shown in **Table 4.9**.

Table 4.9 Resources Used by the Boot Program for 3.3-V eMMC (Difference from 1.8-V eMMC)

No.	Register Name	Address	Initial Value	Value after Booting	Remarks
1	GPIO_SD_CH0	H'0_1103_3000	H'0000_0000	H'0000_0000	SD0_PVDD: 0 = 3.3 V In boot mode 1 or 2, this is automatically set by hardware. The user does not need to set this register.

4.2.3.4 Notes

- This mode does not support booting from an MMC card.
- The width of the data bus is fixed to eight bits; 1-bit or 4-bit data bus cannot be used in this mode.

4.2.4 Boot Mode 3 (1.8-V Single, Quad, or Octal Serial Flash Memory)

Table 4.10 shows the interface signals used for connection with the external device in boot mode 3 (1.8-V serial flash memory).

Table 4.10 External Interface Signals Used in Boot Mode 3

Interface Module	Pin Name	I/O	Function	Pin Type
QSPI0 and QSPI1	QSPI0_SPCLK	Input/output	QSPI clock	Dedicated pins (1.8 V)
	QSPI0_IO0	Input/output	QSPI data 0	
	QSPI0_IO1	Input/output	QSPI data 1	
	QSPI0_IO2	Input/output	QSPI data 2	
	QSPI0_IO3	Input/output	QSPI data 3	
	QSPI0_SSL	Output	Slave select	
	QSPI1_SPCLK	Output	QSPI clock	
	QSPI1_IO0	Input/output	QSPI data 4	
	QSPI1_IO1	Input/output	QSPI data 5	
	QSPI1_IO2	Input/output	QSPI data 6	
	QSPI1_IO3	Input/output	QSPI data 7	
	QSPI1_SSL	Input/output	OCTAL DQS input	
	QSPI_RESET#	Output	QSPI reset	
	QSPI_WP#	Output	QSPI write protect	
	QSPI_INT#	Input	QSPI interrupt	

Note: The Octal flash memory does not have the pins shaded in gray.

4.2.4.1 External Connections

Figure 4.11 to **Figure 4.13** show the connections with the Single SPI memory, Quad SPI memory, and Octal flash memory, respectively.

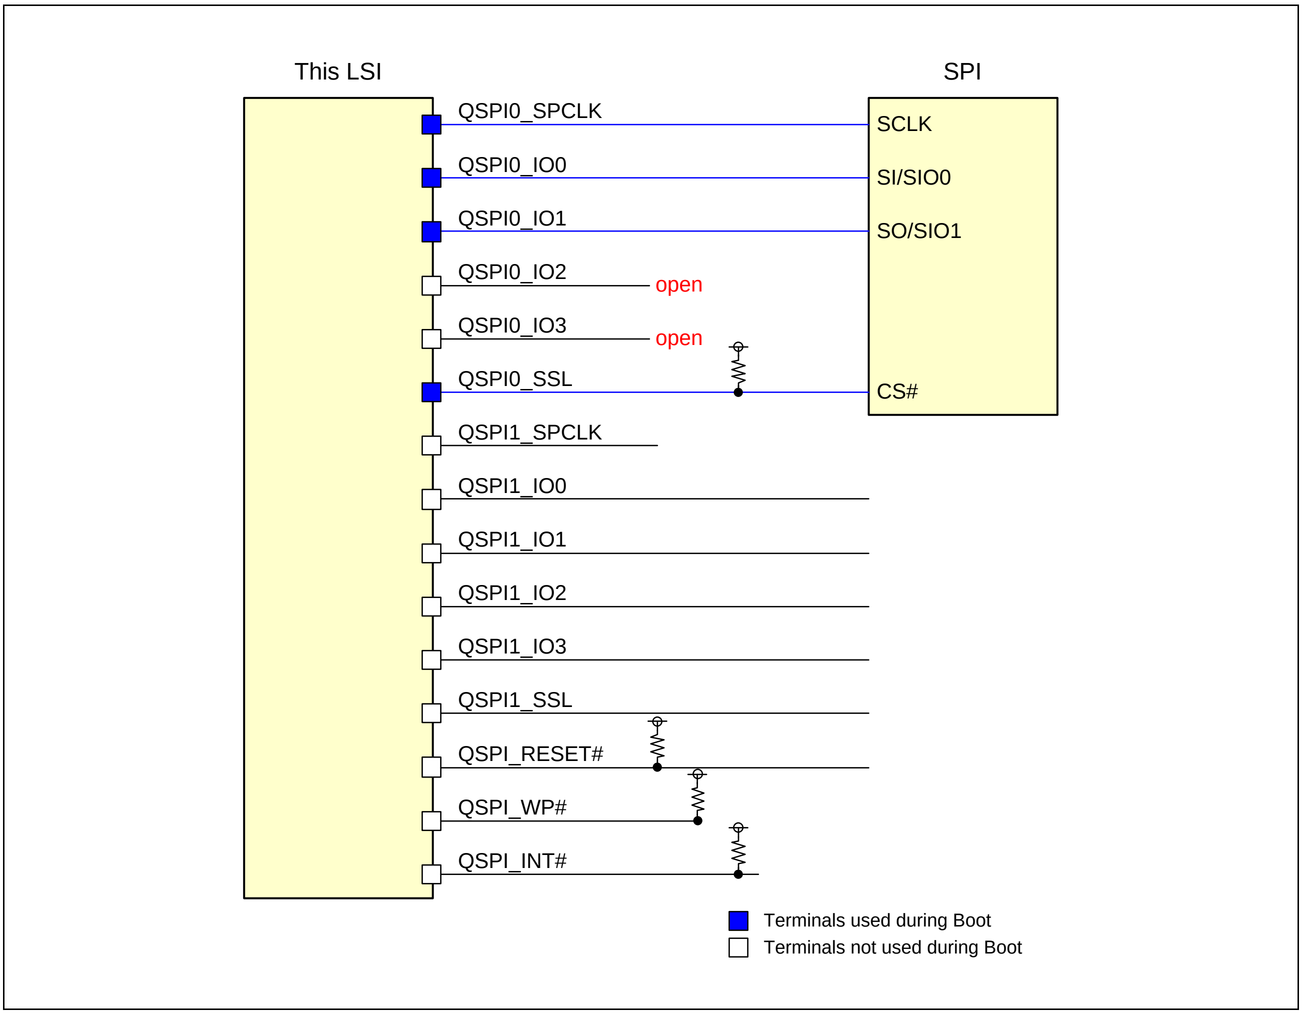

Figure 4.11 Connections with Single SPI Memory in Boot Mode 3

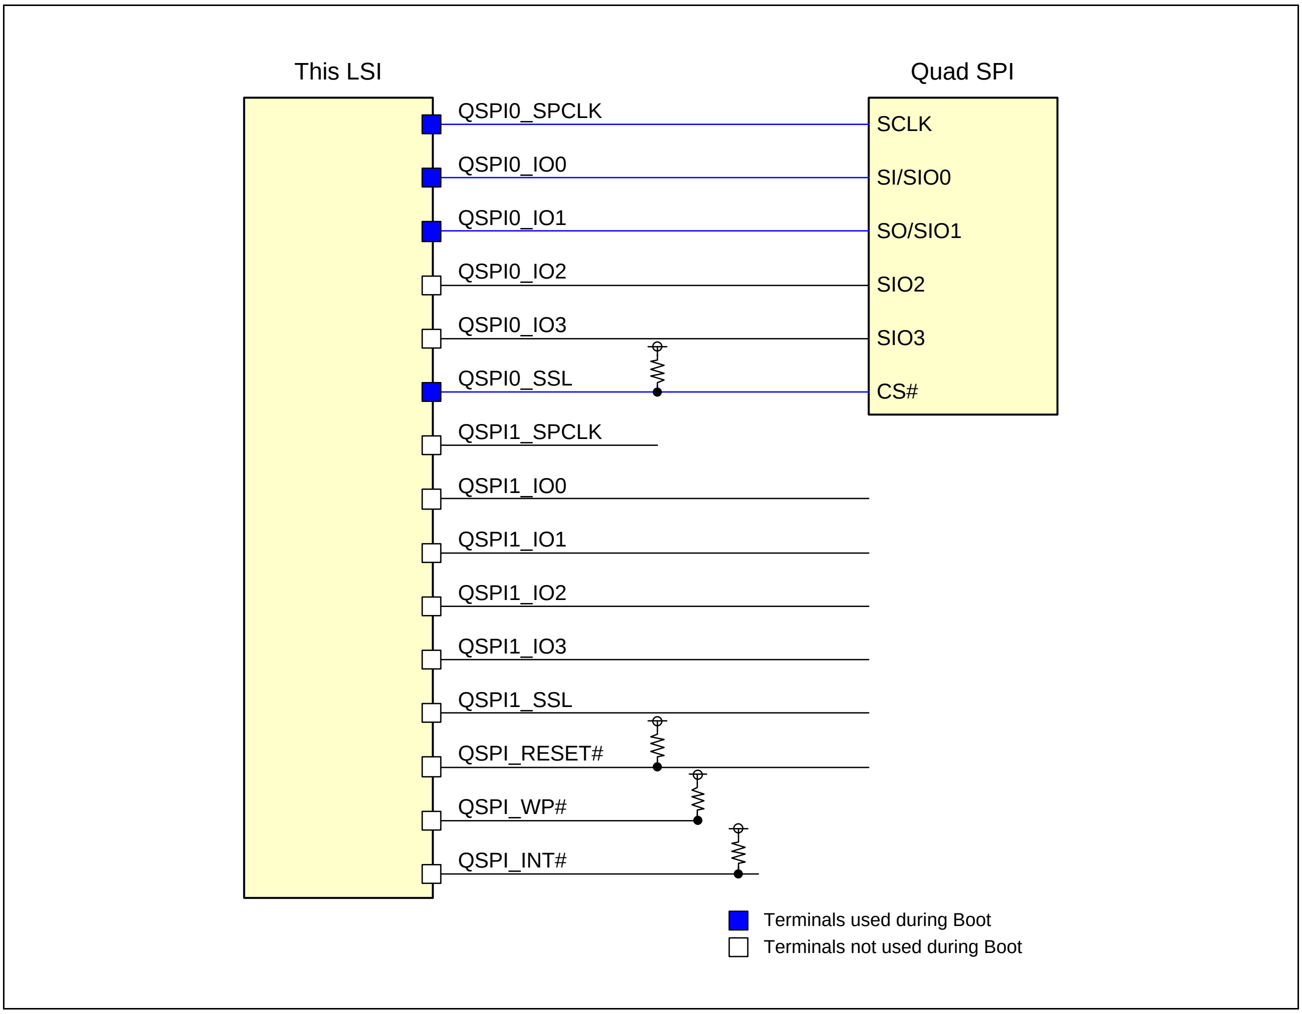

Figure 4.12 Connections with Quad SPI Memory in Boot Mode 3

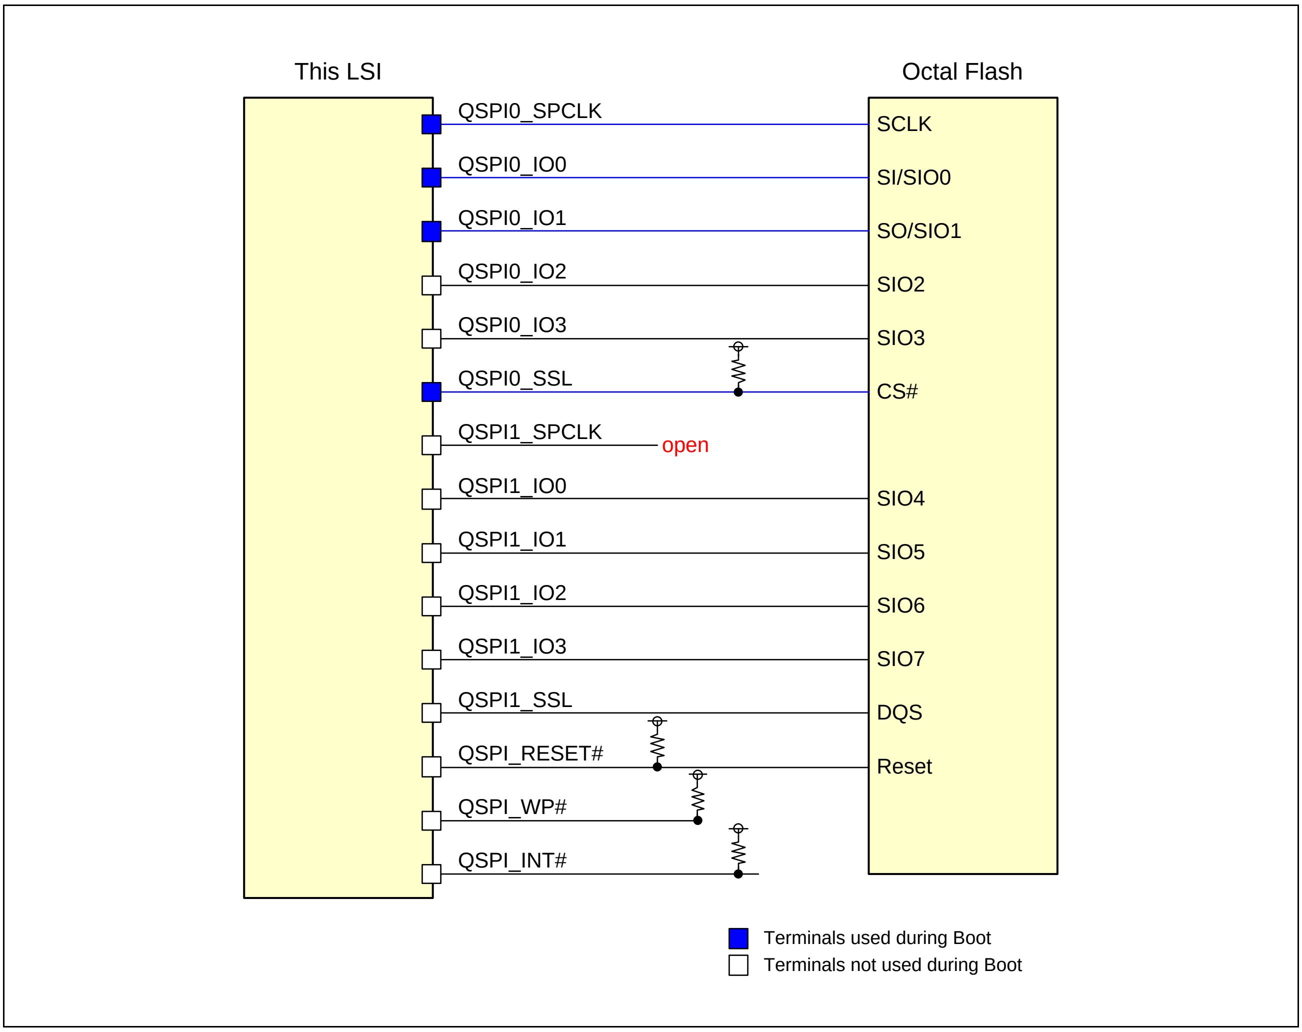

Figure 4.13 Connections with Octal Flash Memory in Boot Mode 3

4.2.4.2 Overview of Operation

This mode is used to boot this LSI from the user program stored in the Single, Quad, or Octal flash memory device.

The serial flash memory mounted in advance on the board is used in this mode. The target device operates at 1.8 V and the I/O power of this LSI is also fixed to 1.8 V in this mode. The clock frequency at the startup is set to 16.6 MHz. The LSI is booted up through an SPI handshake with the Single, Quad, or Octal flash memory device.

Upon detecting boot mode 3 according to the value read from the SYSC, the boot program makes the necessary settings of the SPI multi I/O bus controller to access memory. The boot program handles the following steps to control the booting process.

1. The CPG is set up to supply clocks, and the SPI multi I/O bus controller receives the operating clock and is released from the reset state.
2. The necessary information to control the I/O buffers is read from the registers in the SYSC.
   The given information is copied from the OTPC to the SYSC registers in advance.
3. The properties such as the driving ability of the I/O buffers of the signals to be used are set up.
4. After the above setup, the SPI multi I/O bus controller performs a handshake process with the target memory device.
5. When a Quad SPI handshake is required, the user program should control the process.

4.2.4.3 Operation of Booting from 1.8-V Serial Flash Memory

In boot mode 3 (booting from the serial flash memory), this LSI is booted from the loader program in the 1.8-V serial flash memory connected to the SPI multi I/O bus controller (SPIBSC).

The boot program executes the following processing to access the SPI multi I/O bus space.

1. Releasing the SPIBSC from module standby mode
2. Setting up the registers in the necessary peripheral modules (SPIBSC and GPIO)
3. Obtaining the size of the loader program data stored in the area starting from "the start address of the SPI multi I/O bus space (H’0_2000_0000) + offset" through the SPIBSC

After obtaining the size of the loader program data, the SPIBSC transfers the loader program stored in the area starting from "the start address of the SPI multi I/O bus space (H’0_2000_0000) + offset" to the addresses H’0_0001_2000 to H’0_0002_EFFF of the on-chip RAM for the obtained data size.

Then, execution branches to the start address (H’0_0001_2000) of the loader program transferred to the on-chip RAM to execute the loader program that was stored in the serial flash memory.

If the boot program has failed to read data, the boot program enters fail-safe mode (SCIF downloading mode). If the fail-safe processing has failed, execution enters an infinite loop in the on-chip ROM and the boot processing is terminated.

4.2.4.4 Allocation of the Loader Program in the Serial Flash Memory

Figure 4.14 shows the allocation of the loader program size block and loader program in the serial flash memory.

In the loader program size block, the loader program size is stored in the first four bytes and the signature H’AA55 is stored in the last two bytes. **Figure 4.15** shows the structure of the loader program size data. Be sure to store the loader program size in 4-byte little endian.

The loader program is transferred from the area starting from the address “H’0_2000_0000 + H’0200 (offset)” to the addresses H’0_0001_2000 to H’0_0002_EFFF of the on-chip RAM for the obtained loader program size.

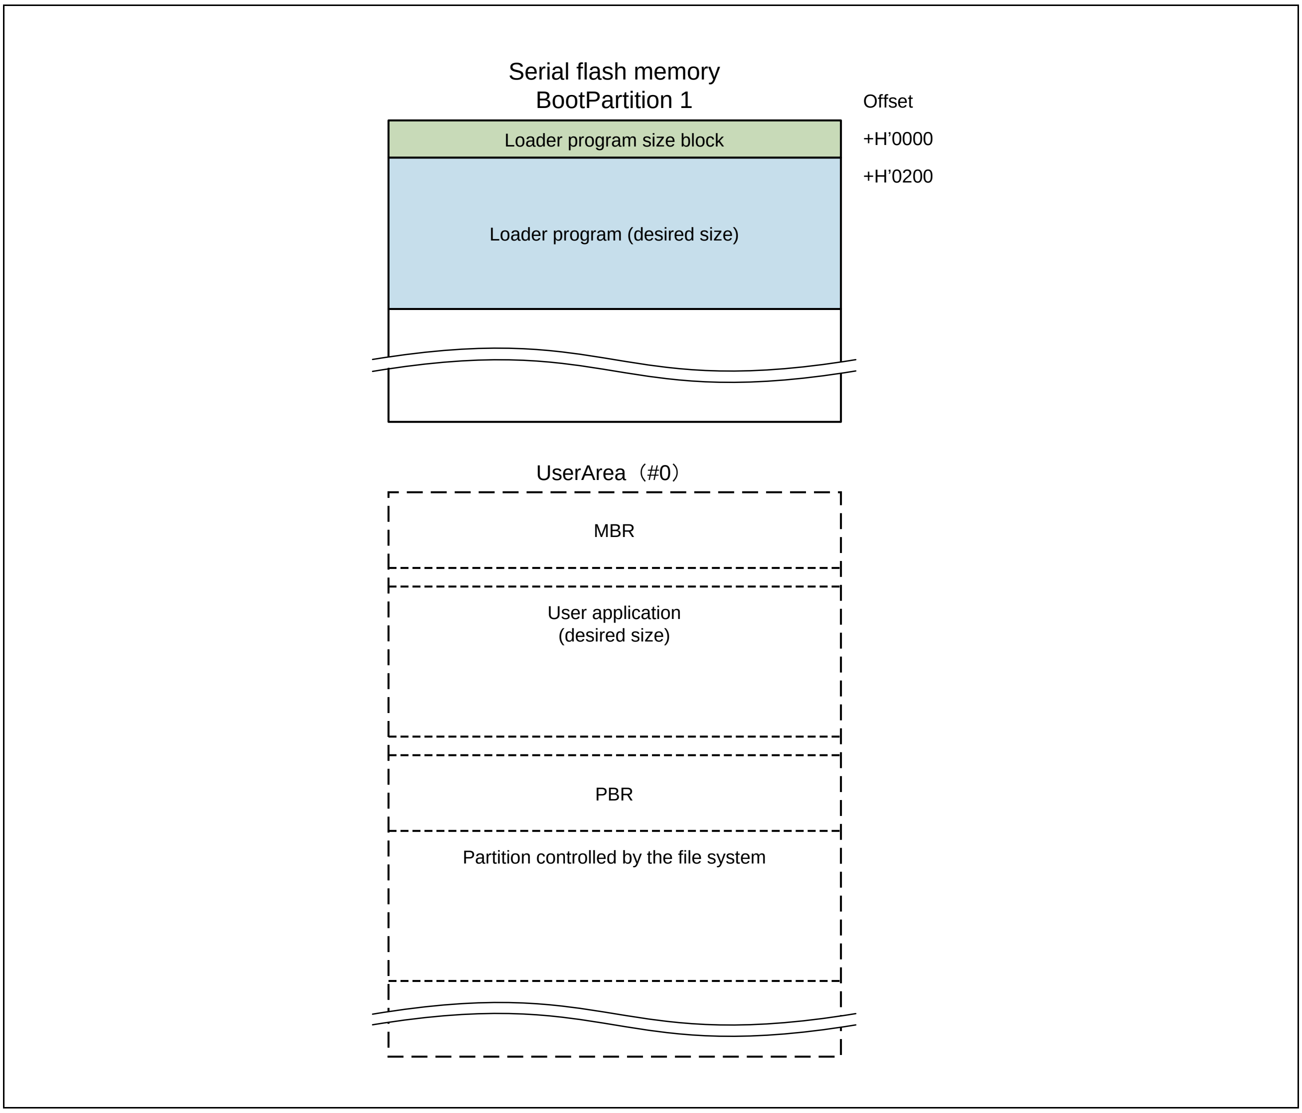

Figure 4.14 Allocation of Loader Program in the Serial Flash Memory Device

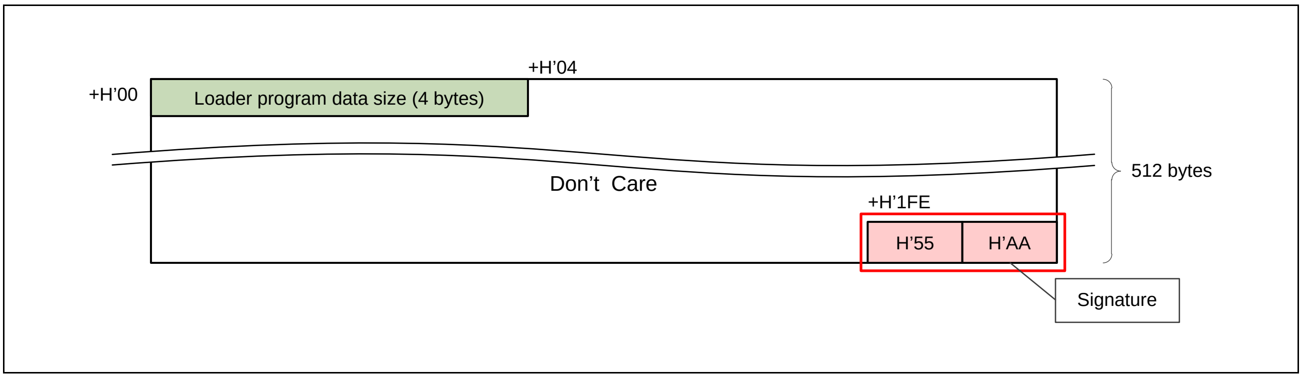

Figure 4.15 Structure of the Loader Program Size Block

4.2.5 Boot Mode 4 (3.3-V Single or Quad Serial Flash Memory)

Table 4.11 shows the interface signals used for connection with the external device in boot mode 4 (3.3-V serial flash memory).

Table 4.11 External Interface Signals Used in Boot Mode 4

Interface Module	Pin Name	I/O	Function	Pin Type
QSPI0	QSPI0_SPCLK	Input/output	QSPI clock	Dedicated pins (3.3 V)
	QSPI0_IO0	Input/output	QSPI data 0	
	QSPI0_IO1	Input/output	QSPI data 1	
	QSPI0_IO2	Input/output	QSPI data 2	
	QSPI0_IO3	Input/output	QSPI data 3	
	QSPI0_SSL	Output	QSPI data 4	
	QSPI1_SPCLK	Output	QSPI clock	
	QSPI1_IO0	Input/output	QSPI data 0	
	QSPI1_IO1	Input/output	QSPI data 1	
	QSPI1_IO2	Input/output	QSPI data 2	
	QSPI1_IO3	Input/output	QSPI data 3	
	QSPI1_SSL	Input/output	QSPI slave select	
	QSPI_RESET#	Output	QSPI reset	
	QSPI_WP#	Output	QSPI write protect	
	QSPI_INT#	Input	QSPI interrupt	

Note: Only interface 0 is used and the pins shaded in gray are not controlled in this mode. To use the shaded pins after booting, control them by the user program.

4.2.5.1 External Connections

Figure 4.16 and **Figure 4.17** show the connections with the 3.3-V Single SPI memory and 3.3-V Quad SPI memory, respectively.

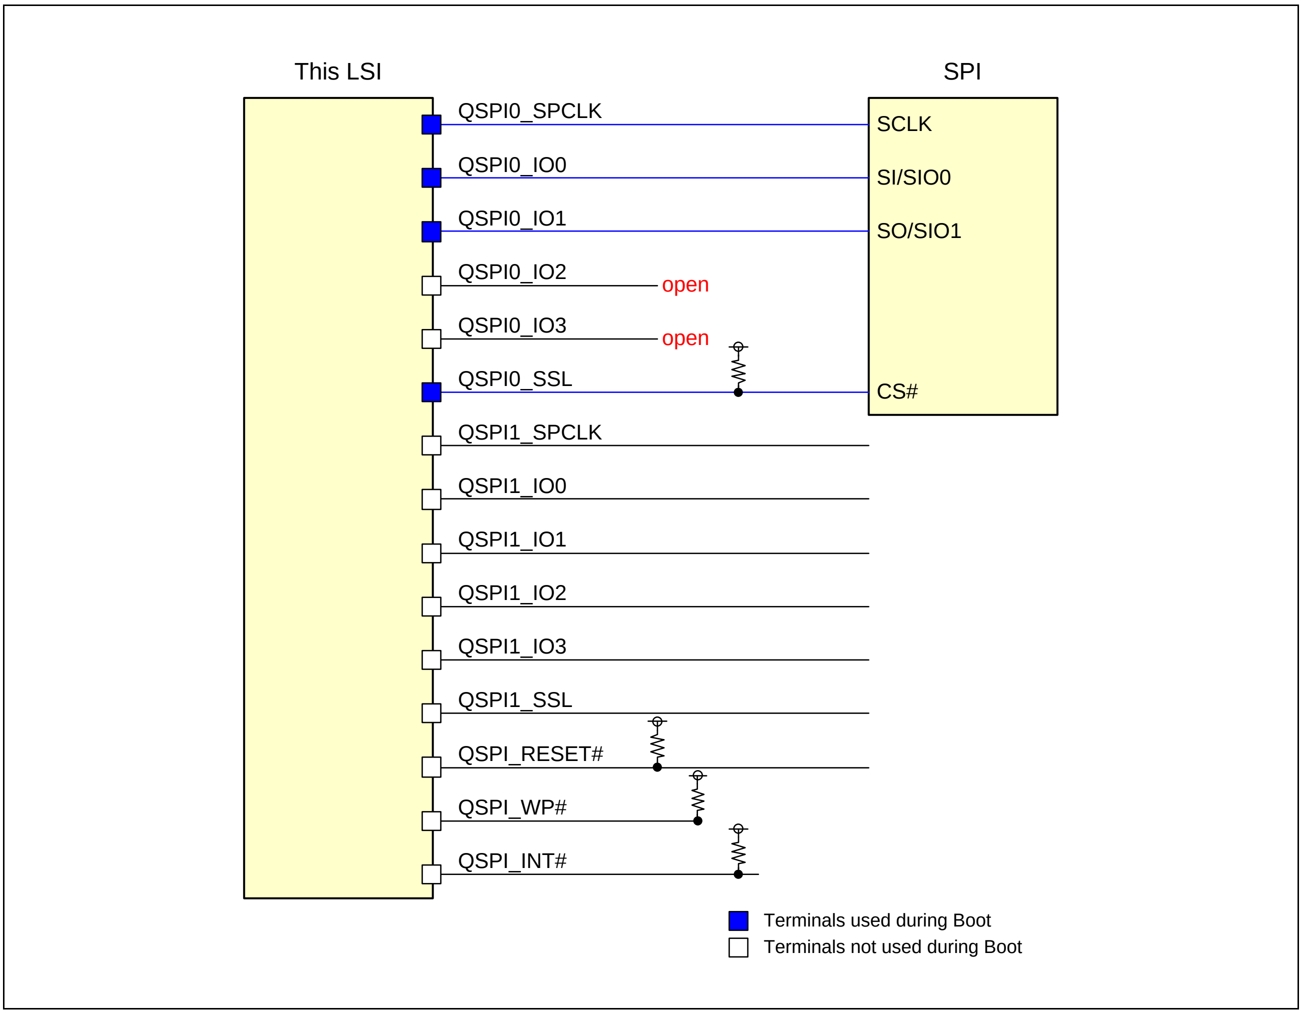

Figure 4.16 Connections with Single SPI Memory in Boot Mode 4

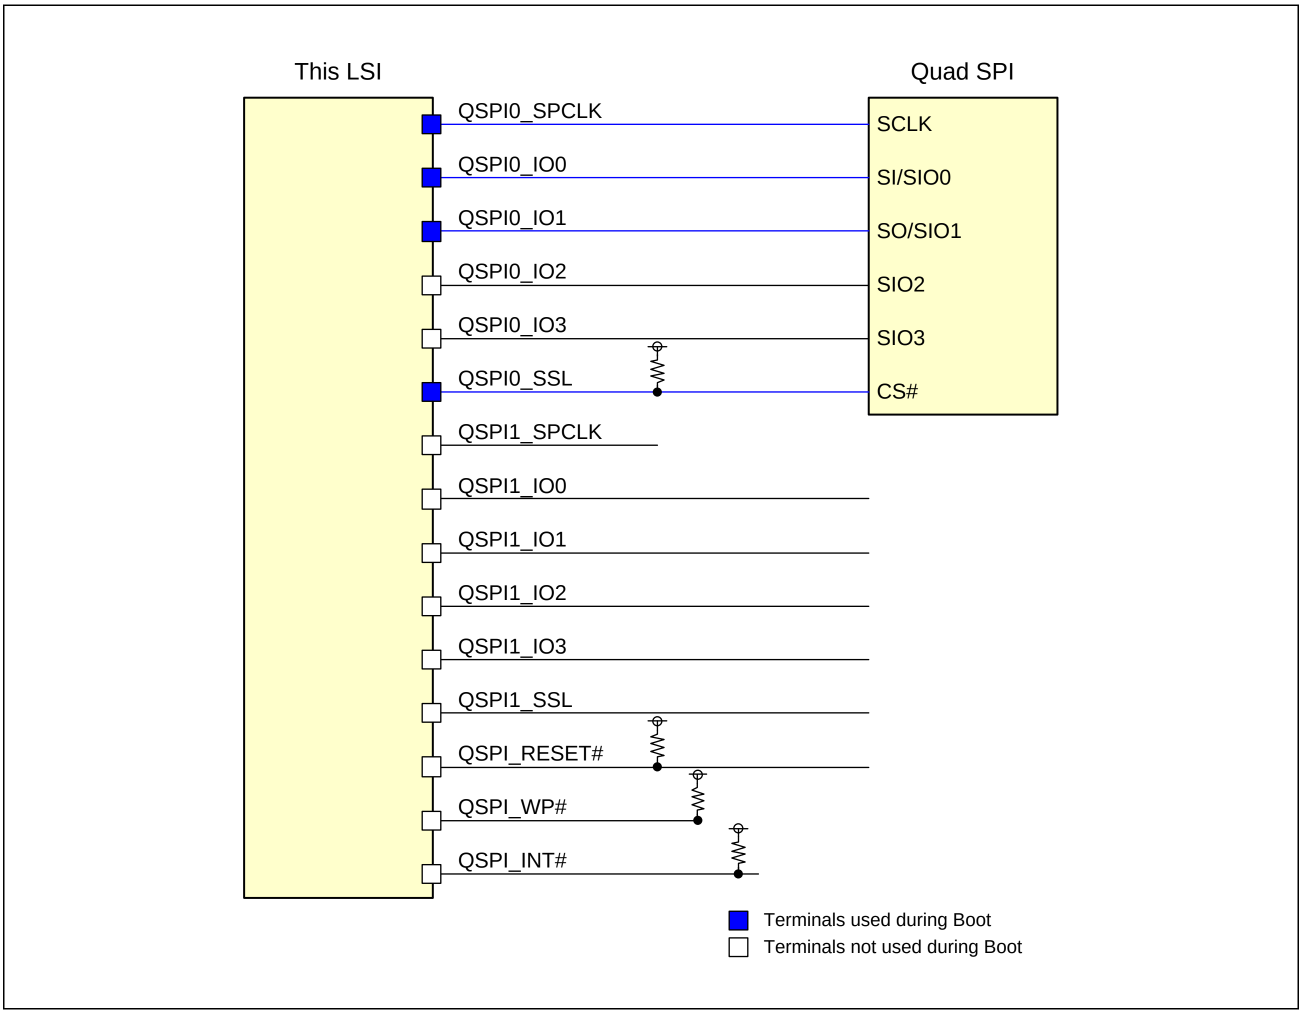

Figure 4.17 Connections with Quad SPI Memory in Boot Mode 4

4.2.5.2 Overview of Operation

This mode is used to boot this LSI from the user program stored in the Single or Quad SPI memory device. The serial flash memory mounted in advance on the board is used in this mode. The target device operates at 3.3 V and the I/O power of this LSI is also fixed to 3.3 V in this mode. The clock frequency at the startup is set to 16.6 MHz.

Upon detecting boot mode 4 according to the value read from the SYSC, the boot program makes the necessary settings of the SPI multi I/O bus controller to access memory. The boot program handles the following steps to control the booting process.

1. The CPG is set up to supply clocks, and the SPI multi I/O bus controller receives the operating clock and is released from the reset state.
2. The necessary information to control the I/O buffers is read from the registers in the SYSC.
   The information is copied from the OTPC to the SYSC registers in advance.
3. The properties such as the driving ability of the I/O buffers of the signals to be used are set up.
4. After the above setup, the SPI multi I/O bus controller performs a handshake process with the target memory device.
5. When a Quad SPI handshake is required, the user program should control the process.

4.2.5.3 Operation of Booting from 3.3-V Serial Flash Memory

Boot mode 4 (booting from 3.3-V serial flash memory) only differs from boot mode 3 (booting from 1.8-V serial flash memory) in the setting of supplied voltage as shown in **Table 4.12**.

Table 4.12 Resources Used by the Boot Program for 3.3-V Serial Flash Memory (Difference from 1.8-V Serial Flash Memory)

Register Name	Address	Initial Value	Value after Booting	Remarks
GPIO_QSPI	H’0_1101_3008	H’0000_0000	H’0000_0000	QSPI_PVDD: 0 = 3.3 V In boot mode 3 or 4, this is automatically set by hardware. The user does not need to set this register.

4.2.5.4 Note

When interface 0 of the SPI multi I/O bus controller is connected with the SPI or QSPI memory, interface 1 can only be used to connect the same type of memory.

4.2.6 Boot Mode 5 (SCIF Downloading)

Table 4.13 shows the interface signals used for connection with the external device in boot mode 5 (SCIF downloading).

Table 4.13 External Interface Signals Used in Boot Mode 5

Interface Module	Pin Name	I/O	Function	Pin Type
SCIF0	SCIF0_SCK	Input/output	SCIF0 serial clock	Multiplexed pins (3.3 V)
	SCIF0_RXD	Input	SCIF0 receive data	
	SCIF0_TXD	Output	SCIF0 transmit data	
	SCIF0_CTS#	Input/output	SCIF0 transmission enable	
	SCIF0_RTS#	Output	SCIF0 transmission request	

4.2.6.1 External Connections

Figure 4.18 shows the external connections for downloading through the SCIF.

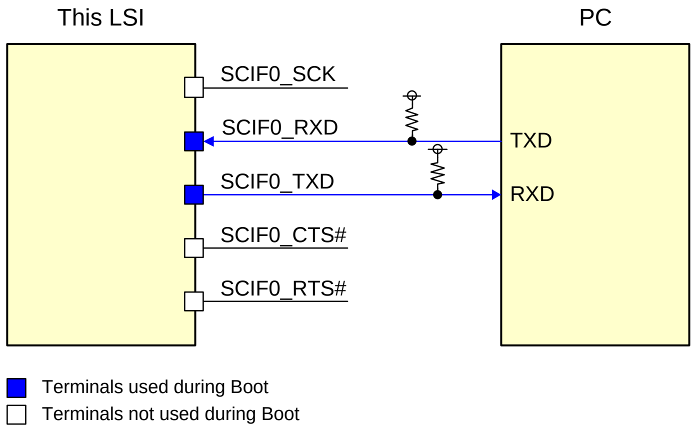

Figure 4.18 Connections for Downloading through the SCIF in Boot Mode 5

4.2.6.2 Overview of Operation

This mode is used to download the user program from the host PC. Upon detecting boot mode 5 according to the value read from the SYSC, the boot program makes the necessary settings of the SCIFA module to access memory. The boot program handles the following steps to control the booting process.

1. The SCIFA module is set up to handle communications as shown below. Asynchronous communications proceed in this mode. The SCIF0_RXD and SCIF0_TXD pins are used.
   Baud rate: 115200 bps
   Data length: 8 bits
   Stop bit: 1 bit
   Flow control: None
   Data format: Motorola S-record
2. The sequence shown in **Figure 4.19** is used to download the user program through the SCIF.

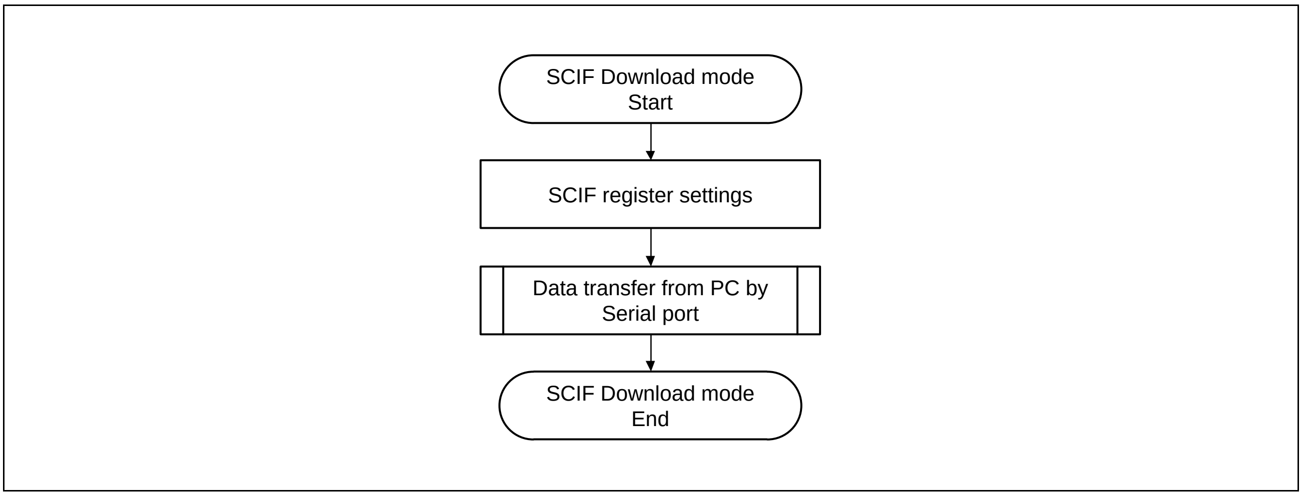

Figure 4.19 Sequence of Downloading through the SCIFA

4.2.6.3 Operation of Booting through SCIF Downloading

In boot mode 5 (booting through SCIF downloading), this LSI is booted from the loader program downloaded from the external host PC through the serial communications interface with FIFO (SCIFA).

The boot program executes the following processing.

1. Setting up the necessary peripheral modules (SCIFA channel 0 and GPIO) and specifying the parameters for communications.

   When the LSI becomes ready for data reception, the boot program outputs the following message to the SCIFA.
   "SCIF Download mode"

   If execution enters boot mode 5 due to the fail-safe processing, the boot program outputs the following message to the SCIFA.
   "SCIF Download mode due to parameter error"

2. Upon receiving the Motorola S0 record sent from the external host PC through the SCIFA, the boot program converts the S3 record to binary data and copies the data to the addresses H'0_0001_2000 to H'0_0002_EFFE (up to 116 Kbytes) of the on-chip RAM.

   The boot program outputs the following message to the SCIFA.
   "-- Load Program to System RAM ---------------"

   Note: The S0 record must always be generated because the boot program requires an S0 record as a trigger for the reception processing.

3. Upon receiving the S7 record, the boot program outputs the following message to the SCIFA and terminates copying to the on-chip RAM. After that, execution branches to the address H'0_0001_2000 of the on-chip RAM.
   "-- Start Boot Program on System RAM ---------"

   If the data in the Motorola S records sent from the external host PC satisfies any of the following error conditions, the corresponding error message is output to the SCIFA and copying to the on-chip RAM is aborted.

   — An S1 or S2 record is received: "Invalid Record Type Error!!! "

   — An address outside the on-chip RAM area is specified: "Address Error!!! "

   — An illegal character code is found: "Invalid Character Error!!! "

   — An illegal byte count is found: "Invalid Byte Count Error!!! "

The data transmission and reception operation in SCIF communications (asynchronous) is shown in **Figure 4.20**.

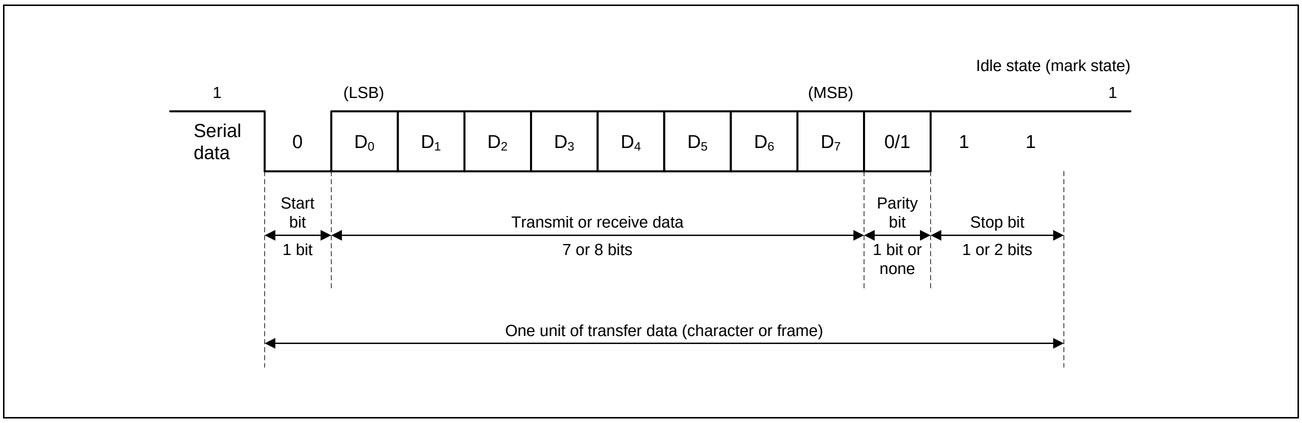

Figure 4.20 Data Transmission and Reception Operation in SCIF Communications

4.2.6.4 Allocation of the Loader Program for SCIF Downloading

Figure 4.21 shows the allocation of the loader program copied to the on-chip RAM.

In the loader program size block (512 bytes), the loader program size is stored in the first four bytes and the signature H’AA55 is stored in the last two bytes. Be sure to store the loader program size in 4-byte little endian.

Figure 4.21 Allocation of the Loader Program for SCIF Downloading Copied to the On-chip RAM

4.2.6.5 Note

The pins assigned to the SCIF0_SCK, SCIF0_CTS, and SCIF0_RTS signals, which are not used in this mode, must not be changed from the initial settings (GPIO pins). If such a pin is set to operate as an SCIF0 pin, it becomes an input pin or an input/output pin. In this case, when the pin is externally placed in the Hi-Z state, this LSI cannot communicate with the host PC correctly.

To use the SCIFA for normal serial communications after booting, the SCIF0_SCK, SCIF0_CTS, and SCIF0_RTS pins should be pulled up or down in accordance with the communication mode and the driver software specifications.

5. LSI Internal Bus

5.1 Overview

5.1.1 Features

The bus system of this LSI provides a physical address space of 16 Gbytes (address bus width of 34 bits). The LSI internal bus of this LSI incorporates Arm CoreLink NIC-400, etc., and controls the following bus functions.

Security control:

Security attribute re-setting, Security level determination

Address translation:

34-bit address space access

Interrupt generation:

AXI bus error interrupt generation

Unit state detection:

Slave unit stop state detection

NOTE

The security control function is valid only for secure products.
For information on secure products, please contact our sales.

5.1.2 Block Diagram of LSI Internal Bus

The LSI internal bus of this LSI consists of the ACPU bus, MCPU bus, and system bus. **Figure 5.1** shows the configuration of the buses.

ACPU bus:

A bus connected to Cortex-A55, DDR memory controllers, image processing units, and Storage and Network

MCPU bus:

A bus connected to Cortex-M33 and serial interface units

System bus:

A bus connected to the control registers of each unit

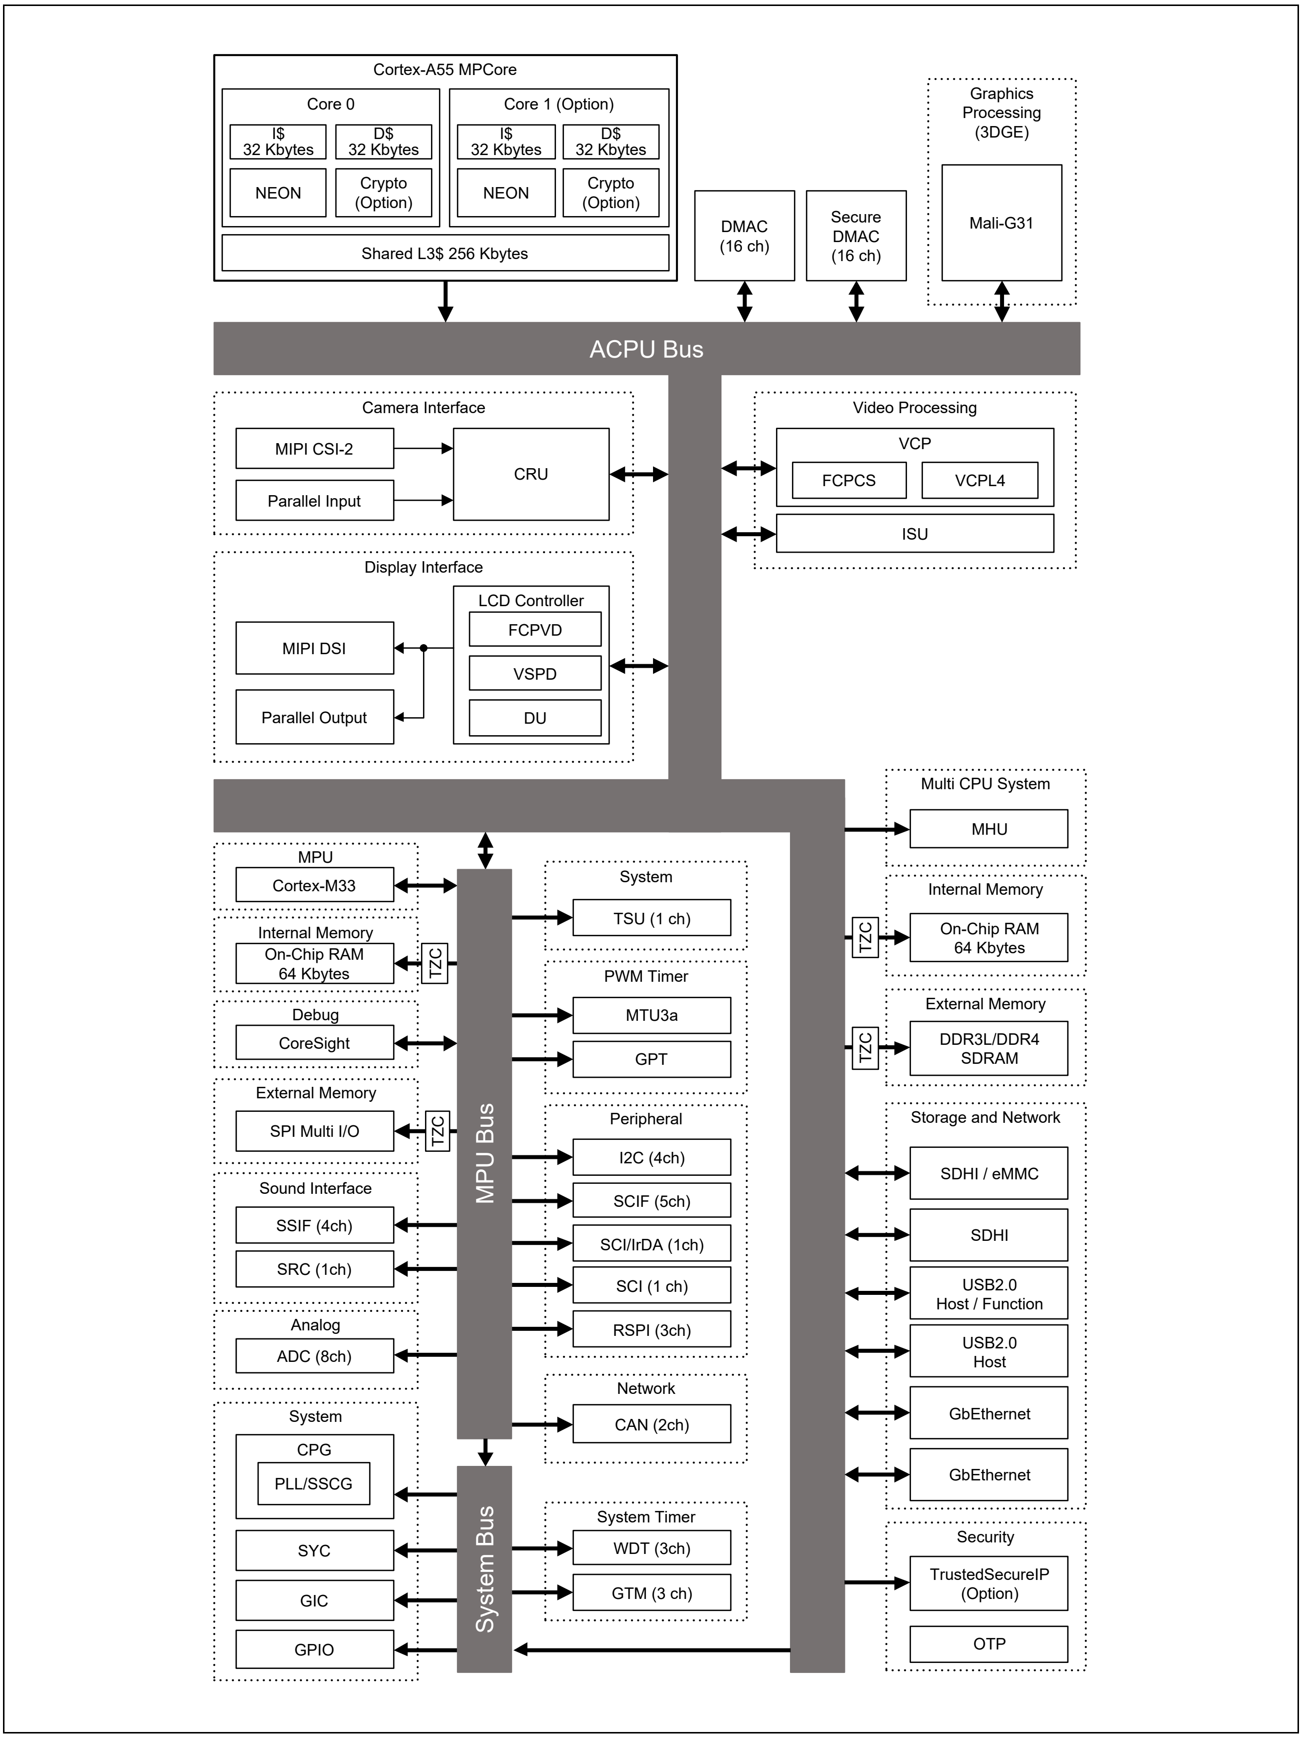

Figure 5.1 Configuration of LSI Internal Bus

5.2 Area Maps

5.2.1 Overall Address Space

Figure 5.2 shows the overall address space of this LSI and **Table 5.1** shows the detailed address space.

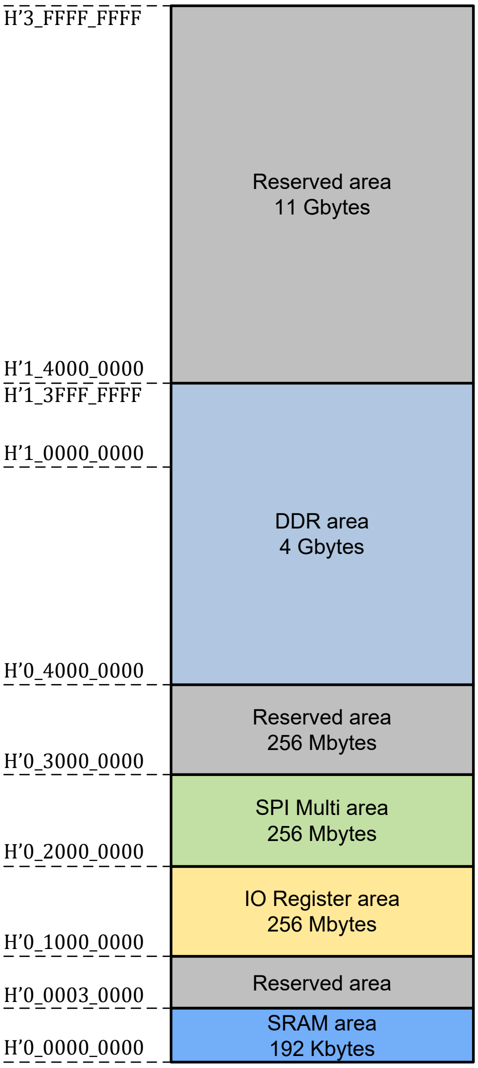

Figure 5.2 Overall Address Space

Some bus master units of this LSI require 34-bit address space access to access an address space of greater than 4 Gbytes in the whole 16-Gbyte address space of this LSI. For details, see **Section 5.4.2.1, 34-Bit Address Space Access**.

The Cortex-M33 address space for this LSI differs from the overall address space. It is the same as the address space of the default memory map of Cortex-M33. For details, see **Section 5.2.2, Cortex-M33 Address Space**.

H'0_0000_0000	H'0_0000_FFFF	64	Kbytes	Reserved	*1

Note 1. Access to the reserved areas is prohibited.
If access to the reserved area is attempted, incorrect operation may occur.

Note 2. Access to the addresses H'4000_0000 to H'4000_001F (for DDR3L) or H'4000_0000 to H'4000_003F (for DDR4) in the DDR area is prohibited because these are used for DDR training. For details, see **Section 9**, **DDR3L/DDR4 SDRAM Memory Controller (MEMC)**.

5.2.2 Cortex-M33 Address Space

Figure 5.3 shows the default memory map of Cortex-M33 and an overview of the Cortex-M33 address space for this LSI, and **Table 5.2** shows the detailed address space. For the concept of the secure and non-secure states, see **Section 3, System CPU Cortex-M33**.

In this LSI, addresses H’0000_0000 to H’1FFF_FFFF are used as the code (program) area and addresses H’2000_0000 to H’3FFF_FFFF are used as the data area in the 1-Gbyte SRAM area (H’0000_0000 to H’3FFF_FFFF).

In this LSI, the hardware automatically translates the addresses in the Cortex-M33 address space to those in the overall address space of this LSI. Users can therefore write programs using the addresses in the address space shown in **Figure 5.3** and **Table 5.2**, without considering the overall address space.

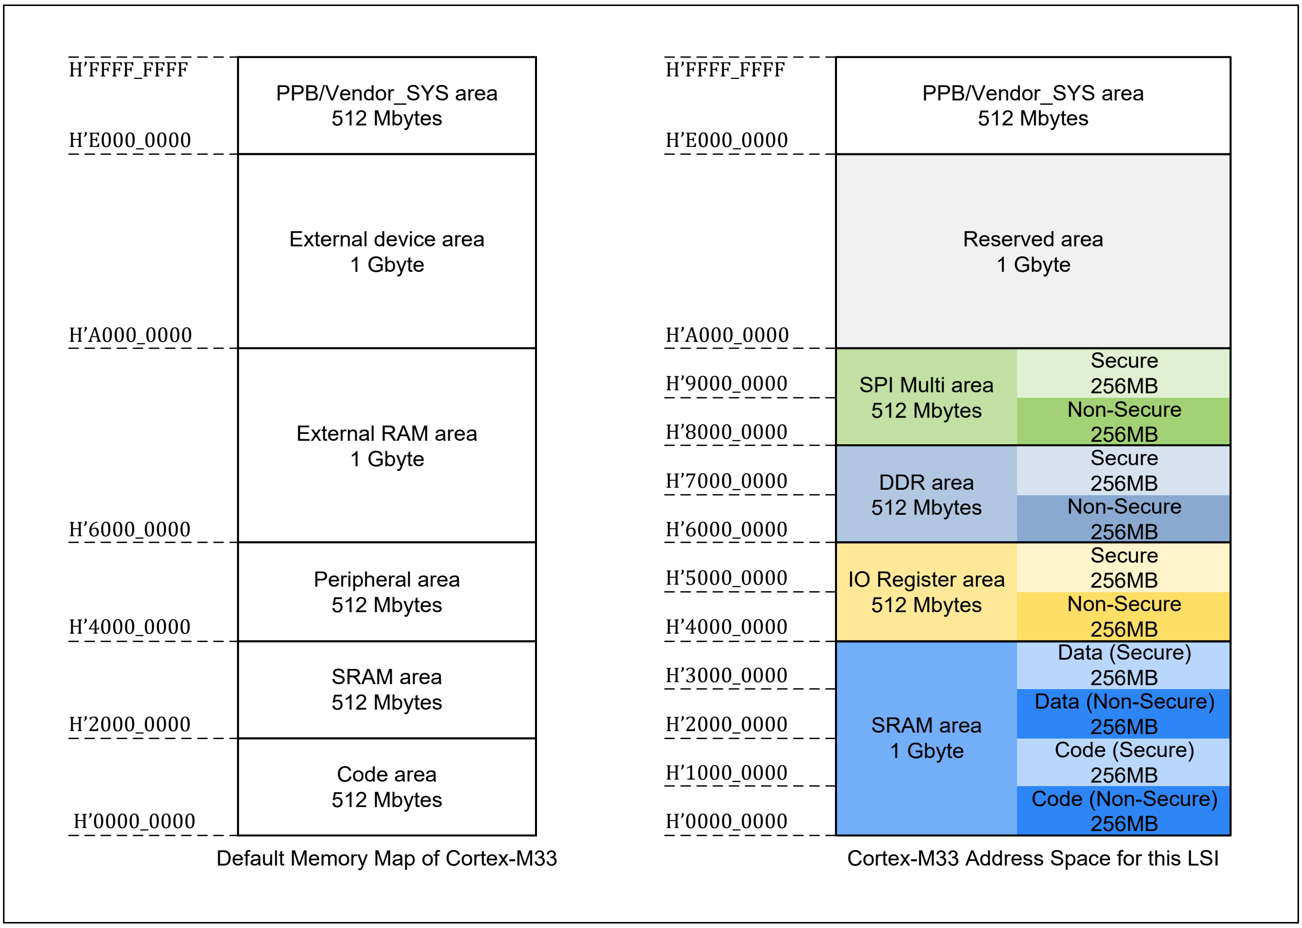

Figure 5.3 Overview of Cortex-M33 Address Space

Note 1. Access to the reserved areas is prohibited.
If access to the reserved area is attempted, incorrect operation may occur.

Note 2. Access to the addresses H'6000_0000 to H'6000_001F and H'7000_0000 to H'7000_001F (for DDR3L) or H'6000_0000 to H'6000_003F and H'7000_0000 to H'7000_003F (for DDR4) in the DDR area is prohibited because these are used for DDR training. For details, see **Section 9, DDR3L/DDR4 SDRAM Memory Controller (MEMC)**.

Note 3. For details on the PPB/Vendor_SYS area, refer to “Arm Cortex-M33 Processor Technical Reference Manual”.

5.3 Accessible Areas

In the bus system of this LSI, each bus master unit can only access the areas that are used for register access or data transfer. **Table 5.3** shows the areas that can be accessed from each master.

The register area of TZC can be accessed only when Secure (AxPROT[1] = 0).

Table 5.3 Accessible Areas (1/2)

	Master Unit													
Slave Unit	Cortex-A55	Mali-G31	DMAC_S	DMAC_NS	Cortex-M33 [C,S-AHB]	CoreSight [AXI-AP]	CoreSight [ETR]	SDHI (ch0, ch1)	Gether (ch0, ch1)	USB2.0 (ch0, ch1)	CRU [Video, Statistics]	FCPVD	DSI (Controller)	ISU

Note 1. Access to TZC-400 registers is prohibited because DMAC_NS is always fixed to the Non-secure state and unprivileged mode by control signals from the SYSC.

Remarks: ✓: Accessible path, ×: Prohibited path

Note: Usage of paths marked with × in the table is prohibited.
If access to such a path is attempted, incorrect operation may occur.

5.4 Bus System Control

5.4.1 Security Control

5.4.1.1 Re-Setting the Security Attribute Output from Bus Masters

This facility is for re-setting the security attributes of bus transactions that are by bus master units. Specifically, use the master access control register (SYS_MSTACCCTLn: n = 0 to 4) to re-set the security attributes. For details on the SYS_MSTACCCTLn register, see **Section 6.3, Register Descriptions**.

NOTE

The bus transaction signals ARPROT[1:0] and AWPROT[1:0] indicate the security attributes, which can be used to protect against illicit transactions.

- ARPROT[0] and AWPROT[0] being 0 or 1 respectively indicate non-privileged access or privileged access.
- ARPROT[1] and AWPROT[1] being 0 or 1 respectively indicate secure access or non-secure access.

The ARPROT and AWPROT signals are prescribed in as part of the AXI protocol. For details, see the AMBA AXI and ACE Protocol Specifications published by Arm Ltd.

Use the SYS_MSTACCCTLn register to make the following settings.

- Selection of security attribute source

  Selection of whether to use the unchanged values of ARPROT[1:0] or AWPROT[1:0] of the ARPROT[2:0] or AWPROT[2:0] signals, which are output from the bus master units, or to re-set ARPROT[1:0] or AWPROT[1:0] according to the settings of the SYS_MSTACCCTL register
- Value to be re-set for ARPROT[1:0] or AWPROT[1:0]

Table 5.4 shows the relation between the registers and bits for use in re-setting the security attributes and the target masters for control.

Table 5.4 List of Register Bits for Use in Re-setting of Security Attributes

Target Master for Control*1	Control Register*2	Write Access Control Bits*3,*4			Read Access Control Bits*3,*5		
		Bit for use in re-setting the security attributes immediately below		Bit for use in selecting the security attribute source	Bit for use in re-setting the security attributes immediately below		Bit for use in selecting the security attribute source
		AWPROT[0]	AWPROT[1]		ARPROT[0]	ARPROT[1]

LCDC	SYS_MSTACCCTL3	Bit 8: AWPU	Bit 9: AWNS	Bit 11: AWSEL	Bit 12: ARPU	Bit 13: ARNS	Bit 15: ARSEL
MIPI DSI	SYS_MSTACCCTL3	Bit 16: AWPU	Bit 17: AWNS	Bit 19: AWSEL	Bit 20: ARPU	Bit 21: ARNS	Bit 23: ARSEL
ISU*8	SYS_MSTACCCTL4	Bit 0: AWPU	Bit 1: AWNS	Bit 3: AWSEL	Bit 4: ARPU	Bit 5: ARNS	Bit 7: ARSEL
CRU (Video)*8	SYS_MSTACCCTL4	Bit 16: AWPU	Bit 17: AWNS	Bit 19: AWSEL			

Note 1. Re-setting of security attributes for the Cortex-A55, Cortex-M33, and CoreSight bus masters is not possible.

Note 2. See **Section 6.3, Register Descriptions** for details on the registers.

Note 3. See **Section 6.3, Register Descriptions** for details on the bits.

Note 4. The values set in AWPU and AWNS are effective when the setting of the corresponding AWSEL bit is 1. For details, see the specifications of the registers in **Section 6.3, Register Descriptions**.

Note 5. The values set in ARPU and ARNS are effective when the setting of the corresponding ARSEL bit is 1. For details, see the specifications of the registers in **Section 6.3, Register Descriptions**.

Note 6. AWPU and ARPU, AWNS and ARNS, and AWSEL and ARSEL for use in control of the non-secure DMAC are respectively fixed to 1, 1, 0, 0, and 1, 1. Accordingly, access to the non-secure DMAC is always non-secure and non-privileged.

Note 7. When the setting of AWSEL for use in control of the USB2.0 module is 0, the values in AWPROT[0] and ARPROT[0] are the same as the value of HPROT[1] output from the USB2.0 module, and the values of AWPROT[1] and ARPROT[1] are always 1. For control of HPROT[1] in the USB2.0 module, see **Section 32A, USB 2.0 Host Module**. The HPROT signal is prescribed in the HB-Lite protocol. For details, see the AMBA 3 AHB-Lite Protocol Specification published by Arm Ltd.

Note 8. AWSEL and ARSEL for use in control of the ISU and CRU (video) should be set to 1. Set AWPU, AWNS, ARPU, and ARNS for the desired security attributes. Operation is not guaranteed if AWSEL and ARSEL are set to 0. For details, see the specifications of the registers in **Section 6.3, Register Descriptions**.

5.4.1.2 Determining the Security Levels of Bus Slaves

This facility is for enabling or disabling access to a bus slave unit by comparing the security attribute that is input to the bus slave unit in a bus transaction with the security setting of the given slave. The security level can be set in one of the following ways. The applicable way depends on the slave.

- Setting by using the SL[1:0] bits in the slave control register (SYS_SLVACCCTLn: n = 0 to 8, 10, 12 to 14)
- Setting by using the nsaid_wr_en[31:16] and nsaid_rd_en[15:0] bits in the region ID access register (REGION_ID_ACCESS_<n>: n = 0 to 2) of the TrustZone address space controller (TZC). For details on the TZC, see **Section 13, TrustZone Address Space Controller (TZC)**.

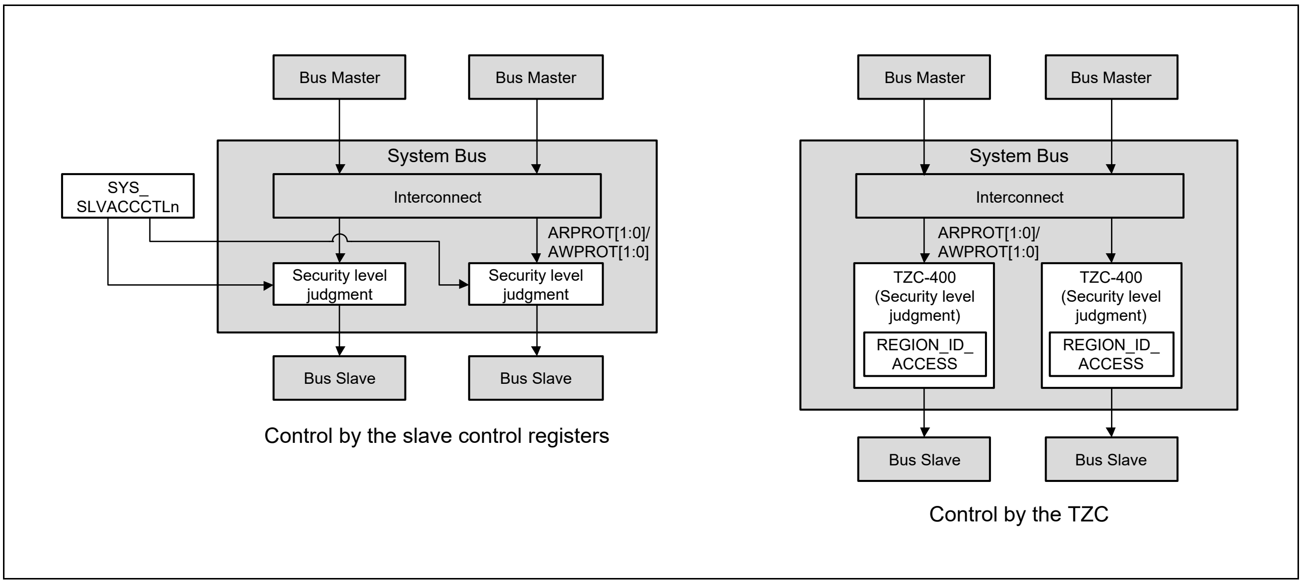

Figure 5.4 Security level determination ways

NOTE

The bus transaction signals ARPROT[1:0] and AWPROT[1:0] indicate the security attributes, which can be used to protect against illicit transactions.

- ARPROT[0] and AWPROT[0] being 0 or 1 respectively indicate non-privileged access or privileged access.
- ARPROT[1] and AWPROT[1] being 0 or 1 respectively indicate secure access or non-secure access.

The ARPROT and AWPROT signals are prescribed in as part of the AXI protocol. For details, see the AMBA AXI and ACE Protocol Specifications published by Arm Ltd.

Table 5.5 shows the correspondence between the settings of the slave control register and the security levels for input transactions. **Table 5.6** shows the correspondence between the settings of the region ID access register of the TZC and the security levels for input bus transactions.

If comparison indicates that access is disabled, a bus error is generated in response to the corresponding attempted bus transaction. Stopping of a slave unit is detected by reference to the module stop state (MSTOP) setting in the CPG. Attempted access to a slave unit in the module stop state leads to a bus error.

Table 5.5 Security Levels Set by Using the Slave Control Register

Setting of SL[1:0]	Security Attribute for Input Bus Transactions			
	Non-privileged Non-secure	Privileged Non-secure	Non-privileged Secure	Privileged Secure
00	Access allowed	Access allowed	Access allowed	Access allowed
01	Access not allowed	Access allowed	Access allowed	Access allowed
10	Access not allowed	Access not allowed	Access allowed	Access allowed
11	Access not allowed	Access not allowed	Access not allowed	Access allowed

Table 5.6 Security Levels Set by Using the TZC

Setting of nsaid_wr_en[31:16] and nsaid_rd_en[15:0]	Security Attribute for Input Bus Transactions			
	Non-privileged Non-secure	Privileged Non-secure	Non-privileged Secure	Privileged Secure
H’000F	Access allowed	Access allowed	Access allowed	Access allowed
H’000B	Access not allowed	Access allowed	Access allowed	Access allowed
H’0003	Access not allowed	Access not allowed	Access allowed	Access allowed
H’0002	Access not allowed	Access not allowed	Access not allowed	Access allowed

Table 5.7 lists the bus slaves for which the security levels are determined by using the slave control registers (SYS_SLVACCCTLn: n = 0 to 8, 10, 12 to 14). **Table 5.8** lists the bus slaves for which security levels are determined by using the region ID access registers (REGION_ID_ACCESS_<n>) of the TZC.

Table 5.7 Bus Slaves for which the Security Levels are Determined by Using the Slave Control Registers (1/2)

Target Bus Slave for Control*[1]	Control Register*[2]	SL[1:0] Allocation Bits*[3]
SRAM ACPU (Reg)	SYS_SLVACCCTL0	Bits [1:0]

Note 1. The security levels for the following bus slaves incorporated in this product are determined by using TZC-400. For details on the registers for controlling the security levels of these bus slaves, see **Table 5.8**.
— DDR3L and DDR4
— Memory areas of the SRAM ACU and SRAM MCPU
— Memory area, write buffer area, and control register area of SPI Multi I/O

Note 2. See **Section 6.3, Register Descriptions** for details on the registers.

Note 3. See **Section 6.3, Register Descriptions** for details on the bits.

Note 4. The SYSC has registers to control these functions. Setting of the security levels for each of the functions is possible. For details on the SYSC registers, see **Section 6.3, Register Descriptions**.

Table 5.8 Bus Slaves for which Security Levels are Determined by Using the Region ID Access Registers of the TZC

Target Bus Slave for Control	Security Control Unit (locations of the control registers)	Control Register*1	Control Bits*2
DDR	TZC (DDR)	REGION_ID_ACCESS_<n> (n: 0,1,2)*3	nsaid_wr_en[31:16], nsaid_rd_en[15:0]
SPI Multi I/O	TZC (SPI Multi I/O)	REGION_ID_ACCESS_0	nsaid_wr_en[31:16], nsaid_rd_en[15:0]
SRAM MCPU	TZC (SRAM MCPU)	REGION_ID_ACCESS_0	nsaid_wr_en[31:16], nsaid_rd_en[15:0]
SRAM ACPU	TZC (SRAM ACPU)	REGION_ID_ACCESS_0	nsaid_wr_en[31:16], nsaid_rd_en[15:0]

Note 1. For details on the related registers, see the Technical Reference Manual of CoreLink TZC-400 TrustZone Address Space Controller published by Arm Ltd.

Note 2. For details on the related bits, see the Technical Reference Manual of CoreLink TZC-400 TrustZone Address Space Controller published by Arm Ltd.

Note 3. REGION_ID_ACCESS_0 is for setting the security level for access to the DDR memory by using port 0 of the MEMC.
REGION_ID_ACCESS_1 is for setting the security level for access to the DDR memory by using port 1 of the MEMC.
REGION_ID_ACCESS_2 is for setting the security level for access to the DDR memory by using port 2 of the MEMC.
See **Section 13.1.2, Block Diagram** and **Figure 13.1** for the port number of the MEMC for use in access to the DDR memory from the bus masters.

5.4.2 Address Translation

5.4.2.1 34-Bit Address Space Access

This LSI has bus master units that can handle up to a 34-bit address space and bus master units that can only handle up to a 32-bit address space (actual size of 4 Gbytes). This function enables a bus master unit that can only handle up to a 32-bit address space (actual size of 4 Gbytes) to access an address space of greater than 4 Gbytes. The target bus master units are as follows.

- SDHI/eMMC
- GEthernet
- USB2.0
- DMAC
- FCPVD
- DSI-LINK

This function translates bus transaction addresses that are output from a bus master unit in 1-Gbyte units according to the settings of the address offset registers (SYS_AOFn: n = 0 to 6), as shown in the figure below. For details on the SYS_AOFn register, see **Section 6.3, Register Descriptions** in **Section 6, System Controller (SYSC)**.

- In the SYS_AOF registers, set bits [33:30] of the remapping destination address in each 1-Gbyte space corresponding to bits [31:30] of the address that is output from the bus master unit.
- Select the 4-bit value of the SYS_AOF register corresponding to the upper two bits (bits [31:30]) of the 32-bit address that is output from the bus master unit.
- In the selected 4-bit value, use the lower two bits to overwrite bits [31:30] of the original address that was output from the bus master unit, and add the upper two bits as bits [33:32] to the original address.

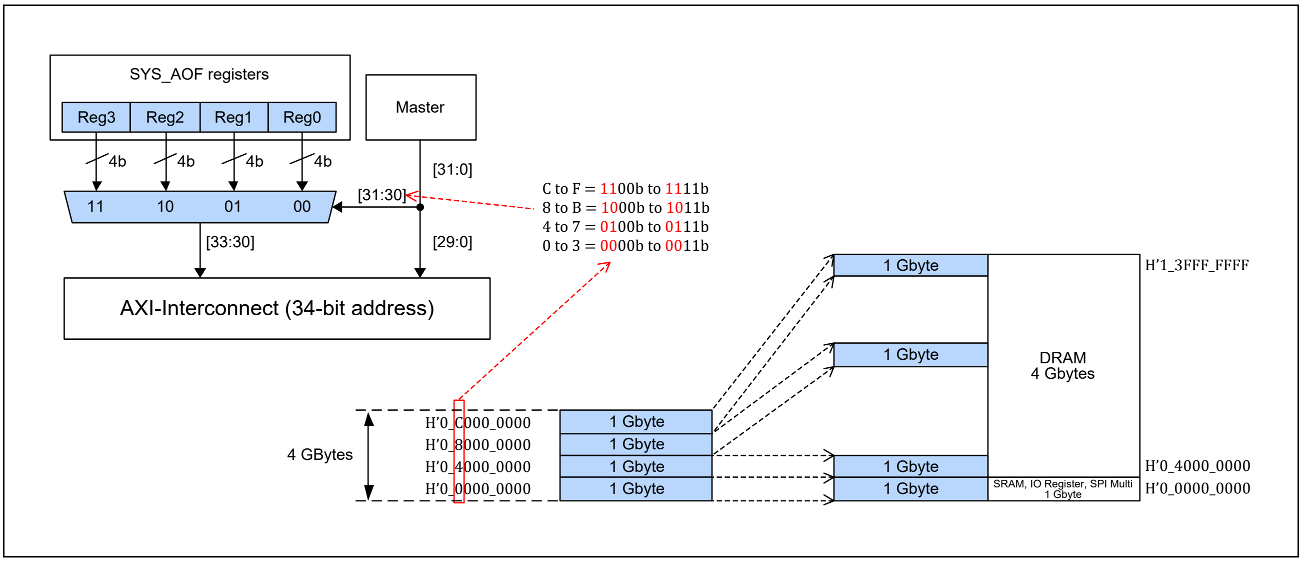

Figure 5.5 Address Space Extension (Overview)

CAUTION

When accessing DRAM from these bus master units, accesses that exceed a 4-Gbyte boundary are prohibited.

5.4.3 Bus Error Interrupt Generation

This LSI generates a bus error interrupt when any of the following conditions is met.

- A bus error is generated when access is disabled by the security setting.
- A bus error is generated when access to a slave unit in the module stop state (MSTOP) is attempted.
- A bus error is generated by a slave unit.

This function is supported for all bus master units included in this LSI.

Bus error interrupts are controlled (retained, cleared, and gathered into a single signal) by the interrupt synchronization circuits (IA55 and IM33). For details, including the types of the bus errors, see **Section 8, Interrupt Controller**.

NOTE

This function cannot distinguish between a bus error generated when access is disabled by the security setting and a bus error generated due to other causes.

In addition to the above bus error, an ERRINT interrupt is generated in any of the following cases.

- When the response to a write transaction with the bufferable attribute from the Cortex-M33 Code AHB interface is ERROR.
- When the response to a write transaction with the bufferable attribute from the Cortex-M33 System AHB interface is ERROR.

6. System Controller (SYSC)

6.1 Overview

6.1.1 Features

SYSC is a unit that performs system control of this LSI and has the following functions.

- Product information, external terminal state capture function
  - Management of product information of this LSI, and external terminal status

- Security control function
  - Re-setting the security attribute of transaction from each bus master
  - Judgement the security level of each bus slave (access management)

- 34-bit address space access function (see **Section 5.4.2.1, 34-Bit Address Space Access** for details)
  - If the bus master address is 32bit, do a 2bit extension to access the 34bit address space

- Low power consumption control (see **Section 42, Low Power Mode** for details)
  - Control the transition of this LSI to each mode of low power consumption
  - Setting cancellation conditions and confirming factors at the time of cancellation

- WDT stop control
  - Control WDT stop from CoreSight
  - Stop control of specified channel of WDT from CPU

6.1.2 Block Diagram of SYSC

The block diagram of SYSC is shown in **Figure 6.1**.

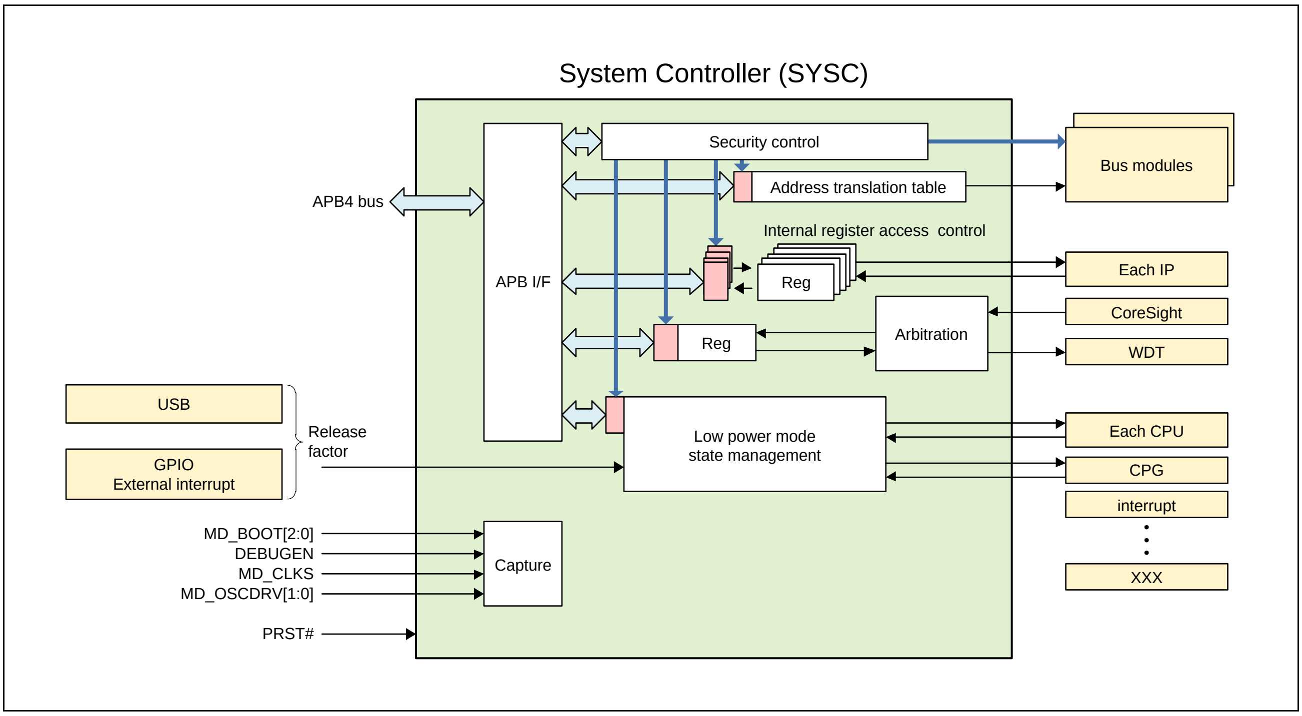

Figure 6.1 SYSC Block Diagram

6.2 Register Configuration

Table 6.1 shows the register configuration of SYSC. The address of the SYSC register is represented by the offset address from the base address. SYSC base address is as follows:

SYSC base address: H’0_1102_0000 (Overall Address Space)
SYSC base address: H’5102_0000 (Cortex-M33 Address Space Secure)
SYSC base address: H’4102_0000 (Cortex-M33 Address Space Non-Secure)

Table 6.1 SYSC Register Configuration (1/2)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
Master Access Control Register0	SYS_MSTACCCTL0	R/W	H’00AA_AA00	H’0000	32
Master Access Control Register1	SYS_MSTACCCTL1	R/W	H’AAAA_AAAA	H’0004	32

6.3 Register Descriptions

6.3.1 Master Access Control Register 0 (SYS_MSTACCCTL0)

This register sets the secure attribute and privilege attribute of transactions from 3DGE and DMAC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GPU_ARSEL	—	GPU_ARNS	GPU_ARRU	GPU_AWSEL	—	GPU_AWNS	GPU_AWPU
Initial Value	0	0	0	0	0	0	0	0	1	0	1	0	1	0	1	0
R/W	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMAC1_ARSEL	—	DMAC1_ARNS	DMAC1_ARRU	DMAC1_AWSEL	—	DMAC1_AWNS	DMAC1_AWPU	DMAC0_ARSEL	—	DMAC0_ARNS	DMAC0_ARRU	DMAC0_AWSEL	—	DMAC0_AWNS	DMAC0_AWPU
Initial Value	1	0	1	0	1	0	1	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	H'00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23	GPU_ARSEL	0	R/W	3DGE read access security attribute source selection*1 0: ARPROT[1:0] is always 10b 1: GPU_ARPU is selected for ARPROT [0], and GPU_ARNS is selected for ARPROT [1].
22	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	GPU_ARNS	1	R/W	3DGE read access secure attribute*1 0: Secure 1: Non-secure
20	GPU_ARPU	0	R/W	3DGE read access privilege attribute*1 0: Non-privileged access 1: Privileged access
19	GPU_AWSEL	1	R/W	3DGE write access security attribute source selection*1 0: AWPROT[1:0] is always 10b 1: GPU_AWPU is selected for AWPROT [0], and GPU_AWNS is selected for AWPROT [1]
18	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	GPU_AWNS	1	R/W	3DGE write access secure attribute*1 0: Secure 1: Non-secure
16	GPU_AWPU	0	R/W	3DGE write access privilege attribute*1 0: Non-privileged access 1: Privileged access
15	DMAC1_ARSEL	1	R	Non-Secure DMAC read access secure attribute source selection The value of this register is always 1. The read value is always 1. For access from Non-Secure DMAC, ARPROT [1: 0] is always 10b.
14	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
13	DMAC1_ARNS	1	R	Non-Secure DMAC read access secure attribute 1: Non- Secure The value of this bit is always 1. The written value is ignored.
12	DMAC1_ARPU	0	R	Non-Secure DMAC read access privilege attribute 0: Non-privileged access The value of this bit is always 0. The written value is ignored.
11	DMAC1_AWSEL	1	R	Non-Secure DMAC write access security attribute source selection The value of this register is always 1. The read value is always 1 For access from Non-Secure DMAC, AWPROT [1: 0] is always 10b.
10	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	DMAC1_AWNS	1	R	Non-Secure DMAC write access secure attribute 1:Non- Secure The value of this bit is always 1. The written value is ignored.
8	DMAC1_AWPU	0	R	Non-Secure DMAC write access privilege attribute 0: Non-privileged access The value of this bit is always 0. The written value is ignored.
7	DMAC0_ARSEL	0	R/W	Secure DMAC read access security attribute source selection*1 0: ARPROT[1: 0] selects the value from Secure DMAC 1: DMAC0_ARPU is selected for ARPROT [0], and DMAC0_ARNS is selected for ARPROT [1].
6	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	DMAC0_ARNS	0	R/W	Secure DMAC read access secure attribute*1 0: Secure 1: Non-secure
4	DMAC0_ARPU	0	R/W	Secure DMAC read access privilege attribute*1 0: Non-privileged access 1: Privileged access
3	DMAC0_AWSEL	0	R/W	Secure DMAC write access security attribute source selection*1 0: AWPROT[1: 0] selects the value from Secure DMAC 1: DMAC0_AWPU is selected for AWPROT [0], and DMAC0_AWNS is selected for AWPROT [1].
2	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	DMAC0_AWNS	0	R/W	Secure DMAC write access secure attribute*1 0: Secure 1: Non-secure
0	DMAC0_AWPU	0	R/W	Secure DMAC write access privilege attribute*1 0: Non-privileged access 1: Privileged access

Note 1. This register setting is prohibited changing the setting while the target master is operating. Change it before the master initiates access.

6.3.2 Master Access Control Register 1 (SYS_MSTACCCTL1)

This register sets the secure attribute and privilege attribute of transactions from GbEthernet and SDHI/eMMC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1	0
R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	GEther1_ARSEL	1	R/W	GbEthernet (channel 1) read access security attribute source selection*[1] 0: ARPROT[1:0] is always 10b 1: GEther1_ARPU is selected for ARPROT [0], and GEther1_ARNS is selected for ARPROT[1].
30	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29	GEther1_ARNS	1	R/W	GbEthernet (channel 1) read access secure attribute*[1] 0: Secure 1: Non-secure
28	GEther1_ARPU	0	R/W	GbEthernet (channel 1) read access privilege attribute*[1] 0: Non-privileged access 1: Privileged access
27	GEther1_AWSEL	1	R/W	GbEthernet (channel 1) write access security attribute source selection*[1] 0: AWPROT[1:0] is always 10b 1: GEther1_AWPU is selected for AWPROT [0], and GEther1_AWNS is selected for AWPROT[1]
26	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25	GEther1_AWNS	1	R/W	GbEthernet (channel 1) write access secure attribute*[1] 0: Secure 1: Non-secure
24	GEther1_AWPU	0	R/W	GbEthernet (channel 1) write access privilege attribute*[1] 0: Non-privileged access 1: Privileged access
23	GEther0_ARSEL	1	R/W	GbEthernet (channel 0) read access security attribute source selection*[1] 0: ARPROT[1:0] is always 10b 1: GEther0_ARPU is selected for ARPROT [0], and GEther0_ARNS is selected for ARPROT[1].
22	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	GEther0_ARNS	1	R/W	GbEthernet (channel 0) read access secure attribute*[1] 0: Secure 1: Non-secure
20	GEther0_ARPU	0	R/W	GbEthernet (channel 0) read access privilege attribute*[1] 0: Non-privileged access 1: Privileged access

Bit	Bit Name	Initial Value	R/W	Description
19	GEther0_AWSEL	1	R/W	GbEthernet (channel 0) write access security attribute source selection*[1] 0: AWPROT[1:0] is always 10b 1: GEther0_AWPU is selected for AWPROT [0], and GEther0_AWNS is selected for AWPROT [1].
18	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	GEther0_AWNS	1	R/W	GbEthernet (channel 0) write access secure attribute*[1] 0: Secure 1: Non-secure
16	GEther0_AWPU	0	R/W	GbEthernet (channel 0) weite access privilege attribute*[1] 0: Non-privileged access 1: Privileged access
15	SDHI1_ARSEL	1	R/W	SDHI (channel 1) read access security attributed source selection*[1] 0: ARPROT[1:0] is always 10b 1: SDHI1_ARPU is selected for ARPROT [0], and SDHI1_ARNS is selected for ARPROT [1].
14	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	SDHI1_ARNS	1	R/W	SDHI (channel 1) read access secure attribute*[1] 0: Secure 1: Non-secure
12	SDHI1_ARPU	0	R/W	SDHI (channel 1) read access privilege attribute*[1] 0: Non-privileged access 1: Privileged access
11	SDHI1_AWSEL	1	R/W	SDHI (channel 1) write access security attribute source selection*[1] 0: AWPROT[1:0] is always 10b 1: SDHI1_AWPU is selected for AWPROT [0], and SDHI1_AWNS is selected for AWPROT [1].
10	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	SDHI1_AWNS	1	R/W	SDHI (channel 1) write access secure attribute*[1] 0: Secure 1: Non-secure
8	SDHI1_AWPU	0	R/W	SDHI (channel 1) write access privilege attribute*[1] 0: Non-privileged access 1: Privileged access
7	SDHI0_ARSEL	1	R/W	SDHI/eMMC (channel 0) read access security attributed source selection *[1] 0: ARPROT[1:0] is always 10b 1: SDHI0_ARPU is selected for ARPROT [0], and SDHI0_ARNS is selected for ARPROT [1].
6	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	SDHI0_ARNS	1	R/W	SDHI/eMMC (channel 0) read access secure attribute*[1] 0: Secure 1: Non-secure
4	SDHI0_ARPU	0	R/W	SDHI/eMMC (channel 0) read access privilege attribute*[1] 0: Non-privileged access 1: Privileged access
3	SDHI0_AWSEL	1	R/W	SDHI/eMMC (channel 0) write access security attribute source selection*[1] 0: AWPROT[1:0] is always 10b 1: SDHI0_AWPU is selected for AWPROT [0], and SDHI0_AWNS is selected for AWPROT [1].

Bit	Bit Name	Initial Value	R/W	Description
2	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	SDHI0_AWNS	1	R/W	SDHI/eMMC (channel 0) write access secure attribute*[1] 0: Secure 1: Non-secure
0	SDHI0_AWPU	0	R/W	SDHI/eMMC (channel 0) write access privilege attribute*[1] 0: Non-privileged access 1: Privileged access

Note 1. This register setting is prohibited changing the setting while the target master is operating. Change it before the master initiates access.

6.3.3 Master Access Control Register 2 (SYS_MSTACCCTL2)

This register sets the secure attribute and privilege attribute of transactions from USB2.0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29, 28	DMAC1_SL [1:0]	00b	R/W	Non-Secure DNAC slave access permission control Set the security level SL [1:0] for the slave Non-Secure DMAC.
27, 26	DMAC0_SL [1:0]	10b	R/W	Secure DMAC slave access permission control Set the security level SL [1:0] for the slave Secure DMAC.
25, 24	MHU_SL[1:0]	00b	R/W	MHU slave access permission control Set the security level SL [1:0] for the slave MHU.
23, 22	GPIO_SL[1:0]	00b	R/W	GPIO slave access permission control Set the security level SL [1:0] for the slave GPIO.
21, 20	IA55_IM33_SL [1:0]	00b	R/W	IA55/IM33 slave access permission control Set the security level SL [1:0] for the slave IA55/IM33.
19, 18	GIC_SL[1:0]	00b	R/W	GIC slave access permission control Set the security level SL [1:0] for the slave GIC.
17, 16	SYS_SL[1:0]	00b	R/W	SYC slave access permission control Set the security level SL [1:0] for the slave SYC.
15, 14	SYSC_SL[1:0]	11b	R	SYSC slave access permission control Reading the bits always returns 11b. Value cannot be written to these bits.
13, 12	CPG_SL[1:0]	00b	R/W	CPG slave access permission control Set the security level SL [1:0] for the slave CPG.
11, 10	CST_SL[1:0]	00b	R/W	CoreSight slave access permission control Set the security level SL [1:0] for the slave CoreSight.
9, 8	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7, 6	TZC3_SL[1:0]	10b	R/W	TZC (DDR) <Reg> slave access permission control Set the security level SL [1:0] for the slave TZC (DDR) <Reg>. These bits can only be set to 10b or 11b. Setting them to 00b or 01b is prohibited. Operation is not guaranteed when 00b or 01b is set.
5, 4	TZC2_SL[1:0]	10b	R/W	TZC (SPI Multi I/O) <Reg> slave access permission control Set the security level SL [1:0] for the slave TZC (SPI Multi I/O) <Reg>. These bits can only be set to 10b or 11b. Setting them to 00b or 01b is prohibited. Operation is not guaranteed when 00b or 01b is set.

Bit	Bit Name	Initial Value	R/W	Description
3, 2	TZC1_SL[1:0]	10b	R/W	TZC (SRAM MCPU) <Reg> slave access permission control Set the security level SL [1:0] for the slave TZC (SRAM MCPU) <Reg>. These bits can only be set to 10b or 11b. Setting them to 00b or 01b is prohibited. Operation is not guaranteed when 00b or 01b is set.
1, 0	TZC0_SL[1:0]	10b	R/W	TZC (SRAM ACPU) <Reg> slave access permission control Set the security level SL [1:0] for the slave TZC (SRAM ACPU) <Reg>. These bits can only be set to 10b or 11b. Setting them to 00b or 01b is prohibited. Operation is not guaranteed when 00b or 01b is set.

6.3.8 Slave Access Control Register 2 (SYS_SLVACCCTL2)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the GTM, WDT, MTU3a, POE3, GPT, POEG, and DDR.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	DDR_SL		POEG_SL		GPT_SL		POE3_SL	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	H'00	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23, 22	DDR_SL	00b	R/W	DDR <Reg> slave access permission control Set the security level SL [1:0] for the slave DDR <Reg>.
21, 20	POEG_SL	00b	R/W	POEG slave access permission control Set the security level SL [1:0] for the slave POEG. 4 pins has a common security level.
19, 18	GPT_SL	00b	R/W	GPT slave access permission control Set the security level SL [1:0] for the slave GPT. 8 channels has a common security level.
17, 16	POE3_SL	00b	R/W	POE3 slave access permission control Set the security level SL [1:0] for the slave POE3.
15, 14	MTU3A_SL	00b	R/W	MTU3a slave access permission control Set the security level SL [1:0] for the slave MTU3a.
13, 12	—	00b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
11, 10	WDT2_SL	00b	R/W	WDT channel 2 slave access permission control Set the security level SL [1:0] for the slave WDT channel 2.
9, 8	WDT1_SL	00b	R/W	WDT channel 1 slave access permission control Set the security level SL [1:0] for the slave WDT channel 1.
7, 6	WDT0_SL	00b	R/W	WDT channel 0 slave access permission control Set the security level SL [1:0] for the slave WDT channel 0.
5, 4	OSTM2_SL	00b	R/W	GTM channel 2 slave access permission control Set the security level SL [1:0] for the slave GTM channel 2.
3, 2	OSTM1_SL	00b	R/W	GTM channel 1 slave access permission control Set the security level SL [1:0] for the slave GTM channel 1.
1, 0	OSTM0_SL	10b	R/W	GTM channel 0 slave access permission control Set the security level SL [1:0] for the slave GTM channel 0.

6.3.9 Slave Access Control Register 3 (SYS_SLVACCCTL3)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the 3DGE, VCPL4, CRU, ISU, DSI, LCD Controller, USB2.0, SDHI/eMMC and GbEthernet.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29, 28	ETH1_SL	00b	R/W	GbEthernet channel1 slave access permission control Set the security level SL [1:0] for the slave GbEthernet channel 1.
27, 26	ETH0_SL	00b	R/W	GbEthernet channel 0 slave access permission control Set the security level SL [1:0] for the slave GbEthernet channel 0.
25, 24	SDHI1_SL	00b	R/W	SDHI channel 1 slave access permission control Set the security level SL [1:0] for the slave SDHI channel 1.
23, 22	SDHI0_SL	00b	R/W	SDHI/eMMC channel 0 slave access permission control Set the security level SL [1:0] for the slave SDHI/eMMC channel 0.
21, 20	USB21_SL	00b	R/W	USB2.0 channel 1 slave access permission control Set the security level SL [1:0] for the slave USB2.0 channel 1.
19, 18	USB20_SL	00b	R/W	USB2.0 channel 0 slave access permission control Set the security level SL [1:0] for the slave USB2.0 channel 0. USB 2.0 channel 0 has a common security level for Host and Function.
17, 16	USBT_SL	00b	R/W	USBPHY Control slave access permission control Set the security level SL [1:0] for the slave USBPHY Control.
15, 14	—	00b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
13, 12	LCDC_SL	00b	R/W	LCD Controller slave access permission control Set the security level SL [1:0] for the slave LCD Controller.
11, 10	DSILINK_SL	00b	R/W	DSI (LINK) slave access permission control Set the security level SL [1:0] for the slave DSI (LINK).
9, 8	DSIPHY_SL	00b	R/W	DSI (PHY) slave access permission control Set the security level SL [1:0] for the slave DSI (PHY).
7, 6	ISU_SL	00b	R/W	ISU slave access permission control Set the security level SL [1:0] for the slave ISU.
5, 4	CRU_SL	00b	R/W	CRU slave access permission control Set the security level SL [1:0] for the slave CRU.
3, 2	H264_SL	00b	R/W	VCPL4 slave access permission control Set the security level SL [1:0] for the slave VCPL4.
1, 0	GPU_SL	00b	R/W	3DGE slave access permission control Set the security level SL [1:0] for the slave 3DGE.

6.3.10 Slave Access Control Register 4 (SYS_SLVACCCTL4)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the I2C, CANFD, RSPI, SCIF, SCI, and IrDA.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	IRDA_SL	00b	R	SCI channel 0 (IrDA) slave access permission control Set the security level SL [1:0] for the slave SCI channel 0 (IrDA).
29, 28	SCI1_SL	00b	R/W	SCI channel 1 slave access permission control Set the security level SL [1:0] for the slave SCI channel 1.
27, 26	SCI0_SL	00b	R/W	SCI channel 0 slave access permission control Set the security level SL [1:0] for the slave SCI channel 0.
25, 24	SCIF4_SL	00b	R/W	SCIF channel 4 slave access permission control Set the security level SL [1:0] for the slave SCIF channel 4.
23, 22	SCIF3_SL	00b	R/W	SCIF channel 3 slave access permission control Set the security level SL [1:0] for the slave SCIF channel 3.
21, 20	SCIF2_SL	00b	R/W	SCIF channel 2 slave access permission control Set the security level SL [1:0] for the slave SCIF channel 2.
19, 18	SCIF1_SL	00b	R/W	SCIF channel 1 slave access permission control Set the security level SL [1:0] for the slave SCIF channel 1.
17, 16	SCIF0_SL	00b	R/W	SCIF channel 0 slave access permission control Set the security level SL [1:0] for the slave SCIF channel 0.
15 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11, 10	RSPI_SL	00b	R/W	RSPI slave access permission control Set the security level SL [1:0] for the slave RSPI. RSPI has a common security level for channel 0 to channel 2.
9, 8	CANFD_SL	00b	R/W	CANFD slave access permission control Set the security level SL [1:0] for the slave CANFD.
7, 6	I2C3_SL	00b	R/W	I2C channel 3 slave access permission control Set the security level SL [1:0] for the slave I2C channel 3.
5, 4	I2C2_SL	00b	R/W	I2C channel 2 slave access permission control Set the security level SL [1:0] for the slave I2C channel 2.
3, 2	I2C1_SL	00b	R/W	I2C channel 1 slave access permission control Set the security level SL [1:0] for the slave I2C channel 1.
1, 0	I2C0_SL	00b	R/W	I2C channel 0 slave access permission control Set the security level SL [1:0] for the slave I2C channel 0.

6.3.11 Slave Access Control Register 5 (SYS_SLVACCCTL5)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the SSIF and SRC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5, 4	SRC_SL	00b	R/W	SRC slave access permission control Set the security level SL [1:0] for the slave SRC.
3, 2	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	SSIF_SL	00b	R/W	SSIF slave access permission control Set the security level SL [1:0] for the slave SSIF. SSIF has a common security level for channel 0 to channel 3.

6.3.12 Slave Access Control Register 6 (SYS_SLVACCCTL6)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the ADC and TSU.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	TSU_SL		ADC_SL	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3, 2	TSU_SL	00b	R/W	TSU slave access permission control Set the security level SL [1:0] for the slave TSU.
1, 0	ADC_SL	00b	R/W	ADC slave access permission control Set the security level SL [1:0] for the slave ADC.

6.3.13 Slave Access Control Register 7 (SYS_SLVACCCTL7)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the OTP.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	OTP_SL		—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3, 2	OTP_SL	00b	R/W	OTP slave access permission control Set the security level SL [1:0] for the slave OTP.
1, 0	—	00b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

6.3.14 Slave Access Control Register 8 (SYS_SLVACCCTL8)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the Cortex-A55 control register and Cortex-M33 control register in SYSC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CA55_SL		CM33_SL	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3, 2	CA55_SL	00b	R/W	SYSC <Cortex-A55 Control Reg> slave access permission control Set the security level SL [1:0] for the Cortex-A55 control register in SYSC.
1, 0	CM33_SL	00b	R/W	SYSC <Cortex-M33 Control Reg> slave access permission control Set the security level SL [1:0] for the Cortex-M33 control register in SYSC.

6.3.15 Slave Access Control Register 10 (SYS_SLVACCCTL10)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the LSI control register in SYSC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LSI_SL	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	LSI_SL	00b	R/W	SYSC <LSI Control Reg> slave access permission control Set the security level SL [1:0] for the LSI control register in SYSC.

6.3.16 Slave Access Control Register 12 (SYS_SLVACCCTL12)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the AOF control register in SYSC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AOF_SL	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	AOF_SL	00b	R/W	SYSC <AOF Control Reg> slave access permission control Set the security level SL [1:0] for the AOF control register in SYSC.

6.3.17 Slave Access Control Register 13 (SYS_SLVACCCTL13)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the Low Power Mode control register in SYSC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LP_SL	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	LP_SL	00b	R/W	SYSC <Low Power Mode Control Reg> slave access permission control Set the security level SL [1:0] for the Low Power Mode control register in SYSC.

6.3.18 Slave Access Control Register 14 (SYS_SLVACCCTL14)

This register sets the security levels for determining whether to enable or disable access to each set of registers in the general-purpose register in SYSC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GPREG_SL	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	GPREG_SL	00b	R/W	SYSC <GPREG> slave access permission control Set the security level SL [1:0] for the General purpose register(GPREG) in SYSC.

6.3.19 ECCRAM0 ECC Setting Register (SYS_RAM0_ECC)

This register is a register that enables and disables the ECC function of ECCRAM0 (SRAM ACPU).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VECCEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	VECCEN	0	R/W	Set enable or disable error correction for ECCRAM0 (SRAM ACPU) 0: ECC function disabled 1: ECC function enabled

6.3.20 ECCRAM0 Access Control Register (SYS_RAM0_EN)

This register is a register that controls access to ECCRAM0 (SRAM ACPU).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VLWEN	VCEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	VLWEN	1	R/W	Set enable or disable writes to ECRAM0 (SRAM ACPU) 0: Write disabled 1: Write enabled
0	VCEN	1	R/W	Set enable or disable access to ECRAM0 (SRAM ACPU) 0: Access disabled 1: Access enabled

6.3.21 ECCRAM1 ECC Setting Register (SYS_RAM1_ECC)

This register is a register that enables and disables the ECC function of ECCRAM1 (SRAM MCPU).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VECCEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	VECCEN	0	R/W	Set enable or disable error correction for ECCRAM1 (SRAM MCPU) 0: ECC function disabled 1: ECC function enabled

6.3.22 ECCRAM1 Access Control Register (SYS_RAM1_EN)

This register is the register that controls access to ECCRAM1 (SRAM M CPU).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VLWEN	VCEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	VLWEN	1	R/W	Set enable or disable writes to ECCRAM1 (SRAM MCPU) 0: Write disabled 1: Write enabled
0	VCEN	1	R/W	Set enable or disable access to ECRAM1 (SRAM MCPU) 0: Access disabled 1: Access enabled

6.3.23 WDT0 Control Register (SYS_WDT0_CTRL)

This register is the register that set the count control of WDT0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTSTOPMASK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTSTOP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	WDTSTOPMASK	1	R/W	Controls the stop function of WDT0 (for Cortex-A55 Core0) from CoreSight during debugging. 0: Stops WDT0 counting during debugging. 1: Not stop WDT0 counting during debugging.
15 to 1	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
0	WDTSTOP	0	R/W	Set whether the WDT0 (for Cortex-A55 Core0) counter is forced to stop 0: Continue counting 1: Stop counting and hold the counter value

6.3.24 WDT1 Control Register (SYS_WDT1_CTRL)

This register is the register that set the count control of WDT1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTSTOPMASK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTSTOP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	WDTSTOPMASK	1	R/W	Controls the stop function of WDT1 (for Cortex-A55 Core1) from CoreSight during debugging. 0: Stops WDT1 counting during debugging. 1: Not stop WDT1 counting during debugging.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	WDTSTOP	0	R/W	Set whether the WDT1 (for Cortex-A55 Core1) counter is forced to stop 0: Continue counting 1: Stop counting and hold the counter value

6.3.25 WDT2 Control Register (SYS_WDT2_CTRL)

This register is the register that set the count control of WDT2.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTSTOPMASK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTSTOP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	WDTSTOPMASK	1	R/W	Controls the stop function of WDT2 (for Cortex-M33) from CoreSight during debugging. 0: Stops WDT2 counting during debugging. 1: Not stop WDT2 counting during debugging.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	WDTSTOP	0	R/W	Set whether the WDT2 (for Cortex-M33) counter is forced to stop 0: Continue counting 1: Stop counting and hold the counter value

6.3.26 GEther0 Config Register (SYS_GETH0_CFG)

This register is the register that indicates the state of Ether ch0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	FEC_GIGA_ENABLE	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	FEC_GIGA_ENABLE	0	R	Indicates the mode of speed for Ether ch0 0: 100M/1Mbps mod 1: 1Gbps mode
23 to 0	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

6.3.27 GEther1 Config Register (SYS_GETH1_CFG)

This register is the register that indicates the state of Ether ch1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	FEC_GIGA_ENABLE	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	FEC_GIGA_ENABLE	0	R	Indicates the mode of speed for Ether ch1 0: 100M/1Mbps mode 1: 1Gbps mode
23 to 0	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

6.3.28 I2C0 Config Register (SYS_I2C0_CFG)

This register is a register that set the bypass mode of the analog filter of I2C ch0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	af_bypass
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	af_bypass	0	R/W	Set whether to bypass the analog filter for noise removal for the input terminals (RIIC0_SDA, RIIC0_SCL) of I2C ch0. 0: Noise reduction is performed using an analog filter for the input signal. 1: The input signal is bypassed an analog filter and noise reduction is not performed.

6.3.29 I2C1 Config Register (SYS_I2C1_CFG)

This register is a register that set the bypass mode of the analog filter of I2C ch1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	af_bypass
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	af_bypass	0	R/W	Set whether to bypass the analog filter for noise removal for the input terminals (RIIC1_SDA, RIIC1_SCL) of I2C ch1. 0: Noise reduction is performed using an analog filter for the input signal. 1: The input signal is bypassed an analog filter and noise reduction is not performed.

6.3.30 I2C2 Config Register (SYS_I2C2_CFG)

This register is a register that set the bypass mode of the analog filter of I2C ch2.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	af_bypass
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	af_bypass	0	R/W	Set whether to bypass the analog filter for noise removal for the input terminals (RIIC2_SDA, RIIC2_SCL) of I2C ch2. 0: Noise reduction is performed using an analog filter for the input signal. 1: The input signal is bypassed an analog filter and noise reduction is not performed.

6.3.31 I2C3 Config Register (SYS_I2C3_CFG)

This register is a register that set the bypass mode of the analog filter of I2C ch3.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	af_bypass
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	af_bypass	0	R/W	Set whether to bypass the analog filter for noise removal for the input terminals (RIIC3_SDA, RIIC3_SCL) of I2C ch3. 0: Noise reduction is performed using an analog filter for the input signal. 1: The input signal is bypassed an analog filter and noise reduction is not performed.

6.3.32 CM33 Config Register0 (SYS_CM33_CFG0)

This register is the register that set the secure Systick of Cortex-M33.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	CONFIGSSYSTICK[25:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CONFIGSSYSTICK[25:0]															
Initial Value	0	0	1	1	1	1	0	1	0	0	0	0	1	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25 to 0	CONFIGSSYSTICK[25:0]	H'000_3D08	R/W	Configuration register for secure Systick. The value must be determined before the cold reset of Cortex-M33 is released. See the Cortex-M33 chapter for more information on settings.

6.3.33 CM33 Config Register1 (SYS_CM33_CFG1)

This register is the register that set cortex-M33 non-secure Systick.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	CONFIGNSSYSTICK[25:0]									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CONFIGNSSYSTICK[25:0]															
Initial Value	0	0	1	1	1	1	0	1	0	0	0	0	1	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25 to 0	CONFIGNSSYSTICK[25:0]	H'000_3D08	R/W	Configuration register for non-secure Systick. The value must be determined before the cold reset of Cortex-M33 is released. See the Cortex-M33 chapter for more information on settings.

6.3.34 CM33 Config Register2 (SYS_CM33_CFG2)

This register is the register that set the secure vector address of Cortex-M33.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INITSVTOR[31:7]															
Initial Value	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INITSVTOR[31:7]									—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	INITSVTOR [31:7]	H'020_0200	R/W	A register that indicates the secure vector address. The address value must be determined before the Cortex-M33 cold reset is released.
6 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

6.3.35 CM33 Config Register3 (SYS_CM33_CFG3)

This register is the register that set the non-secure vector address of Cortex-M33.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INITNSVTOR[31:7]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INITNSVTOR[31:7]									—	—	—	—	—	—	—
Initial Value	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	INITNSVTOR [31:7]	H’000_0300	R/W	A register that indicates the non-secure vector address. The address value must be determined before the Cortex-M33 cold reset is released.
6 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

6.3.36 CM33 Lock Register (SYS_CM33_LOCK)

This register is a register that set the vector-address change permission of Cortex-M33.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LOCKNSVTOR	LOCKSVTAIRCR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1	LOCKNSVTOR	0	R/W	Control the non-secure vector address change permission. 0: Changeable 1: Cannot be changed
0	LOCKSVTAIRCR	0	R/W	Control changing permission of the Secure Vector address, and the PRIS bit and the BFHFNMINS bit of the AIRCR register of Cortex-M33. 0: Changeable 1: Cannot be changed

6.3.37 CA55 Core0 Reset Vector Address Low Configuration Register (SYS_CA55_CFG_RVAL0)

This register is a register that set the reset vector address of Cortex-A55 core0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RVBARADDRL0[31:2]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RVBARADDRL0[31:2]														—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	RVBARADDRL0[31: 2]	H’0000_0000	R/W	Represent bottom bit 31 to bit 2 of the reset vector address of Cortex-A55 Core0. When you change a vector address, you must set the address value and then release the reset (Cold reset/Cluster Warm reset/Core Warm reset). See **Section 2, System CPU Cortex-A55** for the sequence of each reset.
1, 0	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

6.3.38 CA55 Core0 Reset Vector Address High Configuration Register (SYS_CA55_CFG_RVAH0)

This register is a register that set the reset vector address of Cortex-A55 core0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RVBARADDRH0[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	RVBARADDRH0[7:0]	H’00	R/W	Represent upper bit 39 to bit 32 of the reset vector address of Cortex-A55 Core0. When you change a vector address, you must set the address value and then release the reset (Cold reset/Cluster Warm reset/Core Warm reset). See **Section 2, System CPU Cortex-A55** for the sequence of each reset.

6.3.39 CA55 Core1 Reset Vector Address Low Configuration Register (SYS_CA55_CFG_RVAL1)

This register is a register that set the reset vector address of Cortex-A55 core1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RVBARADDRL1[31:2]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RVBARADDRL1[31:2]														—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	RVBARADDRL1[31:2]	H'0000_8000	R/W	Represent bottom bit 31 to bit 2 of the reset vector address of Cortex-A55 Core1. When you change a vector address, you must set the address value and then release the reset (Cold reset/Cluster Warm reset/Core Warm reset). See **Section 2, System CPU Cortex-A55** for the sequence of each reset.
1, 0	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

6.3.40 CA55 Core1 Reset Vector Address High Configuration Register (SYS_CA55_CFG_RVAH1)

This register is a register that set the reset vector address of Cortex-A55 core1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RVBARADDRH1[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	RVBARADDRH1[7:0]	H'00	R/W	Represent upper bit 39 to bit 32 of the reset vector address of Cortex-A55 Core1. When you change a vector address, you must set the address value and then release the reset (Cold reset/Cluster Warm reset/Core Warm reset). See **Section 2, System CPU Cortex-A55** for the sequence of each reset.

6.3.41 LSI Mode Signal Register (SYS_LSI_MODE)

This register indicates the state of the MD_BOOT terminal, the DEBUGEN terminal, the MD_CLKS terminal, and the MD_OSCDRV terminal.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STAT_SEC_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STAT_MD_OSCDRV[1:0]		—	STAT_MD_CLKS	—	—	STAT_DEBUGEN	—	—	—	—	—	—	STAT_MD_BOOT[2:0]		
Initial Value	—	—	0	—	0	0	—	0	0	0	0	0	0	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	STAT_SEC_EN	—	R	Indicates whether this LSI support the security function or not. 0: Not supported 1: Available
15, 14	STAT_MD_OSCDRV[1:0]	—	R	Indicates the terminal state of the external terminal MD_OSCDRV[1:0]. The value is updated at the rising edge of PRST#. If a reset occurs inside the LSI, this register is not updated.
13	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	STAT_MD_CLKS	—	R	Indicates the terminal state of the external terminal MD_CLKS. The value is updated at the rising edge of PRST#. If a reset occurs inside the LSI, this register is not updated.
11, 10	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	STAT_DEBUGEN	—	R	Indicates the terminal state of the external terminal DEBUGEN. The value is updated at the rising edge of PRST#. If a reset occurs inside the LSI, this register is not updated.
8	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
7 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2 to 0	STAT_MD_BOOT[2:0]	—	R	Indicates the terminal state of the external terminal MD_BOOT[2:0]. The value is updated at the rising edge of PRST#. If a reset occurs inside the LSI, this register is not updated.

6.3.42 LSI Device ID Register (SYS_LSI_DEVID)

This register indicates the product specific device ID.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DEV_ID[31:28]				DEV_ID[27:0]											
Initial Value	—	—	—	—	1	0	0	0	0	1	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEV_ID[27:0]															
Initial Value	1	1	0	0	0	1	0	0	0	1	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	DEV_ID [31:28]	—	R	Indicates the product revision.
27 to 0	DEV_ID[27:0]	H’841_C447	R	Indicates the product specific fixed value. *Note*: RZ/G2L and RZ/G2LC are the same value. If identification between G2L and G2LC is needed, read the value of address H’0_1186_1178. The value is below. H’0000_0000: RZ/G2L H’0000_0001: RZ/G2LC

6.3.43 LSI Product Register (SYS_LSI_PRR)

This register indicates information about product options.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CA55_1 CPU
Initial Value	0	0	0	0	0	0	0	—	0	0	0	—	0	0	0	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CA55_1CPU	—	R	Indicates whether the CA55 is single or dual. 0: Cortex-A55 Dual 1: Cortex-A55 Single

6.3.44 Address Offset Register0 (SYS_AOF0)

This register is an address offset register for accessing the 34-bit address space from SD ch0/ch1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OFS11_SXSDHI_1				OFS10_SXSDHI_1				OFS01_SXSDHI_1				OFS00_SXSDHI_1			
Initial Value	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OFS11_SXSDHI_0				OFS10_SXSDHI_0				OFS01_SXSDHI_0				OFS00_SXSDHI_0			
Initial Value	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	OFS11_SXSDHI_1	0011b	R/W	Conversion value to address [33:30] when SD ch1 address [31:30] = 11*1
27 to 24	OFS10_SXSDHI_1	0010b	R/W	Conversion value to address [33:30] when SD ch1 address [31:30] = 10*1
23 to 20	OFS01_SXSDHI_1	0001b	R/W	Conversion value to address [33:30] when SD ch1 address [31:30] = 01*1
19 to 16	OFS00_SXSDHI_1	0000b	R/W	Conversion value to address [33:30] when SD ch1 address [31:30] = 00*1
15 to 12	OFS11_SXSDHI_0	0011b	R/W	Conversion value to address [33:30] when SD ch0 address [31:30] = 11*1
11 to 8	OFS10_SXSDHI_0	0010b	R/W	Conversion value to address [33:30] when SD ch0 address [31:30] = 10*1
7 to 4	OFS01_SXSDHI_0	0001b	R/W	Conversion value to address [33:30] when SD ch0 address [31:30] = 01*1
3 to 0	OFS00_SXSDHI_0	0000b	R/W	Conversion value to address [33:30] when SD ch0 address [31:30] = 00*1

Note 1. Master SD ch0/ch1 are the master of 32bit addresses (4 Gbytes space). Depending on the address value (in 1 GB) of the master address [31:30], you can access the address converted to the address space [33:30]. This gives you access to more than 4 Gbytes of space. This register setting is prohibited from changing the setting while the target master is in operation. Please change it while the access on the master side is stopped.

6.3.45 Address Offset Register1 (SYS_AOF1)

This register is an address offset register for accessing the 34-bit address space from Ether ch0/ch1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OFS11_SXGIGE_1				OFS10_SXGIGE_1				OFS01_SXGIGE_1				OFS00_SXGIGE_1			
Initial Value	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OFS11_SXGIGE_0				OFS10_SXGIGE_0				OFS01_SXGIGE_0				OFS00_SXGIGE_0			
Initial Value	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	OFS11_SXGIGE_1	0011b	R/W	Conversion value to address [33:30] when Ether ch1 address [31:30] = 11*[1]
27 to 24	OFS10_SXGIGE_1	0010b	R/W	Conversion value to address [33:30] when Ether ch1 address [31:30] = 10*[1]
23 to 20	OFS01_SXGIGE_1	0001b	R/W	Conversion value to address [33:30] when Ether ch1 address [31:30] = 01*[1]
19 to 16	OFS00_SXGIGE_1	0000b	R/W	Conversion value to address [33:30] when Ether ch1 address [31:30] = 00*[1]
15 to 12	OFS11_SXGIGE_0	0011b	R/W	Conversion value to address [33:30] when Ether ch0 address [31:30] = 11*[1]
11 to 8	OFS10_SXGIGE_0	0010b	R/W	Conversion value to address [33:30] when Ether ch0 address [31:30] = 10*[1]
7 to 4	OFS01_SXGIGE_0	0001b	R/W	Conversion value to address [33:30] when Ether ch0 address [31:30] = 01*[1]
3 to 0	OFS00_SXGIGE_0	0000b	R/W	Conversion value to address [33:30] when Ether ch0 address [31:30] = 00*[1]

Note 1. Master Ether ch0/ch1 are the master of 32bit addresses (4 Gbytes space). Depending on the address value (in 1 GB) of the master address [31:30], you can access the address converted to the address space [33:30]. This gives you access to more than 4 Gbytes of space. This register setting is prohibited from changing the setting while the target master is in operation. Please change it while the access on the master side is stopped.

6.3.46 Address Offset Register2 (SYS_AOF2)

This register is an address offset register for accessing the 34-bit address space from USB2.0 ch0/ch1 Host.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OFS11_SXUSB2_1				OFS10_SXUSB2_1				OFS01_SXUSB2_1				OFS00_SXUSB2_1			
Initial Value	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OFS11_SXUSB2_0_H				OFS10_SXUSB2_0_H				OFS01_SXUSB2_0_H				OFS00_SXUSB2_0_H			
Initial Value	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	OFS11_SXUSB2_1	0011b	R/W	Conversion value to address [33:30] when USB2.0 ch1 Host address [31:30] = 11*1
27 to 24	OFS10_SXUSB2_1	0010b	R/W	Conversion value to address [33:30] when USB2.0 ch1 Host address [31:30] = 10*1
23 to 20	OFS01_SXUSB2_1	0001b	R/W	Conversion value to address [33:30] when USB2.0 ch1 Host address [31:30] = 01*1
19 to 16	OFS00_SXUSB2_1	0000b	R/W	Conversion value to address [33:30] when USB2.0 ch1 Host address [31:30] = 00*1
15 to 12	OFS11_SXUSB2_0_H	0011b	R/W	Conversion value to address [33:30] when USB2.0 ch0 Host address [31:30] = 11*1
11 to 8	OFS10_SXUSB2_0_H	0010b	R/W	Conversion value to address [33:30] when USB2.0 ch0 Host address [31:30] = 10*1
7 to 4	OFS01_SXUSB2_0_H	0001b	R/W	Conversion value to address [33:30] when USB2.0 ch0 Host address [31:30] = 01*1
3 to 0	OFS00_SXUSB2_0_H	0000b	R/W	Conversion value to address [33:30] when USB2.0 ch0 Host address [31:30] = 00*1

Note 1. Master USB2.0 ch0/ch1 Host are the master of 32bit addresses (4 Gbytes space). Depending on the address value (in 1 GB) of the master address [31:30], you can access the address converted to the address space [33:30]. This gives you access to more than 4 Gbytes of space. This register setting is prohibited from changing the setting while the target master is in operation. Please change it while the access on the master side is stopped.

6.3.47 Address Offset Register3 (SYS_AOF3)

This register is an address offset register for accessing the 34-bit address space from USB2.0 ch0 Function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OFS11_SXUSB2_0_F				OFS10_SXUSB2_0_F				OFS01_SXUSB2_0_F				OFS00_SXUSB2_0_F			
Initial Value	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 12	OFS11_SXUSB2_0_F	0011b	R/W	Conversion value to address [33:30] when USB2.0 ch0 Function address [31:30] = 11*1
11 to 8	OFS10_SXUSB2_0_F	0010b	R/W	Conversion value to address [33:30] when USB2.0 ch0 Function address [31:30] = 10*1
7 to 4	OFS01_SXUSB2_0_F	0001b	R/W	Conversion value to address [33:30] when USB2.0 ch0 Function address [31:30] = 01*1
3 to 0	OFS00_SXUSB2_0_F	0000b	R/W	Conversion value to address [33:30] when USB2.0 ch0 Function address [31:30] = 00*1

Note 1. Master USB2.0 ch0 Function is the master of 32bit addresses (4 Gbytes space). Depending on the address value (in 1 GB) of the master address [31:30], you can access the address converted to the address space [33:30]. This gives you access to more than 4 Gbytes of space. This register setting is prohibited from changing the setting while the target master is in operation. Please change it while the access on the master side is stopped.

6.3.48 Address Offset Register4 (SYS_AOF4)

This register is an address offset register for accessing the 34-bit address space from LCDC and DSI.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OFS11_SXDSIL				OFS10_SXDSIL				OFS01_SXDSIL				OFS00_SXDSIL			
Initial Value	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OFS11_SXLCDC				OFS10_SXLCDC				OFS01_SXLCDC				OFS00_SXLCDC			
Initial Value	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	OFS11_SXDSIL	0011b	R/W	Conversion value to address [33:30] when DSI address [31:30] = 11[*1]
27 to 24	OFS10_SXDSIL	0010b	R/W	Conversion value to address [33:30] when DSI address [31:30] = 10[*1]
23 to 20	OFS01_SXDSIL	0001b	R/W	Conversion value to address [33:30] when DSI address [31:30] = 01[*1]
19 to 16	OFS00_SXDSIL	0000b	R/W	Conversion value to address [33:30] when DSI address [31:30] = 00[*1]
15 to 12	OFS11_SXLCDC	0011b	R/W	Conversion value to address [33:30] when LCDC address [31:30] = 11[*1]
11 to 8	OFS10_SXLCDC	0010b	R/W	Conversion value to address [33:30] when LCDC address [31:30] = 10[*1]
7 to 4	OFS01_SXLCDC	0001b	R/W	Conversion value to address [33:30] when LCDC address [31:30] = 01[*1]
3 to 0	OFS00_SXLCDC	0000b	R/W	Conversion value to address [33:30] when LCDC address [31:30] = 00[*1]

Note 1. Master LCDC and DSI are the master of 32bit addresses (4 Gbytes space). Depending on the address value (in 1 GB) of the master address [31:30], you can access the address converted to the address space [33:30]. This gives you access to more than 4 Gbytes of space. This register setting is prohibited from changing the setting while the target master is in operation. Please change it while the access on the master side is stopped.

6.3.49 Address Offset Register5 (SYS_AOF5)

This register is an address offset register for accessing the 34-bit address space from FCPCS.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OFS11_SXH264				OFS10_SXH264				OFS01_SXH264				OFS00_SXH264			
Initial Value	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 12	OFS11_SXH264	0011b	R/W	Conversion value to address [33:30] when FCPCS address [31:30] = 11*1
11 to 8	OFS10_SXH264	0010b	R/W	Conversion value to address [33:30] when FCPCS address [31:30] = 10*1
7 to 4	OFS01_SXH264	0001b	R/W	Conversion value to address [33:30] when FCPCS address [31:30] = 01*1
3 to 0	OFS00_SXH264	0000b	R/W	Conversion value to address [33:30] when FCPCS address [31:30] = 00*1

Note 1. Master FCPCS is the master of 32bit addresses (4 Gbytes space). Depending on the address value (in 1 GB) of the master address [31:30], you can access the address converted to the address space [33:30]. This gives you access to more than 4 Gbytes of space. This register setting is prohibited from changing the setting while the target master is in operation. Please change it while the access on the master side is stopped.

6.3.50 Address Offset Register6 (SYS_AOF6)

This register is an address offset register for accessing the 34-bit address space from Secure/Non-Secure DMAC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OFS11_SXDMAC_NS				OFS10_SXDMAC_NS				OFS01_SXDMAC_NS				OFS00_SXDMAC_NS			
Initial Value	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OFS11_SXDMAC_S				OFS10_SXDMAC_S				OFS01_SXDMAC_S				OFS00_SXDMAC_S			
Initial Value	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	OFS11_SXDMAC_NS	0011b	R/W	Conversion value to address [33:30] when Non-Secure DMAC address [31:30] = 11*1
27 to 24	OFS10_SXDMAC_NS	0010b	R/W	Conversion value to address [33:30] when Non-Secure DMAC address [31:30] = 10*1
23 to 20	OFS01_SXDMAC_NS	0001b	R/W	Conversion value to address [33:30] when Non-Secure DMAC address [31:30] = 01*1
19 to 16	OFS00_SXDMAC_NS	0000b	R/W	Conversion value to address [33:30] when Non-Secure DMAC address [31:30] = 00*1
15 to 12	OFS11_SXDMAC_S	0011b	R/W	Conversion value to address [33:30] when Secure DMAC address [31:30] = 11*1
11 to 8	OFS10_SXDMAC_S	0010b	R/W	Conversion value to address [33:30] when Secure DMAC address [31:30] = 10*1
7 to 4	OFS01_SXDMAC_S	0001b	R/W	Conversion value to address [33:30] when Secure DMAC address [31:30] = 01*1
3 to 0	OFS00_SXDMAC_S	0000b	R/W	Conversion value to address [33:30] when Secure DMAC address [31:30] = 00*1

Note 1. Master Secure/Non-Secure DMAC are the master of 32bit addresses (4 Gbytes space). Depending on the address value (in 1 GB) of the master address [31:30], you can access the address converted to the address space [33:30]. This gives you access to more than 4 Gbytes of space. This register setting is prohibited from changing the setting while the target master is in operation. Please change it while the access on the master side is stopped.

6.3.51 SYS_LP_CTL1

This register is a register that requests the transition to low power consumption mode and confirms the status.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	0	0	0	0	1	1	1	1	0	0	0	0	0	1	1	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	PDBGCLKQREQn	1b	R/W	Set the level of the QREQn signal to the PDBGCLK domain of the Cortex-A55 cluster. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with PDBGCLKQACCEPTn and PDBGCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
10	GICCLKQREQn	1b	R/W	Set the level of the QREQn signal to the GICCLK domain of the Cortex-A55 cluster. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with GICCLKQACCEPTn and GICCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
9	ATCLKQREQn	1b	R/W	Set the level of the QREQn signal to the ATCLK domain of the Cortex-A55 cluster. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with ATCLKQACCEPTn and ATCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
8	PCLKQREQn	1b	R/W	Set the level of the QREQn signal to the PCLK domain of the Cortex-A55 cluster. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with PCLKQACCEPTn and PCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
7 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	AMCLKQREQn	1b	R/W	Set the level of the QREQn signal to the ACE asynchronous bridge Master Interface on cortex-A55. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with AMCLKQACCEPTn and AMCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.

Bit	Bit Name	Initial Value	R/W	Description
1	ASCLKQREQn	1b	R/W	Set the level of the QREQn signal to the ACE asynchronous bridge Slave Interface on cortex-A55. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with ASCLKQACCEPTn and ASCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
0	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

6.3.59 SYS_LP_CA55CK_CTL3

This register controls the low power mode of Cortex-A55.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	PDBGCLKQDENY	GICCLKQDENY	ATCLKQDENY	PCLKQDENY	—	—	—	—	—	AMCLKQDENY	ASCLKQDENY	CA55_COREINSTRRUN[1]
Initial Value	0	0	0	0	—	—	—	—	0	0	0	0	0	—	—	—

	—	—	—	—	PDBGCLKQACCEPTn	GICCLKQACCEPTn	ATCLKQACCEPTn	PCLKQACCEPTn	—	—	—	—	—	AMCLKQACCEPTn	ASCLKQACCEPTn	CA55_COREINSTRRUN[0]
Initial Value	0	0	0	0	—	—	—	—	0	0	0	0	0	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	0000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27	PDBGCLKQDENY	—	R	Represents the status of the QDENY signal from the PDBGCLK domain of a Cortex-A55 cluster. This register represents the state of the Q-channel in combination with PDBGCLKQREQn and PDBGCLKQACCEPTn. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
26	GICCLKQDENY	—	R	Represents the status of the QDENY signal from the GICCLK domain of a Cortex-A55 cluster. This register represents the state of the Q-channel in combination with GICCLKQREQn and GICCLKQACCEPTn. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
25	ATCLKQDENY	—	R	Represents the status of the QDENY signal from the ATCLK domain of a Cortex-A55 cluster. This register represents the state of the Q-channel in combination with ATCLKQREQn and ATCLKQACCEPTn. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
24	PCLKQDENY	—	R	Represents the status of the QDENY signal from the PCLK domain of a Cortex-A55 cluster. This register represents the state of the Q-channel in combination with PCLKQREQn and PCLKQACCEPTn. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
23 to 19	—	00000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	AMCLKQDENY	—	R	Represents the status of the QDENY signal from the ACE asynchronous bridge Master Interface on cortex-A55. This register represents the state of the Q-channel in combination with AMCLKQREQn and AMCLKQACCEPTn. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.

Bit	Bit Name	Initial Value	R/W	Description
17	ASCLKQDENY	—	R	Represents the status of the QDENY signal from the ACE asynchronous bridge Slave Interface on cortex-A55. This register represents the state of the Q-channel in combination with ASCLKQREQn and ASCLKQACCEPTn. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
16	CA55_COREINSTRRUN[1]	—	R	Indicates that Cortex-A55 Core1 has transitioned to the WFI/WFE state. 0: Transitioned or OFF state 1: Normal operation
15 to 12	—	0000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	PDBGCLKQACCEPTn	—	R	Represents the state of the QACCEPTn signal from the PDBGCLK domain of a Cortex-A55 cluster. This register represents the state of the Q-channel in combination with PDBGCLKQREQn and PDBGCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
10	GICCLKQACCEPTn	—	R	Represents the state of the QACCEPTn signal from the GICCLK domain of a Cortex-A55 cluster. This register represents the state of the Q-channel in combination with GICCLKQREQn and GICCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
9	ATCLKQACCEPTn	—	R	Represents the state of the QACCEPTn signal from the ATCLK domain of a Cortex-A55 cluster. This register represents the state of the Q-channel in combination with ATCLKQREQn and ATCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
8	PCLKQACCEPTn	—	R	Represents the state of the QACCEPTn signal from the PCLK domain of a Cortex-A55 cluster. This register represents the state of the Q-channel in combination with PCLKQREQn and PCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
7 to 3	—	00000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	AMCLKQACCEPTn	—	R	Represents the state of the QACCEPTn signal from the ACE asynchronous bridge Master Interface on cortex-A55. This register represents the state of the Q-channel in combination with AMCLKQREQn and AMCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
1	ASCLKQACCEPTn	—	R	Represents the state of the QACCEPTn signal from the ACE asynchronous bridge Slave Interface on cortex-A55. This register represents the state of the Q-channel in combination with ASCLKQREQn and ASCLKQDENY. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
0	CA55_COREINSTRRUN[0]	—	R	Indicates that Cortex-A55 Core0 has transitioned to the WFI/WFE state. 0: Transitioned or OFF state 1: Normal operation

6.3.60 SYS_LP_GPU_CTL

This register controls the low power mode of GPU.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	QDENY_ACE_MST	QDENY_ACE_SLV	QDENY_AXI_MST	QDENY_AXI_SLV	QDENY_GPU	—	—	—	QACCEPTn_ACE_MST	QACCEPTn_ACE_SLV	QACCEPTn_AXI_MST	QACCEPTn_AXI_SLV	QACCEPTn_GPU

R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	QDENY_ACE_MST	—	R	ACE-lite MST Q-Channel request denial status Represents the state of the QDENYn signal from the GPU ACE-lite asynchronous bridge Master Interface. This register represents the state of the Q-channel in combination with QREQn_ACE_MST and QACCEPTn_ACE_MST. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
27	QDENY_ACE_SLV	—	R	ACE-lite SLV Q-Channel request denial status Represents the state of the QDENYn signal from the GPU ACE-lite asynchronous bridge Slave Interface. This register represents the state of the Q-channel in combination with QREQn_ACE_SLV and QACCEPTn_ACE_SLV. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
26	QDENY_AXI_MST	—	R	AXI4 MST Q-Channel request denial status Represents the state of the QDENYn signal from the GPU AXI4 asynchronous bridge Master Interface. This register represents the state of the Q-channel in combination with QREQn_AXI_MST and QACCEPTn_AXI_MST. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
25	QDENY_AXI_SLV	—	R	AXI4 SLV Q-Channel request denial status Represents the state of the QDENYn signal from the GPU AXI4 asynchronous bridge Slave Interface. This register represents the state of the Q-channel in combination with QREQn_AXI_SLV and QACCEPTn_AXI_SLV. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
24	QDENY_GPU	—	R	GPU Q-Channel request denial status Represents the state of the QDENYn signal from the GPU. This register represents the state of the Q-channel in combination with QREQn_GPU and QACCEPTn_GPU. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
23 to 21	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
20	QACCEPTn_ ACE_MST	—	R	ACE-lite MST Q-Channel request accept status Represents the state of the QACCEPTn signal from the GPU ACE-lite asynchronous bridge Master Interface. This register represents the state of the Q-channel in combination with QREQn_ACE_MST and QDENY_ACE_MST. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
19	QACCEPTn_ ACE_SLV	—	R	ACE-lite SLV Q-Channel request accept status Represents the state of the QACCEPTn signal from the GPU ACE-lite asynchronous bridge Slave Interface. This register represents the state of the Q-channel in combination with QREQn_ACE_SLV and QDENY_ACE_SLV. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
18	QACCEPTn_ AXI_MST	—	R	AXI4 MST Q-Channel request accept status Represents the state of the QACCEPTn signal from the GPU AXI4 asynchronous bridge Master Interface. This register represents the state of the Q-channel in combination with QREQn_AXI_MST and QDENY_AXI_MST. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
17	QACCEPTn_ AXI_SLV	—	R	AXI4 SLV Q-Channel request accept status Represents the state of the QACCEPTn signal from the GPU AXI4 asynchronous bridge Slave Interface. This register represents the state of the Q-channel in combination with QREQn_AXI_SLV and QDENY_AXI_SLV. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
16	QACCEPTn_ GPU	—	R	GPU Q-Channel request accept status Represents the state of the QACCEPTn signal from the GPU. This register represents the state of the Q-channel in combination with QREQn_GPU and QDENY_GPU. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
15 to 13	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	QREQn_ACE _MST	1b	R/W	ACE-lite MST Q-Channel request status Set the level of the QREQn signal to the GPU ACE-lite asynchronous bridge Master Interface. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with QACCEPTn_ACE_MST and QDENY_ACE_MST. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
11	QREQn_ACE _SLV	1b	R/W	ACE-lite SLV Q-Channel request status Set the level of the QREQn signal to the GPU ACE-lite asynchronous bridge Slave Interface. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with QACCEPTn_ACE_SLV and QDENY_ACE_SLV. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
10	QREQn_AXI_ MST	1b	R/W	AXI4 MST Q-Channel request status Set the level of the QREQn signal to the GPU AXI4 asynchronous bridge Master Interface. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with QACCEPTn_AXI_MST and QDENY_AXI_MST. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.

Bit	Bit Name	Initial Value	R/W	Description
9	QREQn_AXI_SLV	1b	R/W	AXI4 SLV Q-Channel request status Set the level of the QREQn signal to the GPU AXI4 asynchronous bridge Slave Interface. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with QACCEPTn_AXI_SLV and QDENY_AXI_SLV. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
8	QREQn_GPU	1b	R/W	GPU Q-Channel request status Set the level of the QREQn signal to the GPU. When this register is read, the value set at the time of the write is read. This register represents the state of the Q-channel in combination with QACCEPTn_GPU and QDENY_GPU. For more information on these combinations, see AMBA® Low Power Interface Arm® Q-Channel and P-Channel Interfaces.
7 to 5	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	QACTIVE_ACE_MST	—	R	ACE-lite MST Q-Channel active status Represents the state of the QACTIVE signal from the GPU ACE-lite asynchronous bridge Master Interface.*1
3	QACTIVE_ACE_SLV	—	R	ACE-lite SLV Q-Channel active status Represents the state of the QACTIVE signal from the GPU ACE-lite asynchronous bridge Slave Interface.*1
2	QACTIVE_AXI_MST	—	R	AXI4 MST Q-Channel active status Represents the state of the QACTIVE signal from the GPU AXI4 asynchronous bridge Master Interface.*1
1	QACTIVE_AXI_SLV	—	R	AXI4 SLV Q-Channel active status Represents the state of the QACTIVE signal from the GPU AXI4 asynchronous bridge Slave Interface.*1
0	QACTIVE_GPU	—	R	GPU Q-Channel active status Represents the state of the QACTIVE signal from the GPU.*1

Note 1. The state of this register is used to determine whether subsequent Q-channel controls will start clock stop operations. For more information about QACTIVE signal specifications, see AMBA® Low Power Interface ARM® Q-Channel and P-Channel Interfaces.

6.3.61 General Register0 (SYS_GPREG_0)

This register is a general-purpose register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GPREG0[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GPREG0[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GPREG0 [31:0]	H’0000_0000	R/W	General-purpose register 0 It is a 32-bit register. It is possible to write any value, read the written value.

6.3.62 General Register1 (SYS_GPREG_1)

This register is a general-purpose register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GPREG1[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GPREG1[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GPREG1 [31:0]	H’0000_0000	R/W	General-purpose register 1 It is a 32-bit register. It is possible to write any value, read the written value.

6.3.63 General Register2 (SYS_GPREG_2)

This register is a general-purpose register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GPREG2[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GPREG2[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GPREG2 [31:0]	H'0000_0000	R/W	General-purpose register 2 It is a 32-bit register. It is possible to write any value, read the written value.

6.3.64 General Register3 (SYS_GPREG_3)

This register is a general-purpose register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GPREG3[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GPREG3[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GPREG3 [31:0]	H'0000_0000	R/W	General-purpose register 3 It is a 32-bit register. It is possible to write any value, read the written value.

6.4 Operation

6.4.1 External Terminal State Capture Function

Captures the state of the following four external terminals at the rising edge of PRST# terminal and holds them into the SYS_LSI_MODE register. The value is not updated by a reset that occurs inside the LSI.

- MD_BOOT[2:0]
- DEBUGEN
- MD_CLKS
- MD_OSCDRV[1:0]

6.4.2 WDT Stop Control Function

By writing 1 to the WDTSTOP bit of the SYS_WDTn_CTRL register (n: 0 to 2), the following WDT corresponding to n is forcibly stopped and the count value is retained.

Also, by writing 1 to the WDTSTOPMASK bit of the SYS_WDTn_CTRL register (n: 0 to 2), the following WDT count corresponding to n can be continued even during debugging. If 0 is written, the WDT count will stop during debugging.

n	Stop WDT
0	WDT0 (for Cortex-A55 core0)
1	WDT1 (for Cortex-A55 core1)
2	WDT2 (for Cortex-M33)

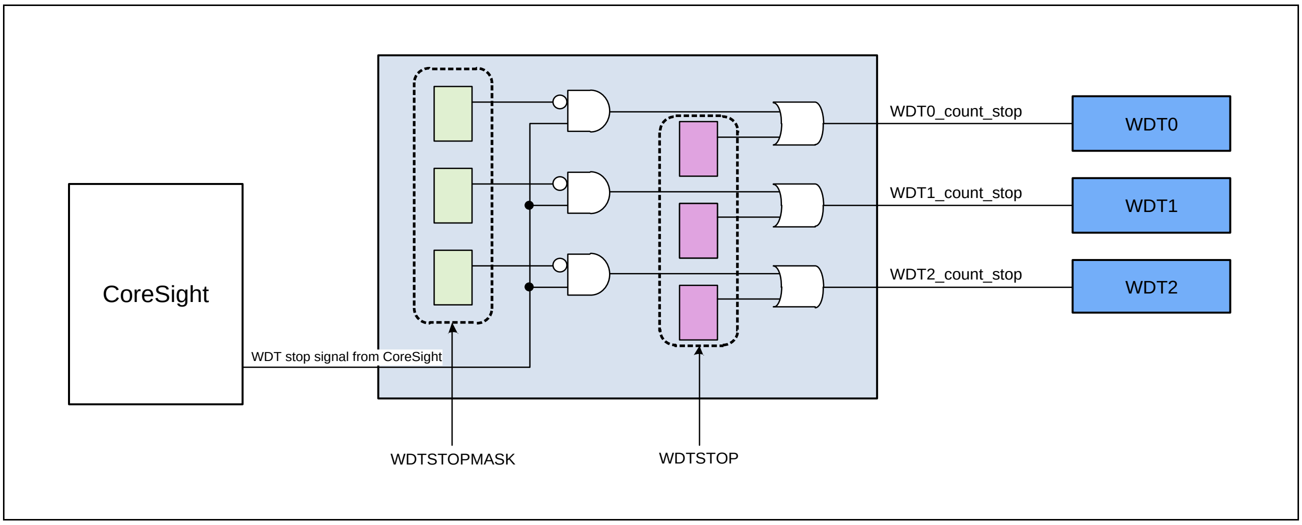

Figure 6.2 Overview of WDT Stop Function

7. Clock Pulse Generator (CPG)

This chapter describes the functions of the clock pulse generator module (CPG).

7.1 Features

7.1.1 Overview

Table 7.1 provides a list of CPG features.

Table 7.1 List of functions

Features	Specification
PLL control	● SSCG control, PLL multiplication factor setting, and ON/OFF control are performed by register setting. ● This LSI is equipped with 6 PLLs. The roles of each are as follows: – PLL1 (SSCG-PLL: Default SSCG ON): Cortex-A55 only – PLL2 (SSCG-PLL: Default SSCG OFF): For SYSTEM-BUS & Module (no SSCG) – PLL3 (SSCG-PLL: Default SSCG ON): For SYSTEM-BUS & Module (SSCG Yes) – PLL4 (SSCG-PLL: Default SSCG ON): DDR-SDRAM Only – PLL5 (SSCG-PLL: Default SSCG ON): Video-Out (DSI/LCDC) / Gigabit Ethernet Interface – PLL6 (SSCG-PLL: Default SSCG ON): 3DGE / Gigabit Ethernet Interface ● Initial value of SSCG for each PLL (PLL3 is fixed): – Fmod: 31.25kHz – Spread: Down spread – Modulation Depth: 2.25% (PLL1, PLL4 and, PLL6) 2.20% (PLL3 and PLL5)
Clock generation and control	The clock to be supplied to each module is generated from the external clock input (EXCLK), crystal oscillator input / output (XIN / XOUT), or PLL output clock. ● Selection of the peri-ratio by register setting ● Clock path selection by clock selector by register setting ● Clock supply ON/OFF control is performed by register setting. (Module Standby Mode control) ● Cortex-M33 Sleep Mode control
Reset generation and control	A reset is generated from the reset factor in (). The types of reset are as follows. ● System reset (external pin) ● Software reset (system reboot, reset control of each module) ● Watchdog reset (WDT module) ● Cortex-A55 Warm reset control (software control) ● Cortex-M33 Warm reset control (software control) ● ON/OFF control for each unit clock (software control)
Monitor	● PLL clock monitor – The function to monitor the operation of the output clocks from PLL1 to PLL6 ● Clock monitor for each module – Function to monitor that the clock monitor is operating ● Reset monitor – Function to monitor the reset status of each module

7.1.2 CPG configuration

Figure 7.1 shows the CPG configuration.

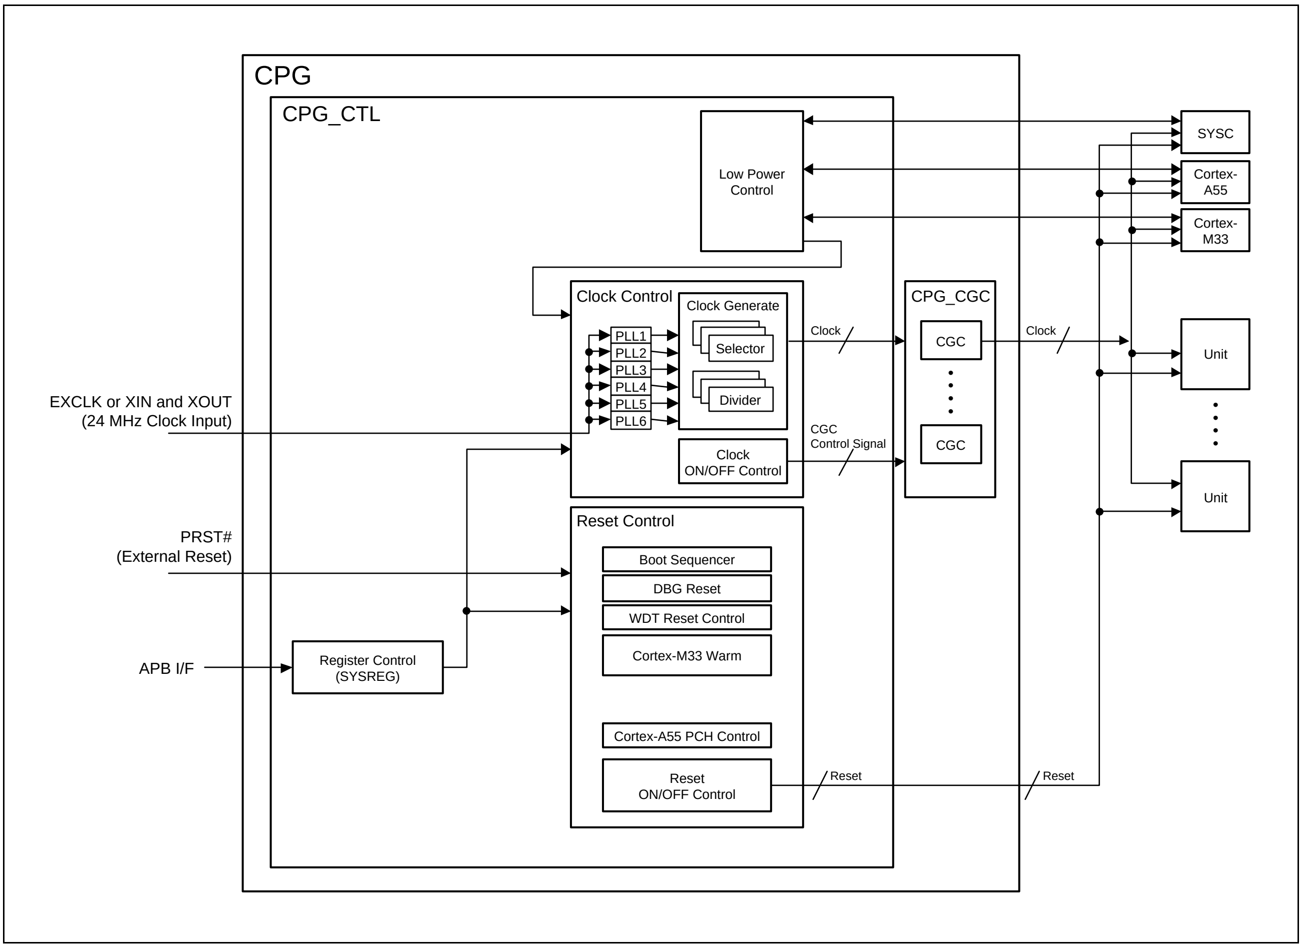

Figure 7.1 CPG Configuration

7.1.3 Pin description

The table below shows a list of CPG pins.

Table 7.2 Pin List

Name	Pin Name	IO	Functions
Mode control pin	MD_BOOT0	I	Set the operating mode. Do not change during PRST# pin asserts and after negating until the operating mode is confirmed.
	MD_BOOT1	I	
	MD_BOOT2	I	
	MD_CLKS	I	Set ON/OFF of SSCG circuit operation of PLL3. Do not change during PRST# terminal asserts and after negating until the operating mode is confirmed.
External clock Input pin*[2]	EXCLK	I	This is the pin to input the external clock.
Crystal oscillator input/output pin*[1]	XIN*[3]	I	This is the pin to connect the crystal oscillator.
	XOUT*[3]	O	
Power on reset input pin	PRST#	I	When this pin becomes low level, it will be in the power on reset state.
OSC drive capacity setting pin 0	MD_OSCDRV0	I	This is a pin for adjusting the drive capacity of the OSC buffer.
OSC drive capacity setting pin 1	MD_OSCDRV1	I	This is a pin for adjusting the drive capacity of the OSC buffer.

Note 1. When using a crystal oscillator, fix the pins of MD_OSCDRV0 and MD_OSCDRV1 to Low Level. Also, refer to the C/R constraints and implementation precautions described in the PCB design checklist.

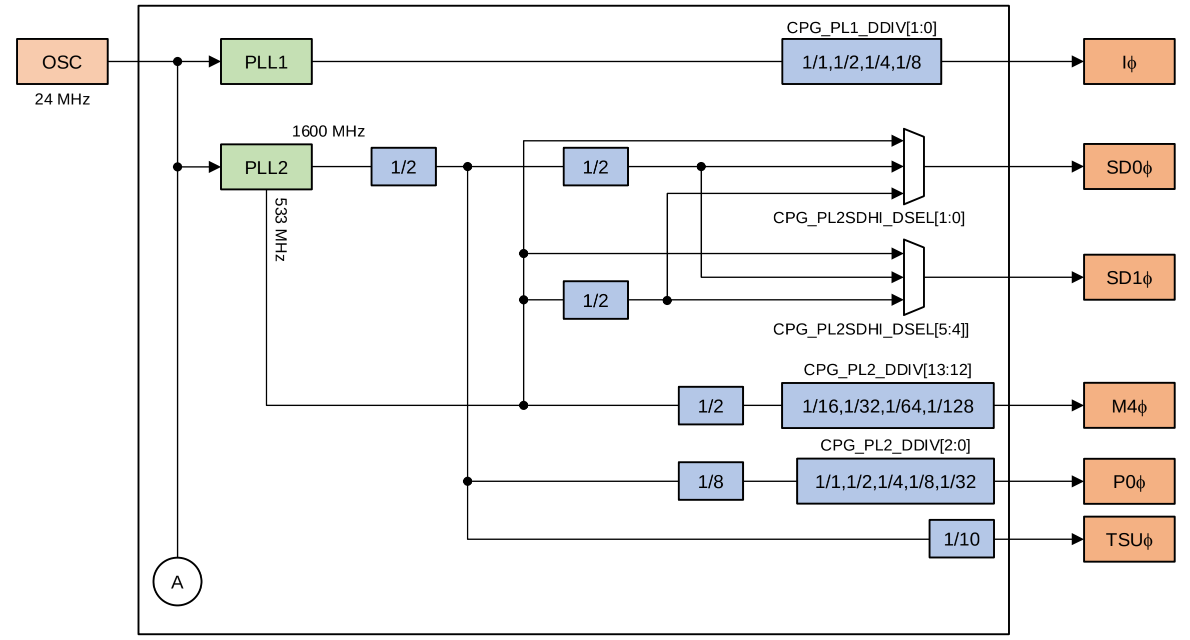
Note 2. When using crystal oscillation, fix the EXCLK pin externally to Low Level.

Note 3. When using the clock from the outside without using the crystal oscillator, set the XIN pin to the external low level fixing process and the XOUT pin to Open.

7.1.4 Clock

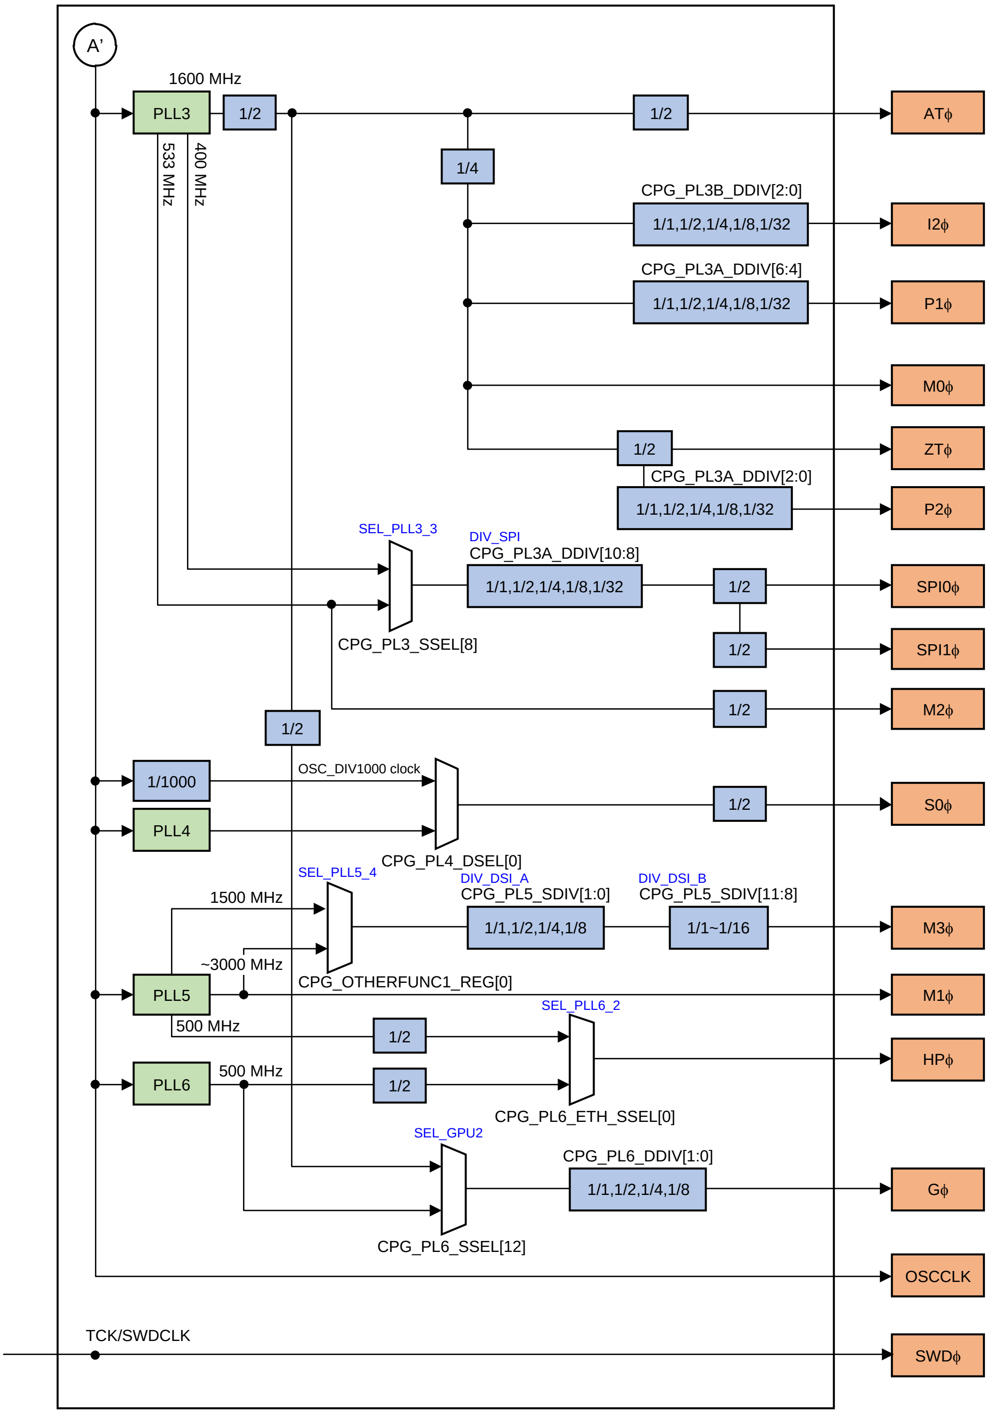
7.1.4.1 Clock System Diagram

Figure 7.2 and **Figure 7.3** show the clock system diagram.



Note: SEL_SDHI0 and SEL_SDHI1 collectively control multiple selectors. The control register for SEL_SDHI0 and SEL_SDHI1 is CPG_PL2SDHI_DSEL.

Figure 7.2 Clock System Diagram (1)



Note: The control registers of each selector are as follows.

- SEL_PLL3_3: CPG_PL3_SSEL
- SEL_PLL4: CPG_PL4_DSEL
- SEL_PLL5_4: CPG_OTHERFUNC1_REG
- SEL_PLL6_2: CPG_PL6_ETH_SSEL
- SEL_GPU2: CPG_PL6_SSEL

7.1.4.2 Clock List

Please refer to another file for the clock list.

7.2 Register description

7.2.1 Register attributes

The following table shows the register attributes described in Register Details.

Table 7.3 Register attributes

Register attributes	Description
RW	A register that can be read and written.
RW0	A register that can read and 0b write. 1b Write is invalid.
RW1	A register that can read and 1b write. 0b Write is invalid.
R0W	It is a register that can be written with 0b Read at all times.
R1W	It is a register that can be written with 1b Read at all times.
R	A register that can read. Write is invalid.
R0W0	It is a register that can always read 0b and write 0b. 1b Write is invalid.
R0W1	It is a register that can always read 0b and write 1b. 0b Write is invalid.
R1W0	It is a register that can always read 1b and write 0b. 1b Write is invalid.
R1W1	It is a register that can always read 1b and write 1b. 0b Write is invalid.
RCW0	A register that can be cleared by Read and 0b Write is possible. 1b Write is invalid.
RCW1	A register that can be cleared by Read and 1b Write is possible. 0b Write is invalid.

Note: This LSI does not guarantee the access result to the Reserved bit area and the undefined bit area.
At the same time, the Reserved bit area and undefined area may have values other than the initial value “0”. We do not guarantee the result of changing these values.

7.2.2 Register classification

The table below shows the general classification of the register space in this module.

The address of the CPG register is represented by an offset address from the CPG-based address.

Base Address: H’0_1101_0000 (Cortex-A55 Address Space)
Base Address: H’4101_0000 (Cortex-M33 Address Space Non-Secure)
Base Address: H’5101_0000 (Cortex-M33 Address Space Secure)

Table 7.4 Register Address space

Classification	Offset Address
SSCG PLL Control Registers (PLL1, 4, 6)	H’000 - H’0FF
Fast PLL Control Registers (PLL2, 3, 5)	H’100 - H’17F
Reserved	H’180 - H’1FF
Frequency Dynamic Change Control Registers	H’200 - H’3FF
Frequency Static Change Control Registers	H’400 - H’4FF
Clock Control Registers	H’500 - H’67F
Clock Monitor Registers	H’680 - H’7FF
Reset Control Registers	H’800 - H’97F
Reset Monitor Registers	H’980 - H’AFF
Other Registers	H’B00 - H’FFF

7.2.3 Register configuration

Table 7.5 Register list (1/5)

Register Name	Abbreviation	R/W	Initial value*1	Address*2	Access Size
PLL1 (SSCG) Standby Control Register	CPG_SAMPLL1_STBY	RW	H’0000 0005	H’000	32
PLL4 (SSCG) Standby Control Register	CPG_SAMPLL4_STBY	RW	H’0000 0004	H’010	32
PLL6 (SSCG) Standby Control Register	CPG_SAMPLL6_STBY	RW	H’0000 0000	H’020	32
PLL1 (SSCG) Output Clock Setting Register 1	CPG_SAMPLL1_CLK1	RW	H’0000 1901	H’004	32

Table 7.5 Register list (5/5)

Register Name	Abbreviation	R/W	Initial value*1	Address*2	Access Size
Reset Monitor Register VCPL4	CPG_RSTMON_VCPL4	R	H'0000 0003	H'9E0	32
Reset Monitor Register CRU	CPG_RSTMON_CRU	R	H'0000 0007	H'9E4	32
Reset Monitor Register MIPI_DSI	CPG_RSTMON_MIPI_DSI	R	H'0000 0007	H'9E8	32
Reset Monitor Register LCDC	CPG_RSTMON_LCDC	R	H'0000 0001	H'9EC	32
Reset Monitor Register SSIF	CPG_RSTMON_SSIF	R	H'0000 000F	H'9F0	32
Reset Monitor Register SRC	CPG_RSTMON_SRC	R	H'0000 0001	H'9F4	32
Reset Monitor Register USB	CPG_RSTMON_USB	R	H'0000 000F	H'9F8	32
Reset Monitor Register ETH	CPG_RSTMON_ETH	R	H'0000 0003	H'9FC	32
Reset Monitor Register I2C	CPG_RSTMON_I2C	R	H'0000 000F	H'A00	32
Reset Monitor Register SCIF	CPG_RSTMON_SCIF	R	H'0000 001F	H'A04	32
Reset Monitor Register SCI	CPG_RSTMON_SCI	R	H'0000 0003	H'A08	32
Reset Monitor Register IRDA	CPG_RSTMON_IRDA	R	H'0000 0001	H'A0C	32
Reset Monitor Register RSPI	CPG_RSTMON_RSPI	R	H'0000 0007	H'A10	32
Reset Monitor Register CANFD	CPG_RSTMON_CANFD	R	H'0000 0003	H'A14	32
Reset Monitor Register GPIO	CPG_RSTMON_GPIO	R	H'0000 0007	H'A18	32
Reset Monitor Register ADC	CPG_RSTMON_ADC	R	H'0000 0003	H'A28	32
Reset Monitor Register TSU	CPG_RSTMON_TSU	R	H'0000 0001	H'A2C	32
Reset Monitor Register AXI_TZCDDR	CPG_RSTMON_AXI_TZCDDR	R	H'0000 0000	H'A5C	32
WDT Overflow System Reset Register	CPG_WDTOVF_RST	RW	H'0000 0000	H'B10	32
WDT Reset Selector Register	CPG_WDTRST_SEL	RW	H'0000 0088	H'B14	32
Cortex-A55 Cluster Power Status Monitor Register	CPG_CLUSTER_PCHMON	R	H'0000 000x	H'B30	32
Cortex-A55 Cluster Power Status Control Register	CPG_CLUSTER_PCHCTL	RW	H'0048 0000	H'B34	32
Cortex-A55 Core0 Power Status Monitor Register	CPG_CORE0_PCHMON	R	H'0000 000x	H'B38	32
Cortex-A55 Core0 Power Status Control Register	CPG_CORE0_PCHCTL	RW	H'0008 0000	H'B3C	32
Cortex-A55 Core1 Power Status Monitor Register	CPG_CORE1_PCHMON	R	H'0000 000x	H'B40	32
Cortex-A55 Core1 Power Status Control Register	CPG_CORE1_PCHCTL	RW	H'0000 0000	H'B44	32
MSTOP Register ACPU	CPG_BUS_ACPU_MSTOP	RW	H'0000 0000	H'B60	32
MSTOP Register MCPU1	CPG_BUS_MCPU1_MSTOP	RW	H'0000 0000	H'B64	32
MSTOP Register MCPU2	CPG_BUS_MCPU2_MSTOP	RW	H'0000 0000	H'B68	32
MSTOP Register PERI_COM	CPG_BUS_PERI_COM_MSTOP	RW	H'0000 0000	H'B6C	32
MSTOP Register PERI_CPU	CPG_BUS_PERI_CPU_MSTOP	RW	H'0000 0000	H'B70	32
MSTOP Register PERI_DDR	CPG_BUS_PERI_DDR_MSTOP	RW	H'0000 0000	H'B74	32
MSTOP Register PERI_VIDEO	CPG_BUS_PERI_VIDEO_MSTOP	RW	H'0000 0000	H'B78	32
MSTOP Register REG0	CPG_BUS_REG0_MSTOP	RW	H'0000 0000	H'B7C	32
MSTOP Register REG1	CPG_BUS_REG1_MSTOP	RW	H'0000 0000	H'B80	32
MSTOP Register TZCDDR	CPG_BUS_TZCDDR_MSTOP	RW	H'0000 0000	H'B84	32
MSTOP Register MHU	CPG_MHU_MSTOP	RW	H'0000 0000	H'B88	32
Other Function Register 1	CPG_OTHERFUNC1_REG	RW	H'0000 0000	H'BE8	32
Other Function Register 2	CPG_OTHERFUNC2_REG	RW	H'0000 0000	H'BEC	32
Clock Control Register MBUS	CPG_CLKON_MBUS	RW	H'0000 07FF	H'5B8	32
Clock Monitor Register MBUS	CPG_CLKMON_MBUS	R	H'0000 07FF	H'738	32

Note 1. **Initial value:** The reset is released according to the sequence of the system reset, and the initial value is the one immediately after the last reset release in the sequence.

Note 2. **Address:** The offset address from the base address.

7.2.4 Register Descriptions

7.2.4.1 PLLn (SSCG) Standby Control Register (CPG_SAMPLLn_STBY) (n = 1, 4, or 6)

This register is used to control the power-saving mode and standby state and enable or disable the SSCG.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	R	RW	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	SSCG_MODE_WEN	0b	R0W1	Flag for enabling the writing to the SSCG_MODE[1:0] bits (bits 5 and 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	SSCG_EN_WEN	0b	R0W1	Flag for enabling the writing to the SSCG_EN bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	RESETB_WEN	0b	R0W1	Flag for enabling the writing to the RESETB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
5, 4	SSCG_MODE[1:0]	00b	RW	SSCG center spread or down spread setting (see the mode setting table below.*1) When writing to these bits, set the SSCG_MODE_WEN bit to 1 at the same time. 00b: Down spread 01b: Setting prohibited 10b: Setting prohibited 11b: Setting prohibited
3	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	SSCG_EN	n=1,4: 1b n=6: 0b	RW	SSCG enable or disable setting (see the mode setting table below.*1) When writing to this bit, set the SSCG_EN_WEN bit to 1 at the same time. 0: SSCG is disabled. 1: SSCG is enabled.
1	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RESETB	n=1: 1b n=4,6: 0b	RW	PLL reset setting (see the mode setting table below.*1) When writing to this bit, set the RESETB_WEN bit to 1 at the same time. 0: Reset state 1: Active state (PLL is released from the reset state.)

Note 1. Mode Setting Table

Mode		Bit Name		
		RESETB	SSCG_EN	SSCG_MODE[1:0]
Reset state		0	—	—
SSCG disabled		1	0	—
SSCG enabled	Down spread		1	00b
Setting prohibited				11b

7.2.4.2 PLLn (SSCG) Output Clock Setting Register 1 (CPG_SAMPLLn_CLK1) (n = 1, 4, or 6)

This register is used to specify the frequency division values k, m, and p for SSCG PLLn (n = 1, 4, or 6).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DIV_K															
Initial Value n = 1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	DIV_K	All 0	RW	Delta-sigma modulator (DSM) setting*4 Specify a 2’s complement of a decimal value from -32,768 to 32,767 that satisfies the restrictions*1. 1000_0000_0000_0000b: k = -32,768 1000_0000_0000_0001b: k = -32,767 1000_0000_0000_0010b: k = -32,766 : 0111_1111_1111_1101b: k = +32,765 0111_1111_1111_1110b: k = +32,766 0111_1111_1111_1111b: k = +32,767
15 to 6	DIV_M	n = 1: 00_0110_ 0100b n = 4: 00_1100_ 1000b n = 6: 00_1111_ 1010b	RW	Main divider setting*4 Specify an unsigned binary value from 64 to 533 that satisfies the restrictions*1 *2. 11_1111_1111b to 10_0001_0110b (Division value m = 534): Setting prohibited 10_0001_0101b: Division value m = 533 10_0001_0100b: Division value m = 532 : 00_0100_0001b: Division value m = 65 00_0100_0000b: Division value m = 64 00_0011_1111b to 00_0000_0000b: Setting prohibited
5 to 0	DIV_P	‘n = 1: 00_0001b ‘n = 4: 00_0011b ‘n = 6: 00_0011b	RW	Pre-divider setting*4 Specify a value from 1 to 8 that satisfies the restrictions*1 *2. 11_1111b to 00_00_0101b: Setting prohibited 00_0100b: Division value p = 4 (FFREF = 6 MHz) 00_0011:b Division value p = 3 (FFREF = 8 MHz) 00_0010b: Division value p = 2 (FFREF = 12 MHz) 00_0001b: Division value p = 1 (FFREF = 24 MHz) 00_0000b: Setting prohibited

Note 1. The PLL oscillation frequency (F_{FVCO}) and output frequency (F_{FOUT}) can be calculated by the following equations.

- Equations

$$F_{FVCO} = \frac{((m + k/65536) \times F_{Fin})}{p}$$

$$F_{Fout} = \frac{((m + k/65536) \times F_{Fin})}{(p \times 2^{s})}^{*3}$$

- Restrictions

  F_{Fin}: 24 MHz
  6 MHz ≤ F_{FREF} = F_{FIN}/p ≤ 30 MHz
  1,125 MHz ≤ F_{FVCO} ≤ 2,500 MHz

Note 2. Specify DIV_K, DIV_M, DIV_P, and DIV_S*3 within the allowable ranges of F_{FVCO} and F_{Fout} for each PLL shown below.

SSCG PLL	FFout Min.	Default FFout Setting	FFout Max.
PLL1	1,000 MHz	1,200 MHz	1,200 MHz
PLL4	800 MHz	1,600 MHz	1,600 MHz
PLL6	100 MHz	500 MHz	500 MHz

Note 3. For DIV_S (value “s”), see **Section 7.2.4.3, PLLn (SSCG) Output Clock Setting Register 2 (CPG_SAMPLLn_CLK2) (n = 1, 4, or 6)**.

Note 4. The PLL should be reset after the PLL settings are modified. For details, refer to **Section 7.4.5, Procedures for PLL Setup**.

7.2.4.3 PLLn (SSCG) Output Clock Setting Register 2 (CPG_SAMPLLn_CLK2) (n = 1, 4, or 6)

This register is used to specify the frequency division value s and SSCG modulation values mfr and mrr for SSCG PLLn (n = 1, 4, or 6).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	RW	RW	RW	RW	RW	RW	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 16	MFR	n = 1: H’18 n = 4: H’08 n = 6: H’08	RW	Modulation frequency setting The PLL should be reset after this setting is modified. For details, refer to **Section 7.4.5, Procedures for PLL Setup**. Specify a value from 0 to 255 (decimal).*1 1111_1111b: mfr = 255 1111_1110b: mfr = 254 : 0000_0001b: mfr = 1 0000_0000b: mfr = 0
15, 14	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 8	MRR	‘n = 1: 00_0110b ‘n = 4: 10_0100b ‘n = 6: 10_1101b	RW	Modulation ratio setting The PLL should be reset after this setting is modified. For details, refer to **Section 7.4.5, Procedures for PLL Setup**. Specify a value from 1 to 63 (decimal).*1 11_1111b: mrr = 63 11_1110b: mrr = 62 : 00_0010b: mrr = 2 00_0001b: mrr = 1 00_0000b: Setting prohibited
7 to 3	—	00000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	DIV_S	‘n = 1: 001b ‘n = 4: 000b ‘n = 6: 010b	RW	Divider s setting*2 Specify a value from 0 to 6 (decimal). 111b: Setting prohibited 110b: Division value s = 6 (Division ratio = 64) 101b: Division value s = 5 (Division ratio = 32) 100b: Division value s = 4 (Division ratio = 16) 011b: Division value s = 3 (Division ratio = 8) 010b: Division value s = 2 (Division ratio = 4) 001b: Division value s = 1 (Division ratio = 2) 000b: Division value s = 0 (Division ratio = 1)

Note 1. The modulation frequency (MF) and modulation ratio (pk-pk) (MR) can be calculated by the following equations.

- Equations

$$\mathrm{MF} = \frac{(\mathrm{F_{Fin}})}{\mathrm{p} \times \mathrm{mfr} \times (2^5)}$$

$$\mathrm{MR} = \frac{\mathrm{mf} \times \mathrm{mrr}}{\mathrm{m} \times (2^6)} \times 100[\%]$$

- Restrictions

F_{Fin}: 24 MHz
0000_0000b ≤ MFR[7:0] ≤ 1111_1111b
00_0001b ≤ MRR[5:0] ≤ 11_1111b
0 ≤ mrr × mfr ≤ 512

Note 2. For DIV_M (value “m”) and DIV_P (value “p”), see **Section 7.2.4.2, PLLn (SSCG) Output Clock Setting Register 1 (CPG_SAMPLLn_CLK1) (n = 1, 4, or 6)**.

Note 3. Change the SSC setting of PLL4 from the default setting to the following value.

- Modulation Depth [%]: −1.0%
- Fmod [kHz]: About 30 kHz

Important:

For the procedures for setting up the PLL, see **Section 7.4.5, Procedures for PLL Setup**.

Initial Values:

The initial values of the registers for PLL1, PLL4, and PLL6 and output clocks are shown below.

- Initial values of registers

	CPG_SAMPLLn_STBY (n = 1, 4, or 6)		
	SSCG_MODE	SSCG_EN	RESETB
PLL	Bits 5 and 4	Bit 2	Bit 0
PLL1	H’0 (Down spread)	1 (SSCG is enabled)	1 (Released from the reset state)
PLL4	H’0 (Down spread)	1 (SSCG is enabled)	0 (Reset state)
PLL6	H’0 (Down spread)	0 (SSCG is disabled)	0 (Reset state)

	CPG_SAMPLLn_CLK1 (n = 1, 4, or 6)			CPG_SAMPLLn_CLK2 (n = 1, 4, or 6)		
	DIV_K	DIV_M	DIV_P	DIV_S	MFR	MRR
PLL	Bits 31 to 16	Bits 15 to 6	Bits 5 to 0	Bits 2 to 0	Bits 23 to 16	Bits 13 to 8
PLL1	H’0000 (k = 0)	H’064 (m = 100)	H’1 (p = 1)	H’1 (s = 1)	H’18 (mfr = 24)	H’06 (mrr = 6)
PLL4	H’0000 (k = 0)	H’0C8 (m = 200)	H’3 (p = 3)	H’0 (s = 0)	H’08 (mfr = 8)	H’24 (mrr = 36)
PLL6	H’0000 (k = 0)	H’0FA (m = 250)	H’3 (p = 3)	H’2 (s = 2)	H’08 (mfr = 8)	H’2D (mrr = 45)

- Output clocks (initial values)

PLL	PLL Operating Mode	Frequency (F_{Fout}) [MHz]	SSCG	Fmod [kHz]	Spread	Modulation Depth [%]
PLL1	Active state	1,200	Enabled	31.25	Down spread	2.25
PLL4	Reset state	1,600	Enabled	31.25	Down spread	2.25
PLL6	Reset state	500	Disabled	31.25	Down spread	2.25

7.2.4.4 PLLn (SSCG) Monitor Register (CPG_SAMPLLn_MON) (n = 1, 4, or 6)

This register is used to monitor the state of the SSCG PLLn (n = 1, 4, or 6).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SEL_PLL1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	SEL_PLL1_WEN	0b	R0W1	Flag for enabling the writing to the SEL_PLL1 bit. This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	SEL_PLL1	1b	RW	The PLL multiplication factor is specified. 0: PLL1 operates according to the settings in the PLL1 SYSREG of the CPG. 1: When bit 0 of OTP_OTPPLL0 is 1, PLL1 operates according to the settings of OTP_OTPPLL0 to OTP_OTPPLL2. When bit 0 of OTP_OTPPLL0 is 0, PLL1 operates according to the settings in the PLL1 SYSREG of the CPG.

7.2.4.6 CPG_OTPPLL0_MON Register (CPG_OTPPLL0_MON)

This register indicates the state of the OTP_OTPPLL0[31:0] pins of the CPG.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OTP31_ MON	OTP30_ MON	OTP29_ MON	OTP28_ MON	OTP27_ MON	OTP26_ MON	OTP25_ MON	OTP24_ MON	OTP23_ MON	OTP22_ MON	OTP21_ MON	OTP20_ MON	OTP19_ MON	OTP18_ MON	OTP17_ MON	OTP16_ MON
Initial Value	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OTPn_MON [n = 31 to 0]	—	R	These bits indicate the state of the OTP_OTPPLL1[31:0] pins of the CPG. *Note*: The values specified in the OTP are set in these bits as the initial values.

7.2.4.8 CPG_OTPPLL2_MON Register (CPG_OTPPLL2_MON)

This register indicates the state of the OTP_OTPPLL2[31:0] pins of the CPG.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OTP31_MON	OTP30_MON	OTP29_MON	OTP28_MON	OTP27_MON	OTP26_MON	OTP25_MON	OTP24_MON	OTP23_MON	OTP22_MON	OTP21_MON	OTP20_MON	OTP19_MON	OTP18_MON	OTP17_MON	OTP16_MON
Initial Value	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OTP15_MON	OTP14_MON	OTP13_MON	OTP12_MON	OTP11_MON	OTP10_MON	OTP9_MON	OTP8_MON	OTP7_MON	OTP6_MON	OTP5_MON	OTP4_MON	OTP3_MON	OTP2_MON	OTP1_MON	OTP0_MON
Initial Value	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OTPn_MON [n = 31 to 0]	—	R	These bits indicate the state of the OTP_OTPPLL2[31:0] pins of the CPG. *Note*: The values specified in the OTP are set in these bits as the initial values.

7.2.4.9 PLL5 (SSCG) Standby Control Register (CPG_SIPLL5_STBY)

This register is used to control the power-saving mode and standby state and enable or disable the SSC in PLL5 that operates at 3 GHz or a higher frequency. When enable PLL5, change to SSCG_EN=0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	DOWNSPREAD_WEN	—	SSCG_EN_WEN	—	RESETB_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R0W1	R	R0W1	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	DOWNSPREAD	—	SSCG_EN	—	RESETB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	R	RW	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	DOWNSPREAD_WEN	0b	R0W1	Flag for enabling the writing to the DOWNSPREAD bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	SSCG_EN_WEN	0b	R0W1	Flag for enabling the writing to the SSCG_EN bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	RESETB_WEN	0b	R0W1	Flag for enabling the writing to the RESETB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	DOWNSPREAD	1b	RW	SSC center spread or down spread setting When writing to this bit, set the DOWNSPREAD_WEN bit to 1 at the same time. 0: Setting prohibited 1: Down spread
3	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	SSCG_EN*[2]	1b	RW	SSC enable or disable setting (see the mode setting table below.*[1]) When writing to this bit, set the SSCG_EN_WEN bit to 1 at the same time. 0: SSC is disabled. 1: SSC is enabled.
1	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
0	RESETB	0b	RW	PLL reset setting (see the mode setting table below.*[1]) When writing to this bit, set the RESETB_WEN bit to 1 at the same time. 0: Reset state 1: Active state (PLL is released from the reset state.)

Note 1. Mode Setting Table

Note 2. Set the SSCG_EN bit to 0, when operating PLL5.

Mode		Bit Name		
		RESETB	SSCG_EN	DOWNSPREAD
Reset state		0	—	—
SSCG disabled		1	0	—
SSCG enabled	Down spread		1	1b

7.2.4.10 PLL5 (SSCG) Output Clock Setting Register 1 (CPG_SIPLL5_CLK1)

This register is used to set up PLL5.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	REFDIV						—	POSTDIV2			—	POSTDIV1		
Initial Value	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0	1
R/W	R	R	RW	RW	RW	RW	RW	RW	R	RW	RW	RW	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 8	REFDIV	00_0001b	RW	REFDIV setting for PLL Specify a value from 1 to 63.
7	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6 to 4	POSTDIV2	001b	RW	POSTDIV2 setting for PLL Specify a value from 1 to 7. The POSTDIV value is obtained by POSTDIV1 × POSTDIV2.
3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2 to 0	POSTDIV1	001b	RW	POSTDIV1 setting for PLL Specify a value from 1 to 7. The POSTDIV value is obtained by POSTDIV1 × POSTDIV2.

7.2.4.11 PLL5 (SSCG) Output Clock Setting Register 2 (CPG_SIPLL5_CLK2)

This register is used to set up PLL5.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	FOUTVCOPD_WEN	—	FOUTPOSTDIVPD_WEN	—	FOUT4PHASEPD_WEN	—	DSMPD_WEN	—	DACPD_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R0W1	R	R0W1	R	R0W1	R	R0W1	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	FOUTVCOPD	—	FOUTPOSTDIVPD	—	FOUT4PHASEPD	—	DSMPD	—	DACPD
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	RW	R	RW	R	RW	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	FOUTVCOPD_WEN	0b	R0W1	Flag for enabling the writing to the FOUTVCOPD bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	FOUTPOSTDIVPD_WEN	0b	R0W1	Flag for enabling the writing to the FOUTPOSTDIVPD bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	FOUT4PHASEPD_WEN	0b	R0W1	Flag for enabling the writing to the FOUT4PHASEPD bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	DSMPD_WEN	0b	R0W1	Flag for enabling the writing to the DSMPD bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	DACPD_WEN	0b	R0W1	Flag for enabling the writing to the DACPD bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
8	FOUTVCOPD	1b	RW	FOUTVCOPD setting for the PLL Power-down of FOUTVCO is specified. 0: FOUTVCO is active. 1: FOUTVCO power is turned down.
7	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	FOUTPOSTDIVPD	0b	RW	FOUTPOSTDIVPD setting for the PLL Power-down of FOUTPOSTDIVPD is specified. (Target: FOUTPOSTDIVPD, FOUT1PH0, FOUT2, FOUT3, and FOUT4) 0: FOUTPOSTDIVPD is active. 1: FOUTPOSTDIVPD power is turned down.
5	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	FOUT4PHASEPD	0b	RW	FOUT4PHASEPD setting for the PLL Power-down of FOUT4PHASEPD is specified. (Target: FOUT1PH0, FOUT2, FOUT3, and FOUT4) 0: FOUT4PHASEPD is active. 1: FOUT4PHASEPD power is turned down.
3	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	DSMPD	0b	RW	Delta-sigma modulator (DSM) power-down setting 0: DSM is active. 1: DSM power is turned down.
1	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	DACPD	0b	RW	Noise-cancelling DAC power-down setting in the FRAC mode 0: DAC is active (default mode). 1: DAC power is turned down (for test mode only).

7.2.4.12 PLL5 (SSCG) Output Clock Setting Register 3 (CPG_SIPLL5_CLK3)

This register is used to set up the SSCG for PLL5.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FRACIN															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FRACIN								—	—	DIVVAL					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	FRACIN	H’00_0000	RW	Division value setting for frequency division
7, 6	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5 to 0	DIVVAL	00_0110b	RW	Modulation frequency setting When DIVVAL = 6’d0, the division value is set to 1. When DIVVAL > 0, the DIVVAL value is used as the division value.

7.2.4.13 PLL5 (SSCG) Output Clock Setting Register 4 (CPG_SIPLL5_CLK4)

This register is used to set up the SSCG for PLL5.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	INTIN											
Initial Value	0	0	0	0	0	0	0	0	0	1	1	1	1	1	0	1
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
27 to 16	INTIN	H’07D	RW	Setting of integer part of division value.
15 to 8	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
7 to 0	—	H’FF	RW	Reserved When read, the initial value is read. The written value will be ignored.

7.2.4.14 PLL5 (SSCG) Output Clock Setting Register 5 (CPG_SIPLL5_CLK5)

This register is used to set up the SSCG for PLL5.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SPREAD				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	0	1	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4 to 0	SPREAD	1_0110b	RW	Spread depth setting 00000b: Setting prohibited 00001b: 0.1% 00010b: 0.2% : 10000b: 1.6% : 11111b: 3.1%

Important:

For the procedures for setting up the PLL, see **Section 7.4.5, Procedures for PLL Setup**.

Initial Values:

The initial values of the registers for PLL5 and output clock are shown below.

- Initial values of registers

	CPG_SIPLL5_STBY		
	DOWNSPREAD	SSCG_EN	RESETB
PLL	Bit 4	Bit 2	Bit 0
PLL5	H'1 (Down spread)	1 (SSCG is enabled)	0 (Reset state)

	CPG_SIPLL5_CLK1		
	REFDIV	POSTDIV2	POSTDIV1
PLL	Bits 13 to 8	Bits 6 to 4	Bits 2 to 0
PLL5	H'01 (REFDIV = 1)	H'1 (POSTDIV2 = 1)	H'1 (POSTDIV1 = 1)

	CPG_SIPLL5_CLK3	
	FRACIN	DIVVAL
PLL	Bits 31 to 8	Bits 5 to 0
PLL5	H'00_0000 (FRACIN = 0)	H'6 (DIVVAL = 6)

	CPG_SIPLL5_CLK4	CPG_SIPLL5_CLK5
	INTIN	SPREAD
PLL	Bits 27 to 16	Bits 4 to 0
PLL5	H'07D (INTIN = 125)	H'16 (SPREAD = 22)

- Output clock (initial values)

PLL	PLL Operating Mode	Frequency (F_{Fout}) [MHz]	SSCG	Fmod [kHz]	Spread	Modulation Depth [%]
PLL5	Reset state	3,000	Enabled	31.25	Down spread	2.20

FOUTVCO = FREF/REFDIV × (INTIN + FRACIN / 2^24)

FOUTPOSTDIV = FOUTVCO / (POSTDIV1 × POSTDIV2)

The specifiable ranges of parameters for PLL5 are shown below.

Parameter	Restrictions	Specifiable Range
FREF	Fixed to the OSC frequency (24)	24
REFDIV	10 ≤ FREF/REFDIV ≤ FOUTVCO/20 (Frac)	1 to 2
INTIN*[1]	20 to 320 (Frac) and 800 ≤ FOUTVCO ≤ 3000 (PLL5)	Values that satisfy the restriction shown to the left
FRACIN*[1]	800 ≤ FOUTVCO ≤ 3000 (PLL5)	Values that satisfy the restriction shown to the left
POSTDIV1	—	1 to 7
POSTDIV2	—	1 to 7

Note 1. The restrictions when the SSCG is disabled are shown. When the SSCG is enabled, the restrictions should be satisfied with the modulation depth taken into account.

7.2.4.15 PLLn (SSCG) Monitor Register (CPG_SIPLLn_MON) (n = 2, 3, or 5)

This register is used to monitor the state of the SSCG PLLn (n = 2, 3, or 5).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value n = 2	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Initial Value n = 3	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Initial Value n = 5	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	PLLn_LOCK	—	—	—	PLLn_RESETB
Initial Value n = 2	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
Initial Value n = 3	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
Initial Value n = 5	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	PLLn_LOCK [n = 2, 3, or 5]	n = 2: 1b n = 3: 1b n = 5: 0b	R	SSCG PLL lock state monitoring 0: PLL is not locked. 1: PLL is locked.
3 to 1	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

7.2.4.16 Division Ratio Setting (PLL1) Register (CPG_PL1_DDIV)

This register is used to set the division ratio of the clock for the Cortex-A55.

The PLL1 (1,200 MHz) output is used as the source clock.

The setting of this register can be dynamically modified while the clock is operating.

7.2.4.17 Division Ratio Setting (PLL2) Register (CPG_PL2_DDIV)

This register is used to set the division ratios of the clocks for the system bus and the IP modules that cannot use SSCG clocks.

The PLL2 (up to 3,200 MHz) output is used as the source clock.

The setting of this register can be dynamically modified while the clock is operating.

7.2.4.18 Division Ratio Setting (PLL3A) Register (CPG_PL3A_DDIV)

This register is used to set the division ratios of the clocks for the system bus and the IP modules that can use SSCG clocks.

The clock obtained by dividing the output of PLL3 is used as the source clock.

The setting of this register can be dynamically modified while the clock is operating.

7.2.4.19 Division Ratio Setting (PLL3B) Register (CPG_PL3B_DDIV)

This register is used to set the division ratio of the clock for the Cortex-M33.

The source clock uses a clock (200MHz) that is 1/8 of the output of PLL3 (1,600MHz).

The setting of this register can be dynamically modified while the clock is operating.

7.2.4.20 Division Ratio Setting (PLL6) Register (CPG_PL6_DDIV)

This register is used to set the division ratios of the clocks for the 3DGE.

The PLL6 (up to 500 MHz) output is used as the source clock.

The setting of this register can be dynamically modified while the clock is operating.

31 to 21	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	SEL_SDHI1_WEN	0b	R0W1	Flag for enabling the writing to the SEL_SDHI1_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	SEL_SDHI0_WEN	0b	R0W1	Flag for enabling the writing to the SEL_SDHI0_SET bits This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5, 4	SEL_SDHI1_SET	01b	RW	SEL_SDHI1 clock switching*[1] 00b: Setting prohibited 01b: 533 MHz 10b: 400 MHz 11b: 266 MHz
3, 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	SEL_SDHI0_SET	01b	RW	SEL_SDHI0 clock switching*[1] 00b: Setting prohibited 01b: 533 MHz 10b: 400 MHz 11b: 266 MHz

Note: When 1 is written to the SEL_SDHI1_WEN or SEL_SDHI0_WEN bit placed in the upper 16 bits of this register, the clock switching control begins even if the settings in the lower bits are not changed. Check the status monitor register and wait until the switching is completed. The clock will temporarily stop at the timing of switching.

Note 1. To change the setting from 01b (533 MHz) to 10b (400 MHz) or vice versa, do not directly switch to the target clock. Switch to 11b (266 MHz) first, and then switch to the target setting (01b (533 MHz) or 10b (400 MHz)). Switching the clock directly between the above frequencies can temporarily generate pulses faster than 533MHz, which can cause malfunctions.

7.2.4.22 Source Clock Setting (DDR) Register (CPG_PL4_DSEL)

This register is used to switch the source clock for the DDR.

8	SEL_PLL3_3_SET	1b	RW	Source clock setting 0: 533MHz 1: 400MHz
7 to 5	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	—	1b	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3 to 1	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	—	1b	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

7.2.4.25 Source Clock Setting Register (CPG_PL6_SSEL)

This register is used to switch the source clocks for the 3DGE.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SEL_GPU2_WEN	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R0W1	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	SEL_GPU2_SET	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W	R	R	R	RW	R	R	R	RW	R	R	R	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	SEL_GPU2_WEN	0b	R0W1	Flag for enabling the writing to the SEL_GPU2_SET bit (bit 12) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
27 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	SEL_GPU2_SET	0b	RW	Source clock setting 0: 500MHz 1: 400MHz
11 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	—	1b	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
7 to 5	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	—	0b	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3 to 1	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	—	1b	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

7.2.4.26 Source Clock Setting Register (CPG_PL6_ETH_SSEL)

This register is used to switch the source clocks for the Gigabit Ethernet Interface.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SEL_PLL6_2_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SEL_PLL6_2_SET
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	SEL_PLL6_2_WEN	0b	R0W1	Flag for enabling the writing to the SEL_PLL6_2_SET bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	—	1b	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3 to 1	—	000b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	SEL_PLL6_2_SET	0b	RW	Source clock setting 0: PLL6 clock (250MHz) 1: PLL5 clock (250MHz)

7.2.4.27 Division Ratio Setting (PLL5) Register (CPG_PL5_SDIV)

This register is used to set the division ratio of the clock for the MIPI DSI.

The clock obtained by dividing the PLL5 (Up to 3000 MHz or 1500MHz) output is used as the source clock.

Select Up to 3000 MHz or 1500 MHz with SEL_PLL5_4 in the previous stage.

This register does not support dynamic modification.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	DIV_DSI_B_WEN	—	—	—	—	—	—	—	DIV_DSI_A_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R0W1	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DIVDSIB_SET				—	—	—	—	—	—	DIVDSIA_SET	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	DIV_DSI_B_WEN	0b	R0W1	Flag for enabling the writing to the DIVDSIB_SET bits (bits 11 to 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	DIV_DSI_A_WEN	0b	R0W1	Flag for enabling the writing to the DIVDSIA_SET bits (bits 1 and 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 8	DIVDSIB_SET	0000b	RW	Division ratio setting for the MIPI clock The division ratio is obtained by DIV_DSI_A × DIV_DSI_B and these bits specify DIV_DSI_B. The clock output range is 5.08 to 148.5MHz. 0000b: 1/1 0001b: 1/2 : 1110b: 1/15 1111b: 1/16
7 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	DIVDSIA_SET	00b	RW	Division ratio setting for the MIPI clock The division ratio is obtained by DIV_DSI_A × DIV_DSI_B and these bits specify DIV_DSI_A. 00b: 1/1 01b: 1/2 10b: 1/4 11b: 1/8

Note: The DIV_DSI_A and DIV_DSI_B settings should satisfy the following conditions.

Mode	DIV_DSI_A				DIV_DSI_B
	Input Clock (SEL_PLL5_4 Route Setting) Selection by CPG_OTHERFUNC1_REG (Bit 0) 0: FOUTPOSTDIV 1: FOUT1PH0	Maximum Input Frequency	Division Setting	Maximum Output Frequency	Division Setting
DSI (MIPI_DSI_PLLCLK/MIPI_DSI_VCLK*1 = even value)	1: FOUT1PH0	1.5 GHz	1/1, 1/2, 1/4, or 1/8	750 MHz	1/1 to 1/16
DSI (MIPI_DSI_PLLCLK/MIPI_DSI_VCLK*1 = odd value)	0: FOUTPOSTDIV	750 MHz	1	750 MHz	Odd value
DPI	0: FOUTPOSTDIV	167 MHz	1/2, 1/4, or 1/8	83.5 MHz	1/1

Note 1. For MIPI_DSI_VCLK, refer to the separate clock list.

7.2.4.28 Clock Control Register Cortex-A55 (CPG_CLKON_CA55)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	CLK5_ONWEN	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	CLK5_ON	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	CLK5_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	CLK4_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	CLK5_ON	1b	RW	The CA55_TSCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_ON	1b	RW	The CA55_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
3	CLK3_ON	1b	RW	The CA55_GICCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	1b	RW	The CA55_ATCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	1b	RW	The CA55_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	1b	RW	The CA55_SCLK/PERICLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.29 Clock Control Register Cortex-M33 (CPG_CLKON_CM33)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_ON	0b	RW	The CM33_TSCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0b	RW	The CM33_CLKIN clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.30 Clock Control Register ACPU (CPG_CLKON_SRAM_ACPU)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_ON	1b	RW	The SRAM_ACPU_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.31 Clock Control Register MCPU (CPG_CLKON_SRAM_MCPU)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_ON	1b	RW	The SRAM_MCPU_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.32 Clock Control Register GIC600 (CPG_CLKON_GIC600)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_ON	1b	RW	The GIC600_GICCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.33 Clock Control Register IA55 (CPG_CLKON_IA55)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_ON	1b	RW	The IA55_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	1b	RW	The IA55_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.34 Clock Control Register IM33 (CPG_CLKON_IM33)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_ON	1b	RW	The IM33_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	1b	RW	The IM33_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.35 Clock Control Register MHU (CPG_CLKON_MHU)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_ON	0b	RW	The MHU_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.36 Clock Control Register CST (CPG_CLKON_CST)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	CLK10_ONWEN	CLK9_ONWEN	CLK8_ONWEN	CLK7_ONWEN	CLK6_ONWEN	CLK5_ONWEN	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	CLK10_ON	CLK9_ON	CLK8_ON	CLK7_ON	CLK6_ON	CLK5_ON	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
26	CLK10_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK10_ON bit (bit 10) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	CLK9_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK9_ON bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	CLK8_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	CLK7_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK7_ON bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	CLK6_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK6_ON bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	CLK5_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	CLK4_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.

Bit	Bit Name	Initial Value	R/W	Description
18	CLK2_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 11	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10	CLK10_ON	1b	RW	The CST_AXI_ETR_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
9	CLK9_ON	1b	RW	The CST_AXI_SB_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
8	CLK8_ON	1b	RW	The CST_ATB_CM33_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
7	CLK7_ON	1b	RW	The CST_ATB_CA55_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
6	CLK6_ON	1b	RW	The CST_AHB_ATH_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
5	CLK5_ON	1b	RW	The CST_AHB_CM33_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_ON	1b	RW	The CST_APB_CA55_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	1b	RW	The CST_APB_CM33_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	1b	RW	The CST_APB_SB_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	1b	RW	The CST_TS_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	1b	RW	The CST_CS_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.37 Clock Control Register SYC (CPG_CLKON_SYC)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_ON	0b	RW	The SYC_CNT_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.38 Clock Control Register DMAC_REG (CPG_CLKON_DMAC_REG)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_ON	0b	RW	The DMAC_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0b	RW	The DMAC_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.39 Clock Control Register GTM (CPG_CLKON_GTM)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	CLK2_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	CLK2_ON	0b	RW	The OSTM2_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0b	RW	The OSTM1_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	1b	RW	The OSTM0_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.40 Clock Control Register MTU (CPG_CLKON_MTU)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_ON	0b	RW	The MTU_X_MCK_MTU3 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.41 Clock Control Register POE3 (CPG_CLKON_POE3)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_ON	0b	RW	The POE3_CLKM_POE clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.42 Clock Control Register GPT (CPG_CLKON_GPT)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_ON	0b	RW	The GPT_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.43 Clock Control Register POEG (CPG_CLKON_POEG)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	CLK3_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	CLK3_ON	0b	RW	The POEG_D_CLKP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0b	RW	The POEG_C_CLKP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0b	RW	The POEG_B_CLKP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0b	RW	The POEG_A_CLKP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.44 Clock Control Register WDT (CPG_CLKON_WDT)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	CLK5_ONWEN	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	CLK5_ON	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	1	1	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	CLK5_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	CLK4_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	—	1b	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
6	—	1b	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
5	CLK5_ON	0b	RW	The WDT2_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
4	CLK4_ON	0b	RW	The WDT2_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	0b	RW	The WDT1_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0b	RW	The WDT1_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	1b	RW	The WDT0_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	1b	RW	The WDT0_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.45 Clock Control Register DDR (CPG_CLKON_DDR)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_ON	0b	RW	The DDR_REG_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0b	RW	The DDR_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.46 Clock Control Register SPI_MULTI (CPG_CLKON_SPI_MULTI)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_ON	0b	RW	The SPI_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0b	RW	The SPI_CLK2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.47 Clock Control Register SDHI (CPG_CLKON_SDHI)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CLK7_ONWEN	CLK6_ONWEN	CLK5_ONWEN	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CLK7_ON	CLK6_ON	CLK5_ON	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23	CLK7_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK7_ON bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	CLK6_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK6_ON bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	CLK5_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	CLK4_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
7	CLK7_ON	0b	RW	The SDHI1_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
6	CLK6_ON	0b	RW	The SDHI1_CLK_HS clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
5	CLK5_ON	0b	RW	The SDHI1_IMCLK2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_ON	0b	RW	The SDHI1_IMCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	0b	RW	The SDHI0_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0b	RW	The SDHI0_CLK_HS clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0b	RW	The SDHI0_IMCLK2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0b	RW	The SDHI0_IMCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.48 Clock Control Register 3DGE (CPG_CLKON_3DGE)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	CLK2_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	CLK2_ON	0b	RW	The GPU_ACE_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0b	RW	The GPU_AXI_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0b	RW	The GPU_CLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.49 Clock Control Register ISU (CPG_CLKON_ISU)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_ON	0b	RW	The ISU_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0b	RW	The ISU_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.50 Clock Control Register VCPL4 (CPG_CLKON_VCPL4)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_ON	0b	RW	The H264_CLK_A and H264_CLK_P clocks are supplied or stopped. 0: Clocks are stopped. 1: Clocks are supplied.

7.2.4.51 Clock Control Register CRU (CPG_CLKON_CRU)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
19	CLK3_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3	CLK3_ON	0b	RW	The CRU_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0b	RW	The CRU_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0b	RW	The CRU_VCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
0	CLK0_ON	0b	RW	The CRU_SYSCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.52 Clock Control Register MIPI_DSI (CPG_CLKON_MIPI_DSI)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	CLK5_ONWEN	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	CLK5_ON	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	CLK5_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	CLK4_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	CLK5_ON	0b	RW	The MIPI_DSI_LPCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_ON	0b	RW	The MIPI_DSI_VCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
3	CLK3_ON	0b	RW	The MIPI_DSI_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0b	RW	The MIPI_DSI_ACLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0b	RW	The MIPI_DSI_SYSCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0b	RW	The MIPI_DSI_PLLCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.53 Clock Control Register LCDC (CPG_CLKON_LCDC)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_ON	0b	RW	The LCDC_CLK_D clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0b	RW	The LCDC_CLK_A and LCDC_CLK_P clocks are supplied or stopped. 0: Clocks are stopped. 1: Clocks are supplied.

7.2.4.54 Clock Control Register SSI (CPG_CLKON_SSI)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CLK7_ONWEN	CLK6_ONWEN	CLK5_ONWEN	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CLK7_ON	CLK6_ON	CLK5_ON	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23	CLK7_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK7_ON bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	CLK6_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK6_ON bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	CLK5_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK5_ON bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	CLK4_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
7	CLK7_ON	0b	RW	The SSI3_PCLK_SFR clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
6	CLK6_ON	0b	RW	The SSI3_PCLK2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
5	CLK5_ON	0b	RW	The SSI2_PCLK_SFR clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
4	CLK4_ON	0b	RW	The SSI2_PCLK2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	0b	RW	The SSI1_PCLK_SFR clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0b	RW	The SSI1_PCLK2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0b	RW	The SSI0_PCLK_SFR clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0b	RW	The SSI0_PCLK2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.55 Clock Control Register SRC (CPG_CLKON_SRC)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_ON	0b	RW	The SRC_CLKP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.56 Clock Control Register USB (CPG_CLKON_USB)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	CLK3_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	CLK3_ON	0b	RW	The USB_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0b	RW	The USB_U2P_EXR_CPUCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0b	RW	The USB_U2H1_HCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0b	RW	The USB_U2H0_HCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.57 Clock Control Register ETH (CPG_CLKON_ETH)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_ON	0b	RW	The ETH1_CLK_AXI/CHI clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0b	RW	The ETH0_CLK_AXI/CHI clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.58 Clock Control Register I2C (CPG_CLKON_I2C)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	CLK3_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	CLK3_ON	0b	RW	The I2C3_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0b	RW	The I2C2_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0b	RW	The I2C1_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0b	RW	The I2C0_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.59 Clock Control Register SCIF (CPG_CLKON_SCIF)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	CLK4_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	CLK4_ON	0b	RW	The SCIF4_CLK_PCK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	0b	RW	The SCIF3_CLK_PCK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	0b	RW	The SCIF2_CLK_PCK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0b	RW	The SCIF1_CLK_PCK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
0	CLK0_ON	0b	RW	The SCIF0_CLK_PCK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.60 Clock Control Register SCI (CPG_CLKON_SCI)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_ON	0b	RW	The SCI1_CLKP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0b	RW	The SCI0_CLKP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.61 Clock Control Register IRDA (CPG_CLKON_IRDA)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_ON	0b	RW	The IRDA_CLKP clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.62 Clock Control Register RSPI (CPG_CLKON_RSPI)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	CLK2_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	CLK2_ON	0b	RW	The RSPI2_CLKB clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	0b	RW	The RSPI1_CLKB clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0b	RW	The RSPI0_CLKB clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.63 Clock Control Register CANFD (CPG_CLKON_CANFD)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_ON	0b	RW	The CANFD_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.64 Clock Control Register GPIO (CPG_CLKON_GPIO)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_ON	0b	RW	The GPIO_HCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.65 Clock Control Register ADC (CPG_CLKON_ADC)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_ON	0b	RW	The ADC_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
0	CLK0_ON	0b	RW	The ADC_ADCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.66 Clock Control Register TSU (CPG_CLKON_TSU)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_ON	0b	RW	The TSU_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.67 Clock Control Register AXI_TZCDDR (CPG_CLKON_AXI_TZCDDR)

This register is used to supply or stop clocks for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	CLK4_ONWEN	CLK3_ONWEN	CLK2_ONWEN	CLK1_ONWEN	CLK0_ONWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	CLK4_ON	CLK3_ON	CLK2_ON	CLK1_ON	CLK0_ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	CLK4_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	CLK3_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	CLK2_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	CLK1_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	CLK0_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	CLK4_ON	1b	RW	The BUS_TZCDDR_ACLK3 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
3	CLK3_ON	1b	RW	The BUS_TZCDDR_ACLK2 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2	CLK2_ON	1b	RW	The BUS_TZCDDR_ACLK1 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
1	CLK1_ON	1b	RW	The BUS_TZCDDR_ACLK0 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

Bit	Bit Name	Initial Value	R/W	Description
0	CLK0_ON	1b	RW	The BUS_TZCDDR_PCLK clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.

7.2.4.68 Clock Monitor Register Cortex-A55 (CPG_CLKMON_CA55)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	CLK5_ MON	CLK4_ MON	CLK3_ MON	CLK2_ MON	CLK1_ MON	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	CLK5_MON	1b	R	The state of the CA55_TSCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
4	CLK4_MON	1b	R	The state of the CA55_ACLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
3	CLK3_MON	1b	R	The state of the CA55_GICCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
2	CLK2_MON	1b	R	The state of the CA55_ATCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
1	CLK1_MON	1b	R	The state of the CA55_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	1b	R	The state of the CA55_SCLK/PERICLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.69 Clock Monitor Register Cortex-M33 (CPG_CLKMON_CM33)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ MON	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_MON	0b	R	The state of the CM33_TSCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the CM33_CLKIN clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.70 Clock Monitor Register SRAM_ACPU (CPG_CLKMON_SRAM_ACPU)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_MON	1b	R	The state of the SRAM_ACPU_ACLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.71 Clock Monitor Register SRAM_MCPU (CPG_CLKMON_SRAM_MCPU)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_MON	1b	R	The state of the SRAM_MCPU_ACLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.72 Clock Monitor Register GIC600 (CPG_CLKMON_GIC600)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_MON	1b	R	The state of the GIC600_GICCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.73 Clock Monitor Register IA55 (CPG_CLKMON_IA55)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ MON	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_MON	1b	R	The state of the IA55_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	1b	R	The state of the IA55_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.74 Clock Monitor Register IM33 (CPG_CLKMON_IM33)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ MON	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_MON	1b	R	The state of the IM33_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	1b	R	The state of the IM33_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.75 Clock Monitor Register MHU (CPG_CLKMON_MHU)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_MON	0b	R	The state of the MHU_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.76 Clock Monitor Register CST (CPG_CLKMON_CST)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	CLK10_MON	CLK9_MON	CLK8_MON	CLK7_MON	CLK6_MON	CLK5_MON	CLK4_MON	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10	CLK10_MON	1b	R	The state of the CST_AXI_ETR_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
9	CLK9_MON	1b	R	The state of the CST_AXI_SB_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
8	CLK8_MON	1b	R	The state of the CST_ATB_CM33_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
7	CLK7_MON	1b	R	The state of the CST_ATB_CA55_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
6	CLK6_MON	1b	R	The state of the CST_AHB_ATH_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
5	CLK5_MON	1b	R	The state of the CST_AHB_CM33_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
4	CLK4_MON	1b	R	The state of the CST_APB_CA55_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
3	CLK3_MON	1b	R	The state of the CST_APB_CM33_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
2	CLK2_MON	1b	R	The state of the CST_APB_SB_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
1	CLK1_MON	1b	R	The state of the CST_TS_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	1b	R	The state of the CST_CS_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

Note: No CGC is provided for CST_SWCLKTCK.

7.2.4.77 Clock Monitor Register SYC (CPG_CLKMON_SYC)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_MON	0b	R	The state of the SYC_CNT_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.78 Clock Monitor Register DMAC_REG (CPG_CLKMON_DMAC_REG)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_MON	0b	R	The state of the DMAC_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the DMAC_ACLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.79 Clock Monitor Register GTM (CPG_CLKMON_GTM)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK2_ MON	CLK1_ MON	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	CLK2_MON	0b	R	The state of the OSTM2_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
1	CLK1_MON	0b	R	The state of the OSTM1_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	1b	R	The state of the OSTM0_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.80 Clock Monitor Register MTU (CPG_CLKMON_MTU)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_MON	0b	R	The state of the MTU_X_MCK_MTU3 clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.81 Clock Monitor Register POE3 (CPG_CLKMON_POE3)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_MON	0b	R	The state of the POE3_CLKM_POE clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.82 Clock Monitor Register GPT (CPG_CLKMON_GPT)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_MON	0b	R	The state of the GPT_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.83 Clock Monitor Register POEG (CPG_CLKMON_POEG)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	CLK3_MON	0b	R	The state of the POEG_D_CLKP clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
2	CLK2_MON	0b	R	The state of the POEG_C_CLKP clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
1	CLK1_MON	0b	R	The state of the POEG_B_CLKP clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the POEG_A_CLKP clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.84 Clock Monitor Register WDT (CPG_CLKMON_WDT)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	CLK5_ MON	CLK4_ MON	CLK3_ MON	CLK2_ MON	CLK1_ MON	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	1	1	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	—	1b	R	Reserved When read, the initial value is read. The written value will be ignored.
6	—	1b	R	Reserved When read, the initial value is read. The written value will be ignored.
5	CLK5_MON	0b	R	The state of the WDT2_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
4	CLK4_MON	0b	R	The state of the WDT2_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
3	CLK3_MON	0b	R	The state of the WDT1_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
2	CLK2_MON	0b	R	The state of the WDT1_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
1	CLK1_MON	1b	R	The state of the WDT0_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	1b	R	The state of the WDT0_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.85 Clock Monitor Register DDR (CPG_CLKMON_DDR)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ MON	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_MON	0b	R	The state of the DDR_REG_ACLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the DDR_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.86 Clock Monitor Register SPI_MULTI (CPG_CLKMON_SPI_MULTI)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ MON	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_MON	0b	R	The state of the SPI_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the SPI_CLK2 clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.87 Clock Monitor Register SDHI (CPG_CLKMON_SDHI)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CLK7_ MON	CLK6_ MON	CLK5_ MON	CLK4_ MON	CLK3_ MON	CLK2_ MON	CLK1_ MON	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	CLK7_MON	0b	R	The state of the SDHI1_ACLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
6	CLK6_MON	0b	R	The state of the SDHI1_CLK_HS clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
5	CLK5_MON	0b	R	The state of the SDHI1_IMCLK2 clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
4	CLK4_MON	0b	R	The state of the SDHI1_IMCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
3	CLK3_MON	0b	R	The state of the SDHI0_ACLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
2	CLK2_MON	0b	R	The state of the SDHI0_CLK_HS clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
1	CLK1_MON	0b	R	The state of the SDHI0_IMCLK2 clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the SDHI0_IMCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.88 Clock Monitor Register 3DGE (CPG_CLKMON_3DGE)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK2_ MON	CLK1_ MON	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored..
2	CLK2_MON	0b	R	The state of the GPU_ACE_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
1	CLK1_MON	0b	R	The state of the GPU_AXI_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the GPU_CLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.89 Clock Monitor Register ISU (CPG_CLKMON_ISU)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ MON	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_MON	0b	R	The state of the ISU_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the ISU_ACLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.90 Clock Monitor Register VCPL4 (CPG_CLKMON_VCPL4)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_MON	0b	R	The state of the H264_CLK_A/P clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.91 Clock Monitor Register CRU (CPG_CLKMON_CRU)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CLK3_ MON	CLK2_ MON	CLK1_ MON	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3	CLK3_MON	0b	R	The state of the CRU_ACLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
2	CLK2_MON	0b	R	The state of the CRU_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
1	CLK1_MON	0b	R	The state of the CRU_VCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the CRU_SYSCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.92 Clock Monitor Register MIPI_DSI (CPG_CLKMON_MIPI_DSI)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	CLK5_MON	CLK4_MON	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	CLK5_MON	0b	R	The state of the MIPI_DSI_LPCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
4	CLK4_MON	0b	R	The state of the MIPI_DSI_VCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
3	CLK3_MON	0b	R	The state of the MIPI_DSI_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
2	CLK2_MON	0b	R	The state of the MIPI_DSI_ACLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
1	CLK1_MON	0b	R	The state of the MIPI_DSI_SYSCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the MIPI_DSI_PLLCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.93 Clock Monitor Register LCDC (CPG_CLKMON_LCDC)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_MON	0b	R	The state of the LCDC_CLK_D clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the LCDC_CLK_A/P clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.94 Clock Monitor Register SSI (CPG_CLKMON_SSI)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CLK7_ MON	CLK6_ MON	CLK5_ MON	CLK4_ MON	CLK3_ MON	CLK2_ MON	CLK1_ MON	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	CLK7_MON	0b	R	The state of the SSI3_PCLK_SFR clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
6	CLK6_MON	0b	R	The state of the SSI3_PCLK2 clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
5	CLK5_MON	0b	R	The state of the SSI2_PCLK_SFR clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
4	CLK4_MON	0b	R	The state of the SSI2_PCLK2 clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
3	CLK3_MON	0b	R	The state of the SSI1_PCLK_SFR clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
2	CLK2_MON	0b	R	The state of the SSI1_PCLK2 clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
1	CLK1_MON	0b	R	The state of the SSI0_PCLK_SFR clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the SSI0_PCLK2 clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.95 Clock Monitor Register SRC (CPG_CLKMON_SRC)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_MON	0b	R	The state of the SRC_CLKP clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.96 Clock Monitor Register USB (CPG_CLKMON_USB)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	CLK3_MON	0b	R	The state of the USB_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
2	CLK2_MON	0b	R	The state of the USB_U2P_EXR_CPUCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
1	CLK1_MON	0b	R	The state of the USB_U2H1_HCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the USB_U2H0_HCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.97 Clock Monitor Register ETH (CPG_CLKMON_ETH)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_MON	0b	R	The state of the ETH1_CLK_AXI/CHI clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the ETH0_CLK_AXI/CHI clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

Note: No CGC is provided for ETH1_REFCLK and ETH0_REFCLK.

7.2.4.98 Clock Monitor Register I2C (CPG_CLKMON_I2C)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CLK3_ MON	CLK2_ MON	CLK1_ MON	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	CLK3_MON	0b	R	The state of the I2C3_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
2	CLK2_MON	0b	R	The state of the I2C2_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
1	CLK1_MON	0b	R	The state of the I2C1_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the I2C0_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.99 Clock Monitor Register SCIF (CPG_CLKMON_SCIF)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	CLK4_MON	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	CLK4_MON	0b	R	The state of the SCIF4_CLK_PCK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
3	CLK3_MON	0b	R	The state of the SCIF3_CLK_PCK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
2	CLK2_MON	0b	R	The state of the SCIF2_CLK_PCK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
1	CLK1_MON	0b	R	The state of the SCIF1_CLK_PCK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the SCIF0_CLK_PCK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.100 Clock Monitor Register SCI (CPG_CLKMON_SCI)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ MON	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored..
1	CLK1_MON	0b	R	The state of the SCI1_CLKP clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the SCI0_CLKP clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.101 Clock Monitor Register IRDA (CPG_CLKMON_IRDA)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_MON	0b	R	The state of the IRDA_CLKP clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.102 Clock Monitor Register RSPI (CPG_CLKMON_RSPI)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK2_ MON	CLK1_ MON	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	CLK2_MON	0b	R	The state of the RSPI2_CLKB clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
1	CLK1_MON	0b	R	The state of the RSPI1_CLKB clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the RSPI0_CLKB clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.103 Clock Monitor Register CANFD (CPG_CLKMON_CANFD)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_MON	0b	R	The state of the CANFD_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.104 Clock Monitor Register GPIO (CPG_CLKMON_GPIO)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_MON	0b	R	The state of the GPIO_HCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.105 Clock Monitor Register ADC (CPG_CLKMON_ADC)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK1_ MON	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CLK1_MON	0b	R	The state of the ADC_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	0b	R	The state of the ADC_ADCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.106 Clock Monitor Register TSU (CPG_CLKMON_TSU)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLK0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CLK0_MON	0b	R	The state of the TSU_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.107 Clock Monitor Register AXI_TZCDDR (CPG_CLKMON_AXI_TZCDDR)

This register is used to monitor the state of the clocks supplied to individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	CLK4_MON	CLK3_MON	CLK2_MON	CLK1_MON	CLK0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	CLK4_MON	1b	R	The state of the BUS_TZCDDR_ACLK3 clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
3	CLK3_MON	1b	R	The state of the BUS_TZCDDR_ACLK2 clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
2	CLK2_MON	1b	R	The state of the BUS_TZCDDR_ACLK1 clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
1	CLK1_MON	1b	R	The state of the BUS_TZCDDR_ACLK0 clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.
0	CLK0_MON	1b	R	The state of the BUS_TZCDDR_PCLK clock is monitored. 0: Clock is not supplied. 1: Clock is supplied.

7.2.4.108 Reset Control Register Cortex-A55 (CPG_RST_CA55)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	UNIT12_RSTWEN	UNIT11_RSTWEN	UNIT10_RSTWEN	UNIT9_RSTWEN	UNIT8_RSTWEN	UNIT7_RSTWEN	UNIT6_RSTWEN	UNIT5_RSTWEN	UNIT4_RSTWEN	UNIT3_RSTWEN	UNIT2_RSTWEN	UNIT1_RSTWEN	UNIT0_RSTWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	UNIT12_RSTB	UNIT11_RSTB	UNIT10_RSTB	UNIT9_RSTB	UNIT8_RSTB	UNIT7_RSTB	UNIT6_RSTB	UNIT5_RSTB	UNIT4_RSTB	UNIT3_RSTB	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	UNIT12_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT12_RSTB bit (bit 12) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
27	UNIT11_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT11_RSTB bit (bit 11) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
26	UNIT10_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT10_RSTB bit (bit 10) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	UNIT9_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT9_RSTB bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	UNIT8_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT8_RSTB bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	UNIT7_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT7_RSTB bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
22	UNIT6_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT6_RSTB bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	UNIT5_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT5_RSTB bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.

Bit	Bit Name	Initial Value	R/W	Description
20	UNIT4_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT4_RSTB bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	UNIT3_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	UNIT12_RSTB	1b	RW	The CA55_RST12 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
11	UNIT11_RSTB	1b	RW	The CA55_RST11 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
10	UNIT10_RSTB	1b	RW	The CA55_RST10 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
9	UNIT9_RSTB	1b	RW	The CA55_RST9 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
8	UNIT8_RSTB	1b	RW	The CA55_RST8 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
7	UNIT7_RSTB	1b	RW	The CA55_RST7 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
6	UNIT6_RSTB	1b	RW	The CA55_RST6reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
5	UNIT5_RSTB	1b	RW	The CA55_RST5 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
4	UNIT4_RSTB	1b	RW	The CA55_RST4 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
3	UNIT3_RSTB	1b	RW	The CA55_RST3_1 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

Bit	Bit Name	Initial Value	R/W	Description
2	UNIT2_RSTB	1b	RW	The CA55_RST3_0 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	1b	RW	The CA55_RST1_1 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	1b	RW	The CA55_RST1_0 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.109 Reset Control Register Cortex-M33 (CPG_RST_CM33)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT2_ RST WEN	UNIT1_ RST WEN	UNIT0_ RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT2_ RSTB	UNIT1_ RSTB	UNIT0_ RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	UNIT2_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	UNIT2_RSTB	0b	RW	The CM33_MISCRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0b	RW	The CM33_NSYSRESET reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The CM33_NPORESET reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.110 Reset Control Register SRAM_ACPU (CPG_RST_SRAM_ACPU)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	UNIT0_RSTB	1b	RW	The SRAM_ACPU_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.111 Reset Control Register SRAM_MCPU (CPG_RST_SRAM_MCPU)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_ RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_ RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	UNIT0_RSTB	1b	RW	The SRAM_MCPU_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.112 Reset Control Register GIC600 (CPG_RST_GIC600)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT1_ RST WEN	UNIT0_ RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT1_ RSTB	UNIT0_ RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	UNIT1_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	UNIT1_RSTB	1b	RW	The GIC600_DBG_GICRESET_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	1b	RW	The GIC600_GICRESET_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.113 Reset Control Register IA55 (CPG_RST_IA55)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	UNIT0_RSTB	1b	RW	The IA55_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.114 Reset Control Register IM33 (CPG_RST_IM33)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	UNIT0_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	UNIT0_RSTB	1b	RW	The IM33_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.115 Reset Control Register MHU (CPG_RST_MHU)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_ RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_ RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	UNIT0_RSTB	0b	RW	The MHU_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.116 Reset Control Register SYC (CPG_RST_SYC)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_RSTWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	UNIT0_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	UNIT0_RSTB	0b	RW	The SYC_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.117 Reset Control Register DMAC (CPG_RST_DMAC)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT1_ RST WEN	UNIT0_ RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT1_ RSTB	UNIT0_ RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	UNIT1_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	UNIT1_RSTB	0b	RW	The DMAC_RST_ASYNC reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The DMAC_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.118 Reset Control Register GTM (CPG_RST_GTM)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT2_ RST WEN	UNIT1_ RST WEN	UNIT0_ RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT2_ RSTB	UNIT1_ RSTB	UNIT0_ RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	UNIT2_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	UNIT2_RSTB	0b	RW	The OSTM2_PRESETZ reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0b	RW	The OSTM1_PRESETZ reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	1b	RW	The OSTM0_PRESETZ reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.119 Reset Control Register MTU (CPG_RST_MTU)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_RSTWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	UNIT0_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	UNIT0_RSTB	0b	RW	The MTU_X_PRESET_MTU3 reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.120 Reset Control Register POE3 (CPG_RST_POE3)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_ RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_ RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	UNIT0_RSTB	0b	RW	The POE3_RST_M_REG reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.121 Reset Control Register GPT (CPG_RST_GPT)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_RSTWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	UNIT0_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	UNIT0_RSTB	0b	RW	The GPT_RST_C reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.122 Reset Control Register POEG (CPG_RST_POEG)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	UNIT3_RST WEN	UNIT2_RST WEN	UNIT1_RST WEN	UNIT0_RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	UNIT3_RSTB	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	UNIT3_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	UNIT3_RSTB	0b	RW	The POEG_D_RST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
2	UNIT2_RSTB	0b	RW	The POEG_C_RST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0b	RW	The POEG_B_RST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The POEG_A_RST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.123 Reset Control Register WDT (CPG_RST_WDT)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT2_RSTWEN	UNIT1_RSTWEN	UNIT0_RSTWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	UNIT2_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	—	1b	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
2	UNIT2_RSTB	0b	RW	The WDT2_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0b	RW	The WDT1_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	1b	RW	The WDT0_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.124 Reset Control Register DDR (CPG_RST_DDR)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	UNIT6_ RST WEN	UNIT5_ RST WEN	UNIT4_ RST WEN	UNIT3_ RST WEN	UNIT2_ RST WEN	UNIT1_ RST WEN	UNIT0_ RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	UNIT6_ RSTB	UNIT5_ RSTB	UNIT4_ RSTB	UNIT3_ RSTB	UNIT2_ RSTB	UNIT1_ RSTB	UNIT0_ RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	UNIT6_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT6_RSTB bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	UNIT5_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT5_RSTB bit (bit 5) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
20	UNIT4_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT4_RSTB bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	UNIT3_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 7	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	UNIT6_RSTB	0b	RW	The DDR_REG_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

Bit	Bit Name	Initial Value	R/W	Description
5	UNIT5_RSTB	0b	RW	The DDR_AXI3_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
4	UNIT4_RSTB	0b	RW	The DDR_AXI2_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
3	UNIT3_RSTB	0b	RW	The DDR_AXI1_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
2	UNIT2_RSTB	0b	RW	The DDR_AXI0_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0b	RW	The DDR_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The DDR_RESET_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.125 Reset Control Register SPI (CPG_RST_SPI)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	UNIT0_RSTB	0b	RW	The SPI_RST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.126 Reset Control Register SDHI (CPG_RST_SDHI)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT1_RST WEN	UNIT0_RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	UNIT1_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	UNIT1_RSTB	0b	RW	The SDHI1_IXRST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The SDHI0_IXRST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.127 Reset Control Register 3DGE (CPG_RST_3DGE)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT2_RSTWEN	UNIT1_RSTWEN	UNIT0_RSTWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	UNIT2_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	UNIT2_RSTB	0b	RW	The GPU_ACE_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0b	RW	The GPU_AXI_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The GPU_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.128 Reset Control Register ISU (CPG_RST_ISU)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT1_RSTWEN	UNIT0_RSTWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	UNIT1_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	UNIT1_RSTB	0b	RW	The ISU_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The ISU_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.129 Reset Control Register VCPL4 (CPG_RST_VCPL4)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT1_RST WEN	UNIT0_RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	UNIT1_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	UNIT1_RSTB	0b	RW	The H264_CP_PRESET_P reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The H264_X_RESET_VCP reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.130 Reset Control Register CRU (CPG_RST_CRU)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT2_RSTWEN	UNIT1_RSTWEN	UNIT0_RSTWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	UNIT2_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	UNIT2_RSTB	0b	RW	The CRU_ARESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0b	RW	The CRU_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The CRU_CMN_RSTB reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.131 Reset Control Register MIPI_DSI (CPG_RST_MIPI_DSI)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT2_RSTWEN	UNIT1_RSTWEN	UNIT0_RSTWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	UNIT2_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	UNIT2_RSTB	0b	RW	The MIPI_DSI_PRESET_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0b	RW	The MIPI_DSI_ARESET_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The MIPI_DSI_CMN_RSTB reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.132 Reset Control Register LCDC (CPG_RST_LCDC)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_ RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_ RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	UNIT0_RSTB	0b	RW	The LCDC_RESET_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.133 Reset Control Register SSIF (CPG_RST_SSIF)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	UNIT3_RSTWEN	UNIT2_RSTWEN	UNIT1_RSTWEN	UNIT0_RSTWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	UNIT3_RSTB	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	UNIT3_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	UNIT3_RSTB	0b	RW	The SSI3_RST_M2_REG reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
2	UNIT2_RSTB	0b	RW	The SSI2_RST_M2_REG reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0b	RW	The SSI1_RST_M2_REG reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The SSI0_RST_M2_REG reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.134 Reset Control Register SRC (CPG_RST_SRC)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_ RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_ RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	UNIT0_RSTB	0b	RW	The SRC_RST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.135 Reset Control Register USB (CPG_RST_USB)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	UNIT3_RSTWEN	UNIT2_RSTWEN	UNIT1_RSTWEN	UNIT0_RSTWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	UNIT3_RSTB	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	UNIT3_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	UNIT3_RSTB	0b	RW	The USB_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
2	UNIT2_RSTB	0b	RW	The USB_U2P_EXL_SYSRST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0b	RW	The USB_U2H1_HRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The USB_U2H0_HRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.136 Reset Control Register ETH (CPG_RST_ETH)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT1_RSTWEN	UNIT0_RSTWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	UNIT1_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	UNIT1_RSTB	0b	RW	The ETH1_RST_HW_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The ETH0_RST_HW_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.137 Reset Control Register I2C (CPG_RST_I2C)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	UNIT3_ RST WEN	UNIT2_ RST WEN	UNIT1_ RST WEN	UNIT0_ RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	UNIT3_ RSTB	UNIT2_ RSTB	UNIT1_ RSTB	UNIT0_ RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	UNIT3_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	UNIT3_RSTB	0b	RW	The I2C3_MRST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
2	UNIT2_RSTB	0b	RW	The I2C2_MRST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0b	RW	The I2C1_MRST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The I2C0_MRST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.138 Reset Control Register SCIF (CPG_RST_SCIF)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	UNIT4_ RST WEN	UNIT3_ RST WEN	UNIT2_ RST WEN	UNIT1_ RST WEN	UNIT0_ RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	UNIT4_ RSTB	UNIT3_ RSTB	UNIT2_ RSTB	UNIT1_ RSTB	UNIT0_ RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	UNIT4_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT4_RSTB bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	UNIT3_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	UNIT4_RSTB	0b	RW	The SCIF4_RST_SYSTEM_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
3	UNIT3_RSTB	0b	RW	The SCIF3_RST_SYSTEM_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
2	UNIT2_RSTB	0b	RW	The SCIF2_RST_SYSTEM_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0b	RW	The SCIF1_RST_SYSTEM_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

Bit	Bit Name	Initial Value	R/W	Description
0	UNIT0_RSTB	0b	RW	The SCIF0_RST_SYSTEM_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.139 Reset Control Register SCI (CPG_RST_SCI)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT1_RST WEN	UNIT0_RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	UNIT1_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	UNIT1_RSTB	0b	RW	The SCI1_RST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The SCI0_RST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.140 Reset Control Register IRDA (CPG_RST_IRDA)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_RSTWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	UNIT0_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	UNIT0_RSTB	0b	RW	The IRDA_RST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.141 Reset Control Register RSPI (CPG_RST_RSPI)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT2_ RST WEN	UNIT1_ RST WEN	UNIT0_ RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT2_ RSTB	UNIT1_ RSTB	UNIT0_ RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	UNIT2_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	UNIT2_RSTB	0b	RW	The RSPI2_RST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0b	RW	The RSPI1_RST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The RSPI0_RST reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.142 Reset Control Register CANFD (CPG_RST_CANFD)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT1_ RST WEN	UNIT0_ RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT1_ RSTB	UNIT0_ RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	UNIT1_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	UNIT1_RSTB	0b	RW	The CANFD_RSTC_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The CANFD_RSTP_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.143 Reset Control Register GPIO (CPG_RST_GPIO)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT2_RST WEN	UNIT1_RST WEN	UNIT0_RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	UNIT2_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	UNIT2_RSTB	0b	RW	The GPIO_SPARE_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	0b	RW	The GPIO_PORT_RESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The GPIO_RSTN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.144 Reset Control Register ADC (CPG_RST_ADC)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT1_RSTWEN	UNIT0_RSTWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	UNIT1_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	UNIT1_RSTB	0b	RW	The ADC_ADRST_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
0	UNIT0_RSTB	0b	RW	The ADC_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.145 Reset Control Register TSU (CPG_RST_TSU)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_ RST WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNIT0_ RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	UNIT0_RST WEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	UNIT0_RSTB	0b	RW	The TSU_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.146 Reset Control Register AXI_TZCDDR (CPG_RST_AXI_TZCDDR)

This register is used to control the reset signals for individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	UNIT4_RSTWEN	UNIT3_RSTWEN	UNIT2_RSTWEN	UNIT1_RSTWEN	UNIT0_RSTWEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	UNIT4_RSTB	UNIT3_RSTB	UNIT2_RSTB	UNIT1_RSTB	UNIT0_RSTB
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	UNIT4_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT4_RSTB bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	UNIT3_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT3_RSTB bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	UNIT2_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT2_RSTB bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	UNIT1_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT1_RSTB bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	UNIT0_RSTWEN	0b	R0W1	Flag for enabling the writing to the UNIT0_RSTB bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	UNIT4_RSTB	1b	RW	The BUS_TZCDDR_ARESET3N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
3	UNIT3_RSTB	1b	RW	The BUS_TZCDDR_ARESET2N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
2	UNIT2_RSTB	1b	RW	The BUS_TZCDDR_ARESET1N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).
1	UNIT1_RSTB	1b	RW	The BUS_TZCDDR_ARESET0N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

Bit	Bit Name	Initial Value	R/W	Description
0	UNIT0_RSTB	1b	RW	The BUS_TZCDDR_PRESETN reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

7.2.4.147 Reset Monitor Register Cortex-A55 (CPG_RSTMON_CA55)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	RST12_MON	RST11_MON	RST10_MON	RST9_MON	RST8_MON	RST7_MON	RST6_MON	RST5_MON	RST4_MON	RST3_MON	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	RST12_MON	0b	R	The state of the CA55_RST12 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
11	RST11_MON	0b	R	The state of the CA55_RST11 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
10	RST10_MON	0b	R	The state of the CA55_RST10 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
9	RST9_MON	0b	R	The state of the CA55_RST9 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
8	RST8_MON	0b	R	The state of the CA55_RST8 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
7	RST7_MON	0b	R	The state of the CA55_RST7 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
6	RST6_MON	0b	R	The state of the CA55_RST6 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
5	RST5_MON	0b	R	The state of the CA55_RST5 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
4	RST4_MON	0b	R	The state of the CA55_RST4 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
3	RST3_MON	0b	R	The state of the CA55_RST3_1 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	0b	R	The state of the CA55_RST3_0 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

Bit	Bit Name	Initial Value	R/W	Description
1	RST1_MON	0b	R	The state of the CA55_RST1_1 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	0b	R	The state of the CA55_RST1_0 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.148 Reset Monitor Register Cortex-M33 (CPG_RSTMON_CM33)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RST2_ MON	RST1_ MON	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	RST2_MON	1b	R	The state of the CM33_MISCRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1b	R	The state of the CM33_NSYSRESET reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the CM33_NPORESET reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.149 Reset Monitor Register SRAM_ACPU (CPG_RSTMON_SRAM_ACPU)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RST0_MON	0b	R	The state of the SRAM_ACPU_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.150 Reset Monitor Register SRAM_MCPU (CPG_RSTMON_SRAM_MCPU)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RST0_MON	0b	R	The state of the SRAM_MCPU_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.151 Reset Monitor Register GIC600 (CPG_RSTMON_GIC600)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	RST1_MON	0b	R	The state of the GIC600_DBG_GICRESET_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	0b	R	The state of the GIC600_GICRESET_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.152 Reset Monitor Register IA55 (CPG_RSTMON_IA55)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RST0_MON	0b	R	The state of the IA55_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.153 Reset Monitor Register IM33 (CPG_RSTMON_IM33)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RST0_MON	0b	R	The state of the IM33_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.154 Reset Monitor Register MHU (CPG_RSTMON_MHU)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RST0_MON	1b	R	The state of the MHU_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.155 Reset Monitor Register SYC (CPG_RSTMON_SYC)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RST0_MON	1b	R	The state of the SYC_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.156 Reset Monitor Register DMAC (CPG_RSTMON_DMAC)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST1_ MON	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	RST1_MON	1b	R	The state of the DMAC_RST_ASYNC reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the DMAC_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.157 Reset Monitor Register GTM (CPG_RSTMON_GTM)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RST2_ MON	RST1_ MON	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	RST2_MON	1b	R	The state of the OSTM2_PRESETZ reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1b	R	The state of the OSTM1_PRESETZ reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	0b	R	The state of the OSTM0_PRESETZ reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.158 Reset Monitor Register MTU (CPG_RSTMON_MTU)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RST0_MON	1b	R	The state of the MTU_X_PRESET_MTU3 reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.159 Reset Monitor Register POE3 (CPG_RSTMON_POE3)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RST0_MON	1b	R	The state of the POE3_RST_M_REG reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.160 Reset Monitor Register GPT (CPG_RSTMON_GPT)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RST0_MON	1b	R	The state of the GPT_RST_C reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.161 Reset Monitor Register POEG (CPG_RSTMON_POEG)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	RST3_ MON	RST2_ MON	RST1_ MON	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	RST3_MON	1b	R	The state of the POEG_D_RST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	1b	R	The state of the POEG_C_RST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1b	R	The state of the POEG_B_RST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the POEG_A_RST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.162 Reset Monitor Register WDT (CPG_RSTMON_WDT)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	RST2_MON	1b	R	The state of the WDT2_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1b	R	The state of the WDT1_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	0b	R	The state of the WDT0_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.163 Reset Monitor Register DDR (CPG_RSTMON_DDR)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	RST6_MON	RST5_MON	RST4_MON	RST3_MON	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	RST6_MON	1b	R	The state of the DDR_REG_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
5	RST5_MON	1b	R	The state of the DDR_AXI3_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
4	RST4_MON	1b	R	The state of the DDR_AXI2_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
3	RST3_MON	1b	R	The state of the DDR_AXI1_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	1b	R	The state of the DDR_AXI0_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1b	R	The state of the DDR_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the DDR_RESET_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.164 Reset Monitor Register SPI (CPG_RSTMON_SPI)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RST0_MON	1b	R	The state of the SPI_RST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.165 Reset Monitor Register SDHI (CPG_RSTMON_SDHI)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST1_ MON	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	RST1_MON	1b	R	The state of the SDHI1_IXRST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the SDHI0_IXRST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.166 Reset Monitor Register 3DGE (CPG_RSTMON_3DGE)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RST2_ MON	RST1_ MON	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	RST2_MON	1b	R	The state of the GPU_ACE_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1b	R	The state of the GPU_AXI_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the GPU_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.167 Reset Monitor Register ISU (CPG_RSTMON_ISU)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST1_ MON	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	RST1_MON	1b	R	The state of the ISU_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the ISU_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.168 Reset Monitor Register VCPL4 (CPG_RSTMON_VCPL4)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST1_ MON	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	RST1_MON	1b	R	The state of the H264_CP_PRESET_P reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the H264_X_RESET_VCP reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.169 Reset Monitor Register CRU (CPG_RSTMON_CRU)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	RST2_MON	1b	R	The state of the CRU_ARESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1b	R	The state of the CRU_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the CRU_CMN_RSTB reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.170 Reset Monitor Register MIPI_DSI (CPG_RSTMON_MIPI_DSI)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RST2_ MON	RST1_ MON	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	RST2_MON	1b	R	The state of the MIPI_DSI_PRESET_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1b	R	The state of the MIPI_DSI_ARESET_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the MIPI_DSI_CMN_RSTB reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.171 Reset Monitor Register LCDC (CPG_RSTMON_LCDC)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RST0_MON	1b	R	The state of the LCDC_RESET_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.172 Reset Monitor Register SSIF (CPG_RSTMON_SSIF)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	RST3_ MON	RST2_ MON	RST1_ MON	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	RST3_MON	1b	R	The state of the SSI3_RST_M2_REG reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	1b	R	The state of the SSI2_RST_M2_REG reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1b	R	The state of the SSI1_RST_M2_REG reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the SSI0_RST_M2_REG reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.173 Reset Monitor Register SRC (CPG_RSTMON_SRC)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RST0_MON	1b	R	The state of the SRC_RST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.174 Reset Monitor Register USB (CPG_RSTMON_USB)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	RST3_ MON	RST2_ MON	RST1_ MON	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	RST3_MON	1b	R	The state of the USB_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	1b	R	The state of the USB_U2P_EXL_SYSRST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1b	R	The state of the USB_U2H1_HRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the USB_U2H0_HRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.175 Reset Monitor Register ETH (CPG_RSTMON_ETH)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST1_ MON	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	RST1_MON	1b	R	The state of the ETH1_RST_HW_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the ETH0_RST_HW_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.176 Reset Monitor Register I2C (CPG_RSTMON_I2C)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	RST3_ MON	RST2_ MON	RST1_ MON	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	RST3_MON	1b	R	The state of the I2C3_MRST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	1b	R	The state of the I2C2_MRST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1b	R	The state of the I2C1_MRST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the I2C0_MRST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.177 Reset Monitor Register SCIF (CPG_RSTMON_SCIF)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	RST4_MON	RST3_MON	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	RST4_MON	1b	R	The state of the SCIF4_RST_SYSTEM_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
3	RST3_MON	1b	R	The state of the SCIF3_RST_SYSTEM_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	1b	R	The state of the SCIF2_RST_SYSTEM_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1b	R	The state of the SCIF1_RST_SYSTEM_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the SCIF0_RST_SYSTEM_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.178 Reset Monitor Register SCI (CPG_RSTMON_SCI)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	RST1_MON	1b	R	The state of the SCI1_RST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the SCI0_RST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.179 Reset Monitor Register IRDA (CPG_RSTMON_IRDA)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RST0_MON	1b	R	The state of the IRDA_RST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.180 Reset Monitor Register RSPI (CPG_RSTMON_RSPI)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RST2_ MON	RST1_ MON	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	RST2_MON	1b	R	The state of the RSPI2_RST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1b	R	The state of the RSPI1_RST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the RSPI0_RST reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.181 Reset Monitor Register CANFD (CPG_RSTMON_CANFD)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	RST1_MON	1b	R	The state of the CANFD_RSTC_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the CANFD_RSTP_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.182 Reset Monitor Register GPIO (CPG_RSTMON_GPIO)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	RST2_MON	1b	R	The state of the GPIO_SPARE_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	1b	R	The state of the GPIO_PORT_RESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the GPIO_RSTN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.183 Reset Monitor Register ADC (CPG_RSTMON_ADC)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST1_ MON	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	RST1_MON	1b	R	The state of the ADC_ADRST_N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	1b	R	The state of the ADC_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.184 Reset Monitor Register TSU (CPG_RSTMON_TSU)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RST0_ MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RST0_MON	1b	R	The state of the TSU_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.185 Reset Monitor Register AXI_TZCDDR (CPG_RSTMON_AXI_TZCDDR)

This register is used to monitor the reset signals of individual modules.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	RST4_MON	RST3_MON	RST2_MON	RST1_MON	RST0_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	RST4_MON	0b	R	The state of the BUS_TZCDDR_ARESET3N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
3	RST3_MON	0b	R	The state of the BUS_TZCDDR_ARESET2N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
2	RST2_MON	0b	R	The state of the BUS_TZCDDR_ARESET1N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
1	RST1_MON	0b	R	The state of the BUS_TZCDDR_ARESET0N reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).
0	RST0_MON	0b	R	The state of the BUS_TZCDDR_PRESETN reset signal is monitored. 0: Reset signal is not applied (released from the reset state). 1: Reset signal is applied (reset state).

7.2.4.186 WDT Overflow System Reset Register (CPG_WDTOVF_RST)

After the release from a system reset applied by the WDT reset circuit in response to a reset request such as a WDT overflow, this register can be used to identify the WDT channel that generated the reset request. If a system reset is not applied according to the WDTRSTSEL register setting, the WDT is not reset and the source of the reset request can be identified by checking the interrupt from the WDT and the status register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTOVF2_WEN	WDTOVF1_WEN	WDTOVF0_WEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W1	R0W1	R0W1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTOVF2	WDTOVF1	WDTOVF0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	WDTOVF2_WEN	0b	R0W1	Flag for enabling the writing to the WDTOVF2 bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	WDTOVF1_WEN	0b	R0W1	Flag for enabling the writing to the WDTOVF1 bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	WDTOVF0_WEN	0b	R0W1	Flag for enabling the writing to the WDTOVF0 bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	WDTOVF2	0b	RW	The system reset generated by WDT channel 2 for the Cortex-M33 is indicated. 0: System reset has not been generated by WDT channel 2 for the Cortex-M33. 1: System reset has been generated by WDT channel 2 for the Cortex-M33. *Note*: This bit is cleared by writing 1.
1	WDTOVF1	0b	RW	The system reset generated by WDT channel 1 for Cortex-A55 Core 1 is indicated. 0: System reset has not been generated by WDT channel 1 for Cortex-A55 Core 1. 1: System reset has been generated by WDT channel 1 for Cortex-A55 Core 1. *Note*: This bit is cleared by writing 1.
0	WDTOVF0	0b	RW	The system reset generated WDT channel 0 for Cortex-A55 Core 0 is indicated. 0: System reset has not been generated by WDT channel 0 for Cortex-A55 Core 0. 1: System reset has been generated by WDT channel 0 for Cortex-A55 Core 0. *Note*: This bit is cleared by writing 1.

7.2.4.187 WDT Reset Selector Register (CPG_WDTRST_SEL)

This register is used to mask reset requests from the WDT.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	WDTRSTSEL10	WDTRSTSEL9	WDTRSTSEL8	—	WDTRSTSEL6	WDTRSTSEL5	WDTRSTSEL4	—	WDTRSTSEL2	WDTRSTSEL1	WDTRSTSEL0
Initial Value	0	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0
R/W	R	R	R	R	R	RW	RW	RW	R	RW	RW	RW	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10	WDTRSTSEL 10	0b	RW	Whether to mask the reset request by WDT channel 2 is specified. 0: Cold reset of the Cortex-M33 is masked. 1: Cold reset of the Cortex-M33 is enabled.
9	WDTRSTSEL 9	0b	RW	Whether to mask the reset request by WDT channel 1 is specified. 0: Cold reset of the Cortex-A55 is masked. 1: Cold reset of the Cortex-A55 is enabled.
8	WDTRSTSEL 8	0b	RW	Whether to mask the reset request by WDT channel 0 is specified. 0: Cold reset of the Cortex-A55 is masked. 1: Cold reset of the Cortex-A55 is enabled.
7	—	1b	R	Reserved Whenever it is read, 1 is read. The written value will be ignored.
6	WDTRSTSEL 6	0b	RW	Whether to mask the assertion of WDTOVFOUT due to a request from WDT channel 2 for the Cortex-M33 is specified. 0: Assertion of WDTOVFOUT is masked. 1: Assertion of WDTOVFOUT is enabled.
5	WDTRSTSEL 5	0b	RW	Whether to mask the assertion of WDTOVFOUT due to a request from WDT channel 1 for Cortex-A55 Core 1 is specified. 0: Assertion of WDTOVFOUT is masked. 1: Assertion of WDTOVFOUT is enabled.
4	WDTRSTSEL 4	0b	RW	Whether to mask the assertion of WDTOVFOUT due to a request from WDT channel 0 for Cortex-A55 Core 0 is specified. 0: Assertion of WDTOVFOUT is masked. 1: Assertion of WDTOVFOUT is enabled.
3	—	1b	R	Reserved Whenever it is read, 1 is read. The written value will be ignored.
2	WDTRSTSEL 2	0b	RW	Whether to mask WDTSYSREST[2] due to a request from WDT channel 2 for the Cortex-M33 is specified. 0: System reset is masked. 1: System reset is enabled.
1	WDTRSTSEL 1	0b	RW	Whether to mask WDTSYSREST[1] due to a request from WDT channel 1 for Cortex-A55 Core 1 is specified. 0: System reset is masked. 1: System reset is enabled.

Bit	Bit Name	Initial Value	R/W	Description
0	WDTRSTSEL0	0b	RW	Whether to mask WDTSYSREST[0] due to a request from WDT channel 0 for Cortex-A55 Core 0 is specified. 0: System reset is masked. 1: System reset is enabled.

Note: Do not make the settings WDTRSTSEL3 = 1 and WDTRSTSEL7 = 0. If these settings are attempted, a system reset initializes the WDTRSTSEL7 bit to 1 (initial value) and WDTOVFOUT is unexpectedly asserted.

7.2.4.188 Cortex-A55 Cluster Power Status Monitor Register (CPG_CLUSTER_PCHMON)

A handshake through the P-Channel is necessary before a warm reset in the Cortex-A55.

This register is monitored by the CPU for software control of the handshake.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PDENY_MON	PACCEPT_MON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	PDENY_MON	—	R	Signal indicating the denial of power mode transition in the cluster
0	PACCEPT_MON	—	R	Signal indicating the acceptance of power mode transition in the cluster

7.2.4.189 Cortex-A55 Cluster Power Status Control Register (CPG_CLUSTER_PCHCTL)

A handshake through the P-Channel is necessary before a warm reset in the Cortex-A55.

This register is used for software control of the handshake.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	PSTATE0_SET						
Initial Value	0	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PREQ_SET
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22 to 16	PSTATE0_SET	100_1000b	RW	Destination power mode of the cluster 100_1000b: ON 000_0000b: OFF
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	PREQ_SET	0b	RW	Signal for indicating a request of power mode transition in the cluster

7.2.4.190 Cortex-A55 Core 0 Power Status Monitor Register (CPG_CORE0_PCHMON)

A handshake through the P-Channel is necessary before a warm reset in the Cortex-A55.

This register is monitored by the CPU for software control of the handshake.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

27	MSTOP11_ON_WEN	0b	R0W1	Flag for enabling the writing to the MSTOP11_ON bit (bit 11) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
26	MSTOP10_ON_WEN	0b	R0W1	Flag for enabling the writing to the MSTOP10_ON bit (bit 10) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
25	MSTOP9_ON_WEN	0b	R0W1	Flag for enabling the writing to the MSTOP9_ON bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24	MSTOP8_ON_WEN	0b	R0W1	Flag for enabling the writing to the MSTOP8_ON bit (bit 8) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
23	MSTOP7_ON_WEN	0b	R0W1	Flag for enabling the writing to the MSTOP7_ON bit (bit 7) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.

Bit	Bit Name	Initial Value	R/W	Description
22	MSTOP6_ON_WEN	0b	R0W1	Flag for enabling the writing to the MSTOP6_ON bit (bit 6) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
21	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	MSTOP4_ON_WEN	0b	R0W1	Flag for enabling the writing to the MSTOP4_ON bit (bit 4) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
19	MSTOP3_ON_WEN	0b	R0W1	Flag for enabling the writing to the MSTOP3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	MSTOP2_ON_WEN	0b	R0W1	Flag for enabling the writing to the MSTOP2_ON bit (bit 2) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	MSTOP1_ON_WEN	0b	R0W1	Flag for enabling the writing to the MSTOP1_ON bit (bit 1) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	MSTOP0_ON_WEN	0b	R0W1	Flag for enabling the writing to the MSTOP0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15	MSTOP15_ON	0b	RW	The state of BUS_PERI_CPU_MSTOP15_MXREG0 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
14	MSTOP14_ON	0b	RW	The state of BUS_PERI_CPU_MSTOP14_MPIM33 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
13	MSTOP13_ON	0b	RW	The state of BUS_PERI_CPU_MSTOP13_MPIA55 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
12	MSTOP12_ON	0b	RW	The state of BUS_PERI_CPU_MSTOP12_MPSRAM_M operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
11	MSTOP11_ON	0b	RW	The state of BUS_PERI_CPU_MSTOP11_MPSRAM_A operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
10	MSTOP10_ON	0b	RW	The state of BUS_PERI_CPU_MSTOP10_MPTZC_3 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
9	MSTOP9_ON	0b	RW	The state of BUS_PERI_CPU_MSTOP9_MPTZC_2 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
8	MSTOP8_ON	0b	RW	The state of BUS_PERI_CPU_MSTOP8_MPTZC_1 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)

Bit	Bit Name	Initial Value	R/W	Description
7	MSTOP7_ON	0b	RW	The state of BUS_PERI_CPU_MSTOP7_MPTZC_0 operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
6	MSTOP6_ON	0b	RW	The state of BUS_PERI_CPU_MSTOP6_MHGPIO operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
5	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	MSTOP4_ON	0b	RW	The state of BUS_PERI_CPU_MSTOP4_MPCPG operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
3	MSTOP3_ON	0b	RW	The state of BUS_PERI_CPU_MSTOP3_MPSYC operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
2	MSTOP2_ON	0b	RW	The state of BUS_PERI_CPU_MSTOP2_MPCST operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
1	MSTOP1_ON	0b	RW	The state of BUS_PERI_CPU_MSTOP1_MXACPU operation is indicated. 0: Normal operation 1: Module stop state (MSTP)
0	MSTOP0_ON	0b	RW	The state of BUS_PERI_CPU_MSTOP0_MXMCPU operation is indicated. 0: Normal operation 1: Module stop state (MSTP)

7.2.4.199 MSTOP Register PERI_DDR (CPG_BUS_PERI_DDR_MSTOP)

This register indicates the stop state of individual modules.

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	MSTOP0_ON_WEN	0b	R0W1	Flag for enabling the writing to the MSTOP0_ON bit (bit 0) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	MHU_MSTOP	0b	RW	The state of MHU_MSTOP operation is indicated. 0: Normal operation 1: Module stop state (MSTP)

7.2.4.205 Other Function Register 1 (CPG_OTHERFUNC1_REG)

This register is used for miscellaneous functions.

Bit 0 is used to switch the source clock for the system bus and the IPs that can use SSCG clocks

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	RESn_ON_WEN [n=15 to 1]	All 0	R0W1	Flags for enabling the writing to the RESn_SET bits. These bits are always read as 0. 0: Writing is disabled. 1: Writing is enabled.
16	RES0_ON_WEN	0b	R0W1	Flag for enabling the writing to the RES0_SET bit (bit 0) (DDR_RST_N). This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
15 to 1	RESn_SET [n = 15 to 1]	All 0	RW	No function is assigned to these bits. When the flags for enabling the writing are set to 1, these bits can be written to. The written value is read from these bits.
0	RES0_SET	0b	RW	The DDR_RST_N reset terminal is controlled. 0: Reset signal is applied (reset state). 1: Reset signal is stopped (released from the reset state).

Note: The change to the setting in this register is immediately reflected in the reset signal. Therefore, no register is provided to monitor the result of the change.

7.2.4.207 Clock Control Register MBUS (CPG_CLKON_MBUS)

This register is used to supply or stop clocks for individual modules.

Use this register only when switching SEL_PLL3_3. Reserved bit is prohibited from setting anything other than the initial value.The clocks listed in this register are not listed in the separate clock list.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	CLK9_ON_WEN	—	—	—	—	—	CLK3_ON_WEN	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R0W1	R	R	R	R	R	R0W1	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CLK9_ON	—	—	—	—	—	CLK3_ON	—	—	—
Initial Value	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	RW	R	R	R	R	R	RW	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
25	CLK9_ONWEN	0b	R0W1	Flag for enabling the writing to the CLK9_ON bit (bit 9) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
24 to 20	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
19	CLK3_ON_WEN	0b	R0W1	Flag for enabling the writing to the CLK3_ON bit (bit 3) This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18 to 10	—	H'001	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9	CLK9_ON	1b	RW	The MBUS_CLK9 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
8 to 4	—	All 1	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3	CLK3_ON	1b	RW	The MBUS_CLK3 clock is supplied or stopped. 0: Clock is stopped. 1: Clock is supplied.
2 to 0	—	111b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

7.2.4.208 Clock Monitor Register MBUS (CPG_CLKMON_MBUS)

This register is used to monitor the state of the clocks supplied to individual modules.

The clocks listed in this register are not listed in the separate clock list.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CLK9_MON	—	—	—	—	—	CLK3_MON	—	—	—
Initial Value	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
11 to 10	—	01b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9	CLK9_MON	1b	R	The state of the MBUS_CLK9 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
8 to 4	—	All 1	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3	CLK3_MON	1b	R	The state of the MBUS_CLK3 clock is monitored. 0: Clock is stopped. 1: Clock is supplied.
2 to 0	—	111b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

7.3 Functions of the CPG

This section describes the functions of the CPG.

7.3.1 Clock Control

The CPG has the following five types of clock control functions.

- PLL control, setting, and monitoring functions
- Clock frequency dividers and selectors
- Fixed frequency dividers
- Clock enabling function

7.3.1.1 PLL Control, Setting, and Monitoring Functions

This section describes the functions for controlling, setting, and monitoring the PLL (PLL1 to PLL6).

The PLL is controlled through the registers in the CPG.

The PLL control module counts the PLL lock wait time to generate the PLL lock signal and it is used to control the PLL output clocks by the CGC so that invalid clocks are not output before the PLL is locked.

The reset state and lock state of the PLL can be monitored through registers in the CPG.

The following shows the PLL control, setting, and monitoring functions.

- PLL operating mode control
- Output clock setting
- PLL reset and lock state monitoring

These functions are described in detail in the following sections.

(1) PLL Operating Mode Control

The CPG registers are used to specify the SSCG PLL operating mode and make SSCG settings.

The normal mode or standby mode can be selected as the operating mode.

The following can be set up through CPG registers.

- Operating mode setting (normal mode or standby mode)
- SSCG enable or disable setting (valid in the normal mode)

The following table shows the registers to be used.

For details of the settings, refer to the functional description of the target register.

Table 7.6 Registers for Controlling the PLL Operating Mode

Register Name	Abbreviation	Function
PLLn (SSCG) standby control registers	CPG_SAMPLLn_STBY (n = 1, 4, or 6) CPG_SIPLL5_STBY	Standby mode setting (reset state) and SSCG enable or disable setting

(2) Output Clock Setting

The CPG registers are used to specify the clocks output from the PLL.

The following values can be set up.

- Output clock frequency setting
- SSCG modulation value setting

Table 7.7 Registers for Setting PLL Output Clocks

Register Name	Abbreviation	Function
PLLn (SSCG) output clock setting register 1	CPG_SAMPLLn_CLK1	Frequency setting
PLLn (SSCG) output clock setting register 2	CPG_SAMPLLn_CLK2	Frequency setting and SSCG modulation value setting

Note: n = 1, 4, or 6

Table 7.8 Registers for Setting PLL Output Clocks 2

Register Name	Abbreviation	Function
PLLn (SSCG) output clock setting register 1	CPG_SIPLL5_CLK1	Frequency setting
PLLn (SSCG) output clock setting register 3	CPG_SIPLL5_CLK3	Frequency setting and SSCG modulation value setting
PLLn (SSCG) output clock setting register 4	CPG_SIPLL5_CLK4	Frequency setting
PLLn (SSCG) output clock setting register 5	CPG_SIPLL5_CLK5	SSCG modulation value setting

(3) PLL State Monitoring

The reset state and lock state of the PLL can be monitored through CPG registers.

The following table shows the registers to be used.

Table 7.9 Registers for Monitoring the PLL State

Register Name	Abbreviation	Function
PLLn monitor registers	CPG_SAMPLLn_MON (n = 1, 4, or 6) CPG_SIPLLn_MON (n = 2, 3, or 5)	PLL state monitoring

(4) SSCG Switching in PLL3

In PLL3, the SSCG function is enabled or disabled through the MD_CLKS signal from the SYSC.

The state of the MD_CLKS signal is determined when the LSI is released from the system reset (PRST#) state and the signal state does not change after the system is activated.

The SSCG enabled or disable state in PLL3 cannot be switched through register settings.

MD_CLKS = 0: SSCG is disabled.

MD_CLKS = 1: SSCG is enabled.

7.3.1.2 Clock Frequency Dividers and Selectors

The CPG uses several frequency dividers and selectors to provide appropriate clocks that meet the specifications of individual modules. The frequency dividers and selectors are classified into the dynamic switching type that can be switched without generating a glitch and the static switching type that should be switched after the clock for the target module is stopped because a glitch is generated if this type of divider or selector is switched while the clock is supplied.

The following frequency dividers and selectors are provided.

- Fixed frequency dividers
- Dynamic switching selectors
- Dynamic switching variable-frequency dividers
  (with a duty ratio of 50:50 when divided by an even number)
- Static switching selectors
- Static switching variable-frequency dividers
  (with a duty ratio of 50:50 when divided by an even number)

A specific procedure should be used to switch each frequency divider or selector. Refer to **Section 7.4.6, Procedure for Switching the Division Ratio of the Dynamic Switching Frequency Dividers**, **Section 7.4.7, Procedure for Switching Clocks by the Dynamic Switching Frequency Selectors**, and **Section 7.4.8, Procedure for Switching Clocks by the Static Switching Frequency Dividers and Selectors (Procedure for Switching Source Clocks)**.

7.3.1.3 Fixed Frequency Dividers

A fixed frequency divider uses a fixed division value. The CPG provides 1/2, 1/4, 1/8, 1/10, 1/16, and 1/32 dividers, and all fixed dividers generate clocks with a duty ratio of 50:50.

7.3.1.4 PLL Clock Monitoring

This function monitors whether the PLL1 to PLL6 output clocks are operating.

The frequency in the CPG is divided to obtain the frequency that can be monitored through the external pin of this LSI and then output to the upper layer.

The following table shows the instance names and clock frequencies of the monitor points.

Table 7.10 Instance Names and Clock Frequencies of the Monitor Points

PLL Name	Instance Name of Monitor Point	Maximum Frequency (MHz)	Divider Value	Output Clock Frequency (MHz)
PLL1	CPG_CTL/PLL1/FOUT	1200	32	38
PLL2	CPG_CTL/PLL2/FOUT1PH0	1600 (1/2 of 3200)	32	50
PLL2	CPG_CTL/PLL2/FOUT3	533 (1/6 of 3200)	16	34
PLL3	CPG_CTL/PLL3/FOUT1PH0	1600 (1/2 of 3200)	32	50
PLL3	CPG_CTL/PLL3/FOUT3	533 (1/6 of 3200)	16	34
PLL3	CPG_CTL/PLL3/FOUT4	400 (1/8 of 3200)	8	50
PLL4	CPG_CTL/PLL4/FOUT	1600	32	50
PLL5	CPG_CTL/PLL5/FOUTPOSTDIV	3000	64	47
PLL5	CPG_CTL/PLL5/FOUT3	500 (1/6 of 3000)	16	32
PLL5	CPG_CTL/PLL5/FOUT1PH0	1500 (1/2 of 3000)	32	47
PLL6	CPG_CTL/PLL6/FOUT	500	16	32

7.3.2 Clock Generation and Control Functions

The following types of reset are provided.

Table 7.11 Reset Types

No.	Type	Method	Source	Range of Reset
1	System reset	Hardware reset	Reset by PRST#	All
2		WDT system reset	WDT overflow, etc.	All (The WDTOVF register is excluded.)
3	Module reset	WDT system reset	WDT overflow, etc.	CPU corresponding to each WDT
4		Software reset	Control through CPG registers	individual on-chip modules

7.3.2.1 Range of Reset Application

The following shows the application (target) range of the reset generated by each reset source.

(1) Hardware sources (PRST#, TRST#, and DEBUGEN)

(2) WDT system reset sources

Table 7.12 Range of Reset Application (1/2)

		Reset Source				Range of Reset Application				
						Modules Related to Debugging		WDT		
	Operating Mode	Debug Reset	System Reset							
No.	DEBUGEN	TRST#	PRST#	WDT Reset	JTAG Interface	Cortex-A55 Debug Reset (nPDGRESET)	Coresight Reset	Reset for WDTOVF Register	All Modules*1	Description of Reset
1	0	0	0	0	Reset	Reset	Reset	Reset	Reset	User mode, Hardware system reset
2	0	0	0	1	Reset	Reset	Reset	Reset	Reset	User mode, Hardware system reset
3	0	0	1	0	Reset	Reset	Reset	Reset	Reset	User mode, WDT system reset
4	0	0	1	1	Reset	Released	Reset	Released	Released	User mode, Normal operation state
5	0	1	0	0	Setting prohibited	—	—	—	—	—
6	0	1	0	1	Setting prohibited	—	—	—	—	—
7	0	1	1	0	Setting prohibited	—	—	—	—	—
8	0	1	1	1	Setting prohibited	—	—	—	—	—
9	1	0	0	0	Reset	Reset	Reset	Reset	Reset	Debug mode, Hardware system reset
10	1	0	0	1	Reset	Reset	Reset	Reset	Reset	Debug mode, Hardware system reset
11	1	0	1	0	Reset*2	Reset*3	Reset*2	Released	Reset*2	Debug mode, WDT system reset
12	1	0	1	1	Reset	Released	Released	Released	Released	Debug mode, Normal operation state
13	1	1	0	0	Reset	Reset	Reset	Released	Reset	Debug mode, Hardware system reset

Table 7.12 Range of Reset Application (2/2)

		Reset Source				Range of Reset Application				
						Modules Related to Debugging		WDT		
No.	Operating Mode DEBUGEN	Debug Reset TRST#	System Reset PRST#	WDT Reset	JTAG Interface	Cortex-A55 Debug Reset (nPDGRESET)	Coresight Reset	Reset for WDTOVF Register	All Modules*1	Description of Reset
14	1	1	0	1	Reset	Reset	Reset	Reset	Reset	Debug mode, Hardware system reset
15	1	1	1	0	Reset*2	Reset*3	Reset*2	Released	Reset*2	Debug mode, WDT system reset
16	1	1	1	1	Released	Released	Released	Released	Released	Debug mode, Normal operation state

Note 1. Reset when the system reset is enabled by the WDTRSTSEL register.

Note 2. Reset when the Cortex-A55 reset is enabled by the WDTRSTSEL register.

7.3.2.2 System Reset (External Pin)

A system reset is applied when the reset signal from the external PRST# pin is asserted and it initializes the entire LSI.

7.3.2.3 WDT System Reset

This LSI has three WDT channels and the CPG issues a reset request when any of the following sources is generated.

WDT Channel	Target of Monitoring	Function
Channel 0	Cortex-A55 Core 0	Reset due to a parity error in Cortex-A55 Core 0
Channel 1	Cortex-A55 Core 1	Reset due to a parity error in Cortex-A55 Core 1
Channel 2	Cortex-M33	Reset due to the LOCK signal in Cortex-M33

(1) WDT System Reset Circuit

The reset requests from three WDT channels can be assigned to the desired signals shown below by using the masking function specified through the settings of the WDTRSTSEL register implemented in the CPG.

If a bit in the WDTRSTSEL register is set to 1, the corresponding signal is asserted when the WDT issues a reset request.

Target of Monitoring	Function
WDT system reset	The reset request signal WDTRST# is sent to the reset generation circuit to apply a system reset.
WDTOVF_PERROUT	The WDTOVF_PERR signal is asserted to notify the external devices of the application of a system reset.
Cortex-A55 cold reset	A cold reset request is issued when either WDT channel 0 or 1 detects an error.

Bit	Bit Name	Initial Value	R/W	Reset Source Module	Function
0	WDTRSTSEL0	0	R/W	WDT (channel 0) Cortex-A55 Core 0	When the corresponding WDT issues a reset request due to an overflow, etc. 0: WDT system reset is masked. 1: WDT system reset is applied.
1	WDTRSTSEL1	0	R/W	WDT (channel 1) Cortex-A55 Core 1	
2	WDTRSTSEL2	0	R/W	WDT (channel 2) Cortex-M33	
3	Reserved	1	R/W	—	—
4	WDTRSTSEL4	0	R/W	WDT (channel 0) Cortex-A55 Core 0	When the corresponding WDT issues a reset request due to an overflow, etc. 0: Assertion of WDTOVFOUT is masked. 1: WDTOVFOUT is asserted.
5	WDTRSTSEL5	0	R/W	WDT (channel 1) Cortex-A55 Core 1	
6	WDTRSTSEL6	0	R/W	WDT (channel 2) Cortex-M33	
7	Reserved	1	R/W	—	—
8	WDTRSTSEL8	0	R/W	WDT (channel 0) Cortex-A55 Core 0	When either WDT channel 0 or 1 issues a reset request[*1,*2] 0: Cold reset of the Cortex-A55 is masked. 1: Cold reset of the Cortex-A55 is applied.
9	WDTRSTSEL9	0	R/W	WDT (channel 1) Cortex-A55 Core 1	
10	WDTRSTSEL10	0	R/W	WDT (channel 2) Cortex-M33	When WDT channel 2 issues a reset request[*3] 0: Cold reset of the Cortex-M33 is masked. 1: Cold reset of the Cortex-M33 is applied.

Note 1. When an error occurs in either Core 0 or 1 in the Cortex-A55, a cold reset is applied to the entire Cortex-A55.

Note 2. For the timing of the cold reset in the Cortex-A55, refer to **Section 7.3.2.3(4), Timing of Cortex-A55 Cold Reset due to the WDT Source**.

Note 3. For the timing of the cold reset in the Cortex-M33, refer to **Section 7.3.2.3(5), Timing of Cortex-M33 Cold Reset due to the WDT Source**.

(2) WDTOVF_PERROUT Signal

This is an external signal that notifies the system that the WDT has applied a WDT system reset to this LSI.

If another WDT system reset is requested before the output of this signal pulse is completed, it is ignored.

The GPIO settings of the WDTOVF_PERROUT# pin such as the driving capability are reset by the GPIO_RST_WDTOVFN signal for the CPG_WDTOVFRST[3:0] register bits.

The following shows the sequence of reset by the WDT.

(1) The WDT channel selected by the WDTRSTSEL[7:4] bits generates a reset request.

(2) The CPG applies a WDT system reset.

(3) 64 cycles of the 24-MHz clock are waited.
* This is the period until the necessary settings are reflected in the entire LSI.

(4) A low pulse is output from the WDTOVF_PERROUT pin for 64 cycles of the 24-MHz clock.

(5) 64 cycles of the 24-MHz clock are waited.

(6) The WDT system reset signal is deasserted and the boot sequence is performed.

(3) WDT Overflow System Reset Register (CPG_WDTOVF_RST)

After the release from the WDT system reset applied by the WDT system reset circuit in response to a reset request such as a WDT overflow, this register is used to identify the WDT channel that generated the reset request.

This register is not reset by the WDT system reset generated by the WDT.

If a WDT system reset is not applied according to the WDTRSTSEL register setting, the WDT is not reset and the source of the reset request can be identified by checking the interrupt from the WDT and the status register in the WDT.

Table 7.13 WDT Overflow System Reset Register (CPG_WDTOVF_RST)

Bit	Bit Name	Initial Value	R/W	Reset Source Module	Function
0	WDTOVF0	0	R/W	WDT (channel 0) Cortex-A55 Core 0	When a WDT channel has applied a WDT system reset, the corresponding bit is set to 1. These bits are cleared by writing 1.
1	WDTOVF1	0	R/W	WDT (channel 1) Cortex-A55 Core 1	
2	WDTOVF2	0	R/W	WDT (channel 2) Cortex-M33	
15 to 3	Reserved	0	R	—	—
16	WDTOVF0_WEN	0	R0W1	—	Writing to the WDTOVF0 bit (bit 0) is masked. This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
17	WDTOVF1_WEN	0	R0W1	—	Writing to the WDTOVF1 bit (bit 1) is masked. This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.
18	WDTOVF2_WEN	0	R0W1	—	Writing to the WDTOVF2 bit (bit 2) is masked. This bit is always read as 0. 0: Writing is disabled. 1: Writing is enabled.

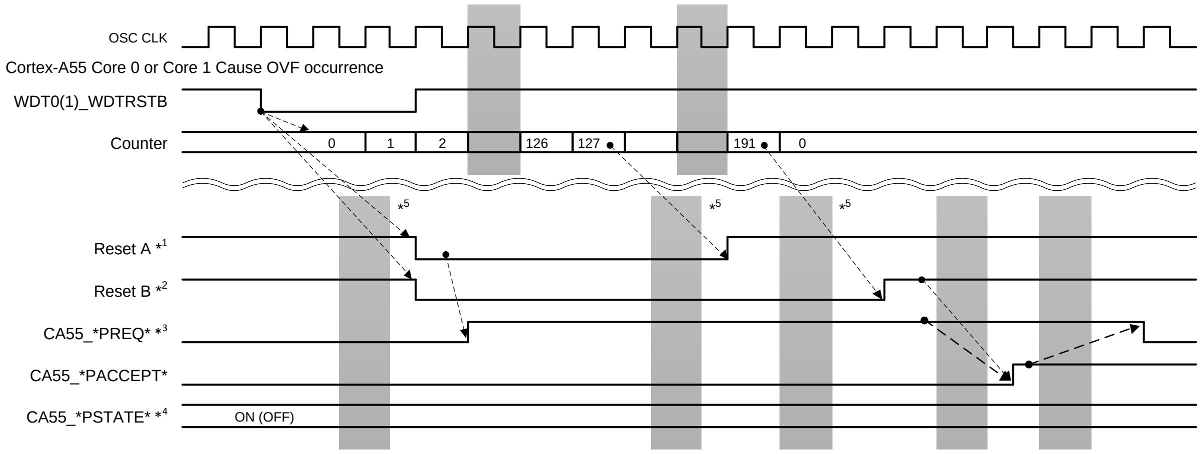
(4) Timing of Cortex-A55 Cold Reset due to the WDT Source

The following figure shows the timing of the cold reset for the Cortex-A55 alone due to the WDT source.

WDT Cortex-A55 Single Reset Time Chart



Note 1. CA55_RST10/CA55_RST11/CA55_RST12

Note 2. CA55_RST0[1:0]/CA55_RST3[1:0]/CA55_RST4/CA55_RST5/CA55_RST6/CA55_RST7/CA55_RST8/CA55_RST9

Note 3. The SYSREG setting must be set to ‘0’.

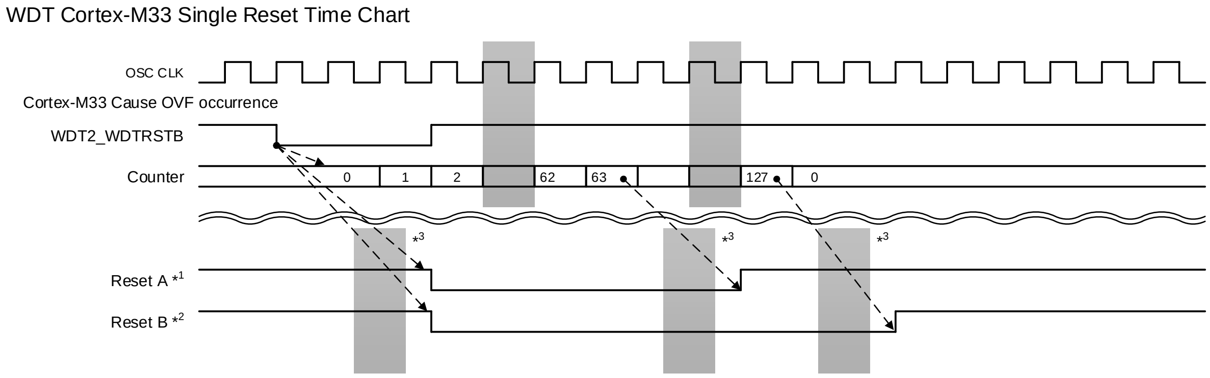
Note 4. The SYSREG setting is ‘ON’ for Core 0/Cluster and optional setting (on or off) for Core 1.

Note 5. Cortex-A55 reset generation has a certain time lag (approximately 35CLK@24MHz).

Figure 7.4 Timing of Cold Reset for the Cortex-A55 Alone due to the WDT Source

(5) Timing of Cortex-M33 Cold Reset due to the WDT Source

The following figure shows the timing of the cold reset for the Cortex-M33 alone due to the WDT source.



Note 1. CM33_MISCRESETN

Note 2. CA55_NPORESET/CM33_NSYSRESET

Note 3. Cortex-M33 reset generation has a certain time lag (approximately 35CLK@24MHz)

Figure 7.5 Timing of Cold Reset for the Cortex-M33 Alone due to the WDT Source

7.3.2.4 Cortex-A55 Reset

The following four types of reset corresponding to the target ranges of reset are provided for the Cortex-A55.

When the P-Channel circuit receives a request for a warm reset ((2) to (4) below), the P-Channel control is required before the application of a reset to the Cortex-A55.

(1) Cold reset
(2) Cluster warm reset
(3) Core 0 warm reset
(4) Core 1 warm reset

When a request to reset the Cortex-A55 alone is generated in the WDT, an error has probably occurred in the Cortex-A55, and the application of a warm reset may be difficult because the warm reset requires a handshake through the P-Channel. Therefore, a cold reset is applied to the Cortex-A55 instead of a warm reset.

- A warm reset for the Cortex-A55 is controlled by software executed in the Cortex-M33.
- After a cold reset (system reset) (normal), Cortex-A55 Core 0 is automatically activated by hardware.
- Refer to **Section 7.3.2.3(4), Timing of Cortex-A55 Cold Reset due to the WDT Source** for the operation of a cold reset (reset of a single core requested from the WDT). Reset control from CPG is performed by hardware.

(1) P-Channel Control for Cortex-A55 Reset

A handshake through the P-Channel is necessary before the application of a warm reset to the Cortex-A55. The registers in the CPG are monitored by the CPU for software control of the handshake. Three types of P-Channel are provided corresponding to the warm reset types. The CPG incorporates the registers (shown in the next page) for the following P-Channel signals and performs a handshake triggered by the PREQ signal. After the handshake, the reset signals for the target of the warm reset should be asserted and then negated by software to apply a warm reset.

Only the negation of the PREQ signal at the release of a cold reset (a system reset or a cold reset from the WDT) is controlled by the CPG hardware.

NOTES

1. The LSI that does not incorporate the Cortex-M33 does not support the warm reset of Cortex-A55.
2. When controlling the P-Channel by software, mask the cold reset of a single core of the Cortex-A55 from the WDT so that the cold reset is not applied. The system reset from the WDT does not need to be masked (the WDT system reset takes priority over the warm reset).
3. When enabling the cold reset of a single core of the Cortex-A55 from the WDT, make the “ON” setting through the PSTATE signal in the corresponding channel so that the PREQ signal is automatically controlled after the release from the reset state.

(a) P-Channel Control Registers in the Cortex-A55

The Cortex-A55 provides a P-Channel for power control for each of the regions — that is, the cluster region including the L3 and SCU, Core 0 region, and Core 1 region.

The P-Channel is driven in the PERIPHCLK domain, and the CPG contains the registers for controlling and monitoring the P-Channel signals other than the PACTIVE signal.

The CPG performs synchronization for the PACCEPT and PDENY signals.

For the PREQ and PSTATE signals, the Cortex-A55 has a synchronization circuit; the CPG does not perform synchronization.

For the P-Channel control registers, refer to following sections.

Section 7.2.4.188, Cortex-A55 Cluster Power Status Monitor Register (CPG_CLUSTER_PCHMON) to **Section 7.2.4.193, Cortex-A55 Core 1 Power Status Control Register (CPG_CORE1_PCHCTL)**

(b) P-Channel Handshake Control

The following describes the operation of the handshake through the P-Channel in the Cortex-A55.

Cold Reset (System Reset)

A handshake is necessary for a transition to the “ON” state.

Core 0: PREQ = 1 and PSTATE = ON in the initial state. After the release from the reset state, a handshake will be performed automatically and core 0 will be activated.
The CPG automatically clears PREQ for Core 0 to 0 after the release from the reset state.

Core 1: PREQ = 1 and PSTATE = OFF in the initial state. After the release from the reset state, a handshake will be performed automatically and core 1 will be stopped.
The CPG automatically clears PREQ for Core 1 to 0 after the release from the reset state.

Cold Reset (Cold Reset of the Cortex-A55 Alone Requested from the WDT)

A handshake is necessary for a transition to the “ON” state.

Core 0: When the cold reset of the Cortex-A55 alone requested from the WDT is enabled, set PREQ to 0 and PSTATE to "ON" in the register in advance. After the release from the reset state, a handshake is automatically executed to activate Core 0.
The CPG automatically clears PREQ for Core 0 to 0 after the release from the reset state.

Core 1: When the cold reset of the Cortex-A55 alone requested from the WDT is enabled, s Set PREQ to 0 and PSTATE to the desired value in advance in the register. After the release from the reset state, a handshake is automatically executed to activate Core 1 when PSTATE = “ON” or stop Core 1 when PSTATE = “OFF”.
The CPG automatically clears PREQ for Core 1 to 0 after the release from the reset state.

Warm Reset

Although the CPG has P-Channel control registers, it does not automatically control the P-Channel when a warm reset is requested; the user should control the P-Channel by software.

Figure 7.6 shows a flowchart and **Figure 7.7** shows a timing chart of the handshake for a warm reset through the Cortex-A55 P-Channel.

To execute the handshake, the user should manipulate registers in the CPG by software.

For a single-core Cortex-A55:

The PSTATE signal for Core 1 is fixed to the “OFF” state irrespective of the register settings when the Cortex-A55 incorporates a single core. Note that the PREQ signal for Core 1 is always controlled automatically regardless of whether the Cortex-A55 has a single-core or dual-core configuration.

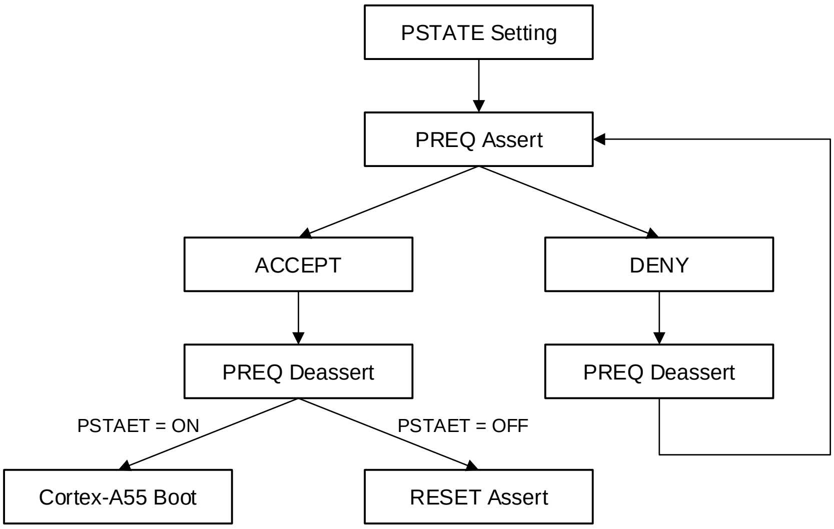


Figure 7.6 Flowchart of a Handshake through the Cortex-A55 P-Channel

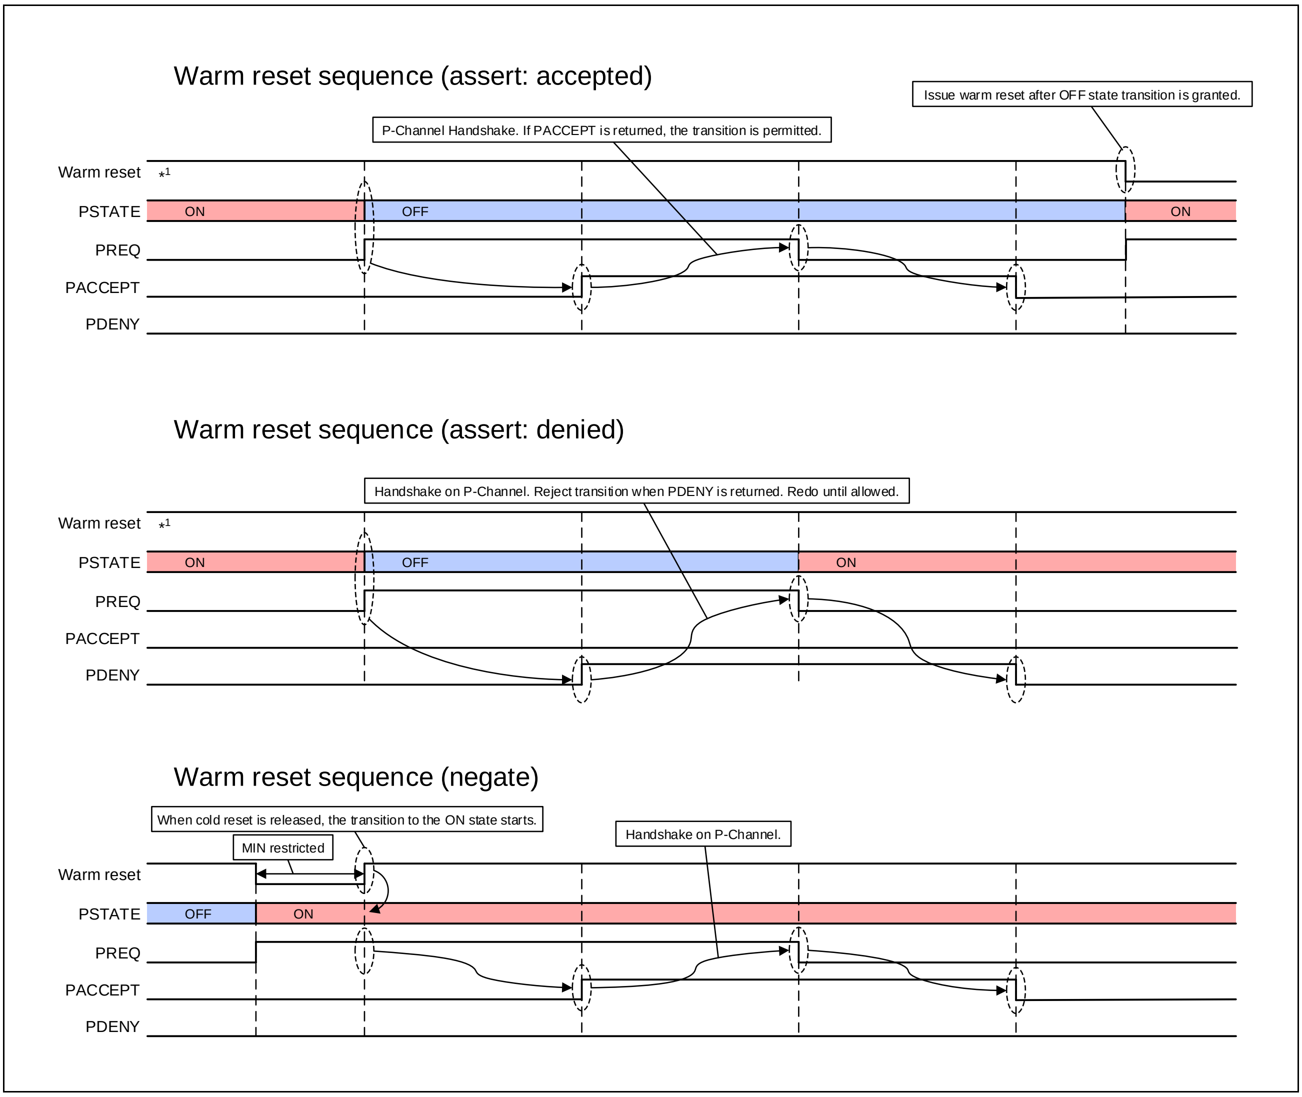


Warm reset sequence (assert: accepted)

Issue warm reset after OFF state transition is granted.

P-Channel Handshake. If PACCEPT is returned, the transition is permitted.

Warm reset sequence (assert: denied)

Handshake on P-Channel. Reject transition when PDENY is returned. Redo until allowed.

Warm reset sequence (negate)

When cold reset is released, the transition to the ON state starts.

MIN restricted

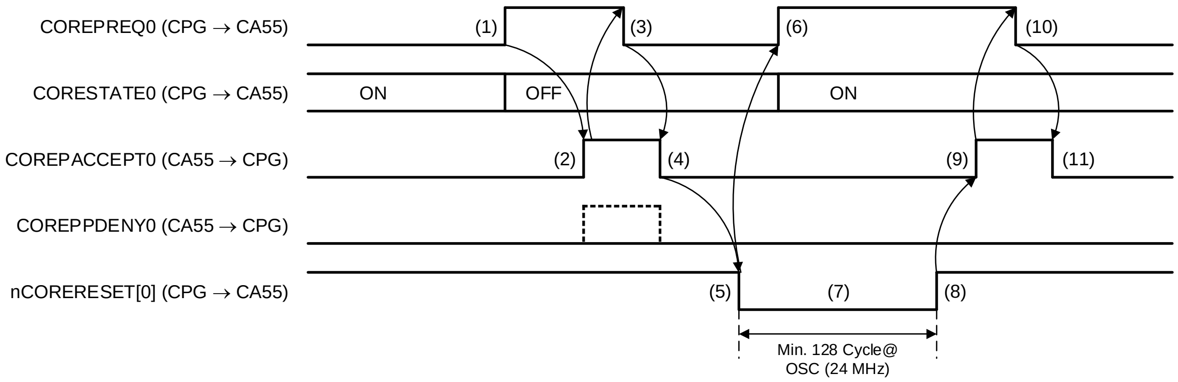
Handshake on P-Channel.

Figure 7.7 Timing Chart of a Handshake through the Cortex-A55 P-Channel (Warm Reset)

(c) Cortex-A55 Warm Reset Sequence

The following describes the warm reset sequence through the P-Channel.

Figure 7.8 shows a waveform when a warm reset of Cortex-A55 Core 0 is requested and accepted. When the request is denied, steps 1 to 4 are repeated until the request is accepted. The same sequence is used for the warm reset of the cluster or Core 1.



(1) The Cortex-M33 asserts COREPREQ0 according to CPG register settings (PSTATE = OFF).

(2) The Cortex-A55 asserts COREPACCEPT0.

(3) The Cortex-M33 deasserts COREPREQ0 according to CPG register settings.

(4) The Cortex-A55 deasserts COREPACCEPT0.

(5) The Cortex-M33 asserts the target reset signal (nCORERESET[0]) assigned to the warm reset of Cortex-A55 Core 0 according to CPG register settings.

(6) The Cortex-M33 asserts COREPREQ0 according to CPG register settings (PSTATE = ON).

(7) The Cortex-M33 waits for a certain period after the assertion of the reset signal.
18 cycles of the Cortex-A55 clock or 128 cycles at 24 MHz

(8) The Cortex-M33 deasserts the target reset signal (nCORERESET[0]) assigned to the warm reset of Cortex-A55 Core 0 according to CPG register settings.

(9) The Cortex-A55 asserts COREPACCEPT0.

(10) The Cortex-M33 deasserts COREPREQ0 according to CPG register settings.

(11) The Cortex-A55 deasserts COREPACCEPT0.

Figure 7.8 Cortex-A55 Warm Reset Sequence

(2) Operation of the Cortex-A55 Reset Control Circuit

The reset control circuit asserts the reset signal assigned to the reset request from the reset generator or software.

Reset Request Source	Reset Signal Assertion	Reset Signal Deassertion
System reset (including the reset from the WDT)	The CPG asserts the reset signal assigned to the cold reset.	The reset sequencer (boot sequencer) in the CPG releases the reset terminal assigned to the cold reset from the reset state. (The software reset register bit that corresponds to the reset terminal assigned to the cold reset indicates the reset released state in the initial state.)
Cold reset (software reset)*1	The Cortex-M33 asserts the reset signal assigned to the cold reset.	The Cortex-M33 deasserts the asserted signal so that the timing described in **Section 7.3.2.4(3), Timing of Cortex-A55 Reset**.
Cold reset (WDT)	The CPG asserts the reset signal assigned to the cold reset.	The CPG deasserts the asserted signal so that the timing described in **Section 7.3.2.3(4), Timing of Cortex-A55 Cold Reset due to the WDT Source**, is satisfied.
Cluster warm reset	The Cortex-M33 asserts the reset signal assigned to the cluster warm reset.	The Cortex-M33 deasserts the asserted signal after a period of 128 cycles at 24 MHz has elapsed.
Core 0 warm reset	The Cortex-M33 asserts the reset signal assigned to the Core 0 warm reset.	The Cortex-M33 deasserts the asserted signal after a period of 128 cycles at 24 MHz has elapsed.
Core 1 warm reset	The Cortex-M33 asserts the reset signal assigned to the Core 1 warm reset.	The Cortex-M33 deasserts the asserted signal after a period of 128 cycles at 24 MHz has elapsed.
Software reset*1	A software reset is applied by asserting the reset signal according to the data written to the register by software.	The CPG does not automatically deassert the reset signal. The reset signal retains the asserted state until the next access to the registers.

Note 1. The target reset signal should be controlled by software.

(3) Timing of Cortex-A55 Reset

There is a restriction on the timing of the release of the Cortex-A55 from the reset state.

When a reset is controlled by software, the restriction should be satisfied by software.

Hardware control is done for the system reset (including the reset from the WDT source) and the Cortex-A55 cold reset from the WDT.

The reset signals are classified into two groups:

Group (A):	nCPUPORESET[1:0], nCORERESET[1:0], nSPORESET, nSRESET, nPRESET, nATRESET, nGICRESET, and nPERIPHRESET
Group (B):	nARESET, nMISCRESET, and nPDBGRESET

To satisfy the restriction, the CPG deasserts group (B) after a period of 64 cycles at 24 MHz has elapsed since the deassertion of group (A).

7.3.2.5 Cortex-M33 Reset

Two types of reset corresponding to the target ranges of reset are provided for the Cortex-M33.

When a request to reset the Cortex-M33 alone is generated in the WDT, an error has probably occurred in the Cortex-M33, and the application of a warm reset may be difficult because the warm reset requires a handshake through the P-Channel. Therefore, a cold reset is applied to the Cortex-M33 instead of a warm reset.

- For the warm reset, refer to **Section 7.3.2.5(1), Handshake Control for Cortex-M33 Reset**, and **Section 7.3.2.5(2), Cortex-M33 Reset Sequence**. The reset control from the CPG is performed by hardware.
- To release the Cortex-M33 from the cold reset (system reset) state, refer to **Section 7.3.2.5(4), Timing of Cortex-M33 Reset**, and satisfy the described restriction. The reset control from the CPG needs software operation.
- The reset control from the CPG is performed by hardware.

MISCRESETn is a reset signal for the sub-system (SS) layer. This signal is used for a cold reset.
(For details, refer to the restriction on the timing of the Cortex-M33 cold reset.)

(1) Handshake Control for Cortex-M33 Reset

Like the warm reset for the Cortex-A55, the Cortex-M33 requires a handshake process to control the warm reset. After SYSRESETREQ is set to 1 in the Cortex-M33 and the Cortex-M33 enters the WFI state, the CPG executes a handshake with the Cortex-M33 to apply a warm reset to the Cortex-M33.

(2) Cortex-M33 Reset Sequence

For a warm reset for the Cortex-A55, the reset request signal nSYSRESET is issued as a result of the handshake between the CPG and Cortex-M33 and the signal pulse is generated for 128 cycles of the 24-MHz clock after the assertion of the signal.

The nSYSRESET signal is asserted under the conditions of SYSRESETREQ = high and SLEEPING = high.

(3) Operation of the Cortex-M33 Reset Control Circuit

The reset control circuit asserts the reset signal assigned to the reset request from the reset generator or software.

Reset Request Source	Reset Signal Assertion	Reset Signal Deassertion
System reset (including the reset from the WDT)	The software reset register is set to the initial value (initial value = cold reset).	The reset state is retained until the Cortex-A55 releases it.
Cold reset (software reset)*[1]	The Cortex-A55 asserts the following signals assigned to the cold reset. nPORESET nSYSRESET MISCRESTn	The Cortex-A55 deasserts MISCRESETn after a period of 64 cycles at 24 MHz has elapsed since the assertion of MISCRESETn. nSYSRESET and nPORESET are deasserted after a period of 64 cycles at 24 MHz has elapsed since the deassertion of MISCRESETn.
Cold reset (WDT)	The CPG asserts the following signals assigned to the cold reset. nPORESET nSYSRESET MISCRESTn	The CPG deasserts MISCRESETn after a period of 64 cycles at 24 MHz has elapsed since the assertion of MISCRESETn. nSYSRESET and nPORESET are deasserted after a period of 128 cycles at 24 MHz has elapsed since the deassertion of MISCRESETn. (See **Figure 7.5, Timing of Cold Reset for the Cortex-M33 Alone due to the WDT Source**.)
Warm reset	The CPG asserts the nSYSRESET signal assigned to the Cortex-M33 warm reset according to the procedure of Cortex-M33 warm reset.	The CPG deasserts the asserted signal after a period of 128 cycles at 24 MHz has elapsed.
Software reset*[1]	A software reset is applied by asserting the reset signal according to the data written to the register by software.	The reset signal is not deasserted. The reset signal retains the asserted state until the next access to the registers.

Note 1. The target reset signal should be controlled by software.

(4) Timing of Cortex-M33 Reset

There is a restriction on the timing of the release of the Cortex-M33 from the reset state.

When a reset is controlled by software, the restriction should be satisfied by software.

Hardware control is done for the Cortex-M33 cold reset from the WDT.

The reset signals are classified into two groups:

Group (A): MISCRESETn

Group (B): nPORESET and nSYSRESET

To satisfy the restriction, the CPG deasserts group (B) after a period of 64 cycles at 24 MHz has elapsed since the deassertion of group (A).

7.3.2.6 Module Reset Application Control

The application of a reset is controlled for individual modules.

In addition to a reset applied to individual modules according to register settings by software, some modules are reset in a certain reset mode.

For register setting specifications, refer to the descriptions of the reset control register *** (CPG_RST_***).

For a clock that is controlled by the corresponding CGC and is synchronized with a reset signal, the processing for stopping the clock is performed at the release of the reset state.

7.4 Operating Procedures

This section describes the procedures for operating the CPG.

7.4.1 Procedures for Supplying and Stopping Module Clocks

Use the following procedures to switch between the supply and stop of the target clock for a module.

* Sample procedures for the SRAM_MCPU clock (SRAM_MCPU_ACLK) are described here.

Supplying a Clock:

1. Setting the register for supplying the SRAM_MCPU clock (SRAM_MCPU_ACLK)

   Set up the following bits in the clock control register SRAM_MCPU (CPG_CLKON_SRAM_MCPU).
   — Setting for supplying the clock: Bit 0 (CLK0_ON) = 1 and bit 16 (CLK0_ONWEN) = 1

2. Confirming that the output of the SRAM_MCPU clock (SRAM_MCPU_ACLK) has started

   Read the following bit in the clock monitor register SRAM_MCPU (CPG_CLKMON_SRAM_MCPU) to confirm that the output of the clock has started.
   — Clock state: Bit 0 (UNIT0_CLK_MON), 1: Clock is supplied. (0: Clock is stopped.)

Stopping a Clock:

1. Setting the register for stopping the SRAM_MCPU clock (SRAM_MCPU_ACLK)

   Set up the following bits in the clock control register SRAM_MCPU (CPG_CLKON_SRAM_MCPU).
   — Setting for stopping the clock: Bit 0 (CLK0_ON) = 0 and bit 16 (CLK0_ONWEN) = 1

2. Confirming that the output of the SRAM_MCPU clock (SRAM_MCPU_ACLK) has been stopped

   Read the following bit in the clock monitor register SRAM_MCPU (CPG_CLKMON_SRAM_MCPU) to confirm that the output of the clock has been stopped.
   — Clock state: Bit 0 (UNIT0_CLK_MON), 0: Clock is stopped. (1: Clock is supplied.)

The following registers are used in the above procedures.

— 7.2.4.x Clock control registers ***** (CPG_CLKON_*****)

— 7.2.4.x Clock monitor registers ***** (CPG_CLKMON_*****)

For the procedures for supplying and stopping a clock signal, refer also to the section on the target module. If specific procedures for the module are described, use them.

7.4.2 Procedures for Supplying and Stopping Reset Signals

Use the following procedures to switch between the supply (reset state) and stop (released from the reset state) of the target reset signal for a module.

* Sample procedures for the SRAM_MCPU reset (SRAM_MCPU_ARESETN) are described here.

Supplying a Reset Signal:

1. Setting the register for supplying the SRAM_MCPU reset signal (SRAM_MCPU_ARESETN)

   Set up the following bits in the reset control register SRAM_MCPU (CPG_RST_SRAM_MCPU).
   — Setting for supplying the reset signal: Bit 0 (UNIT0_RSTB) = 1 and bit 16 (UNIT0_RST WEN) = 1

Stopping a Reset Signal:

1. Setting the register for stopping the SRAM_MCPU reset signal (SRAM_MCPU_ARESETN)

   Set up the following bits in the reset control register SRAM_MCPU (CPG_RST_SRAM_MCPU).

   - Setting for stopping the reset signal: Bit 0 (UNIT0_RSTB) = 0 and bit 16 (UNIT0_RST WEN) = 1
2. Confirming that the output of the SRAM_MCPU reset signal (SRAM_MCPU_ARESETN) has been stopped

   Read the following bit in the reset monitor register SRAM_MCPU (CPG_RSTMON_SRAM_MCPU) to confirm that the output of the reset signal has been stopped.
   — Reset state: Bit 0 (UNIT0_RST_MON)
   0: Reset signal is stopped (released from the reset state)
   1: Reset signal is output.

The following registers are used in the above procedures.

— 7.2.4.x Reset control registers ***** (CPG_RST_*****)

— 7.2.4.x Reset monitor registers ***** (CPG_RSTMON_*****)

For the procedures for supplying and stopping a reset signal, refer also to the section on the target module. If specific procedures for the module are described, use them.

7.4.3 Procedure for Activating Modules

Use the following procedure to activate an inactive module after a system reset.

For the specific procedure for activating the target module, refer to the section on the module.

1. Set up the clock control register for the clock signal connected to the target module to start the supply of the clock. Note that the PLL for the clock should be started before the clock if the PLL is stopped.
2. Read the clock monitor register to confirm that the supply of the target clock has started.
3. Set up the reset control register for the reset signal connected to the target module to release the module from the reset state.
4. Read the reset monitor register to conform that the module has been released from the reset state.

7.4.4 Procedure for Activating the Modules Related to PLL5

The synchronizer is intentionally removed from some PLL5 clock paths. For the following modules that use PLL5 clocks, use the activation flow and software control procedures shown in **Figure 7.9** and described later to avoid malfunctions due to hazards.

Applicable modules

- DSI
- LCDC

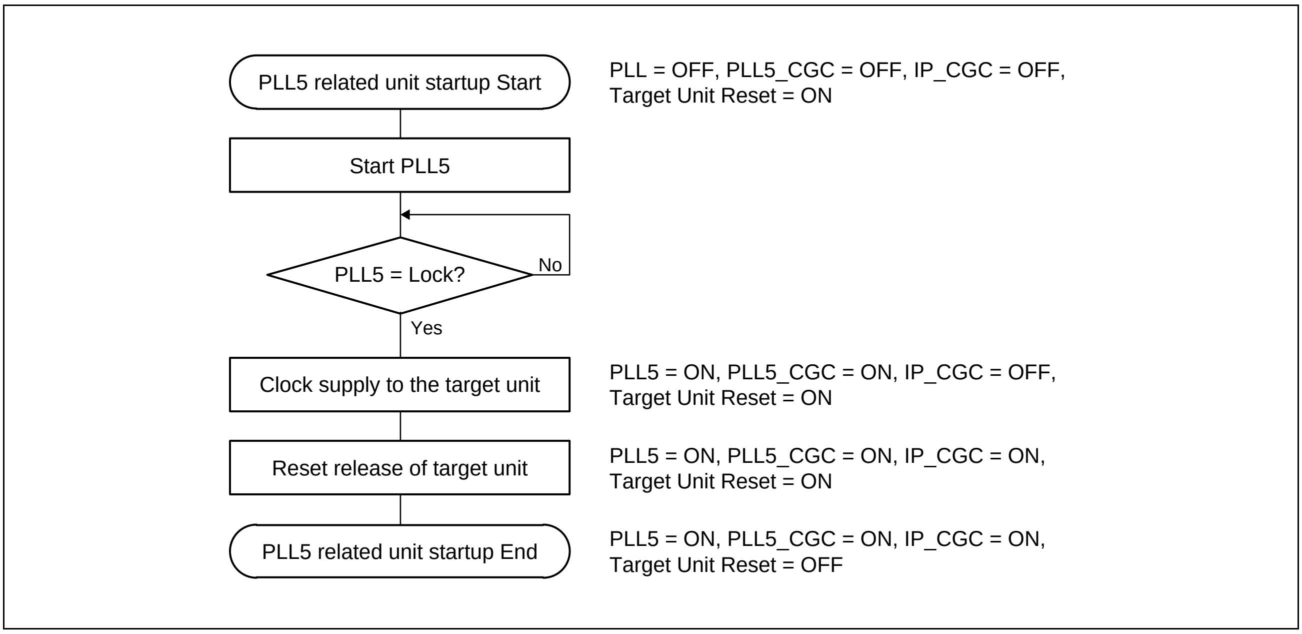


Figure 7.9 Flowchart of Activation of the Modules Related to PLL5

[Activation Flow]

<Initial state>

PLL5 = stopped, PLL5_CGC = activated, IP_CGC = activated,
and reset signals = applied (by hardware)

1) From the activation of PLL5 to the wait for the lock of PLL5:

PLL5 = activated (by software), PLL5_CGC = stopped, IP_CGC = stopped,
and reset signals for the target module = applied
In this period, the unstable clock before PLL5 is stopped by PLL5_CGC and does not propagate to the frequency divider or target module in the subsequent stages.

2) From the lock of PLL5 to the supply of the clock to the frequency divider DIV_DSI_A/B:

When PLL5 is locked, PLL5_CGC is automatically activated.

PLL5 = activated, PLL5_CGC = activated (by hardware), IP_CGC = stopped,
and reset signals for the applicable modules = applied

As soon as PLL5_CGC is activated, a clock hazard is momentarily present on the frequency divider but the incorrect output from the divider is stopped by the IP_CGC.
The frequency divider DIV_DSI_A will be stable in a short time.

The time until the divider becomes stable depends on the frequency setting in PLL5 but it is very short; there is no need to check whether it is stable by software.

3) Supplying clocks to the target module

Start the supply of the clocks to the target module by software.

PLL5 = activated, PLL5_CGC = activated, IP_CGC = activated (by software),
and reset signals for the target module = applied

Whether the IP_CGC is released from the reset state in synchronization with the clock differs between the PLLCLK_IN line and other lines.

For the PLLCLK_IN line, a synchronizer that synchronizes the maximum frequency (3 GHz) of PLLCLK_IN cannot be implemented by primitives. Therefore, the IP_CGC is released from the reset state asynchronously and a clock hazard will be present.
Accordingly, all reset signals for the target module (DSI) should be continued in this step.

4) Releasing the target module from the reset state

Release the target module from the reset state by software.

PLL5 = activated, PLL5_CGC = activated, IP_CGC = activated,
and reset signals = stopped (by software)

Before and after the release from the reset state, the clocks with which the reset signals are synchronized are stopped in the target module for several tens of clock cycles to avoid contention or adjust the timing flexibly.

Note that PLLCLK_IN does not stop because the DSI where PLLCLK_IN is supplied does not have reset signals synchronized with PLLCLK_IN.

7.4.5 Procedures for PLL Setup

The following shows the procedures for PLL setup.

7.4.5.1 Procedure for Setting PLL Normal Mode (Changing the Output Clock and SSCG Mode)

Use the following procedure to shift the PLL from the standby mode to the normal mode (change the output clock and SSCG mode).

[n = 1, 4, or 6: PLL1, PLL4, or PLL6]

1) Confirming the PLL operating mode (confirming that the PLL is in the standby mode)

- Check the following bit in the PLLn (SSCG) monitor register (CPG_SAMPLLn_MON).
- Shift to the standby mode: Confirm that bit 0 (PLLn_RESETB) = 0 (standby mode).
- Check the following bit in the PLLn (SSCG) monitor register (CPG_SAMPLLn_MON).
- Unlock of PLL: Confirm that bit 4 (PLLn_LOCK) = 0 (PLL is not locked).

Wait until the above conditions are satisfied.

2) Setting the output clock 1

- Modify the following bits in PLLn (SSCG) output clock setting register 1 (CPG_SAMPLLn_CLK1).
- For details of the settings, refer to **Section 7.2.4, Register Descriptions**.
- Setting of output clock (desired setting): Bits 5 to 0 (DIV_P_5 to DIV_P_0), bits 15 to 6 (DIV_M_9 to DIV_M_0), and bits 31 to 16 (DIV_K_15 to DIV_K_0)

3) Setting the output clock and SSCG modulation value 2

- Modify the following bits in PLLn (SSCG) output clock setting register 2 (CPG_SAMPLLn_CLK2).
- For details of the settings, refer to **Section 7.2.4, Register Descriptions**.
- Setting of output clock (desired setting): Bits 2 to 0 (DIV_S_2 to DIV_S_0)
- Setting of SSCG modulation value (desired setting): Bits 13 to 8 (MRR_5 to MRR_0) and bits 23 to 16 (MFR_7 to MFR_0)

4) Setting the PLL normal mode

- Set up the following bits in the PLLn (SSCG) standby control register (CPG_SAMPLLn_STBY).
- Setting of operating mode: Bit 0 (RESETB) = 1 (normal mode)
- Setting of SSCG mode: Bit 2 (SSCG_EN) = Desired setting

5) Confirming the shift to the PLL normal mode and the stable output of the clock

- Check the following bit in the PLLn (SSCG) monitor register (CPG_SAMPLLn_MON).
- Shift to standby mode: Confirm that bit 0 (PLLn_RESETB) = 1 (normal mode).
- Check the following bit in the PLLn (SSCG) monitor register (CPG_SAMPLLn_MON).
- Lock of PLL: Confirm that bit 4 (PLLn_LOCK) = 1 (PLL is locked).

Wait until the above conditions are satisfied.

NOTE

If there is no change in a parameter in step (2) or (3), the corresponding register does not need to be modified.

[PLL5]

1) PLL operation mode status check (confirmation that it is in standby mode)

- Check the following bits of the PLL5 (SSCG) monitor register (CPG_SIPLL5_MON).
- Standby mode transition confirmation: bit0 (PLLn_RESETB) = 0 (standby mode).
- Check the following bits of the PLL5 (SSCG) monitor register (CPG_SIPLL5_MON).
- Confirmation of PLL lock release: bit4 (PLLn_LOCK) = 0 (PLL is not locked).

Wait until the above conditions are satisfied.

2) Output clock setting 1

- Change the following bits of PLL5 (SSCG) output clock setting register 1 (CPG_SIPLL5_CLK1).
- For details on the setting values, refer to **Section 7.2.4, Register Descriptions**.
- Output frequency setting (optional):bit2-0(POSTDIV1)、bit6-4(POSTDIV2)、bit13-8(REFDIV)

3) Output clock setting, SSCG modulation value setting 3

- Change the following bits of PLLn (SSCG) output clock setting register 3 (CPG_SIPLL5_CLK3).
- For details of the setting values, refer to **Section 7.2.4, Register Descriptions**.
- Output frequency setting (optional): bit31-8(FRACIN)
- SSCG modulation value setting (optional): bit5-0(DIVVAL)

4) Output clock setting 4

- Change the following bits of PLL5 (SSCG) output clock setting register 4 (CPG_SIPLL5_CLK4).
- For details of the setting values, refer to **Section 7.2.4, Register Descriptions**.
- Output frequency setting (optional): bit27-16(INTIN)

5) SSCG modulation value setting 5

- Change the following bits of PLL5 (SSCG) output clock setting register 5 (CPG_SIPLL5_CLK5).
- For details of the setting values, refer to **Section 7.2.4, Register Descriptions**.
- SSCG modulation value setting (optional): bit4-0(SPREAD)

6) PLL normal mode setting

- Set the following bits of the PLLn (SSCG) standby control register (CPG_SIPLL5_STBY).
- Operation mode setting: bit0 (RESETB) = 1 (normal mode)
- SSCG mode setting: bit2 (SSC_EN) = optional

7) PLL normal mode transition, output clock stability check

- Check the following bits of the PLL5 (SSCG) monitor register (CPG_SIPLL5_MON).

- Confirmation of transition to normal mode: bit0 (PLLn_RESETB) = 1 (normal mode).
- Check the following bits of the PLL5 (SSCG) monitor register (CPG_SIPLL5_MON).
- PLL Lock confirmation: Bit4 (PLLn_LOCK) = 1 (PLL Lock).

Wait until the above conditions are satisfied.

NOTE

If there is no change in a parameter in step (2), (3), (4) or (5), the corresponding register does not need to be modified.

7.4.5.2 Procedure for Setting PLL Standby Mode

Use the following procedure to shift the PLL from the normal standby mode to the standby mode.

[n = 1, 4, or 6: PLL1, PLL4, or PLL6]

1) Setting the PLL standby mode

- Set the following bits of the PLL5 (SSCG) standby control register (CPG_SAM / SIPLL5_STBY).
- Operation mode setting: bit0 (RESETB) = 0 (standby mode) (other bits are “0”).

2) Confirming the shift to the PLL standby mode

- Check the following bits of the PLLn (SSCG) monitor register (CPG_SAM / SIPLL5_MON).
- Standby mode transition confirmation: bit0 (PLLn_RESETB) = 0 (standby mode).
- Check the following bits of the PLLn (SSCG) monitor register (CPG_SAM / SIPLL5_MON).
- Confirmation of PLL lock release: bit4 (PLLn_LOCK) = 0 (PLL is not locked).

Wait until the above conditions are satisfied.

7.4.5.3 PLLs with Restrictions

PLL1 to PLL3 cannot be switched to desired clock settings by the user because these PLLs output clocks for the CPU and bus operation.

PLL1 outputs clocks dedicated to the Cortex-A55. To modify its settings after booting, the registers should be manipulated from the Cortex-M33.

The PLL2 and PLL3 settings cannot be modified after booting because these PLLs output system clocks for bus operation.

PLL4 to PLL6 can be set up, started, or stopped by the user at the desired timing under the allowable conditions of use for the target module.

7.4.6 Procedure for Switching the Division Ratio of the Dynamic Switching Frequency Dividers

Use the following procedure to set the division ratio of the dynamic switching frequency dividers.

* A sample procedure for DIV_PLL2_A is described here.

1) Confirming the DIV_PLL2_A state (checking that it is not busy)

- Check the following bit in the clock status monitor register (CPG_CLKSTATUS).
- DIV_PLL2_A state: Confirm that bit 0 (DIVPL2A_STS) = 0 (switching is completed).

Wait until the above condition is satisfied.

2) Setting the DIV_PLL2_A division ratio

- Set up the following bits in the division ratio setting (PLL2) register (CPG_PL2_DDIV).
- Setting of division ratio: Bits 1 and 0 (DIVPL2A_SET) = desired value and bit 16 (DIV_PLL2_A_WEN) = 1

3) Confirming the DIV_PLL2_A state (checking that it is not busy)

- Check the following bit in the clock status monitor register (CPG_CLKSTATUS).
- DIV_PLL2_A state: Confirm that bit 0 (DIVPL2A_STS) = 0 (switching is completed).

Wait until the above condition is satisfied.

The following registers are used in the above procedure.

— Division ratio setting (PLL1) register (CPG_PL1_DDIV)
— Division ratio setting (PLL2) register (CPG_PL2_DDIV)
— Division ratio setting (PLL3) register (CPG_PL3A_DDIV)
— Division ratio setting (PLL3) register (CPG_PL3B_DDIV)
— Division ratio setting (PLL6) register (CPG_PL6_DDIV)

The following status monitor register is used.

— Clock status monitor register (CPG_CLKSTATUS)

When 1 is written to a xx_WEN bit placed in the upper 16 bits of a division ratio setting register, the clock switching control begins even if the settings in the lower bits are not changed. Check the status monitor register (CPG_CLKSTATUS) and wait until the switching is completed. The clock will temporarily stop at the timing of switching.

7.4.7 Procedure for Switching Clocks by the Dynamic Switching Frequency Selectors

Use the following procedure to switch clocks by the dynamic switching frequency selectors.

* A sample procedure for SEL_PLL4 is described here.

1) Confirming the SEL_PLL4 state (checking that it is not busy)

- Check the following bit in the clock status monitor register (CPG_CLKSTATUS).
- SEL_PLL4 state: Confirm that bit 31 (SELPLL4_STS) = 0 (switching is completed).

Wait until the above condition is satisfied.

2) Setting the switching of the clock output from SEL_PLL4

- Set up the following bits in the source clock setting (DDR) register (CPG_PL4_DSEL).
- Setting of clocks switching (switch from PLL4 to OSC_DIV1000): Bits 31 to 0 = H’0001_0000
  (switch from OSC_DIV1000 to PLL4): Bits 31 to 0 = H’0001_0001

Confirming the SEL_PLL4 state (checking that it is not busy)

- Check the following bit in the clock status monitor register (CPG_CLKSTATUS).
- SEL_PLL4 state: Confirm that bit 31 (SELPLL4_STS) = 0 (switching is completed).

Wait until the above condition is satisfied.

The following registers are used in the above procedure.

— Source clock setting (DDR) register (CPG_PL4_DSEL)

— Source clock setting (SDHI) register (CPG_PL2SDHI_DSEL)

When 1 is written to a xx_WEN bit placed in the upper 16 bits of a source clock setting register, the clock switching control begins even if the settings in the lower bits are not changed. Check the status monitor register (CPG_CLKSTATUS) and wait until the switching is completed. The clock will temporarily stop at the timing of switching.

7.4.8 Procedure for Switching Clocks by the Static Switching Frequency Dividers and Selectors (Procedure for Switching Source Clocks)

Use the following procedure to set the division ratio of the static switching frequency dividers and to switch clocks by the static switching frequency selectors.

When a source clock is active: Stop the clock. → Make settings for switching clocks. → Start the clock.

When a source clock is stopped: Make settings for switching.

The following registers are used in the above procedure.

— Source clock setting register (CPG_PL3_SSEL)*[1]

— Source clock setting register (CPG_PL6_SSEL)

— Source clock setting register (CPG_PL6_ETH_SSEL)*[2]

— Division ratio setting (PLL5) register (CPG_PL5_SDIV)

— Bit 0 (RES0_SET) in other function register 1 (CPG_OTHERFUNC1_REG)

Note 1. When switching SEL_PLL3_3 in CPG_PL3_SSEL, please note the following points.

1) Do not access SPI-Multi during switching.
2) If a TZC2INT interrupt is occurring, allow the interrupt to complete before stopping the clock on the CPG_CLKON_MBUS.
3) Before switching, stop the following clocks.
    - CPG_CLKON_SPI_MULTI (bit1, bit0)
    - CPG_CLKON_MBUS (bit9, bit3)
4) CPG_CLKON_SPI_MULTI and CPG_CLKON_MBUS are not in the order to stop the clock.

Note 2. Set the CPG_PL6_ETH_SSEL in the ETHER module stopped state (reset state).

7.4.9 Boot Sequence (Normal Operation)

After the reset sequence ends, perform the following operations if necessary.

- Start PLLs.
- Set up clock selectors.
- Set up clock division ratios.
- Supply clocks to modules.
- Release modules from the reset state.

7.4.10 Boot Sequence (Debug Mode)

After the reset sequence (debug mode) ends, perform the following operations if necessary.

- Start PLLs.
- Set up clock selectors.
- Set up clock division ratios.
- Supply clocks to modules.
- Release modules from the reset state.

7.4.11 General Operating Procedures

The following describes general operating procedures.

7.4.11.1 Procedure for Writing to Registers

The registers in the CPG have write-enable flags in the upper 16 bits and normal data fields in the lower 16 bits except for the registers shown below. Therefore, only the desired bit can be modified without read-modify-write operation.

To modify the value of a bit, write 1 to the write-enable flag having the target bit number + 16 and write a desired value to the target bit.

(Examples: To modify bit 0 to 1b, write H’0001_0001. To modify it to 0b, write H’0001_0000. When H’0000_xxxx is written, the value of bits 15 to 0 does not change.)

NOTE

In some registers, a single write-enable flag controls multiple data bit. Refer to the description of each register.

Registers that have data fields in the upper bits instead of write-enable flags:

— PLLn (SSCG) output clock setting register 1 (CPG_SAMPLLn_CLK1): (n = 1, 4, or 6)

— PLLn (SSCG) output clock setting register 2 (CPG_SAMPLLn_CLK2): (n = 1, 4, or 6)

— PLLn (SSCG) output clock setting register 3 (CPG_SIPLLn_CLK3): (n = 5)

— PLLn (SSCG) output clock setting register 4 (CPG_SIPLLn_CLK4): (n = 5)

— PLLn (SSCG) output clock setting register 5 (CPG_SIPLLn_CLK5): (n = 5)

— Cortex-A55 cluster power status control register (CPG_CLUSTER_PCHCTL)

— Cortex-A55 Core 0 power status control register (CPG_CORE0_PCHCTL)

— Cortex-A55 Core 1 power status control register (CPG_CORE1_PCHCTL)

8. Interrupt Controller

The interrupt controller decides the priority of interrupt sources and controls interrupt requests to the CPU.

The interrupt controller registers set the order of priority of each interrupt, allowing the user to process interrupt requests according to the user-set priority.

8.1 Features

■ **Equipped with Arm® CoreLink™ GIC-600 Generic Interrupt Controller*1 for Arm Cortex-A55.**

- 32 levels of priority.
- SGI (Software Generated Interrupt): 16 interrupts
- PPI (Private Peripheral Interrupt): 16 interrupts
- SPI (Shared Peripheral Interrupt): 480 interrupts
- LPI (Locality-specific Peripheral Interrupt): Not supported

■ **Nested Vectored Interrupt Controller (NVIC)*2 built in Arm Cortex-M33.**

- 256 levels of priority
- 480 interrupts

■ **External Interrupts**

- NMI, IRQ0-7, TINT0-31
- Noise filter function.*3

■ **Internal Interrupts**

- On-chip peripheral interrupts
- On-chip Bus error interrupts
- On-chip RAM ECC error interrupts

Note 1. Refer to Arm® CoreLink™ GIC-600 Generic Interrupt Controller Revision: r1p6 Technical Reference Manual.
Note 2. Refer to Arm® Cortex®-M33 Processor Revision: r0p4 Technical Reference Manual.
Note 3. Refer to **Section 41, General Purpose Input Output Port (GPIO)**.

8.1.1 External Signal Pins

The following table shows external signal pins for Interrupt Controller.

Table 8.1 External Signal Pins

Name	Width	I/O	Description
NMI	1	I	NMI (Non Maskable Interrupt) pin. Refer to **Section 8.7.1**.
IRQ0 – IRQ7	8	I	IRQ (Interrupt Request) pins. GPIO pins can be used as IRQ pins. Refer to **Section 8.7.2**.
P0_0 – P48_4	123	I	GPIO pins. GPIO pins can be used as external interrupt input pins (GPIOINT0-122). Assign only 32 pins in GPIOINT0-122 to TINT0-31. Refer to **Section 8.7.3**.

8.1.2 Block Diagram

The block diagram of Interrupt Controller is as follows.

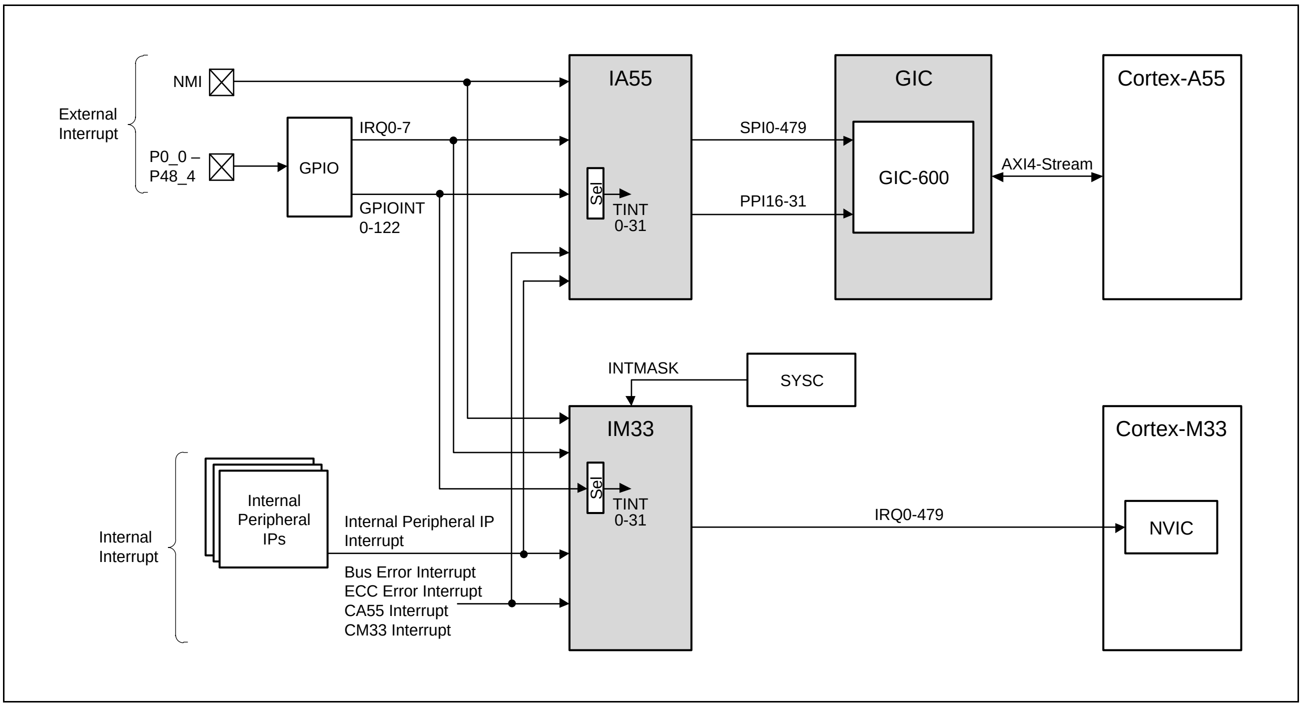

Figure 8.1 Interrupt Controller Block Diagram

GIC

GIC is equipped with Arm® CoreLink™ GIC-600 Generic Interrupt Controller for Cortex-A55.

IA55

IA55 performs various interrupt controls including synchronization for the external interrupts of NMI, IRQ, and GPIOINT and the interrupts of the built-in peripheral interrupts output by each IP. And it notifies the interrupt to the GIC.

- Select 32 TINT from 123 GPIOINT.
- Integration of bus error interrupts from system bus.
- Integration of ECC error interrupts from On-chip RAM.
- Indicate interrupt status. (NMI, IRQ, TINT, integrated bus error interrupt and integrated ECC error interrupt)
- Setting of interrupt detection method. (NMI, IRQ and TINT)

IM33

IM33 performs various interrupt controls including synchronization for the external interrupts of NMI, IRQ and GPIOINT and internal peripheral interrupts output by each IP. And it notifies the interrupt to the built-in interrupt controller (NVIC) for Cortex-M33.

- Select 32 TINT from 123 GPIOINT.
- Integration of bus error interrupts from system bus.
- Integration of ECC error interrupts from On-chip RAM.
- Indicate interrupt status. (NMI, IRQ, TINT, integrated bus error interrupt and integrated ECC error interrupt)

- Set interrupt detection method. (NMI, IRQ and TINT)
- All interrupts can be masked by setting of SYSC Register. (IM33_MASK bit of SYS_LP_CLT7 register.)
  Refer to **Section 42, Low Power Mode**.

8.2 Interrupt Mapping

The following table indicates interrupt mapping for Cortex-A55 and Cortex-M33.

Refer to **Section 14, Direct Memory Access Controller** with the interrupts through DMA Controller, and **Section 8.8.1**.

Note 1. Exception handlers of Cortex-M33 has Interrupt Service Routines (ISRs), Fault handler and System handler.
IRQ0-479 is treated as Interrupt Service Routines (ISRs).
Refer to “Arm Cortex-M33 Processor Technical Reference Manual” and “Arm Cortex-M33 Processor User Guide” for details and targets of Fault handler and System handler.

Note 2. Set GICD_ICFGR<n> of the interrupt controller for Cortex-A55 (GIC-600) according to the description of Interrupt Type for each Interrupt ID.
Refer to “ARM CoreLink GIC-600 Generic Interrupt Controller Technical Reference Manual” for the specification of GIC-600 registers.
Equivalent settings are not required for the interrupt controller for Cortex-M33 (Cortex-M33 built-in NVIC).

Note 3. Refer to the source unit section for the specification of each interrupt source.

Note 4. NMI is not treated as NMI exception.
NMI interrupt setting can be controlled by the registers in IA55 and IM33. Refer to **Section 8.7.1** for details.

Note 5. IRQ0-7 interrupt settings can be controlled by the registers in IA55 and IM33. Refer to **Section 8.7.2** for details.

Note 6. TINT0-31 interrupt settings can be controlled by the registers in IA55 and IM33. Refer to **Section 8.7.3** for details.

Note 7. BUS_ERR_INT is the interrupt integrated multiple interrupts into one in IA55 and IM33.
The interrupt settings can be controlled by the registers in IA55 and IM33. Refer to **Section 8.7.4.1** for details.

Note 8. Each EC7TIE1, TC7TIE2 and EC7TIOVF is the interrupt integrated multiple interrupts into one in IA55 and IM33.
The interrupt settings can be controlled by the registers in IA55 and IM33. Refer to **Section 8.7.4.2** for details.

8.3 GIC-600 and NVIC Register Configuration

■ GIC-600 Register

Refer to Arm® CoreLink™ GIC-600 Generic Interrupt Controller Revision: r1p6 Technical Reference Manual.
ITS and LPI are not supported.

Base Address: H’0_1190_0000 (Cortex-A55 Address Space)

Base Address: H’4190_0000 (Cortex-M33 Address Space Non-Secure)
Base Address: H’5190_0000 (Cortex-M33 Address Space Secure)

■ NVIC Register

Refer to Arm® Cortex®-M33 Processor Revision: r0p4 Technical Reference Manual.

8.4 GIC-600 and NVIC Register Descriptions

■ GIC-600 Register

Refer to Arm® CoreLink™ GIC-600 Generic Interrupt Controller Revision: r1p6 Technical Reference Manual for detail.

■ NVIC Register

Refer to Arm® Cortex®-M33 Processor Revision: r0p4 Technical Reference Manual for detail.

8.5 IA55 and IM33 Register Configuration

■ IA55

Base Address: H’0_110A_0000 (Cortex-A55 Address Space)

Base Address: H’410A_0000 (Cortex-M33 Address Space Non-Secure)
Base Address: H’510A_0000 (Cortex-M33 Address Space Secure)

■ IM33

Base Address: H’0_110B_0000 (Cortex-A55 Address Space)

Base Address: H’410B_0000 (Cortex-M33 Address Space Non-Secure)
Base Address: H’510B_0000 (Cortex-M33 Address Space Secure)

The following table shows IA55 and IM33 Register list.
Prohibit to write undefined area.

Table 8.3 IA55 and IM33 Register List

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
NMI Status Control Register	NSCR	R/W	H’0000_0000	H’0000	32
NMI Interrupt Type Selection Register	NITSR	R/W	H’0000_0000	H’0004	32
IRQ Status Control Register	ISCR	R/W	H’0000_0000	H’0010	32

Bus Error Interrupt Status Control Register1	BEISR1	R/W	H’0000_0000	H’0054	32
ECCRAM Error Interrupt Status Control Register0	EREISR0	R/W	H’0000_0000	H’0060	32
ECCRAM Error Interrupt Status Control Register1	EREISR1	R/W	H’0000_0000	H’0064	32

8.6 IA55 and IM33 Register Descriptions

8.6.1 NMI Status Control Register (NSCR)

This register shows NMI status.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NSMON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NSTAT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	NSMON	0	R	This bit indicates NMI pin signal level. [Read operation] 0: NMI pin is Low-level. 1: NMI pin is High-level. [Write operation] Invalid to write.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	NSTAT	0	R/W	This bit indicates NMI interrupt status. NMI interrupt status can be cleared writing 0 in case NSTAT is 1. [Read operation] 0: NMI interrupt is not detected. 1: NMI interrupt is detected. [Write operation] ● In case NSTAT is 1 0: NMI interrupt status is cleared. 1: Invalid to write. ● In case NSTAT is 0 Invalid to write.

8.6.2 NMI Interrupt Type Selection Register (NITSR)

This register selects NMI detecting method.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NTSEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	NTSEL	0	R/W	This bit is used to select NMI interrupt detection method. 0: Falling-edge detection. 1: Rising-edge detection.

8.6.3 IRQ Status Control Register (ISCR)

This register shows IRQ status.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ISTAT7	ISTAT6	ISTAT5	ISTAT4	ISTAT3	ISTAT2	ISTAT1	ISTAT0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
n	ISTATn	0	R/W	This bit indicates IRQn interrupt status. When the interrupt detection method is set to an edge type detection in IITSR, IRQn interrupt status can be cleared writing 0 in case ISTATn is 1. [Read operation] 0: IRQn interrupt is not detected. 1: IRQn interrupt is detected. [Write operation] When “Falling-edge detection”, “Rising-edge detection” or “Falling/Rising-edge detection” is set in ITSR.: ● In case ISTAT is 1 0: IRQn interrupt detection status is cleared. 1: Invalid to write. ● In case ISTAT is 0 Invalid to write. When “Low-level detection” is set in IITSR.: Invalid to write.

Note: n = 7 to 0

8.6.4 IRQ Interrupt Type Selection Register (IITSR)

This register selects IRQ detecting method.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IITSEL7		IITSEL6		IITSEL5		IITSEL4		IITSEL3		IITSEL2		IITSEL1		IITSEL0	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2n+1 to 2n	IITSEL	All 0	R/W	This bit is used to select IRQn interrupt detection method. 00: Low-level detection. 01: Falling-edge detection. 10: Rising-edge detection. 11: Falling/Rising-edge detection.

Note: n = 7 to 0

8.6.5 TINT Status Control Register (TSCR)

This register shows TINT status.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TSTAT31	TSTAT30	TSTAT29	TSTAT28	TSTAT27	TSTAT26	TSTAT25	TSTAT24	TSTAT23	TSTAT22	TSTAT21	TSTAT20	TSTAT19	TSTAT18	TSTAT17	TSTAT16
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSTAT15	TSTAT14	TSTAT13	TSTAT12	TSTAT11	TSTAT10	TSTAT9	TSTAT8	TSTAT7	TSTAT6	TSTAT5	TSTAT4	TSTAT3	TSTAT2	TSTAT1	TSTAT0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
n	TSTATn	All 0	R/W	This bit indicates TINTn interrupt status. When the interrupt detection method is set to edge type detection in TITSR0/1, TINTn interrupt status can be cleared writing 0 in case TSTATn is 1. [Read operation] 0: TINTn interrupt is not detected. 1: TINTn interrupt is detected. [Write operation] When “Rising-edge detection” or “Falling-edge detection” is set in TITSR0/1.: ● In case TSTAT is 1 0: TINTn interrupt detection status is cleared. 1: Invalid to write. ● In case TSTAT is 0 Invalid to write. When “Low-level detection” or ”High-Level detection” is set in TITSR0/1.: Invalid to write.

Note: n = 31 to 0

8.6.6 TINT Interrupt Type Selection Register0 (TITSR0)

This register selects detecting method of TINT15 to TINT0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TITSEL15		TITSEL14		TITSEL13		TITSEL12		TITSEL11		TITSEL10		TITSEL9		TITSEL8	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TITSEL7		TITSEL6		TITSEL5		TITSEL4		TITSEL3		TITSEL2		TITSEL1		TITSEL0	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
2n+1 to 2n	TITSELn	All 0	R/W	This bit is used to select TINTn interrupt detection method. 00: Rising-edge detection. 01: Falling-edge detection. 10: High-level detection. 11: Low-level detection.

Note: n = 15 to 0

8.6.7 TINT Interrupt Type Selection Register1 (TITSR1)

This register selects detecting method of TINT31 to TINT16.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TITSEL31		TITSEL30		TITSEL29		TITSEL28		TITSEL27		TITSEL26		TITSEL25		TITSEL24	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
8n+7	TIENn	0	R/W	This bit enables TINTn. 1: Enable. 0: Invalid.
8n+6 to 8n	TSSELn	All 0	R/W	This bit selects a source of TINTn. 0000000: TINTn = GPIOINT0 0000001: TINTn = GPIOINT1 ~ 1111010: TINTn = GPIOINT122 1111011: Cannot be set. 1111100: Cannot be set. 1111101: Cannot be set. 1111110: Cannot be set. 1111111: Cannot be set. Assign different sources to TINT0-31.

Note: n = 3 to 0

8.6.9 TINT Source Selection Register1 (TSSR1)

This register selects the interrupt source of TINT7 to TINT4.

Refer to **Section 8.7.3** about mapping GPIOINT onto GPIO pin.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TIEN7	TSSEL7							TIEN6	TSSEL6						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIEN5	TSSEL5							TIEN4	TSSEL4						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
8(n-4)+7	TIENn	0	R/W	This bit enables TINTn. 1: Enable. 0: Invalid.
8(n-4)+6 to 8(n-4)	TSSELn	All 0	R/W	This bit selects a source of TINTn. 0000000: TINTn = GPIOINT0 0000001: TINTn = GPIOINT1 ~ 1111010: TINTn = GPIOINT122 1111011: Cannot be set. 1111100: Cannot be set. 1111101: Cannot be set. 1111110: Cannot be set. 1111111: Cannot be set. Assign different sources to TINT0-31.

Note: n = 7 to 4

8.6.10 TINT Source Selection Register2 (TSSR2)

This register selects the interrupt source of TINT11 to TINT8.

Refer to **Section 8.7.3** about mapping GPIOINT onto GPIO pin.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TIEN11	TSSEL11							TIEN10	TSSEL10						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIEN9	TSSEL9							TIEN8	TSSEL8						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
8(n-8)+7	TIENn	0	R/W	This bit enables TINTn. 1: Enable. 0: Invalid.
8(n-8)+6 to 8(n-8)	TSSELn	All 0	R/W	This bit selects a source of TINTn. 0000000: TINTn = GPIOINT0 0000001: TINTn = GPIOINT1 ~ 1111010: TINTn = GPIOINT122 1111011: Cannot be set. 1111100: Cannot be set. 1111101: Cannot be set. 1111110: Cannot be set. 1111111: Cannot be set. Assign different sources to TINT0-31.

Note: n = 11 to 8

8.6.11 TINT Source Selection Register3 (TSSR3)

This register selects the interrupt source of TINT15 to TINT12.

Refer to **Section 8.7.3** about mapping GPIOINT onto GPIO pin.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TIEN15	TSSEL15							TIEN14	TSSEL14						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIEN13	TSSEL13							TIEN12	TSSEL12						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
8(n-12)+7	TIENn	0	R/W	This bit enables TINTn. 1: Enable. 0: Invalid.
8(n-12)+6 to 8(n-12)	TSSELn	All 0	R/W	This bit selects a source of TINTn. 0000000: TINTn = GPIOINT0 0000001: TINTn = GPIOINT1 ~ 1111010: TINTn = GPIOINT122 1111011: Cannot be set. 1111100: Cannot be set. 1111101: Cannot be set. 1111110: Cannot be set. 1111111: Cannot be set. Assign different sources to TINT0-31.

Note: n = 15 to 12

8.6.12 TINT Source Selection Register4 (TSSR4)

This register selects the interrupt source of TINT19 to TINT16.

Refer to **Section 8.7.3** about mapping GPIOINT onto GPIO pin.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TIEN19	TSSEL19							TIEN18	TSSEL18						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIEN17	TSSEL17							TIEN16	TSSEL16						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
8(n-16)+7	TIENn	0	R/W	This bit enables TINTn. 1: Enable. 0: Invalid.
8(n-16)+6 to 8(n-16)	TSSELn	All 0	R/W	This bit selects a source of TINTn. 0000000: TINTn = GPIOINT0 0000001: TINTn = GPIOINT1 ~ 1111010: TINTn = GPIOINT122 1111011: Cannot be set. 1111100: Cannot be set. 1111101: Cannot be set. 1111110: Cannot be set. 1111111: Cannot be set. Assign different sources to TINT0-31.

Note: n = 19 to 16

8.6.13 TINT Source Selection Register5 (TSSR5)

This register selects the interrupt source of TINT23 to TINT20.

Refer to **Section 8.7.3** about mapping GPIOINT onto GPIO pin.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TIEN23	TSSEL23							TIEN22	TSSEL22						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIEN21	TSSEL21							TIEN20	TSSEL20						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
8(n-20)+7	TIENn	0	R/W	This bit enables TINTn. 1: Enable. 0: Invalid.
8(n-20)+6 to 8(n-20)	TSSELn	All 0	R/W	This bit selects a source of TINTn. 0000000: TINTn = GPIOINT0 0000001: TINTn = GPIOINT1 ~ 1111010: TINTn = GPIOINT122 1111011: Cannot be set. 1111100: Cannot be set. 1111101: Cannot be set. 1111110: Cannot be set. 1111111: Cannot be set. Assign different sources to TINT0-31.

Note: n = 23 to 20

8.6.14 TINT Source Selection Register6 (TSSR6)

This register selects the interrupt source of TINT27 to TINT24.

Refer to **Section 8.7.3** about mapping GPIOINT onto GPIO pin.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TIEN27	TSSEL27							TIEN26	TSSEL26						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIEN25	TSSEL25							TIEN24	TSSEL24						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
8(n-24)+7	TIENn	0	R/W	This bit enables TINTn. 1: Enable. 0: Invalid.
8(n-24)+6 to 8(n-24)	TSSELn	All 0	R/W	This bit selects a source of TINTn. 0000000: TINTn = GPIOINT0 0000001: TINTn = GPIOINT1 ~ 1111010: TINTn = GPIOINT122 1111011: Cannot be set. 1111100: Cannot be set. 1111101: Cannot be set. 1111110: Cannot be set. 1111111: Cannot be set. Assign different sources to TINT0-31.

Note: n = 27 to 24

8.6.15 TINT Source Selection Register7 (TSSR7)

This register selects the interrupt source of TINT31 to TINT28.

Refer to **Section 8.7.3** about mapping GPIOINT onto GPIO pin.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TIEN31	TSSEL31							TIEN30	TSSEL30						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIEN29	TSSEL29							TIEN28	TSSEL28						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
8(n-28)+7	TIENn	0	R/W	This bit enables TINTn. 1: Enable. 0: Invalid.
8(n-28)+6 to 8(n-28)	TSSELn	All 0	R/W	This bit selects a source of TINTn. 0000000: TINTn = GPIOINT0 0000001: TINTn = GPIOINT1 ~ 1111010: TINTn = GPIOINT122 1111011: Cannot be set. 1111100: Cannot be set. 1111101: Cannot be set. 1111110: Cannot be set. 1111111: Cannot be set. Assign different sources to TINT0-31.

Note: n = 31 to 28

8.6.16 Bus Error Interrupt Status Control Register0 (BEISR0)

This register shows Bus error status.

Refer to LSI Internal Bus section and **Section 8.7.4.1** for bus error interrupt cause.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BESTAT31	BESTAT30	BESTAT29	BESTAT28	BESTAT27	BESTAT26	BESTAT25	BESTAT24	BESTAT23	BESTAT22	BESTAT21	BESTAT20	BESTAT19	BESTAT18	BESTAT17	BESTAT16
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BESTAT15	BESTAT14	BESTAT13	TSTAT12	BESTAT11	BESTAT10	BESTAT9	BESTAT8	BESTAT7	BESTAT6	BESTAT5	BESTAT4	BESTAT3	BESTAT2	BESTAT1	BESTAT0

Bit	Bit Name	Initial Value	R/W	Description
n	BESTATn	All 0	R/W	This bit indicates BUSERR_INTn interrupt status. BUSERR_INTn interrupt status can be cleared writing 0 in case BESTAT is 1. [Read operation] 0: BUSERR_INTn is not detected. 1: BUSERR_INTn is detected. [Write operation] ● In case BESTATn is 1 0: BUSERR_INTn interrupt status is cleared. 1: Invalid to write. ● In case BESTATn is 0 Invalid to write.

Note: n = 31 to 0

8.6.17 Bus Error Interrupt Status Control Register1 (BEISR1)

This register shows Bus error status.

Refer to LSI Internal Bus section and **Section 8.7.4.1** for bus error interrupt cause.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
n-32	BESTATn	All 0	R/W	This bit indicates BUSERR_INTn interrupt status. BUSERR_INTn interrupt status can be cleared writing 0 in case BESTAT is 1. [Read operation] 0: BUSERR_INTn is not detected. 1: BUSERR_INTn is detected. [Write operation] ● In case BESTATn is 1 0: BUSERR_INTn interrupt status is cleared. 1: Invalid to write. ● In case BESTATn is 0 Invalid to write.

Note: n = 44 to 32

8.6.18 ECCRAM Error Interrupt Status Control Register0 (EREISR0)

This register shows ECC Error status of ECCRAM0.

Refer to **Section 8.7.4.2** for ECCRAM error interrupt cause.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	OFSTAT7	OFSTAT6	OFSTAT5	OFSTAT4	OFSTAT3	OFSTAT2	OFSTAT1	OFSTAT0

	E2STAT7	E2STAT6	E2STAT5	E2STAT4	E2STAT3	E2STAT2	E2STAT1	E2STAT0	E1STAT7	E1STAT6	E1STAT5	E1STAT4	E1STAT3	E1STAT2	E1STAT1	E1STAT0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 16	OFSTATn	All 0	R/W	This bit indicates ECCRAM0_OFn interrupt status. ECCRAM0_OFn interrupt status can be cleared writing 0 in case OFSTATn is 1. [Read operation] 0: ECCRAM0_OFn is not detected. 1: ECCRAM0_OFn is detected. [Write operation] ● In case OFSTATn is 1 0: ECCRAM0_OFn interrupt status is cleared. 1: Invalid to write. ● In case OFSTATn is 0 Invalid to write.
15 to 8	E2STATn	All 0	R/W	This bit indicates ECCRAM0_2En interrupt status. ECCRAM0_2En interrupt status can be cleared writing 0 in case E2STATn is 1. [Read operation] 0: ECCRAM0_2En is not detected. 1: ECCRAM0_2En is detected. Write operation: ● In case E2STATn is 1 0: ECCRAM0_2En interrupt status is cleared. 1: Invalid to write. ● In case E2STATn is 0 Invalid to write.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	E1STATn	All 0	R/W	This bit indicates ECCRAM0_1En interrupt status. ECCRAM0_1En interrupt status can be cleared writing 0 in case E1STATn is 1. [Read operation] 0: ECCRAM0_1En is not detected. 1: ECCRAM0_1En is detected. [Write operation] ● In case E1STATn is 1 0: ECCRAM0_1En interrupt status is cleared. 1: Invalid to write. ● In case E1STATn is 0 Invalid to write.

Note: n = 7 to 0

8.6.19 ECCRAM Error Interrupt Status Control Register1 (EREISR1)

This register shows ECC Error status of ECCRAM1.

Refer to **Section 8.7.4.2** for ECCRAM error interrupt cause.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	OFSTAT7	OFSTAT6	OFSTAT5	OFSTAT4	OFSTAT3	OFSTAT2	OFSTAT1	OFSTAT0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	E2STAT7	E2STAT6	E2STAT5	E2STAT4	E2STAT3	E2STAT2	E2STAT1	E2STAT0	E1STAT7	E1STAT6	E1STAT5	E1STAT4	E1STAT3	E1STAT2	E1STAT1	E1STAT0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 16	OFSTATn	All 0	R/W	This bit indicates ECCRAM1_OFn interrupt status. ECCRAM1_OFn interrupt status can be cleared writing 0 in case OFSTATn is 1. [Read operation] 0: ECCRAM1_OFn is not detected. 1: ECCRAM1_OFn is detected. [Write operation] ● In case OFSTATn is 1 0: ECCRAM1_OFn interrupt status is cleared. 1: Invalid to write. ● In case OFSTATn is 0 Invalid to write.
15 to 8	E2STATn	All 0	R/W	This bit indicates ECCRAM1_2En interrupt status. ECCRAM1_2En interrupt status can be cleared writing 0 in case E2STATn is 1. [Read operation] 0: ECCRAM1_2En is not detected. 1: ECCRAM1_2En is detected. [Write operation] ● In case E2STATn is 1 0: ECCRAM1_2En interrupt status is cleared. 1: Invalid to write. ● In case E2STATn is 0 Invalid to write.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	E1STATn	All 0	R/W	This bit indicates ECCRAM1_1En interrupt status. ECCRAM1_1En interrupt status can be cleared writing 0 in case E1STATn is 1. [Read operation] 0: ECCRAM1_1En is not detected. 1: ECCRAM1_1En is detected. [Write operation] ● In case E1STATn is 1 0: ECCRAM1_1En interrupt status is cleared. 1: Invalid to write. ● In case E1STATn is 0 Invalid to write.

Note: n = 7 to 0

8.7 Operation

8.7.1 NMI Interrupt

NMI interrupt is the highest priority interrupt by default even though it can be masked.

NMI is not treated as NMI exception.

[Setting]

- A noise filter function of NMI pin can be enabled by GPIO register setting.
  Refer to **Section 41.4.1, Operation for GPIO Function** for detail.
- NMI pin input is detected by edge. A detection method is set by NTSEL bit of NMI Interrupt Type Selection Register (NITSR) in IA55/IM33. It can be selected “Rising-edge detection” or “Falling-edge detection”.

[Status Control]

- NMI interrupt request can be confirmed by reading NSTAT bit of NMI Status Control Register (NSCR) in IA55/IM33.
  The interrupt request can be cleared by writing 0 to NSTAT bit.
- A signal level (High or Low) of NMI pin can be confirmed by reading NSMON bit of NMI Status Control Register (NSCR) in IA55/IM33.

8.7.2 IRQ Interrupt

IRQ interrupt is the interrupt from IRQ0-7 input pins.

[Setting]

- Using IRQ pins as interrupt must be mapped GPIO pins onto IRQ pins by GPIO register setting.
  Refer to **Section 41.4.2, Operation for Peripheral Function** for detail.
- A noise filter function of IRQ pins can be enabled by GPIO register setting.
  Refer to **Section 41.4.1, Operation for GPIO Function** for detail.
- IRQ pin inputs are detected by a level or an edge. A detection method is set by ITSEL bit of IRQ Interrupt Type Selection Register (IITSR) in IA55/IM33. It can be selected “Low-level detection”, “Falling-edge detection”, “Rising-edge detection” or “Falling/Rising-edge detection”.

[Status Control]

- IRQ interrupt requests can be confirmed by reading ISTATn bit of IRQ Status Control Register (ISCR) in IA55/IM33.
- In case selected a level detection in IITSR, the interrupt requests are cleared when the interrupt sources de-assert the interrupts.
- In case selected an edge detection in IITSR, the interrupt requests can be cleared by writing 0 to ISTATn bit.

8.7.3 GPIO Interrupt (TINT)

GPIO interrupt is the interrupt using GPIO pins as external interrupt input pins.

[Setting]

- When using GPIO pins as interrupts, assign GPIO pins as external interrupt input pins (GPIOINT0-122) by GPIO register setting.
  Refer to **Section 41.4.1, Operation for GPIO Function** for details.
  Refer to **Table 8.4** for mapping GPIO pins onto GPIOINT0-122.
- The noise filter function of GPIO pins assigned to TINT can be enabled by GPIO register setting.
  Refer to **Section 41.4.1, Operation for GPIO Function** for details.
- Assign any 32 interrupt sources to TINT from GPIOINT0-122 by TINT Source Selection Register (TSSR0-7) in IA55/IM33.

  Note: Even if the TINT is assigned by TSSR0-7, no interrupt request is generated unless it is assigned to an external pin interrupt by GPIO registers.
- TINT inputs are detected by a level or an edge. A detection method is set by TTSEL bit of TINT Interrupt Type Selection Register (TITSR0/1) in IA55/IM33. It can be selected “Rising-edge detection”, “Falling-edge detection”, “High-level detection” or “Low-level detection”.

[Status Control]

- TINT interrupt requests can be confirmed by reading TSTATn bit of TINT Status Control Register (TSCR) in IA55/IM33.
- In case selected a level detection in TITSR0/1, the interrupt requests are cleared when the interrupt sources de-assert the interrupts.
- In case selected an edge detection in TITSR0/1, the interrupt requests can be cleared by writing 0 to TSTATn bit.

Table 8.4 GPIOINT Mapping

No.	GPIO Pin	GPIOINT

8.7.4 Internal Interrupt

8.7.4.1 Bus Error Interrupt

Bus error interrupts (BUSERR_INT0-41) generated by system bus are integrated into one interrupt (BUS_ERR_INT) by IA55/IM33 and the integrated interrupt is notified to CPU.

[Status Control]

- Bus error interrupt requests can be confirmed by reading BUS Error Interrupt Status Control Register (BEISR0/1) in IA55/IM33.
  Refer to **Table 8.5** and **Table 8.6** for mapping BESTAT0-41 onto bus error interrupt causes.
- The interrupt requests can be cleared by writing 0 to BESTAT0-41 bit.

Table 8.5 BEISR0 Bus Error Mapping

BEISR0	Interrupt	Description
BESTAT0	BUSERR_INT0	Bus Write Error Interrupt for CA55
BESTAT1	BUSERR_INT1	Bus Read Error Interrupt for CA55
BESTAT2	BUSERR_INT2	Bus Write Error Interrupt for Mali-G31

8.7.4.2 ECCRAM Error Interrupt

ECCRAM error interrupts generated by On-Chip RAM (ECCRAM0, ECCRAM1) are integrated into one interrupt from eight interrupts by IA55/IM33 and the integrated interrupt is notified to CPU.

Integrated 1bit error interrupt: EC7TIE1_0, EC7TIE1_1
Integrated 2bit error interrupt: EC7TIE2_0, EC7TIE2_1
Integrated overflow interrupt: EC7TIOVF_0, EC7TIOVF_1

[Status Control]

- ECCRAM error interrupt requests can be confirmed by reading ECCRAM Error Interrupt Status Control Register (EREISR0/1) in IA55/IM33.
  Refer to **Table 8.7** and **Table 8.8** for mapping E1STAT0-7, E2STAT0-7 and OFSTAT0-7 onto ECCRAM error interrupt causes.
- The interrupt requests can be cleared by writing 0 to E1STAT0-7, E2STAT0-7 and OFSTAT0-7 bit.

Table 8.7 ECCRAM0 ECC Error Mapping

EREISR0	Interrupt	Description	Integrated Interrupt
E1STAT0	ECCRAM0_1E0	ECC 1bit error interrupt bit[31:0]	EC7TIE1_0
E1STAT1	ECCRAM0_1E1	ECC 1bit error interrupt bit[63:32]	
E1STAT2	ECCRAM0_1E2	ECC 1bit error interrupt bit[95:64]	
E1STAT3	ECCRAM0_1E3	ECC 1bit error interrupt bit[127:96]	
E1STAT4	ECCRAM0_1E4	ECC 1bit error interrupt bit[159:128]	
E1STAT5	ECCRAM0_1E5	ECC 1bit error interrupt bit[191:160]	
E1STAT6	ECCRAM0_1E6	ECC 1bit error interrupt bit[223:192]	
E1STAT7	ECCRAM0_1E7	ECC 1bit error interrupt bit[255:224]	
E2STAT0	ECCRAM0_2E0	ECC 2bit error interrupt bit[31:0]	EC7TIE2_0
E2STAT1	ECCRAM0_2E1	ECC 2bit error interrupt bit[63:32]	
E2STAT2	ECCRAM0_2E2	ECC 2bit error interrupt bit[95:64]	
E2STAT3	ECCRAM0_2E3	ECC 2bit error interrupt bit[127:96]	
E2STAT4	ECCRAM0_2E4	ECC 2bit error interrupt bit[159:128]	
E2STAT5	ECCRAM0_2E5	ECC 2bit error interrupt bit[191:160]	
E2STAT6	ECCRAM0_2E6	ECC 2bit error interrupt bit[223:192]	
E2STAT7	ECCRAM0_2E7	ECC 2bit error interrupt bit[255:224]	
OFSTAT0	ECCRAM0_OF0	ECC error overflow interrupt bit[31:0]	EC7TIOVF_0
OFSTAT1	ECCRAM0_OF1	ECC error overflow interrupt bit[63:32]	
OFSTAT2	ECCRAM0_OF2	ECC error overflow interrupt bit[95:64]	
OFSTAT3	ECCRAM0_OF3	ECC error overflow interrupt bit[127:96]	
OFSTAT4	ECCRAM0_OF4	ECC error overflow interrupt bit[159:128]	
OFSTAT5	ECCRAM0_OF5	ECC error overflow interrupt bit[191:160]	
OFSTAT6	ECCRAM0_OF6	ECC error overflow interrupt bit[223:192]	
OFSTAT7	ECCRAM0_OF7	ECC error overflow interrupt bit[255:224]	

Table 8.8 ECCRAM1 ECC Error Mapping

EREISR1	Interrupt	Description	Integrated Interrupt
E1STAT0	ECCRAM1_1E0	ECC 1bit error interrupt bit[31:0]	EC7TIE1_1
E1STAT1	ECCRAM1_1E1	ECC 1bit error interrupt bit[63:32]	
E1STAT2	ECCRAM1_1E2	ECC 1bit error interrupt bit[95:64]	
E1STAT3	ECCRAM1_1E3	ECC 1bit error interrupt bit[127:96]	
E1STAT4	ECCRAM1_1E4	ECC 1bit error interrupt bit[159:128]	
E1STAT5	ECCRAM1_1E5	ECC 1bit error interrupt bit[191:160]	
E1STAT6	ECCRAM1_1E6	ECC 1bit error interrupt bit[223:192]	
E1STAT7	ECCRAM1_1E7	ECC 1bit error interrupt bit[255:224]	
E2STAT0	ECCRAM1_2E0	ECC 2bit error interrupt bit[31:0]	EC7TIE2_1
E2STAT1	ECCRAM1_2E1	ECC 2bit error interrupt bit[63:32]	
E2STAT2	ECCRAM1_2E2	ECC 2bit error interrupt bit[95:64]	
E2STAT3	ECCRAM1_2E3	ECC 2bit error interrupt bit[127:96]	
E2STAT4	ECCRAM1_2E4	ECC 2bit error interrupt bit[159:128]	
E2STAT5	ECCRAM1_2E5	ECC 2bit error interrupt bit[191:160]	
E2STAT6	ECCRAM1_2E6	ECC 2bit error interrupt bit[223:192]	
E2STAT7	ECCRAM1_2E7	ECC 2bit error interrupt bit[255:224]	
OFSTAT0	ECCRAM1_OF0	ECC error overflow interrupt bit[31:0]	EC7TIOVF_1
OFSTAT1	ECCRAM1_OF1	ECC error overflow interrupt bit[63:32]	
OFSTAT2	ECCRAM1_OF2	ECC error overflow interrupt bit[95:64]	
OFSTAT3	ECCRAM1_OF3	ECC error overflow interrupt bit[127:96]	
OFSTAT4	ECCRAM1_OF4	ECC error overflow interrupt bit[159:128]	
OFSTAT5	ECCRAM1_OF5	ECC error overflow interrupt bit[191:160]	
OFSTAT6	ECCRAM1_OF6	ECC error overflow interrupt bit[223:192]	
OFSTAT7	ECCRAM1_OF7	ECC error overflow interrupt bit[255:224]	

8.8 Usage Note

8.8.1 Precaution when use the peripheral modules which can initiate DMA Controller.

Some on-chip peripheral modules use the same signal both for an interrupt request and for a DMA transfer request.
Refer to **Section 14.4.25, DMA Extension Resource Selectors 0/0S to 7/7S** for detail.

If such a module is selected by a DMARSn/nS register, the signal works as a DMA transfer request signal and interrupt requests to the interrupt controller are masked.

To enable the interrupt, clear the setting of DMARSn/nS (set all MID[7:0] and RID[1:0] to 0).
In addition, need following register settings even if DMA controller is not used.

- Set CPG_CLKON_DMAC_REG register to supply a clock for DMA Controller.
  Refer to **Section 7.2.4, Clock Control Register DMAC_REG** for register detail.
- Set CPG_RST_DMAC register to release a reset for DMA Controller.
  Refer to **Section 7.2.4, Reset Control Register DMAC** for register detail.

8.8.2 Clear Timing of Interrupt Cause

Clear the interrupt cause flag in the interrupt exception service routine. It takes time from clearing the interrupt cause flag until the interrupt cause to the CPU is actually removed. Therefore, to prevent the interrupt cause that should have been cleared from being accidentally accepted again, the interrupt cause flag is read after clearing, and then the return instruction is executed.

8.8.3 Precaution when Changing Interrupt Settings

To change the NMI, IRQ, TINT interrupt settings, mask the interrupts and change the settings.

- When changing the noise filter settings.
- When switching the GPIO pins to IRQ or GPIOINT.
- When changing the source of TINT.
- When changing the interrupt detection method.

When changing the NMI, IRQ, TINT interrupt detection method to the edge type, perform the process of clearing the interrupt status after changing the setting.

- NMI: Write 0 to the NSTAT bit of NSCR.
- IRQ: Write 0 to the ISTATn bit of ISCR.
- TINT: Write 0 to the TSTATn bit of TSCR.

9. DDR3L/DDR4 SDRAM Memory Controller (MEMC)

DDR3L/DDR4 SDRAM Memory Controller (MEMC) is External Bus Controller for DDR3L/DDR4 SDRAM (DDR). This block supports up to DDR4-1600 and DDR3L-1333 SDRAM. Interface bus width is 16 bits. In line ECC can be supported.
For sepup and configuration to this block, please use and refer to the linux software package of this LSI including DDR setup codes.

9.1 Features

This unit consists of MC (Memory controller) and PHY. It supports the following specifications.

- DDR3L (JEDEC STANDARD JESD79-3F, JESD79-3-1A.01)
- DDR4 (JEDEC STANDARD JESD79-4C)

Figure 9.1 shows features of this block.

Table 9.1 DDR3L/DDR4 SDRAM Memory Controller (MEMC) features

Feature	Description
DRAM IF	● DDR3L: 800 to 1333 Mbps (400 to 666 MHz) ● DDR4: 1333 to 1600 Mbps (666 to 800 MHz) ● Width: 16 bits (Full (16 bits) or Half (8 bits) datawidth mode) ● Rank: 1, 2
MC (Memory controller)	● Fully pipelined command, read and write data interfaces to the controller. ● Advanced bank look-ahead features for high memory throughput. ● A programmable register interface to control memory parameters and protocols including auto pre-charge. ● Full initialization of memory on controller reset. ● ECC function for single bit and double bit error reporting, single bit error correction, and programmable removal of ECC storage.
PHY	● Write Leveling (Deskew CK vs Write-DQS) ● Bit Leveling (Deskew DQS vs DQ/DM, Read and Write) ● Vref Training (Read and Write) ● Self Calibration Logic (Deskew Read vs Internal clock) ● Command/Address Swizzling

The diagrams of this unit are follows.

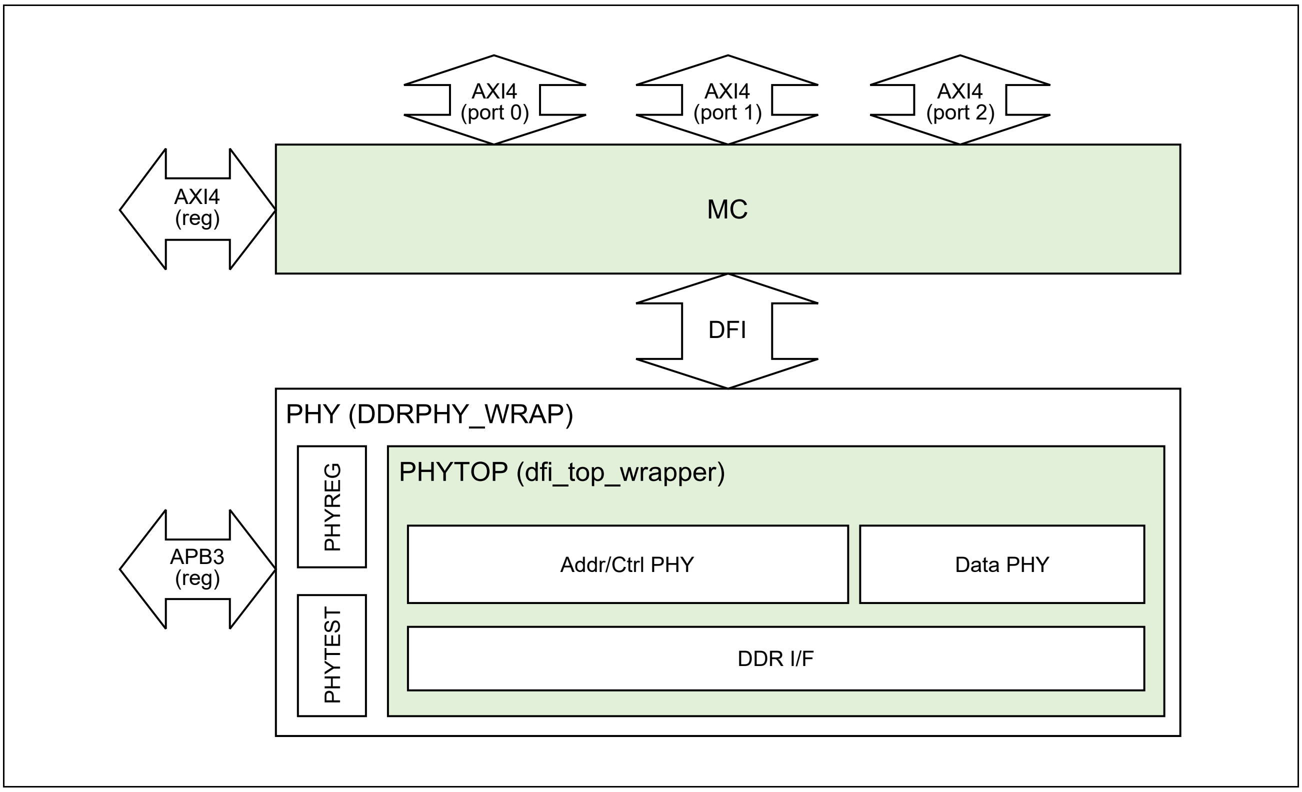

Figure 9.1 Block Diagram

This unit has the following restrictions.

DDR3L

- BC4 is not supported.
- Interleave is not supported.

DDR4

- BC4 is not supported.
- Interleave is not supported.
- Geardown Mode is not supported.
- Fine granularity refresh mode is supported, but only in Fixed x1 mode.
- CAL Mode is not supported.
- DBI is not supported.
- CRC is not supported.
- CA Parity is not supported.

9.2 Interface

9.2.1 Power, Ground

Table 9.2 shows the power and ground pins of this unit.

Table 9.2 Power, Ground

Name	I/O	Description
DDR_VDDQ	Supply	Power supply for I/O
VDD	Supply	Power supply for core
VSS	Ground	Ground for core

9.2.2 External Pins

Table 9.3 shows the external pins for DDR interface.

Table 9.3 External pin list

External pin	I/O	Description
DDR_CLK_P	O	DDR Clock (Pos)
DDR_CLK_N	O	DDR Clock (Neg)
DDR_RESET#	O	DDR Active Low Asynchronous Reset
DDR_CKE	O	DDR Clock Enable
DDR_CS0#	O	DDR Address or Command
DDR_CS1#	O	DDR Address or Command
DDR_RAS#	O	DDR Address or Command
DDR_CAS#	O	DDR Address or Command
DDR_WE#	O	DDR Address or Command
DDR_BA0 to DDR_BA2	O	DDR Address or Command
DDR_ADDR0 to DDR_ADDR15	O	DDR Address or Command
DDR_ODT0	O	DDR On Die Termination
DDR_ODT1	O	DDR On Die Termination
DDR_DQS0_P	IO	DDR Data Strobe (Pos)
DDR_DQS0_N	IO	DDR Data Strobe (Neg)
DDR_DQS1_P	IO	DDR Data Strobe (Pos)
DDR_DQS1_N	IO	DDR Data Strobe (Neg)
DDR_DQ0 to DDR_DQ15	IO	DDR Data
DDR_DM0	O	DDR Data Mask
DDR_DM1	O	DDR Data Mask
DDR_CALIBRATION	IO	Should be connected to an external 240-ohm resistor. It is used for drive and termination impedance calibration of IOs.

9.3 Usage Note

This unit has the following restrictions.

Table 9.4 External pin list

Item	Restriction
Address map	It has the area (address) that access is prohibited, because it is used by the periodic training. It is as below. DRAM address: BA = 0, ROW = H'0, COL = H'000 to H'00F BG = 0 and 1 (only DDR4) System address: H'040000000 to H'04000003F (if DDR4) H'040000000 to H'04000001F (if DDR3L)
Period of DRAM inaccessibility	It has the period of DRAM inaccessibility to execute the periodic training. It depends only on the Bit Rate, and not on the kind of DRAM. It is belows: 1600Mbps: 5.0 μsec every 1000 msec 1333Mbps: 1.5 μsec every 1000 msec 1066Mbps: 1.875 μsec every 1000 msec 800Mbps: 2.5 μsec every 1000 msec

9.3.1 Power On

The power on sequence for the DDR_VDDQ and VDD domains is such that either the 2 voltages should be ramped up together or VDD should be ramped up prior to DDR_VDDQ in order to prevent voltage stress in the DDR IOs.

10. On-chip RAM

This LSI has an on-chip RAM for work area. These memory units can be used to store instructions or data. The operation and write access to the on-chip RAM can be enabled or disabled through the RAM enable bit (VCEN in SYS_RAMn_EN register) (n = 0-1) and RAM write enable bit (VLWEN in SYS_RAMn_EN register) (n = 0-1).

For details on the register, refer to the **Section 6.3** in chapter SYSC.

10.1 Features

■ Memory size

128 Kbytes (SRAM ACPU: 64 Kbytes, SRAM MCPU: 64 Kbytes)

■ Ports

On-chip RAM has one read and write port and is connected to the AXI bus.

■ Method of arbitration

When the same port of the on-chip RAM is accessed from different masters simultaneously, the AXI bus performs arbitration in round-robin mode.

■ Number of access cycles

The number of cycles for access to read or write is one cycle of SRAM_ACPU_ACLK (P1ϕ).

The number of cycles for access to read or write is one cycle of SRAM_MCPU_ACLK (I2ϕ).

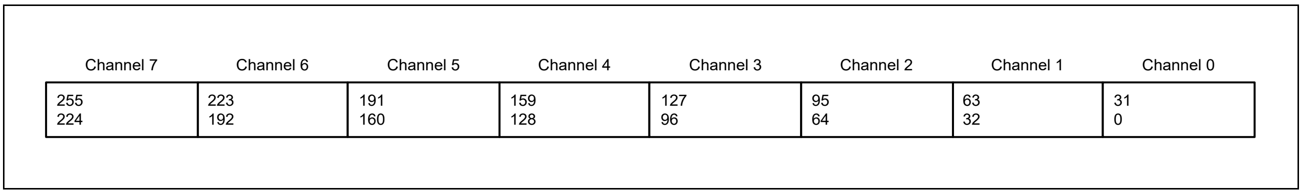
11. Error Correcting Code (ECC) for On-Chip RAM

11.1 Overview

This LSI chip has two 64-Kbyte areas of on-chip RAM for use as the working area.

Each of on-chip RAM incorporates an ECC function, which allows the detection and correction of 1-bit errors and the detection of 2-bit errors. When a 1-bit or 2-bit error occurs, the address where the error occurred can be stored in an ECC error address register.

The data bus width is 256 bits. This is divided into eight channels as shown in **Figure 11.1**, with detection handled in each 32-bit channel.



Channel 7	Channel 6	Channel 5	Channel 4	Channel 3	Channel 2	Channel 1	Channel 0
255 224	223 192	191 160	159 128	127 96	95 64	63 32	31 0

Figure 11.1 Division for ECC Processing

11.1.1 Features

- Error detection and correction
  - Detection and correction of 1-bit errors and detection of 2-bit errors are possible.
  - An error involving 3 or more bits cannot be correctly handled and may result in erroneous detection and correction.
- Control of error detection and correction
  - Error detection and correction, and correction of 1-bit errors can respectively be enabled or disabled.
- Capture of the addresses where errors occurred
  - When a 1-bit or 2-bit error is detected, the address where the error was encountered is stored in an ECC error address register. Each channel has eight ECC error address registers.
- Interrupt request
  - An interrupt request can be generated on the detection of a 1-bit error (selectable as enabled or disabled).
  - An interrupt request can be generated on the detection of a 2-bit error (selectable as enabled or disabled).
  - An overflow interrupt is generated from each channel on detection of an error when all ECC error address registers contain values.

11.2 Register Configuration

Table 11.1 and **Table 11.2** respectively show the base register and base address. The addresses of the ECC registers are represented by offsets from the base address.

Table 11.1 Base Register

Base Register Name	On-Chip RAM	Register Abbreviation
<REG_base>	SRAM ACPU	ECCRAM0
	SRAM MCPU	ECCRAM1

Table 11.2 Base Register

Base Register Name	On-Chip RAM	Register Abbreviation
<ADR_base>	SRAM ACPU	H’0_1108_0000 (Overall Address Space) H’4108_0000 (Cortex-M33 Address Space Non-Secure) H’5108_0000 (Cortex-M33 Address Space Secure)
	SRAM MCPU	H’0_1109_0000 (Overall Address Space) H’4109_0000 (Cortex-M33 Address Space Non-Secure) H’5109_0000 (Cortex-M33 Address Space Secure)

Table 11.3 lists the ECC registers.

Do not attempt access to the on-chip RAM areas while the registers listed in **Table 11.3** are being set.

Table 11.3 List of the ECC Registers (1/2)

Channel	Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
0	ECC control register_0	<REG_base>CTL_0	R/W	H'0000_0010	<ADR_base> + H'0000	32
	ECC error address register 0_0	<REG_base>EAD0_0	R	H'0000_0000	<ADR_base> + H'0010	32
	ECC error address register 1_0	<REG_base>EAD1_0	R	H'0000_0000	<ADR_base> + H'0014	32
	ECC error address register 2_0	<REG_base>EAD2_0	R	H'0000_0000	<ADR_base> + H'0018	32
	ECC error address register 3_0	<REG_base>EAD3_0	R	H'0000_0000	<ADR_base> + H'001C	32
	ECC error address register 4_0	<REG_base>EAD4_0	R	H'0000_0000	<ADR_base> + H'0020	32
	ECC error address register 5_0	<REG_base>EAD5_0	R	H'0000_0000	<ADR_base> + H'0024	32
	ECC error address register 6_0	<REG_base>EAD6_0	R	H'0000_0000	<ADR_base> + H'0028	32
	ECC error address register 7_0	<REG_base>EAD7_0	R	H'0000_0000	<ADR_base> + H'002C	32
1	ECC control register_1	<REG_base>CTL_1	R/W	H'0000_0010	<ADR_base> + H'0040	32
	ECC error address register 0_1	<REG_base>EAD0_1	R	H'0000_0000	<ADR_base> + H'0050	32
	ECC error address register 1_1	<REG_base>EAD1_1	R	H'0000_0000	<ADR_base> + H'0054	32
	ECC error address register 2_1	<REG_base>EAD2_1	R	H'0000_0000	<ADR_base> + H'0058	32
	ECC error address register 3_1	<REG_base>EAD3_1	R	H'0000_0000	<ADR_base> + H'005C	32
	ECC error address register 4_1	<REG_base>EAD4_1	R	H'0000_0000	<ADR_base> + H'0060	32
	ECC error address register 5_1	<REG_base>EAD5_1	R	H'0000_0000	<ADR_base> + H'0064	32
	ECC error address register 6_1	<REG_base>EAD6_1	R	H'0000_0000	<ADR_base> + H'0068	32
	ECC error address register 7_1	<REG_base>EAD7_1	R	H'0000_0000	<ADR_base> + H'006C	32
2	ECC control register_2	<REG_base>CTL_2	R/W	H'0000_0010	<ADR_base> + H'0080	32
	ECC error address register 0_2	<REG_base>EAD0_2	R	H'0000_0000	<ADR_base> + H'0090	32
	ECC error address register 1_2	<REG_base>EAD1_2	R	H'0000_0000	<ADR_base> + H'0094	32
	ECC error address register 2_2	<REG_base>EAD2_2	R	H'0000_0000	<ADR_base> + H'0098	32
	ECC error address register 3_2	<REG_base>EAD3_2	R	H'0000_0000	<ADR_base> + H'009C	32
	ECC error address register 4_2	<REG_base>EAD4_2	R	H'0000_0000	<ADR_base> + H'00A0	32
	ECC error address register 5_2	<REG_base>EAD5_2	R	H'0000_0000	<ADR_base> + H'00A4	32
	ECC error address register 6_2	<REG_base>EAD6_2	R	H'0000_0000	<ADR_base> + H'00A8	32
	ECC error address register 7_2	<REG_base>EAD7_2	R	H'0000_0000	<ADR_base> + H'00AC	32
3	ECC control register_3	<REG_base>CTL_3	R/W	H'0000_0010	<ADR_base> + H'00C0	32
	ECC error address register 0_3	<REG_base>EAD0_3	R	H'0000_0000	<ADR_base> + H'00D0	32
	ECC error address register 1_3	<REG_base>EAD1_3	R	H'0000_0000	<ADR_base> + H'00D4	32
	ECC error address register 2_3	<REG_base>EAD2_3	R	H'0000_0000	<ADR_base> + H'00D8	32

11.3 Register Descriptions

11.3.1 ECC Control Registers_n (<REG_base>CTL_n) (n = 0 to 7)

Each ECC control register_n is used to control the ECC function in the corresponding channel n shown in **Figure 11.1**.

After writing the initial value to the entire usage area of the on-chip RAM, set the given ECERVF bits to 1 to enable error detection. Be sure to write 01b to the corresponding EMCA[1:0] bits to enable writing to an ECERVF bit.

For writing the initial value to the on-chip RAM areas, refer to **Section 11.5, Initializing the Detection-Usage Areas of the On-Chip RAM**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	ECDEDF7	0	R	ECC 2-Bit Error Detection Flags ECDEDFm (m = 0 to 7) These bits indicate the occurrence of 2-bit errors in the data output from the RAM while error detection is enabled. The addresses of the errors will be stored in the <REG_base>EADm_n registers. ECC 1-Bit Error Detection Flags ECSEDFm (m = 0 to 7) These bits indicate the occurrence of 1-bit errors in the data output from the RAM while error detection is enabled. The addresses of the errors will be stored in the <REG_base>EADm_n registers. The ECDEDFm and ECSEDFm bits are cleared to 0 under any of the following conditions. 1. Power-on reset 2. Writing 1 to the corresponding ECER2C bit 3. Setting the ECC error detection enable bit to “disabled” (ECERVF = 0) 4. Reset by WDT overflow
30	ECSEDF7	0	R	
29	ECDEDF6	0	R	
28	ECSEDF6	0	R	
27	ECDEDF5	0	R	
26	ECSEDF5	0	R	
25	ECDEDF4	0	R	
24	ECSEDF4	0	R

22	ECSEDF3	0	R	
21	ECDEDF2	0	R	
20	ECSEDF2	0	R	
19	ECDEDF1	0	R	
18	ECSEDF1	0	R	
17	ECDEDF0	0	R	
16	ECSEDF0	0	R	
15, 14	EMCA[1:0]	00b	R/W	Enable Writing to ECERVF 01b: Enabled Others: Disabled These bits are always read as 00b.
13, 12	—	00b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

Bit	Bit Name	Initial Value	R/W	Description
11	ECOVFF	0	R	ECC Overflow Detection Flag This bit is set to 1 and an overflow interrupt is output on detection of an error when the ECC error address registers (<REG_base>EADm_n (m = 0 to 7)) all contain data. An overflow interrupt is output even if the error is detected while the setting of this bit is already 1. This bit is cleared to 0 under any of the following conditions. 1. Power-on reset 2. Writing 1 to the corresponding ECER2C bit or ECER1C bit 3. Setting the ECC error detection enable bit to “disabled” (ECERVF = 0)
10	ECER2C	0	R/W	2-Bit Error Detection Flag Clear 0: The internal state does not change. 1: The corresponding 2-bit error detection flag ECER2F is cleared. This bit is always read as 0.
9	ECER1C	0	R/W	1-Bit Error Detection Flag Clear 0: The internal state does not change. 1: The corresponding 1-bit error detection flag ECER1F is cleared. This bit is always read as 0.
8, 7	—	00b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
6	ECERVF	0	R/W	ECC Error Detection Enable 0: Disables error detection. 1: Enables error detection. 1-bit error correction (EC1ECP) and interrupt control (EC2EDIC and EC1EDIC) are only possible when error detection is enabled. *Note*: To write to this bit, the corresponding EMCA[1:0] bits must be set to 01b.
5	EC1ECP	0	R/W	1-Bit Error Correction Enable 0: The error is corrected when a 1-bit error is detected. 1: The error is not corrected when a 1-bit error is detected.
4	EC2EDIC	1	R/W	2-Bit Error Detection Interrupt Control 0: An interrupt is not generated when a 2-bit error is detected. 1: An interrupt is generated when a 2-bit error is detected. The interrupt is only generated when the corresponding 2-bit error detection flag (ECER2F) changes from 0 to 1.
3	EC1EDIC	0	R/W	1-Bit Error Detection Interrupt Control 0: An interrupt is not generated when a 1-bit error is detected. 1: An interrupt is generated when a 1-bit error is detected. The interrupt is only generated when the corresponding 1-bit error detection flag (ECER1F) changes from 0 to 1.
2	ECER2F	0	R	2-Bit Error Detection Flag 0: A 2-bit error has not occurred. 1: A 2-bit error has occurred. This bit is cleared to 0 under any of the following conditions. 1. Power-on reset 2. Writing 1 to the corresponding ECER2C bit 3. Setting the ECC error detection enable bit to "disabled" (ECERVF = 0)
1	ECER1F	0	R	1-Bit Error Detection Flag 0: A 1-bit error has not occurred. 1: A 1-bit error has occurred. This bit is cleared to 0 under any of the following conditions. 1. Power-on reset 2. Writing 1 to the corresponding ECER1C bit 3. Setting the ECC error detection enable bit to "disabled" (ECERVF = 0)

Bit	Bit Name	Initial Value	R/W	Description
0	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

11.3.2 ECC Error Address Registers m_n (<REG_base>EADm_n) (m = 0 to 7) (n = 0 to 7)

When a 1- or 2-bit error occurs, up to eight error addresses are sequentially stored in the registers from <REG_base>EAD0_n to <REG_base>EAD7_n.

When a 2-bit error is detected while only 1-bit error addresses were stored up to <REG_base>EAD7_n, <REG_base>EAD7_n is overwritten by the address of the 2-bit error. Otherwise, it will not be overwritten. For details, refer to **Section 11.6.4, ECC Error Address Register Overwrite Conditions**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEAD0[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEAD0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ECEAD0 [31:0]	All 0	R	These bits hold the address of the (m + 1)th error to have been detected. These bits are cleared to 0 under the following condition: clearing ECER2F or ECER1F in the <REG_base>CTL_n register.

11.4 Initializing the ECC Function

Initialize the ECC by following the procedure below to enable the ECC function.

1. Set the VECCEN bit in the ECCRAM setting register corresponding to the RAM area for which the ECC function is to be enabled to 1.
2. Write the initial value to the entire usage area of the RAM for which the ECC function is to be enabled.
3. Set the ECERVF bits in the ECC control registers_n to 1 to enable error detection. Then, set the respective bits to control 1-bit error correction and interrupts.

For notes on the settings of registers of this module, refer to **Section 11.6.1, Notes on Setting the Registers of This Module**.

11.5 Initializing the Detection-Usage Areas of the On-Chip RAM

Before using the ECC function, write the initial value to the entire usage area of the on-chip RAM for which the ECC function is to be enabled. The initial value can be any value. Since the detection of ECC errors is handled in 32-bit units in each channel, the initial value should also be written in 32-bit units.

Enabling error detection without initialization may cause an ECC error due to unintended reading.

Examples of Operations that May Lead to Errors

1. When writing is to proceed in 8- or 16-bit units, reading the 32-bit value from the given address and then writing the data
2. If the locations are not initialized, an ECC error may occur when the 32-bit value is read. For details on writing in 8- or 16-bit units, refer to **section 11.6.2, 8- or 16-Bit Access**.
3. When the CPU cache is enabled, if a cache miss occurs in writing, the cache being refilled by a 1-line unit
   At this time if data are not initialized, an ECC error may occur because data are read in 1-line (32-byte) units.

11.6 Usage Notes

11.6.1 Notes on Setting the Registers of This Module

Ensure that none of the bus masters proceeds with access to the on-chip RAM areas while the registers listed in **Table 11.3** are being set up.

11.6.2 8- or 16-Bit Access

The ECC function for the on-chip RAM areas handles error detection in 32-bit units. Accordingly, when access is to be in 8- or 16-bit units, the operations proceed as follows.

(1) 8- or 16-bit reading

(a) The 32 bits of data are read and the ECC is used to determine whether or not an error is present.

(b) The 8 or 16 bits of data are then returned to the bus master that issued the read request.

(2) 8- or 16-bit writing

(a) The 32 bits of data from the address that contains the location for writing are read and the ECC is used to determine whether or not an error is present.

(b) The 32 bits of data that have been read are then overwritten with the 8- or 16-bit data.

(c) The ECC value for the overwritten 32-bit data in (b) is added by writing it to the RAM.

11.6.3 Numbers of Cycles for Reading from or Writing to a RAM Area with the ECC Function Enabled

The numbers of cycles for reading from or writing to an on-chip RAM area with the ECC function enabled are as follows.

(1) Reading

The number of cycles for reading in 8- or 16-bit and 32-bit units when the ECC function is enabled is one cycle of SRAM_ACPU_ACLK or SRAM_MCPU_ACLK longer than when the ECC function is disabled.

(2) Writing

The number of cycles for writing in 8- or 16-bit units when the ECC function is enabled is two cycles of SRAM_ACPU_ACLK or SRAM_MCPU_ACLK longer than when the ECC function is disabled. The number of cycles for writing in 32-bit units when the ECC function is enabled is the same as when the ECC function is disabled.

11.6.4 ECC Error Address Register Overwrite Conditions

If a new ECC error occurs with the ECC error address stored up to <REG_base> EAD7_n, <REG_base> EAD7_n may or may not be overwritten. The conditions to be overwritten are shown below.

Error Address Storage Status Up to <REG_base> EAD7_n	New ECC Error	<REG_base>EAD7_n Overwrite	Overflow Interrupt
Only 1-bit error	1-bit error	Not overwritten	Occur
Only 1-bit error	2-bit error	Overwritten	Occur
Only 2-bit error	1-bit error	Not overwritten	Occur
Only 2-bit error	2-bit error	Not overwritten	Occur
1-bit error and 2-bit error	1-bit error	Not overwritten	Occur
1-bit error and 2-bit error	2-bit error	Not overwritten	Occur

12. Message Handling Unit (MHU)

MHU is a function for message communication between Cortex-A55(CA55) cores and Cortex-M33(CM33). Message communication is done by shared RAM (On-chip RAM) for passing message and response between CPUs and the function (MHU) for notifying when messages and responses are stored in the memory.

12.1 Features

Table 12.1 shows MHU feature summary.

Table 12.1 Feature summary

Feature	Description
Interrupt by Message and response	Generate interrupt to notify each Cortex-A55 or Cortex-M33 when the message/response is stored in shared RAM (On-chip RAM).
Software interrupt control	Control registers for interrupt setting, clearing, and status confirmation

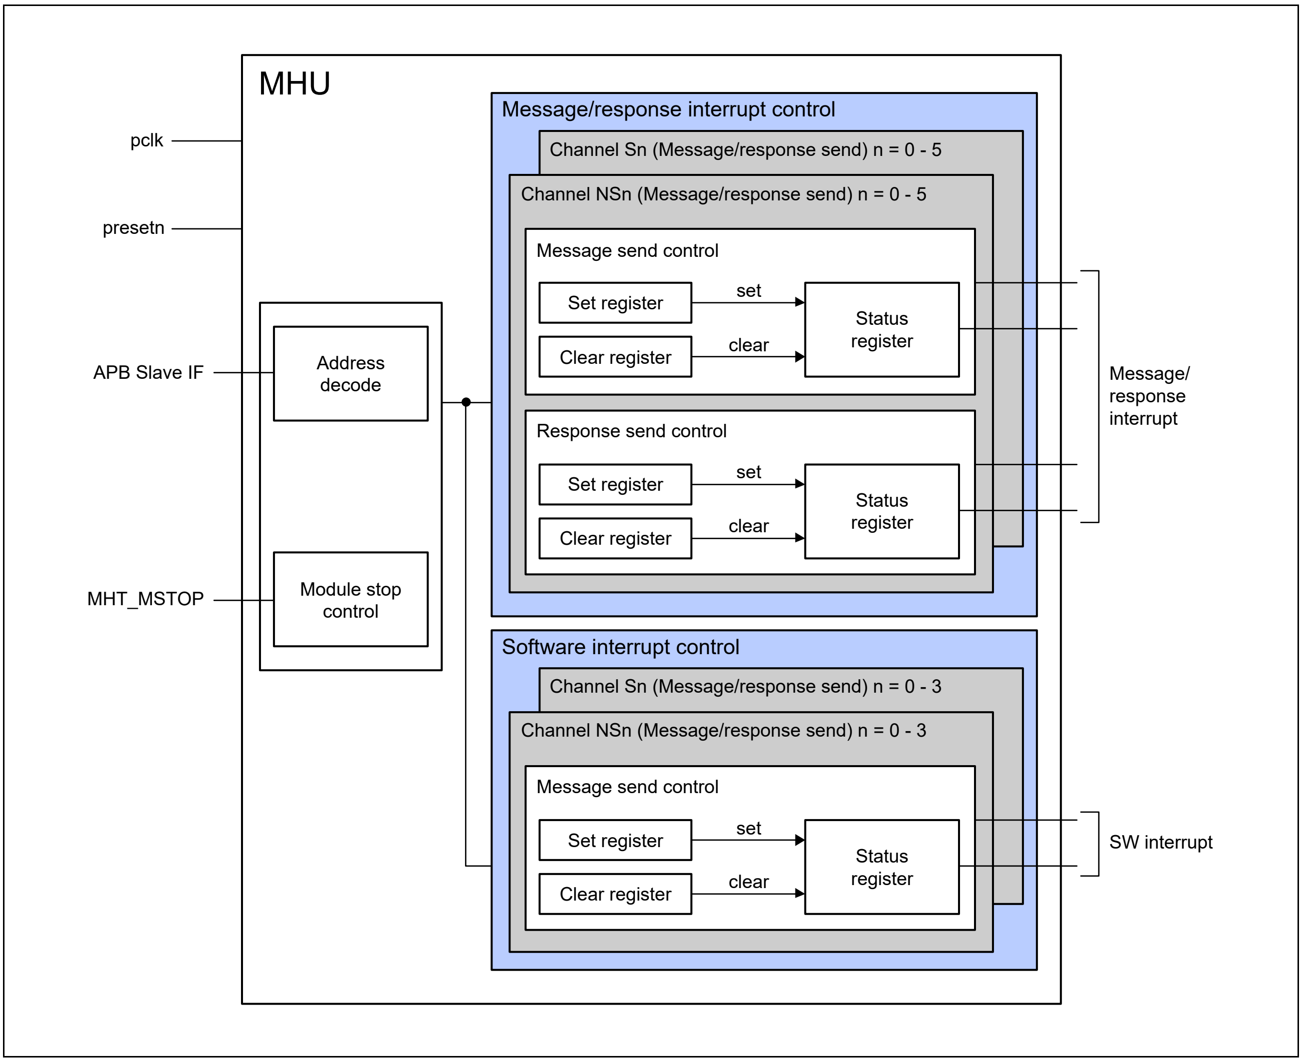

Figure 12.1 MHU Block diagram

Message/response interrupt control registers

Registers that control message/response interrupts.

The message/response interrupt control register controls interrupts with the set register, clear register, and status register. An interrupt is asserted by writing “1” to the set register. The interrupt is negated by writing “1” to the clear register. The status can be checked by reading the status register. With these as one set, the message transmission processing register

One channel is composed of a pair of data transmission processing register and response transmission processing register, and a total of 12 channels are mounted. The breakdown of 12 channels is as follows.

Shows MHU feature summary.

Non-Secure interrupt control register(Channel NS0-5):

Channel NS0 (CA55 Core0: Message transmission/CA55 Core1: Response transmission)

Channel NS1 (CA55 Core0: Message transmission/CM33: Response transmission)

Channel NS2 (CA55 Core1: Message transmission/CA55 Core0: Response transmission)

Channel NS3 (CA55 Core1: Message transmission/CM33: Response transmission)

Channel NS4 (CM33: Message transmission/CA55 Core0: Response transmission)

Channel NS5 (CM33: Message transmission/CA55 Core1: Response transmission)

Secure interrupt control register(Channel S0-5):

Channel S0 (CA55 Core0: Message transmission/CA55 Core1: Response transmission)

Channel S1 (CA55 Core0: Message transmission/CM33 : Response transmission)

Channel S2 (CA55 Core1: Message transmission/CA55 Core0: Response transmission)

Channel S3 (CA55 Core1: Message transmission/CM33: Response transmission)

Channel S4 (CM33: Message transmission/CA55 Core0: Response transmission)

Channel S5 (CM33: Message transmission/CA55 Core1: Response transmission)

Software interrupt control register

Registers that control software interrupts.

The software interrupt control register controls interrupts using the set register, clear register, and status register. An interrupt is asserted by writing “1” to the set register. The interrupt is negated by writing “1” to the clear register. You can also check the interrupt status by reading the status register. With these as one set, the message transmission processing register and response.

One channel is composed of a pair of transmission processing registers, and a total of 4 channels are mounted.

Module stop control

This circuit refers to the module stop control (MHU_MSTOP) in CPG_MHU_MSTOP register on Clock Pulse Generator (CPG) and returns an error response if an access occurs while the module is stopped.

12.2 Interrupt

Table 12.2 shows interrupt output.

Table 12.2 Interrupt type

Output	Description	Pulse/Level	Active Level
msg_ch0_ns	Non secure message transmission interrupt (CA55 Core0 -> CA55 Core1)	Level	HIGH
rsp_ch0_ns	Non secure response transmission interrupt (CA55 Core1 -> CA55 Core0)	Level	HIGH
msg_ch1_ns	Non secure message transmission interrupt (CA55 Core0 -> CM33)	Level	HIGH
rsp_ch1_ns	Non secure response transmission interrupt (CM33 -> CA55 Core0)	Level	HIGH
msg_ch2_ns	Non secure message transmission interrupt (CA55 Core1 -> CA55 Core0)	Level	HIGH
rsp_ch2_ns	Non secure response transmission interrupt (CA55 Core0 -> CA55 Core1)	Level	HIGH
msg_ch3_ns	Non secure message transmission interrupt (CA55 Core1 -> CM33)	Level	HIGH
rsp_ch3_ns	Non secure response transmission interrupt (CM33 -> CA55 Core1)	Level	HIGH
msg_ch4_ns	Non secure message transmission interrupt (CM33 -> CA55 Core0)	Level	HIGH
rsp_ch4_ns	Non secure response transmission interrupt (CA55 Core0 -> CM33)	Level	HIGH
msg_ch5_ns	Non secure message transmission interrupt (CM33 -> CA55 Core1)	Level	HIGH
rsp_ch5_ns	Non secure response transmission interrupt (CA55 Core1 -> CM33)	Level	HIGH
msg_ch0_s	Secure message transmission interrupt (CA55 Core0 -> CA55 Core1)	Level	HIGH
rsp_ch0_s	Secure response transmission interrupt (CA55 Core1 -> CA55 Core0)	Level	HIGH
msg_ch1_s	Secure message transmission interrupt (CA55 Core0 -> CM33)	Level	HIGH
rsp_ch1_s	Secure response transmission interrupt (CM33 -> CA55 Core0)	Level	HIGH
msg_ch2_s	Secure message transmission interrupt (CA55 Core1 -> CA55 Core0)	Level	HIGH
rsp_ch2_s	Secure response transmission interrupt (CA55 Core0 -> CA55 Core1)	Level	HIGH
msg_ch3_s	Secure message transmission interrupt (CA55 Core1 -> CM33)	Level	HIGH
rsp_ch3_s	Secure response transmission interrupt (CM33 -> CA55 Core1)	Level	HIGH
msg_ch4_s	Secure message transmission interrupt (CM33 -> CA55 Core0)	Level	HIGH
rsp_ch4_s	Secure response transmission interrupt (CA55 Core0 -> CM33)	Level	HIGH
msg_ch5_s	Secure message transmission interrupt (CM33 -> CA55 Core1)	Level	HIGH
rsp_ch5_s	Secure response transmission interrupt (CA55 Core1-> CM33)	Level	HIGH
sw_mhu_int_0	software interrupt 0 (CA55-CM33)	Level	HIGH
sw_mhu_int_1	software interrupt 1 (CA55-CM33)	Level	HIGH
sw_mhu_int_2	software interrupt 2 (CA55-CM33)	Level	HIGH
sw_mhu_int_3	software interrupt 3 (CA55-CM33)	Level	HIGH

12.3 Register Configuration

Table 12.3 shows address mapping for MHU. MHU has 4KB address space.

Table 12.3 MHU Address map

Offset Address (CA55 MHU Base address: H’0_1040_0000) (CM33 non-secure MHU Base address: H’4040_0000) (CM33 secure MHU Base address: H’5040_0000)	Description
H’0000 - H’07FF	Non secure message/response interrupt control register
H’0800 - H’0FFF	Non secure software interrupt control register
H’1000 - H’17FF	Secure message/response interrupt control register
H’1800 - H’1FFF	Reserved
H’2000 - H’FFFF	Reserved

Note: Prohibit to access Reserved area.

Table 12.4 shows register attributes

Table 12.4 Register attributes

Attribute	Description
RW	Read&Write register
RW0	Read &Write 0 register. Invalid Write 1.
RW1	Read&Write 1 register. Invalid Write 0.
R0W	Read0&Write register. Always Read 0.
R1W	Read1&Write register. Always Read 1.
R	Read Only
R0W0	Read0&Write0 register. Always Read 0. Invalid Write 1.
R0W1	Read0&Write1 register. Always Read 0. Invalid Write 0.
R1W0	Read1&Write0 register. Always Read 1. Invalid Write 1.
R1W1	Read1&Write1 register. Always Read 1. Invalid Write 0.
RCW0	Read by clear. Write0 register. Invalid Write 1.
RCW1	Read by clear. Write1 register. Invalid Write 0.

Note: No guarantee function for access to Reserved area, Debug and undefined area.

Table 12.5 shows registers

Table 12.5 List of Registers (1/4)

Offset Address	Register Name	Abbreviation	Initial value	Access Size
Non Secure message/response interrupt				
Non secure message transmission interrupt register (CA55 Core0 -> CA55 Core1) channel 0

12.5 Function description

12.5.1 Inter CPU communication

The hardware configuration is shown in **Figure 12.2**. Inter-CPU communication is established by sending a message from the message source to the message destination and sending a response from the message destination to the message source. The MHU uses an interrupt to notify that the message / response to the CPU has been written to Shared RAM(On-chip RAM). Interrupts are controlled by the Set register, Clear register, and Status register. Interrupt can be asserted by writing "1" to the Set register. Interrupt is negated by writing "1" to the Clear register, and check the interrupt status by reading the Status register. With these registers as one set, one channel is composed of a message transmission processing / response transmission processing pair. A total of 12 channels are installed so that bidirectional communication can be performed between Cortex-A55 Core0, Cortex-A55 Core1 and Cortex-M33. **Table 12.6** shows the channel and message source / destination correspondence.

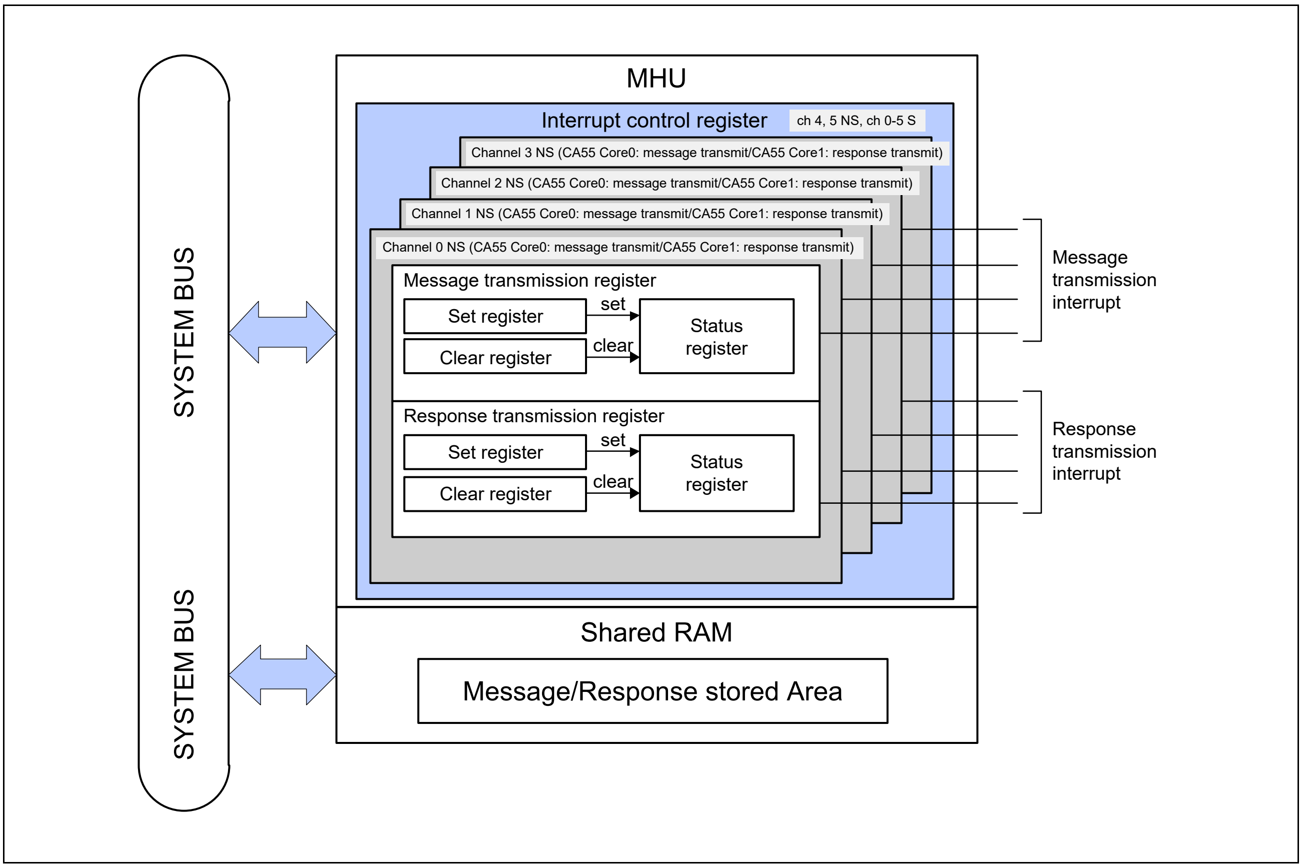

Figure 12.2 Hardware configuration

Table 12.6 Channel and message destination/source reference

channel	Source	Destination	Message transmit register	Response transmit register
channel 0 NS	CA55 Core0	CA55 Core1	MSG_INT_(SET/CLR/STS)0_NS	RSP_INT_(SET/CLR/STS)0_NS
channel 1 NS	CA55 Core0	CM33	MSG_INT_(SET/CLR/STS)1_NS	RSP_INT_(SET/CLR/STS)1_NS
channel 2 NS	CA55 Core1	CA55 Core0	MSG_INT_(SET/CLR/STS)2_NS	RSP_INT_(SET/CLR/STS)2_NS
channel 3 NS	CA55 Core1	CM33	MSG_INT_(SET/CLR/STS)3_NS	RSP_INT_(SET/CLR/STS)3_NS
channel 4 NS	CM33	CA55 Core0	MSG_INT_(SET/CLR/STS)4_NS	RSP_INT_(SET/CLR/STS)4_NS
channel 5 NS	CM33	CA55 Core1	MSG_INT_(SET/CLR/STS)5_NS	RSP_INT_(SET/CLR/STS)5_NS
channel 0 S	CA55 Core0	CA55 Core1	MSG_INT_(SET/CLR/STS)0_S	RSP_INT_(SET/CLR/STS)0_S
channel 1 S	CA55 Core0	CM33	MSG_INT_(SET/CLR/STS)1_S	RSP_INT_(SET/CLR/STS)1_S
channel 2 S	CA55 Core1	CA55 Core0	MSG_INT_(SET/CLR/STS)2_S	RSP_INT_(SET/CLR/STS)2_S
channel 3 S	CA55 Core1	CM33	MSG_INT_(SET/CLR/STS)3_S	RSP_INT_(SET/CLR/STS)3_S
channel 4 S	CM33	CA55 Core0	MSG_INT_(SET/CLR/STS)4_S	RSP_INT_(SET/CLR/STS)4_S
channel 5 S	CM33	CA55 Core1	MSG_INT_(SET/CLR/STS)5_S	RSP_INT_(SET/CLR/STS)5_S

12.6 Operation sequence

12.6.1 Message transmit sequence

Show Message transmit sequence from Cortex-M33 to Cortex-A55 Core0 in below and **Figure 12.3**.

(1)	Cortex-M33:	Check “0” for bit0 in register: MSG_INT_STS4. (Confirm cleared status and move to (2))
(2)	Cortex-M33:	Write message to Shared RAM
(3)	Cortex-M33:	Write “1” to bit 0 in register: MSG_INT_SET4
(4)	MHU channel 4:	Assert interrupt: int_msg_ch4 for Cortex-A55
(5)	Cortex-A55 Core0:	Check interrupt reason (Detect message transmit)
(6)	Cortex-A55 Core0:	Check “1” for bit 0 in register: MSG_INT_STS4
(7)	Cortex-A55 Core0:	Read message from shared RAM
(8)	Cortex-A55 Core0:	Write “1” to bit0 in register: MSG_INT_CLR4
(9)	MHU channel 4:	Negate interrupt: int_msg_ch4 to Cortex-A55

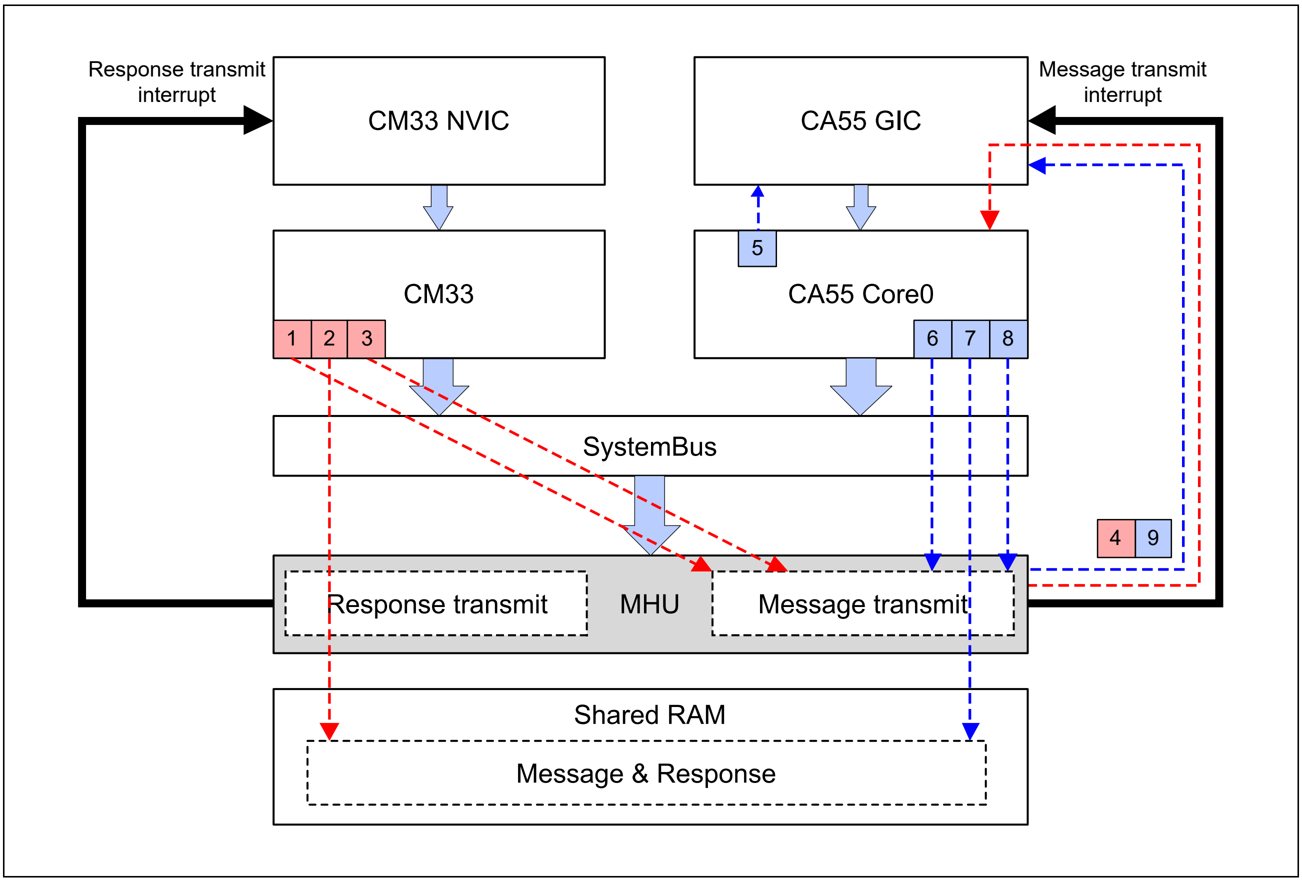

Figure 12.3 Message transmit sequence (CM33 -> CA55 Core0)

12.6.2 Response transmit sequence

Show Response transmit sequence from Cortex-A55 Core0 to Cortex-M33 in below and **Figure 12.4**.

(1) Cortex-A55 Core0: Check “0” for bit0 in register: RSP_INT_STS4.
(Confirm cleared status and move to (2))

(2) Cortex-A55 Core0: Write Response to Shared RAM

(3) Cortex-A55 Core0: Write “1” to bit 0 in register: RSP_INT_SET4

(4) MHU channel 4: Assert interrupt: int_rsp_ch2 for Cortex-M33

(5) Cortex-M33: Check interrupt reason (Detect response transmit)

(6) Cortex-M33: Check “1” for bit 0 in register: RSP_INT_STS4

(7) Cortex-M33: Read response from shared RAM

(8) Cortex-M33: Write “1” to bit0 in register: RSP_INT_CLR4

(9) MHU channel 4: Negate interrupt:int_rsp_ch4 to Cortex-M33

13. TrustZone Address Space Controller (TZC)

13.1 Overview

This LSI has four TrustZone Address Space Controller (TZC) to realize memory access in a safe area. It performs security checks on transactions to memory or peripherals. Transactions must meet security requirements to access memory or peripherals. This is an IP (“CoreLink™ TrustZone Address Space Controller TZC-400”) provided by Arm, for details on the functions of TZC-400, see the relevant Technical Reference Manual.

13.1.1 Features

The TZC works between TrustZone system ACE-Lite masters and ACE-Lite slaves to filter bus access from master to slave. It performs filtering based on the security requirements specified in the address space.

Each TZC is installed on the interface of the following modules of this LSI.

- Internal RAM for ACPU (64 KB)
- Internal RAM for MCPU (64 KB)
- SPI Multi I/O Bus Controller
- DDR3L/DDR4 SDRAM Memory Controller

For details on the internal bus, please refer to **Section 5, LSI Internal Bus**.

The TZC provides the following key features:

- The ability to define up to eight address regions in the area map.
- A default base region to cover all remaining portions of the address map.
- Software programmable security access permissions for each address region through an APB interface.
  This includes the default base region, Region 0.
- Filter units only allow data transfer between an ACE-Lite master and an ACE-Lite slave if the security status of the ACE-Lite transaction and its identity match the security settings of the memory region it addresses.
- Common region configuration register settings shared between multiple filter units.
- Normal path for accesses with a much higher outstanding access support.
- Identity-based filtering of Non-secure accesses.
- Reporting and interrupt signaling that is configurable from software to manage failed permission checks.
  You can program the TZC to assert TZCnINT (n = 0, 1, 2, 3) when an access fails its security check.
- Gate keeper to allow or block accesses to each filter unit.
- Support for 256 outstanding transactions on the normal paths.

13.1.2 Block Diagram

Figure 13.1 shows a block diagram.

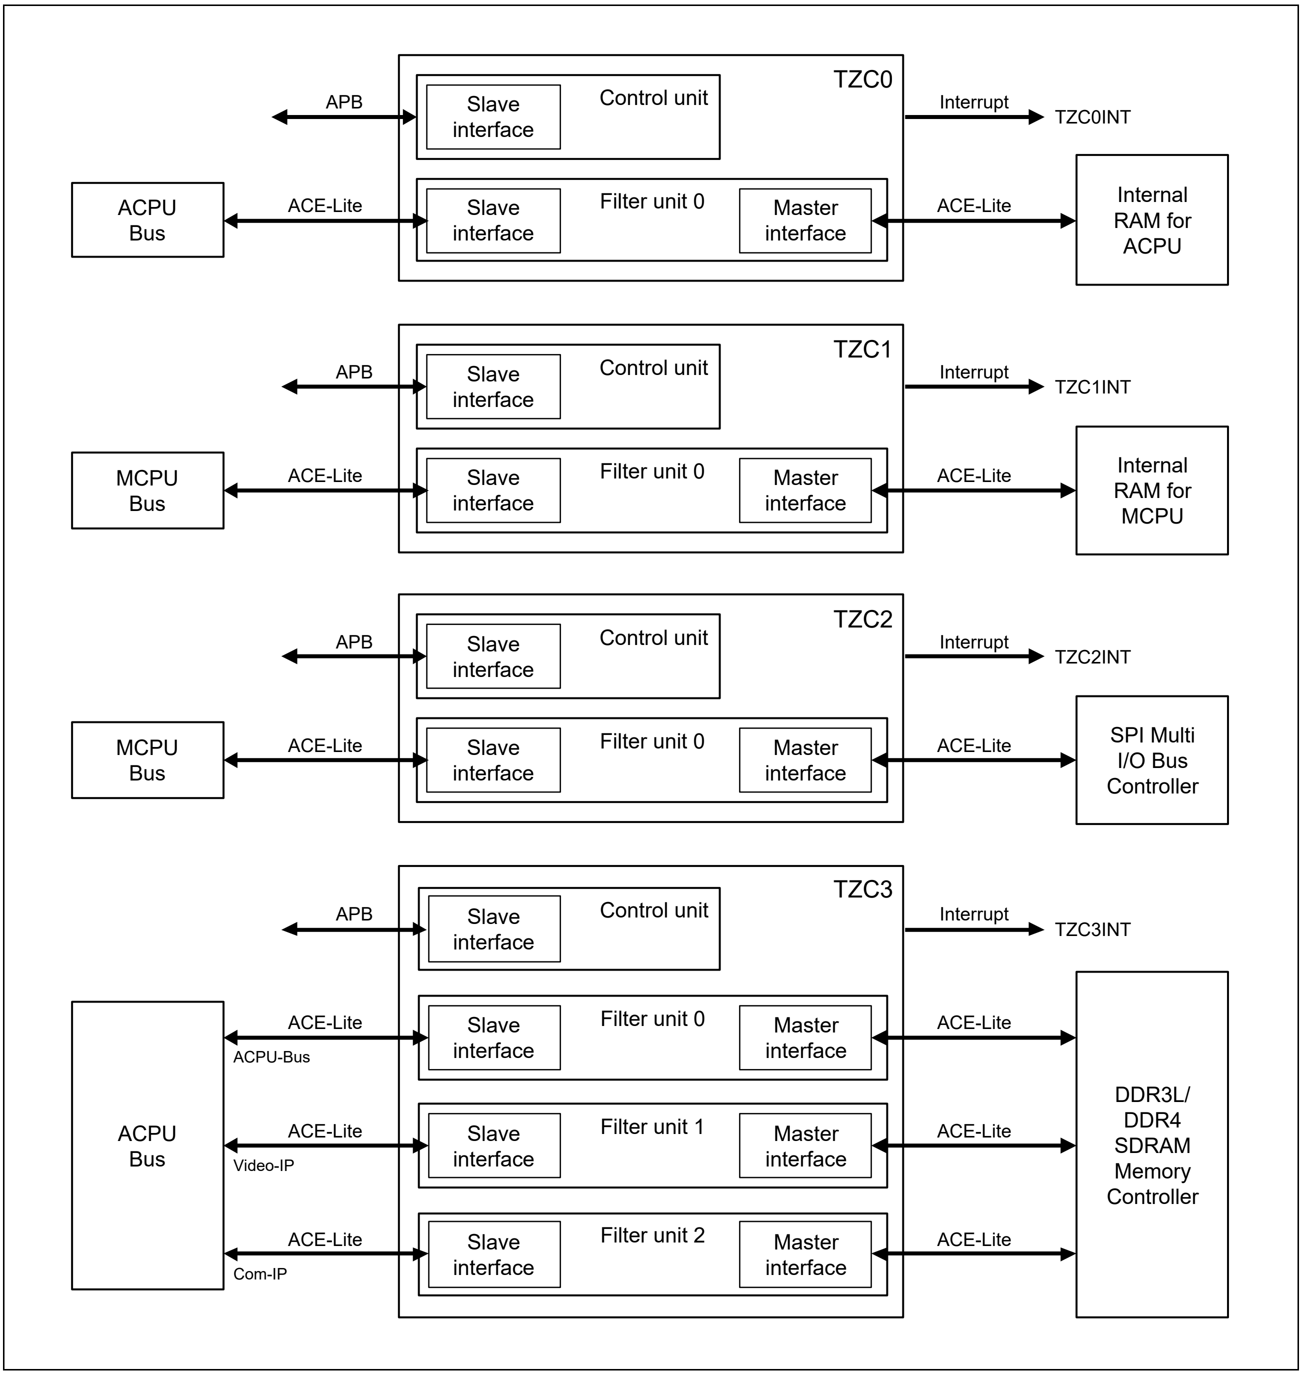

Figure 13.1 Block Diagram

Filter units perform security checks. Each filter unit has an ACE-Lite slave interface and an ACE-Lite master interface. All filter units operate from one set of shared region configuration registers. This ensures consistency across all filter units.

The number of filter units of TZC installed on each interface is as follows.

- Internal RAM for ACPU (64 KB): 1 filter unit
- Internal RAM for MCPU (64 KB): 1 filter unit
- SPI Multi I/O Bus Controller: 1 filter unit
- DDR3L/DDR4 SDRAM Memory Controller: 3 filter units
    - filter unit 0: Access from the ACPU bus passes
    - filter unit 1: Access from the Video IP passes
    - filter unit 2: Access from the Communication IP passes

13.1.3 External Pins

In TZC, there are no external pins.

13.2 Register Configuration

The base address of the TZC associated with each module is as follows:

- TZC0: Internal RAM for ACPU (64KB)

  H’0_1104_0000 (Cortex-A55 Address Space)
  H’4104_0000 (Cortex-M33 Address Space Non-Secure)
  H’5104_0000 (Cortex-M33 Address Space Secure)

- TZC1: Internal RAM for MCPU (64KB)

  H’0_1105_0000 (Cortex-A55 Address Space)
  H’4105_0000 (Cortex-M33 Address Space Non-Secure)
  H’5105_0000 (Cortex-M33 Address Space Secure)

- TZC2: SPI Multi I/O Bus Controller

  H’0_1106_0000 (Cortex-A55 Address Space)
  H’4106_0000 (Cortex-M33 Address Space Non-Secure)
  H’5106_0000 (Cortex-M33 Address Space Secure)

- TZC3: DDR3L/DDR4 SDRAM Memory Controller

  H’0_1107_0000 (Cortex-A55 Address Space)
  H’4107_0000 (Cortex-M33 Address Space Non-Secure)
  H’5107_0000 (Cortex-M33 Address Space Secure)

For details on the functions of TZC-400, see the relevant Technical Reference Manual. (ARM® CoreLink™ TZC-400 TrustZone® Address Space Controller Technical Reference Manual, Revision: r0p1)

13.3 Register Descriptions

For details on the functions of TZC-400, see the relevant Technical Reference Manual. (ARM® CoreLink™ TZC-400 TrustZone® Address Space Controller Technical Reference Manual, Revision: r0p1)

TZC has registers to specify the address area where access is controlled. Please refer Overall Address Space (**Table 5.1, Detailed Address Space**) for the addresses specified in these registers.

13.4 Operation

For details on the functions of TZC-400, see the relevant Technical Reference Manual. (ARM® CoreLink™ TZC-400 TrustZone® Address Space Controller Technical Reference Manual, Revision: r0p1)

13.5 Usage Note

For details on the functions of TZC-400, see the relevant Technical Reference Manual. (ARM® CoreLink™ TZC-400 TrustZone® Address Space Controller Technical Reference Manual, Revision: r0p1)

14. Direct Memory Access Controller

The direct memory access controller can be used in place of the CPU to perform high-speed transfers between external memory, on-chip memory, memory-mapped external devices, and on-chip peripheral modules.

This module has controllers that handles secure and non-secure access. Do not assign the same DMA transfer request to secure access and non- secure access, respectively.

14.1 Features

- Number of channels selectable: 16 channels (CH0 to CH15).
- 4-Gbyte address space (according to the architecture)
- Transfer data size: Byte, 2 bytes, 4 bytes, 8 bytes, 16 bytes, 32 bytes, 64 bytes, and 128 bytes
- Maximum transfer count: $2^{32} - 1$ bytes
- Address mode: Dual address mode
- Transfer requests: Can be selected from the two types of on-chip peripheral module request, and auto request (software trigger)
- Transfer mode: Single transfer mode and block transfer mode are selectable.
- Priority: The channel priority levels within channels 0 to 7 and within channels 8 to 15 are selectable between fixed mode and round-robin mode (the channel priority level between the group of channels 0 to 7 and the group of channels 8 to 15 is round-robin mode).
- Interrupt request: An interrupt request can be sent to the CPU on completion of data transfer (DMA transfer end interrupt per channel) or on occurrence of a transfer error (DMA error interrupt).
- The DMA registers have a continuous execution function that allows the next DMA transfer to be executed continuously by making settings for the next DMA transfer during execution of the current DMA transfer. This continuous execution function can be enabled or disabled independently in each channel.
- Link mode: In this mode, the setting data (descriptor data) located in the memory by the CPU is automatically retrieved by the DMAC, and DMA transfer is performed according to those values.
- Buffer sweep: If an ongoing DMA transfer is forced to end, the data already retrieved into the buffer can be output before DMA transfer ends.
- Interval: A specific DMA transfer interval can be specified to adjust the bus occupancy.

14.2 Input/Output Pins

Requests from external pins are not supported.

14.3 Register Configuration

The register configuration is shown in the figure below.

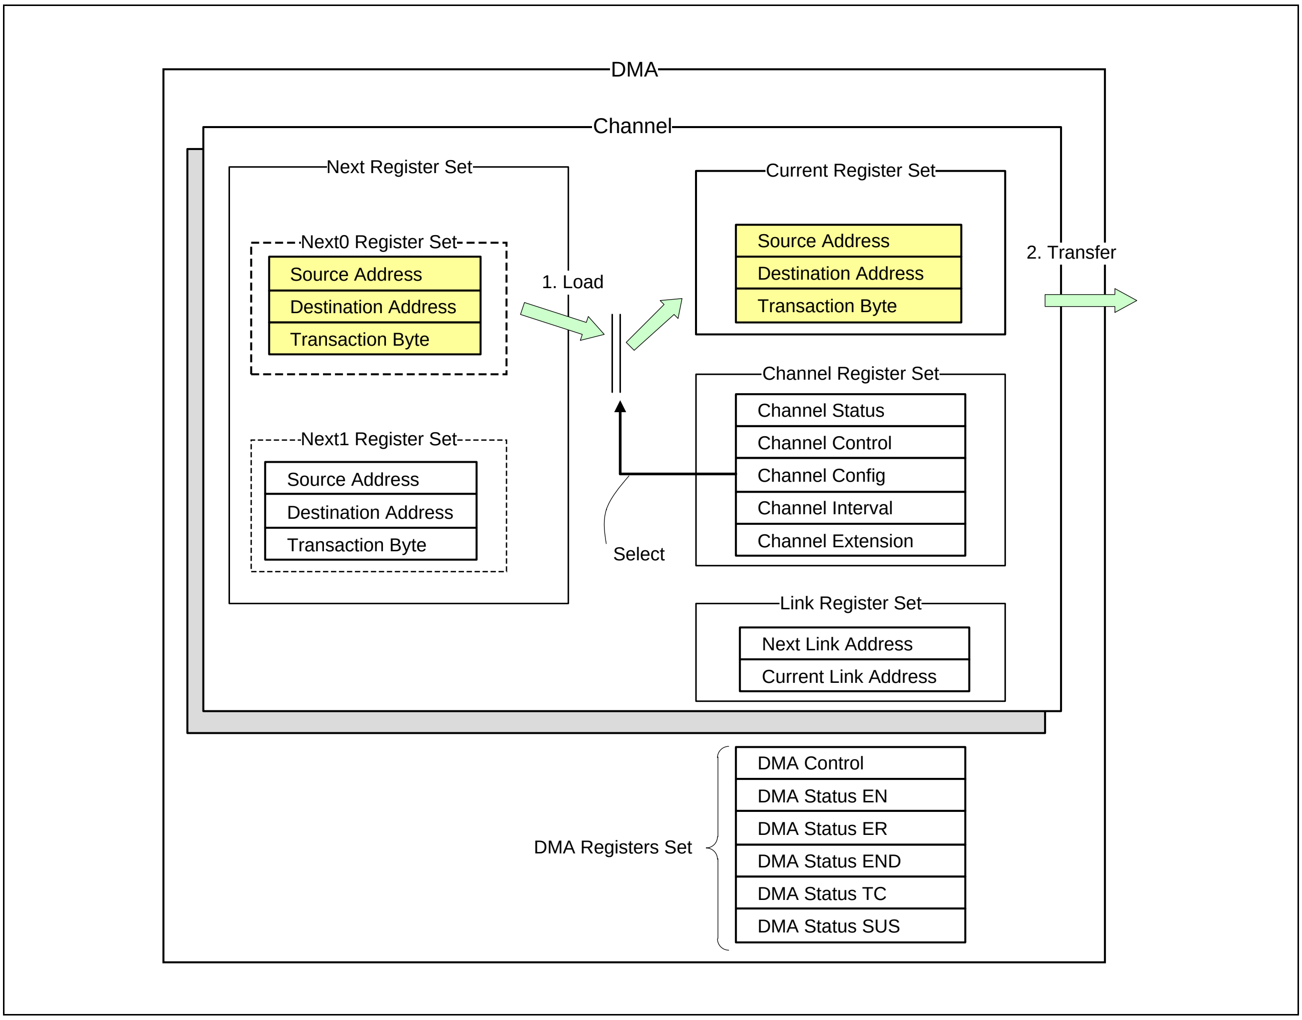

Figure 14.1 Register Configuration

(a) Next Register Set

This register set is used to set the source address, destination address, and transfer byte count of the DMA transaction to be executed next.

It consists of the Next0 register set and the Next1 register set.

In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.

These registers set values are loaded to the Current Register Set and used for DMA transfer.

(b) Current Register Set

This register set indicates the source address, destination address, and transfer byte count of the currently executed DMA transaction.

The values are loaded from the Next0/1 register set (register mode) or from the descriptor read data (link mode). The user cannot write directly to this register set.

The register set is automatically updated each time a DMA transaction is executed.

(c) Channel Register Set

This register set is used to make the DMA transfer settings.
The settings to be made with this register set include channel status indication, channel control, DMA transaction setting, and DMA transaction interval.

(d) Link Register Set

This register set consists of a register that sets the address of the descriptor to be loaded next in link mode (Next Link Address Register) and a register that indicates the address of the currently executed descriptor (Current Link Address Register).

The Current Link Address Register is automatically updated when a descriptor is read. The user cannot write directly to this register set.

(e) DMA Register Set

This register set consists of a register that controls DMA as a whole and registers that indicate the status of the corresponding channels. It enables channel priority control as well as the monitoring of the channel status (EN, ER, END, TC, and SUS).

(f) Extended Resource Selector Register Set

This register set is used to select the on-chip peripheral module to perform DMA transfer request.

14.4 Register Descriptions

Table 14.1 lists the register configuration. There are eleven control registers and five status registers for each channel, and twelve common control registers are used by all channels. In addition, there is one extension resource selector per two channels.

The notation for the registers of each channel is as follows.

- Next 0 Source Address Register of channel 0 for secure access: Next 0 Source Address Register 0S (abbreviation: N0SA_0S)
- Next 0 Source Address Register of channel 0 for non-secure access: Next 0 Source Address Register 0 (abbreviation: N0SA_0)

14.4.1 Next Source Address Register n/nS (N0SA_n/nS, N1SA_n/nS)

This register sets the DMA transfer source address (32 bits) of DMA channel n (n = 0 to 15) which is to be executed next. N0SA_n/nS is for the Next0 Register Set, and N1SA_n/nS is for the Next1 Register Set.

In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.

These register set values are loaded to the Current Register Set and used for DMA transfer.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SA	All 0	R/W	Source Address Sets the start address of the DMA transfer source.

14.4.2 Next Destination Address Register n/nS (N0DA_n/nS, N1DA_n/nS)

This register sets the DMA transfer destination address (32 bits) of DMA channel n (n = 0 to 15) which is to be executed next.

N0DA_n/nS is for the Next0 Register Set, and N1DA_n/nS is for the Next1 Register Set.

In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.

These register set values are loaded to the Current Register Set and used for DMA transfer.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DA	All 0	R/W	Destination Address Sets the start address of the DMA transfer destination.

14.4.3 Next Transaction Byte Register n/nS (N0TB_n/nS, N1TB_n/nS)

This register sets the total transfer byte count (DMA transaction) of DMA channel (n = 0 to 15) which is to be executed next.

N0TB_n/nS is for the Next0 Register Set, and N1TB_n/nS is for the Next1 Register Set.

In register mode, set this register set by using software. In link mode, the descriptor read data is automatically set in the Next0 register set.

These register set values are loaded to the Current Register Set and used for DMA transfer.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TB	All 0	R/W	Transaction Byte Sets the total transfer byte count. *Note*: Do not start a DMA transaction with 0 set in this register.

14.4.4 Current Source Address Register n/nS (CRSA_n/nS)

This register indicates the DMA transfer source address of DMA channel n (n = 0 to 15).

The values are loaded from the Next0/1 register set in register mode or from the descriptor read data in link mode. This register cannot be written by software.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRSA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRSA	All 0	R	Current Source Address Register Indicates the read address of the next DMA transaction. The value automatically increments during the DMA transaction. (The value is fixed when 1 is set in SAD of the CHCFG_n/nS register.) The value increments when a read transfer starts. Read this register after DMA stops (0 is set in EN of the CHSTAT_n/nS register). (Any value obtained during the DMA operation should be handled as a reference value.)

14.4.5 Current Destination Address Register n/nS (CRDA_n/nS)

This register indicates the DMA transfer destination address of DMA channel n (n = 0 to 15).

The values are loaded from the Next0/1 register set in register mode or from the descriptor read data in link mode. This register cannot be written by software.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	CRDA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRDA	All 0	R	Current Destination Address Register Indicates the write address of the next DMA transaction. The value automatically increments during the DMA transaction. (The value is fixed when 1 is set in DAD of the CHCFG_n/nS register.) The value increments when a write transfer starts. Read this register after DMA stops (0 is set in EN of the CHSTAT_n/nS register). (Any value obtained during the DMA operation should be handled as a reference value.)

14.4.6 Current Transaction Byte Register n/nS (CRTB_n/nS)

This register indicates the total transfer byte count of DMA channel n (n = 0 to 15). The value of this register becomes 0 when the transaction ends.

The values are loaded from the Next0/1 register set in register mode or from the descriptor read data in link mode. This register cannot be written by software.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRTB															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRTB															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRTB	All 0	R	Current Transaction Byte Register Indicates the remaining transfer byte count of the currently executed DMA transaction. The value automatically decrements during the DMA transaction. The value decrements when a write transfer is completed. Read this register after DMA stops (0 is set in EN of the CHSTAT_n/nS register). (Any value obtained during the DMA operation should be handled as a reference value.)

14.4.7 Channel Status Register n/nS (CHSTAT_n/nS)

This register indicates the status of DMA channel n (n = 0 to 15).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	INTMSK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MODE	DER	DW	DL	SR	TC	END	ER	SUS	TACT	RQST	EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
16	INTMSK	0	R	Indicates the temporary mask status of the DMA transfer end interrupt. 1: Masked temporarily 0: Unmasked temporarily Set condition(s): ● When SETINTMSK (CHCTRL_n/nS) is set to 1 Reset condition(s): ● When CLRINTMSK (CHCTRL_n/nS) is set to 1 ● When SWRST (CHCTRL_n/nS) is set to 1
15 to 12	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
11	MODE	0	R	DMA Mode Indicates the DMA mode. It corresponds to the value set in the DMS bit of the CHCFG_n/nS register. 0: Register mode 1: Link mode
10	DER	0	R	Descriptor Error Indicates whether the link valid value of the read descriptor is invalid (LV = 0) (this is not dependent on the DIM level of the descriptor). If a descriptor error has occurred, the transfer is stopped but no DMA error interrupt occurs. 0: Descriptor Error not detected 1: Descriptor Error detected Set condition(s): ● When the LV value loaded with the descriptor in link mode is 0 Reset condition(s): ● When SWRST (CHCTRL_n/nS) is set to 1
9	DW	0	R	Descriptor WriteBack Indicates the descriptor writeback status. The bit maintains 1 if a bus error is received during descriptor writeback. 0: Operation other than writeback is being performed for the header in link mode. 1: (ER = 0) Writeback is being performed for the header in link mode. (ER = 1) A bus error occurs during writeback for the header in link mode. Set condition(s): ● When header writeback in link mode starts Reset condition(s): ● When header writeback in link mode ends with an OK response ● When SWRST (CHCTRL_n/nS) is set to 1

Bit	Bit Name	Initial Value	R/W	Description
8	DL	0	R	Descriptor Load Indicates whether the descriptor is being loaded. The bit maintains 1 if a bus error is received during descriptor load. 0: Operation other than descriptor load 1: (ER = 0) Descriptor load is in progress in link mode. (ER = 1) A bus error occurs during descriptor load in link mode. Set condition(s): ● When descriptor load in link mode starts Reset condition(s): ● When descriptor load in link mode ends with an OK response ● When SWRST (CHCTRL_n/nS) is set to 1
7	SR	0	R	Selected Register Set Indicates the register set currently selected in register mode. 0: Next0 Register Set 1: Next1 Register Set Set condition(s): ● When RSEL (CHCFG_n/nS) is set to 1 Reset condition(s): ● When RSEL (CHCFG_n/nS) is set to 0
6	TC	0	R	Terminal Count Indicates whether the DMA transaction is completed. 0: DMA transfer not completed 1: DMA transfer completed Set condition(s): ● When data equivalent to the total transfer byte count set in the CRTB register has been transferred in register mode ● When data equivalent to the total transfer byte count set in the CRTB register has been transferred in link mode, with 1 set in WBD of the descriptor header ● When descriptor writeback is completed in link mode, with 0 set in WBD of the descriptor header Clear condition(s): ● When the CLRTC (CHCTRL_n/nS) bit is set to 1 ● When the SWRST (CHCTRL_n/nS) bit is set to 1
5	END	0	R	DMAEND Interrupted Indicates whether the DMA transaction is completed and whether the DMA transfer end interrupt has occurred. 0: DMA transfer not completed 1: DMA transfer completed Set condition(s): ● When one of the set conditions for the TC bit is met and 0 is set in DEM of the CHCFG_n/nS register ● When the descriptor is read in link mode and both LV of the header and DIM are set to 0 Clear condition(s): ● When CLREND (CHCTRL_n/nS) is set to 1 ● When SWRST (CHCTRL_n/nS) is set to 1

Bit	Bit Name	Initial Value	R/W	Description
4	ER	0	R	Error bit Indicates that a DMA error interrupt has occurred because an error response has been received from the transfer source or destination and a bus error has occurred during the DMA transfer. 0: No bus error has occurred 1: A DMA error interrupt has occurred due to a bus error Set condition(s): ● When a bus error has occurred during a bus cycle Clear condition(s): ● When SWRST (CHCTRL_n/nS) is set to 1
3	SUS	0	R	Suspend Indicates whether the channel is suspended. 0: Channel_n not suspended 1: Channel_n suspended Set condition(s): ● When SETSUS (CHCTRL_n/nS) is set to 1 during a DMA transfer on Channel_n, creating a SUSPEND status internally Clear condition(s): ● When CLRSUS (CHCTRL_n/nS) is set to 1 ● When CLREN (CHCTRL_n/nS) is set to 1
2	TACT	0	R	Transaction Active Indicates whether the DMAC is active. This bit is intended to check that the channel is completely inactive. 0: DMA on Channel_n inactive 1: DMA on Channel_n active Set condition(s): ● When a DMA transaction starts on Channel_n Clear condition(s): ● When a DMA transaction is completed
1	RQST	0	R	Request Indicates whether a transfer request is being received. 0: DMA transfer request not being received 1: DMA transfer request being received Set condition(s): ● When the STG bit (CHCTRL_n/nS) is set to 1 (auto request) ● When a transfer request is received from the DMA request source set in the CHCFG_n/nS register Clear condition(s): ● When SWRST (CHCTRL_n/nS) is set to 1 ● When CLRRQ (CHCTRL_n/nS) is set to 1 ● When a transfer is executed on the side specified by REQD (CHCFG_n/nS) in single transfer mode (TM = 0). ● When all DMA transactions are completed in register mode (the transaction ends with REN set to 0) ● When the DMA transfer of the last descriptor (LE = 1) is completed in link mode ● When descriptor read stops (LV = 0) in link mode ● When a bus error is received due to an error response

Bit	Bit Name	Initial Value	R/W	Description
0	EN	0	R	Enable Indicates whether the operation of DMA channel n is enabled or disabled. 0: Operation disabled 1: Operation enabled Set condition(s): ● When SETEN (CHCTRL_n/nS) is set to 1 Clear condition(s): ● When SWRST (CHCTRL_n/nS) is set to 1 ● When CLREN (CHCTRL_n/nS) is set to 1 ● When a bus error is received due to an error response during the transfer ● When all DMA transactions are completed in register mode (the transaction ends with REN set to 0) ● When the DMA transfer of the last descriptor (LE = 1) is completed in link mode (writeback when WBD is set to 0) ● When descriptor read stops (LV = 0) in link mode

CAUTION

If the ER bit is set to 1 for any transfer, the whole transfer should be handled as invalid.

To suspend a DMA transaction, mask or clear the transfer request or clear the Enable bit (for the procedure, see **Section 14.7.8(2), Transfer Stop**).

If a transfer request from an on-chip peripheral module input is made concurrently with an auto request (by setting 1 in the STG bit) for the same one channel, the trigger source that takes effect cannot be identified. Make sure that only one of these transfer requests is used in the system.

When transfer is requested by an auto request, wait for the last requested DMA transfer to complete (use the Current Register or other data to check the status) before setting the STG bit for the next transfer request.

14.4.8 Channel Control Register n/nS (CHCTRL_n/nS)

This register controls the DMA transfer operation on DMA channel n (n = 0 to 15).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLRINT MSK	SETINT MSK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CLRSU S	SETSU S	—	CLRTC	CLREN D	CLRRQ	SWRST	STG	CLREN	SETEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
17	CLRINTMSK	0	R/W	When this bit is set to 1, the mask of the DMA transfer end interrupt is cleared. Also, the INTMSK bit of the CHSTAT_n/nS register is set to 0. If the mask is cleared when 1 is set in both LVINT of the DCTRL register and END of the CHSTAT_n/nS register, the DMA transfer end interrupt becomes active. (It does not become active when 0 is set in LVINT.) A read operation results in 0 being read. 1: Clears the mask set by SETINTMSK. 0: Does not affect the operation.
16	SETINTMSK	0	R/W	When this bit is set to 1, the DMA transfer end interrupt is temporarily masked. Also, the INTMSK bit of the CHSTAT_n/nS register is set to 1. A read operation results in 0 being read. 1: Masks the DMA transfer end interrupt. 0: Does not affect the operation.
15 to 10	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
9	CLRSUS	0	R/W	Clear Suspend Clears the suspend status. Setting this bit to 1 when 1 is set in SUS of the CHSTAT_n/nS register can clear the suspend status. An attempt to read this bit results in 0 being read. 1: Clears the suspend status of the current DMA transfer. 0: Does not affect the operation.
8	SETSUS	0	R/W	Set Suspend Suspends the current DMA transfer. Setting this bit to 1 when 1 is set in EN of the CHSTAT_n/nS register can suspend the current DMA transfer. An attempt to read this bit results in 0 being read. 1: Suspends the current DMA transfer. 0: Does not affect the operation.
7	—	0	R	Reserved. Set 0. A read operation results in 0 being read.
6	CLRTC	0	R/W	Clear TC bit Setting this bit to 1 can clear the TC bit of the CHSTAT_n/nS register. An attempt to read this bit results in 0 being read. 1: Clears the TC bit. 0: Does not affect the operation.

Bit	Bit Name	Initial Value	R/W	Description
5	CLREND	0	R/W	Clear End bit Setting this bit to 1 can clear the END bit of the CHSTAT_n/nS register. Also, the DMA transfer end interrupt is cleared. An attempt to read this bit results in 0 being read. 1: Clears the END bit. 0: Does not affect the operation.
4	CLRRQ	0	R/W	Clear Request bit Setting this bit to 1 can clear the RQST bit of the CHSTAT_n/nS register. An attempt to read this bit results in 0 being read. 1: Clears the RQST bit. 0: Does not affect the operation.
3	SWRST	0	R/W	Software Reset Setting this bit to 1 can clear the channel status register (CHSTAT_n/nS). When setting this bit to 1, make sure that both the EN bit and TACT bit are set to 0. An attempt to read this bit results in 0 being read. 1: Resets the channel status register. 0: Does not affect the operation.
2	STG	0	R/W	Software Trigger Setting this bit to 1 sets an auto request. If this bit is set at the same time the SWRST bit is set, the clear operation by the SWRST bit takes precedence. An attempt to read this bit results in 0 being read. 1: Sets a transfer request triggered by an auto request (sets 1 in the RQST bit). 0: Does not affect the operation.
1	CLREN	0	R/W	Clear Enable Setting this bit to 1 can clear the EN bit (for details, see **Section 14.7.8(2), Transfer Stop**). An attempt to read this bit results in 0 being read. 1: Stops the DMA transfer (clears the EN bit). 0: Does not affect the operation.
0	SETEN	0	R/W	Set Enable Enables a DMA transfer on DMA channel n. If this bit is set at the same time the SWRST bit is set, the clear operation by the SWRST bit takes precedence and the transfer does not start. An attempt to read this bit results in 0 being read. 1: Enables a DMA transfer (sets 1 in the EN bit). 0: Does not affect the operation.

14.4.9 Channel Configuration Register n/nS (CHCFG_n/nS)

This register controls the DMA transfer operation on DMA channel n (n = 0 to 15).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	DMS	0	R/W	DMA Mode Select Sets the DMA mode. 0: Register mode (initial value) 1: Link mode
30	REN	0	R/W	Register Set Enable After a DMA transaction is completed, DMA transfers are continued using the Next register set selected by RSEL. This bit is valid only in register mode. 0: Does not continue DMA transfers. 1: Continues DMA transfers. Set condition(s): ● When 1 is written to this bit Clear condition(s): ● When 0 is written to this bit ● When a DMA transaction is completed, with REN set to 1
29	RSW	0	R/W	Register Select Switch Inverts RSEL automatically after a DMA transaction is completed. This bit is valid only in register mode. 0: Does not invert RSEL automatically after a DMA transaction (initial value). 1: Inverts RSEL automatically after a DMA transaction.
28	RSEL	0	R/W	Register Set Select Selects the Next register set to be executed next. This bit is valid only in register mode. When RSW is set to 1, this bit is inverted automatically when a DMA transaction is completed. 0: Executes the Next0 Register Set (initial value). 1: Executes the Next1 Register Set. Transition condition(s): ● When a DMA transaction is completed, with RSW set to 1
27	SBE	0	R/W	Sweep Buffer Enable Selects whether to sweep (write) the data already read into the buffer and stop the DMA transfer if the Enable bit is cleared to 0 during a DMA transaction. The sweep mode is available only when REQD is set to 0. 0: Stops the DMA transfer without sweeping the buffer (initial value). 1: Stops the DMA transfer after sweeping the buffer.
26, 25	—	0	R	Reserved. Set 0. A read operation results in 0 being read.

<table>
<tr><th>Bit</th><th>Bit Name</th><th>Initial Value</th><th>R/W</th><th>Description</th></tr>
<tr><td>24</td><td>DEM</td><td>0</td><td>R/W</td><td>DMA Transfer End Interrupt Mask
Masks the DMA transfer end interrupt for register mode transfer.
If 1 is set in this bit when a DMA transfer end interrupt is output, the DMA transfer end interrupt signal is not asserted. In this case, DEM is cleared to 0 automatically.
0: Does not mask the DMA transfer end interrupt (initial value).
1: Masks the DMA transfer end interrupt.

001: Level mode (active until the transfer request from an on-chip peripheral module input becomes inactive)
01x: Bus cycle mode (active while the DMA transfer is in a bus cycle)
1xx: DMAACK not to be output (this setting should be made when an auto request is made by STG (CHCTRL_n/nS) or when the SCIFA transfer is performed)</td></tr>
</table>

Bit	Bit Name	Initial Value	R/W	Description
7	—	0	R	Reserved. Set 0. A read operation results in 0 being read.
6	LVL	0	R/W	Level Selects whether to detect a DMA request based on the level or edge of the signal. 0: Detects based on the edge (initial value). 1: Detects based on the level.
5	HIEN	0	R/W	High Enable Selects whether to detect a DMA request using the High level or rising edge of the signal. When LVL = 0: HIEN = 1: Detects a request in response to the rising edge of the signal. HIEN = 0: Does not detect a request in response to the rising edge of the signal (initial value). When LVL = 1: HIEN = 1: Detects a request when the signal is at the High level. HIEN = 0: Does not detect a request even when the signal is at the High level (initial value).
4	LOEN	0	R/W	Low Enable Selects whether to detect a DMA request using the Low level or falling edge of the signal. When LVL = 0: LOEN = 1: Detects a request in response to the falling edge of the signal. LOEN = 0: Does not detect a request in response to the falling edge of the signal (initial value). When LVL = 1: LOEN = 1: Detects a request when the signal is at the Low level. LOEN = 0: Does not detect a request even when the signal is at the Low level (initial value).
3	REQD	0	R/W	Request Direction Selects whether DMAREQ selected by the SEL bit is the source or destination. This bit is also used to define when DMAACK is to become active. 0: Source; DMAACK is to become active when read (initial value). 1: Destination; DMAACK is to become active when written.
2 to 0	SEL[2:0]	000	R/W	These bits are used to set a DMAC channel. Set one of the following values so that the channel set by the SEL bits matches the CHCFG_n/nS channel. 000: CH0/CH8 001: CH1/CH9 010: CH2/CH10 011: CH3/CH11 100: CH4/CH12 101: CH5/CH13 110: CH6/CH14 111: CH7/CH15

14.4.10 Channel Interval Register n/nS (CHITVL_n/nS)

This register sets the transfer interval for DMA channel n (n = 0 to 15).

For details, see **Section 14.7.6, Interval Count Function**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
15 to 0	ITVL	All 0	R/W	Sets the channel transfer interval.

14.4.11 Channel Extension Register n/nS (CHEXT_n/nS)

This is an extension register for DMA channel n (n = 0 to 15).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCA[3:0]				—	DPR[2:0]			SCA[3:0]				—	SPR[2:0]

R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Set 0. A read operation results in 0 being read.
15 to 12	DCA[3:0]	0000	R/W	Destination CACHE Sets the value to be output to AWCACHE[3:0] for DMA write transfer. See Note 1 below.
11	—	0	R	Set 0. A read operation results in 0 being read.
10 to 8	DPR[2:0]	000	R/W	Destination PROT Sets the value to be output to AWPROT[2:0] for DMA write transfer. In the case of non-secure access, the value output as AWPROT[1] is fixed to 1 regardless of the setting of the DPR[1] bit. See Note 2 below.
7 to 4	SCA[3:0]	0000	R/W	Source CACHE Sets the value to be output to ARCACHE[3:0] for DMA read transfer. See Note 1 below.
3	—	0	R	Set 0. A read operation results in 0 being read.
2 to 0	SPR[2:0]	000	R/W	Source PROT Sets the value to be output to ARPROT[2:0] for DMA read transfer. In the case of non-secure access, the value output as ARPROT[1] is fixed to 1 regardless of the setting of the SPR[1] bit. See Note 2 below.

Note 1. Cache support: Bits SCA and DCA are used to change the settings.

Note 2. Protection unit support: Bits SPR and DPR are used to change the settings.
For the setting value, see AMBA AXI Protocol Specification from Arm Limited.

14.4.12 Next Link Address Register n/nS (NXLA_n/nS)

This is a 32-bit register that sets the link address of DMA channel n (n = 0 to 15).

For information about the link mode, see **Section 14.6.3, Link Mode**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NXLA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NXLA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	NXLA	All 0	R/W	Sets a link address. The low-order 2 bits are masked with 0s. Only an address aligned with a 4-byte boundary can be set.

14.4.13 Current Link Address Register n/nS (CRLA_n/nS)

This is a 32-bit register that indicates the link address of DMA channel n (n = 0 to 15).

For information about the link mode, see **Section 14.6.3, Link Mode**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRLA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRLA	All 0	R	Indicates the address of the currently executed descriptor.

14.4.14 DMA Control Register (DCTRL_0_7/0_7S, DCTRL_8_15/8_15S)

This register sets the transfer type for descriptor access and the arbitration between channels.
(DCTRL_0_7/0_7S is common for channels 0 to 7 and DCTRL_8_15/8_15S is common for channels 8 to 15.)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LWCA				—	LWPR			LDCA				—	LDPR		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LVINT	PR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	LWCA	0000	R/W	Link WriteBack CACHE Sets the value to be output to AWCACHE[3:0] during descriptor writeback in link mode. For the setting value, see Note in **Section 14.4.11, Channel Extension Register n/nS (CHEXT_n/nS)**.
27	—	0	R	Reserved. Set 0. The initial value is 0.
26 to 24	LWPR	000	R/W	Link WriteBack PROT Sets the value to be output to AWPROT[2:0] during descriptor writeback in link mode. In the case of non-secure access, the value output as AWPROT[1] is fixed to 1 regardless of the setting of the LWPR[1] bit. For the setting value, see AMBA AXI Protocol Specification from Arm Limited.
23 to 20	LDCA	0000	R/W	Link Descriptor CACHE Sets the value to be output to ARCACHE[3:0] during descriptor load in link mode. For the setting value, see Note in **Section 14.4.11, Channel Extension Register n/nS (CHEXT_n/nS)**.
19	—	0	R	Reserved. Set 0. The initial value is 0.
18 to 16	LDPR	000	R/W	Link Descriptor PROT Sets the value to be output to ARPROT[2:0] during descriptor load in link mode. In the case of non-secure access, the value output as ARPROT[1] is fixed to 1 regardless of the setting of the LDPR[1] bit. For the setting value, see AMBA AXI Protocol Specification from Arm Limited.
15 to 2	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
1	LVINT	0	R/W	Sets whether to use pulse output or level output for the DMA transfer end interrupt and DMA error interrupt. Set pulse output for this product. 0: Pulse output (initial value) 1: Level output
0	PR	0	R/W	Sets the transfer priority control mode between channels (see **Section 14.7.2, Priority Control for DMA Channels**). 0: Fixed priority mode (initial value) 1: Round robin mode

14.4.15 DMA Status EN Register (DSTAT_EN_0_7/0_7S)

This register indicates the EN bit status of the CHSTAT_n/nS register (n = 0 to 7).

Writing to this register does not affect the values of the bits.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	EN7	EN6	EN5	EN4	EN3	EN2	EN1	EN0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	EN7	0	R	Indicates the EN bit status of DMA channel 7.
6	EN6	0	R	Indicates the EN bit status of DMA channel 6.
5	EN5	0	R	Indicates the EN bit status of DMA channel 5.
4	EN4	0	R	Indicates the EN bit status of DMA channel 4.
3	EN3	0	R	Indicates the EN bit status of DMA channel 3.
2	EN2	0	R	Indicates the EN bit status of DMA channel 2.
1	EN1	0	R	Indicates the EN bit status of DMA channel 1.
0	EN0	0	R	Indicates the EN bit status of DMA channel 0.

14.4.16 DMA Status EN Register (DSTAT_EN_8_15/8_15S)

This register indicates the EN bit status of the CHSTAT_n/nS register (n = 8 to 15).

Writing to this register does not affect the values of the bits.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	EN15	0	R	Indicates the EN bit status of DMA channel 15.
6	EN14	0	R	Indicates the EN bit status of DMA channel 14.
5	EN13	0	R	Indicates the EN bit status of DMA channel 13.
4	EN12	0	R	Indicates the EN bit status of DMA channel 12.
3	EN11	0	R	Indicates the EN bit status of DMA channel 11.
2	EN10	0	R	Indicates the EN bit status of DMA channel 10.
1	EN9	0	R	Indicates the EN bit status of DMA channel 9.
0	EN8	0	R	Indicates the EN bit status of DMA channel 8.

14.4.17 DMA Status ER Register (DSTAT_ER_0_7/0_7S)

This register indicates the ER bit status of the CHSTAT_n/nS register (n = 0 to 7).

Writing to this register does not affect the values of the bits.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	ER7	0	R	Indicates the ER bit status of DMA channel 7.
6	ER6	0	R	Indicates the ER bit status of DMA channel 6.
5	ER5	0	R	Indicates the ER bit status of DMA channel 5.
4	ER4	0	R	Indicates the ER bit status of DMA channel 4.
3	ER3	0	R	Indicates the ER bit status of DMA channel 3.
2	ER2	0	R	Indicates the ER bit status of DMA channel 2.
1	ER1	0	R	Indicates the ER bit status of DMA channel 1.
0	ER0	0	R	Indicates the ER bit status of DMA channel 0.

14.4.18 DMA Status ER Register (DSTAT_ER_8_15/8_15S)

This register indicates the ER bit status of the CHSTAT_n/nS register (n = 8 to 15).

Writing to this register does not affect the values of the bits.

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	ER15	0	R	Indicates the ER bit status of DMA channel 15.
6	ER14	0	R	Indicates the ER bit status of DMA channel 14.
5	ER13	0	R	Indicates the ER bit status of DMA channel 13.
4	ER12	0	R	Indicates the ER bit status of DMA channel 12.
3	ER11	0	R	Indicates the ER bit status of DMA channel 11.
2	ER10	0	R	Indicates the ER bit status of DMA channel 10.
1	ER9	0	R	Indicates the ER bit status of DMA channel 9.
0	ER8	0	R	Indicates the ER bit status of DMA channel 8.

14.4.19 DMA Status END Register (DSTAT_END_0_7/0_7S)

This register indicates the END bit status of the CHSTAT_n/nS register (n = 0 to 7).

Writing to this register does not affect the values of the bits.

31 to 8	—	All 0	R	Reserved. Set 0. A read operation results in 0 being read.
7	SUS15	0	R	Indicates the SUS bit status of DMA channel 15.
6	SUS14	0	R	Indicates the SUS bit status of DMA channel 14.
5	SUS13	0	R	Indicates the SUS bit status of DMA channel 13.
4	SUS12	0	R	Indicates the SUS bit status of DMA channel 12.
3	SUS11	0	R	Indicates the SUS bit status of DMA channel 11.
2	SUS10	0	R	Indicates the SUS bit status of DMA channel 10.
1	SUS9	0	R	Indicates the SUS bit status of DMA channel 9.
0	SUS8	0	R	Indicates the SUS bit status of DMA channel 8.

14.4.25 DMA Extension Resource Selectors 0/0S to 7/7S (DMARS0/0S to DMARS7/7S)

DMARSn/nS (n = 0 to 7) are 32-bit readable/writable registers that specify the DMA transfer sources from peripheral modules in each channel. DMARS0/0S is for channels 0/0S and 1/1S, DMARS1/1S is for channels 2/2S and 3/3S, and so on.

Table 14.3 shows the specifiable combinations.

Some on-chip peripheral modules in this product use the same signal both for an interrupt request and for a DMA transfer request. If such a module is selected by a DMARSn/nS register, the signal works as a DMA transfer request signal and interrupt requests to the interrupt controller are masked. To enable the interrupt, clear the setting of DMARSn/nS (set all MID[7:0] and RID[1:0] to 0). See **Table 14.3** for possible combinations of MID[7:0] and RID[1:0].

14.5 Operation

When there is a DMA transfer request, the DMAC starts the transfer according to the predetermined channel priority order; when the transfer end conditions are satisfied, it ends the transfer. Transfers can be requested in two modes: auto request, and on-chip peripheral module request.

14.5.1 Transfer Flow

After the next source address register (N0SA_n/nS, N1SA_n/nS), next destination address register (N0DA_n/nS, N1DA_n/nS), next transaction byte register (N0TB_n/nS, N1TB_n/nS), channel control register (CHCTRL_n/nS), channel configuration register (CHCFG_n/nS), channel extension register (CHEXT_n/nS), DMA control register (DCTRL_0_7/0_7S, DCTRL_8_15/8_15S), and DMA extension resource selector (DMARSn/nS) are set for the target transfer conditions, the DMAC transfers data according to the following procedure:

1. Checks to see if transfer is enabled (EN = 0 and TACT = 0 in channel status register).
2. Clears the channel status register (set 1 in the SWRST bit of the channel control register).
3. Enables DMA transfer (set 1 in the SETEN bit of the channel control register).
4. When a transfer request comes and transfer is enabled, the DMAC transfers one transfer unit of data (depending on the DDS[3:0] and SDS[3:0] bit settings). For an auto request, the transfer begins automatically when 1 is set in the STG bit of the channel control register. The CRTB_n/nS value will be decremented by 1 for each transfer.
5. If 0 is set in the REN bit of the channel configuration register when transfer has been completed for the specified count (when CRTB_n/nS reaches 0), transfer ends normally. If the DEM bit of the channel configuration register is set to 0 at this time, a DMA transfer end interrupt is sent to the CPU. If the REN bit is 1 when CRTB_n/nS reaches 0, transfer operations are continued with the values of N0SA_n/nS, N1SA_n/nS, N0DA_n/nS, N1DA_n/nS, N0TB_n/nS, and N1TB_n/nS set by the RSEL bit of the channel configuration register until there are no more transfer requests.
6. When an address error in the DMAC is generated, the transfer is stopped. Transfers are also stopped when 1 is set in the CLREN bit of CHCTRL_n/nS.

14.5.2 DMA Transfer Requests

DMA transfer requests are basically generated in either the data transfer source or destination, but they can also be generated in on-chip peripheral modules that are neither the transfer source nor destination. Transfers can be requested in two modes: auto request, and on-chip peripheral module request. On-chip peripheral module request is selected by the DMARS0/0S to DMARS7/7S registers.

(1) Auto-Request Mode

When there is no transfer request signal from an external source, as in a memory-to-memory transfer or a transfer between memory and an on-chip peripheral module unable to request a transfer, auto-request mode allows the DMAC to automatically generate a transfer request signal internally. When the STG bit in channel control register n is set to 1, the transfer begins so long as the TACT bit in channel status register is 0.

(2) On-Chip Peripheral Module Request Mode

In this mode, the transfer is performed in response to the DMA transfer request signal from an on-chip peripheral module.

When a transfer request signal is sent in on-chip peripheral module request mode while DMA transfer is enabled, the DMA transfer is performed.

The DMA transfer request signals to be sent from on-chip peripheral modules or external pin input are listed in

Table 14.3.

The transfer source or destination is fixed for some on-chip peripheral module requests. For details, see **Table 14.3**.

LVL	0: REQ edge detection 1: REQ level detection
REQD	0: ACK output at read 1: ACK output at write

Note 2. Only in products with a Trusted Secure IP

14.6 DMA Mode

14.6.1 Mode Setting

The DMS field of the CHCFG_n/nS register can be used to toggle between register mode and link mode.

Table 14.4 DMA Mode Setting

DMS (CHCFG_n/nS)	Mode	Description
0	Register mode	A DMA transfer is executed using the values set in the Next Register Set.
1	Link mode	A DMA transfer is executed using the descriptor set in the Current register. The DMAC repeatedly loads the descriptor and executes the DMA transfer unless otherwise set by the descriptor or stopped by the control register.

14.6.2 Register Mode

In register mode, a DMA transfer is executed using the values set in the internal registers.

Two sets of the source address, destination address, and transfer byte count (Next0 Register Set and Next1 Register Set) can be set. It is possible to select the Next register set to be used for the DMA transfer, as well as to execute two Next register sets continuously for the DMA transfer.

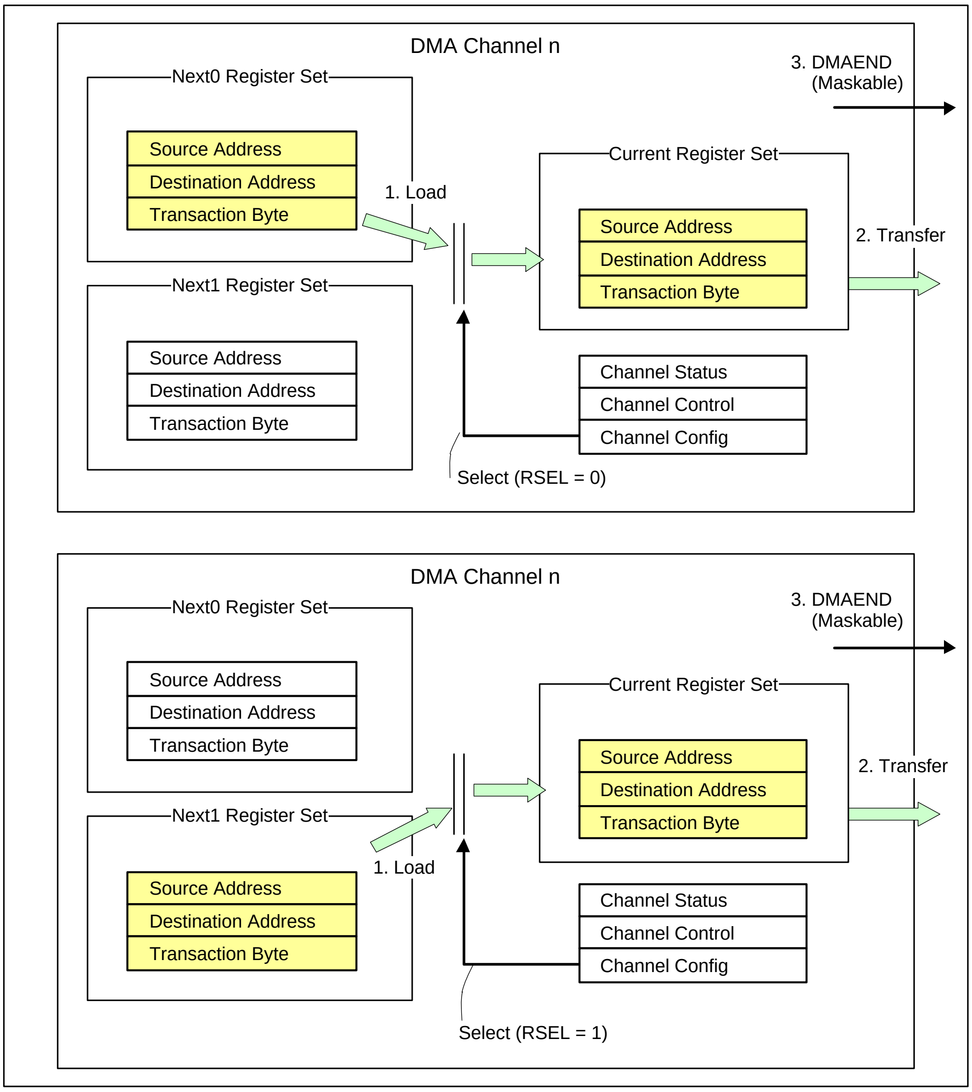

Figure 14.2 Outline of Normal Register Mode

The above figure shows how the transfer is executed when the Next0 Register Set is used (upper part of the figure) and when the Next1 Register Set is used (lower part of the figure).

(1) Operation Flow

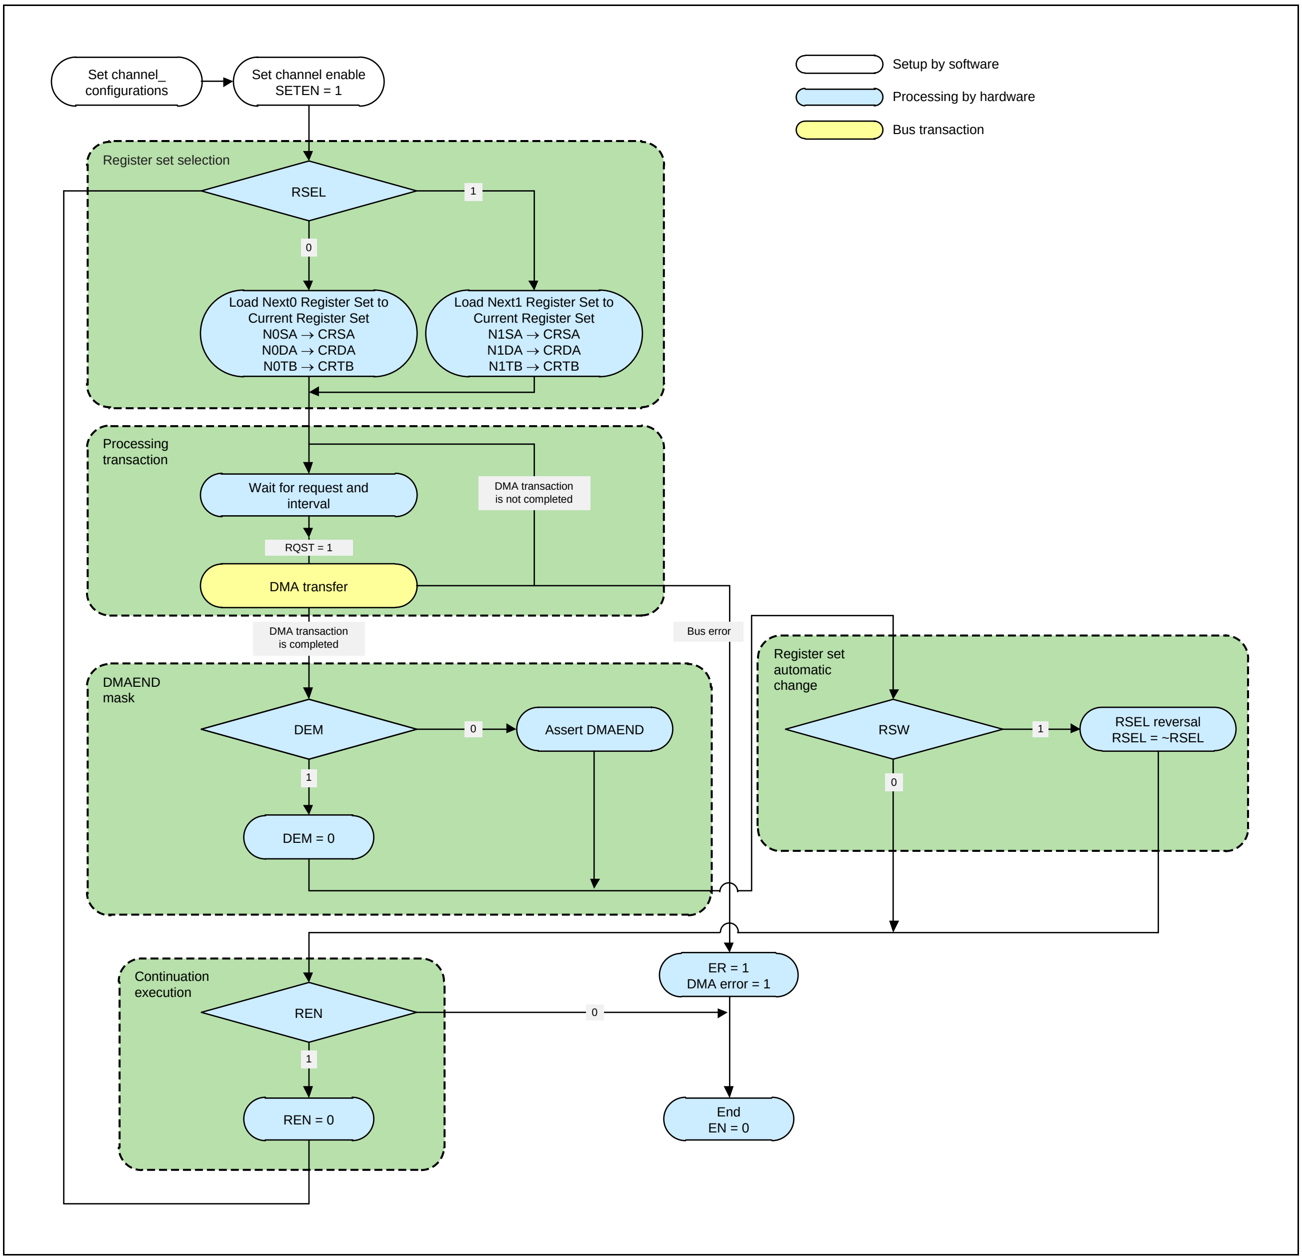

Figure 14.3 Register Mode Flow

<Explanation of the register mode flow>

1. Channel setting (set channel configuration)

   The Next0 or Next1 register set (destination address, source address, and total transfer byte count) is set.

   In the Channel register set, the DMA register set (REQ, DMAACK, transfer size, etc.) is set. (See **Section 14.7, DMA Transfer**.)

2. Register set selection (register set selection)

   When 1 is set in EN, the values set in the Next register set selected by RSEL are loaded to the Current register set.

3. DMA transaction (processing transaction)

   A DMA transfer is executed according to the set values. For details of the transfer, see **Section 14.7, DMA Transfer**.

4. DMA transfer end interrupt mask (DMAINT mask)

   The DMA transfer end interrupt is masked according to the value set in the DEM bit of CHCFG_n/nS. When 1 is set in DEM, the DMA transfer end interrupt is not output. Also, immediately after that, DEM is automatically cleared to 0.

5. Automatic register set change (register set automatic change)

   Whether to use the other Next register set is determined by the value set in the RSW bit of CHCFG_n/nS.

6. Continuation of execution (continuation execution)

   Whether to continue the execution of the DMA transfer is determined by the value set in the REN bit of CHCFG_n/ nS. When 1 is set in REN, the execution of the DMA transfer is continued. Also, immediately after that, REN is automatically cleared to 0.

(2) Register Setting

(a) Register mode setting

Select the register set to be executed.

Table 14.5 Register Mode Setting

DMS (CHCFG_n/nS)	RSEL (CHCFG_n/nS)	Description
0	0	Executes the Next0 Register Set.
	1	Executes the Next1 Register Set.

(b) DMA transfer end interrupt mask setting

The DMA transfer end interrupt can be masked individually for each register set.

Table 14.6 DMAINT Mask Setting

DEM (CHCFG_n/nS)	Operation
0	When the DMA transaction is completed, a DMA transfer end interrupt is issued.
1	Even when the DMA transaction is completed, a DMA transfer end interrupt is not issued. After the DMA transaction is completed, DEM is cleared to 0 by hardware.

(c) Automatic register set execution setting

After DMA transfers, the DMA transaction of the selected register set is automatically executed.

Table 14.7 Automatic Register Set Execution Setting

REN (CHCFG_n/nS)	Operation	Remark
0	When the DMA transaction of the register set selected by RSEL is completed, the EN bit is cleared and the DMA operation ends.	Set this value to execute a DMA transaction once.
1	When a DMA transaction is completed, the DMAC continues to execute a DMA transfer by using the data set in the selected register set. When continuous transfers are successful, REN is cleared to 0.	Set this value to continuously execute DMA transfers by using the data set in separate register sets.

(d) Automatic register set change setting

When 1 is set in REN, the DMAC can automatically change to the register set to be executed next, after a DMA transaction is completed.

Table 14.8 Automatic Register Set Change Setting

RSW (CHCFG_n/nS)	Operation	Remark
0	If 1 is set in REN when a DMA transaction is completed, the register set is not changed.	Set this value to use only one register set.
1	If 1 is set in REN when a DMA transaction is completed, the value of RSEL is automatically inverted and the other register set is selected.	Set this value to change the register set.

(3) Setting Examples

(a) When only the Next0 register set is used

Table 14.9 Register Mode Setting Example 1

DMS (CHCFG_n/nS)	RSEL (CHCFG_n/nS)	DEM (CHCFG_n/nS)	RSW (CHCFG_n/nS)	REN (CHCFG_n/nS)
0 (Register mode)	0 (Next0)	0 (not masked)	0 (not switched)	0 (not continuously executed)

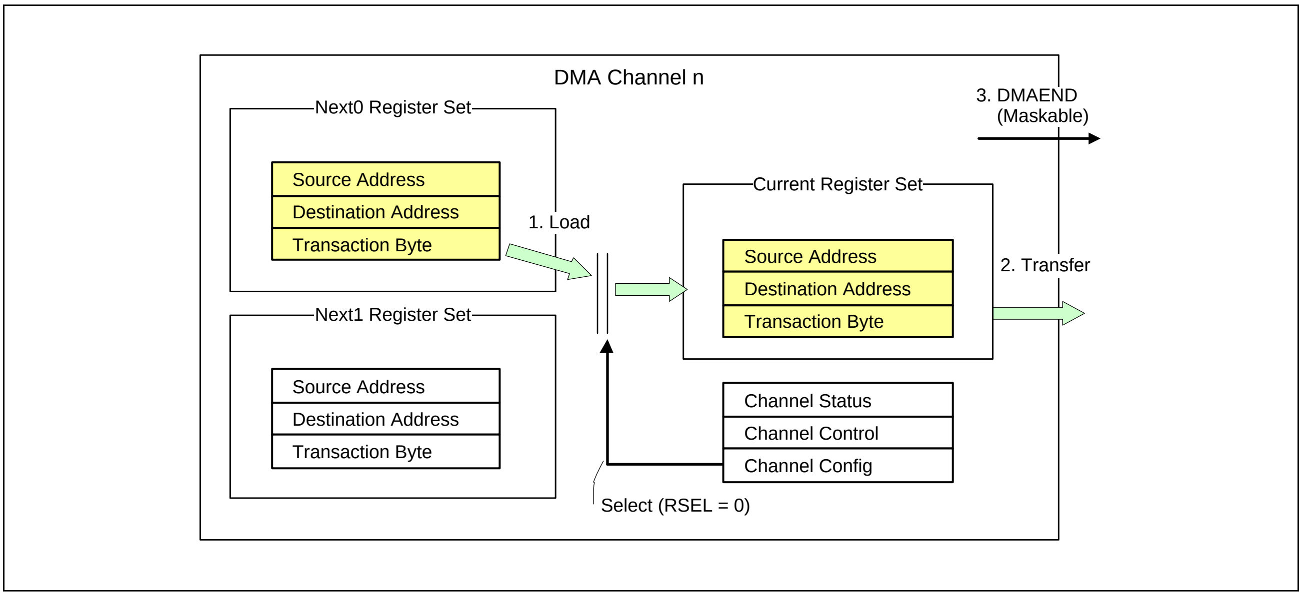

Figure 14.4 Register Mode Setting Example 1

1. 1 is set in EN (SETEN = 1), and the Next0 register set is loaded to the Current register set.
2. A DMA transaction is executed according to the values set in the Current register set and Channel register set.
3. Because 0 is set in DEM, the DMA transfer end interrupt is issued after the DMA transaction is completed.
4. Because 0 is set in REN, EN is cleared to 0 and the DMA transaction ends.

(b) When two register sets are used continuously

Table 14.10 Automatic Register Set Execution Setting

DMS (CHCFG_n/nS)	RSEL (CHCFG_n/nS)	DEM (CHCFG_n/nS)	RSW (CHCFG_n/nS)	REN (CHCFG_n/nS)
0 (Register mode)	0 (Next0)	1 (masked)	1 (switched)	1 (continuously executed)

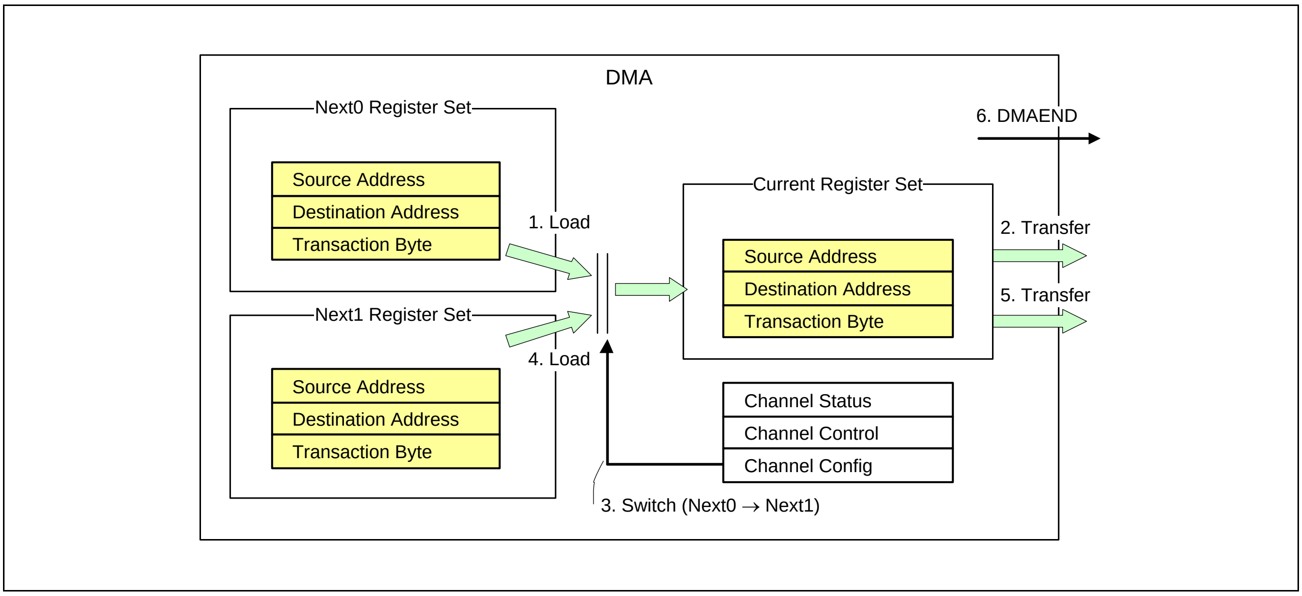

Figure 14.5 Register Mode Setting Example 2

1. 1 is set in EN (SETEN = 1), and the Next0 register set is loaded to the Current register set.
2. A DMA transaction is executed according to the values set in the Current register set and Channel register set.
3. Because 1 is set in DEM, DMA transfer end interrupt is not output after the DMA transaction is completed. Also, DEM is automatically cleared to 0.
4. Because 1 is set in REN, the execution is continued. Also, REN is automatically cleared to 0.
5. Because 1 is set in RSW, the register set to be executed next is switched (RSEL = 0 → 1).
6. The Next1 register set is loaded to the Current register set.
7. A DMA transaction is executed according to the values set in the Current register set and Channel register set.
8. Because 0 is set in DEM, the DMA transfer end interrupt is issued after the DMA transaction is completed.
9. Because 0 is set in REN, EN is cleared to 0 and the DMA transaction ends.

14.6.3 Link Mode

In link mode, a descriptor stored in external memory is loaded as set values and a DMA transaction is executed using the loaded values. The DMAC contains a Next Link address and a Current Link address for each channel, and these addresses are used to set the descriptor address to be executed next and to indicate the descriptor address of the currently executed DMA transaction, respectively.

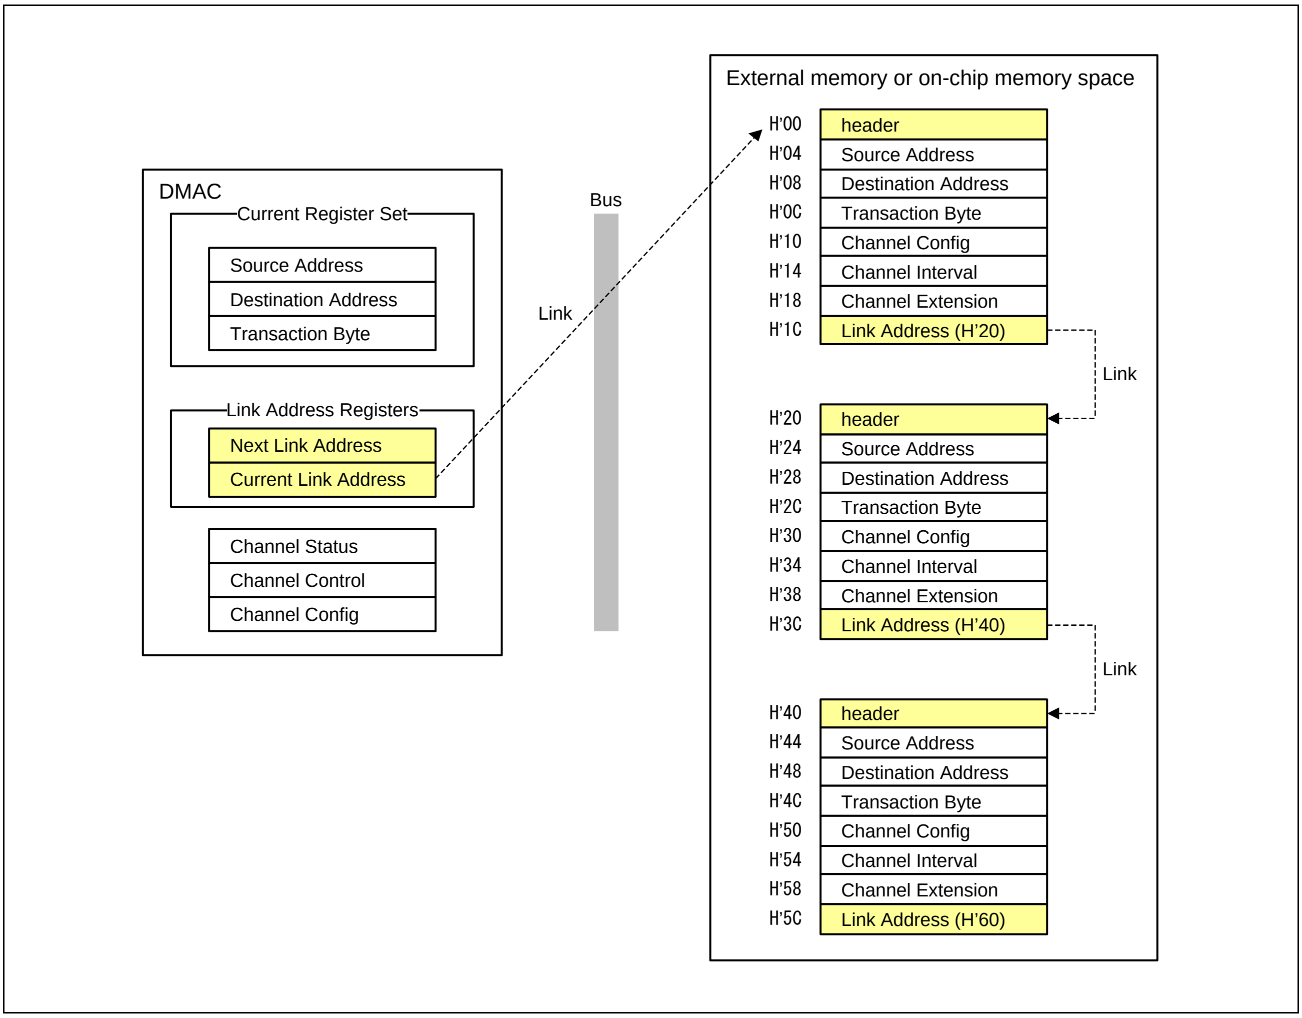

Figure 14.6 Link Mode Outline

(1) Operation Flow

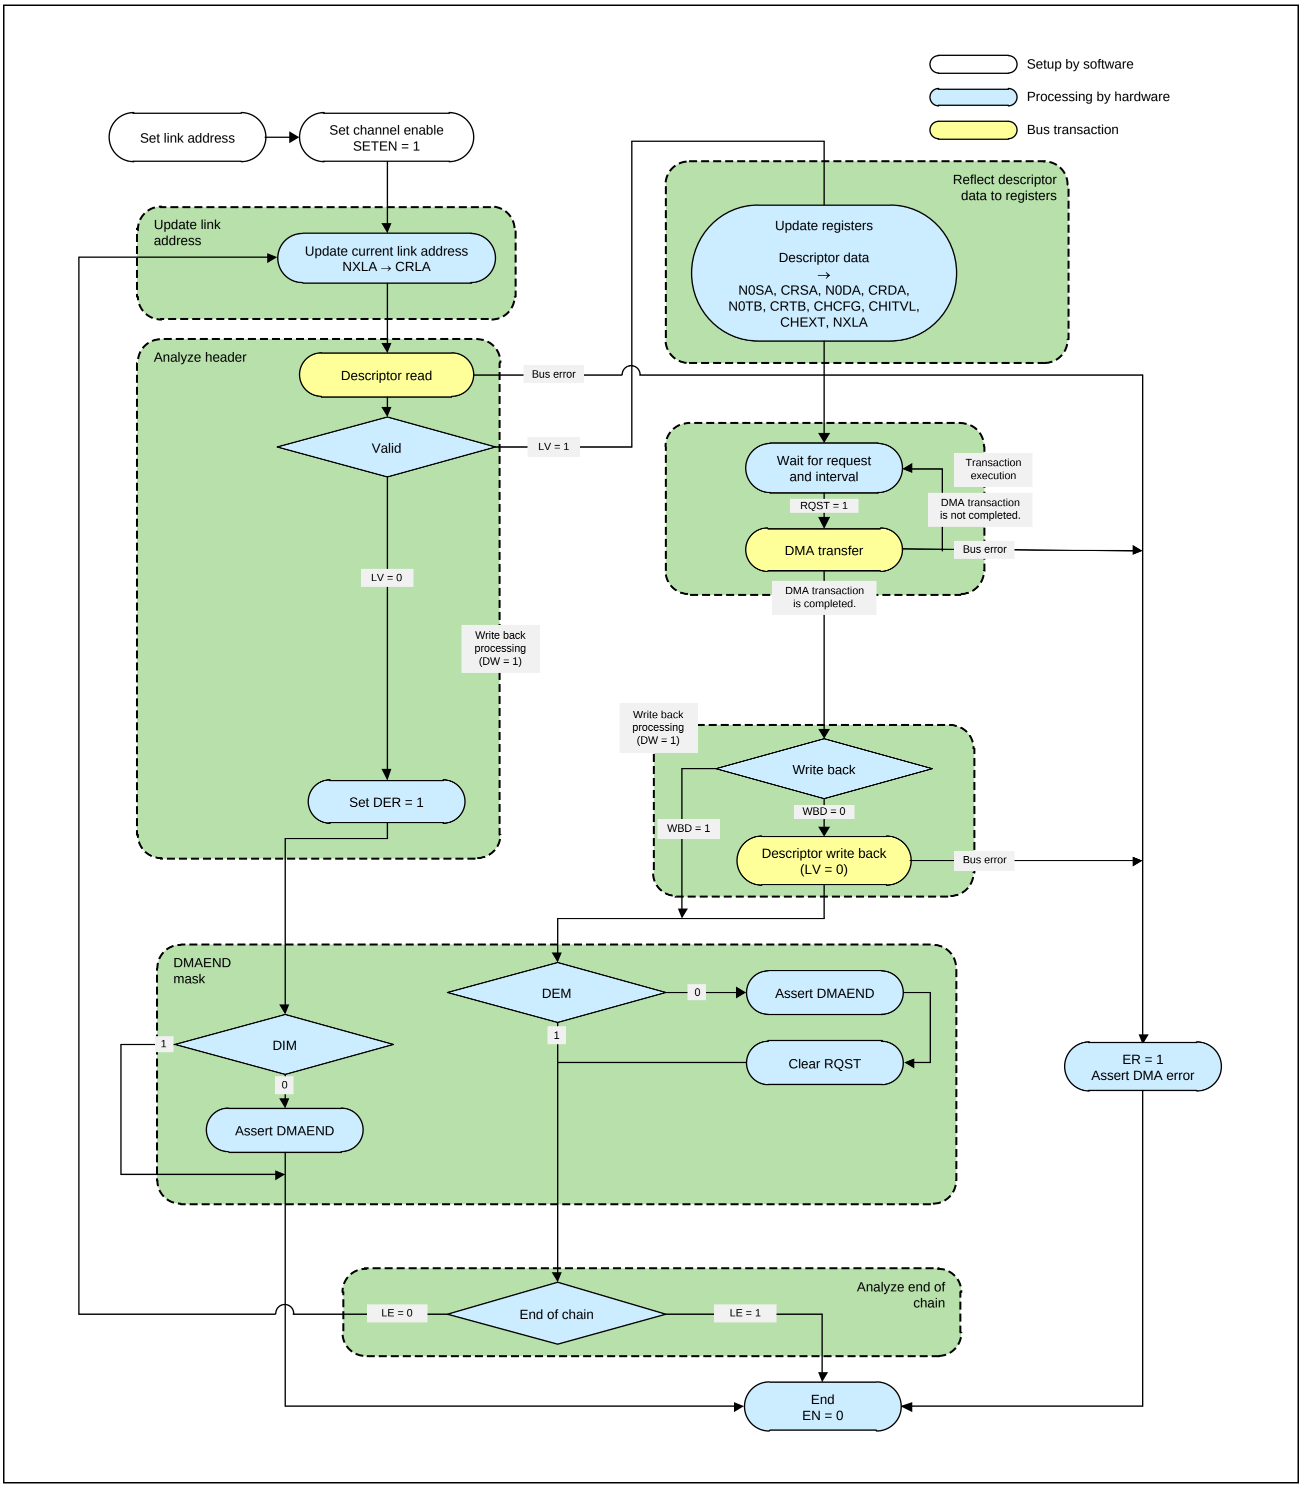

Figure 14.7 Link Mode Flow

<Explanation of the link mode flow>

1. Channel setting

The start address of the link destination is set in NXLA_n/nS.

2. Link address update

   When 1 is set in EN (1 is set in SETEN), the Link address set in NXLA_n/nS is loaded to CRLA_n/nS.

3. Descriptor load and header analysis

   The DMAC begins to load the descriptor and then analyzes the content of the header. When LV is 0, the DMAC discards the loaded descriptor and sets 1 in DER to end the operation (EN = 0). In this case, if 0 is set in DIM of the header, DMAEND is issued.

4. Descriptor setting

   The loaded descriptor is set in the Current register set and Channel register set. Also, the next link address is set in NXLA_n/nS.

5. DMA transaction

   A DMA transaction is executed according to the set values.

6. Header writeback

   When 0 is set in WBD of the header, the DMAC writes back the header with 0 set in its LV bit.

7. DMAINT mask

   When 0 is set in the DEM bit of CHCFG_n/nS, the DMA transfer end interrupt is issued.

8. Link end analysis

   When 1 is set in LE of the header, the operation is ended by clearing EN to 0, after transfer using the settings of the descriptor is completed. If the setting of LE is 0, the Current registers are then updated and loading of the next descriptor begins. The TEND signal is issued after the transfer of each descriptor.

(2) Register Setting

(a) Link mode setting

To use the link mode, set 1 in the DMS bit of the CHCFG_n/nS register.

Table 14.11 Link Mode Setting

DMS (CHCFG_n/nS)	Description
1	Operates in link mode. This bit cannot be changed using a descriptor.

(b) Link address setting

There are two registers that indicate a link address:

Next Link address register and Current Link address register.

To start the link mode, set a link address in the Next Link address register.

The Next Link address indicates the next link address after a descriptor is loaded. The Current Link address indicates the currently executed link address.

Table 14.12 Link Address Register Set

Register	Description
Next Link Address Register (NXLA_n/nS)	Sets and indicates the next link address. Before starting the link mode, set a link address in this register.
Current Link Address Register (CRLA_n/nS)	Indicates the currently executed link address. This register is read-only.

CAUTION

In link mode, the settings can be changed by reading a descriptor. It is not possible, however, to synchronize the change of the settings with a peripheral module request or external request. Therefore, when using a peripheral module request or external request, set AM, LVL, HIEN, LOEN, and SEL of the CHCFG_n/nS register before setting Enable and do not change any of these bits in the descriptor.

(3) Descriptor Setting

In a link address, prepare a descriptor with data arranged in the order shown below.

The DMAC reads the descriptor in burst mode.

(a) Descriptor data arrangement

Table 14.13 Descriptor Data Arrangement

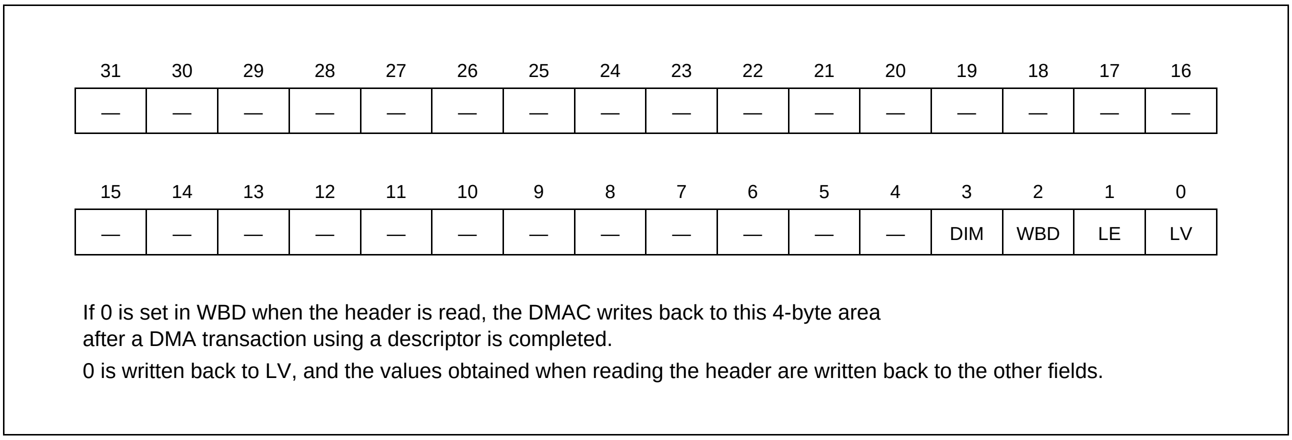
Address	Data	Remarks
Link address + H'00	header	
Link address + H'04	Source Address	
Link address + H'08	Destination Address	
Link address + H'0C	Transaction Byte	
Link address + H'10	Config	The register mode cannot be set.
Link address + H'14	Interval	
Link address + H'18	Extension	
Link address + H'1C	Next Link Address	

Note: As a link address, set an address aligned along the 32-bit boundary.

(b) header

The header indicates the status of the descriptor, as shown below.

The DMAC reads this area when a DMA transfer is started in link mode. Also, after a DMA transaction is completed, the DMAC writes back the transfer status to the area.



31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
—	—	—	—	—	—	—	—	—	—	—	—	DIM	WBD	LE	LV

If 0 is set in WBD when the header is read, the DMAC writes back to this 4-byte area after a DMA transaction using a descriptor is completed.

0 is written back to LV, and the values obtained when reading the header are written back to the other fields.

Figure 14.8 Header Area

Table 14.14 Header Area

Bit Position	Bit Name	Meaning
31 to 4	—	—
3	DIM	Descriptor Interrupt Mask Sets whether to mask the DMA transfer end interrupt if 0 is set in LV when the header is loaded. 0: Issues a DMA transfer end interrupt. 1: Does not issue a DMA transfer end interrupt.
2	WBD	Write Back Disable Sets whether to mask LV bit writeback. When 1 is set in this bit, the DMAC does not perform writeback. 0: Writes the LV bit back to 0. 1: Does not write back the LV bit.
1	LE	Link End Indicates whether the link ends with the DMA transaction of this descriptor. Set 1 in this bit to indicate the end of the link. 0: The link continues. 1: The link ends.
0	LV	Link Valid Indicates whether this descriptor is valid. If 0 is set in WBD, the DMAC writes 0 in this bit after the DMA transaction written in the descriptor is executed. When setting the header, set 1 in this bit. 0: Descriptor invalid 1: Descriptor valid

(c) Descriptor data other than the header

The data items of the descriptor other than the header are the same as defined in the internal register specifications (note that the DMS bit of the CHCFG_n/nS register cannot be changed using the descriptor). For information about the internal register specifications, see **Section 14.4, Register Descriptions**.

For descriptor setting examples, see **Section 14.8, DMA Setting Examples**.

(d) CACHE settings for descriptor access

The CACHE settings for descriptor access can be set in LWCA and LDCA of the DMA control register (DCTRL_0_7/ 0_7S, DCTRL_8_15/8_15S). Make these settings as appropriate for the access destination in which the descriptor is prepared.

(e) Descriptor area and DMA transfer area

The following figure outlines the descriptor area and DMA transfer area that are accessed by the DMAC.

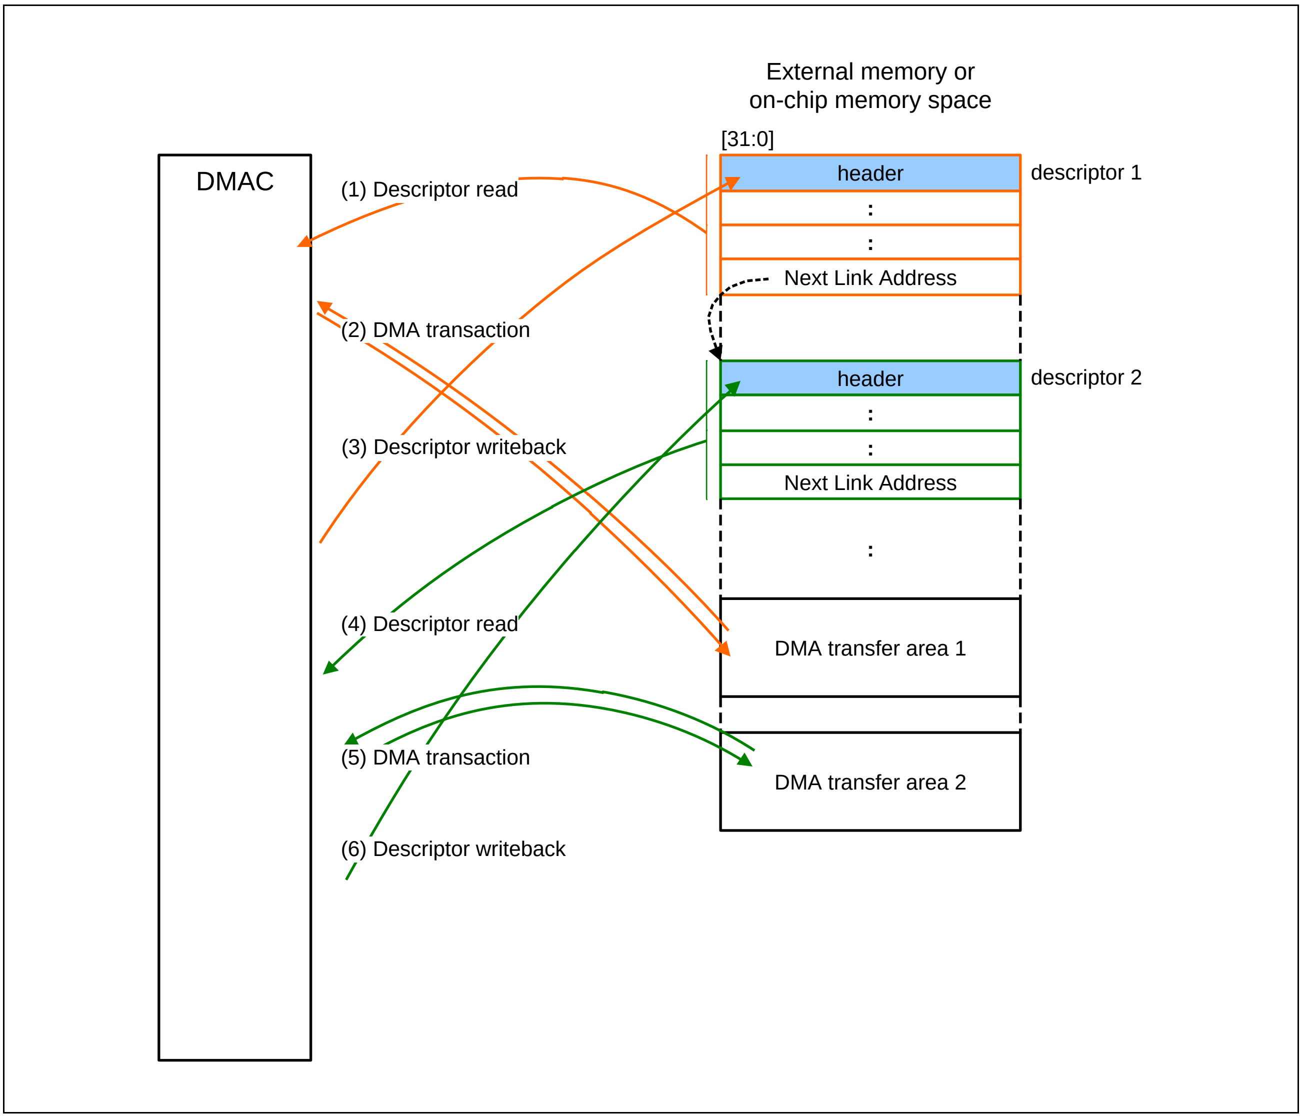


Figure 14.9 Outline of the Descriptor Area and DMA Transfer Area

1. Descriptor read

   The values set in the internal Next Link Address register are loaded to the Current Link Address register, and a descriptor is read from the external memory space (descriptor1) pointed to by the Current Link Address register.

2. DMA transfer

   When 1 is set in the LV bit of the header in the descriptor, a DMA transfer is executed according to the descriptor data.

3. Descriptor writeback

   When 0 is set in the WBD bit of the header after the DMA transfer of the set number of bytes is completed, the DMAC writes back data in word size to the header of descriptor1, with 0 set in LV and the other bits containing the values read in <1>.

4. Descriptor read

   When 0 is set in the LE bit of the header in the last read descriptor (<1>), the next descriptor is read from the address (descriptor2) indicated by Next Link Address in the descriptor.

5. DMA transfer

   When 1 is set in the LV bit of the header in the descriptor, a DMA transfer is executed according to the descriptor data.

6. Descriptor writeback

   When 0 is set in the WBD bit of the header after the DMA transfer of the set number of bytes is completed, the DMAC writes back data in word size to the header of descriptor2, with 0 set in LV and the other bits containing the values read in <4>.

4 through 6 are repeated.

When the header contains 1 in LE and 0 in WBD, the DMAC executes a DMA transfer using the settings of that descriptor, writes back data with 0 set in the LV bit of the header and ends the operation.

When the header contains 1 in both LE and WBD, the DMAC executes a DMA transfer using the settings of that descriptor and ends the operation (without writing back).

When the header contains 0 in LV, the DMAC ends the operation (without executing a DMA transfer).

(4) Descriptor Configuration Examples

In link mode, a descriptor can be configured as shown below.

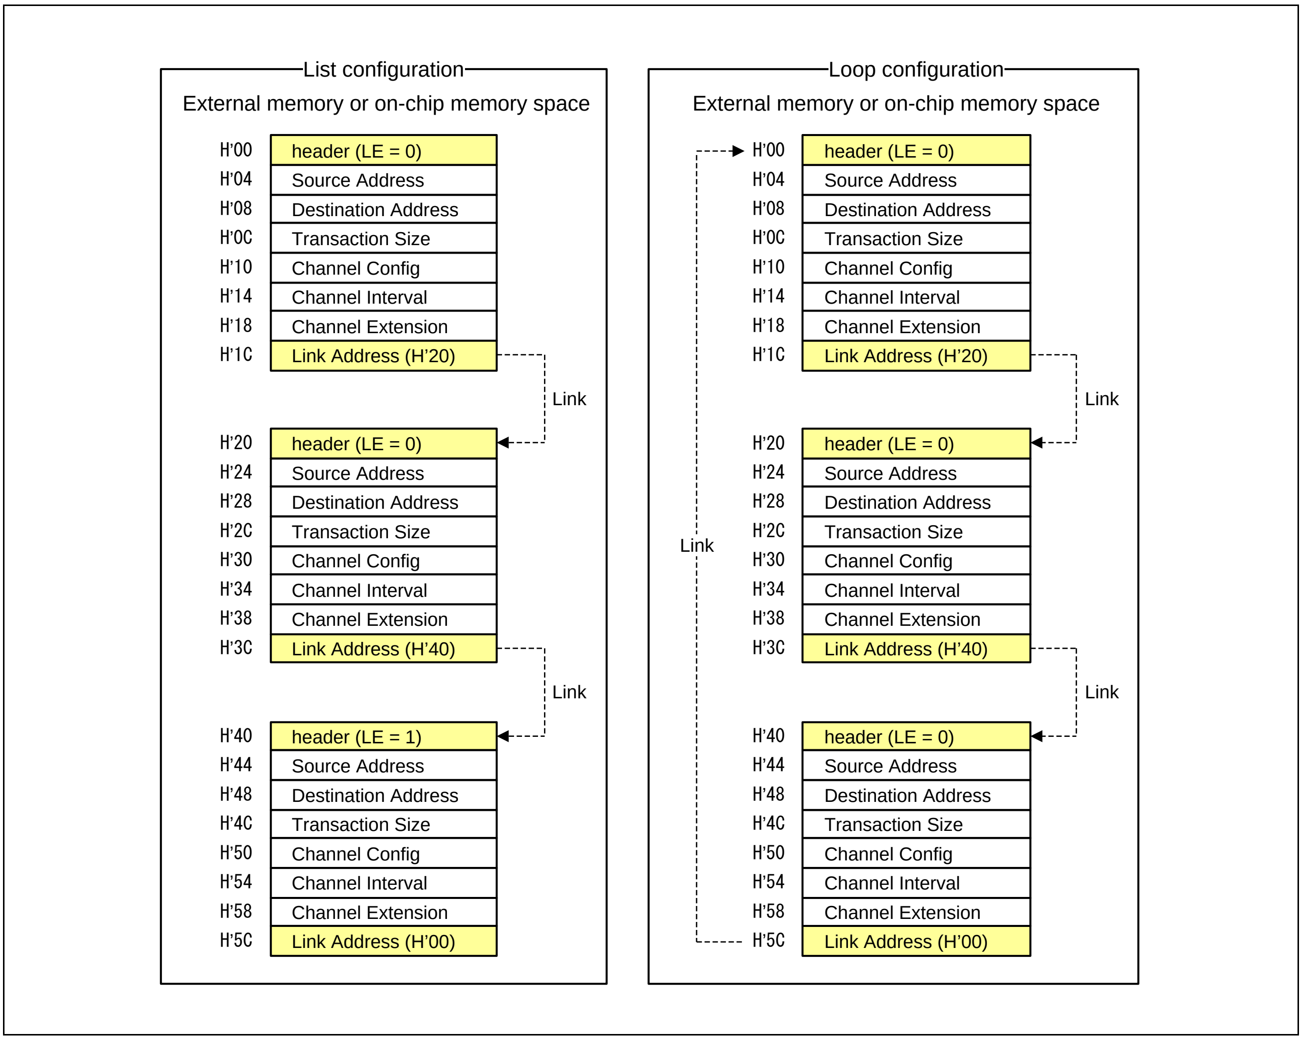

Figure 14.10 Descriptor Configuration Examples

- List configuration
  The link is ended by setting 1 in the LE bit of the header in the last descriptor.
- Loop configuration
  A descriptor can be created with a loop configuration, by setting the address of the top descriptor in the link address of the last descriptor. To end the loop, change the value of the LE bit of the header to 1 before the DMAC reads the descriptor, or follow the transfer suspension procedure.

14.7 DMA Transfer

The basic operation of DMA transfer is described here.

14.7.1 Transfer Mode

Two transfer modes are supported: single transfer mode and block transfer mode.

To select a transfer mode, set the TM bit of CHCFG_n/nS for each channel.

Table 14.15 Basic Transfer Setting

Transfer Mode	TM (CHCFG_n/nS)	Function
Single transfer	0	A single DMA transfer is executed in response to a DMAREQ.
Block transfer	1	In response to a DMAREQ, the DMAC continues to execute the transfer until the DMA transaction is completed.

(1) Single Transfer Mode

When a DMA transfer request is received, a DMA transfer is executed once in the direction indicated by REQD (source or destination). A DMA transfer is executed once each time a transfer request is received, and this operation continues until the number of bytes loaded to CRTB_n/nS is reached (arbitration between channels is accomplished for each DMA transfer).

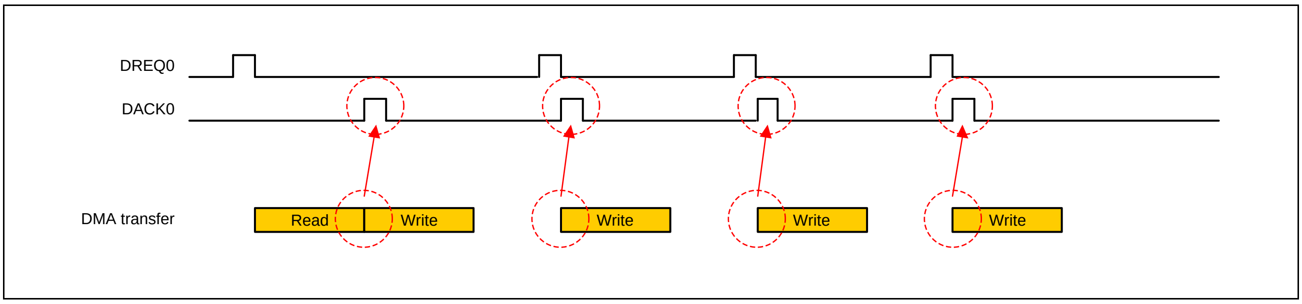

Figure 14.11 Single Transfer Mode (REQD = 1, SDS > DDS)

(2) Block Transfer Mode

Once a DMA transfer request is received, the DMAC continues to execute the transfer until data equivalent to the number of bytes loaded to the DMA transfer byte register (CRTB_n/nS register) is transferred (the DMA transaction is completed) (arbitration between channels is accomplished for each DMA transfer).

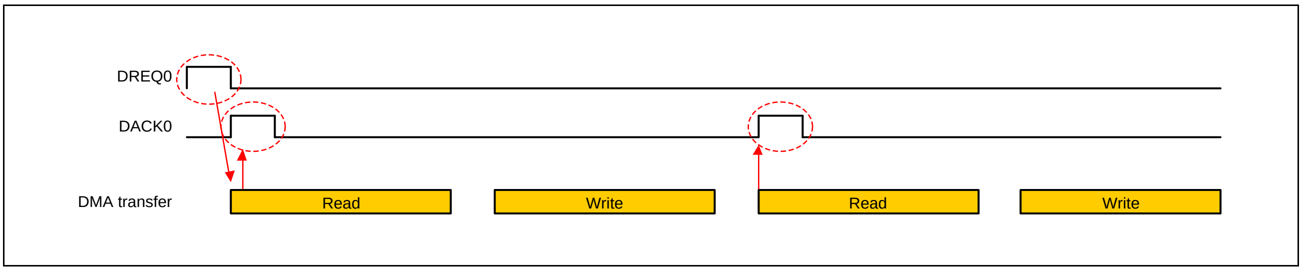

Figure 14.12 Block Transfer Mode (REQD = 0, SDS < DDS)

14.7.2 Priority Control for DMA Channels

Within channels 0 to 7 and 8 to 15, two priority control modes are supported: fixed priority mode and round robin mode. Only round robin mode is supported for priority control between the group of channels 0 to 7 and the group of channels 8 to 15. To select a priority control mode, use the PR bit of the DMA control register (DCTRL register). The fixed priority mode is selected when 0 is set in the PR bit, and the round robin mode is selected when 1 is set.

Read priority and write priority are controlled independently.

The DMAC issues transfer requests to different channels concurrently without waiting for the completion of any particular transfer and processes responses in the order it receives them. Therefore, the order in which the channels start transactions is not necessarily consistent with the order in which the transactions end.

Table 14.16 Priority Control Setting

Mode	PR (DCTRL)	Function	Purpose
Fixed priority	0	Requests are controlled based on the fixed order of priority for channels 0 to 7 and 8 to 15 (High: CH0 (CH8) > CH1 (CH9) > CH2 (CH10) > CH3 (CH11) > CH4 (CH12) > CH5 (CH13) > CH6 (CH14) > CH7 (CH15): Low).	Use this mode when the channels have a specific order of priority.
Round robin	1	Requests are controlled in a round robin fashion.	Use this mode to execute all requests evenly.

(1) Fixed Priority Mode

In fixed priority mode, the channels have a fixed order of priority in channels 0 to 7 and 8 to 15. Round robin mode is used to determine the priority between the group of channels 0 to 7 and the group of channels 8 to 15.

Immediately after a reset, the order of priority is as follows.

High CH0 > CH8 > CH1 > CH9 > CH2 > CH10 > CH3 > CH11 > CH4 > CH12 > CH5 > CH13 > CH6 > CH14 > CH7 > CH15 Low

If there is a transfer request from DMA channel 0 in this state, a transfer is executed on DMA channel 0. After the transfer is completed, the order of priority is as follows.

High CH8 > CH0 > CH9 > CH1 > CH10 > CH2 > CH11 > CH3 > CH12 > CH4 > CH13 > CH5 > CH14 > CH6 > CH15 > CH7 Low

If a DMA transfer request occurs on multiple channels simultaneously, the DMA transfer request of the channel having the smallest channel number is given priority. The following figure shows an example where a DMA transfer request occurs on a channel having a higher priority while a DMA transfer is being executed in fixed priority mode.

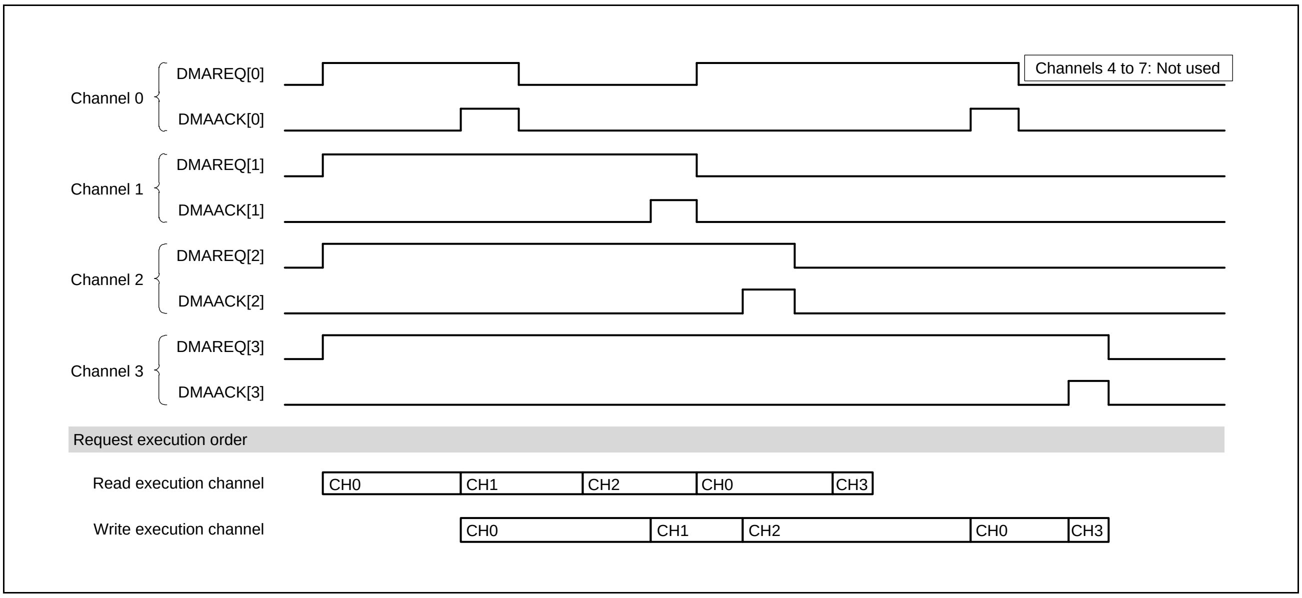

Figure 14.13 Fixed Priority Mode (Number of Channels = 4, REQD = 1)

(2) Round Robin Mode

In round robin mode, each time a transfer request is received from a channel in the group of channels 0 to 7 and the group of channels 8 to 15, the order of priority is changed in such a way that the channel that executed a transfer last has the lowest priority.
Round robin mode is used to determine the priority between the group of channels 0 to 7 and the group of channels 8 to 15.

Immediately after a reset, the order of priority is the same as that of the fixed priority mode, which is as follows.
High CH0 > CH8 > CH1 > CH9 > CH2 > CH10 > CH3 > CH11 > CH4 > CH12 > CH5 > CH13 > CH6 > CH14 > CH7 > CH15 Low

If a transfer request is received from DMA channel 2 in this state, a transfer is executed on DMA channel 2. After the transfer is completed, the order of priority is as follows.
High CH8 > CH3 > CH9 > CH4 > CH10 > CH5 > CH11 > CH6 > CH12 > CH7 > CH13 > CH0 > CH14 > CH1 > CH15 > CH2 Low

The following figure shows an example where DMA transfers are executed in round robin mode.

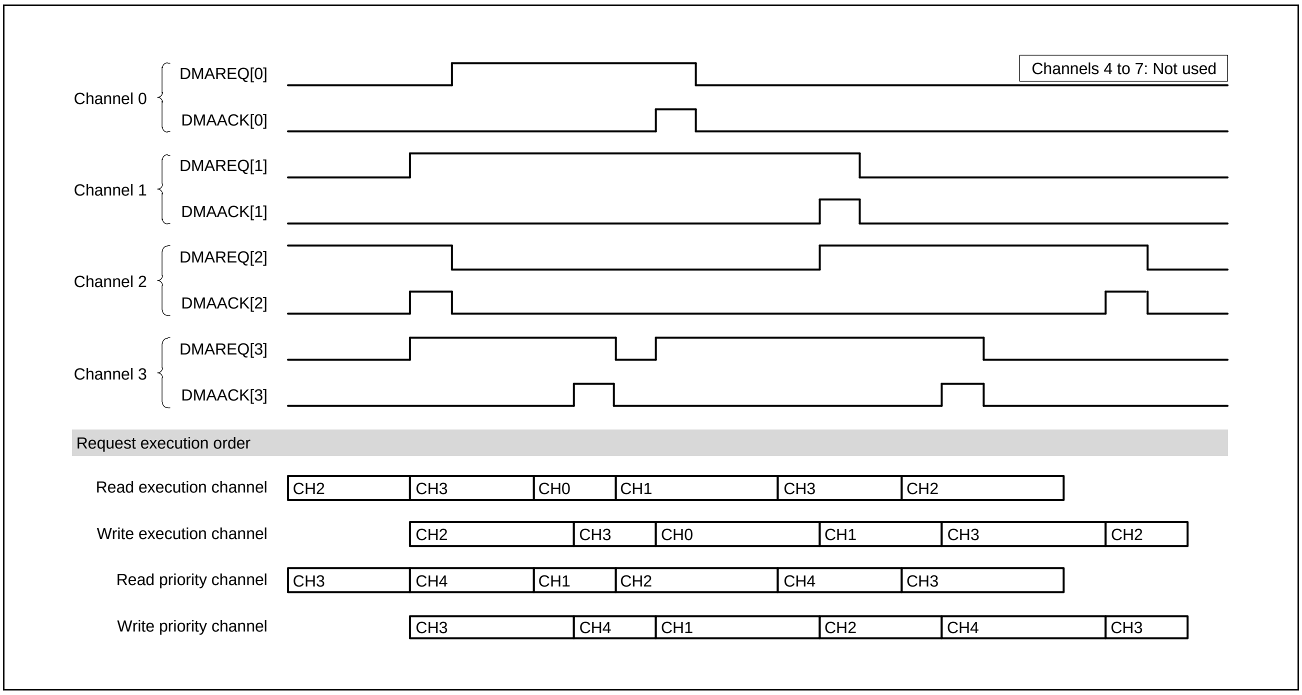

Figure 14.14 Round Robin Mode (Number of Channels = 4, REQD = 0)

The channel whose channel number is the number of the currently transferring channel + 1 gets to execute a DMA transfer next. If there is no transfer request from this channel, the channel whose channel number is the number of this channel + 1 gets to execute a DMA transfer.

14.7.3 DMA Transfer Request

Edge detection or level detection can be selected using the LVL bit of the CHCFG_n/nS register.

The HIEN and LOEN bits of the CHCFG_n/nS register are used to select either the rising edge or falling edge in the case of edge detection or either the high level or low level in the case of level detection.

When the transfer request is by an on-chip peripheral module, set the CHCFG_n/nS register according to **Table 14.3**.

(1) Edge Detection

Setting 0 in the LVL bit of the CHCFG_n/nS register enables edge detection.

(2) Level Detection

Setting 1 in the LVL bit of the CHCFG_n/nS register enables level detection.

14.7.4 DMA Transfer End Interrupt

The DMA transfer end interrupt is an interrupt request signal that indicates that a DMA transaction is completed. There is an independent DMA transfer end interrupt for each channel.

When the transfer of data equivalent to the total transfer byte count loaded to the CRTB (Current Transaction Byte) is completed, 1 is set in END of the CHSTAT_n/nS register. In this case, when 0 is set in DEM of the CHCFG_n/nS register, the DMA transfer end interrupt (DMAINTn_NS/S) is output (n = 0 to 15). (When writeback is performed in link mode, the signal is output after the writeback operation.)

When 0 is set in LV of the header in the read descriptor in link mode, 1 is set in DER of the CHSTAT_n/nS register. In this case, when 0 is set in DIM of the header, the DMA transfer end interrupt is output.

Table 14.17 Assertion Conditions of DMA Transfer End Interrupt

Source	Condition	DMA Transfer End Interrupt Mask Signal
DMA transaction end	When the transfer of data equivalent to the total transfer byte count loaded to the CRTB (Current Transaction Byte) is completed with an OKAY response (or after the writeback operation when writeback is performed in link mode)	DEM bit of the CHCFG_n/nS register
Descriptor invalid	When 0 is set in LV of the header in the read descriptor in link mode while 0 is set in DIM of the header	DIM bit of the header

14.7.5 DMA Error Interrupt

If an error response is received for a DMA transfer or descriptor access, the DMAC regards it as an error and stops the transfer. Upon receiving an error response, the EN bit of the CHSTAT_n/nS register of transferring channel n is cleared to 0 and 1 is set in the ER bit (n = 0 to 15). Also, the DMA error interrupt (DMAERR_NS/S) is output.

The DMA error interrupt cannot be masked.

Once an error occurs, the data of the whole transfer cannot be guaranteed. Be sure to start the transaction again from the beginning by following the procedure below.

1. Set 1 in the SWRST bit of the CHCTRL_n/nS register.
2. Set each register again.

14.7.6 Interval Count Function

The interval at which a DMA transfer is executed can be adjusted by setting the ITVL bit of the channel interval register (CHITVL_n/nS). This function is intended to prevent the DMA controller from occupying the bus all the time.

When a read or write operation is completed, a countdown starts from the value set in CHITVL_n/nS. The next internal request is not executed until the count value reaches 0.

The following figure shows an example of how this works.

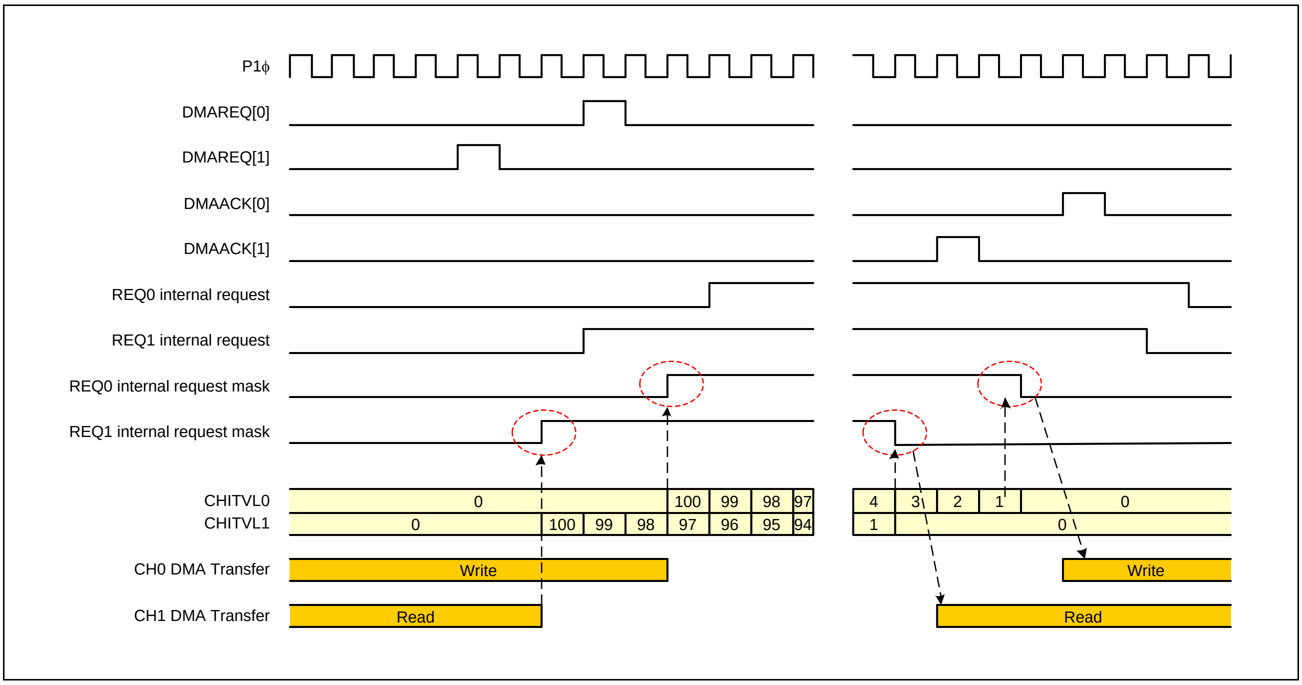

Figure 14.15 Interval Count

14.7.7 Difference in Operation Due to the Transfer Size

(1) When the Source Transfer Size Is Smaller

When the read of data equivalent to the destination data size is completed, the data is written to the destination.

The following figure shows a timing chart where the source transfer size is 8 bits and the destination transfer size is 32 bits (in the case of rising edge detection).

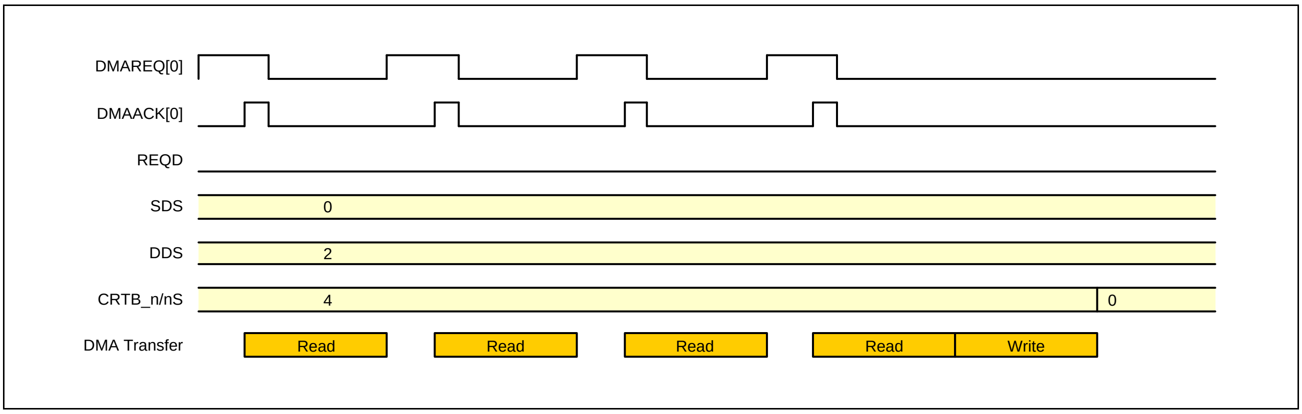

Figure 14.16 When the Source Transfer Size Is Smaller (LVL = 0, HIEN = 1, REQD = 0, SDS < DDS in CHCFG_n/nS)

(2) When the Destination Transfer Size Is Smaller

Since the source transfer size is larger, multiple destination writes occur after a single source read. The following figure shows a timing chart where the source transfer size is 64 bits and the destination transfer size is 16 bits (in the case of rising edge detection) (1 is set in REQD of the CHCFG_n/nS register).

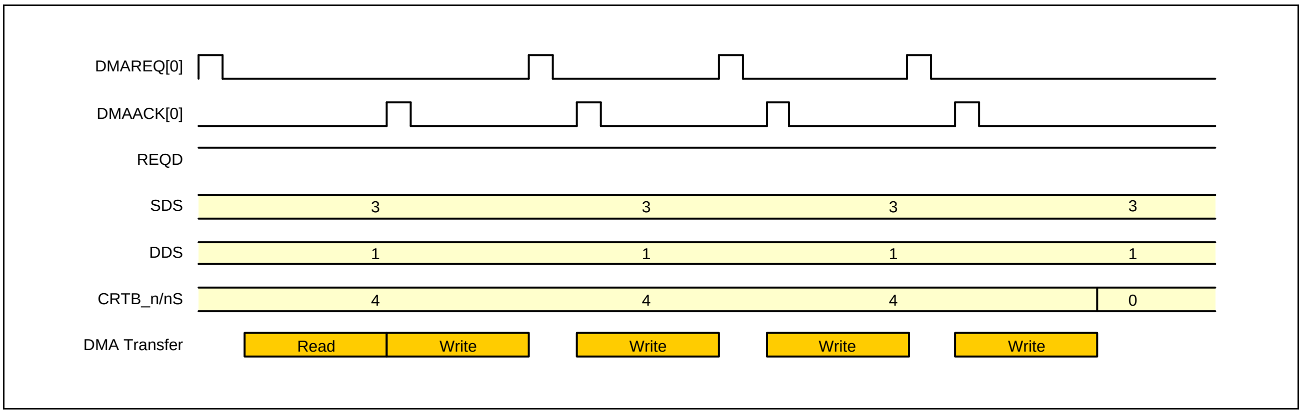

Figure 14.17 When the Destination Transfer Size Is Smaller (LVL = 0, HIEN = 1, REQD = 1, SDS > DDS in CHCFG_n/nS)

(3) When the Source Transfer Size Is the Same as the Destination Transfer Size

Every time a DMA transfer request is detected, a source read and a destination write occur.

The following figure shows a timing chart where the source transfer size and the destination transfer size are both 8 bits (in the case of rising edge detection, with 1 set in REQD of the CHCFG_n/nS register).

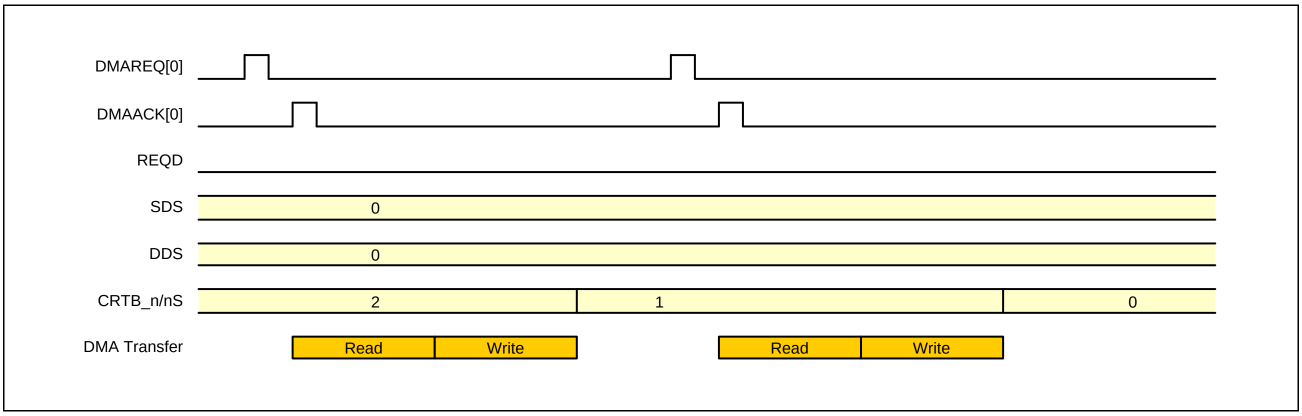

Figure 14.18 When the Source Transfer Size Is the Same as the Destination Transfer Size (LVL = 0, HIEN = 1, REQD = 0, SDS = DDS in CHCFG_n/nS)

14.7.8 Transfer Status

The channel status register indicates the status of DMA transfer execution on a channel.

(1) Suspend

A DMA transfer can be suspended by using the SETSUS bit of CHCTRL_n/nS. In this case, if an ongoing bus cycle exists, the DMAC waits for that cycle to end before suspending the transfer. Writing 1 in the CLRSUS bit restores the DMA transfer from the suspend status.

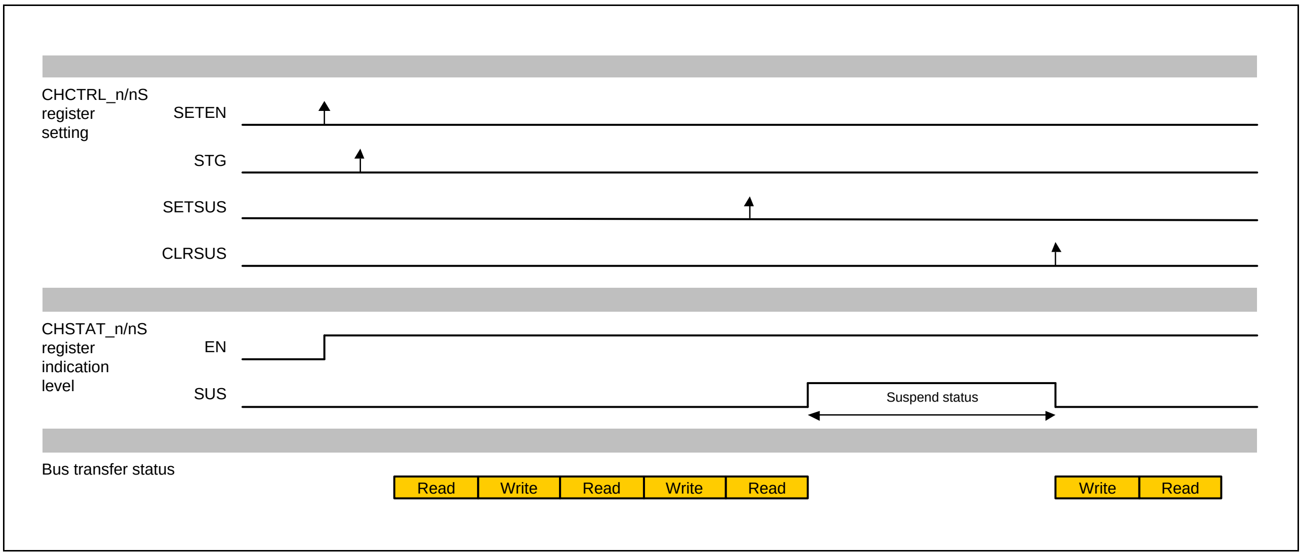

Figure 14.19 DMAC Suspend Status (Auto Request/Block Transfer)

In the above case, the DMA transfer is suspended after the read transfer is completed.

If there is any ongoing DMA transfer, the suspend status starts when that transfer is completed. To make sure that the transfer is suspended, read the CHSTAT or DSTAT_SUS register, after setting SETSUS, and check that 1 is set in the SUS bit for the relevant channel.

(2) Transfer Stop

If 1 is written to CLREN while a DMA transaction is in progress, the DMA transaction for the corresponding channel can be stopped. For the post-stop processing, two modes are supported: one sweeps out the data remaining in the buffer when the transaction is stopped (SBE = 1) and the other does not (SBE = 0). One of these modes can be selected using the SBE bit of the CHCFG_n/nS register. By default, SBE is set to 0.

When this sweep mode is enabled and CLREN is set to 1, and if a DMA transaction is stopped with data remaining in the DMAC buffer, the transaction is completed after the DMAC sweeps the data.

(a) Transfer Stop (Buffer Sweep Disabled - SBE = 0)

If 1 is set in CLREN during a DMA transfer, the DMA transfer is stopped. The stop timing depends on the value set in REQD. After stopping a DMA transfer, be sure to set 1 in SWRST to clear the DMA internal status before setting the next transfer.

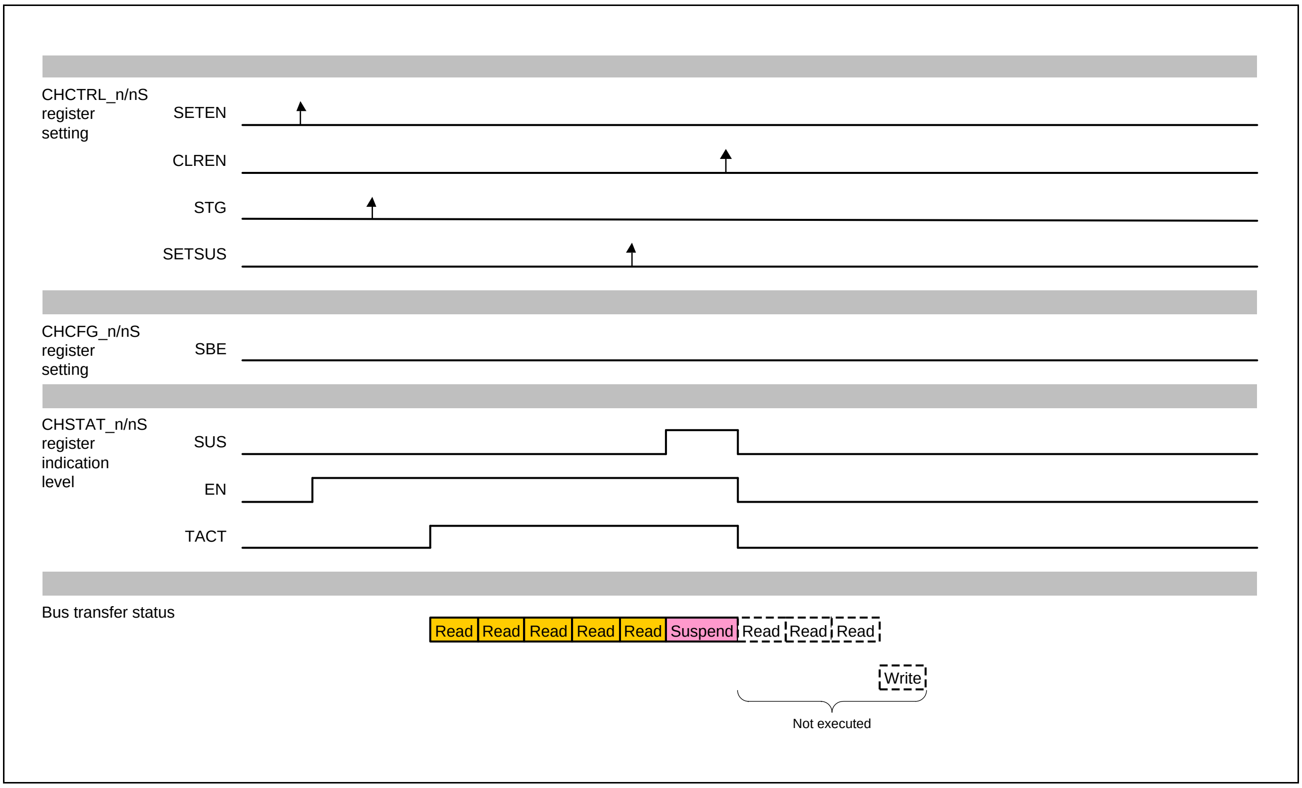

Figure 14.20 DMAC Transfer Stop

- The setting of the TACT bit being 0 indicates that the channel has been brought to a complete stop.
- If an ongoing DMA transfer is stopped before it is completed, the DMA transfer end interrupt is not asserted.
- If 0 is set in REQD, the DMA transfer is stopped when the next read is completed. (If the buffer contains any data that can be written, the DMA transfer is stopped after the data is written.)
- If 1 is set in REQD, the DMA transfer is stopped when the next write is completed.

(b) Transfer Stop (Buffer Sweep Enabled - SBE = 1)

If 1 is set in CLREN during a DMA transfer, the DMA transfer is stopped. When 0 is set in REQD, the DMA transfer is stopped after the DMAC sweeps (writes) the already read data. If 1 is set in REQD to use hardware requests, do not use the sweep mode. After stopping a DMA transfer, be sure to set 1 in SWRST to clear the DMAC internal status before setting the next transfer.

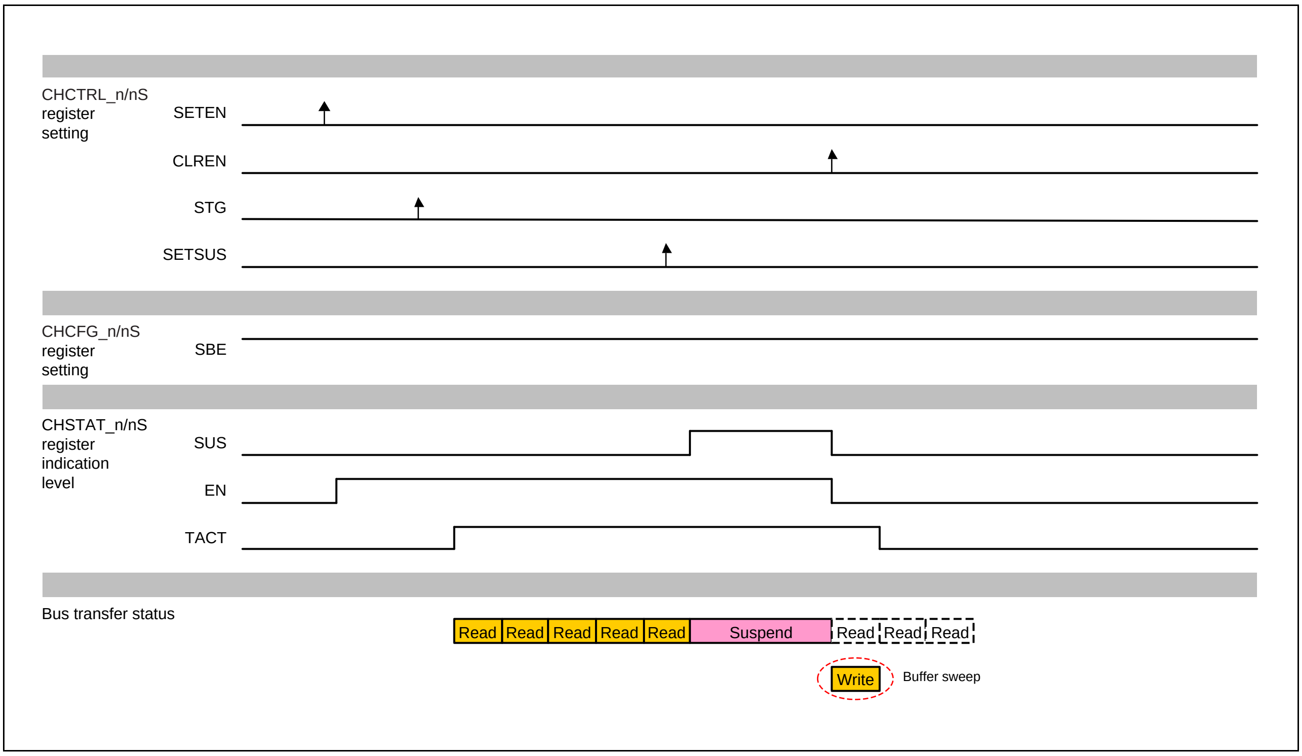

Figure 14.21 DMA Transfer Stop (Buffer Sweep Mode)

- The setting of the TACT bit being 0 indicates that the channel has been brought to a complete stop.
- If a transfer is stopped in sweep mode (SBE = 1) during the fifth read transfer by setting SETSUS and then CLREN, the read data is written before the DMA transfer is stopped.

(c) Channel Stop Check Method

Even when the EN bit is cleared to 0, the DMA transfer cannot be stopped immediately, if the bus is already executing the transfer. Therefore, in order to make sure that the DMAC has been brought to a complete stop, check that the EN bit and TACT bit are both set to 0.

(d) Transfer Stop Procedure

The transfer stop procedure is described below.

1. Set 1 in SETSUS of CHCTRL_n/nS.
2. Repeat polling until the SUS bit of CHSTAT_n/nS is set to 1. (If EN is already set to 0, the DMAC has already been stopped. Go to step 6.)
3. Set 1 in CLREN of CHCTRL_n/nS.

4. When 0 is set in SBE, the transfer is stopped according to the value of REQD. When 1 is set in SBE, the sweep mode is enabled. When 1 is set in SBE, set 0 in REQD.
5. Read CHSTAT_n/nS to check that 0 is set in the TACT bit. When TACT is set to 0, it means that the DMAC has been brought to a complete stop. When TACT is set to 1, repeat polling until this bit is set to 0.
6. To execute the next DMA transfer after stopping a transfer, be sure to set 1 in the SWRST (software reset) bit of CHCTRL_n/nS before the next DMA transfer starts.

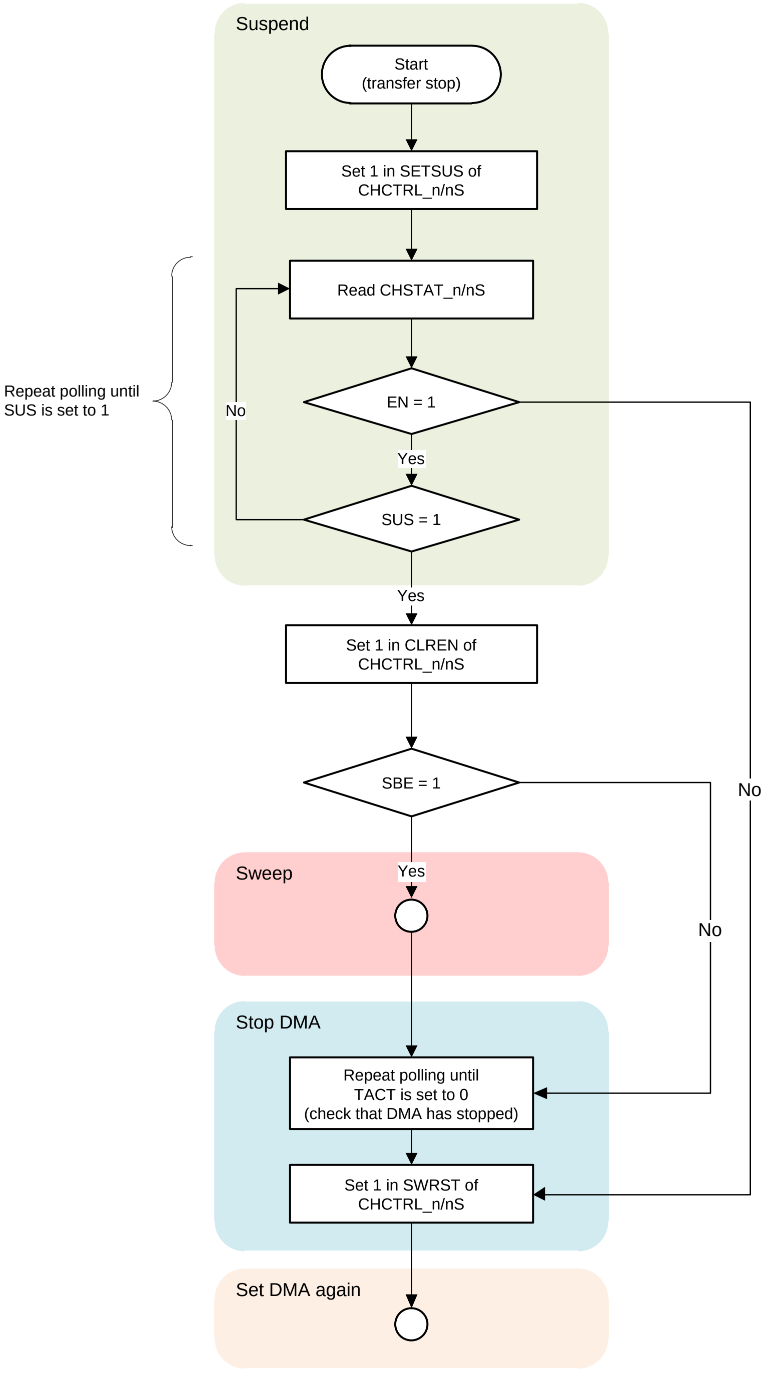

Figure 14.22 Transfer Stop Flow

14.8 DMA Setting Examples

Setting examples applicable when DMA transfer is executed using the direct memory access controller are shown in the following.

The transfer conditions for these setting examples are as follows.

Table 14.18 Transfer Condition List for DMA Transfer Setting Examples

	DMA Mode	Transfer Mode	Transfer Request
Setting example 1	Register	Single	Hardware
Setting example 2	Register	Block	Software
Setting example 3	Register (continuous execution)	Block	Software
Setting example 4	Link	Block	Software

For details of the settings, see the individual setting examples.

14.8.1 Setting Example 1 (Register Mode/Hardware Request)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

Table 14.19 DMA Transfer Setting Example 1

Item		Description	
Channel used		3	
DMA mode		Register	
Transfer mode		Single transfer	
Register set used		Next0	
Source/destination		Source	Destination
	Start address	H’11110000	H’22220000
	Address direction	Increment	Increment
	Data size	32 bits	32 bits
DMA transfer byte count		64 bytes	
DMA transfer request		Rising edge detection by hardware	
DMAACK signal		Level output during read	
DMA transfer end interrupt mask		Not masked	
CACHE setting		Default value	

Setting example 1

N0SA = H’11110000 (source address)
N0DA = H’22220000 (destination address)
N0TB = H’00000040 (transfer byte count)

CHCFG = H’00022123 (configuration)
CHITVL = H’00000000 (interval)
CHEXT = H’00000000 (CACHE setting)

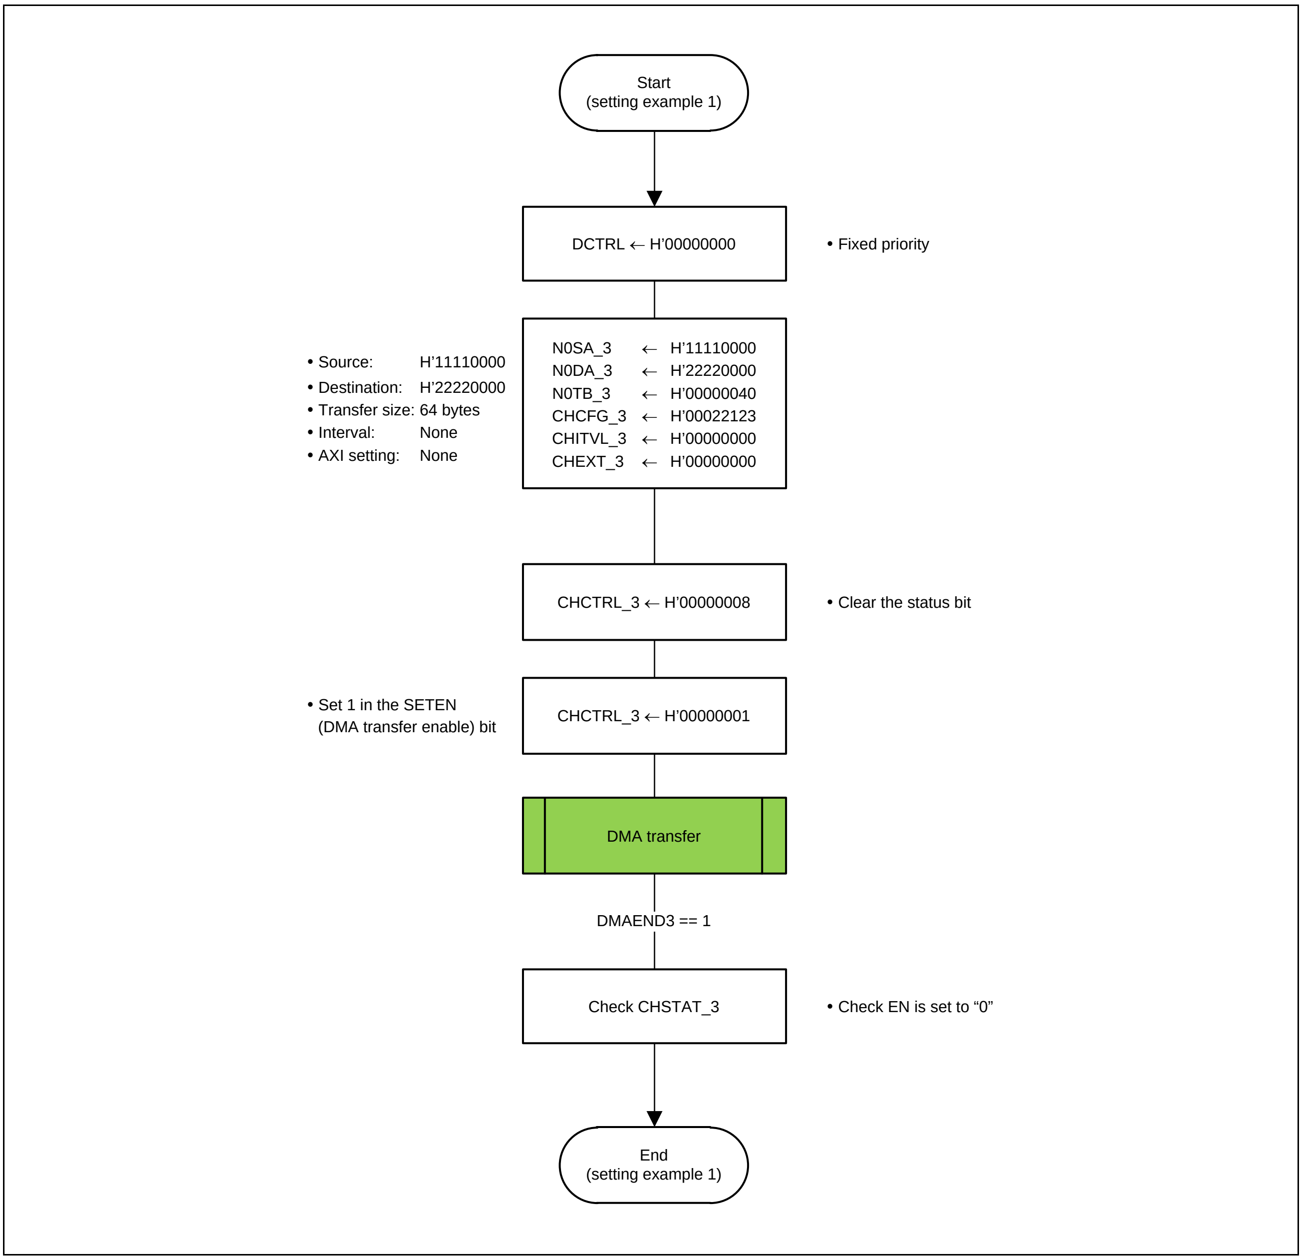

Figure 14.23 Setting Example 1

14.8.2 Setting Example 2 (Register Mode/Software Request)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

Table 14.20 DMA Transfer Setting Example 2

Item		Description	
Channel used		2	
Priority control		Round robin	
DMA mode		Register	
Transfer mode		Block transfer	
Register set used		Next1	
Source/destination		Source	Destination
	Start address	H’0FFFE000	H’33330000
	Address direction	Increment	Increment
	Data size	8 bits	256 bits
DMA transfer byte count		128 bytes	
DMA transfer request		Auto request	
DMAACK signal		Masked	
DMA transfer end interrupt mask		Not masked	
CACHE setting		Default value	

Setting example 2

DCTRL = H’00000001 (DMA setting)

N1SA = H’0FFFE000 (source address)
N1DA = H’33330000 (destination address)
N1TB = H’00000080 (transfer byte count)

CHCFG = H’10450402 (configuration)
CHITVL = H’00000000 (interval)
CHEXT = H’00000000 (CACHE setting)

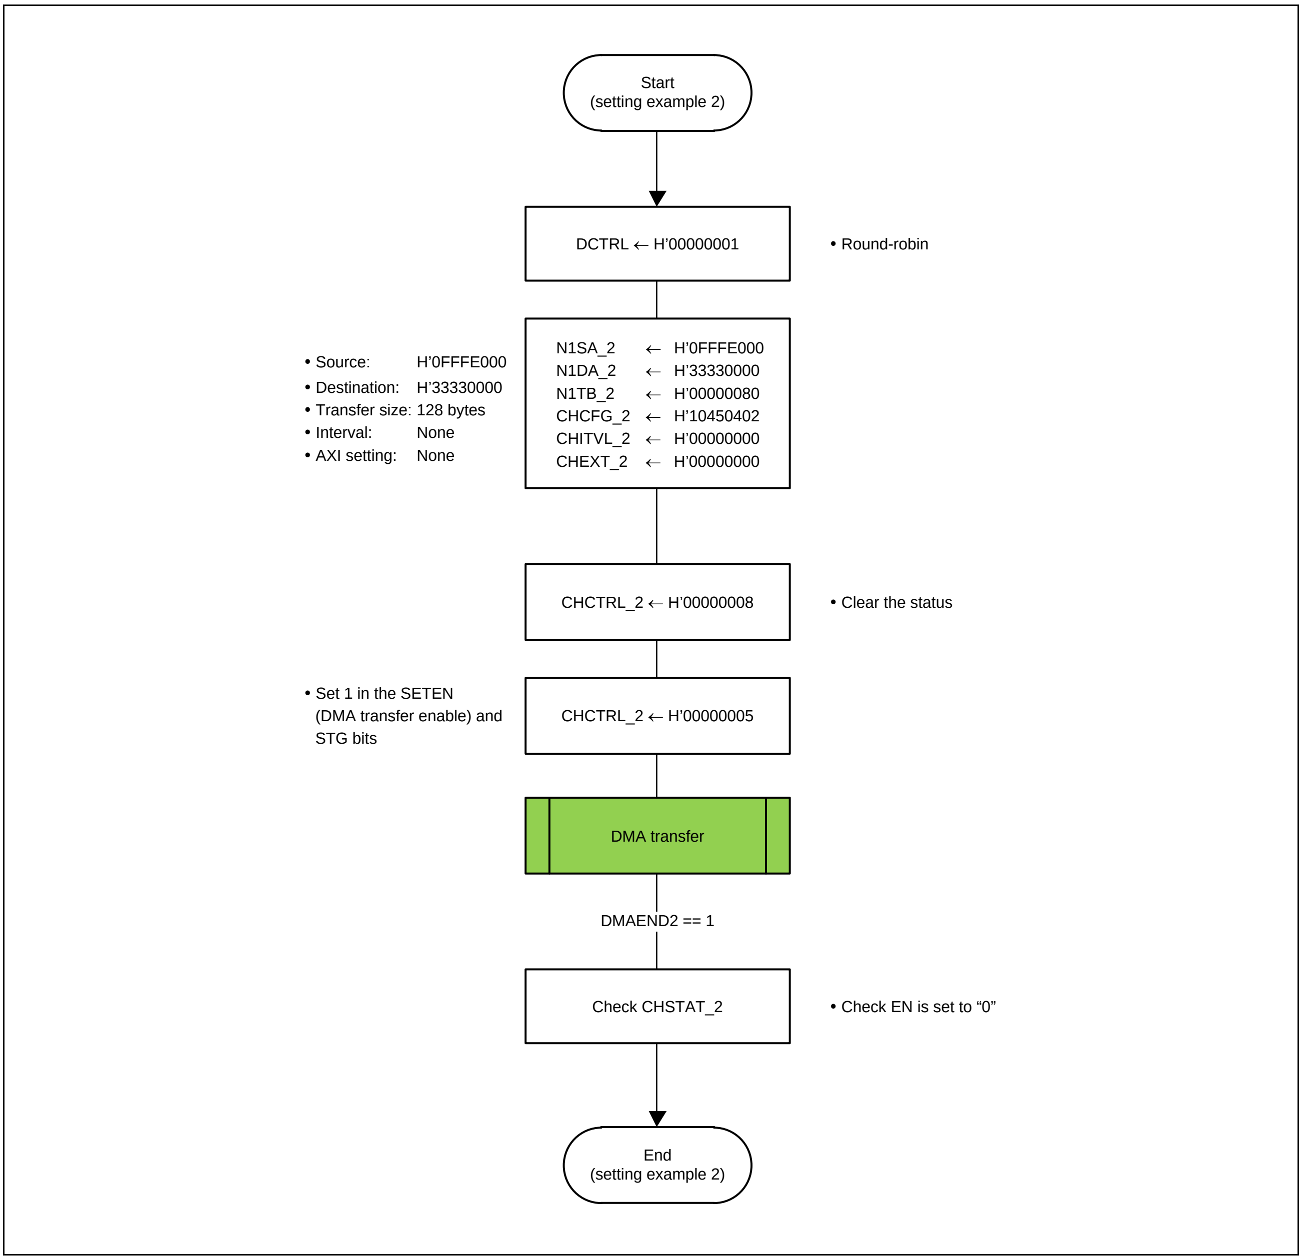

Figure 14.24 Setting Example 2

14.8.3 Setting Example 3 (Register Mode/Continuous Execution)

The following table shows a setting example applicable when DMA transfer is executed using the settings shown below.

Table 14.21 DMA Transfer Setting Example 3

Item		Description	
Channel used		1	
Priority control		Round robin	
DMA mode		Register	
Transfer mode		Block transfer	
Register set used		Use Next0 and then Next1 continuously	
Next0		Source	Destination
	Start address	H’11110000	H’33330000
	Address direction	Fixed	Fixed
	Data size	32 bits	512 bits
	DMA transfer byte count	512 bytes	
Next1		Source	Destination
	Start address	H’22220000	H’44440000
	Address direction	Fixed	Fixed
	Data size	32 bits	512 bits
	DMA transfer byte count	2048 bytes	
DMA transfer request		Auto request	
DMAACK signal		Not output	
DMA transfer end interrupt mask		Mask the DMA transfer end interrupt upon completion of Next0	
CACHE setting		Default value	

Setting example 3

DCTRL = H’00000001 (DMA setting)

N0SA = H’11110000 (source address)
N0DA = H’33330000 (destination address)
N0TB = H’00000200 (transfer byte count)

N1SA = H’22220000 (source address)
N1DA = H’44440000 (destination address)
N1TB = H’00000800 (transfer byte count)

CHCFG = H’61762001 (configuration)
CHITVL = H’00000000 (interval)
CHEXT = H’00000000 (CACHE setting)

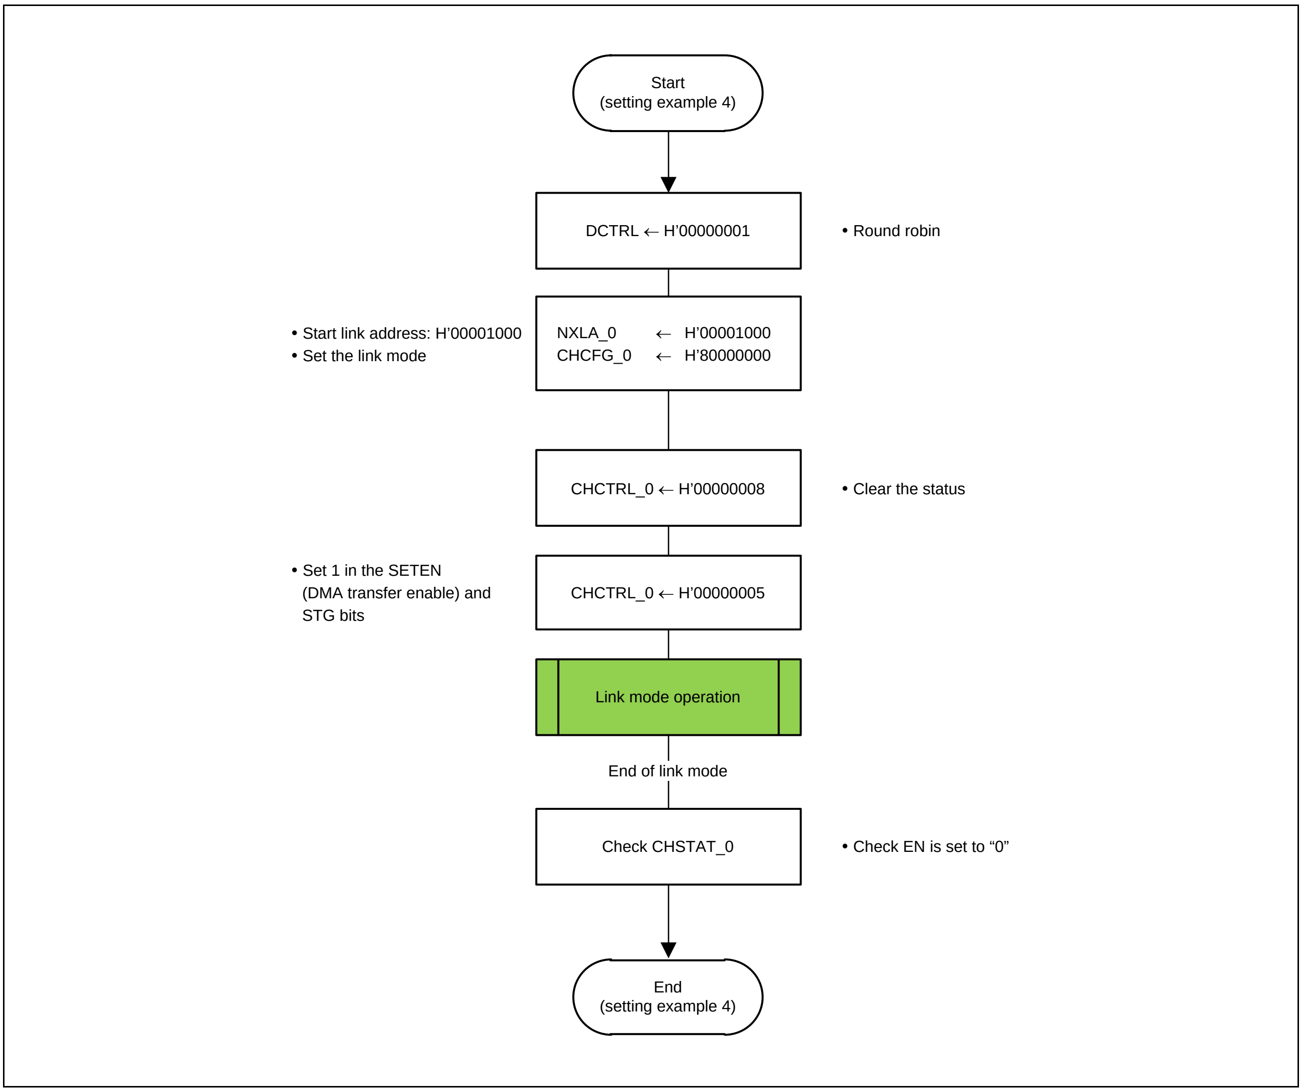

Figure 14.26 Setting Example 4

14.8.5 Next Register Set Continuous Execution Setting

The following figure shows the flowchart for executing DMA transfers continuously by using two Next register sets in register mode. While a DMA transaction is being executed using one Next register set, the other Next register set is set in order to continue to execute DMA transfers.

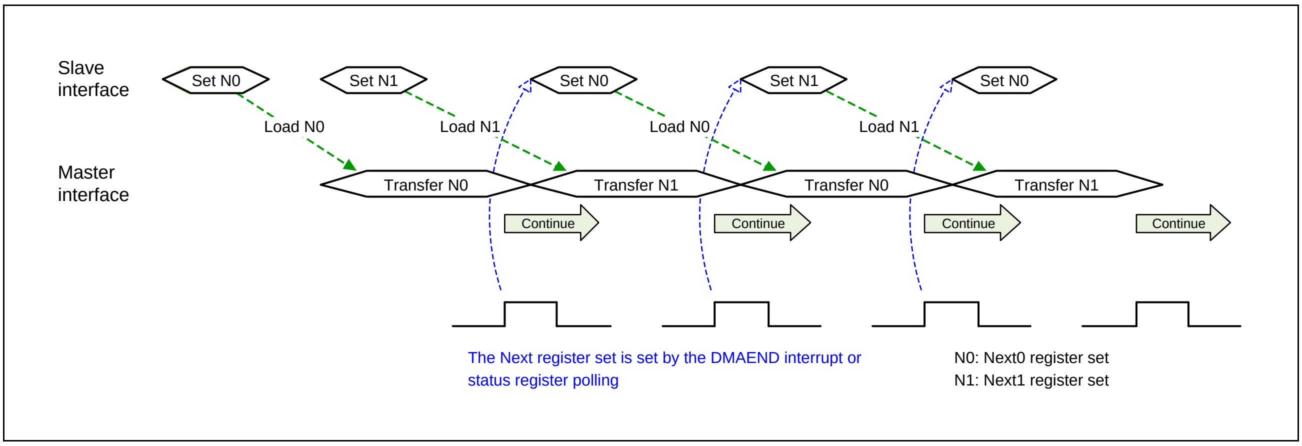

Figure 14.27 Image of Next Register Set Continuous Execution

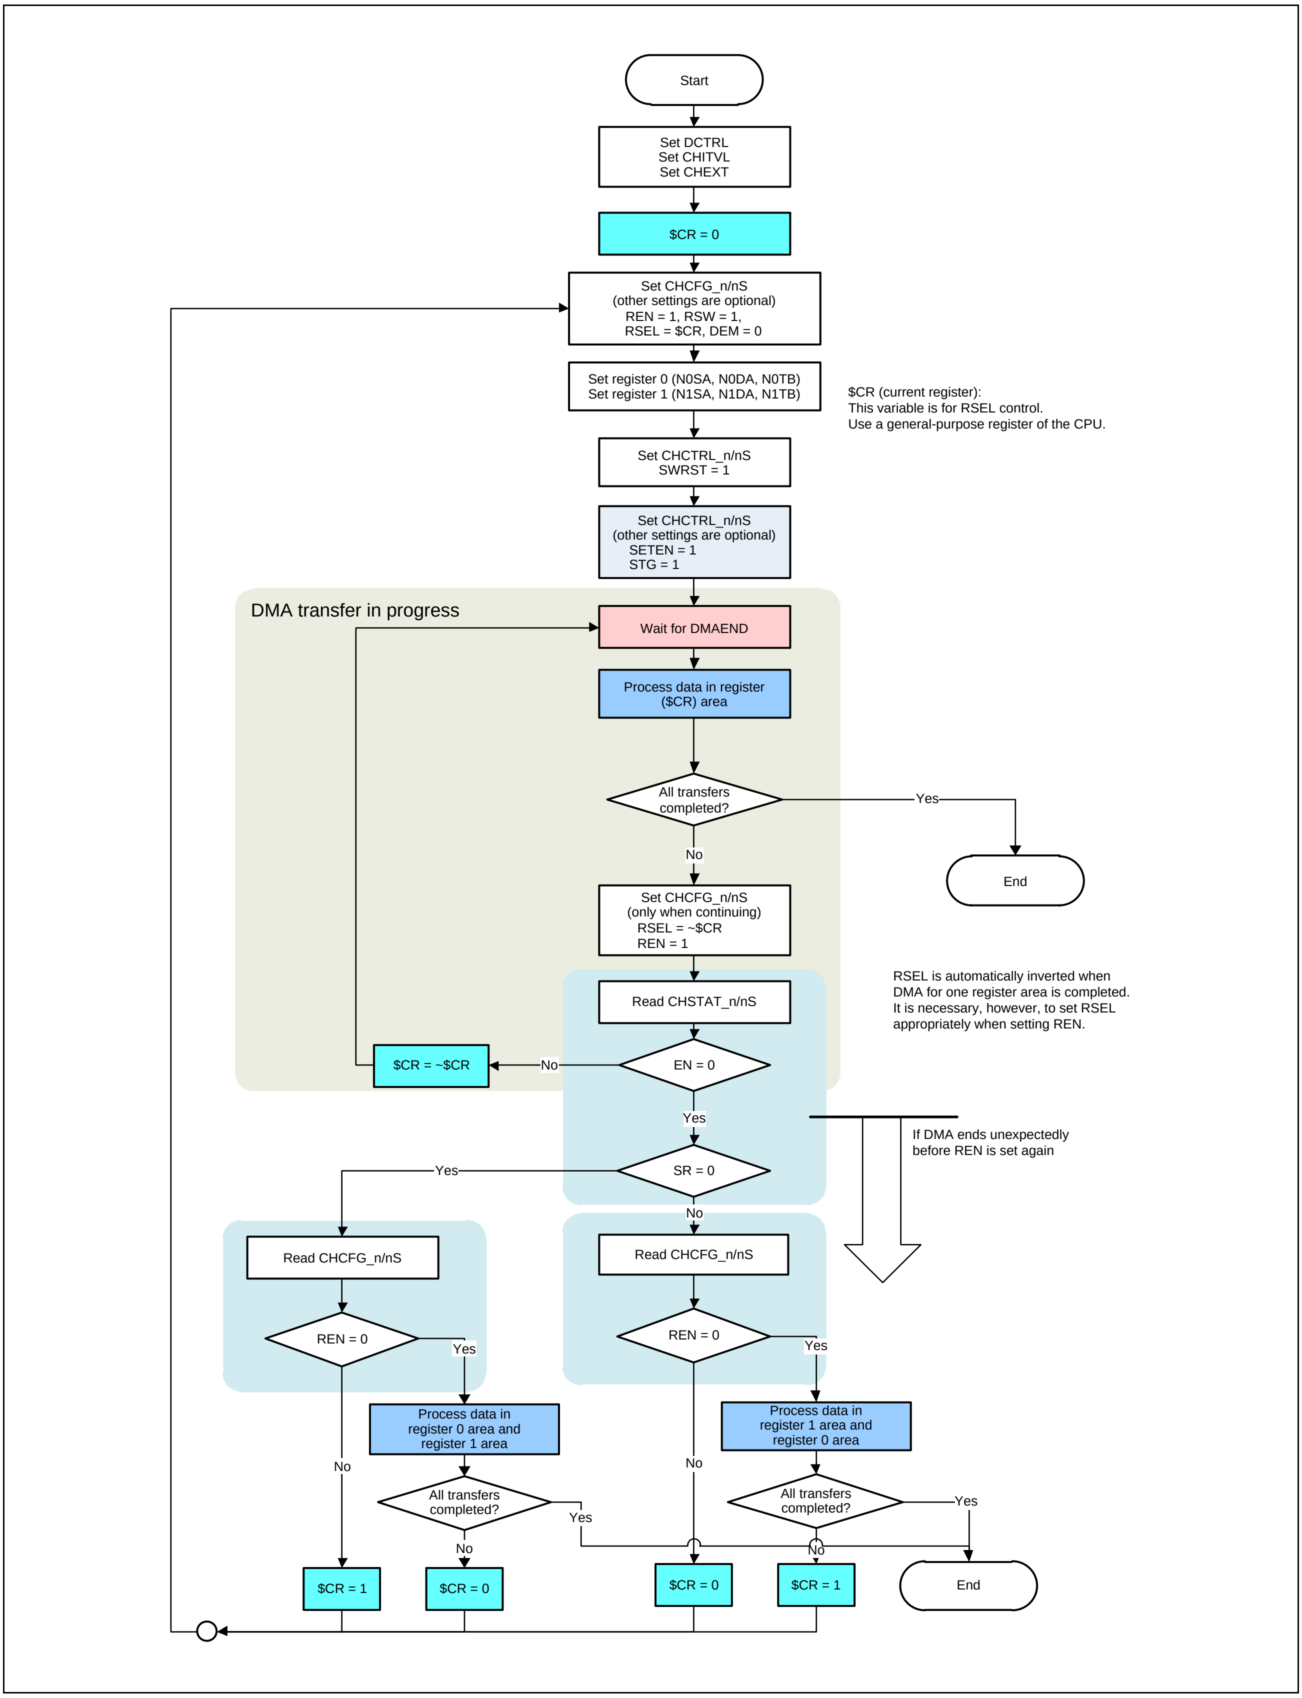

Figure 14.28 Example of Continuous DMA Execution by Using a Next Register Set

- Supplementary information

  First, save the data of the register sets to be used for DMA transfers (0 (N0SA, N0DA, and N0TB) and 1 (N1SA, N1DA, and N1TB)) to a general-purpose register of the CPU (the values of this register is referred to as $CR for the sake of convenience).

  Each time the DMA transfers for one register set are completed (the DMA transfer end interrupt is output), REN is automatically cleared to 0. In order to continue to execute DMA transfers, it is necessary to set REN of the CHCFG_n/nS register every time the DMA transfer end interrupt is asserted. This register also contains the RSEL bit, and the value of this bit needs to be set appropriately as well. Therefore, use $CR.

  In this mode, two Next register sets are executed continuously. However, if CLREN is not set before the DMA transaction is completed (the next DMA transfer end interrupt is output), continuous execution stops. In this case, how much of data has been transferred can be checked by reading the SR and EN bits of the CHSTAT_n/nS register and the REN bit of the CHCFG_n/nS register. To restart the DMA transaction, follow the flowchart shown above.

15. System Counter (SYC)

SYC generates the count value used by 3DGE and the generic timer built into Cortex-A55.

It uses the Timestamp generator, which is one of the components of Arm CoreSight SoC-400, to generate a 64-bit count value. For more information on the Timestamp generator, please refer to *the ARM CoreSight SoC-400 Technical Reference Manual*.

15.1 Overview

15.1.1 Features

- Count by 24 MHz clock (SYC_CNT_CLK)

- 64 bit gray code counter value generation
  - Convert the value generated by Timestamp generator to Gray code and output

- Access control
  - Access control for the two interfaces of the Timestamp generator
  - Control secure access/non-secure access

- Halt on Debug function
  - Counting can be stopped/restarted during debugging according to request from CoreSight

15.1.2 Block Diagram of SYC

The SYC connection diagram is shown in **Figure 15.1** and the SYC block diagram is shown in **Figure 15.2**.

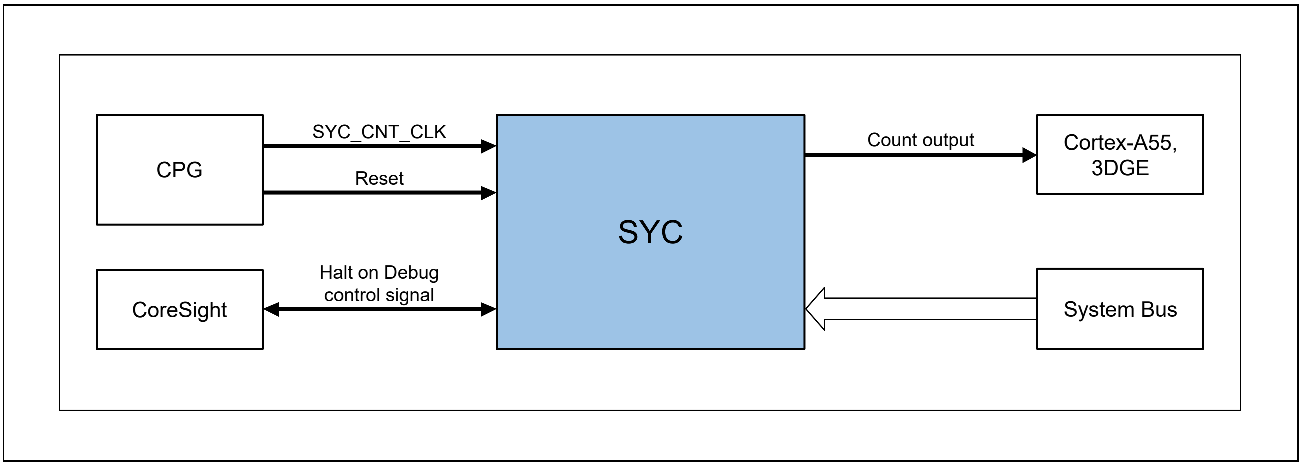

Figure 15.1 SYC Connection Diagram

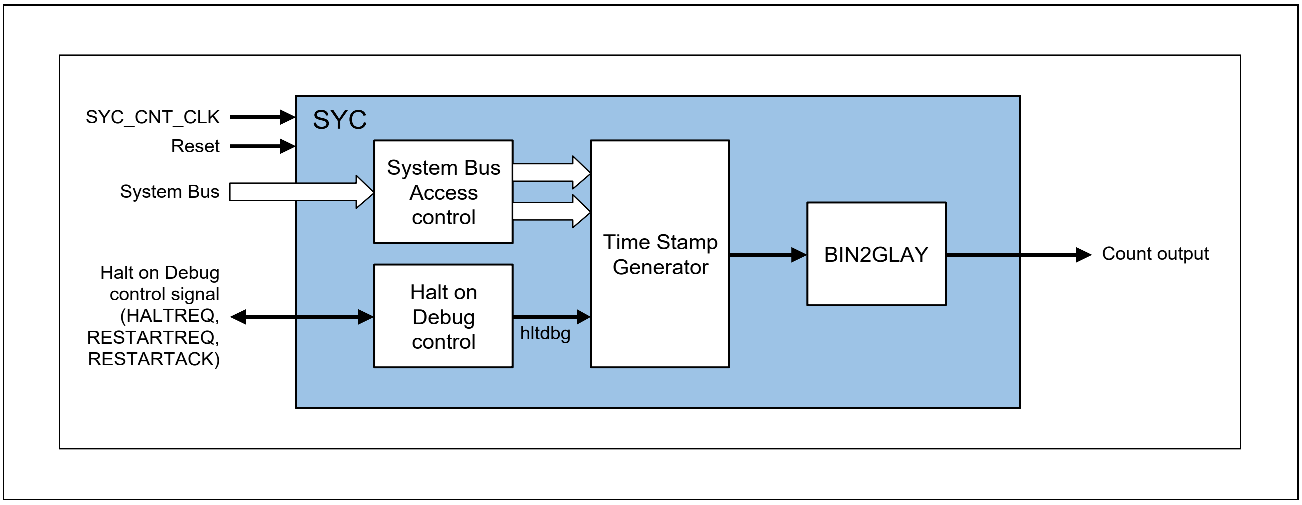

Figure 15.2 SYC Block Diagram

15.2 Address Space

Table 15.1 shows the SYC address space. SYC has an address space of 8 KB. The SYC address space is offset from the base address. The base address of SYC is as follows.

SYC base address: H’0_1100_0000 (Overall Address Space)
SYC base address: H’5100_0000 (Cortex-M33 Address Space Secure)
SYC base address: H’4100_0000 (Cortex-M33 Address Space Non-Secure)

Table 15.1 SYC Address Space

Offset Address	Region Name	Access Target
H’0000 to H’0FFF	PSELCTRL region	PSELCTRL region & PSELCTRL region Management registers
H’1000 to H’1FFF	PSELREAD region	PSELREAD region & PSELREAD region Management registers

Note: Secure access and non-secure access are possible for the PSELCTRL region and PSELREAD region.

15.3 Register Descriptions

For more information on SYC registers, please refer ARM CoreSight SoC-400 Technical Reference Manual 3.10 Timestamp generator.

15.4 Operation

15.4.1 System Bus Access Control

Access control from one system bus interface of SYC to two APB interfaces of Timestamp Generator is performed.

Controls so that the PSELCTRL area can be accessed when accessing the first half 4 KB of the 8 KB address area of SYC, and the PSELREAD area can be accessed when accessing the latter 4 KB.

The PSELCTRL area and PSELREAD area accept secure access and non-secure access.

15.4.2 Halt on Debug Function

SYC supports the Halt on Debug function included in Timestamp Generator. When HALTREQ is asserted from CoreSight, the counting operation of Timestamp Generator is stopped.

When RESTARTREQ is asserted from CoreSight, the counting operation of Timestamp Generator is restarted.

HALTREQ and RESTARTREQ are controlled by CoreSight's CTI (Cross Trigger Interface).

NOTE

This LSI supplies the common count value generated by SYC to Cortex-A55 and 3DGE. The stop/restart control of the count value by the Halt on Debug function is also performed for Cortex-A55 and 3DGE at the same time.

16. Multi-Function Timer Pulse Unit 3 (MTU3a)

16.1 Overview

This LSI has an on-chip multi-function timer pulse unit 3 (MTU3a), consisting of eight 16-bit timer channels and one 32- bit timer channel.

Table 16.1 shows the specifications of the MTU and **Table 16.2** lists the functions of the MTU. **Figure 16.1** and **Figure 16.2** are block diagrams of the MTU.

Table 16.1 MTU Specifications (1/2)

Item	Description
Pulse input/output	28 lines max.
Pulse input	3 lines
Count clock	11 clocks for each channel (14 clocks for MTU0, 12 clocks for MTU2, and 10 clocks for MTU5, four clocks for MTU1-MTU2 combination (when LWA = 1))
Operating frequency	Up to 100 MHz
Available operations	[MTU0 to MTU4, MTU6, MTU7, and MTU8] ● Waveform output on compare match ● Input capture function (noise filter setting available) ● Counter-clearing operation ● Simultaneous writing to multiple timer counters (TCNT) (excluding MTU8) ● Simultaneous clearing on compare match or input capture (excluding MTU8) ● Simultaneous input and output to registers in synchronization with counter operations (excluding MTU8) ● Up to 12-phase PWM output in combination with synchronous operation (excluding MTU8)
	[MTU0 MTU3, MTU4, MTU6, MTU7, and MTU8] ● Buffer operation specifiable
	[MTU1, MTU2] ● Phase counting mode can be specified independently ● 32-bit phase counting mode can be specified for interlocked operation of MTU1 and MTU2 (when TMDR3.LWA = 1) ● Cascade connection operation available
	[MTU3, MTU4, MTU6, and MTU7] ● Through interlocked operation of MTU3/4 and MTU6/7, the positive and negative signals in six phases (12 phases in total) can be output in complementary PWM and reset-synchronized PWM operation. ● In complementary PWM mode, values can be transferred from buffer registers to temporary registers at crests and troughs of the timer-counter values or when the buffer registers (TGRD registers in MTU4 and MTU7) are written to. ● Double-buffering selectable in complementary PWM mode
	[MTU3 and MTU4] ● Through interlocking with MTU0, a mode for driving AC synchronous motors (brushless DC motors) by using complementary PWM output and reset-synchronized PWM output is settable and allows the selection of two types of waveform output (chopping or level)
	[MTU5] ● Capable of operation as a dead-time compensation counter
	[MTU0/MTU5, MTU1, MTU2, and MTU8] 32-bit phase counting mode specifiable by combining MTU1 and MTU2 and through interlocked operation with MTU0/MTU5 and MTU8
Interrupt-skipping function	● In complementary PWM mode, interrupts on crests and troughs of counter values and triggers to start conversion by the A/D converter can be skipped
Interrupt sources	43 sources
Buffer operation	Automatic transfer of register data (transfer from the buffer register to the timer register)

Table 16.1 MTU Specifications (2/2)

Item	Description
Trigger generation	A/D converter start triggers can be generated
	A/D converter start request delaying function enables A/D converter to be started with any desired timing and to be synchronized with PWM output
Low power consumption function	The MTU3a can be placed in the module-stop state.

Table 16.2 MTU Functions (1/2)

Item		MTU0	MTU1	MTU2	MTU1 & MTU2 (LWA = 1)	MTU3	MTU4	MTU5	MTU6	MTU7	MTU8

Table 16.2 MTU Functions (2/2)

Item	MTU0	MTU1	MTU2	MTU1 & MTU2 (LWA = 1)	MTU3	MTU4	MTU5	MTU6	MTU7	MTU8
A/D converter start trigger	TGRA compare match or input capture TGRE compare match	TGRA compare match or input capture	TGRA compare match or input capture	TGRALW input capture	TGRA compare match or input capture	TGRA compare match or input capture, or TCNT underflow (trough) in complementary PWM mode	—	TGRA compare match or input capture	TGRA compare match or input capture, or TCNT underflow (trough) in complementary PWM mode	—
Interrupt sources	Seven sources • Compare match or input capture 0A • Compare match or input capture 0B • Compare match or input capture 0C • Compare match or input capture 0D • Compare match 0E • Compare match 0F • Overflow	Four sources • Compare match or input capture 1A • Compare match or input capture 1B • Overflow • Underflow	Four sources • Compare match or input capture 2A • Compare match or input capture 2B • Overflow • Underflow	Four sources • Input capture 1A • Input capture 1B • Overflow • Underflow	Five sources • Compare match or input capture 3A • Compare match or input capture 3B • Compare match or input capture 3C • Compare match or input capture 3D • Overflow	Five sources • Compare match or input capture 4A • Compare match or input capture 4B • Compare match or input capture 4C • Compare match or input capture 4D • Overflow or underflow*3	Three sources • Compare match or input capture 5U • Compare match or input capture 5V • Compare match or input capture 5W	Five sources • Compare match or input capture 6A • Compare match or input capture 6B • Compare match or input capture 6C • Compare match or input capture 6D • Overflow	Five sources • Compare match or input capture 7A • Compare match or input capture 7B • Compare match or input capture 7C • Compare match or input capture 7D • Overflow or underflow*3	Five sources • Compare match or input capture 8A • Compare match or input capture 8B • Compare match or input capture 8C • Compare match or input capture 8D • Overflow
A/D converter start request delaying function	—	—	—	—	—	• A/D converter start request at a match between TADCORA and TCNT or A/D converter start request at a match between TADCORB and TCNT	—	—	• A/D converter start request at a match between TADCORA and TCNT or A/D converter start request at a match between TADCORB and TCNT	—
Interrupt skipping 1	—	—	—	—	• Skips TGRA compare match interrupts	• Skips TCIV interrupts	—	• Skips TGRA compare match interrupts	• Skips TCIV interrupts	—
Interrupt skipping 2	—	—	—	—	—	• Skipping in compare count between TADCORA and TCNT, and TADCORB and TCNT	—	—	• Skipping in compare count between TADCORA and TCNT, and TADCORB and TCNT	—

Remarks: ✓: Possible —: Not possible

Note 1. When LWA is 1, the TGRALW capture source can be selected from either of the following: an input from MTIOC1A or MTU0.TGRA compare match/input capture event.
The TGRBLW capture source can be selected from any of the following: an input from MTIOC1B, MTU0.TGRC compare match/ input capture event, or MTU8.TGRC compare match event.

Note 2. Capture in MTU8 is supported only in normal mode.

Note 3. The underflow interrupt source is valid only in complementary PWM mode.

Table 16.3 shows the configuration of pins for the MTU.

Table 16.3 Pin Configuration of the MTU

Channel	Pin Name	I/O	Function
MTU	MTCLKA	Input	External clock A input pin (MTU1/MTU2 phase counting mode A phase input)
	MTCLKB	Input	External clock B input pin (MTU1/MTU2 phase counting mode B phase input)
	MTCLKC	Input	External clock C input pin (MTU2 phase counting mode A phase input)
	MTCLKD	Input	External clock D input pin (MTU2 phase counting mode B phase input)
MTU0	MTIOC0A	I/O	MTU0 TGRA input capture input/output compare output/PWM output pin
	MTIOC0B	I/O	MTU0 TGRB input capture input/output compare output/PWM output pin
	MTIOC0C	I/O	MTU0 TGRC input capture input/output compare output/PWM output pin
	MTIOC0D	I/O	MTU0 TGRD input capture input/output compare output/PWM output pin
MTU1	MTIOC1A	I/O	MTU1 TGRA input capture input/output compare output/PWM output pin
	MTIOC1B	I/O	MTU1 TGRB input capture input/output compare output/PWM output pin
MTU2	MTIOC2A	I/O	MTU2 TGRA input capture input/output compare output/PWM output pin
	MTIOC2B	I/O	MTU2 TGRB input capture input/output compare output/PWM output pin
MTU3	MTIOC3A	I/O	MTU3 TGRA input capture input/output compare output/PWM output pin
	MTIOC3B	I/O	MTU3 TGRB input capture input/output compare output/PWM output pin
	MTIOC3C	I/O	MTU3 TGRC input capture input/output compare output/PWM output pin
	MTIOC3D	I/O	MTU3 TGRD input capture input/output compare output/PWM output pin
MTU4	MTIOC4A	I/O	MTU4 TGRA input capture input/output compare output/PWM output pin
	MTIOC4B	I/O	MTU4 TGRB input capture input/output compare output/PWM output pin
	MTIOC4C	I/O	MTU4 TGRC input capture input/output compare output/PWM output pin
	MTIOC4D	I/O	MTU4 TGRD input capture input/output compare output/PWM output pin
MTU5	MTIC5U	Input	MTU5 TGRU input capture input/external pulse input pin
	MTIC5V	Input	MTU5 TGRV input capture input/external pulse input pin
	MTIC5W	Input	MTU5 TGRW input capture input/external pulse input pin
MTU6	MTIOC6A	I/O	MTU6 TGRA input capture input/output compare output/PWM output pin
	MTIOC6B	I/O	MTU6 TGRB input capture input/output compare output/PWM output pin
	MTIOC6C	I/O	MTU6 TGRC input capture input/output compare output/PWM output pin
	MTIOC6D	I/O	MTU6 TGRD input capture input/output compare output/PWM output pin
MTU7	MTIOC7A	I/O	MTU7 TGRA input capture input/output compare output/PWM output pin
	MTIOC7B	I/O	MTU7 TGRB input capture input/output compare output/PWM output pin
	MTIOC7C	I/O	MTU7 TGRC input capture input/output compare output/PWM output pin
	MTIOC7D	I/O	MTU7 TGRD input capture input/output compare output/PWM output pin
MTU8	MTIOC8A	I/O	MTU8.TGRA input capture input/output compare output pin
	MTIOC8B	I/O	MTU8.TGRB input capture input/output compare output pin
	MTIOC8C	I/O	MTU8.TGRC input capture input/output compare output pin
	MTIOC8D	I/O	MTU8.TGRD input capture input/output compare output pin

16.2 Register Descriptions

Table 16.4 shows the register configuration. The MTU address space is offset from the base address. The base address of MTU is as follows.

MTU base address: H’0_1000_0000 (Overall Address Space)

MTU base address: H’5000_0000 (Cortex-M33 Address Space Secure)

MTU base address: H’4000_0000 (Cortex-M33 Address Space Non-Secure)

Table 16.4 Register configuration (1/5)

Channel	Register Name	Abbreviation	Address	Access size
MTU0	Timer control register	TCR	H’1300	8
	Timer mode register 1	TMDR1	H’1301	8
	Timer I/O control register H	TIORH	H’1302	8

16.2.1 Timer Control Register (TCR)

(1) MTU0.TCR, MTU1.TCR, MTU2.TCR, MTU3.TCR, MTU4.TCR, MTU6.TCR, MTU7.TCR, MTU8.TCR

Address(es): MTU0.TCR H’0_1000_1300, MTU1.TCR H’0_1000_1380, MTU2.TCR H’0_1000_1400, MTU3.TCR H’0_1000_1200, MTU4.TCR H’0_1000_1201, MTU6.TCR H’0_1000_1A00, MTU7.TCR H’0_1000_1A01, MTU8.TCR H’0_1000_1600

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	CCLR[2:0]			CKEG[1:0]		TPSC[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	TPSC[2:0]	All 0	R/W	Time Prescaler Select See **Table 16.7** to **Table 16.10**.
b4, b3	CKEG[1:0]	All 0	R/W	Clock Edge Select b4 b3 0 0: Count at rising edge 0 1: Count at falling edge 1 x: Count at both edges
b7 to b5	CCLR[2:0]	All 0	R/W	Counter Clear Source Select See **Table 16.5** and **Table 16.6**.

Remarks: x: Don’t care

The TCR register controls the TCNT operation for each channel in combination with the TCR2 register. The MTU has a total of 11 TCR registers, one each for MTU0 to MTU4, MTU 6, MTU7, and MTU8 and three (TCRU, TCRV, and TCRW) for MTU5. TCR values should be specified only while TCNT operation is stopped.

TPSC[2:0] Bits (Time Prescaler Select)

These bits select the TCNT count clock source. The clock source can be selected independently for each channel. See **Table 16.7** to **Table 16.10** for details.

CKEG[1:0] Bits (Clock Edge Select)

These bits select the count clock source edge, including the MTIOC1A pin. When the internal clock is counted at both edges, the count clock period is halved (e.g. P0ϕ/4 at both edges = P0ϕ/2 at rising edge). If phase counting mode is used on MTU1 and MTU2, the setting of these bits is ignored and the phase counting mode setting has priority. Internal clock edge selection is valid when the count clock source is P0ϕ/2 or slower. When P0ϕ/1 or the overflow/underflow in another channel is selected for the count clock source, a value can be written to these bits but counter operation compiles with the initial value.

CCLR[2:0] Bits (Counter Clear Source Select)

These bits select the TCNT counter clearing source. See **Table 16.5** and **Table 16.6** for details.

Table 16.5 CCLR[2:0] (MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8)

	Bit 7	Bit 6	Bit 5	
Channel	CCLR2	CCLR1	CCLR0	Description
MTU0 MTU3 MTU4 MTU6 MTU7 MTU8	0	0	0	TCNT clearing disabled
	0	0	1	TCNT cleared by TGRA compare match/input capture
	0	1	0	TCNT cleared by TGRB compare match/input capture
	0	1	1	TCNT cleared by counter clearing in another channel where synchronous clearing or synchronous operation is selected*[1]
	1	0	0	TCNT clearing disabled
	1	0	1	TCNT cleared by TGRC compare match/input capture*[2]
	1	1	0	TCNT cleared by TGRD compare match/input capture*[2]
	1	1	1	TCNT cleared by counter clearing in another channel where synchronous clearing or synchronous operation is selected*[1]

Note 1. Synchronous operation is selected by setting a SYNC bit in TSYRA or TSYRB to 1 except for MTU8.

Note 2. When TGRC or TGRD is used as a buffer register, TCNT is not cleared because the buffer register setting has priority and compare match/input capture does not occur.

Table 16.6 CCLR[2:0] (MTU1 and MTU2)

	Bit 7	Bit 6	Bit 5	
Channel	Reserved*[2]	CCLR1	CCLR0	Description
MTU1 MTU2	0	0	0	TCNT clearing disabled
	0	0	1	TCNT cleared by TGRA compare match/input capture
	0	1	0	TCNT cleared by TGRB compare match/input capture
	0	1	1	TCNT cleared by counter clearing in another channel where synchronous clearing or synchronous operation is selected*[1]

Note 1. Synchronous operation is selected by setting a SYNC bit in TSYRA or TSYRB to 1.

Note 2. Bit 7 is reserved in MTU1 and MTU2. It is read as 0. The write value is ignored.

(2) MTU5.TCRU, MTU5.TCRV, MTU5.TCRW

Address(es): MTU5.TCRU H'0_1000_1C84, MTU5.TCRV H'0_1000_1C94, MTU5.TCRW H'0_1000_1CA4

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	TPSC[1:0]	
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	TPSC[1:0]	All 0	R/W	Time Prescaler Select See **Table 16.11**.
b7 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

TPSC[1:0] Bits (Time Prescaler Select)

These bits select the TCNT count clock source. See **Table 16.11** for details.

16.2.2 Timer Control Register 2 (TCR2)

(1) MTU0.TCR2, MTU3.TCR2, MTU4.TCR2, MTU6.TCR2, MTU7.TCR2, MTU8.TCR2

Address(es): MTU0.TCR2 H'0_1000_1328, MTU3.TCR2 H'0_1000_124C, MTU4.TCR2 H'0_1000_124D,
MTU6.TCR2 H'0_1000_1A4C, MTU7.TCR2 H'0_1000_1A4D, MTU8.TCR2 H'0_1000_1606

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TPSC2[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(2) MTU1.TCR2, MTU2.TCR2

Address(es): MTU1.TCR2 H'0_1000_1394, MTU2.TCR2 H'0_1000_140C

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	PCB[1:0]		TPSC2[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	TPSC2[2:0]	All 0	R/W	Time Prescaler Select See **Table 16.7** to **Table 16.10**.
b4, b3	PCB[1:0]	All 0	R/W	Phase Counting Mode Function Expansion Control Functional Expansion Control for Phase Counting Modes 2, 3, and 5
b7 to b5	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

The TCR2 register controls the TCNT operation for each channel in combination with the TCR register. The MTU has a total of 11 TCR2 registers, one each for MTU0 to MTU4, MTU 6, MTU7, and MTU8 and three (TCR2U, TCR2V, and TCR2W) for MTU5. TCR2 values should be specified only while TCNT operation is stopped.

TPSC2[2:0] Bits (Time Prescaler Select)

These bits select the TCNT count clock source. The clock source can be selected independently for each channel. See **Table 16.7** to **Table 16.10** for details.

PCB[1:0] Bits (Phase Counting Mode Function Expansion Control)

These bits control extended functions for phase counting mode 2, 3, and 5 in MTU1 and MTU2. See **Section 16.3.6, Phase Counting Mode**.

(3) MTU5.TCR2U, MTU5.TCR2V, MTU5.TCR2W

Address(es): MTU5.TCR2U H'0_1000_1C85, MTU5.TCR2V H'0_1000_1C95, MTU5.TCR2W H'0_1000_1CA5

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	CKEG[1:0]		TPSC2[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	TPSC2[2:0]	All 0	R/W	Time Prescaler Select See **Table 16.11**.
b4, b3	CKEG[1:0]	All 0	R/W	Clock Edge Select b4 b3 0 0: Counts at the rising edge. 0 1: Counts at the falling edge. 1 x: Counts at both edges.
b7 to b5	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Remarks: x: Don’t care

TPSC2[2:0] Bits (Time Prescaler Select)

These bits select the TCNT count clock source. See **Table 16.11** for details.

CKEG[1:0] Bits (Clock Edge Select)

These bits select the edge of the count clock source signal output from the MTIOC1A pin.

Table 16.7 TPSC[2:0], TPSC2[2:0] (MTU0)

	TCR2[2:0]			TCR[2:0]			
	Bit 2	Bit 1	Bit 0	Bit 2	Bit 1	Bit 0	
Channel	TPSC22	TPSC21	TPSC20	TPSC2	TPSC1	TPSC0	Description

16.2.3 Timer Mode Register 1 (TMDR1)

(1) MTU0.TMDR1

Address(es): MTU0.TMDR1 H'0_1000_1301

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	BFE	BFB	BFA	MD[3:0]			
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(2) MTU1.TMDR1, MTU2.TMDR1

Address(es): MTU1.TMDR1 H'0_1000_1381, MTU2.TMDR1 H'0_1000_1401

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	MD[3:0]			
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(3) MTU3.TMDR1, MTU4.TMDR1, MTU6.TMDR1, MTU7.TMDR1, MTU8.TMDR1

Address(es): MTU3.TMDR1 H'0_1000_1202, MTU4.TMDR1 H'0_1000_1203, MTU6.TMDR1 H'0_1000_1A02,
MTU7.TMDR1 H'0_1000_1A03, MTU8.TMDR1 H'0_1000_1601

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	BFB	BFA	MD[3:0]			
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b3 to b0	MD[3:0]	All 0	R/W	Mode Select These bits specify the timer operating mode. See **Table 16.12** for details.
b4	BFA	0	R/W	Buffer Operation A 0: TGRA and TGRC operate normally 1: TGRA and TGRC used together for buffer operation
b5	BFB	0	R/W	Buffer Operation B 0: TGRB and TGRD operate normally 1: TGRB and TGRD used together for buffer operation
b6	BFE	0	R/W	Buffer Operation E 0: MTU0.TGRE and MTU0.TGRF operate normally 1: MTU0.TGRE and MTU0.TGRF used together for buffer operation
b7	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.

The TMDR1 register specifies the operating mode of each channel. The MTU has a total of eight TMDR1 registers, one each for MTU0 to MTU4, MTU 6, MTU7, and MTU8. TMDR1 register values should be specified only while TCNT operation is stopped.

Table 16.12 Operating Mode Setting by MD[3:0] Bits (MTU0 to MTU4, MTU6 to MTU8)

Bit 3	Bit 2	Bit 1	Bit 0		MTU0	MTU1	MTU2	MTU1 & MTU2 (LWA = 1)	MTU3	MTU4	MTU6	MTU7	MTU8
MD3	MD2	MD1	MD0	Description									
0	0	0	0	Normal mode	✓	✓	✓		✓	✓	✓	✓	✓
0	0	0	1	Setting prohibited									
0	0	1	0	PWM mode 1	✓	✓	✓		✓	✓	✓	✓	
0	0	1	1	PWM mode 2	✓	✓	✓						
0	1	0	0	Phase counting mode 1		✓	✓	✓					
0	1	0	1	Phase counting mode 2		✓	✓	✓					
0	1	1	0	Phase counting mode 3		✓	✓	✓					
0	1	1	1	Phase counting mode 4		✓	✓	✓					
1	0	0	0	Reset-synchronized PWM mode*[1]					✓		✓		
1	0	0	1	Phase counting mode 5		✓	✓	✓					
1	0	1	x	Setting prohibited									
1	1	0	0	Setting prohibited									
1	1	0	1	Complementary PWM mode 1 (transfer at crest)*[1]					✓		✓		
1	1	1	0	Complementary PWM mode 2 (transfer at trough)*[1]					✓		✓		
1	1	1	1	Complementary PWM mode 3 (transfer at crest and trough)*[1]					✓		✓		

Note: Only set the corresponding operating mode listed above for each channel.

Remarks: x: Don't care

Note 1. Reset-synchronized PWM mode and complementary PWM mode can only be set for MTU3 and MTU6. When MTU3 or MTU6 is set to reset-synchronized PWM mode or complementary PWM mode, the MTU4 or MTU7 settings become ineffective and automatically conform to the MTU3 or MTU6 setting, respectively. MTU4 and MTU7 should be set to the initial values (normal mode).

BFA Bit (Buffer Operation A)

This bit specifies whether to operate TGRA in the normal way or to use TGRA and TGRC together for buffer operation. When TGRC is used as a buffer register, TGRC input capture/output compare does not take place in modes other than complementary PWM mode, but compare match with TGRC occurs in complementary PWM mode.

If a compare match occurs on MTU4 in the Tb interval in complementary PWM mode, the TGIEC bit in timer interrupt enable register (MTU4.TIER) should be set to 0.

In reset-synchronized PWM mode or complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in the BFA bit of MTU3.TMDR1 (MTU6.TMDR1). The BFA bit of MTU4.TMDR1 (MTU7.TMDR1) should be set to 0.

In MTU1 and MTU2, which have no TGRC, this bit is reserved. It is read as 0. The write value should be 0. See **Figure 16.50** for an illustration of the Tb interval in complementary PWM mode.

BFB Bit (Buffer Operation B)

This bit specifies whether to operate TGRB in the normal way or to use TGRB and TGRD together for buffer operation. When TGRD is used as a buffer register, TGRD input capture/output compare does not take place in modes other than complementary PWM mode, but compare match with TGRD occurs in complementary PWM mode.

If a compare match occurs on MTU4 in the Tb interval in complementary PWM mode, the TGIED bit in timer interrupt enable register (MTU4.TIER) should be set to 0.

In reset-synchronized PWM mode or complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in the BFB bit of MTU3.TMDR1 (MTU6.TMDR1). The BFB bit of MTU4.TMDR1 (MTU7.TMDR1) should be set to 0.

In MTU1 and MTU2, which have no TGRD, this bit is reserved. It is read as 0. The write value should be 0. See **Figure 16.50** for an illustration of the Tb interval in complementary PWM mode.

BFE Bit (Buffer Operation E)

This bit specifies whether to operate MTU0.TGRE and MTU0.TGRF in the normal way or to use them together for buffer operation. Compare match with TGRF occurs even when TGRF is used as a buffer register.

In MTU0 to MTU4, MTU6, MTU7, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

16.2.4 Timer Mode Registers 2 (TMDR2A and TMDR2B)

Address(es): MTU.TMDR2A H'0_1000_1270, MTU.TMDR2B H'0_1000_1A70

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DRS
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	DRS	0	R/W	Double Buffer Select 0: Double buffer function is disabled 1: Double buffer function is enabled
b7 to b1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

TMDR2A and TMDR2B specify the double buffer function in complementary PWM mode 3 (transfer at the crest and trough of the counter value). The MTU has two TMDR2 registers, one each for MTU3 (TMDR2A) and MTU6 (TMDR2B). TMDR2A and TMDR2B values should be specified only while TCNT operation is stopped.

DRS Bit (Double Buffer Select)

This bit enables or disables the double buffer function in complementary PWM mode.

16.2.5 Timer Mode Register 3 (TMDR3)

Address(es): MTU1.TMDR3 H'0_1000_1391

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	PHCKSEL	LWA
Initial Value	0	0	0	0	0	0	1	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	LWA	0	R/W	MTU1/MTU2 Combination Longword Access Control 0: 16-bit access is enabled. 1: 32-bit access is enabled.
b1	PHCKSEL	1	R/W	External Input Phase Clock Select Selects the external clock pin for phase counting mode. 0: MTCLKA and MTCLKB are selected for the external phase clock. 1: MTCLKC and MTCLKD are selected for the external phase clock.
b7 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

The TMDR3 register controls longword access to a 32-bit register or counter in a combination of MTU1 and MTU2. There is only one TMDR3 register in MTU1. The counter (TCNTLW), general register A (TGRALW), and general register B (TGRBLW) of MTU1 and MTU2 are accessed in the combinations listed in **Table 16.13**.

LWA Bit (MTU1/MTU2 Combination Longword Access Control)

This bit selects a 32-bit access in a combination of MTU1 and MTU2.

When the LWA bit is set to 0, MTU1 and MTU2 operate independently as 16-bit timers and the TCNTLW, TGRALW, and TGRBLW registers cannot be accessed.

When the LWA bit is set to 1, MTU1 and MTU2 are cascaded and operate as a 32-bit timer, which is controlled through the TCR, TCR2, TIOR, and TMDR1 registers in MTU1. The TCR, TCR2, TIOR, and TMDR1 register settings in MTU2 are ignored. The 16-bit registers (TCNT, TGRA, and TGRB) in MTU1 and MTU2 cannot be accessed. MTU2 input capture and compare match are disabled.

Note that MTU1 and MTU2 can be cascaded by setting the LWA bit to 1 only in phase-counting mode. Cascade connection cannot be used in normal, PWM1, or PWM2 mode. When setting the LWA bit to 1, be sure to select phase-counting mode.

In addition, initialize the TCNT, TGRA, and TGRB registers in MTU1 and MTU2 before setting the LWA bit to 1.

PHCKSEL Bit (External Input Phase Clock Select)

When the MTU1 and MTU2 registers are combined for 32-bit phase counting mode or MTU2 phase counting mode, this bit selects either the A- or B-phase signal from the external clock. See **Table 16.66, Clock Input Pins in Phase Counting Mode** for details.

Table 16.13 Setting and Combination of the TMDR3 Register

	TMDR3.LWA = 0		TMDR3.LWA = 1	
Register	Symbol	Access mode	Symbol	Access mode
Counter in MTU1*[1]	MTU1.TCNT	Word	MTU1.TCNT_1_LW	Longword
Counter in MTU2	MTU2.TCNT	Word		
General register A in MTU1	MTU1.TGRA	Word	MTU1.TGRA_1_LW	Longword
General register A in MTU2	MTU2.TGRA	Word		
General register B in MTU1	MTU1.TGRB	Word	MTU1.TGRB_1_LW	Longword
General register B in MTU2	MTU2.TGRB	Word		

Note 1. When the LWA bit is set to 1, setting the count clock for MTU1 as MTU2.TCNT overflow/underflow is not required.

16.2.6 Timer I/O Control Register (TIOR)

(1) MTU0.TIORH, MTU1.TIOR, MTU2.TIOR, MTU3.TIORH, MTU4.TIORH, MTU6.TIORH, MTU7.TIORH, MTU8.TIORH

Address(es): MTU0.TIORH H’0_1000_1302, MTU1.TIOR H’0_1000_1382, MTU2.TIOR H’0_1000_1402, MTU3.TIORH H’0_1000_1204, MTU4.TIORH H’0_1000_1206, MTU6.TIORH H’0_1000_1A04, MTU7.TIORH H’0_1000_1A06, MTU8.TIORH H’0_1000_1602

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	IOB[3:0]				IOA[3:0]			
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b3 to b0	IOA[3:0]	All 0	R/W	I/O Control A*[1] See the following tables. MTU0.TIORH: **Table 16.28** MTU1.TIOR: **Table 16.30** MTU2.TIOR: **Table 16.31** MTU3.TIORH: **Table 16.32** MTU4.TIORH: **Table 16.34** MTU6.TIORH: **Table 16.36** MTU7.TIORH: **Table 16.38** MTU8.TIORH: **Table 16.40**
b7 to b4	IOB[3:0]	All 0	R/W	I/O Control B*[1] See the following tables. MTU0.TIORH: **Table 16.14** MTU1.TIOR: **Table 16.16** MTU2.TIOR: **Table 16.17** MTU3.TIORH: **Table 16.18** MTU4.TIORH: **Table 16.20** MTU6.TIORH: **Table 16.22** MTU7.TIORH: **Table 16.24** MTU8.TIORH: **Table 16.26**

Note 1. When the value of IOn[3:0] (n = A, B) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

(2) MTU0.TIORL, MTU3.TIORL, MTU4.TIORL, MTU6.TIORL, MTU7.TIORL, MTU8.TIORL

Address(es): MTU0.TIORL H’0_1000_1303, MTU3.TIORL H’0_1000_1205, MTU4.TIORL H’0_1000_1207, MTU6.TIORL H’0_1000_1A05,MTU7.TIORL H’0_1000_1A07, MTU8.TIORL H’0_1000_1603

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	IOD[3:0]				IOC[3:0]			
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b3 to b0	IOC[3:0]	All 0	R/W	I/O Control C*[1] See the following tables. MTU0.TIORL: **Table 16.29** MTU3.TIORL: **Table 16.33** MTU4.TIORL: **Table 16.35** MTU6.TIORL: **Table 16.37** MTU7.TIORL: **Table 16.39** MTU8.TIORL: **Table 16.41**
b7 to b4	IOD[3:0]	All 0	R/W	I/O Control D*[1] See the following tables. MTU0.TIORL: **Table 16.15** MTU3.TIORL: **Table 16.19** MTU4.TIORL: **Table 16.21** MTU6.TIORL: **Table 16.23** MTU7.TIORL: **Table 16.25** MTU8.TIORL: **Table 16.27**

Note 1. When the value of IOn[3:0] (n = C, D) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

(3) MTU5.TIORU, MTU5.TIORV, MTU5.TIORW

Address(es): MTU5.TIORU H’0_1000_1C86, MTU5.TIORV H’0_1000_1C96, MTU5.TIORW H’0_1000_1CA6

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	IOC[4:0]				
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b4 to b0	IOC[4:0]	All 0	R/W	I/O Control C See the following table. MTU5.TIORU, MTU5.TIORV, MTU5.TIORW: **Table 16.42**
b7 to b5	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

The TIOR register controls the TGR register. The MTU has a total of 17 TIOR registers, two each for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8, one each for MTU1 and MTU2, and three (MTU5.TIORU/TIORV/TIORW) for MTU5. The TIOR register should be set when the TMDR register setting is normal mode, PWM mode, or phase counting mode.

Note that TIOR is affected by the TMDR1 setting.

The initial output specified by TIOR is valid when the counter is stopped (the CSTn bits in TSTRA and TSTRB are cleared to 0). Note also that, in PWM mode 2, the output at the point at which the counter is cleared to 0 is specified. When TGRC or TGRD is designated for buffer operation, this setting is invalid and the register operates as a buffer register.

Table 16.14 TIORH (MTU0)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB3	IOB2	IOB1	IOB0	MTU0.TGRB Function	MTIOC0B Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by TCNT (LWA = 0) or TCNTLW (LWA = 1) in MTU1*[1]

Remarks: Don’t care

Note 1. Input capture will not be generated in MTU0 if P0ϕ/1 is selected as the count clock for MTU1. Select a clock other than P0ϕ/1.

Table 16.15 TIORL (MTU0)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD3	IOD2	IOD1	IOD0	MTU0.TGRD Function	MTIOC0D Pin Function
0	0	0	0	Output compare register*[1]	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register*[1]	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by TCNT (LWA = 0) or TCNTLW (LWA = 1) in MTU1*[2]

Remarks: Don't care

Note 1. When the MTU0.TMDR1.BFB is set to 1 and MTU0.TGRD is used as a buffer register, this setting is invalid and input capture/ output compare is not generated.

Note 2. Input capture will not be generated in MTU0 if P0ϕ/1 is selected as the count clock for MTU1. Select a clock other than P0ϕ/1.

Table 16.16 TIOR (MTU1)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB3	IOB2	IOB1	IOB0	MTU1.TGRB/TGRBLW Function	MTIOC1B Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	0	0		Input capture at occurrence of compare match or input capture in the MTU0.TGRC register
1	1	1	x		Input capture at occurrence of compare match in the MTU8.TGRC register

Remarks: x: Don’t care

Table 16.17 TIOR (MTU2)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB3	IOB2	IOB1	IOB0	MTU2.TGRB Function	MTIOC2B Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don’t care

1	x	1	x		Input capture at both edges.

Remarks: x: Don’t care

Note 1. When the BFB bit in MTU7.TMDR1 is set to 1 and MTU7.TGRD register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 16.26 TIORH (MTU8)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB3	IOB2	IOB1	IOB0	MTU8.TGRB Function	MTIOC8B Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by MTU1.TCNT (LWA = 0) or MTU1.TCNTLW (LWA = 1)*[1]

Remarks: x: Don't care

Note 1. Input capture will not be generated in MTU8 if P0ϕ/1 is selected as the count clock for MTU1. Select a clock other than P0ϕ/1.

Table 16.27 TIORL (MTU8)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD3	IOD2	IOD1	IOD0	MTU8.TGRD Function	MTIOC8D Pin Function
0	0	0	0	Output compare register*[1]	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don't care

Note 1. When the BFB bit of the TMDR1 register is set to 1 and the TGRD register is used as a buffer register in MTU8, this setting is invalid and input capture/output compare is not generated.

Table 16.28 TIORH (MTU0)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU0.TGRA Function	MTIOC0A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	0	0		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by TCNT (LWA = 0) or TCNTLW (LWA = 1) in MTU1*[1]
1	1	1	x		Input capture on generation of compare match with MTU8.TGRC

Remarks: x: Don’t care

Note 1. Input capture will not be generated in MTU0 if P0ϕ/1 is selected as the count clock for MTU1. Select a clock other than P0ϕ/1.

Table 16.29 TIORL (MTU0)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC3	IOC2	IOC1	IOC0	MTU0.TGRC Function	MTIOC0C Pin Function
0	0	0	0	Output compare register*[1]	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register*[1]	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by TCNT (LWA = 0) or TCNTLW (LWA = 1) in MTU1*[2]

Remarks: x: Don’t care

Note 1. When the BFA bit in MTU0.TMDR1 is set to 1 and MTU0.TGRC is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Note 2. Input capture will not be generated in MTU0 if P0ϕ/1 is selected as the count clock for MTU1. Select a clock other than P0ϕ/1.

Table 16.30 TIOR (MTU1)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU1.TGRA/TGRALW Function	MTIOC1A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Input capture at generation of MTU0.TGRA compare match/input capture.

Remarks: x: Don’t care

Table 16.31 TIOR (MTU2)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU2.TGRA Function	MTIOC2A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don’t care

Table 16.32 TIORH (MTU3)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU3.TGRA Function	MTIOC3A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don’t care

Table 16.33 TIORL (MTU3)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC3	IOC2	IOC1	IOC0	MTU3.TGRC Function	MTIOC3C Pin Function
0	0	0	0	Output compare register*[1]	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*[1]	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don’t care

Note 1. When the BFA bit in MTU3.TMDR1 is set to 1 and MTU3.TGRC is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 16.34 TIORH (MTU4)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU4.TGRA Function	MTIOC4A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don't care

Table 16.35 TIORL (MTU4)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC3	IOC2	IOC1	IOC0	MTU4.TGRC Function	MTIOC4C Pin Function
0	0	0	0	Output compare register*[1]	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*[1]	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don't care

Note 1. When the BFA bit in MTU4.TMDR1 is set to 1 and MTU4.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 16.36 TIORH (MTU6)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU6.TGRA Function	MTIOC6A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don’t care

Table 16.37 TIORL (MTU6)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC3	IOC2	IOC1	IOC0	MTU6.TGRC Function	MTIOC6C Pin Function
0	0	0	0	Output compare register*[1]	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*[1]	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don’t care

Note 1. When the BFA bit in MTU6.TMDR1 is set to 1 and MTU6.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 16.38 TIORH (MTU7)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU7.TGRA Function	MTIOC7A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don't care

Table 16.39 TIORL (MTU7)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC3	IOC2	IOC1	IOC0	MTU7.TGRC Function	MTIOC7C Pin Function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don't care

Note 1. When the BFA bit in MTU7.TMDR1 is set to 1 and MTU7.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 16.40 TIORH (MTU8)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU8.TGRA Function	MTIOC8A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don’t care

Table 16.41 TIORL (MTU8)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC3	IOC2	IOC1	IOC0	MTU8.TGRC Function	MTIOC8C Pin Function
0	0	0	0	Output compare register*[1]	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

Remarks: x: Don’t care

Note 1. When the MTU8.TMDR1.BFA bit is set to 1 and the MTU8.TGRC register is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 16.42 TIORU, TIORV, and TIORW (MTU5)

Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC4	IOC3	IOC2	IOC1	IOC0	MTU5.TGRU, MTU5.TGRV, MTU5.TGRW Function	MTIC5U, MTIC5V, MTIC5W Pin Function
0	0	0	0	0	Output compare register	No function
0	0	0	0	1		Setting prohibited
0	0	0	1	x		Setting prohibited
0	0	1	x	x		Setting prohibited
0	1	x	x	x		Setting prohibited
1	0	0	0	0	Input capture register*[1]	Setting prohibited
1	0	0	0	1		Input capture at rising edge.
1	0	0	1	0		Input capture at falling edge.
1	0	0	1	1		Input capture at both edges.
1	0	1	x	x		Input capture on generation of compare match with MTU8.TGRC
1	1	0	0	0		Setting prohibited
1	1	0	0	1		Measurement of low pulse width of external input signal. Capture at trough in complementary PWM mode.
1	1	0	1	0		Measurement of low pulse width of external input signal. Capture at crest of complementary PWM mode.
1	1	0	1	1		Measurement of low pulse width of external input signal. Capture at crest and trough of complementary PWM mode.
1	1	1	0	0		Setting prohibited
1	1	1	0	1		Measurement of high pulse width of external input signal. Capture at trough in complementary PWM mode.
1	1	1	1	0		Measurement of high pulse width of external input signal. Capture at crest of complementary PWM mode.
1	1	1	1	1		Measurement of high pulse width of external input signal. Capture at crest and trough of complementary PWM mode.

Remarks: x: Don’t care

Note 1. Setting the IOC[4:0] bits to “H’19”, “H’1A”, “H’1B”, “H’1D”, “H’1E”, or “H’1F” is only allowed when the external pulse width measurement function is used or the dead time compensation function, in coordination with MTU6 and MTU7, is used. For details, refer to **Section 16.3.11, External Pulse Width Measurement**, and **Section 16.3.12, Dead Time Compensation**.

16.2.7 Timer Compare Match Clear Register (TCNTCMPCLR)

Address(es): MTU5.TCNTCMPCLR H'0_1000_1CB6

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	CMPCLR5U	CMPCLR5V	CMPCLR5W
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	CMPCLR5W	0	R/W	TCNT Compare Clear 5W 0: Disables MTU5.TCNTW to be cleared to H'0000 at MTU5.TCNTW and MTU5.TGRW compare match or input capture 1: Enables MTU5.TCNTW to be cleared to H'0000 at MTU5.TCNTW and MTU5.TGRW compare match or input capture
b1	CMPCLR5V	0	R/W	TCNT Compare Clear 5V 0: Disables MTU5.TCNTV to be cleared to H'0000 at MTU5.TCNTV and MTU5.TGRV compare match or input capture 1: Enables MTU5.TCNTV to be cleared to H'0000 at MTU5.TCNTV and MTU5.TGRV compare match or input capture
b2	CMPCLR5U	0	R/W	TCNT Compare Clear 5U 0: Disables MTU5.TCNTU to be cleared to H'0000 at MTU5.TCNTU and MTU5.TGRU compare match or input capture 1: Enables MTU5.TCNTU to be cleared to H'0000 at MTU5.TCNTU and MTU5.TGRU compare match or input capture
b7 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

TCNTCMPCLR specifies requests to clear MTU5.TCNTU, MTU5.TCNTV, and MTU5.TCNTW. The MTU has one TCNTCMPCLR (on MTU5).

16.2.8 Timer Interrupt Enable Register (TIER)

(1) MTU1.TIER, MTU2.TIER

Address(es): MTU1.TIER H'0_1000_1384, MTU2.TIER H'0_1000_1404

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TTGE	—	TCIEU	TCIEV	—	—	TGIEB	TGIEA
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(2) MTU0.TIER, MTU3.TIER, MTU6.TIER

Address(es): MTU0.TIER H'0_1000_1304, MTU3.TIER H'0_1000_1208, MTU6.TIER H'0_1000_1A08

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TTGE	—	—	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(3) MTU4.TIER, MTU7.TIER

Address(es): MTU4.TIER H'0_1000_1209, MTU7.TIER H'0_1000_1A09

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TTGE	TTGE2	—	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(4) MTU8.TIER

Address(es): MTU8.TIER H'0_1000_1604

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	TGIEA	0	R/W	TGR Interrupt Enable A 0: Interrupt requests (TGIA) disabled 1: Interrupt requests (TGIA) enabled
b1	TGIEB	0	R/W	TGR Interrupt Enable B 0: Interrupt requests (TGIB) disabled 1: Interrupt requests (TGIB) enabled
b2	TGIEC	0	R/W	TGR Interrupt Enable C 0: Interrupt requests (TGIC) disabled 1: Interrupt requests (TGIC) enabled
b3	TGIED	0	R/W	TGR Interrupt Enable D 0: Interrupt requests (TGID) disabled 1: Interrupt requests (TGID) enabled
b4	TCIEV	0	R/W	Overflow Interrupt Enable 0: Interrupt requests (TCIV) disabled 1: Interrupt requests (TCIV) enabled
b5	TCIEU	0	R/W	Underflow Interrupt Enable 0: Interrupt requests (TCIU) disabled 1: Interrupt requests (TCIU) enabled
b6	TTGE2	0	R/W	A/D Converter Start Request Enable 2 0: A/D converter start request generation by MTUn.TCNT underflow (trough) disabled 1: A/D converter start request generation by MTUn.TCNT underflow (trough) enabled
b7	TTGE	0	R/W	A/D Converter Start Request Enable 0: A/D converter start request generation disabled 1: A/D converter start request generation enabled

Note: n = 4, 7

The TIER register enables or disables interrupt requests from each channel. The MTU has a total of ten TIER registers, two for MTU0 and one each for MTU1 to MTU8.

TGIEA and TGIEB Bits (TGR Interrupt Enable A and B)

Each bit enables or disables interrupt requests (TGIn) (n = A, B).

TGIEC and TGIED Bits (TGR Interrupt Enable C and D)

Each bit enables or disables an interrupt request (TGIn) (n = C, D).

In MTU1 and MTU2, these bits are reserved. They are read as 0. The write value should be 0.

TCIEV Bit (Overflow Interrupt Enable)

This bit enables or disables interrupt requests (TCIV).

TCIEU Bit (Underflow Interrupt Enable)

This bit enables or disables interrupt requests (TCIU).

In MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

TTGE2 Bit (A/D Converter Start Request Enable 2)

This bit enables or disables generation of A/D converter start requests by MTUn.TCNT underflow (trough) in complementary PWM mode (n = 4, 7).

In MTU0 to MTU3, MTU6, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

TTGE Bit (A/D Converter Start Request Enable)

This bit enables or disables generation of A/D converter start requests by TGRA input capture/compare match. MTU8 is a reserved bit. It is read as 0. The write value should be 0.

(5) MTU0.TIER2

Address(es): MTU0.TIER2 H'0_1000_1324

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TTGE2	—	—	—	—	—	TGIEF	TGIEE
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	TGIEE	0	R/W	TGR Interrupt Enable E 0: Interrupt requests (TGIE) disabled 1: Interrupt requests (TGIE) enabled
b1	TGIEF	0	R/W	TGR Interrupt Enable F 0: Interrupt requests (TGIF) disabled 1: Interrupt requests (TGIF) enabled
b6 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b7	TTGE2	0	R/W	A/D Converter Start Request Enable 2 0: A/D converter start request generation by compare match between MTU0.TCNT and MTU0.TGRE disabled 1: A/D converter start request generation by compare match between MTU0.TCNT and MTU0.TGRE enabled

TGIEE and TGIEF Bits (TGR Interrupt Enable E and F)

Each bit enables or disables interrupt requests by compare match between MTU0.TCNT and MTU0.TGRn (n = E, F).

TTGE2 Bit (A/D Converter Start Request Enable 2)

This bit enables or disables AD converter start requests by compare match between TCNT and TGRE in MTU0.

(6) MTU5.TIER

Address(es): MTU5.TIER H'0_1000_1CB2

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TGIE5U	TGIE5V	TGIE5W
Initial Value	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	TGIE5W	0	R/W	TGR Interrupt Enable 5W 0: Interrupt requests TGIW5 disabled 1: Interrupt requests TGIW5 enabled
b1	TGIE5V	0	R/W	TGR Interrupt Enable 5V 0: Interrupt requests TGIV5 disabled 1: Interrupt requests TGIV5 enabled
b2	TGIE5U	0	R/W	TGR Interrupt Enable 5U 0: Interrupt requests TGIU5 disabled 1: Interrupt requests TGIU5 enabled
b7 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

TGIE5n Bits (TGR Interrupt Enable 5n)

Each bit enables or disables interrupt requests (TGIn5) (n = U, V, W).

16.2.9 Timer Status Register (TSR)

(1) MTU1.TSR, MTU2.TSR

Address(es): MTU1.TSR H'0_1000_1385, MTU2.TSR H'0_1000_1405

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TCFD	—	—	—	—	—	—	—
Initial Value	1	1	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(2) MTU3.TSR, MTU4.TSR, MTU6.TSR, MTU7.TSR

Address(es): MTU3.TSR H'0_1000_122C, MTU4.TSR H'0_1000_122D, MTU6.TSR H'0_1000_1A2C,
MTU7.TSR H'0_1000_1A2D

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TCFD	—	—	—	—	—	—	—
Initial Value	1	1	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b5 to b0	—	All 0	R/W	Reserved The read value is undefined. The write value should be 1.
b6	—	1	R/W	Reserved This bit is read as 1. The write value should be 1.
b7	TCFD	1	R	Count Direction Flag 0: TCNT counts down 1: TCNT counts up

TSR indicates the states of each of the channels. The MTU has a total of six TSR registers, one each for MTU1 to MTU4, MTU6, and MTU7.

TCFD Flag (Count Direction Flag)

Status flag that indicates the direction in which TCNT is counting in MTU1 to MTU4, MTU6, and MTU7.

16.2.10 Timer Buffer Operation Transfer Mode Register (TBTM)

(1) MTU0.TBTM

Address(es): MTU0.TBTM H'0_1000_1326

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TTSE	TTSB	TTSA
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(2) MTU3.TBTM, MTU4.TBTM, MTU6.TBTM, MTU7.TBTM

Address(es): MTU3.TBTM H'0_1000_1238, MTU4.TBTM H'0_1000_1239, MTU6.TBTM H'0_1000_1A38,
MTU7.TBTM H'0_1000_1A39

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	TTSB	TTSA
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	TTSA	0	R/W	Timing Select A 0: When compare match A occurs in each channel, data is transferred from TGRC to TGRA 1: When TCNT is cleared in each channel, data is transferred from TGRC to TGRA
b1	TTSB	0	R/W	Timing Select B 0: When compare match B occurs in each channel, data is transferred from TGRD to TGRB 1: When TCNT is cleared in each channel, data is transferred from TGRD to TGRB
b2	TTSE	0	R/W	Timing Select E 0: When compare match E occurs in MTU0, data is transferred from MTU0.TGRF to MTU0.TGRE 1: When MTU0.TCNT is cleared in MTU0, data is transferred from MTU0.TGRF to MTU0.TGRE
b7 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

TBTM specifies the timing for transferring data from the buffer register to the timer general register in PWM mode. The MTU has a total of five TBTM registers, one each for MTU0, MTU3, MTU4, MTU6, and MTU7.

TTSA Bit (Timing Select A)

This bit specifies the timing for transferring data from TGRC to TGRA in each channel when they are used together for buffer operation. When a channel is not set to PWM mode, do not set the TTSA bit in the channel to 1.

TTSB Bit (Timing Select B)

This bit specifies the timing for transferring data from TGRD to TGRB in each channel when they are used together for buffer operation. When a channel is not set to PWM mode, do not set the TTSB bit in the channel to 1.

TTSE Bit (Timing Select E)

This bit specifies the timing for transferring data from MTU0.TGRF to MTU0.TGRE when they are used together for buffer operation.

In MTU3, MTU4, MTU6, and MTU7, this bit is reserved. It is read as 0 and the write value should be 0. When a channel is not set to PWM mode, do not set the TTSE bit in the channel to 1.

16.2.11 Timer Input Capture Control Register (TICCR)

Address(es): MTU1.TICCR H'0_1000_1390

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	I2BE	I2AE	I1BE	I1AE
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	I1AE	0	R/W	Input Capture Enable 0: Does not include the MTIOC1A pin in the MTU2.TGRA input capture conditions 1: Includes the MTIOC1A pin in the MTU2.TGRA input capture conditions
b1	I1BE	0	R/W	Input Capture Enable 0: Does not include the TMTIOC1B pin in the MTU2.TGRB input capture conditions 1: Includes the MTIOC1B pin in the MTU2.TGRB input capture conditions
b2	I2AE	0	R/W	Input Capture Enable 0: Does not include the MTIOC2A pin in the MTU1.TGRA input capture conditions 1: Includes the MTIOC2A pin in the MTU1.TGRA input capture conditions
b3	I2BE	0	R/W	Input Capture Enable 0: Does not include the MTIOC2B pin in the MTU1.TGRB input capture conditions 1: Includes the MTIOC2B pin in the MTU1.TGRB input capture conditions
b7 to b4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

TICCR specifies input capture conditions when MTU1.TCNT and MTU2.TCNT are cascaded. The MTU has one TICCR for MTU1.

16.2.12 Timer Synchronous Clear Register (TSYCR)

Address(es): MTU6.TSYCR H'0_1000_1A50

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	CE0A	CE0B	CE0C	CE0D	CE1A	CE1B	CE2A	CE2B
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	CE2B	0	R/W	Clear Enable 2B 0: Disables counter clearing by the MTU2.TGIB2 interrupt generation timing. 1: Enables counter clearing by the MTU2.TGIB2 interrupt generation timing.
b1	CE2A	0	R/W	Clear Enable 2A 0: Disables counter clearing by the MTU2.TGIA2 interrupt generation timing*[1]. 1: Enables counter clearing by the MTU2.TGIA2 interrupt generation timing*[1].
b2	CE1B	0	R/W	Clear Enable 1B 0: Disables counter clearing by the MTU1.TGIB1 interrupt generation timing*[1]. 1: Enables counter clearing by the MTU1.TGIB1 interrupt generation timing*[1].
b3	CE1A	0	R/W	Clear Enable 1A 0: Disables counter clearing by the MTU1.TGIA1 interrupt generation timing*[1]. 1: Enables counter clearing by the MTU1.TGIA1 interrupt generation timing*[1].
b4	CE0D	0	R/W	Clear Enable 0D 0: Disables counter clearing by the MTU0.TGID0 interrupt generation timing*[1]. 1: Enables counter clearing by the MTU0.TGID0 interrupt generation timing*[1].
b5	CE0C	0	R/W	Clear Enable 0C 0: Disables counter clearing by the MTU0.TGIC0 interrupt generation timing*[1]. 1: Enables counter clearing by the MTU0.TGIC0 interrupt generation timing*[1].
b6	CE0B	0	R/W	Clear Enable 0B 0: Disables counter clearing by the MTU0.TGIB0 interrupt generation timing*[1]. 1: Enables counter clearing by the MTU0.TGIB0 interrupt generation timing*[1].
b7	CE0A	0	R/W	Clear Enable 0A 0: Disables counter clearing by the MTU0.TGIA0 interrupt generation timing*[1]. 1: Enables counter clearing by the MTU0.TGIA0 interrupt generation timing*[1].

Note 1. This does not depend on the TIERn.TGIEm bit setting. (n = 0, 1, 2; m = A, B, C, D)

TSYCR specifies synchronous clear conditions for MTU6.TCNT and MTU7.TCNT. The MTU has one TSYCR for MTU1.

CEnm Bits (Clear Enable nm; n = 0, 1, 2; m = A, B, C, D)

These bits enable or disable counter clearing by the MTUn.TGImn interrupt generation timing.

16.2.13 Timer Counter (TCNT)

(1) MTU0.TCNT to MTU7.TCNT

Address(es): MTU0.TCNT H'0_1000_1306, MTU1.TCNT H'0_1000_1386, MTU2.TCNT H'0_1000_1406, MTU3.TCNT H'0_1000_1210, MTU4.TCNT H'0_1000_1212, MTU5.TCNTU H'0_1000_1C80, MTU5.TCNTV H'0_1000_1C90, MTU5.TCNTW H'0_1000_1CA0, MTU6.TCNT H'0_1000_1A10, MTU7.TCNT H'0_1000_1A12

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TCNT must not be accessed in eight bits; it should be accessed in 16 bits.

(2) MTU8.TCNT

Address(es): MTU8.TCNT H'0_1000_1608

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TCNT must not be accessed in 8 or 16 bits; it should be accessed in 32 bits.

MTU0.TCNT to MTU7.TCNT are 16-bit readable/writable counters and MTU8.TCNT is a 32-bit readable/writable counter. The MTU has a total of 11 TCNT counters, one each for MTU0 to MTU4, MTU6, MTU7, and MTU8 and three (TCNTU, TCNTV, and TCNTW) for MTU5. The TCNT counters in MTU0 to MTU4, MTU6, and MTU7 are initialized to H’0000 by a reset, and the TCNT counter in MTU8 is initialized to H’00000000 by a reset. The TCNTU, TCNTV, and TCNTW counters in MTU5 are initialized to H’0000 by a reset. In MTU0 to MTU4, MTU6, and MTU7, the TCNT counters must not be accessed in 8-bit units; they should be accessed in 16-bit units. The MTU8.TCNT counter must not be accessed in 8- or 16-bit units; it should be accessed in 32-bit units.

The MTU1.TCNT and MTU2.TCNT counters are read as H’0000 when TMDR3.LWA is 1. See **Section 16.2.5, Timer Mode Register 3 (TMDR3)** for details.

16.2.14 Timer Longword Counter (TCNTLW)

Address(es): MTU1.TCNTLW H’0_1000_13A0

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TCNTLW must not be accessed in 8 or 16 bits; it should be accessed in 32 bits.

The TCNTLW counter is a 32-bit readable/writable counter. Only one counter of this type is provided, and is formed by combining MTU1.TCNT and MTU2.TCNT. Such operation is only effective when TMDR3.LWA is 1. The TCNTLW counter is initialized to H’0000 0000 by a reset. This counter is read as H’0000 0000 when TMDR3.LWA is 0. See **Section 16.2.5, Timer Mode Register 3 (TMDR3)** for details. This register can only be used in 32-bit phase counting mode.

16.2.15 Timer General Register (TGR)

(1) MTU0.TGR to MTU7.TGR

Address(es): MTU0.TGRA H'0_1000_1308, MTU0.TGRB H'0_1000_130A, MTU0.TGRC H'0_1000_130C,
MTU0.TGRD H'0_1000_130E, MTU0.TGRE H'0_1000_1320, MTU0.TGRF H'0_1000_1322,
MTU1.TGRA H'0_1000_1388, MTU1.TGRB H'0_1000_138A, MTU2.TGRA H'0_1000_1408,
MTU2.TGRB H'0_1000_140A, MTU3.TGRA H'0_1000_1218, MTU3.TGRB H'0_1000_121A,
MTU3.TGRC H'0_1000_1224, MTU3.TGRD H'0_1000_1226, MTU3.TGRE H'0_1000_1272,
MTU4.TGRA H'0_1000_121C, MTU4.TGRB H'0_1000_121E, MTU4.TGRC H'0_1000_1228,
MTU4.TGRD H'0_1000_122A, MTU4.TGRE H'0_1000_1274, MTU4.TGRF H'0_1000_1276,
MTU5.TGRU H'0_1000_1C82, MTU5.TGRV H'0_1000_1C92, MTU5.TGRW H'0_1000_1CA2,
MTU6.TGRA H'0_1000_1A18, MTU6.TGRB H'0_1000_1A1A, MTU6.TGRC H'0_1000_1A24,
MTU6.TGRD H'0_1000_1A26, MTU6.TGRE H'0_1000_1A72, MTU7.TGRA H'0_1000_1A1C,
MTU7.TGRB H'0_1000_1A1E, MTU7.TGRC H'0_1000_1A28, MTU7.TGRD H'0_1000_1A2A,
MTU7.TGRE H'0_1000_1A74, MTU7.TGRF H'0_1000_1A76

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TGR must not be accessed in eight bits; it should be accessed in 16 bits. The initial value of TGR is H'FFFF.

(2) MTU8.TGR

Address(es): MTU8.TGRA H'0_1000_160C, MTU8.TGRB H'0_1000_1610, MTU8.TGRC H'0_1000_1614, MTU8.TGRD H'0_1000_1618

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TGR must not be accessed in 8 or 16 bits; it should be accessed in 32 bits.

The MTU0.TGR to MTU7.TGR registers are 16-bit readable/writable registers; the MTU8.TGR register is a 32-bit readable/writable register. The MTU has a total of 39 TGR registers, six for MTU0, two each for MTU1 and MTU2, five each for MTU3 and MTU6, six each for MTU4 and MTU7, three for MTU5 and four for MTU8.

The TGRA, TGRB, TGRC, and TGRD registers function as either output compare or input capture registers. The TGRC and TGRD registers for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8 can also be designated for operation as buffer registers. TGR buffer register combinations are TGRA and TGRC, and TGRB and TGRD.

MTU0.TGRE and MTU0.TGRF function as compare registers. When the MTU0.TCNT count matches the MTU0.TGRE value, an A/D converter start request can be issued. The TGRF register can also be designated for operation as a buffer register. TGR buffer register combination is TGRE and TGRF. MTU5.TGRU, MTU5.TGRV, and MTU5.TGRW function as compare match, input capture, or external pulse width measurement registers.

The MTU1.TGRA, MTU2.TGRA, MTU1.TGRB, and MTU2.TGRB registers are read as H'0000 when TMDR3.LWA is 1. See **Section 16.2.5, Timer Mode Register 3 (TMDR3)** for details.

16.2.16 Timer Longword General Registers (TGRALW and TGRBLW)

Address(es): MTU1.TGRALW H'0_1000_13A4, MTU1.TGRBLW H'0_1000_13A8

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TGRALW and TGRBLW must not be accessed in 8 or 16 bits; they should be accessed in 32 bits.

The TGRALW (TGRBLW) register is a 32-bit readable/writable register. Two general registers of this type are provided, and are formed by combining the TGRA (TGRB) registers in MTU1 and MTU2. Such operation is only effective when TMDR3.LWA is 1.

The TGRALW (TGRBLW) register is initialized to H'FFFF FFFF by a reset, but it is read as H'0000 0000 when TMDR3.LWA is 0. See **Section 16.2.5, Timer Mode Register 3 (TMDR3)** for details.

The TGRALW (TGRBLW) register functions as an output compare or input capture register when TMDR3.LWA is 1. This register can only be used in 32-bit phase counting mode.

16.2.17 Timer Start Registers (TSTRA, TSTRB, and TSTR)

(1) MTU.TSTRA (MTU0, MTU1, MTU2, MTU3, MTU4, MTU8)

Address(es): MTU.TSTRA H'0_1000_1280

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	CST4	CST3	—	—	CST8	CST2	CST1	CST0
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	CST0	0	R/W	Counter Start 0 0: MTU0.TCNT counting is stopped 1: MTU0.TCNT performs count operation
b1	CST1	0	R/W	Counter Start 1 0: MTU1.TCNT counting is stopped 1: MTU1.TCNT performs count operation
b2	CST2	0	R/W	Counter Start 2 0: MTU2.TCNT counting is stopped 1: MTU2.TCNT performs count operation
b3	CST8	0	R/W	Counter start 8 0: MTU8.TCNT counting is stopped 1: MTU8.TCNT performs count operation.
b5, b4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b6	CST3	0	R/W	Counter Start 3 0: MTU3.TCNT counting is stopped 1: MTU3.TCNT performs count operation
b7	CST4	0	R/W	Counter Start 4 0: MTU4.TCNT counting is stopped 1: MTU4.TCNT performs count operation

Note: When 1 is written to a bit in TCSYSTR, the corresponding bit in TSTRA is also set to 1 automatically.

The TSTRA register starts or stops TCNT operation in MTU0 to MTU4 and MTU8. TSTRA starts or stops TCNT operation in MTU0 to MTU4.

TSTRB starts or stops TCNT operation in MTU6 and MTU7. TSTR starts or stops TCNT operation in MTU5.

Before setting the operating mode in TMDR1 or setting the TCNT count clock in TCR, be sure to stop the TCNT counting.

CSTn Bits (Counter Start n) (n = 0, 1, 2, 3, 4, 8)

Each bit starts or stops TCNT in the corresponding channel.

If 0 is written to the CSTn bit during operation with the MTIOC pin designated for output, the counter stops. In this case, the initial output value specified by the TOCR1A or TOCR2A register is output from the MTIOC pin in complementary PWM mode or reset-synchronized PWM mode.

In the other modes, the level of the output compare signal from the MTIOC pin is retained. If TIOR is written to while the CSTn bit is 0, the level of output from the pin will be updated to the specified initial output value.

(2) MTU.TSTRB(MTU6, MTU7)

Address(es): MTU.TSTRB H'0_1000_1A80

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	CST7	CST6	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b5 to b0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b6	CST6	0	R/W	Counter Start 6 0: MTU6.TCNT counting is stopped 1: MTU6.TCNT performs count operation
b7	CST7	0	R/W	Counter Start 7 0: MTU7.TCNT counting is stopped 1: MTU7.TCNT performs count operation

Note: When 1 is written to a bit in TCSYSTR, the corresponding bit in TSTRB is also set to 1 automatically.

CSTn Bits (Counter Start n) (n = 6, 7)

Each bit starts or stops TCNT in the corresponding channel.

If 0 is written to the CSTn bit during operation with the MTIOC pin designated for output, the counter stops. In this case, the initial output value specified by the TOCR1B or TOCR2B register is output from the MTIOC pin in complementary PWM mode or reset-synchronized PWM mode.

In the other modes, the level of the output compare signal from the MTIOC pin is retained. If TIOR is written to while the CSTn bit is 0, the level of output from the pin will be updated to the specified initial output value.

(3) MTU5.TSTR(MTU5)

Address(es): MTU5.TSTR H'0_1000_1CB4

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	CSTU5	CSTV5	CSTW5
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	CSTW5	0	R/W	Counter Start W5 0: MTU5.TCNTW counting is stopped 1: MTU5.TCNTW performs count operation
b1	CSTV5	0	R/W	Counter Start V5 0: MTU5.TCNTV counting is stopped 1: MTU5.TCNTV performs count operation
b2	CSTU5	0	R/W	Counter Start U5 0: MTU5.TCNTU counting is stopped 1: MTU5.TCNTU performs count operation
b7 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

16.2.18 Timer Synchronous Registers (TSYRA and TSYRB)

(1) MTU.TSYRA(MTU0, MTU1, MTU2, MTU3, MTU4)

Address(es): MTU.TSYRA H'0_1000_1281

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	SYNC4	SYNC3	—	—	—	SYNC2	SYNC1	SYNC0
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	SYNC0	0	R/W	Timer Synchronous Operation 0 0: MTU0.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU0.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)
b1	SYNC1	0	R/W	Timer Synchronous Operation 1 0: MTU1.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU1.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)
b2	SYNC2	0	R/W	Timer Synchronous Operation 2 0: MTU2.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU2.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)
b5 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b6	SYNC3	0	R/W	Timer Synchronous Operation 3 0: MTU3.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU3.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)
b7	SYNC4	0	R/W	Timer Synchronous Operation 4 0: MTU4.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU4.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)

TSYRA selects independent operation or synchronous operation of TCNT in MTU0 to MTU4. TSYRB selects independent operation or synchronous operation of TCNT in MTU6 and MTU7. A channel performs synchronous operation when the corresponding bit in TSYR is set to 1.

SYNCn Bits (Timer Synchronous Operation n) (n = 0, 1, 2, 3, 4)

Each bit selects whether operation is independent of or synchronized with other channels.

When synchronous operation is selected, the TCNT synchronous setting of multiple channels and synchronous clearing by counter clearing on another channel are possible.

To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of the TCR.CCLR[2:0] bits.

(2) MTU.TSYRB(MTU6, MTU7)

Address(es): MTU.TSYRB H'0_1000_1A81

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	SYNC7	SYNC6	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b5 to b0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b6	SYNC6	0	R/W	Timer Synchronous Operation 6 0: MTU6.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU6.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)
b7	SYNC7	0	R/W	Timer Synchronous Operation 7 0: MTU7.TCNT operates independently (TCNT setting/clearing is not related to other channels). 1: MTU7.TCNT performs synchronous operation. (TCNT synchronous setting/synchronous clearing is enabled.)

SYNCn Bits (Timer Synchronous Operation n) (n = 6, 7)

Each bit selects whether operation is independent of or synchronized with other channels.

When synchronous operation is selected, the TCNT synchronous setting of multiple channels and synchronous clearing by counter clearing on another channel are possible.

To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of bits TCR.CCLR[2:0].

16.2.19 Timer Counter Synchronous Start Register (TCSYSTR)

Address(es): MTU.TCSYSTR H'0_1000_1282

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	SCH0	SCH1	SCH2	SCH3	SCH4	—	SCH6	SCH7
Initial Value	0	0	0	0	0	0	0	0
R/W	R/(W)[*1]	R/(W)[*1]	R/(W)[*1]	R/(W)[*1]	R/(W)[*1]	R	R/(W)[*1]	R/(W)[*1]

Bit	Bit Name	Initial Value	R/W	Description
b0	SCH7	0	R/(W)[*1]	Synchronous Start 7 0: Does not specify synchronous start for MTU7.TCNT 1: Specifies synchronous start for MTU7.TCNT
b1	SCH6	0	R/(W)[*1]	Synchronous Start 6 0: Does not specify synchronous start for MTU6.TCNT 1: Specifies synchronous start for MTU6.TCNT
b2	—	0	R	Reserved This bit is read as 0. The write value should be 0.
b3	SCH4	0	R/(W)[*1]	Synchronous Start 4 0: Does not specify synchronous start for MTU4.TCNT 1: Specifies synchronous start for MTU4.TCNT
b4	SCH3	0	R/(W)[*1]	Synchronous Start 3 0: Does not specify synchronous start for MTU3.TCNT 1: Specifies synchronous start for MTU3.TCNT
b5	SCH2	0	R/(W)[*1]	Synchronous Start 2 0: Does not specify synchronous start for MTU2.TCNT 1: Specifies synchronous start for MTU2.TCNT
b6	SCH1	0	R/(W)[*1]	Synchronous Start 1 0: Does not specify synchronous start for MTU1.TCNT 1: Specifies synchronous start for MTU1.TCNT
b7	SCH0	0	R/(W)[*1]	Synchronous Start 0 0: Does not specify synchronous start for MTU0.TCNT 1: Specifies synchronous start for MTU0.TCNT

Note 1. Only 1 can be written to this bit. It is automatically cleared to 0 when counting begins.

TCSYSTR specifies synchronous start of the counters.

SCH7 Bit (Synchronous Start 7)

This bit controls synchronous start of TCNT in MTU7. [Clearing condition]

- When the CST7 bit in TSTRB is set to 1 while SCH7 = 1

SCH6 Bit (Synchronous Start 6)

This bit controls synchronous start of TCNT in MTU6. [Clearing condition]

- When the CST6 bit in TSTRB is set to 1 while SCH6 = 1

SCH4 Bit (Synchronous Start 4)

This bit controls synchronous start of TCNT in MTU4. [Clearing condition]

- When the CST4 bit in TSTRA is set to 1 while SCH4 = 1

SCH3 Bit (Synchronous Start 3)

This bit controls synchronous start of TCNT in MTU3. [Clearing condition]

- When the CST3 bit in TSTRA is set to 1 while SCH3 = 1

SCH2 Bit (Synchronous Start 2)

This bit controls synchronous start of TCNT in MTU2. [Clearing condition]

- When the CST2 bit in TSTRA is set to 1 while SCH2 = 1

SCH1 Bit (Synchronous Start 1)

This bit controls synchronous start of TCNT in MTU1. [Clearing condition]

- When the CST1 bit in TSTRA is set to 1 while SCH1 = 1

SCH0 Bit (Synchronous Start 0)

This bit controls synchronous start of TCNT in MTU0. [Clearing condition]

- When the CST0 bit in TSTRA is set to 1 while SCH0 = 1

16.2.20 Timer Read/Write Enable Registers (TRWERA and TRWERB)

Address(es): MTU.TRWERA H'0_1000_1284, MTU.TRWERB H'0_1000_1A84

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	RWE
Initial Value	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	RWE	1	R/W	Read/Write Enable 0: Read/write access to the registers is disabled 1: Read/write access to the registers is enabled
b7 to b1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

TRWERA enables or disables access to the registers and counters that have write-protection capability against accidental modification in MTU3 and MTU4.

TRWERB enables or disables access to the registers and counters that have write-protection capability against accidental modification in MTU6 and MTU7.

RWE Bit (Read/Write Enable)

This bit enables or disables access to the registers that have write-protection capability against accidental modification.

[Clearing condition]

When 0 is written to the RWE bit after reading RWE = 1

- Registers and Counters having Write-Protection Capability against Accidental Modification (TRWERA)

  24 registers: MTUn.TCR, MTUn.TCR2, MTUn.TMDR1, MTUn.TIORH, MTUn.TIORL, MTUn.TIER, MTUn.TGRA, MTUn.TGRB, TOERA, TOCR1A, TOCR2A, TGCRA, TCDRA, TDDRA, and MTUn.TCNT (n = 3, 4)

- Registers and Counters having Write-Protection Capability against Accidental Modification (TRWERB)

  23 registers: MTUn.TCR, MTUn.TCR2, MTUn.TMDR1, MTUn.TIORH, MTUn.TIORL, MTUn.TIER, MTUn.TGRA, MTUn.TGRB, TOERB, TOCR1B, TOCR2B, TCDRB, TDDRB, and MTUn.TCNT (n = 6, 7)

16.2.21 Timer Output Master Enable Registers (TOERA and TOERB)

(1) MTU.TOERA

Address(es): MTU.TOERA H'0_1000_120A

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	OE4D	OE4C	OE3D	OE4B	OE4A	OE3B
Initial Value	1	1	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	OE3B	0	R/W	Master Enable MTIOC3B 0: MTU output is disabled[*1] 1: MTU output is enabled
b1	OE4A	0	R/W	Master Enable MTIOC4A 0: MTU output is disabled[*1] 1: MTU output is enabled
b2	OE4B	0	R/W	Master Enable MTIOC4B 0: MTU output is disabled[*1] 1: MTU output is enabled
b3	OE3D	0	R/W	Master Enable MTIOC3D 0: MTU output is disabled[*1] 1: MTU output is enabled
b4	OE4C	0	R/W	Master Enable MTIOC4C 0: MTU output is disabled[*1] 1: MTU output is enabled
b5	OE4D	0	R/W	Master Enable MTIOC4D 0: MTU output is disabled[*1] 1: MTU output is enabled
b7, b6	—	All 1	R/W	Reserved These bits are read as 1. The write value should be 1.

Note 1. To output the inactive level from each pin when the MTU output is set to disabled, first set the port mode register (PMn) and port register (Pn) of I/O ports to output the inactive level from general I/O ports, and then set the port mode control register (PMCn) to use general I/O ports. For details, refer to **Section 41**, **General Purpose Input Output Port**.

TOERA enables or disables output settings for output pins MTIOC4D, MTIOC4C, MTIOC3D, MTIOC4B, MTIOC4A, and MTIOC3B.

These pins do not output values correctly if the bits of the TOERA register are not appropriately set. Write a desired value to the TOERA register before setting up the TIOR registers in MTU3 and MTU4.

Set the TOERA register after clearing the CST3 and CST4 bits in the TSTRA register to 0 (see **Figure 16.44** and **Figure 16.48**).

(2) MTU.TOERB

Address(es): MTU.TOERB H'0_1000_1A0A

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	OE7D	OE7C	OE6D	OE7B	OE7A	OE6B
Initial Value	1	1	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	OE6B	0	R/W	Master Enable MTIOC6B 0: MTU output is disabled*[1] 1: MTU output is enabled
b1	OE7A	0	R/W	Master Enable MTIOC7A 0: MTU output is disabled*[1] 1: MTU output is enabled
b2	OE7B	0	R/W	Master Enable MTIOC7B 0: MTU output is disabled*[1] 1: MTU output is enabled
b3	OE6D	0	R/W	Master Enable MTIOC6D 0: MTU output is disabled*[1] 1: MTU output is enabled
b4	OE7C	0	R/W	Master Enable MTIOC7C 0: MTU output is disabled*[1] 1: MTU output is enabled
b5	OE7D	0	R/W	Master Enable MTIOC7D 0: MTU output is disabled*[1] 1: MTU output is enabled
b7, b6	—	All 1	R/W	Reserved These bits are read as 1. The write value should be 1.

Note 1. To output the inactive level from each pin when the MTU output is set to disabled, first set the port mode register (PMn) and port register (Pn) of I/O ports to output the inactive level from general I/O ports, and then set the port mode control register (PMCn) to use general I/O ports. For details, refer to **Section 41**, **General Purpose Input Output Port**.

TOERB enables or disables output settings for output pins MTIOC7D, MTIOC7C, MTIOC6D, MTIOC7B, MTIOC7A, and MTIOC6B.

These pins do not output values correctly if the bits of the TOERB register are not appropriately set. Write a desired value to the TOERB register before setting up the TIOR registers in MTU6 and MTU7.

Set the TOERB register after clearing the CST6 and CST7 bits in the TSTRB register to 0 (see **Figure 16.44** and **Figure 16.48**).

16.2.22 Timer Output Control Registers 1 (TOCR1A and TOCR1B)

Address(es): MTU.TOCR1A H'0_1000_120E, MTU.TOCR1B H'0_1000_1A0E

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	PSYE	—	—	TOCL	TOCS	OLSN	OLSP
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	OLSP	0	R/W	Output Level Select P*1 *3 See **Table 16.43**.
b1	OLSN	0	R/W	Output Level Select N*1 *3 See **Table 16.44**.
b2	TOCS	0	R/W	TOC Select 0: TOCR1j setting is selected (j = A, B) 1: TOCR2j setting is selected
b3	TOCL	0	R/W	TOC Register Write Protection*2 *4 0: Write access to the TOCS, OLSN, and OLSP bits is enabled 1: Write access to the TOCS, OLSN, and OLSP bits is disabled
b5, b4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b6	PSYE	0	R/W	PWM Synchronous Output Enable 0: Toggle output is disabled 1: Toggle output is enabled
b7	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.

Note 1. Clearing the TOCR1j.TOCS bit to 0 makes this bit setting valid.

Note 2. Setting the TOCR1j.TOCL bit to 1 prevents accidental modification when the CPU goes out of control.

Note 3. If dead-time is not generated, the negative-phase output is the exact inverse of the positive-phase output. In this case, only the OLSP bit is valid.

Note 4. This bit can be set to 1 only once after a reset. After 1 is written, 0 cannot be written to the bit.

TOCR1A and TOCR1B enable or disable PWM-synchronized toggle output in complementary PWM mode and reset-synchronized PWM mode, and control inversion of PWM output level.

OLSP Bit (Output Level Select P)

This bit selects the positive-phase output level in reset-synchronized PWM mode and complementary PWM mode. The initial output is selected while the counter is stopped.

OLSN Bit (Output Level Select N)

This bit selects the negative-phase output level in reset-synchronized PWM mode and complementary PWM mode. The initial output is selected while the counter is stopped.

TOCS Bit (TOC Select)

This bit selects either the TOCR1j or TOCR2j (j = A, B) setting to be used for the output level in complementary PWM mode and reset-synchronized PWM mode.

TOCL Bit (TOC Register Write Protection)

This bit enables or disables write access to the TOCS, OLSN, and OLSP bits in TOCR1j (j = A, B).

PSYE Bit (PWM Synchronous Output Enable)

This bit enables or disables toggle output synchronized with the PWM cycle.

Table 16.43 Output Level Select Function

Bit 0	Function			
			Compare Match Output	
OLSP	Initial Output	Active Level	Up-Counting	Down-Counting
0	High level	Low level	Low level	High level
1	Low level	High level	High level	Low level

Table 16.44 Output Level Select Function

Bit 1	Function			
			Compare Match Output	
OLSN	Initial Output	Active Level	Up-Counting	Down-Counting
0	High level	Low level	High level	Low level
1	Low level	High level	Low level	High level

Note: The initial output value of negative-phase waveform changes to an active level after the dead time has passed since counting starts.

Figure 16.3 shows an example of output in complementary PWM mode (one phase) when OLSN = 1 and OLSP = 1.

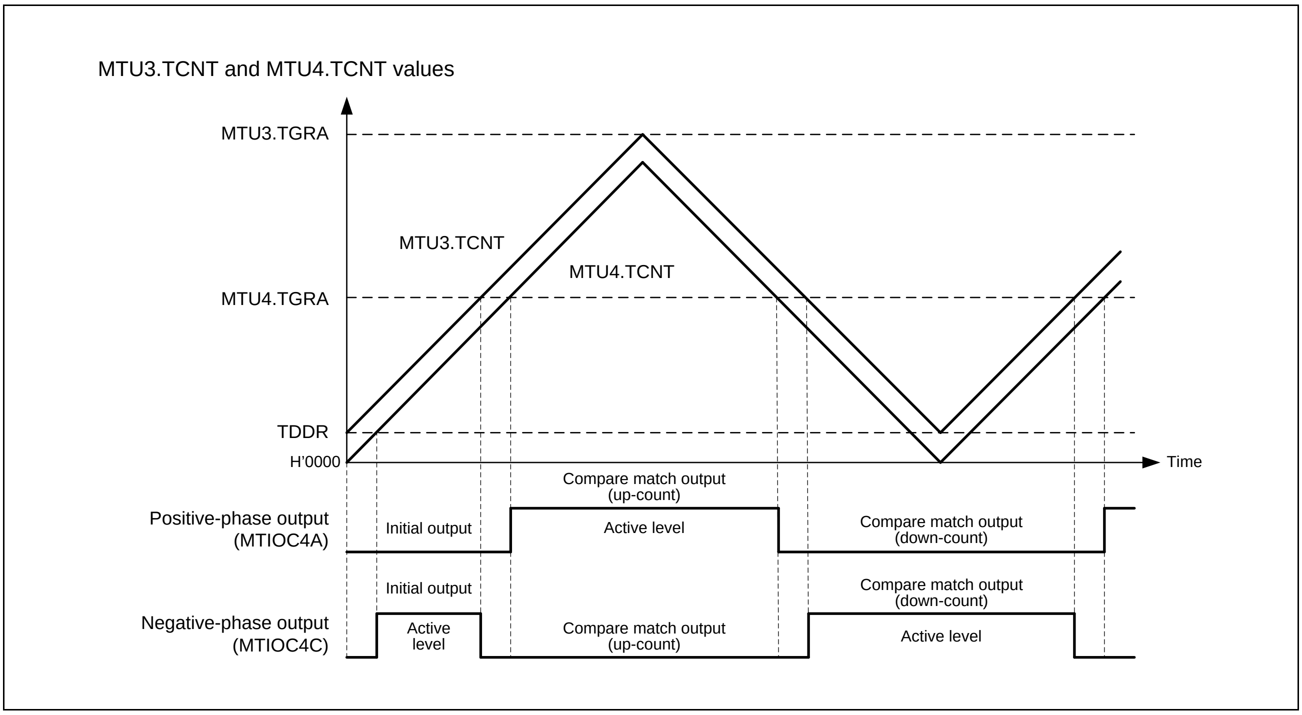

Figure 16.3 Example of Output in Complementary PWM Mode

16.2.23 Timer Output Control Registers 2 (TOCR2A and TOCR2B)

Address(es): MTU.TOCR2A H'0_1000_120F, MTU.TOCR2B H'0_1000_1A0F

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	BF[1:0]		OLS3N	OLS3P	OLS2N	OLS2P	OLS1N	OLS1P
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	OLS1P	0	R/W	Output Level Select 1P[*1] [*2] This bit selects the output level on MTIOC3B or MTIOC6B in reset-synchronized PWM mode and complementary PWM mode. See **Table 16.45**.
b1	OLS1N	0	R/W	Output Level Select 1N[*1] [*2] This bit selects the output level on MTIOC3D or MTIOC6D in reset-synchronized PWM mode and complementary PWM mode. See **Table 16.46**.
b2	OLS2P	0	R/W	Output Level Select 2P[*1] [*2] This bit selects the output level on MTIOC4A or MTIOC7Ain reset-synchronized PWM mode and complementary PWM mode. See **Table 16.47**.
b3	OLS2N	0	R/W	Output Level Select 2N[*1] [*2] This bit selects the output level on MTIOC4C or MTIOC7C in reset-synchronized PWM mode and complementary PWM mode. See **Table 16.48**.
b4	OLS3P	0	R/W	Output Level Select 3P[*1] [*2] This bit selects the output level on MTIOC4B or MTIOC7B in reset-synchronized PWM mode and complementary PWM mode. See **Table 16.49**.
b5	OLS3N	0	R/W	Output Level Select 3N[*1] [*2] This bit selects the output level on MTIOC4D or MTIOC7D in reset-synchronized PWM mode and complementary PWM mode. See **Table 16.50**.
b7, b6	BF[1:0]	All 0	R/W	TOLBR Buffer Transfer Timing Select These bits select the timing for transferring data from TOLBRj to TOCR2j. See **Table 16.51** for details.

Note: j = A, B

Note 1. Setting the TOCR1j.TOCS bit to 1 makes this bit setting valid.

Note 2. If dead-time is not generated, the negative-phase output is the exact inverse of the positive-phase output. In this case, only the OLSiP bits are valid (i = 1 to 3).

TOCR2A and TOCR2B control inversion of PWM output level in complementary PWM mode and reset-synchronized PWM mode.

The initial output is selected while the counter is stopped.

Table 16.45 MTIOCmB Output Level Select Function

Bit 0	Function			
			Compare Match Output

0	High level	Low level	High level	Low level
1	Low level	High level	Low level	High level

Note: m = 4, 7

Note: The initial output value of negative-phase waveform changes to an active level after the dead time has passed since counting starts.

Table 16.51 Setting of TOCR2j.BF[1:0] Bits

Bit 7	Bit 6	Description	
BF1	BF0	Complementary PWM Mode	Reset-Synchronized PWM Mode
0	0	Does not transfer data from the buffer register (TOLBRj) to TOCR2j.	Does not transfer data from the buffer register (TOLBRj) to TOCR2j.
	1	Transfers data from the buffer register (TOLBRj) to TOCR2j at the crest of the MTUn.TCNT count.	Transfers data from the buffer register (TOLBRj) to TOCR2j when MTUm.TCNT or MTUn.TCNT is cleared.
1	0	Transfers data from the buffer register (TOLBRj) to TOCR2j at the trough of the MTUn.TCNT count.	Setting prohibited
	1	Transfers data from the buffer register (TOLBRj) to TOCR2j at the crest and trough of the MTUn.TCNT count.	Setting prohibited

Note: n = 4, 7;
m = 3, 6;
j = A, B

16.2.24 Timer Output Level Buffer Registers (TOLBRA and TOLBRB)

Address(es): MTU.TOLBRA H'0_1000_1236, MTU.TOLBRB H'0_1000_1A36

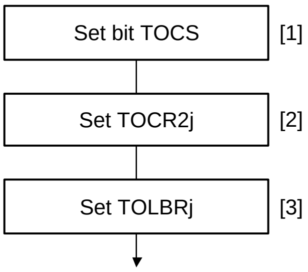
Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	OLS3N	OLS3P	OLS2N	OLS2P	OLS1N	OLS1P
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	OLS1P	0	R/W	Output Level Select 1P Specify the buffer value to be transferred to the OLS1P bit in TOCR2j.
b1	OLS1N	0	R/W	Output Level Select 1N Specify the buffer value to be transferred to the OLS1N bit in TOCR2j.
b2	OLS2P	0	R/W	Output Level Select 2P Specify the buffer value to be transferred to the OLS2P bit in TOCR2j.
b3	OLS2N	0	R/W	Output Level Select 2N Specify the buffer value to be transferred to the OLS2N bit in TOCR2j.
b4	OLS3P	0	R/W	Output Level Select 3P Specify the buffer value to be transferred to the OLS3P bit in TOCR2j.
b5	OLS3N	0	R/W	Output Level Select 3N Specify the buffer value to be transferred to the OLS3N bit in TOCR2j.
b7, b6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note: j = A, B

TOLBRA and TOLBRB are buffer registers for TOCR2A and TOCR2B and specify the PWM output level in complementary PWM mode and reset-synchronized PWM mode.

Figure 16.4 shows an example of the PWM output level setting procedure in buffer operation.



[1] Set bit TOCS in TOCR1j (j = A or B) to 1 to enable the TOCR2j setting.

[2] Use bits TOCR2j.BF[1:0] to select the TOLBRj buffer transfer timing. Use bits OLS3N to OLS1N and OLS3P to OLS1P to specify the PWM output levels.

[3] The TOLBRj initial setting must be the same value as specified in bits OLS3N to OLS1N and OLS3P to OLS1P in TOCR2j.

Figure 16.4 Example of PWM Output Level Setting Procedure in Buffer Operation

16.2.25 Timer Gate Control Register A (TGCRA)

Address(es): MTU.TGCRA H'0_1000_120D

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	BDC	N	P	FB	WF	VF	UF
Initial Value	1	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	UF	0	R/W	Output Phase Switch
b1	VF	0	R/W	These bits turn on or off the positive-phase/negative-phase output. The setting of these bits is valid only when the FB bit is set to 1. In this case, the setting of b0 to b2 is used instead of the external input. See **Table 16.52**.
b2	WF	0	R/W	
b3	FB	0	R/W	External Feedback Signal Enable 0: Output is switched by external input (input sources are TGRA, TGRB, and TGRC input capture signals in MTU0) 1: Output is switched by software (TGCRA's UF, VF, and WF settings)
b4	P	0	R/W	Positive-Phase Output (P) Control 0: Level output 1: Reset-synchronized PWM or complementary PWM output
b5	N	0	R/W	Negative-Phase Output (N) Control 0: Level output 1: Reset-synchronized PWM or complementary PWM output
b6	BDC	0	R/W	Brushless DC Motor 0: Ordinary output 1: Functions of this register are effective.
b7	—	1	R/W	Reserved This bit is read as 1. The write value should be 1.

TGCRA controls the output waveform necessary for brushless DC motor control in reset-synchronized PWM mode and complementary PWM mode. TGCRA register settings are ineffective for anything other than complementary PWM mode and reset-synchronized PWM mode.

UF, VF, and WF Bits (Output Phase Switch)

The setting of these bits is valid only when the FB bit is set to 1. In this case, the setting of b0 to b2 is used instead of the external input. See **Table 16.52** for details.

FB Bit (External Feedback Signal Enable)

This bit selects whether the positive-/negative-phase output is switched automatically with the TGRA, TGRB, and TGRC input capture signals in MTU0 or by writing 0 or 1 to bits 2 to 0 in TGCRA.

When the FB bit in the TGCRA register is 0, the output signals from MTU3 and MTU4 are switched automatically with the TGRA, TGRB, and TGRC input capture signals in MTU0.

P Bit (Positive-Phase Output (P) Control)

This bit selects either the level output or the reset-synchronized PWM/complementary PWM output for the positive-phase output pins (MTIOC3B, MTIOC4A, and MTIOC4B pins).

N Bit (Negative-Phase Output (N) Control)

This bit selects the level output or the reset-synchronized PWM/complementary PWM output for the negative-phase output pins (MTIOC3D, MTIOC4C, and MTIOC4D pins).

BDC Bit (Brushless DC Motor)

This bit selects whether to make the functions of TGCRA effective or ineffective.

Table 16.52 Output Level Select Function

Bit 2	Bit 1	Bit 0	Function					
			MTIOC3B	MTIOC4A	MTIOC4B	MTIOC3D	MTIOC4C	MTIOC4D
WF	VF	UF	U Phase	V Phase	W Phase	U Phase	V Phase	W Phase
0	0	0	OFF	OFF	OFF	OFF	OFF	OFF
		1	ON	OFF	OFF	OFF	OFF	ON
	1	0	OFF	ON	OFF	ON	OFF	OFF
		1	OFF	ON	OFF	OFF	OFF	ON
1	0	0	OFF	OFF	ON	OFF	ON	OFF
		1	ON	OFF	OFF	OFF	ON	OFF
	1	0	OFF	OFF	ON	ON	OFF	OFF
		1	OFF	OFF	OFF	OFF	OFF	OFF

16.2.26 Timer Subcounters (TCNTSA and TCNTSB)

Address(es): MTU.TCNTSA H'0_1000_1220, MTU.TCNTSB H'0_1000_1A20

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: TCNTSA and TCNTSB must not be accessed in eight bits; it should be accessed in 16 bits.

TCNTSA and TCNTSB are 16-bit read-only counters that are used only in complementary PWM mode. The initial value of TCNTSA and TCNTSB after a reset is H'0000.

16.2.27 Timer Cycle Data Registers (TCDRA and TCDRB)

Address(es): MTU.TCDRA H'0_1000_1214, MTU.TCDRB H'0_1000_1A14

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TCDRA and TCDRB must not be accessed in eight bits; it should be accessed in 16 bits.

TCDRA and TCDRB are 16-bit readable/writable registers used only in complementary PWM mode. Set half the PWM carrier cycle as the TCDRA and TCDRB values. The TCDRA and TCDRB registers are constantly compared with the TCNTSA and TCNTSB counters in complementary PWM mode, respectively. When a match occurs, the TCNTSA and TCNTSB counters switch the count direction (down-count to up-count). The initial value of TCDRA and TCDRB after a reset is H'FFFF.

16.2.28 Timer Cycle Buffer Registers (TCBRA and TCBRB)

Address(es): MTU.TCBRA H’0_1000_1222, MTU.TCBRB H’0_1000_1A22

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TCBRA and TCBRB must not be accessed in eight bits; it should be accessed in 16 bits.

TCBRA and TCBRB are 16-bit readable/writable registers, used only in complementary PWM mode, that function as buffer registers for TCDRA and TCDRB. The TCBRA and TCBRB values are transferred to TCDRA and TCDRB with the transfer timing set in TMDR1. The initial value of TCBRA and TCBRB after a reset is H’FFFF.

16.2.29 Timer Dead Time Data Registers (TDDRA and TDDRB)

Address(es): MTU.TDDRA H’0_1000_1216, MTU.TDDRB H’0_1000_1A16

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TDDRA and TDDRB must not be accessed in eight bits; it should be accessed in 16 bits.

TDDRA and TDDRB are 16-bit readable/writable registers, used only in complementary PWM mode, that specify the MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) counter offset value. In complementary PWM mode, when the MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) counters are cleared and then restarted, the TDDRA (TDDRB) value is loaded into the MTU3.TCNT (MTU6.TCNT) counter and the count operation starts. The initial value of TDDRA and TDDRB after a reset is H’FFFF.

16.2.30 Timer Dead Time Enable Registers (TDERA and TDERB)

Address(es): MTU.TDERA H'0_1000_1234, MTU.TDERB H'0_1000_1A34

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	TDER
Initial Value	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/(W)

Bit	Bit Name	Initial Value	R/W	Description
b0	TDER	1	R/(W)	Dead Time Enable 0: No dead time is generated 1: Dead time is generated*1
b7 to b1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. TDDRA and TDDRB must be set to 1 or a larger value.

TDERA and TDERB control dead time generation in complementary PWM mode. The MTU has one TDER each for MTU3 and MTU6. TDERA and TDERB should be modified only while TCNT stops.

TDER Bit (Dead Time Enable)

This bit specifies whether to generate dead time.

[Clearing condition]

- When 0 is written to TDER after reading TDER = 1

16.2.31 Timer Buffer Transfer Set Registers (TBTERA and TBTERB)

Address(es): MTU.TBTERA H'0_1000_1232, MTU.TBTERB H'0_1000_1A32

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	BTE[1:0]	
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	BTE[1:0]	All 0	R/W	Buffer Transfer Disable and Interrupt Skipping Link Setting These bits enable or disable transfer from the buffer registers*[1] used in complementary PWM mode to the temporary registers, and specify whether to link the transfer with interrupt skipping function 1. For details, see **Table 16.53**.
b7 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Applicable buffer registers (TBTERA):
MTU3.TGRC, MTU3.TGRD, MTU4.TGRC, MTU4.TGRD, and TCBRA
Applicable buffer registers (TBTERB):
MTU6.TGRC, MTU6.TGRD, MTU7.TGRC, MTU7.TGRD, and TCBRB

TBTERA and TBTERB enable or disable transfer from the buffer registers used in complementary PWM mode to the temporary registers, and specify whether to link the transfer with interrupt skipping 1 operation.

Table 16.53 Setting of BTE[1:0] Bits in TBTERA and TBTERB

Bit 1	Bit 0	
BTE1	BTE0	Description
0	0	Enables transfer from the buffer registers to the temporary registers*[1] and does not link the transfer with interrupt skipping function 1.
	1	Disables transfer from the buffer registers to the temporary registers.
1	0	Links transfer from the buffer registers to the temporary registers with interrupt skipping function 1.*[2]
	1	Setting prohibited

Note 1. Data is transferred according to the MD3 to MD0 bit setting in TMDR1. For details, refer to **Section 16.3.8, Complementary PWM Mode**.

Note 2. When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits are cleared to 0 in the timer interrupt skipping set register (TITCR1A (TITCR1B)) or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are cleared to 0), be sure to disable link of buffer transfer with interrupt skipping (clear the BTE1 bit in the timer buffer transfer set register (TBTERA (TBTERB)) to 0). If link with interrupt skipping is enabled while interrupt skipping is disabled, buffer transfer will not be performed.

16.2.32 Timer Waveform Control Registers (TWCRA and TWCRB)

Address(es): MTU.TWCRA H’0_1000_1260, MTU.TWCRB H’0_1000_1A60

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	CCE	—	—	—	—	—	SCC	WRE
Initial Value	0*2	0	0	0	0	0	0	0
R/W	R/(W)	R/W	R/W	R/W	R/W	R/W	R/(W)	R/(W)*3

Bit	Bit Name	Initial Value	R/W	Description
b0	WRE	0	R/(W) *3	Waveform Retain Enable 0: Initial values specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are output 1: Initial output is inhibited
b1	SCC*1 *3	0	R/(W)	Synchronous Clearing Control (Only valid in register TWCRB) 0: Clearing of MTU6.TCNT and MTU7.TCNT in response to synchronous clearing for MTU0, MTU1, MTU2–MTU6, MTU7 is enabled. 1: Clearing of MTU6.TCNT and MTU7.TCNT in response to synchronous clearing for MTU0, MTU1, MTU2–MTU6, MTU7 is disabled.
b6 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b7	CCE*2	0	R/(W)	Compare Match Clear Enable 0: Counters are not cleared at MTU3.TGRA (MTU6.TGRA) compare match 1: Counters are cleared at MTU3.TGRA (MTU6.TGRA) compare match

Note 1. This bit is only valid in register TWCRB and is a reserved bit in register TWCRA.

Note 2. Do not set to 1 when complementary PWM mode 1 is not selected.

Note 3. Do not set to 1 when complementary PWM mode is not selected.

TWCRA and TWCRB control the output waveform when synchronous counter clearing occurs in MTU3.TNCT and MTU4.TNCT (MTU6.TNCT and MTU7.TNCT) in complementary PWM mode and specifies whether to clear the counters at MTU3.TGRA (MTU6.TGRA) compare match.

The CCE bit and WRE bit in TWCRA and TWCRB should be modified only while TCNT stops.

WRE Bit (Waveform Retain Enable)

This bit selects the waveform output when synchronous counter clearing occurs in complementary PWM mode. The initial output is inhibited with this function only when synchronous clearing occurs within the Tb interval at the trough in complementary PWM mode. When synchronous clearing occurs outside this interval, the initial values

specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are output regardless of the WRE bit setting. The initial values specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are also output when synchronous clearing occurs in the Tb interval at the trough immediately after MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) start operation.

For the Tb interval at the trough in complementary PWM mode, see **Figure 16.50**.

[Setting condition]

- When 1 is written to the WRE bit after reading WRE = 0

SCC Bit (Synchronous Clearing Control)

The setting of this bit selects whether MTU6.TCNT and MTU7.TCNT are or are not cleared when counter-synchronous clearing is generated for MTU0, MTU1, MTU2–MTU6, MTU7 in complementary PWM mode.

Make the complementary PWM mode settings for MTU6 and MTU7 when this function is in use. When writing a new value to the SCC bit while the counter is operating, do not change the values of the CCE and WRE bits.

Synchronous clearing from the MTU module only becomes disabled due to the setting of the SCC bit when synchronous clearing is generated outside the Tb interval in the trough. If synchronous clearing is generated within the Tb interval in the trough including immediately after the value at which MTU6.TCNT and MTU7.TCNT start, MTU6.TCNT and MTU7.TCNT are cleared.

Regarding the Tb interval in the trough in complementary PWM mode, see **Figure 16.50**.

[Setting condition]

- Writing of 1 to the SCC bit after reading it as 0

The corresponding bit in register TWCRA is reserved and is read as 0. When writing to TWCRA, write 0 to this bit.

CCE Bit (Compare Match Clear Enable)

This bit specifies whether to clear counters at MTU3.TGRA (MTU6.TGRA) compare match in complementary PWM mode.

[Setting condition]

When 1 is written to CCE after reading CCE = 0

16.2.33 Noise Filter Control Register n (NFCRn) (n = 0 to 4, 6, 7, 8, C)

(1) MTU0.NFCR0, MTU1.NFCR1, MTU2.NFCR2, MTU3.NFCR3, MTU4.NFCR4, MTU6.NFCR6, MTU7.NFCR7, MTU8.NFCR8

Address(es): MTU0.NFCR0 H'0_1000_1290, MTU1.NFCR1 H'0_1000_1291, MTU2.NFCR2 H'0_1000_1292, MTU3.NFCR3 H'0_1000_1293, MTU4.NFCR4 H'0_1000_1294, MTU6.NFCR6 H'0_1000_1A93, MTU7.NFCR7 H'0_1000_1A94, MTU8.NFCR8 H'0_1000_1298

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	NFCS[1:0]		NFDEN	NFCEN	NFBEN	NFAEN
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W*[1]	R/W*[1]	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	NFAEN	0	R/W	Noise Filter A Enable 0: The noise filter for the MTIOCnA pin is disabled. 1: The noise filter for the MTIOCnA pin is enabled.
b1	NFBEN	0	R/W	Noise Filter B Enable 0: The noise filter for the MTIOCnB pin is disabled. 1: The noise filter for the MTIOCnB pin is enabled.
b2	NFCEN	0	R/W*[1]	Noise Filter C Enable 0: The noise filter for the MTIOCnC pin is disabled. 1: The noise filter for the MTIOCnC pin is enabled.
b3	NFDEN	0	R/W*[1]	Noise Filter D Enable 0: The noise filter for the MTIOCnD pin is disabled. 1: The noise filter for the MTIOCnD pin is enabled.
b5, b4	NFCS[1:0]	All 0	R/W	Noise Filter Clock Select b5 b4 0 0: P0ϕ/1 0 1: P0ϕ/8 1 0: P0ϕ/32 1 1: Clock source for counting
b7, b6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. These bits are reserved in the NFCR1 and NFCR2 registers. These bits are read as 0 and writing to them has no effect.

The NFCRn register (n = 0 to 4, 6, 7, or 8) specifies the noise filter function of the input capture input pin of the corresponding channel.

NFAEN Bit (Noise Filter A Enable)

This bit disables or enables the noise filter for input from the MTIOCnA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFBEN Bit (Noise Filter B Enable)

This bit disables or enables the noise filter for input from the MTIOCnB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFCEN Bit (Noise Filter C Enable)

This bit disables or enables the noise filter for input from the MTIOCnC pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFDEN Bit (Noise Filter D Enable)

This bit disables or enables the noise filter for input from the MTIOCnD pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFCS[1:0] Bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. When setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval before setting the input-capture function. When the NFCS[1:0] bits are set to 11b, i.e. selecting the external clock as the source to drive counting, wait for two cycles of the external clock before setting the input capture function.

(2) MTU0.NFCRC

Address(es): MTU0.NFCRC H'0_1000_1299

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	NFCS[1:0]		NFDEN	NFCEN	NFBEN	NFAEN
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	NFAEN	0	R/W	Noise Filter A Enable 0: The noise filter for the MTCLKA pin is disabled. 1: The noise filter for the MTCLKA pin is enabled.
b1	NFBEN	0	R/W	Noise Filter B Enable 0: The noise filter for the MTCLKB pin is disabled. 1: The noise filter for the MTCLKB pin is enabled.
b2	NFCEN	0	R/W	Noise Filter C Enable 0: The noise filter for the MTCLKC pin is disabled. 1: The noise filter for the MTCLKC pin is enabled.
b3	NFDEN	0	R/W	Noise Filter D Enable 0: The noise filter for the MTCLKD pin is disabled. 1: The noise filter for the MTCLKD pin is enabled.
b5, b4	NFCS[1:0]	All 0	R/W	Noise Filter Clock Select b5 b4 0 0: P0ϕ/1 0 1: P0ϕ/2 1 0: P0ϕ/8 1 1: P0ϕ/32
b7, b6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

The NFCRC register is used in common with all channels and specifies the noise filter function of the external clock pins.

NFAEN Bit (Noise Filter A Enable)

This bit disables or enables the noise filter for input from the MTCLKA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFBEN Bit (Noise Filter B Enable)

This bit disables or enables the noise filter for input from the MTCLKB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFCEN Bit (Noise Filter C Enable)

This bit disables or enables the noise filter for input from the MTCLKC pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFDEN Bit (Noise Filter D Enable)

This bit disables or enables the noise filter for input from the MTCLKD pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFCS[1:0] Bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. After setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval to set the input capture function.

16.2.34 Noise Filter Control Register 5 (NFCR5)

Address(es): MTU5.NFCR5 H'0_1000_1A95

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	NFCS[1:0]		—	NFWEN	NFVEN	NFUEN
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	NFUEN	0	R/W	Noise Filter U Enable 0: The noise filter for the MTIC5U pin is disabled. 1: The noise filter for the MTIC5U pin is enabled.
b1	NFVEN	0	R/W	Noise Filter V Enable 0: The noise filter for the MTIC5V pin is disabled. 1: The noise filter for the MTIC5V pin is enabled.
b2	NFWEN	0	R/W	Noise Filter W Enable 0: The noise filter for the MTIC5W pin is disabled. 1: The noise filter for the MTIC5W pin is enabled.
b3	—	0	R/W	Reserved These bits are read as 0. The write value should be 0.
b5, b4	NFCS[1:0]	All 0	R/W	Noise Filter Clock Select b5 b4 0 0: P0ϕ/1 0 1: P0ϕ/8 1 0: P0ϕ/32 1 1: Clock source for counting
b7, b6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

NFUEN Bit (Noise Filter U Enable)

This bit disables or enables the noise filter for input from the MTIC5U pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

NFVEN Bit (Noise Filter V Enable)

This bit disables or enables the noise filter for input from the MTIC5V pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

NFWEN Bit (Noise Filter W Enable)

This bit disables or enables the noise filter for input from the MTIC5W pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

NFCS[1:0] Bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. When setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval before setting the input-capture function.

16.2.35 Timer A/D Converter Start Request Control Register (TADCR)

(1) MTU4.TADCR

Address(es): MTU4.TADCR H'0_1000_1240

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Bit	Bit Name	Initial Value	R/W	Description
b0	ITB4VE	0	R/W	TCIV4 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG4BN and TCIV4 interrupt skipping 1 are not linked 1: A/D converter start request signal TRG4BN and TCIV4 interrupt skipping 1 are linked
b1	ITB3AE	0	R/W	TGIA3 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG4BN and TGIA3 interrupt skipping 1 are not linked 1: A/D converter start request signal TRG4BN and TGIA3 interrupt skipping 1 are linked
b2	ITA4VE	0	R/W	TCIV4 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG4AN and TCIV4 interrupt skipping 1 are not linked 1: A/D converter start request signal TRG4AN and TCIV4 interrupt skipping 1 are linked
b3	ITA3AE	0	R/W	TGIA3 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG4AN and TGIA3 interrupt skipping 1 are not linked 1: A/D converter start request signal TRG4AN and TGIA3 interrupt skipping 1 are linked
b4	DT4BE	0	R/W	Down-Count TRG4BN Enable*3 0: A/D converter start requests (TRG4BN) disabled during MTU4.TCNT down-count operation 1: A/D converter start requests (TRG4BN) enabled during MTU4.TCNT down-count operation
b5	UT4BE	0	R/W	Up-Count TRG4BN Enable 0: A/D converter start requests (TRG4BN) disabled during MTU4.TCNT up-count operation 1: A/D converter start requests (TRG4BN) enabled during MTU4.TCNT up-count operation
b6	DT4AE	0	R/W	Down-Count TRG4AN Enable*3 0: A/D converter start requests (TRG4AN) disabled during MTU4.TCNT down-count operation 1: A/D converter start requests (TRG4AN) enabled during MTU4.TCNT down-count operation
b7	UT4AE	0	R/W	Up-Count TRG4AN Enable 0: A/D converter start requests (TRG4AN) disabled during MTU4.TCNT up-count operation 1: A/D converter up requests (TRG4AN) enabled during MTU4.TCNT down-count operation
b13 to b8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
b15, b14	BF[1:0]	All 0	R/W	MTU4.TADCOBRA/TADCOBRB Transfer Timing Select See **Table 16.54** for details. These bits specify the transfer timing from MTU4.TADCOBRA and MTU4.TADCOBRB to MTU4.TADCORA and MTU4.TADCORB.

Note: The TADCR register in MTU4 must not be accessed in eight bits; it should be accessed in 16 bits.

Note 1. Clear the bit to 0 when interrupt skipping is disabled (the T3AEN or T4VEN bit in TITCR1A is cleared to 0 or the T3ACOR or T4VCOR bits in TITCR1A are cleared to 0).

Note 2. If link with interrupt skipping is enabled while interrupt skipping is disabled, A/D converter start requests will not be issued.

Note 3. Clear the bit to 0 when complementary PWM mode is not selected.

TADCR enables or disables A/D converter start requests and specifies whether to link A/D converter start requests with interrupt skipping function. The MTU has one TADCR each for MTU4 and MTU7.

Table 16.54 Setting of Transfer Timing by TADCR.BF[1:0] Bits (MTU4)

Bit 15	Bit 14	Description			
BF[1]	BF[0]	Complementary PWM Mode	Reset-Synchronized PWM Mode	PWM Mode 1	Normal Mode
0	0	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4).	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4).	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4).	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4).
0	1	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) at the crest of the TCNT count in MTU4.	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) when a compare match occurs between TCNT and TGRA in MTU3.	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) when a compare match occurs between TCNT and TGRA in MTU4.	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) when a compare match occurs between TCNT and TGRA in MTU4.
1	0	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) at the trough of the TCNT count in MTU4.	Setting prohibited	Setting prohibited	Setting prohibited
1	1	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU4) to the cycle set register (TADCORA or TADCORB in MTU4) at the crest and trough of the TCNT count in MTU4.	Setting prohibited	Setting prohibited	Setting prohibited

(2) MTU7.TADCR

Address(es): MTU7.TADCR H'0_1000_1A40

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Bit	Bit Name	Initial Value	R/W	Description
b0	ITB7VE	0	R/W	TCIV7 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG7BN and TCIV7 interrupt skipping 1 are not linked 1: A/D converter start request signal TRG7BN and TCIV7 interrupt skipping 1 are linked
b1	ITB6AE	0	R/W	TGIA6 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG7BN and TGIA6 interrupt skipping 1 are not linked 1: A/D converter start request signal TRG7BN and TGIA6 interrupt skipping 1 are linked
b2	ITA7VE	0	R/W	TCIV7 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG7AN and TCIV7 interrupt skipping 1 are not linked 1: A/D converter start request signal TRG7AN and TCIV7 interrupt skipping 1 are linked
b3	ITA6AE	0	R/W	TGIA6 Interrupt Skipping Link Enable*1 *2 *3 0: A/D converter start request signal TRG7AN and TGIA6 interrupt skipping 1 are not linked 1: A/D converter start request signal TRG7AN and TGIA6 interrupt skipping 1 are linked
b4	DT7BE	0	R/W	Down-Count TRG7BN Enable*3 0: A/D converter start requests (TRG7BN) disabled during MTU7.TCNT down-count operation 1: A/D converter start requests (TRG7BN) enabled during MTU7.TCNT down-count operation
b5	UT7BE	0	R/W	Up-Count TRG7BN Enable 0: A/D converter start requests (TRG7BN) disabled during MTU7.TCNT up-count operation 1: A/D converter start requests (TRG7BN) enabled during MTU7.TCNT up-count operation
b6	DT7AE	0	R/W	Down-Count TRG7AN Enable*3 0: A/D converter start requests (TRG7AN) disabled during MTU7.TCNT down-count operation 1: A/D converter start requests (TRG7AN) enabled during MTU7.TCNT down-count operation
b7	UT7AE	0	R/W	Up-Count TRG7AN Enable 0: A/D converter start requests (TRG7AN) disabled during MTU7.TCNT up-count operation 1: A/D converter up requests (TRG7AN) enabled during MTU7.TCNT down-count operation
b13 to b8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
b15, b14	BF[1:0]	All 0	R/W	MTU7.TADCOBRA/TADCOBRB Transfer Timing Select See **Table 16.55** for details. These bits specify the transfer timing from MTU7.TADCOBRA and MTU7.TADCOBRB to MTU7.TADCORA and MTU7.TADCORB.

Note: The TADCR register in MTU7 must not be accessed in eight bits; it should be accessed in 16 bits.

Note 1. Clear the bit to 0 when interrupt skipping is disabled (the T6AEN or T7VEN bit in TITCR1B is cleared to 0 or the T6ACOR or T7VCOR bits in TITCR1B are cleared to 0).

Note 2. If link with interrupt skipping is enabled while interrupt skipping is disabled, A/D converter start requests will not be issued.

Note 3. Clear the bit to 0 when complementary PWM mode is not selected.

Table 16.55 Setting of Transfer Timing by TADCR.BF[1:0] Bits (MTU7)

Bit 15	Bit 14	Description			
BF[1]	BF[0]	Complementary PWM Mode	Reset-Synchronized PWM Mode	PWM Mode 1	Normal Mode
0	0	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7).	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7).	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7).	Does not transfer data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7).
0	1	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) at the crest of the TCNT count in MTU7.	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) when a compare match occurs between TCNT and TGRA in MTU6.	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) when a compare match occurs between TCNT and TGRA in MTU7.	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) when a compare match occurs between TCNT and TGRA in MTU7.
1	0	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) at the trough of the TCNT count in MTU7.	Setting prohibited	Setting prohibited	Setting prohibited
1	1	Transfers data from the cycle set buffer register (TADCOBRA or TADCOBRB in MTU7) to the cycle set register (TADCORA or TADCORB in MTU7) at the crest and trough of the TCNT count in MTU7.	Setting prohibited	Setting prohibited	Setting prohibited

16.2.36 Timer A/D Converter Start Request Cycle Set Registers (TADCORA and TADCORB)

Address(es): MTU4.TADCORA H’0_1000_1244, MTU4.TADCORB H’0_1000_1246, MTU7.TADCORA H’0_1000_1A44, MTU7.TADCORB H’0_1000_1A46

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TADCORA and TADCORB must not be accessed in eight bits; it should be accessed in 16 bits.

Note 1. When the A/D converter start request delaying function linked with skipping function 1 (for details, see **Section 16.3.9(5), A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 1**) is used, the value of this register should be H’0002 to TCDRA setting - 2 in MTU4 and H’0002 to TCDRB setting - 2 in MTU7.

Note 2. When interrupt skipping function 2 is used and the difference between the TADCORA value and the TADCORB value is small, the skipping count may not be counted correctly and the A/D converter start request may not be generated with the expected timing in some cases. The TADCORA and TADCORB values should satisfy the following conditions.

(1) When skipping function 2 is specified with the skipping count set to 0

- The difference between the TADCORA and TADCORB values should be equal to or greater than 4.
- The TADCORA compare interval should be equal to or greater than 4 P0ϕ cycles (the TADCORA update value should be the previous value + 4 or greater, or previous value - 4 or smaller).
- The TADCORB compare interval should be equal to or greater than 4 P0ϕ cycles (the TADCORB update value should be the previous value + 4 or greater, or previous value - 4 or smaller).

(2) When skipping function 2 is specified with the skipping count set to 1 or greater

- The difference between the TADCORA and TADCORB values should be equal to or greater than 2.
- The TADCORB compare interval should be equal to or greater than 2 P0ϕ cycles (the TADCORB update value should be the previous value + 2 or greater, or previous value - 2 or smaller).

TADCORA and TADCORB are 16-bit readable/writable registers that issue a corresponding A/D converter start request when the MTUn.TCNT (n = 4, 7) count reaches the value in TADCORA or TADCORB.

MTUn.TADCORA and TADCORB are initialized to H’FFFF by a reset.

16.2.37 Timer A/D Converter Start Request Cycle Set Buffer Registers (TADCOBRA and TADCOBRB)

Address(es): MTU4.TADCORA H’0_1000_1248, MTU4.TADCORB H’0_1000_124A, MTU7.TADCORA H’0_1000_1A48, MTU7.TADCORB H’0_1000_1A4A

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TADCOBRA and TADCOBRB must not be accessed in eight bits; it should be accessed in 16 bits.

TADCOBRA and TADCOBRB are 16-bit readable/writable registers whose values are transferred to TADCORA and TADCORB, respectively, when the crest or trough of the MTUn.TCNT count is reached.

TADCOBRA and TADCOBRB are initialized to H’FFFF by a reset.

16.2.38 Timer Interrupt Skipping Mode Registers (TITMRA and TITMRB)

Address(es): MTU.TITMRA H’0_1000_123A, MTU.TITMRB H’0_1000_1A3A

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	TITM
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	TITM	0	R/W	Interrupt Skipping Function Select Selects one of the two types of interrupt skipping functions. 0: Selects interrupt skipping function 1*1 1: Selects interrupt skipping function 2*2
b7 to b1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. TITCR1A or TITCR1B is used to enable interrupt skipping function 1.

Note 2. TITCR2A or TITCR2B is used to enable interrupt skipping function 2.

TITMRA and TITMRB are used to select either of two skipping functions for the TITMRA and TITMRB registers.

16.2.39 Timer Interrupt Skipping Set Registers 1 (TITCR1A and TITCR1B)

(1) MTU.TITCR1A

Address(es): MTU.TITMRA H'0_1000_1230

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	T3AEN	T3ACOR[2:0]			T4VEN	T4VCOR[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	T4VCOR[2:0]	All 0	R/W	TCIV4 Interrupt Skipping Count Setting These bits specify the TCIV4 interrupt skipping count within the range from 0 to 7.*1 For details, see **Table 16.56**.
b3	T4VEN	0	R/W	T4VEN 0: TCIV4 interrupt skipping disabled 1: TCIV4 interrupt skipping enabled
b6 to b4	T3ACOR[2:0]	All 0	R/W	TGIA3 Interrupt Skipping Count Setting These bits specify the TGIA3 interrupt skipping count within the range from 0 to 7. For details, see **Table 16.57**.
b7	T3AEN	0	R/W	T3AEN 0: TGIA3 interrupt skipping disabled 1: TGIA3 interrupt skipping enabled

Note 1. When 0 is specified for the interrupt skipping count, no interrupt skipping will be performed.
Before changing the interrupt skipping count, be sure to clear the TITCR1A.T3AEN and TITCR1A.T4VEN bits to 0 to clear the skipping counter (TITCNT1A).

(2) MTU.TITCR1B

Address(es): MTU.TITCR1B H'0_1000_1A30

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	T6AEN	T6ACOR[2:0]			T7VEN	T7VCOR[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	T7VCOR[2:0]	All 0	R/W	TCIV7 Interrupt Skipping Count Setting These bits specify the TCIV7 interrupt skipping count within the range from 0 to 7.*[1] For details, see **Table 16.58**.
b3	T7VEN	0	R/W	T7VEN 0: TCIV7 interrupt skipping disabled 1: TCIV7 interrupt skipping enabled
b6 to b4	T6ACOR[2:0]	All 0	R/W	TGIA6 Interrupt Skipping Count Setting These bits specify the TGIA6 interrupt skipping count within the range from 0 to 7.*[1] For details, see **Table 16.59**.
b7	T6AEN	0	R/W	T6AEN 0: TGIA6 interrupt skipping disabled 1: TGIA6 interrupt skipping enabled

Note 1. When 0 is specified for the interrupt skipping count, no interrupt skipping will be performed.
Before changing the interrupt skipping count, be sure to clear the TITCR1B.T6AEN and TITCR1B.T7VEN bits to 0 to clear the skipping counter (TITCNT1B).

TITCR1A and TITCR1B enable or disable interrupt skipping and specify the interrupt skipping count.

The setting in the TITCR1A (TITCR1B) register is valid only while the TITM bit in TITMRA (TITMRB) is set to 0; when the TITM bit in TITMRA (TITMRB) is set to 1, the setting in TITCR1A (TITCR1B) is cleared.

Table 16.56 Setting of Interrupt Skipping Count by T4VCOR[2:0] Bits

Bit 2	Bit 1	Bit 0	
T4VCOR2	T4VCOR1	T4VCOR0	Description
0	0	0	Does not skip TCIV4 interrupts.
		1	Sets the TCIV4 interrupt skipping count to 1.
	1	0	Sets the TCIV4 interrupt skipping count to 2.
		1	Sets the TCIV4 interrupt skipping count to 3.
1	0	0	Sets the TCIV4 interrupt skipping count to 4.
		1	Sets the TCIV4 interrupt skipping count to 5.
	1	0	Sets the TCIV4 interrupt skipping count to 6.
		1	Sets the TCIV4 interrupt skipping count to 7.

Table 16.57 Setting of Interrupt Skipping Count by T3ACOR[2:0] Bits

Bit 6	Bit 5	Bit 4	
T3ACOR2	T3ACOR1	T3ACOR0	Description
0	0	0	Does not skip TGIA3 interrupts.
		1	Sets the TGIA3 interrupt skipping count to 1.
	1	0	Sets the TGIA3 interrupt skipping count to 2.
		1	Sets the TGIA3 interrupt skipping count to 3.
1	0	0	Sets the TGIA3 interrupt skipping count to 4.
		1	Sets the TGIA3 interrupt skipping count to 5.
	1	0	Sets the TGIA3 interrupt skipping count to 6.
		1	Sets the TGIA3 interrupt skipping count to 7.

Table 16.58 Setting of Interrupt Skipping Count by T7VCOR[2:0] Bits

Bit 2	Bit 1	Bit 0	
T7VCOR2	T7VCOR1	T7VCOR0	Description
0	0	0	Does not skip TCIV7 interrupts.
		1	Sets the TCIV7 interrupt skipping count to 1.
	1	0	Sets the TCIV7 interrupt skipping count to 2.
		1	Sets the TCIV7 interrupt skipping count to 3.
1	0	0	Sets the TCIV7 interrupt skipping count to 4.
		1	Sets the TCIV7 interrupt skipping count to 5.
	1	0	Sets the TCIV7 interrupt skipping count to 6.
		1	Sets the TCIV7 interrupt skipping count to 7.

Table 16.59 Setting of Interrupt Skipping Count by T6ACOR[2:0] Bits

Bit 6	Bit 5	Bit 4	
T6ACOR2	T6ACOR1	T6ACOR0	Description
0	0	0	Does not skip TGIA6 interrupts.
		1	Sets the TGIA6 interrupt skipping count to 1.
	1	0	Sets the TGIA6 interrupt skipping count to 2.
		1	Sets the TGIA6 interrupt skipping count to 3.
1	0	0	Sets the TGIA6 interrupt skipping count to 4.
		1	Sets the TGIA6 interrupt skipping count to 5.
	1	0	Sets the TGIA6 interrupt skipping count to 6.
		1	Sets the TGIA6 interrupt skipping count to 7.

16.2.40 Timer Interrupt Skipping Counters 1 (TITCNT1A and TITCNT1B)

(1) MTU.TITCNT1A

Address(es): MTU.TITCNT1A H'0_1000_1231

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	T3ACNT[2:0]			—	T4VCNT[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	T4VCNT[2:0]	All 0	R	TCIV4 Interrupt Counter While the T4VEN bit in TITCR1A is set to 1, the count in these bits is incremented every time a TCIV4 interrupt occurs.
b3	—	0	R	Reserved This bit is read as 0.
b6 to b4	T3ACNT[2:0]	All 0	R	TGIA3 Interrupt Counter While the T3AEN bit in TITCR1A is set to 1, the count in these bits is incremented every time a TGIA3 interrupt occurs.
b7	—	0	R	Reserved This bit is read as 0.

Note: To clear the TITCNT1A, clear the TITCR1A.T3AEN and TITCR1A.T4VEN bits to 0.

TITCNT1A and TITCNT1B are 8-bit readable/writable counters. TITCNTA and TITCNTB retain their values even after stopping the count operation of MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT).

T4VCNT[2:0] Bits (TCIV4 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRA is 1
- When the T4VEN bit in TITCR1A is cleared to 0
- When the T4VCOR[2:0] bits in TITCR1A are cleared to 000b
- When the T4VCNT[2:0] bits in TITCNT1A match the T4VCOR[2:0] bits in TITCR1A

T3ACNT[2:0] Bits (TGIA3 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRA is 1
- When the T3AEN bit in TITCR1A is cleared to 0
- When the T3ACOR[2:0] bits in TITCR1A are cleared to 000b
- When the T3ACNT[2:0] bits in TITCNT1A match the T3ACOR[2:0] bits in TITCR1A

(2) MTU.TITCNT1B

Address(es): MTU.TITCNT1B H'0_1000_1A31

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	T6ACNT[2:0]			—	T7VCNT[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	T7VCNT[2:0]	All 0	R	TCIV7 Interrupt Counter While the T7VEN bit in TITCR1B is set to 1, the count in these bits is incremented every time a TCIV7 interrupt occurs.
b3	—	0	R	Reserved This bit is read as 0.
b6 to b4	T6ACNT[2:0]	All 0	R	TGIA6 Interrupt Counter While the T6AEN bit in TITCR1B is set to 1, the count in these bits is incremented every time a TGIA6 interrupt occurs.
b7	—	0	R	Reserved This bit is read as 0.

Note: To clear the TITCNT1B, clear the TITCR1B.T6AEN and TITCR1B.T7VEN bits to 0.

T7VCNT[2:0] Bits (TCIV7 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRB is 1
- When the T7VEN bit in TITCR1B is cleared to 0
- When the T7VCOR[2:0] bits in TITCR1B are cleared to 000b
- When the T7VCNT[2:0] bits in TITCNT1B match the T7VCOR[2:0] bits in TITCR1B

T6ACNT[2:0] Bits (TGIA6 Interrupt Counter)

[Clearing conditions]

- When the TITM bit in TITMRB is 1
- When the T6AEN bit in TITCR1B is cleared to 0
- When the T6ACOR[2:0] bits in TITCR1B are cleared to 000b
- When the T6ACNT[2:0] bits in TITCNT1B match the T6ACOR[2:0] bits in TITCR1B

16.2.41 Timer Interrupt Skipping Set Registers 2 (TITCR2A and TITCR2B)

(1) MTU.TITCR2A

Address(es): MTU.TITCR2A H'0_1000_123B

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TRG4COR[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	TRG4COR [2:0]	All 0	R/W	TRG4AN/TRG4BN Interrupt Skipping Count Setting These bits specify the TRG4AN/TRG4BN interrupt skipping count within the range from 0 to 7. For details, see **Table 16.60**.
b7 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

TITCR2A and TITCR2B specify the interrupt skipping count for TRG4AN and TRG4BN (TRG7AN and TRG7BN). This setting is valid only while TITMRA or TITMRB is set to 1.

Table 16.60 Setting of Interrupt Skipping Count by TRG4COR[2:0] Bits

Bit 2	Bit 1	Bit 0	
TRG4COR2	TRG4COR1	TRG4COR0	Description
0	0	0	Does not skip TRG4AN and TRG4BN interrupts.
		1	Sets the TRG4AN and TRG4BN interrupt skipping count to 1.
	1	0	Sets the TRG4AN and TRG4BN interrupt skipping count to 2.
		1	Sets the TRG4AN and TRG4BN interrupt skipping count to 3.
1	0	0	Sets the TRG4AN and TRG4BN interrupt skipping count to 4.
		1	Sets the TRG4AN and TRG4BN interrupt skipping count to 5.
	1	0	Sets the TRG4AN and TRG4BN interrupt skipping count to 6.
		1	Sets the TRG4AN and TRG4BN interrupt skipping count to 7.

(2) MTU.TITCR2B

Address(es): MTU.TITCR2B H'0_1000_1A3B

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TRG7COR[2:0]		
Initial Value	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	TRG7COR [2:0]	All 0	R/W	TRG7AN/TRG7BN Interrupt Skipping Count Setting These bits specify the TRG7AN/TRG7BN interrupt skipping count within the range from 0 to 7. For details, see **Table 16.61**.
b7 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Table 16.61 Setting of Interrupt Skipping Count by TRG7COR[2:0] Bits

Bit 2	Bit 1	Bit 0	
TRG7COR2	TRG7COR1	TRG7COR0	Description
0	0	0	Does not skip TRG7AN and TRG7BN interrupts.
		1	Sets the TRG7AN and TRG7BN interrupt skipping count to 1.
	1	0	Sets the TRG7AN and TRG7BN interrupt skipping count to 2.
		1	Sets the TRG7AN and TRG7BN interrupt skipping count to 3.
1	0	0	Sets the TRG7AN and TRG7BN interrupt skipping count to 4.
		1	Sets the TRG7AN and TRG7BN interrupt skipping count to 5.
	1	0	Sets the TRG7AN and TRG7BN interrupt skipping count to 6.
		1	Sets the TRG7AN and TRG7BN interrupt skipping count to 7.

16.2.42 Timer Interrupt Skipping Counters 2 (TITCNT2A and TITCNT2B)

(1) MTU.TITCNT2A

Address(es): MTU.TITCNT2A H'0_1000_123C

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TRG4CNT[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	TRG4CNT [2:0]	All 0	R	TRG4AN/TRG4BN Interrupt Counter These bits start counting from the value set in TRG4COR[2:0] and the count decrements every time TRG4AN or TRG4BN is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts become valid.
b7 to b3	—	All 0	R	Reserved These bits are read as 0.

TITCNT2A and TITCNT2B start counting from the values set in the TRG4COR[2:0] and TRG7COR[2:0] bits and the count decrements every time TRG4AN or TRG4BN (TITCNT2A) is generated or TRG7AN or TRG7BN (TITCNT2B) is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts or the TRG7AN and TRG7BN interrupts become valid.

TRG4CNT[2:0] Bits (TRG4AN/TRG4BN Interrupt Counter)

These bits start counting from the value set in the TRG4COR[2:0] bits and the count decrements every time a TRG4AN or TRG4BN interrupt is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts become valid.

[Clearing conditions]

- When the TITM bit in TITMRA is 0
- When the TRG4COR[2:0] bits in TITCR2A are cleared to 000b
- When the count of TRG4AN and TRG4BN occurrence matches the TRG4COR[2:0] value in TITCR2A

(2) MTU.TITCNT2B

Address(es): MTU.TITCNT2B H'0_1000_1A3C

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TRG7CNT[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	TRG7CNT [2:0]	All 0	R	TRG7AN/TRG7BN Interrupt Counter These bits start counting from the value set in TRG7COR[2:0] and the count decrements every time TRG7AN or TRG7BN is generated. When the count reaches 0 and is reloaded, the TRG7AN and TRG7BN interrupts become valid.
b7 to b3	—	All 0	R	Reserved These bits are read as 0.

TRG7CNT[2:0] Bits (TRG7AN/TRG7BN Interrupt Counter)

These bits start counting from the value set in the TRG7COR[2:0] bits and the count decrements every time a TRG7AN or TRG7BN interrupt is generated. When the count reaches 0 and is reloaded, the TRG7AN and TRG7BN interrupts become valid.

[Clearing conditions]

- When the TITM bit in TITMRB is 0
- When the TRG7COR[2:0] bits in TITCR2B are cleared to 000b
- When the count of TRG7AN and TRG7BN occurrence matches the TRG7COR[2:0] value in TITCR2B

16.2.43 Bus Master Interface

The timer counter (MTU8.TCNT), general registers (MTU8.TGRn) for MTU8, and MTU1.TCNTLW, MTU1.TGRALW, and MTU1.TGRBLW registers when TMDR3.LWA = 1 are 32-bit registers. A 32-bit data bus to the bus master enables 32-bit read/write access. 8- and 16-bit read/write are not allowed. Access these registers in 32-bit units.

Excluding MTU8, the timer counters (MTU0.TCNT to MTU7.TCNT), general registers (MTU0.TGRn to MTU7.TGRn), timer subcounters (TCNTSA and TCNTSB), timer cycle buffer registers (TCBRA and TCBRB), timer dead time data registers (TDDRA and TDDRB), timer cycle data registers (TCDRA and TCDRB), timer A/D converter start request control registers (MTU4.TADCR and MTU7.TADCR), timer A/D converter start request cycle set registers (MTU4.TADCORA, MTU4.TADCORB, MTU7.TADCORA, and MTU7.TADCORB), and timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA, MTU4.TADCOBRB, MTU7.TADCOBRA, and MTU7.TADCOBRB) are 16-bit registers. A 16-bit data bus to the bus master enables 16-bit read/write access. 8-bit read/ write is not allowed. Access the registers in 16-bit units.

All registers other than the above registers are 8-bit registers. Read from/write to these registers in 8-bit units.

16.3 Operation

16.3.1 Basic Functions

Each channel has TCNT and TGR. TCNT in each channel performs up-counting and is also capable of free-running count, periodic count, and external event count operations.

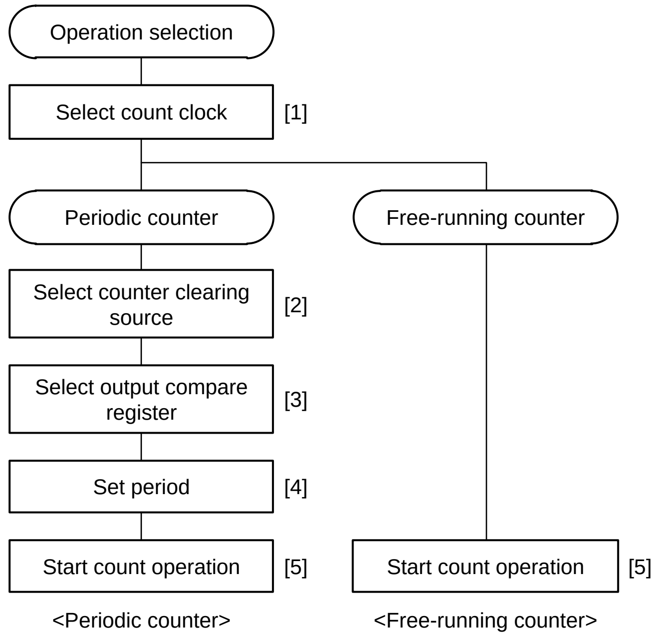
Each TGR can be used as an input capture register or an output compare register.

(1) Counter Operation

When one of bits CST0 to CST4 and CST8 in TSTRA, bits CST6 and CST7 in TSTRB, and bits CSTU5, CSTV5, and CSTW5 in MTU5.TSTR is set to 1, TCNT for the corresponding channel begins counting. TCNT can perform various count operations such as free-running count or periodic count operations.

(a) Example of Count Operation Setting Procedure

Figure 16.5 shows an example of the count operation setting procedure.



[1] Select the count clock source with bits TPSC[2:0] in TCR. At the same time, select the count clock source edge with bits CKEG[1:0] in TCR.

[2] For periodic counter operation, select the TGR to be used as the TCNT clearing source with bits CCLR[2:0] in TCR.

[3] Designate the TGR selected in [2] as an output compare register by means of TIOR.

[4] Set the periodic counter cycle in the TGR selected in [2].

[5] Set the CSTn bit in TSTRA, TSTRB, or MTU5.TSTR to 1 to start the counter operation.

Figure 16.5 Example of Count Operation Setting Procedure

(b) Free-Running Count Operation and Periodic Count Operation

Immediately after a reset, all TCNT counters are designated as free-running counters. When the CSTn bit in TSTRA, TSTRB, or TSTR in MTU5 is set to 1, the corresponding TCNT counter starts up-counting as a free-running counter. When TCNT overflows (from H'FFFF to H'0000), if the corresponding TIER.TCIEV bit is 1, an interrupt request is issued to the CPU. After an overflow, TCNT starts counting up again from H'0000.

Figure 16.6 illustrates free-running counter operation.

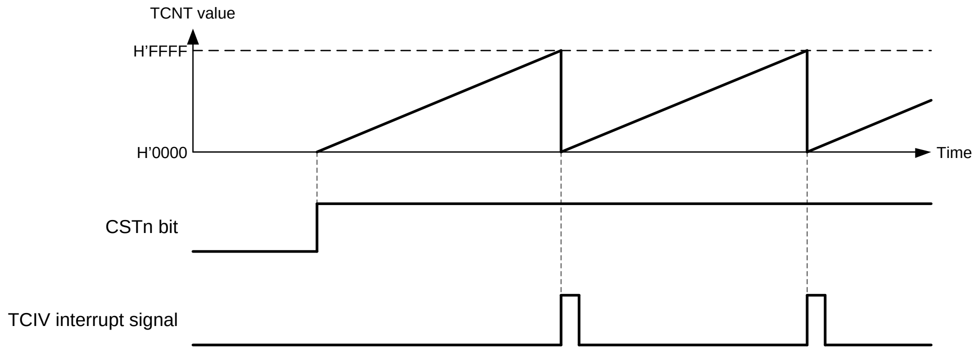


Figure 16.6 Free-Running Counter Operation

When compare match is selected as the TCNT clearing source, TCNT for the relevant channel performs periodic count operation. TGR for setting the cycle is designated as an output compare register, and counter clearing by compare match is selected by means of bits CCLR[2:0] in TCR. After the settings have been made, TCNT starts up-counting as a periodic counter when the corresponding CSTn bit in TSTRA, TSTRB, or TSTR in MTU5 is set to 1. When the count matches the value in TGR, TCNT is cleared to H'0000.

If the value of the corresponding TIER.TGIE bit is 1 at this point, an interrupt request is issued to the CPU. After a compare match, TCNT starts counting up again from H'0000.

Figure 16.7 illustrates periodic counter operation.

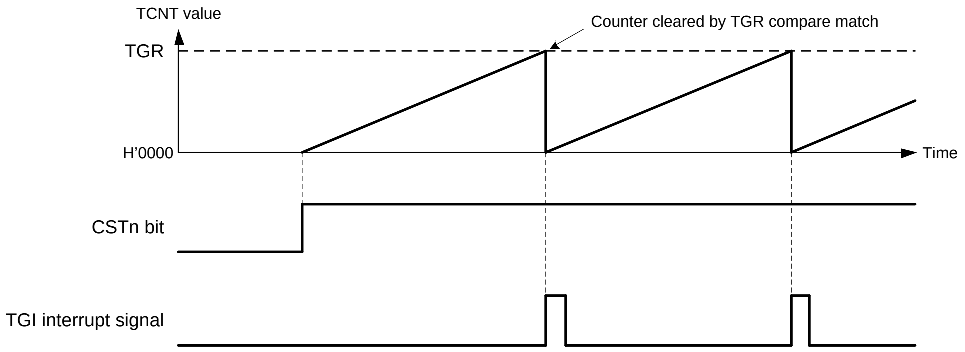

Figure 16.7 Periodic Counter Operation

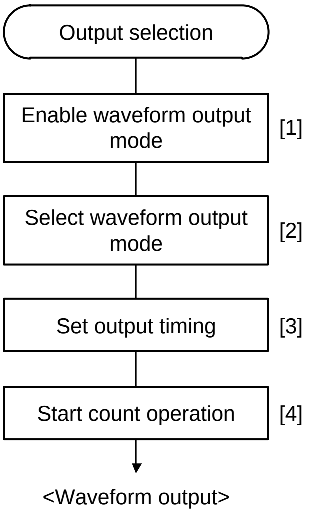
(2) Waveform Output by Compare Match

Upon compare match, low, high, or toggle output from the corresponding pin can be performed. The compare match output operation is not available in MTU5.

(a) Example of Procedure for Setting Waveform Output by Compare Match

Figure 16.8 shows an example of the procedure for setting waveform output by compare match



[1] Enable TOERA output when outputting a waveform from the MTIOC pin of MTU3 and MTU4. Enable TOERB output when outputting a waveform from the MTIOC pin of MTU6 and MTU7.

[2] Select initial value low output or high output, and compare match output value low output, high output, or toggle output, by means of TIOR. The set initial value is output at the MTIOC pin until the first compare match occurs.

[3] Set the timing for compare match generation in TGR.

[4] Set the CSTn bit in TSTRA or TSTRB to 1 to start the count operation.

Figure 16.8 Example of Procedure for Setting Waveform Output by Compare Match

(b) Examples of Waveform Output Operation

Figure 16.9 shows an example of low output and high output.

In this example, TCNT has been designated as a free-running counter, and settings have been made so that high is output by compare match A and low is output by compare match B. When the pin level is the same as the specified level, the pin level does not change.

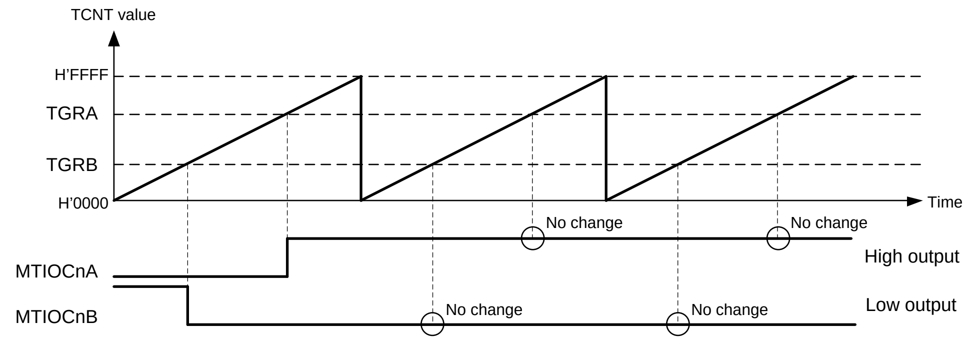


Figure 16.9 Example of low output and high output Operation (n = 0 to 4, 6, 7, 8)

Figure 16.10 shows an example of toggle output.

In this example, TCNT has been designated as a periodic counter (with counter clearing on compare match B), and settings have been made so that the output is toggled by both compare match A and compare match B.

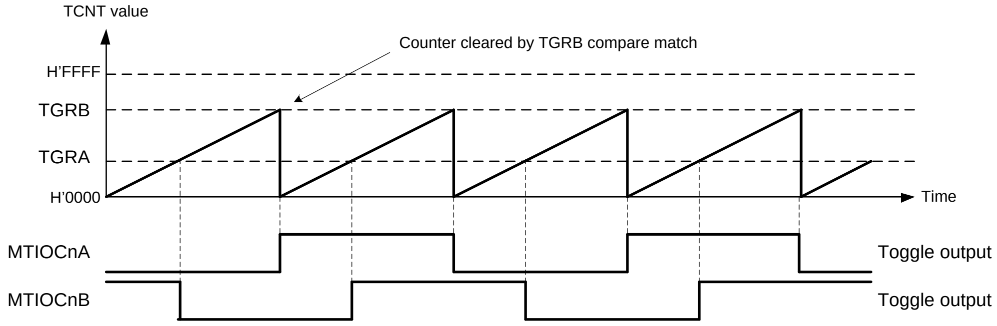

Figure 16.10 Example of Toggle Output Operation (n = 0 to 4, 6, 7, 8)

(3) Input Capture Function

The TCNT value can be transferred to TGR on detection of the MTIOCnm, MTIC5U, MTIC5V, or MTIC5W pin (n = 0 to 4, 6, 7, 8; m = A to D), input edge.

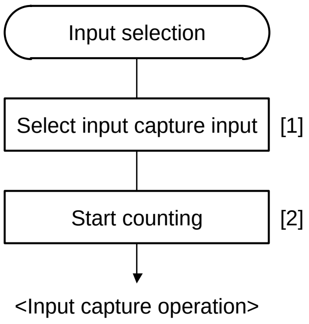
The rising edge, falling edge, or both edges can be selected as the detection edge. For MTU0 and MTU1, another channel’s count clock or compare match signal can also be specified as the input capture source.

NOTE

When another channel’s count clock is used as the input capture input for MTU0 and MTU1, P0ϕ/1 should not be selected as the count clock used for input capture input. Input capture will not be generated if P0ϕ/1 is selected.

(a) Example of Input Capture Operation Setting Procedure

Figure 16.11 shows an example of the input capture operation setting procedure.



[1] Designate TGR as an input capture register by means of TIOR, and select rising edge, falling edge, or both edges as the input capture source and input signal edge.

[2] Set the CSTn bit in TSTRA, TSTRB or MTU5.TSTR to 1 to start the count operation.

Figure 16.11 Example of Input Capture Operation Setting Procedure

(b) Example of Input Capture Operation

Figure 16.12 shows an example of input capture operation.

In this example, both rising and falling edges have been selected as the MTIOCnA pin input capture input edge, the falling edge has been selected as the MTIOCnB pin input capture input edge, and counter clearing by TGRB input capture has been designated for TCNT. (n = 0 to 4, 6, 7, 8)

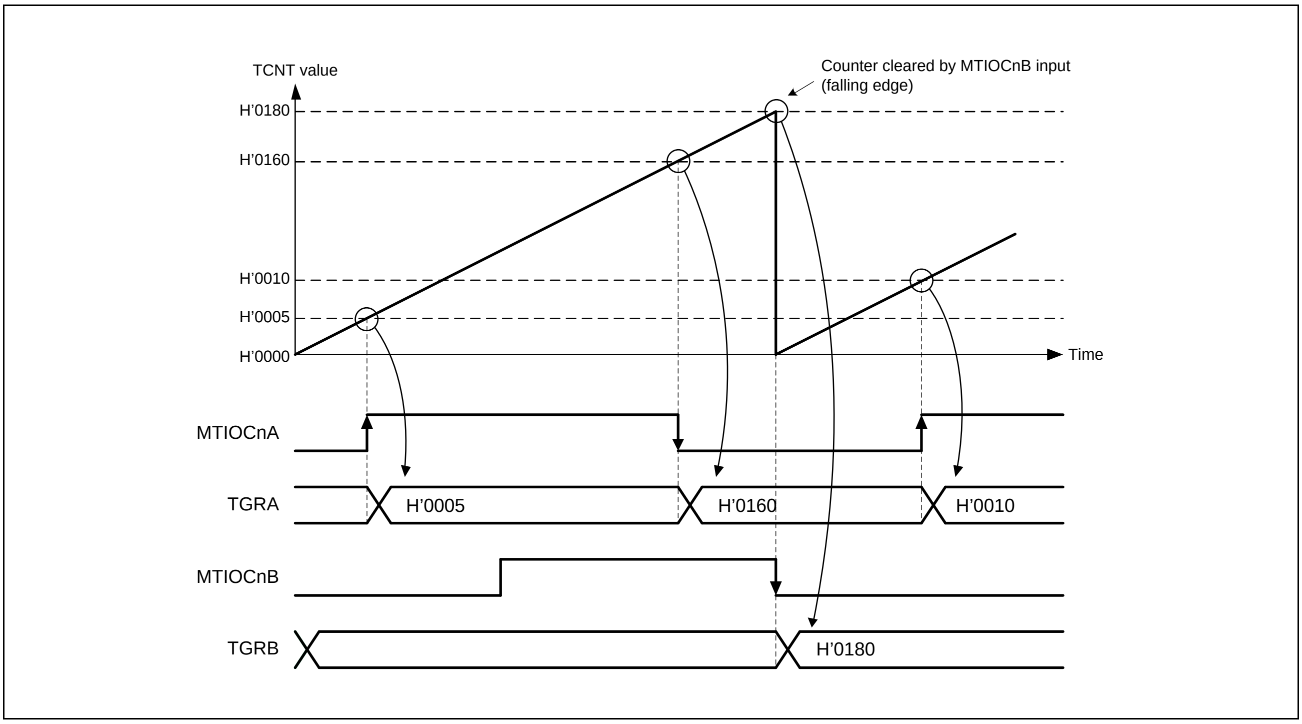


Figure 16.12 Example of Input Capture Operation (n = 0 to 4, 6, 7, 8)

16.3.2 Synchronous Operation

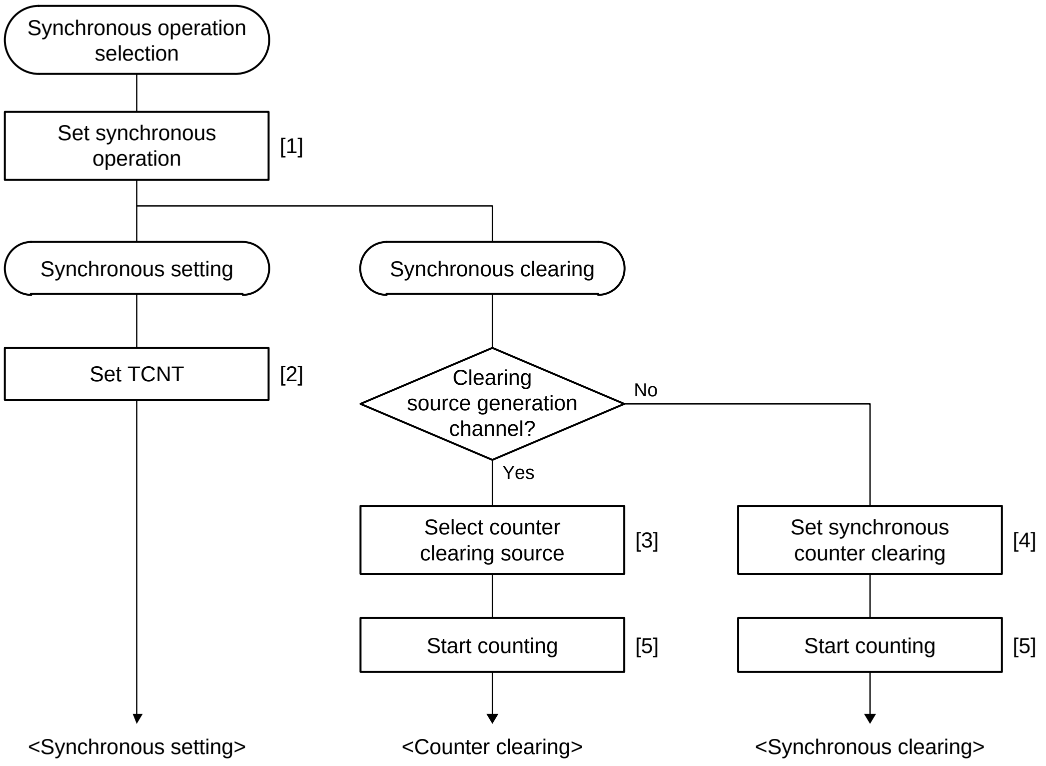
In synchronous operation, the values in multiple TCNT counters can be modified simultaneously (synchronous setting). In addition, multiple TCNT counters can be cleared simultaneously (synchronous clearing) by making the appropriate setting in TCR.

Synchronous operation can increase the number of TGR registers assigned to the same time base.

MTU0 to MTU4, MTU6, and MTU7 can all be designated for synchronous operation. MTU5 and MTU8 cannot be used for synchronous operation.

(1) Example of Synchronous Operation Setting Procedure

Figure 16.13 shows an example of the synchronous operation setting procedure.



[1] Set to 1 in the SYNC bits in TSYRA and TSYRB corresponding to the channels to be designated for synchronous operation.
[2] When the TCNT counter of any of the channels designated for synchronous operation is written to, the same value is simultaneously written to the other TCNT counters.
[3] Use the CCLR[2:0] bits in TCR to specify TCNT clearing by input capture/output compare, etc.
[4] Use the CCLR[2:0] bits in TCR to designate synchronous clearing for the counter clearing source.
[5] Set to 1 in the CSTn bits in TSTRA and TSTRB for the relevant channels, to start the count operation.

Figure 16.13 Example of Synchronous Operation Setting Procedure

(2) Example of Synchronous Operation

Figure 16.14 shows an example of synchronous operation.

In this example, synchronous operation and PWM mode 1 have been designated for MTU0 to MTU 2, MTU0.TGRB compare match has been set as the counter clearing source in MTU0, and synchronous clearing has been set for the counter clearing source in MTU1 and MTU2.

Three-phase PWM waveforms are output from pins MTIOC0A, MTIOC1A, and MTIOC2A. At this time, synchronous setting and synchronous clearing by MTU0.TGRB compare match are performed for the TCNT counters in MTU0 to MTU2, and the data set in MTU0.TGRB is used as the PWM cycle.

For details of PWM modes, see **Section 16.3.5, PWM Modes**.

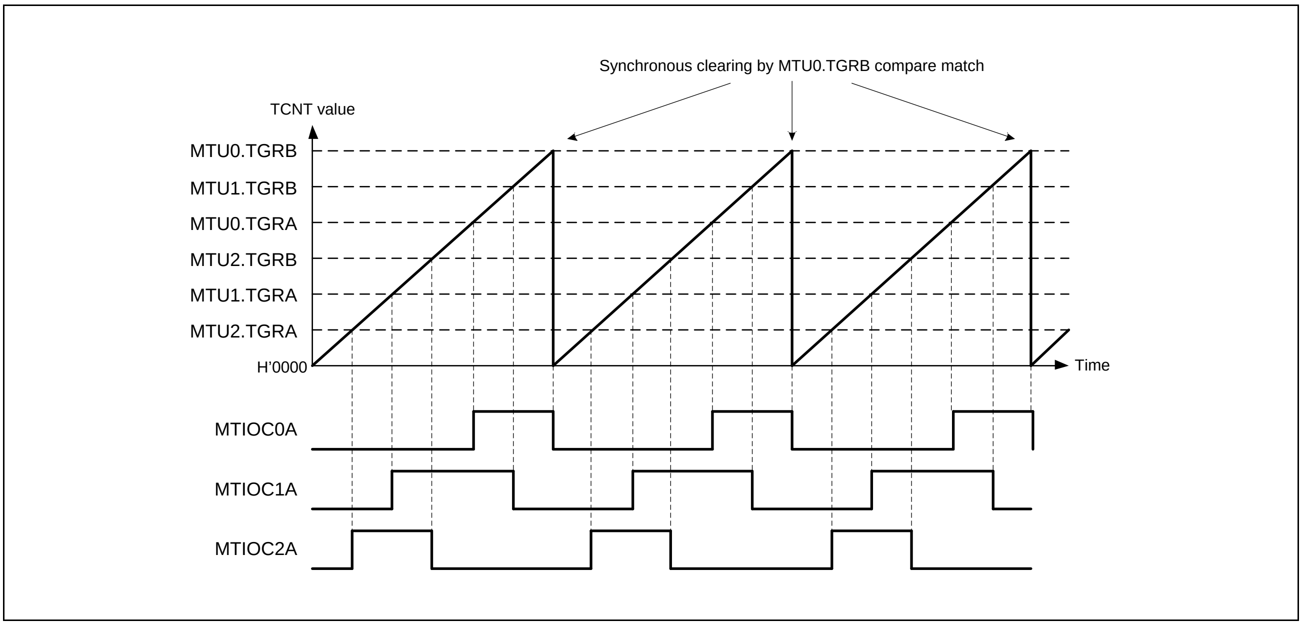


Figure 16.14 Example of Synchronous Operation

16.3.3 Buffer Operation

Buffer operation, provided for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8, enables TGRC and TGRD to be used as buffer registers. In MTU0, TGRF can also be used as a buffer register.

Buffer operation differs depending on whether TGR has been designated as an input capture register or as a compare match register.

NOTE

MTU0.TGRE cannot be designated as an input capture register and can only operate as a compare match register.

Table 16.62 shows the register combinations used in buffer operation.

Table 16.62 Register Combinations in Buffer Operation

Channel	Timer General Register	Buffer Register
MTU0	TGRA	TGRC
	TGRB	TGRD
	TGRE	TGRF
MTU3	TGRA	TGRC
	TGRB	TGRD
MTU4	TGRA	TGRC
	TGRB	TGRD
MTU6	TGRA	TGRC
	TGRB	TGRD
MTU7	TGRA	TGRC
	TGRB	TGRD
MTU8	TGRA	TGRC
	TGRB	TGRD

When TGR is an output compare register

When a compare match occurs, the value in the buffer register for the corresponding channel is transferred to the timer general register.

This operation is illustrated in **Figure 16.15**.

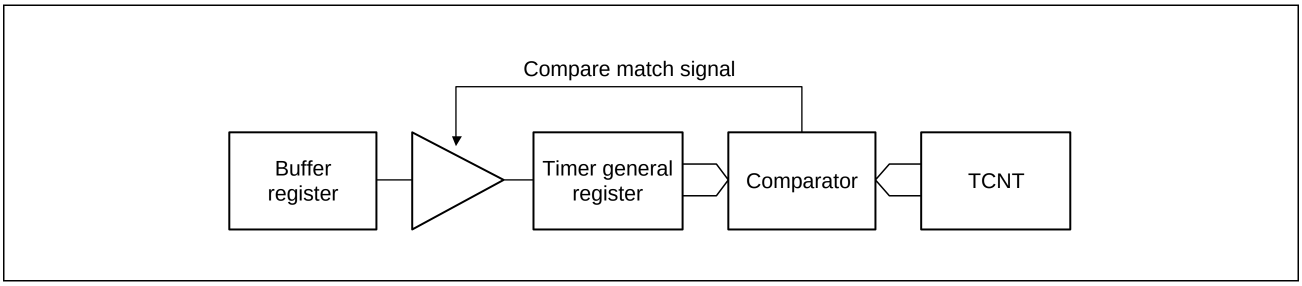

Figure 16.15 Compare Match Buffer Operation

When TGR is an input capture register

When an input capture occurs, the value in TCNT is transferred to TGR and the value previously held in TGR is transferred to the buffer register.

This operation is illustrated in **Figure 16.16**.

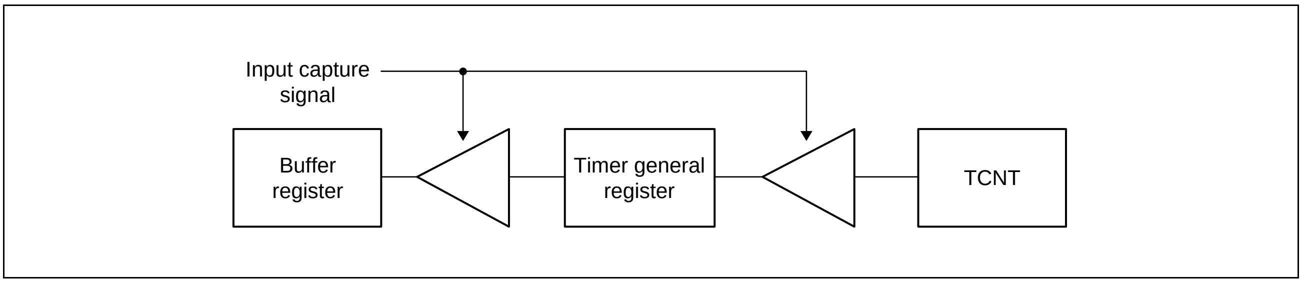

Figure 16.16 Input Capture Buffer Operation

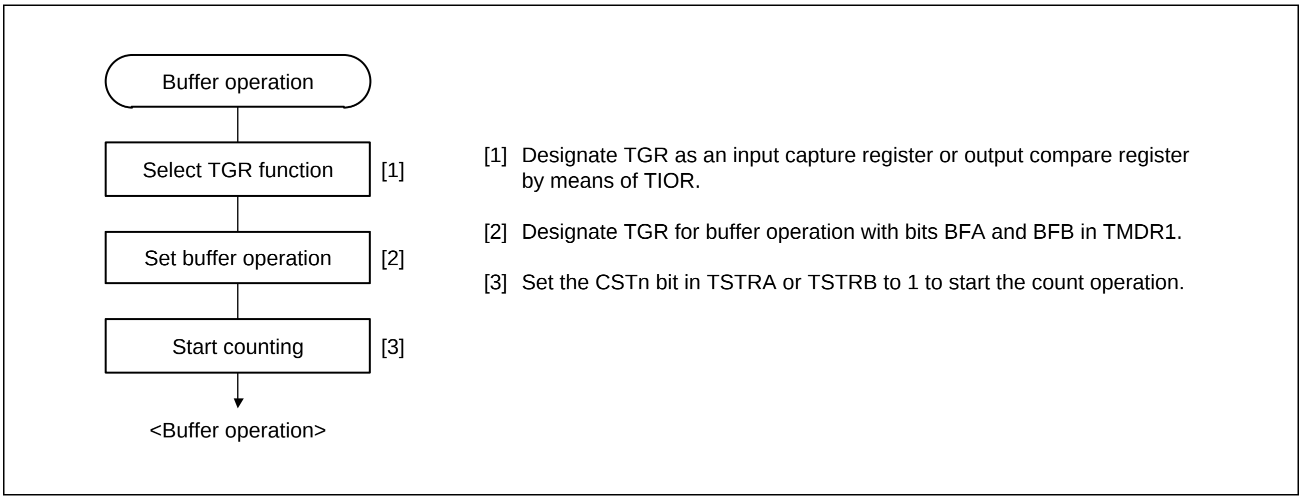
(1) Example of Buffer Operation Setting Procedure

Figure 16.17 shows an example of the buffer operation setting procedure.



[1] Designate TGR as an input capture register or output compare register by means of TIOR.

[2] Designate TGR for buffer operation with bits BFA and BFB in TMDR1.

[3] Set the CSTn bit in TSTRA or TSTRB to 1 to start the count operation.

Figure 16.17 Example of Buffer Operation Setting Procedure

(2) Examples of Buffer Operation

(a) When TGR is an Output Compare Register

Figure 16.18 shows an operation example in which PWM mode 1 has been designated for MTU0, and buffer operation has been designated for TGRA and TGRC. The settings used in this example are TCNT clearing by compare match B, high output at compare match A, and low output at compare match B. In this example, the TTSA bit in TBTM is cleared to 0.

As buffer operation has been set, when compare match A occurs, the output changes and the value in buffer register TGRC is simultaneously transferred to timer general register TGRA. This operation is repeated each time compare match A occurs.

For details of PWM modes, see **Section 16.3.5, PWM Modes**.

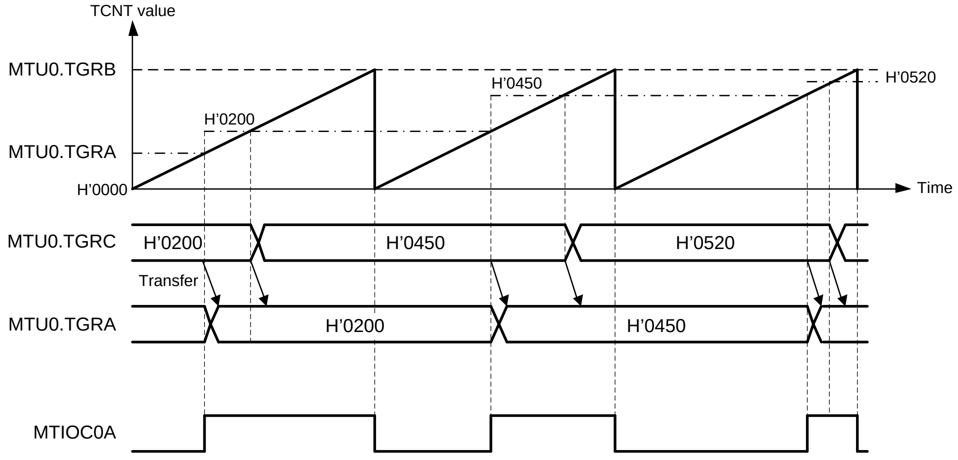


Figure 16.18 Example of Buffer Operation (1)

(b) When TGR is an Input Capture Register

Figure 16.19 shows an operation example in which TGRA has been designated as an input capture register, and buffer operation has been designated for TGRA and TGRC.

Counter clearing by TGRA input capture has been set for TCNT, and both rising and falling edges have been selected as the MTIOCnA pin input capture input edge. (n = 0 to 4, 6, 7, 8)

As buffer operation has been set, when the TCNT value is transferred to TGRA upon occurrence of input capture A, the value previously stored in TGRA is simultaneously transferred to TGRC.

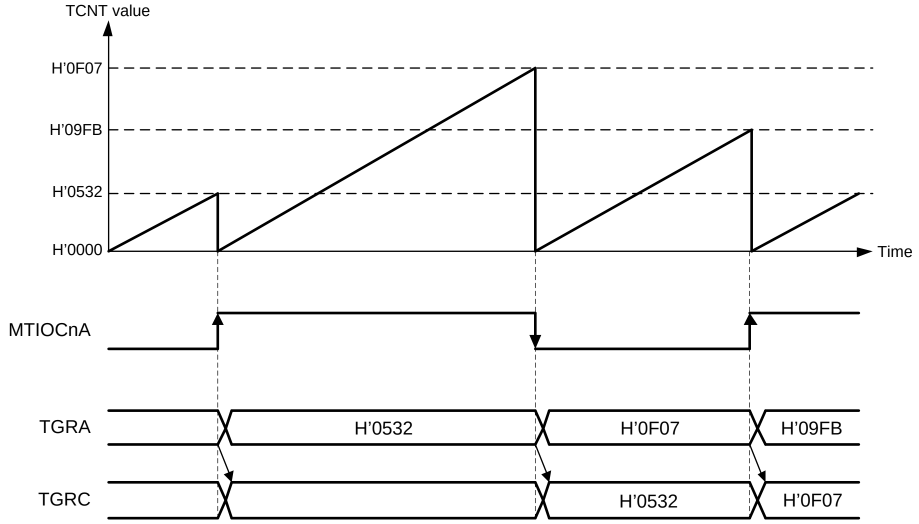

Figure 16.19 Example of Buffer Operation (2) (n = 0 to 4, 6, 7, 8)

(3) Selecting Timing for Transfer from Buffer Registers to Timer General Registers in Buffer Operation

The timing for transfer from buffer registers to timer general registers can be selected in PWM mode 1 or 2 for MTU0 or in PWM mode 1 for MTU3, MTU4, MTU6, and MTU7 by setting the buffer operation transfer mode registers (MTUn.TBTM (n = 0, 3, 4, 6, 7)). Either compare match (value after reset) or TCNT clearing can be selected for the transfer timing. TCNT clearing as transfer timing is one of the following cases.

- When TCNT overflows (H’FFFF to H’0000)
- When H’0000 is written to TCNT during counting
- When TCNT is cleared to H’0000 under the condition specified in the CCLR[2:0] bits in TCR

NOTE

TBTM must be modified only while TCNT stops.

Figure 16.20 shows an operation example in which PWM mode 1 is designated for MTU0 and buffer operation is designated for MTU0.TGRA and MTU0.TGRC. The settings used in this example are MTU0.TCNT clearing by compare match B, high output at compare match A, and low output at compare match B. The TTSA bit in MTU0.TBTM is set to 1.

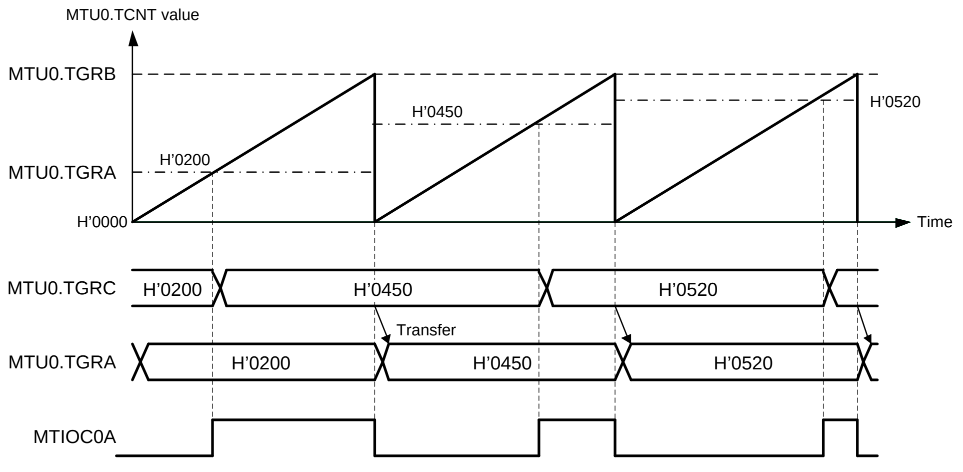

Figure 16.20 Example of Buffer Operation When MTU0.TCNT Clearing is Selected for MTU0.TGRC to MTU0.TGRA Transfer Timing

16.3.4 Cascaded Operation

In cascaded operation, two 16-bit counters in different channels are used together as a 32-bit counter.

There are two functions for connecting MTU1 and MTU2 to use as a 32-bit counter: cascade connection to be set when the MTU1.TMDR3.LWA bit is 0, and cascade connection 32-bit phase counting mode to be set when the MTU1.TMDR3.LWA bit is 1. For details on cascade connection 32-bit phase counting mode, refer to **Section 16.3.6.2, Cascade Connection 32-Bit Phase Counting Mode**. This section describes the cascade connection function to be set when the MTU1.TMDR3.LWA bit is 0.

This function works when the LWA bit of TMDR3 in MTU1 is set to 0 and the TPSC[2:0] bits of TCR in MTU1 are set so that TCNT in MTU1 counts at an overflow/underflow of TCNT in MTU2.

Underflow occurs only when the MTU2 to which the lower 16 bits allocated is in phase counting mode.

Table 16.63 shows the register combinations used in cascaded operation.

NOTE

When phase counting mode is set for MTU1, the count clock setting is invalid and the counters operate independently in phase counting mode.

Table 16.63 Cascaded Combinations

Combination	Upper 16 Bits	Lower 16 Bits
MTU1 and MTU2	MTU1.TCNT	MTU2.TCNT

For simultaneous input capture of MTU1.TCNT and MTU2.TCNT during cascaded operation, additional input capture input pins can be specified by the input capture control register (TICCR). The input-capture condition is of edges in the signal produced by taking the logical OR of the input level on the main input pin and the input level on the added input pin. Accordingly, if either is at the high level, a change in the level of the other will not produce an edge for detection. For details, see **Section 16.3.4(4), Cascaded Operation Example (c)**. For input capture in cascade connection, refer to **Section 16.6.20, Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection**.

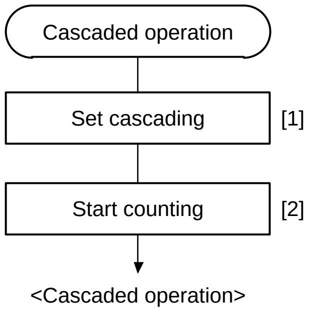
Table 16.64 shows the TICCR setting and input capture input pins.

Table 16.64 TICCR Setting and Input Capture Input Pins

Target Input Capture	TICCR Setting	Input Capture Input Pin
Input capture from MTU1.TCNT to MTU1.TGRA	I2AE bit = 0 (Initial value)	MTIOC1A
	I2AE bit = 1	MTIOC1A, MTIOC2A
Input capture from MTU1.TCNT to MTU1.TGRB	I2BE bit = 0 (Initial value)	MTIOC1B
	I2BE bit = 1	MTIOC1B, MTIOC2B
Input capture from MTU2.TCNT to MTU2.TGRA	I1AE bit = 0 (Initial value)	MTIOC2A
	I1AE bit = 1	MTIOC2A, MTIOC1A
Input capture from MTU2.TCNT to MTU2.TGRB	I1BE bit = 0 (Initial value)	MTIOC2B
	I1BE bit = 1	MTIOC2B, MTIOC1B

(1) Example of Cascaded Operation Setting Procedure

Figure 16.21 shows an example of the cascaded operation setting procedure.



[1] Set the TPSC[2:0] bits in TCR to 111b in MTU1 to select counting at a TCNT overflow/underflow in MTU2.

[2] Set the CSTn bits in TSTRA for the upper and lower channels to 1 to start the count operation.

Figure 16.21 Cascaded Operation Setting Procedure

(2) Cascaded Operation Example (a)

Figure 16.22 shows the operation when MTU1.TCNT is set for counting at MTU2.TCNT overflow/underflow and MTU2 is set for phase counting mode 1 while MTU1.TCNT and MTU2.TCNT are cascaded.

MTU1.TCNT is incremented by MTU2.TCNT overflow and decremented by MTU2.TCNT underflow.

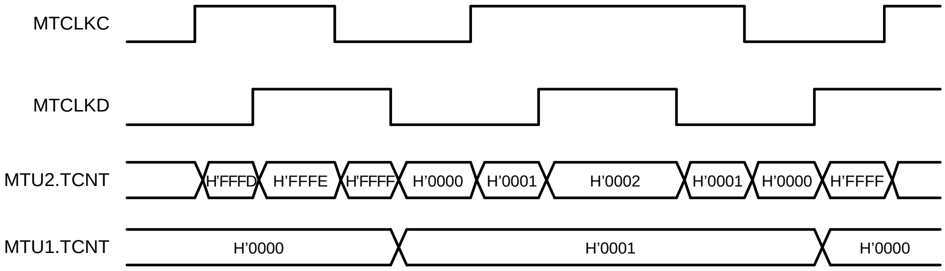


Figure 16.22 Cascaded Operation Example (a)

(3) Cascaded Operation Example (b)

Figure 16.23 illustrates the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the I2AE bit in TICCR has been set to 1 to include the MTIOC2A pin in the MTU1.TGRA input capture conditions. In this example, the MTU1.TIOR.IOA[3:0] bits have selected the MTIOC1A rising edge for the input capture timing while the MTU2.TIOR.IOA[3:0] bits have selected the MTIOC2A rising edge for the input capture timing.

Under these conditions, the rising edge of both MTIOC1A and MTIOC2A is used for the MTU1.TGRA input capture condition. For the MTU2.TGRA input capture condition, the MTIOC2A rising edge is used.

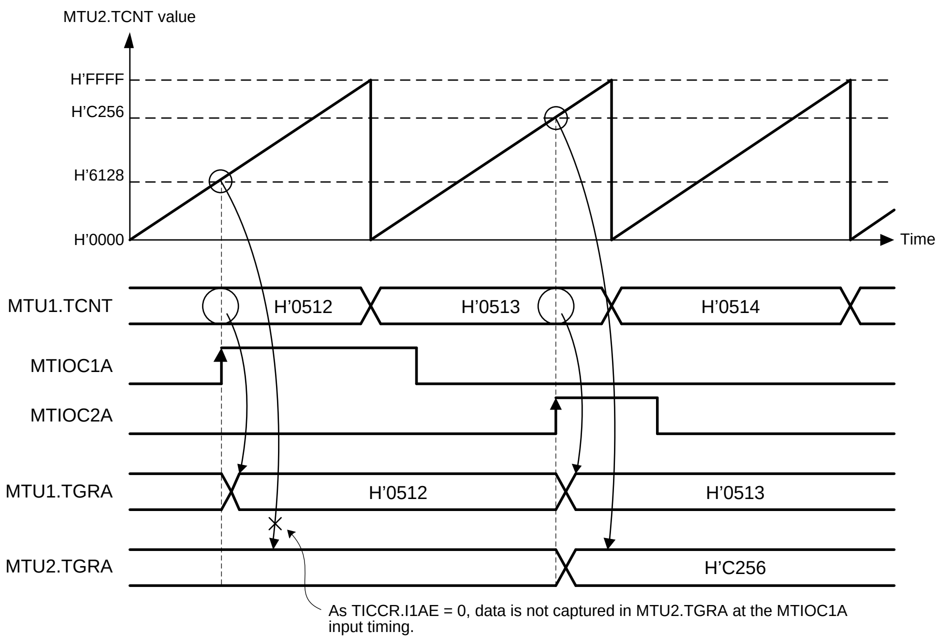

Figure 16.23 Cascaded Operation Example (b)

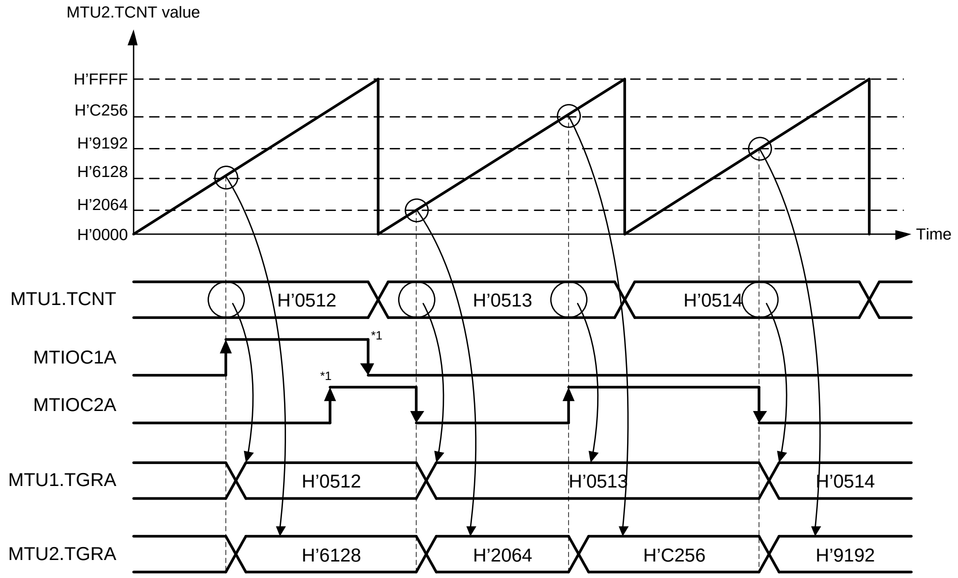
(4) Cascaded Operation Example (c)

Figure 16.24 illustrates the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the TICCR.I2AE and I1AE bits have been set to 1 to include the MTIOC2A and MTIOC1A pins in the MTU1.TGRA and MTU2.TGRA input capture conditions, respectively. In this example, the IOA[3:0] bits in both MTU1.TIOR and MTU2.TIOR have selected both the rising and falling edges for the input capture timing. Under these conditions, the ORed result of MTIOC1A and MTIOC2A input is used for the MTU1.TGRA and MTU2.TGRA input capture conditions.



Note 1. When either of the input signals is driven high, the selected edge of the other cannot act as the input capture condition.

Figure 16.24 Cascaded Operation Example (c)

(5) Cascaded Operation Example (d)

Figure 16.25 illustrates the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the TICCR.I2AE bit has been set to 1 to include the MTIOC2A pin in the MTU1.TGRA input capture conditions. In this example, the IOA[3:0] bits in MTU1.TIOR have selected occurrence of MTU0.TGRA compare match or input capture for the input capture timing while the IOA[3:0] bits in MTU2.TIOR have selected the MTIOC2A rising edge for the input capture timing.

Under these conditions, as MTU1.TIOR has selected occurrence of MTU0.TGRA compare match or input capture for the input capture timing, the MTIOC2A edge is not used for MTU1.TGRA input capture condition although the I2AE bit in TICCR has been set to 1.

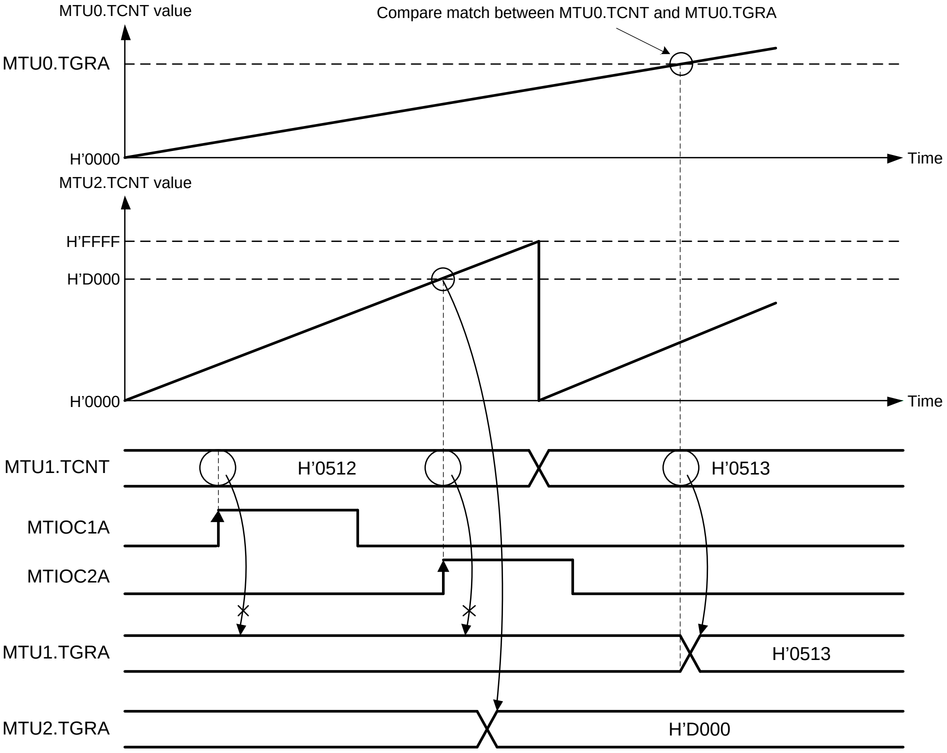


Figure 16.25 Cascaded Operation Example (d)

16.3.5 PWM Modes

PWM modes are provided to output PWM waveforms from the external pins. The output level can be selected as low, high, or toggle output in response to a compare match of each TGR.

PWM waveforms in the range of 0% to 100% duty cycle can be output according to the TGR settings.

By designating TGR compare match as the counter clearing source, the PWM cycle can be specified in that register. Every channel except MTU5 and MTU8 can be set to PWM mode independently. Synchronous operation is also possible between the channels placed in PWM mode or between a channel in PWM mode and another channel in a different mode.

There are two PWM modes as described below.

PWM Mode 1

PWM waveforms are output from the MTIOCnA and MTIOCnC pins by pairing TGRA with TGRB and TGRC with TGRD. The levels specified by the TIOR.IOA[3:0] and IOC[3:0] bits are output from the MTIOCnA and MTIOCnC pins at compare matches A and C, and the level specified by the TIOR.IOB[3:0] and IOD[3:0] bits are output at compare matches B and D (n = 0 to 4, 6, 7). The initial output value is set in TGRA or TGRC. If the values set in paired TGRs are identical, the output value does not change even when a compare match occurs.

In PWM mode 1, PWM waveforms in up to 12 phases can be output.

PWM Mode 2

PWM waveform output is generated using one TGR as the cycle register and the others as duty registers. The level specified in TIOR is output at compare matches. Upon counter clearing by a cycle register compare match, the initial value set in TIOR is output from each pin. If the values set in the cycle and duty registers are identical, the output value does not change even when a compare match occurs.

In PWM mode 2, up to eight phases of PWM waveforms can be output when synchronous clearing is used as synchronous operation in the channels that cannot be placed in PWM mode 2.

The correspondence between PWM output pins and registers is shown in **Table 16.65**.

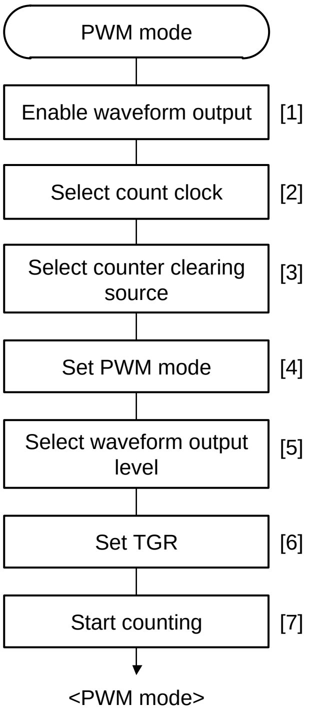
Table 16.65 PWM Output Registers and Output Pins

		Output Pins	
Channel	Register	PWM Mode 1	PWM Mode 2
MTU0	TGRA	MTIOC0A	MTIOC0A
	TGRB		MTIOC0B
	TGRC	MTIOC0C	MTIOC0C
	TGRD		MTIOC0D
MTU1	TGRA	MTIOC1A	MTIOC1A
	TGRB		MTIOC1B
MTU2	TGRA	MTIOC2A	MTIOC2A
	TGRB		MTIOC2B
MTU3	TGRA	MTIOC3A	Setting prohibited
	TGRB		
	TGRC	MTIOC3C	
	TGRD		
MTU4	TGRA	MTIOC4A	
	TGRB		
	TGRC	MTIOC4C	
	TGRD		
MTU6	TGRA	MTIOC6A	
	TGRB		
	TGRC	MTIOC6C	
	TGRD		
MTU7	TGRA	MTIOC7A	
	TGRB		
	TGRC	MTIOC7C	
	TGRD		

Note: In PWM mode 2, PWM waveform output is not possible for the TGR register in which the PWM cycle is set.

(1) Example of PWM Mode Setting Procedure

Figure 16.26 shows an example of the PWM mode setting procedure.



[1] Enable TOERA output when outputting a waveform from the MTIOC pin of MTU3 and MTU4. Enable TOERB output when outputting a waveform from the MTIOC pin of MTU6 and MTU7.

[2] Select the count clock source with bits TPSC[2:0] in TCR. At the same time, select the input edge of the count clock source with bits CKEG[1:0] in TCR.

[3] Use bits CCLR[2:0] in TCR to select the TGR to be used as the TCNT clearing source.

[4] Select the PWM mode with bits MD[3:0] in TMDR.

[5] Use TIOR to designate the TGR as an output compare register, and select the initial value and output value.

[6] Set the cycle in the TGR selected in [3], and set the duty ratio in the other TGR.

[7] Set the CSTn bit in TSTRA or TSTRB to 1 to start the count operation.

Figure 16.26 Example of PWM Mode Setting Procedure

(2) Examples of PWM Mode Operation

Figure 16.27 shows an example of operation in PWM mode 1.

In this example, TGRA compare match is set as the TCNT clearing source, 0 is set as the initial output value and output value for TGRA, and 1 is set as the output value for TGRB.

In this case, the value set in TGRA is used as the cycle, and the value set in TGRB is used as the duty ratio.

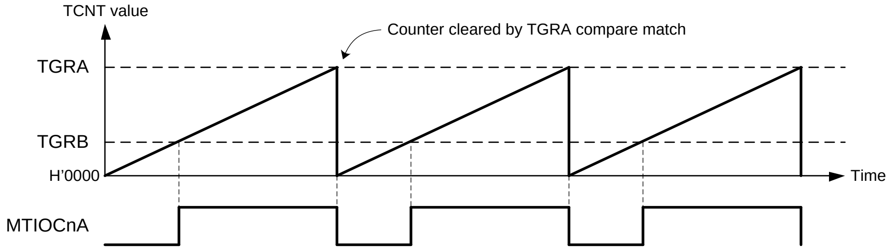


Figure 16.27 Example of PWM Mode 1 Operation (n = 0 to 4, 6, 7)

Figure 16.28 shows an example of operation in PWM mode 2.

In this example, synchronous operation is designated for MTU0 and MTU1, MTU1.TGRB compare match is set as the TCNT clearing source, and low is set as the initial output value and high as the output value for the other TGR registers (MTU0.TGRA to MTU0.TGRD and MTU1.TGRA), outputting 5-phase PWM waveforms.

In this case, the value set in MTU1.TGRB is used as the cycle, and the values set in the other TGRs are used as the duty ratio.

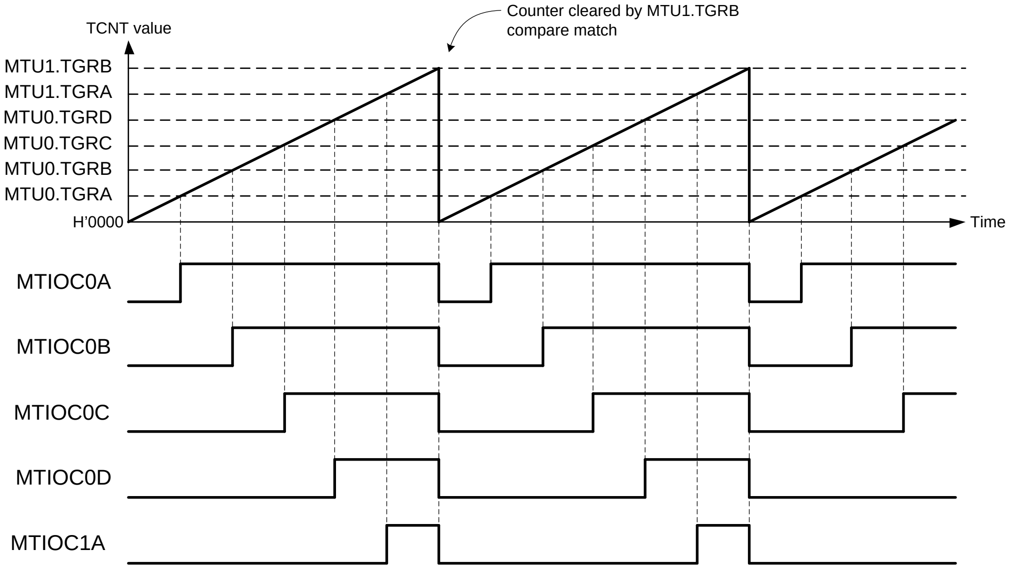

Figure 16.28 Example of PWM Mode 2 Operation

Figure 16.29 shows examples of PWM waveform output with 0% duty and 100% duty in PWM mode 1. In these examples, TGRA compare match is selected as the TCNT clearing source, the initial output value and the output value for TGRA are set to the low level, and the output value for TGRB is set to the high level.

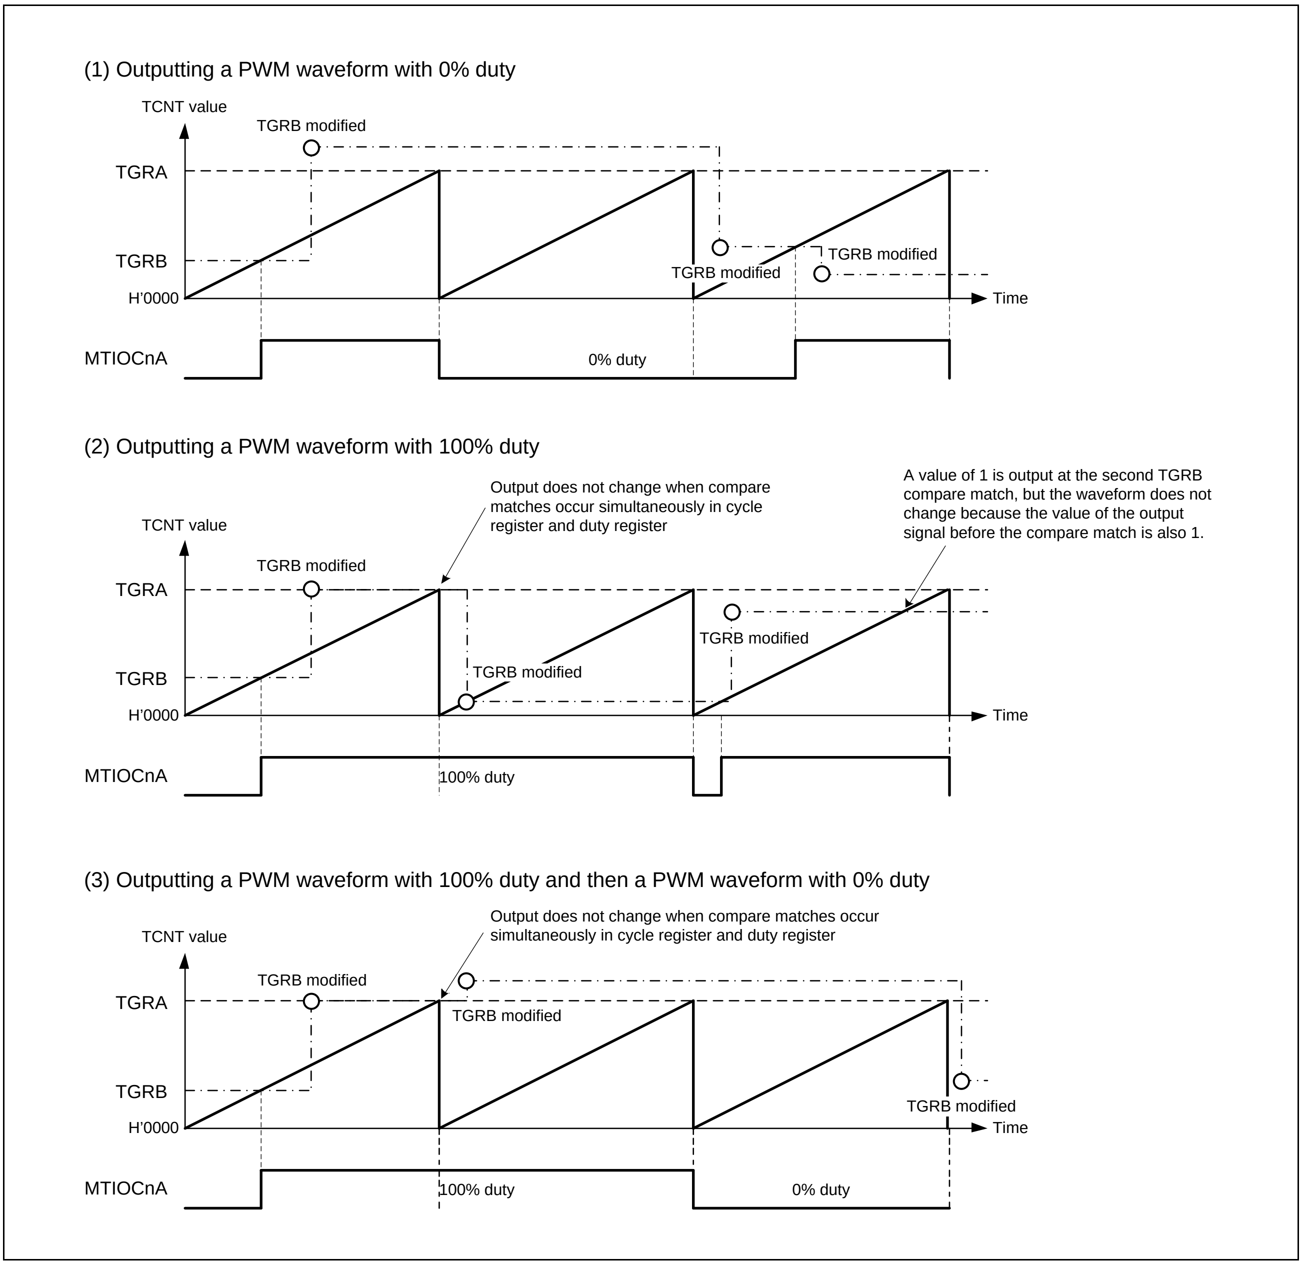

Figure 16.29 Examples of PWM Mode Operation (PWM Waveform Output with 0% Duty and 100% Duty) (n = 0 to 4, 6, 7)

16.3.6 Phase Counting Mode

There are two phase counting modes: 16-bit phase counting mode in which MTU1 and MTU2 operate independently, and cascade connection 32-bit phase counting mode in which MTU1 and MTU2 are cascaded.

In phase counting mode, the phase difference between two external input clocks is detected and the corresponding TCNT is incremented or decremented.

Two external clock input pins for each phase counting mode are not affected by the settings of TCR.TPSC[2:0], TCR2.TPSC2[2:0], and CKEG[1:0]. The two external clock input pins used in 16-bit phase counting mode and cascade connection 32-bit phase counting mode of MTU2 can be selected by MTU1.TMDR3.PHCKSEL. In a phase counting mode other than 16-bit phase counting mode and cascade connection 32-bit phase counting mode of MTU2, MTCLKA and MTCLKB are selected for A-phase and B-phase, respectively. In phase counting mode, the external clock pins MTCLKA, MTCLKB, MTCLKC, and MTCLKD are used for two-phase encoder pulse input.

Table 16.66 lists the external clock input pins to be connected in each phase counting mode.

Table 16.66 Clock Input Pins in Phase Counting Mode

Phase Counting Mode	TMDR3.PHCKSEL bit	External Clock Input Pins	
		A-Phase	B-Phase
MTU1 16-bit phase counting mode	x (Don’t care)	MTCLKA	MTCLKB
MTU2 16-bit phase counting mode	0	MTCLKA	MTCLKB
	1 (initial value)	MTCLKC	MTCLKD
Cascade connection 32-bit phase counting mode	0	MTCLKA	MTCLKB
	1 (initial value)	MTCLKC	MTCLKD

16.3.6.1 16-Bit Phase Counting Mode

When the MTU1.TMDR3.LWA is 0, 16-bit phase counting mode can be set individually for MTU1 and MTU2.

In 16-bit phase counting mode, the phase difference between two external input clocks is detected and the 16-bit counter TCNT of the corresponding channel is incremented or decremented.

When 16-bit phase counting mode is specified, an external clock is selected as the count clock and TCNT operates as an up-counter/down-counter regardless of the setting of TCR.TPSC[2:0], TCR2.TPSC2[2:0], and CKEG[1:0]. However, the functions of TCR.CCLR[1:0],TIOR, TIER, and TGR are enabled, and input capture/compare match and interrupt functions can be used.

These external input pins can be used for two-phase encoder pulse input.

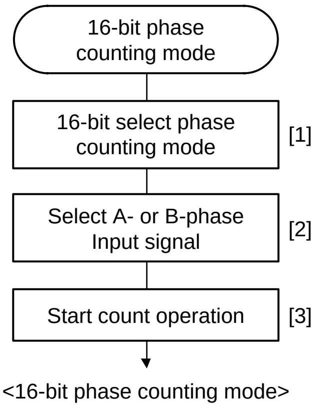
If an overflow occurs during TCNT up-counting, a TCIV interrupt is generated when the corresponding TCIEV bit in the TIER register is set to 1.

If an underflow occurs during TCNT down-counting, a TCIU interrupt is generated when the corresponding TCIEU bit in the TIER register is set to 1.

The TCFD bit in TSR is the count direction flag. Read the TCFD flag to check whether TCNT is counting up or down.

(1) Example of 16-Bit Phase Counting Mode Setting Procedure

Figure 16.30 shows an example of the phase counting mode setting procedure.



[1] Set the TMDR3.LWA bit of MTU1 to 0. Set the TMDR1.MD[3:0] bits to select the phase counting mode.

[2] When the MTU2 is set to phase counting mode, select the A- or B-phase input signal with the PHCKSEL bit in TMDR3. This setting is not necessary for MTU1 because MTCLKA and MTCLKB are always selected for A-phase and B-phase, respectively.

[3] Set the CSTn bit in TSTRA to 1 to start the count operation.

Figure 16.30 Example of 16-Bit Phase Counting Mode Setting Procedure

(2) Examples of 16-Bit Phase Counting Mode Operation

In phase counting mode, TCNT is incremented or decremented according to the phase difference between two external clocks. There are five modes according to the count conditions. Each mode operates under the condition PHCKSEL = 1, which means the phase clock for MTU1 is input from MTCLKA or MTCLKB and that for MTU2 is input from MTCLKC or MTCLKD.

(a) Phase Counting Mode 1

Figure 16.31 shows an example of operation in phase counting mode 1, and **Table 16.67** summarizes the TCNT up- counting and down-counting conditions.

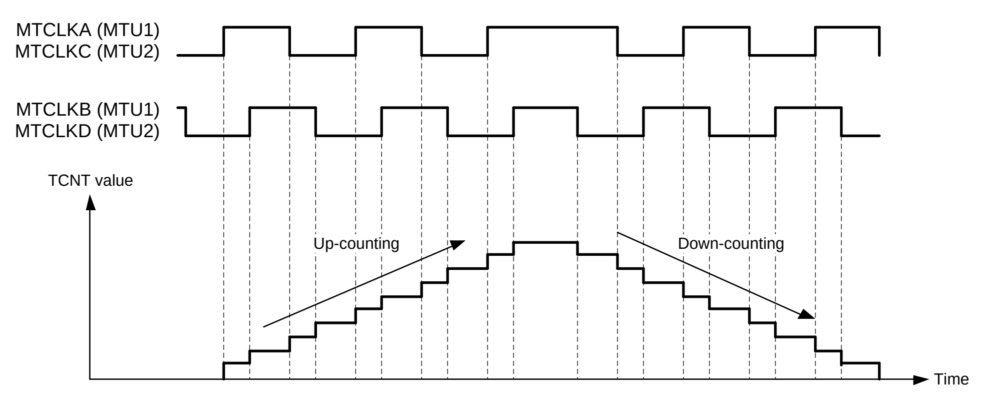


Figure 16.31 Example of Operation in Phase Counting Mode 1

Table 16.67 Up-Counting and Down-Counting Conditions in Phase Counting Mode 1

(3) 16-Bit Phase Counting Mode Application Example

Figure 16.41 shows an example in which MTU1 is in phase counting mode, and MTU1 is coupled with MTU0 to input 2-phase encoder pulses of a servo motor in order to detect position or speed.

MTU1 is set to phase counting mode 1, and the encoder pulse A-phase and B-phase are input to MTCLKA and MTCLKB.

In MTU0, MTU0.TGRC compare match is specified as the TCNT clearing source and MTU0.TGRA and MTU0.TGRC are used for the compare match function and are set with the speed control cycle and position control cycle.

MTU0.TGRB is used for input capture, with MTU0.TGRB and MTU0.TGRD operating in buffer mode. The MTU1 count clock is designated as the MTU0.TGRB input capture source, and the widths of 2-phase encoder 4-multiplication pulses are detected.

MTU1.TGRA and MTU1.TGRB for MTU1 are designated for the input capture function and MTU0.TGRA and MTU0.TGRC compare matches in MTU0 are selected as the input capture sources to store the up/down-counter values for the control cycles.

This procedure enables the accurate detection of position and speed.

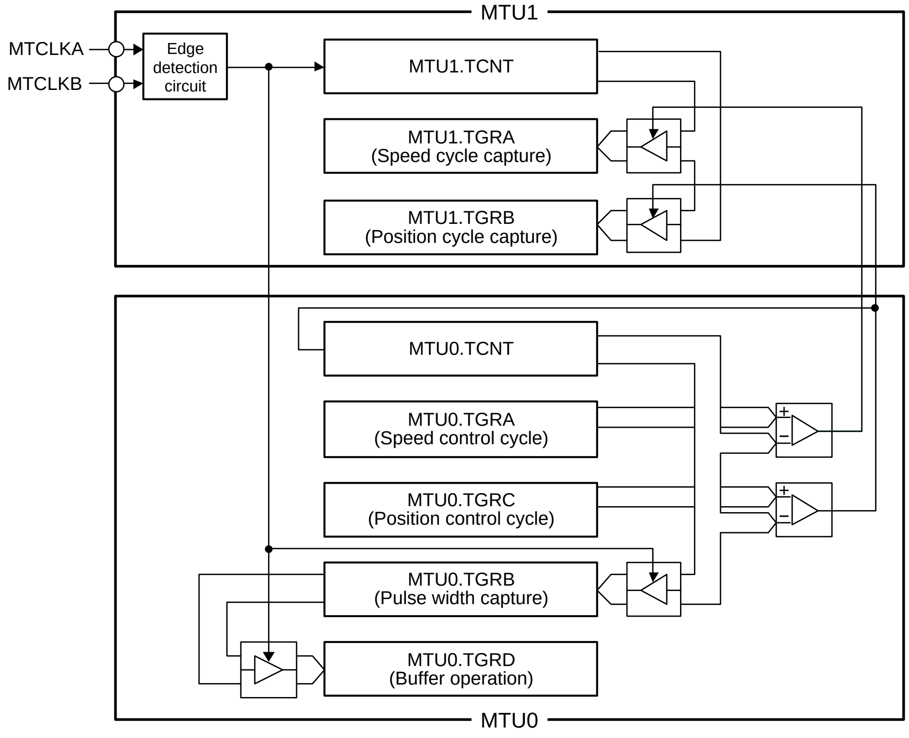

Figure 16.41 16-Bit Phase Counting Mode Application Example

16.3.6.2 Cascade Connection 32-Bit Phase Counting Mode

When MTU1 is set to phase counting mode by setting MTU1.TMDR3.LWA = 1, MTU1 and MTU2 are connected to operate in cascade connection 32-bit phase counting mode as shown in **Figure 16.42**. When this mode is used, the TCR, TCR2, TIOR, TIER, TGR, and TSR registers are controlled by MTU1 and the settings of MTU2 are disabled. See **Figure 16.43** for the procedure for setting cascade connection 32-bit phase counting mode.

In this mode, three-phase (A, B, and Z) signals can be input. As an encoder pulse signal, the external input phase clocks MTCLKA and MTCLKB or MTCLKC and MTCLKD can be selected for A-phase and B-phase, and MTIOC1A can be selected for Z-phase, respectively. See **Table 16.70** for selecting external clock input of A-phase and B-phase. A counter event is generated using an A-phase or B-phase pulse and counted by the 32-bit counter MTU1.TCNTLW.

An input capture can also be generated using a Z-phase signal; thus, an angular velocity can be measured using the value captured in the general register.

Furthermore, MTU8 can be used as a channel for measuring a 1-ms interval, and a compare match signal can be output at a 1-ms interval to the MTU1 and MTU2, which operate in cascade connection 32-bit phase counting mode. That is, a compare match signal of MTU8 is used as a capture signal of MTU1 and MTU2, and the number of A-phase and B-phase pulses for a 1-ms period can be measured.

When MTU0 or MTU5 is specified as the channel for measuring Z-phase signal pulses, this compare match signal of TGRC in MTU8 can be output as a capture signal or a clear signal to MTU0 or MTU5; thus, the Z-phase count can be measured at 1-ms intervals.

In addition, a counter event signal of combined MTU1 and MTU2 can be used as a capture signal of TGRD in MTU8, and measurement can be performed including the intervals of A, B, or both phase pulses. In this case, the TGRD register in MTU8 should be set to buffer operation.

Refer to **Section 16.3.4, Cascaded Operation**, for details on the cascade connection function for connecting MTU1 and MTU2 in a mode other than cascade connection 32-bit phase counting mode.

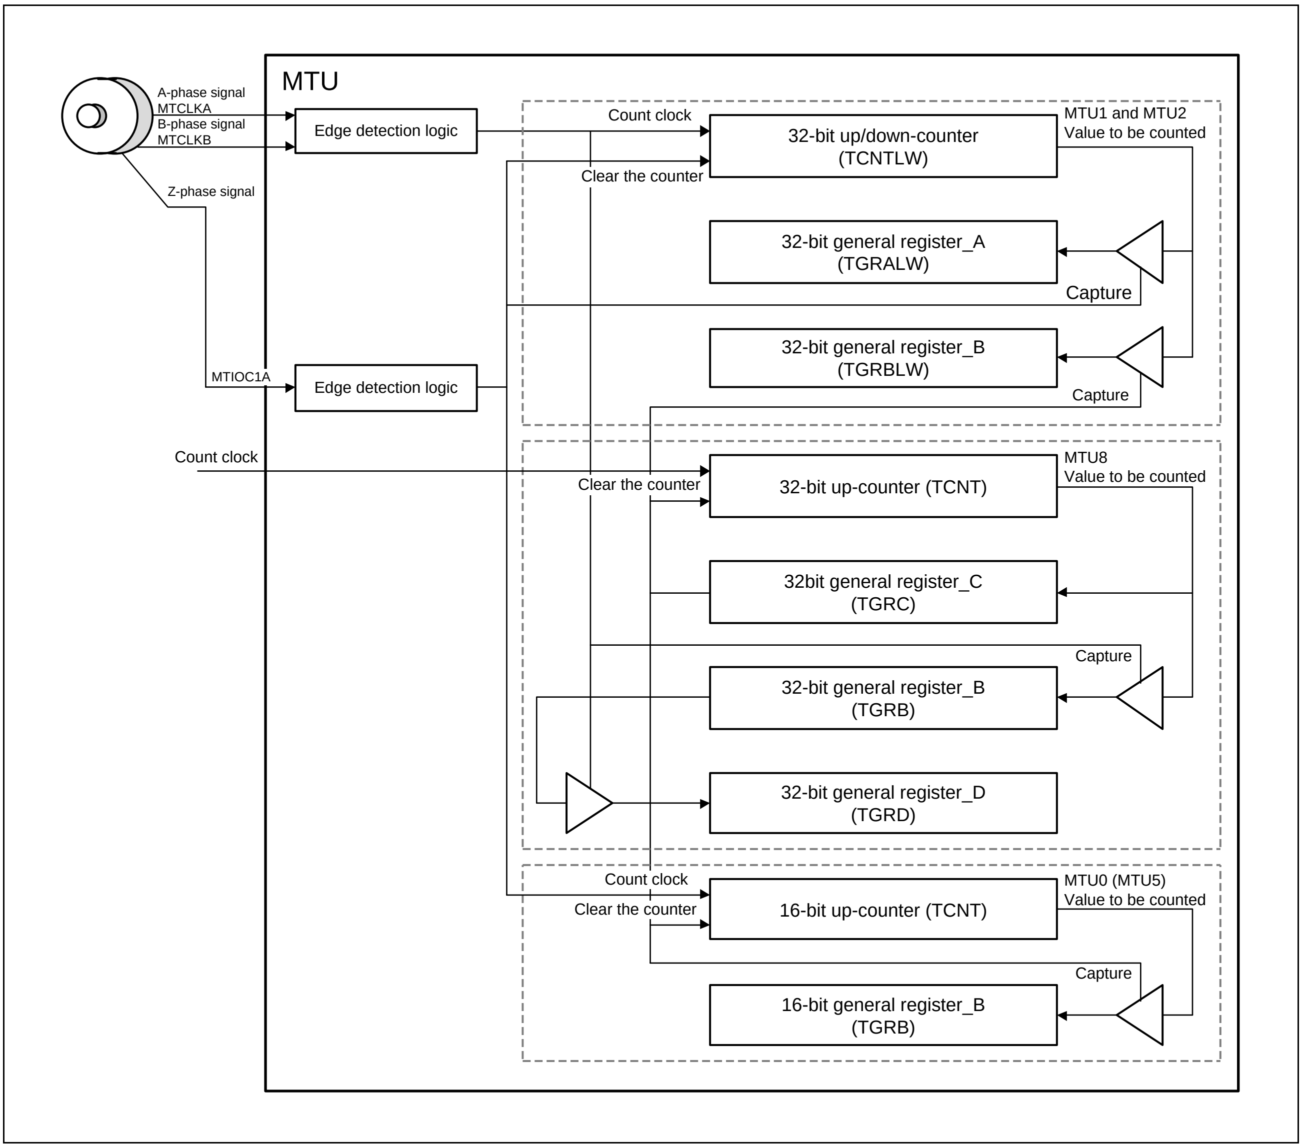

Figure 16.42 Block Diagram for Operation in Cascade Connection 32-Bit Phase Counting Mode

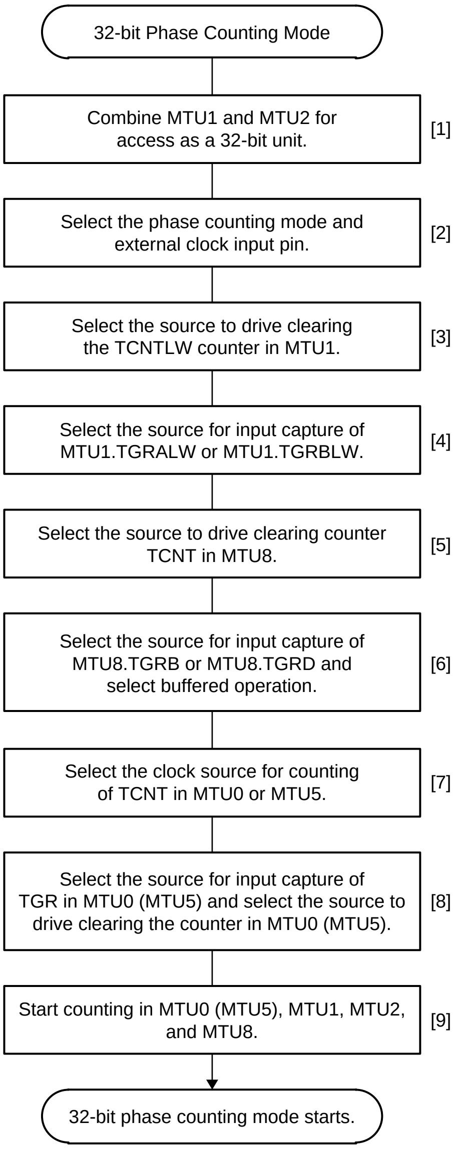
(1) Example of Setting Cascade Connection 32-Bit Phase Counting Mode

Figure 16.43 shows an example of the procedure for setting cascade connection 32-bit phase counting mode.



[1] Set the LWA bit in MTU1.TMDR3 to 1 and combine MTU1 and MTU3 for access as a 32-bit unit.*1

[2] Select phase counting mode with the MD[3:0] bits in MTU1.TMDR1 and select the external clock input pin with the PHCKSEL bits in MTU1.TMDR3.

[3] Set the CCLR[2:0] bits of TCR in MTU1 to 001b to select input capture of TGRALW in MTU1 as the source of the signal to drive clearing the TCNTLW counter in MTU1.

[4] Set the IOA[3:0] bits in MTU1.TIOR to select the effective edge (rising, falling or both) of the signal produced by input capture of TGRALW in MTU1. After that, set the IOB[3:0] bits in MTU1.TIOR to 1110b to select the compare match signal of MTU8.TGRC as the source to drive input capture of MTU1.TGRBLW.

[5] Set the CCLR[2:0] bits in MTU8.TCR to 101b to select the compare match signal of MTU8.TGRC as the source to drive clearing counter TCNT in MTU8.

[6] Select the source for input capture of MTU8.TGRB as the clock for counting of TCNTLW in MTU1 by setting the IOB[3:0] bits in MTU8.TIORH to 1110b. At the same time, select buffered operation for TGRB and TGRD by setting the BFB bit in MTU8.TMDR1 to 1.

[7] Set the TPSC2[2:0] bits in MTU0.TCR2 to 111b to select the MTIOC1A pin as the clock source for counting of TCNT in MTU0.
(When using TCNT in MTU5, set the TPSC2[2:0] bits in MTU5.TCR2 to 111b).

[8] Select the compare match signal of MTU8.TGRC as the source to drive input capture of MTU0.TGRA by setting the IOA[3:0] bits in MTU0.TIORH to 1110b. (When using TCNT in MTU5, set the TIORU, TIORV, or TIORW bit in MTU5 is set to 10100b).
After that, select input capture of MTU0.TGRA as the source to drive clearing counter TCNT in MTU0 by setting the CCLR[2:0] bits in MTU0.TCR to 001b.

[9] Start counting in MTU0, MTU1, MTU2, and MTU8 by setting the CST0, CST1, CST2, and CST8 bits in TSTRA to 1 at the same time.
(When using TCNT in MTU5, set the counter corresponding to TSTR in MTU5 to 1).

Note 1. When the LWA bit in MTU1.TMDR3 is set to 1, the TCR, TCR2, TMDR, and TIOR registers in MTU1 are effective in controlling cascaded operation. In this case, the settings of these registers in MTU2 are ignored.

Figure 16.43 Procedure for Setting Cascade Connection 32-Bit Phase Counting Mode

16.3.7 Reset-Synchronized PWM Mode

In the reset-synchronized PWM mode, three phases of positive and negative PWM waveforms (six phases in total) that share a common wave transition point can be output by combining MTU3 and MTU4 and MTU6 and MTU7.

When set for reset-synchronized PWM mode, the MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, and MTIOC7D pins function as PWM output pins and timer counters 6 and 12 (MTU3.TCNT and MTU6.TCNT) functions as an up-counter.

Table 16.72 shows the PWM output pins used. **Table 16.73** shows the settings of the registers.

Table 16.72 Output Pins for Reset-Synchronized PWM Mode

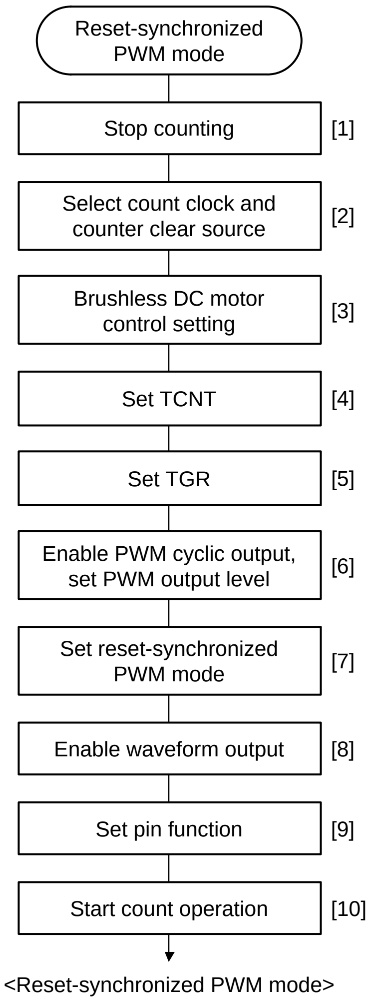
Channel	Output Pin	Description
MTU3	MTIOC3B	PWM output pin 1
	MTIOC3D	PWM output pin 1' (negative-phase waveform of PWM output 1)
MTU4	MTIOC4A	PWM output pin 2
	MTIOC4C	PWM output pin 2' (negative-phase waveform of PWM output 2)
	MTIOC4B	PWM output pin 3
	MTIOC4D	PWM output pin 3' (negative-phase waveform of PWM output 3)
MTU6	MTIOC6B	PWM output pin 4
	MTIOC6D	PWM output pin 4' (negative-phase waveform of PWM output 4)
MTU7	MTIOC7A	PWM output pin 5
	MTIOC7C	PWM output pin 5' (negative-phase waveform of PWM output 5)
	MTIOC7B	PWM output pin 6
	MTIOC7D	PWM output pin 6' (negative-phase waveform of PWM output 6)

Table 16.73 Register Settings for Reset-Synchronized PWM Mode

Register	Setting
MTU3.TCNT	Initial setting (H’0000)
MTU4.TCNT	Initial setting (H’0000)
MTU3.TGRA	Set the count cycle for MTU3.TCNT
MTU3.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC3B and MTIOC3D pins
MTU4.TGRA	Set the transition point of the PWM waveform to be output from the MTIOC4A and MTIOC4C pins
MTU4.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC4B and MTIOC4D pins
MTU6.TCNT	Initial setting (H’0000)
MTU7.TCNT	Initial setting (H’0000)
MTU6.TGRA	Set the count cycle for MTU6.TCNT
MTU6.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC6B and MTIOC6D pins
MTU7.TGRA	Set the transition point of the PWM waveform to be output from the MTIOC7A and MTIOC7C pins
MTU7.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC7B and MTIOC7D pins

(1) Example of Procedure for Setting Reset-Synchronized PWM Mode

Figure 16.44 shows an example of the procedure for specifying the reset-synchronized PWM mode.



[1] Clear the TSTRA.CST3 (TSTRB.CST6) and TSTRA.CST4 (TSTRB.CST7) bits to 0 to stop the TCNT count operation. Specify the reset-synchronized PWM mode while MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) are stopped.

[2] Set the TCR.TPSC[2:0] and TCR.CKEG[1:0] bits of MTU3 (MTU6) to select the count clock source and clock edge for MTU3 (MTU6). Set the TCR.CCLR[2:0] bits to select TGRA compare match as the counter clear source.

[3] To control a brushless DC motor, set the TGCRA.BDC bit and set the feedback signal input source and output chopping or gate signal direct output (only when MTU3 and MTU4 are used).

[4] Set MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) to H'0000.

[5] MTU3.TGRA (MTU6.TGRA) is the cycle register. Set the PWM cycle in MTU3.TGRA (MTU6.TGRA).
Set the PWM output transition timing in MTU3.TGRB (MTU6.TGRB), MTU4.TGRA (MTU7.TGRA), and MTU4.TGRB (MTU7.TGRB).
Note that the setting values should be within the range of compare match with MTU3.TCNT (MTU6.TCNT).

X ≤ MTU3.TGRA (X: Set value)

[6] Set the PSYE bit in the TOCR1A (TOCR1B) register to enable or disable toggle output synchronized with the PMW cycle, and set the OLSP and OLSN bits to select the PWM output level.
When specifying the PWM output level using the TOCR2A (TOCR2B) and TOLBRA (TOLBRB) in buffer operation, see Timer Output Level Buffer Registers (TOLBRA and TOLBRB).

[7] Set the MD[3:0] bits in MTU3.TMDR1 (MTU6.TMDR1) register to 1000b to select the reset-synchronized PWM mode. Specify the buffer operation (BFA = 1) of the MTU3.TGRA (MTU6.TGRA) register and the buffer operation (BFB = 1) of the MTU3.TGRB register when necessary. Set the MTU4.TMDR1 (MTU7.TMDR1) register to the initial value (normal operation; BFA = 0 and BFB = 0).

[8] Set the TOERA (TOERB) register to enable or disable output from the PWM output pin. Then, set the MTU3.TIORH (MTU6.TIORH), MTU3.TIORL (MTU6.TIORL), MTU4.TIORH (MTU7.TIORH), and MTU4.TIORL (MTU7.TIORL) registers to H'00.

[9] Set the port mode control registers (PMCn) and Pmn port fuction control reigister (PFCm) of the GPIO ports.

[10] Set the TSTRA.CST3 (TSTRB.CST6) bit to 1 to start count operation.

Note: The output waveform starts to toggle at the point of MTU3.TCNT (MTU6.TCNT) = MTU3.TGRA (MTU6.TGRA) = X by setting X = MTU3.TGRA (MTU6.TGRA), i.e., cycle = duty ratio.

Figure 16.44 Procedure for Selecting Reset-Synchronized PWM Mode

(2) Example of Reset-Synchronized PWM Mode Operation

Figure 16.45 shows an example of operation in the reset-synchronized PWM mode.

MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) operate as up-counters. The counters are cleared when a compare match occurs between MTU3.TCNT (MTU6.TCNT) and MTU3.TGRA (MTU6.TGRA), and then begin incrementing from H’0000. The output from the PWM pins toggles every time a compare match occurs in MTU3.TGRB (MTU6.TGRB), MTU4.TGRA (MTU7.TGRA), and MTU4.TGRB (MTU7.TGRB) and the counters are cleared.

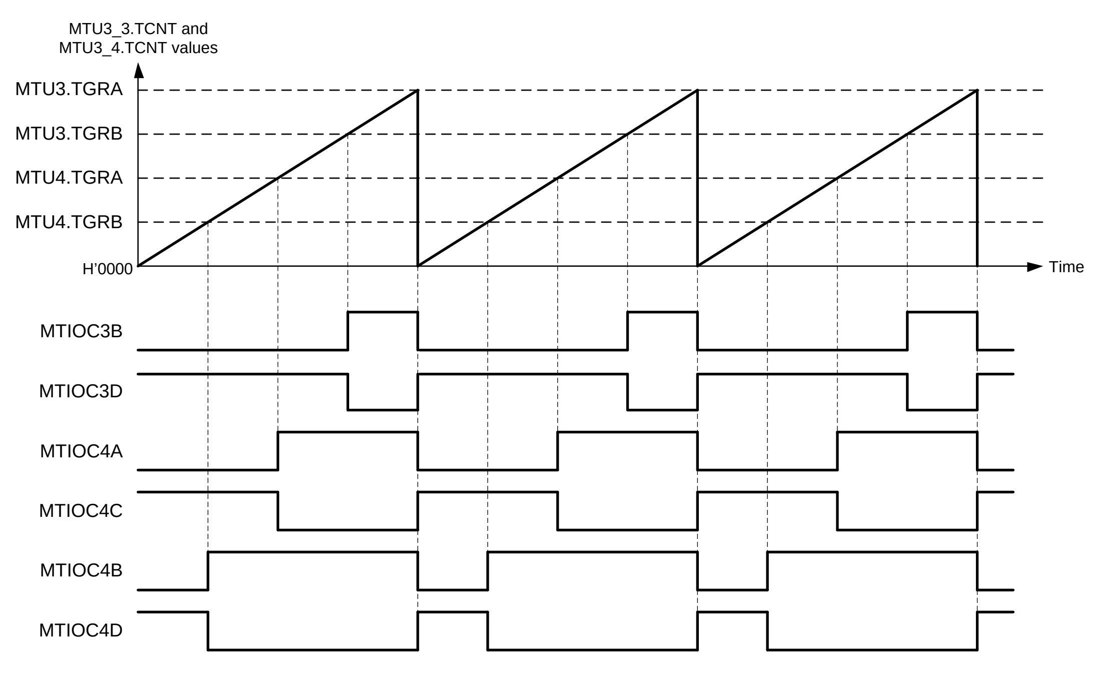


Figure 16.45 Example of Reset-Synchronized PWM Mode Operation
(When OLSN = 1 and OLSP = 1 in MTU3.TOCR1 and MTU4.TOCR1)

16.3.8 Complementary PWM Mode

In complementary PWM mode, dead time can be set for PWM waveforms to be output. The dead time is the period during which the upper and lower arm transistors are set to the inactive level in order to prevent short-circuiting of the arms.

Six positive-phase and six negative-phase PWM waveforms (12 phases in total) with dead time can be output by combining MTU3/ MTU4 and MTU6/MTU7. PWM waveforms without dead time can also be output.

In complementary PWM mode, MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D, MTIOC6B,

MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D pins function as PWM output pins, and the MTIOC3A and MTIOC6A pins can be set for toggle output synchronized with the PWM cycle.

MTU3.TCNT, MTU4.TCNT, MTU6.TCNT, and MTU7.TCNT function as up/down-counters.

Table 16.74 shows the PWM output pins used. **Table 16.75** shows the settings of the registers used.

A function to directly cut off the PWM output by using an external signal is supported as a port function.

Table 16.74 Output Pins for Complementary PWM Mode

Channel	Output Pin	Description
MTU3	MTIOC3A	Toggle output synchronized with PWM cycle (or I/O port)
	MTIOC3B	PWM output pin 1
	MTIOC3C	I/O port*1
	MTIOC3D	PWM output pin 1' (negative-phase waveform output of PWM output 1)
MTU4	MTIOC4A	PWM output pin 2
	MTIOC4C	PWM output pin 2' (negative-phase waveform output of PWM output 1)
	MTIOC4B	PWM output pin 3
	MTIOC4D	PWM output pin 3' (negative-phase waveform output of PWM output 1)
MTU6	MTIOC6A	Toggle output synchronized with PWM cycle (or I/O port)
	MTIOC6B	PWM output pin 4
	MTIOC6C	I/O port*1
	MTIOC6D	PWM output pin 4' (negative-phase waveform output of PWM output 4)
MTU7	MTIOC7A	PWM output pin 5
	MTIOC7C	PWM output pin 5' (negative-phase waveform output of PWM output 5)
	MTIOC7B	PWM output pin 6
	MTIOC7D	PWM output pin 6' (negative-phase waveform output of PWM output 6)

Note 1. Avoid setting the MTIOC3C and MTIOC6C pins as timer I/O pins in complementary PWM mode.

Table 16.75 Register Settings for Complementary PWM Mode (1/2)

Channel	Counter / Register	Description	Read/Write from CPU
MTU3	TCNT	Starts up-counting from the value set in the dead time register	Maskable by TRWERA setting*[1]
	TGRA	Set MTU3.TCNT upper limit value (1/2 carrier cycle + dead time)	Maskable by TRWERA setting*[1]
	TGRB	PWM output 1 compare register	Maskable by TRWERA setting*[1]
	TGRC	MTU3.TGRA buffer register	Readable/writable
	TGRD	PWM output 1/MTU3.TGRB buffer register	Readable/writable
	TGRE	MTU3.TGRB buffer register B (when double buffer function is used)	Readable/writable
MTU4	TCNT	Starts up-counting after being initialized to H'0000	Maskable by TRWERA setting*[1]
	TGRA	PWM output 2 compare register	Maskable by TRWERA setting*[1]
	TGRB	PWM output 3 compare register	Maskable by TRWERA setting*[1]
	TGRC	PWM output 2/MTU4.TGRA buffer register	Readable/writable
	TGRD	PWM output 3/MTU4.TGRB buffer register	Readable/writable
	TGRE	MTU4.TGRA buffer register B (when double buffer function is used)	Readable/writable
	TGRF	MTU4.TGRB buffer register B (when double buffer function is used)	Readable/writable
MTU6	TCNT	Starts up-counting from the value set in the dead time register	Maskable by TRWERB setting*[2]
	TGRA	Set MTU6.TCNT upper limit value (1/2 carrier cycle + dead time)	Maskable by TRWERB setting*[2]
	TGRB	PWM output 4 compare register	Maskable by TRWERB setting*[2]
	TGRC	MTU6.TGRA buffer register	Readable/writable
	TGRD	PWM output 4/MTU6.TGRB buffer register	Readable/writable
	TGRE	MTU6.TGRB buffer register B (when double buffer function is used)	Readable/writable
MTU7	TCNT	Starts up-counting after being initialized to H'0000	Maskable by TRWERB setting*[2]
	TGRA	PWM output 5 compare register	Maskable by TRWERB setting*[2]
	TGRB	PWM output 6 compare register	Maskable by TRWERB setting*[2]
	TGRC	PWM output 5/MTU7.TGRA buffer register	Readable/writable
	TGRD	PWM output 6/MTU7.TGRB buffer register	Readable/writable
	TGRE	MTU7.TGRA buffer register B (when double buffer function is used)	Readable/writable
	TGRF	MTU7.TGRB buffer register B (when double buffer function is used)	Readable/writable

Note 1. Access can be enabled or disabled according to the setting in TRWERA (timer read/write enable register A).

Note 2. Access can be enabled or disabled according to the setting in TRWERB (timer read/write enable register B).

Table 16.76 Register Settings for Complementary PWM Mode (2/2)

Counter / Register	Description	Read/Write from CPU
Timer dead time data register A (TDDRA)	Set MTU4.TCNT and MTU3.TCNT offset value (dead time value)	Maskable by TRWERA setting*[1]
Timer dead time data register B (TDDRB)	Set MTU7.TCNT and MTU6.TCNT offset value (dead time value)	Maskable by TRWERB setting*[2]
Timer cycle data register A (TCDRA)	Set MTU4.TCNT upper limit value (1/2 carrier cycle)	Maskable by TRWERA setting*[1]
Timer cycle data register B (TCDRB)	Set MTU7.TCNT upper limit value (1/2 carrier cycle)	Maskable by TRWERB setting*[2]
Timer cycle buffer register A (TCBRA)	TCDRA buffer register	Readable/writable
Timer cycle buffer register B (TCBRB)	TCDRB buffer register	Readable/writable
Subcounter A (TCNTSA)	Subcounter A for dead time generation	Read-only
Subcounter B (TCNTSB)	Subcounter B for dead time generation	Read-only
Temporary register 1A (TEMP1A)	PWM output 1/MTU3.TGRB temporary register A	Not readable or writable
Temporary register 1B (TEMP1B)	PWM output 1/MTU3.TGRB temporary register B (when double buffer function is used)	Not readable or writable
Temporary register 2A (TEMP2A)	PWM output 2/MTU4.TGRA temporary register A	Not readable or writable
Temporary register 2B (TEMP2B)	PWM output 2/MTU4.TGRA temporary register B (when double buffer function is used)	Not readable or writable
Temporary register 3A (TEMP3A)	PWM output 3/MTU4.TGRB temporary register A	Not readable or writable
Temporary register 3B (TEMP3B)	PWM output 3/MTU4.TGRB temporary register B (when double buffer function is used)	Not readable or writable
Temporary register 4A (TEMP4A)	PWM output 4/MTU6.TGRB temporary register A	Not readable or writable
Temporary register 4B (TEMP4B)	PWM output 4/MTU6.TGRB temporary register B (when double buffer function is used)	Not readable or writable
Temporary register 5A (TEMP5A)	PWM output 5/MTU7.TGRA temporary register A	Not readable or writable
Temporary register 5B (TEMP5B)	PWM output 5/MTU7.TGRA temporary register B (when double buffer function is used)	Not readable or writable
Temporary register 6A (TEMP6A)	PWM output 6/MTU7.TGRB temporary register A	Not readable or writable
Temporary register 6B (TEMP6B)	PWM output 6/MTU7.TGRB temporary register B (when double buffer function is used)	Not readable or writable

Note 1. Access can be enabled or disabled according to the setting in TRWERA (timer read/write enable register A).

Note 2. Access can be enabled or disabled according to the setting in TRWERB (timer read/write enable register B).

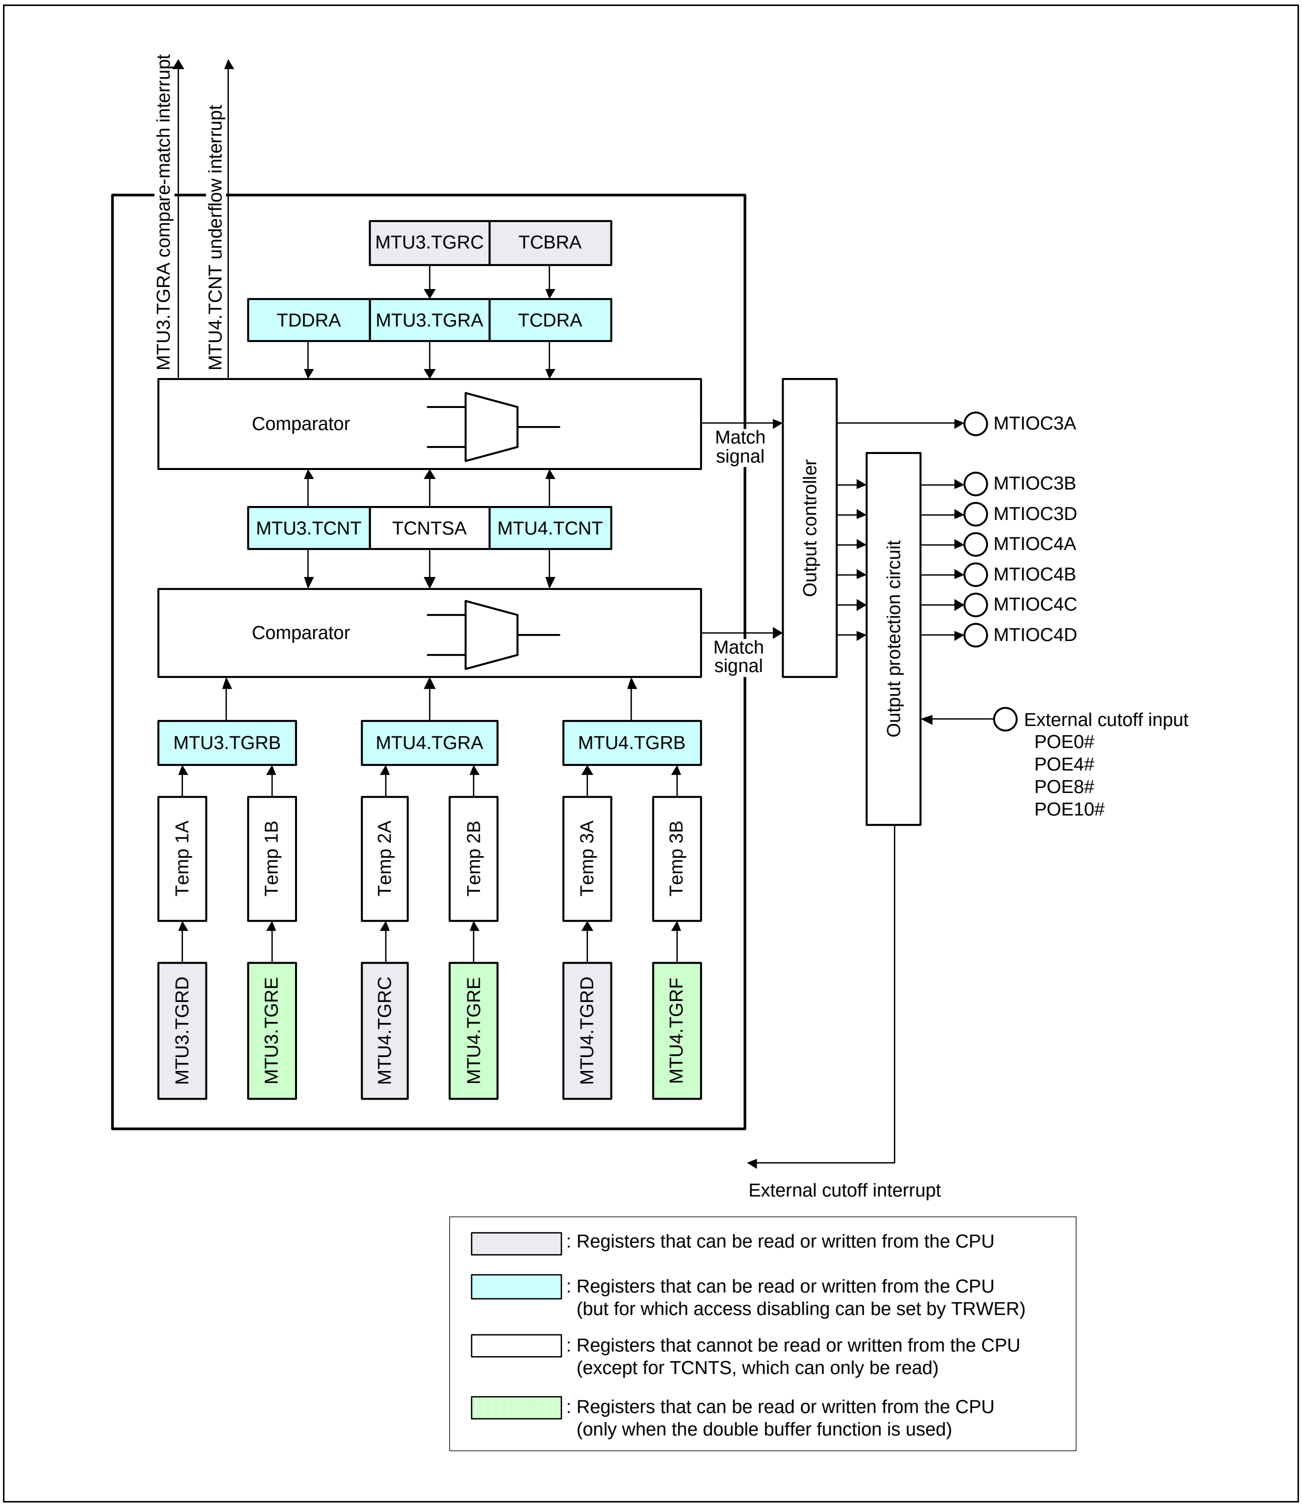

Figure 16.46 Block Diagram of MTU3 and MTU4 in Complementary PWM Mode

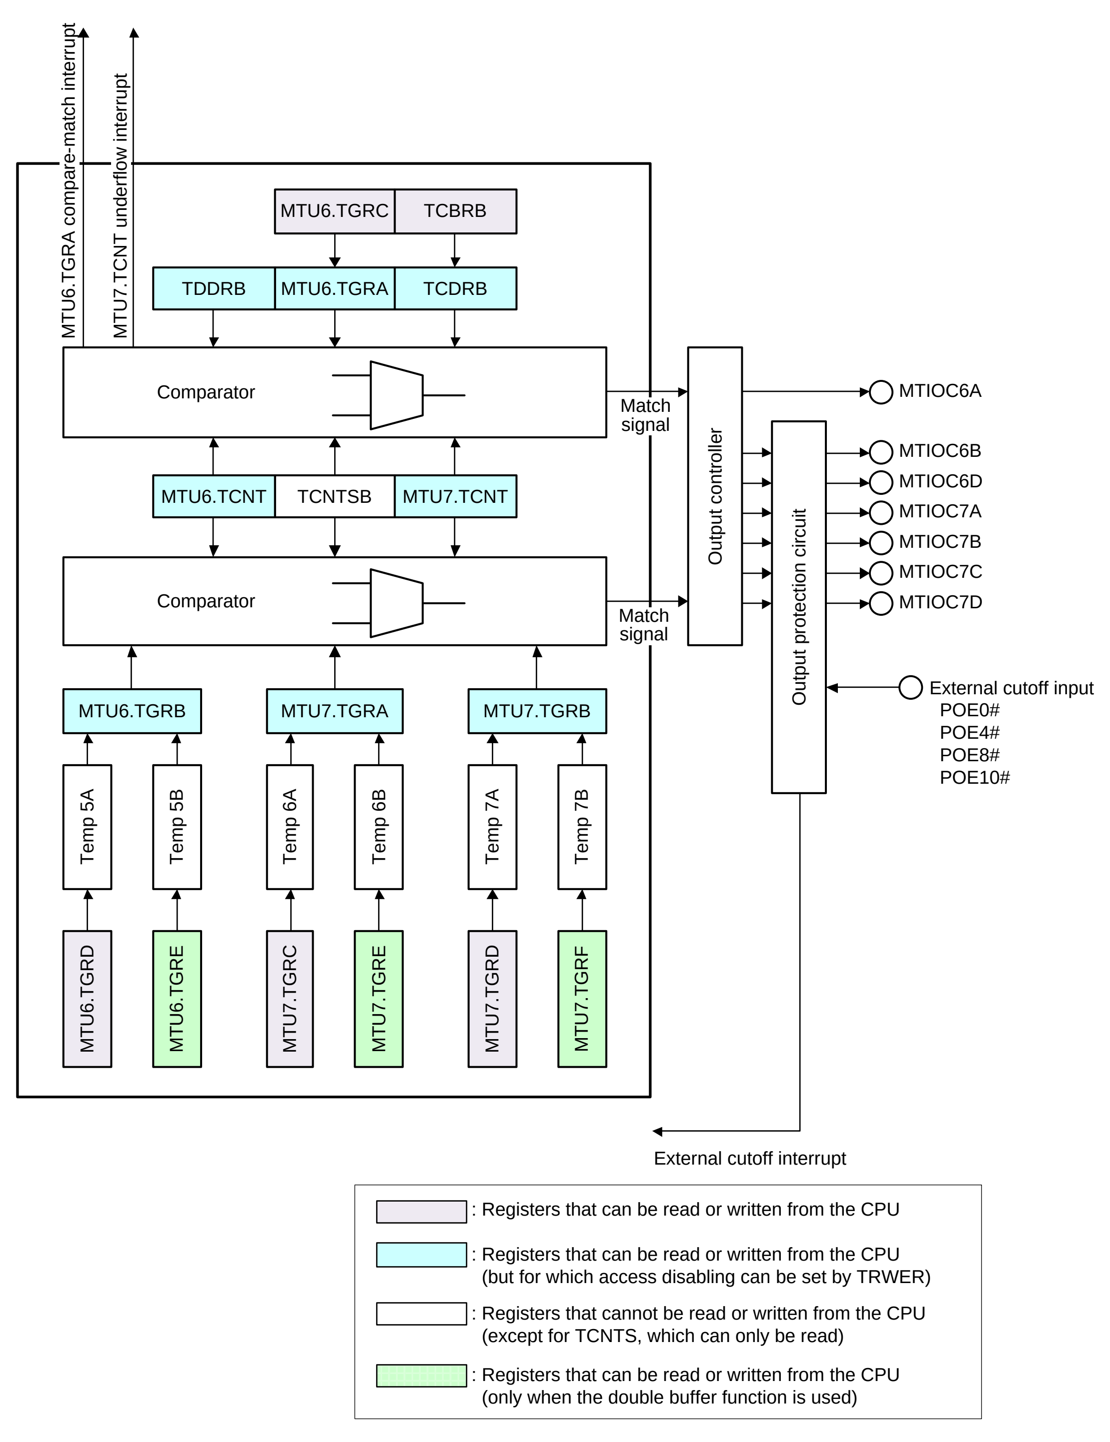

Figure 16.47 Block Diagram of MTU6 and MTU7 in Complementary PWM Mode

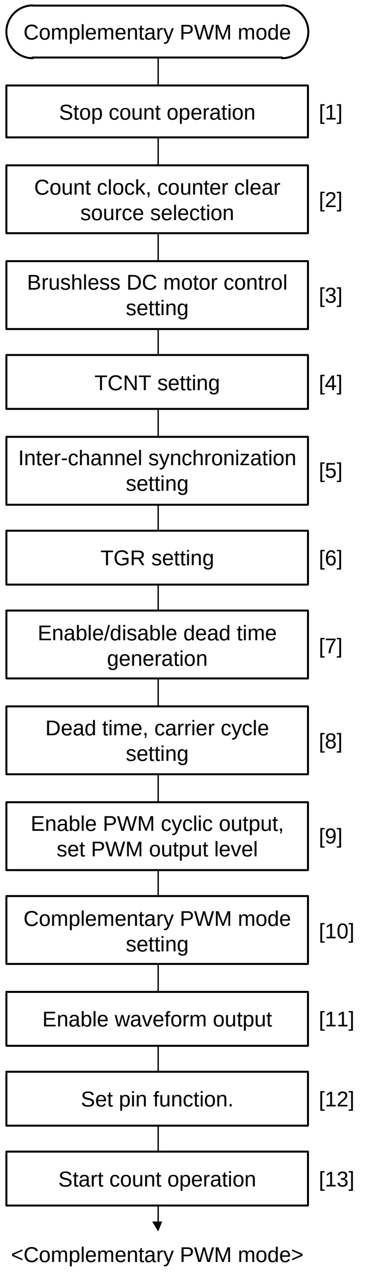
(1) Example of Complementary PWM Mode Setting Procedure

Figure 16.48 shows an example of the complementary PWM mode setting procedure.



[1] Clear the TSTRA.CST3 (TSTRB.CST6) and TSTRA.CST4 (TSTRB.CST7) bits to 0 to stop the TCNT count operation.
Specify complementary PWM mode while MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) are stopped.

[2] Set the TCR.TPSC[2:0] and TCR.CKEG[1:0] bits of MTU3 and MTU4 (MTU6 and MTU7) to select the same count clock source and clock edge for MTU3 and MTU4 (MTU6 and MTU7).
Set the TCR.CCLR[2:0] bits only when restarting by synchronous clearing with another channel during complementary PWM operation.

[3] To control a brushless DC motor, set the TGCRA.BDC bit and set the feedback signal input source and output chopping or gate signal direct output (only when MTU3 and MTU4 are used).

[4] Set the dead time in MTU3.TCNT (MTU6.TCNT). Set MTU4.TCNT (MTU7.TCNT) to H'0000.

[5] Make this setting only when restarting by synchronous clearing with another channel during complementary PWM mode operation. In this case, set the TSYRA register (TSYRB) to synchronize the channel generating the synchronous clear with MTU3 and MTU4 (MTU6 and MTU7).

[6] When MTU3 and MTU6 are used, set the PWM output duty ratio in the duty registers (MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB) and buffer registers (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD).
Be sure to set the same value in each pair of the duty registers (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD) and buffer registers (MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB).
Only when the double buffer function is used, set the PWM output duty value − 1 in the buffer registers (MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF).
When MTU6 and MTU7 are used, set the value to the following registers:
Duty registers (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB)
Buffer registers (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD)
Buffer registers when the double buffer function is used (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF)

[7] This setting is necessary only when no dead time should be generated. Make appropriate settings in the TDERA (TDERB) register so that no dead time generated.

[8] Set the dead time in the TDDRA (TDDRB) register, 1/2 the PWM cycle in the TCDRA (TCDRB) register and TCBRA (TCBRB) register, and 1/2 the PWM cycle plus the dead time in MTU3.TGRA (MTU6.TGRA) and MTU3.TGRC (MTU6.TGRC).
When no dead time generation is selected, set 1 in the TDDRA (TDDRB) register and 1/2 the PWM cycle + 1 in MTU3.TGRA (MTU6.TGRA) and MTU3.TGRC (MTU6.TGRC).

[9] Set the PSYE bit in the TOCR1A register to enable or disable toggle output synchronized with the PWM cycle, and set the OLSP and OLSN bits to select the PWM output level. When specifying the PWM output level using the TOCR2A (TOCR2B) and TOLBRA (TOLBRA) in buffer operation, see Timer Output Level Buffer Registers (TOLBRA and TOLBRB).

[10] Select complementary PWM mode in MTU3.TMDR1 (MTU6.TMDR1). Specify the buffer operation (BFA = 1) of MTU3.TGRA (MTU6.TGRA) and the buffer operation (BFB = 1) of MTU3.TGRB (MTU6.TGRB).
Only when the double buffer function is used, set the TMDR2A (TMDR2B) register to enable the double buffer function.

[11] Set the TOERA (TOERB) register to enable or disable output from the PWM output pin. Then, set the MTU3.TIORH (MTU6.TIORH), MTU3.TIORL (MTU6.TIORL), MTU4.TIORH (MTU7.TIORH), and MTU4.TIORL (MTU7.TIORL) to H'00.

[12] Set the port mode registers (PMn) and Pmn port function control register (PFCm) of the GPIO ports.

[13] Set the TSTRA.CST3 (TSTRB.CST6) and TSTRA.CST4 (TSTRB.CST7) bits to 1 simultaneously to start count operation.

Figure 16.48 Example of Complementary PWM Mode Setting Procedure

(2) Outline of Complementary PWM Mode Operation

In complementary PWM mode, six phases (three positive and three negative) PWM waveforms can be output. **Figure 16.49** illustrates counter operation in complementary PWM mode (MTU3 and MTU4), and **Figure 16.50** shows an example of operation in complementary PWM mode.

(a) Counter Operation

In complementary PWM mode, three counters — MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) — in each unit perform up-/down-count operations.

MTU3.TCNT (MTU6.TCNT) is automatically initialized to the value set in TDDRA (TDDRB) when complementary PWM mode is selected and the CST3 bit in TSTRA (TSTRB) is 0. When the CST3 bit is set to 1, MTU3.TCNT (MTU6.TCNT) counts up to the value set in MTU3.TGRA (MTU6.TGRA), then switches to down-counting when it matches MTU3.TGRA (MTU6.TGRA). When the MTU4.TCNT (MTU7.TCNT) value matches H’0000, MTU3.TCNT (MTU6.TCNT) switches to up-counting, and the operation is repeated in this way.

TCNT in MTU4 (MTU7) should be initialized to H’0000 after a reset. When the CST4 bit is set to 1, MTU4.TCNT (MTU7.TCNT) counts up in synchronization with MTU3.TCNT (MTU6.TCNT), and switches to down-counting when MTU3.TCNT (MTU6.TCNT) matches MTU3.TGRA (MTU6.TGRA). On reaching H’0000, MTU4.TCNT (MTU7.TCNT) switches to up-counting, and the operation is repeated in this way. TCNTSA (TCNTSB) is a read-only counter. It does not need to be initialized after a reset.

In counting up by MTU3.TCNT and MTU4.TCNT (or MTU6.TCNT and MTU7.TCNT), MTU3.TCNT (or MTU6.TCNT) starts counting up when it matches TCDRA (or TCDRB) and switches to counting down when it matches MTU3.TGRA (or MTU6.TGRA). Furthermore, when MTU4.TCNT (or MTU7.TCNT) matches TDDRA (or TDDRB), TCNTSA (or TCNTSB) is set to the value in MTU3.TGRA (or MTU6.TGRA) and counting is stopped.

When MTU4.TCNT (MTU7.TCNT) matches TDDRA (TDDRB) during down-counting of MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT), TCNTSA (TCNTSB) starts up-counting, and when MTU4.TCNT (MTU7.TCNT) matches H’0000, the operation switches to down-counting. When MTU3.TCNT (MTU6.TCNT) matches TCDRA (TCDRB), TCNTSA (TCNTSB) is cleared to H’0000 and stops counting.

TCNTSA (TCNTSB) is compared with the compare register and temporary register, in which the PWM duty is specified, only during the count operation.

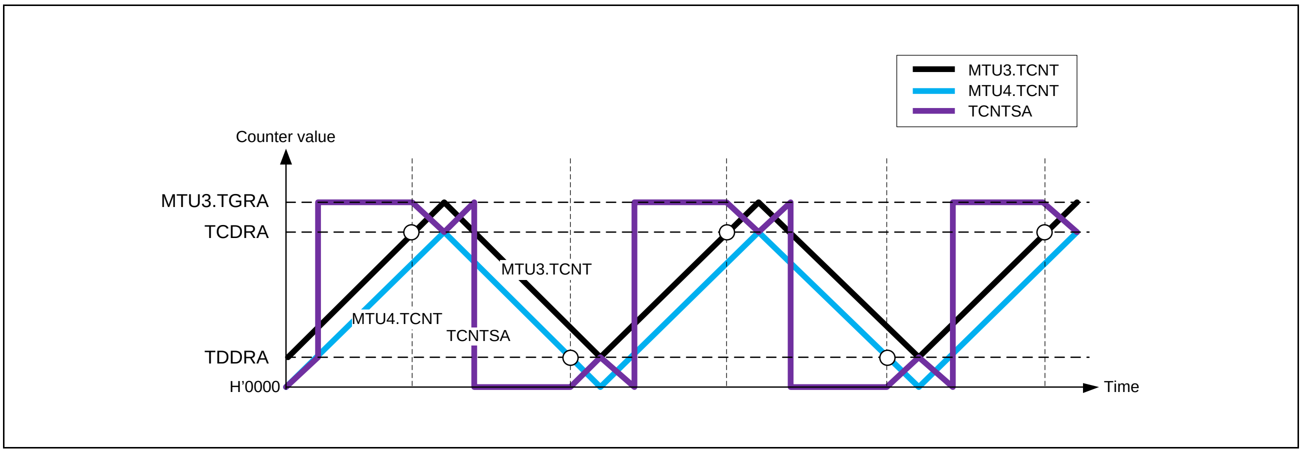


Figure 16.49 Count Operation in Complementary PWM Mode (MTU3 and MTU4)

(b) Register Operation

In complementary PWM mode, nine registers (compare registers, buffer registers, and temporary registers) are used to control the duty ratio for the PWM output. **Figure 16.50** shows an example of operation in complementary PWM mode (MTU3 and MTU4).

MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB) are constantly compared with the counters to generate PWM waveforms. When these registers match the counter, the value set in the OLSN and OLSP bits in the timer output control registers (TOCR1A and TOCR1B) is output from the PWM output pin. MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD) are buffer registers for these compare registers.

When the double buffer function is used, MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF) are also used as buffer registers B. For details of double buffer operation, refer to **Section 16.3.8(2)(s), Double Buffer Function in Complementary PWM Mode**.

Data in a compare register can be changed by writing new data to the corresponding buffer register. The buffer registers can be read or written at any time.

When modifying data in a buffer register, write to MTU4.TGRD (MTU7.TGRD) last and enable data transfer from the buffer register to a temporary register. At this time, transfer from the TCBRA (TCBRB) register and MTU3.TGRC (MTU6.TGRC) register, which operate as buffer registers for the timer cycle registers, to temporary registers is also enabled. Data is transferred to all five temporary registers at the same time.

When transfer is enabled in the Ta interval, data written to a buffer register is transferred to the temporary register. The data is not transferred to the temporary register in the Tb1 and Tb2 intervals. Data enabled for transfer in this interval is transferred to the temporary register at the end of this interval.

The value transferred to a temporary register is transferred to the compare register at the end of the Tb1 interval (when matches MTU3.TGRA (MTU6.TGRA) while TCNTSA (TCNTSB) is counting up), or at the end of the Tb2 interval (when matches H’0000 while TCNTSA (TCNTSB) is counting down). The timing for transfer from the temporary register to the compare register can be selected with bits MD[3:0] in the timer mode register 1 (TMDR1). **Figure 16.50** shows an example in which the trough is selected for the transfer timing.

In the Tb interval in which data is not transferred to the temporary register (Tb1 in **Figure 16.50**), the temporary register has the same function as the compare register and is compared with the counter. In this interval, therefore, there are two compare match registers for one output phase; the compare register contains the pre-change data and the temporary register contains new data. In this interval, three counters MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) and two registers (compare register and temporary register) are compared, and PWM output is controlled accordingly.

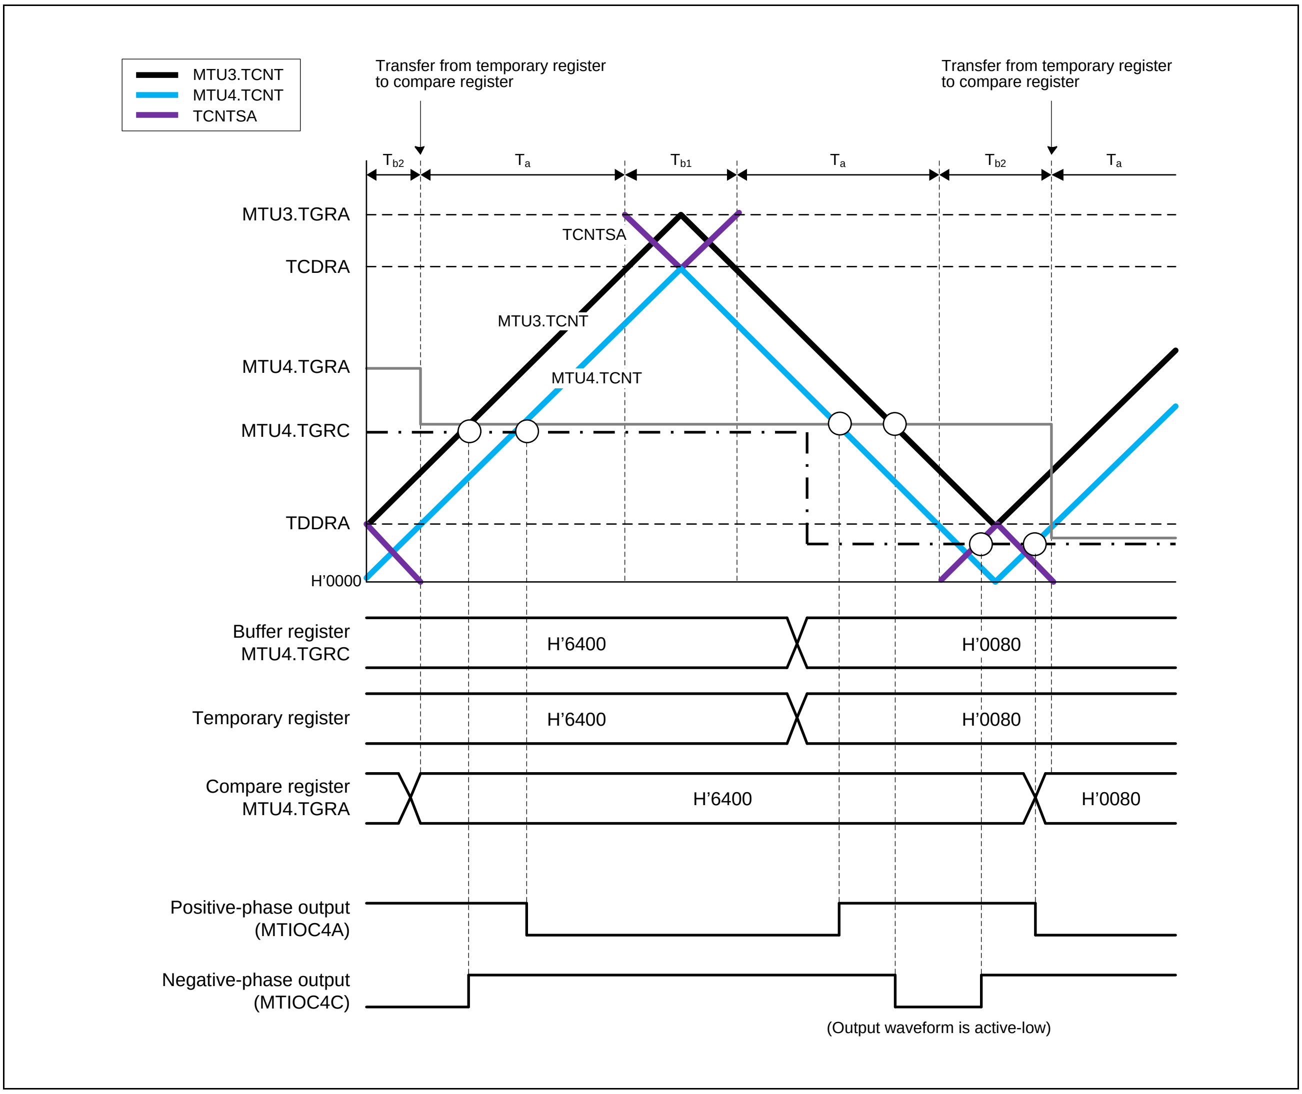

Figure 16.50 Example of Operation in Complementary PWM Mode (MTU3 and MTU4)

(c) Initial Setting

In complementary PWM mode, there are nine registers that require initial setting. In addition, there is a register that specifies whether to generate dead time (it should be used only when dead time generation should be disabled).

Before setting complementary PWM mode with MTU3.TMDR1.MD[3:0] (MTU6.TMDR1.MD[3:0]) bits, initial values should be set in the following registers.

The TOCR1A, TOCR2A, TOCR1B, and TOCR2B registers are used to set the PWM output level. MTU3.TGRC (MTU6.TGRC) operates as the buffer register for MTU3.TGRA (MTU6.TGRA), and should be set with 1/2 the PWM cycle + dead time Td. The timer cycle buffer register (TCBRA or TCBRB) operates as the buffer register for the timer cycle data register (TCDRA or TCDRB), and should be set with 1/2 the PWM cycle. Set dead time Td in the timer dead time data register (TDDRA or TDDRB).

When dead time is not needed, the TDER bit in the timer dead time enable register (TDERA or TDERB) should be cleared to 0, MTU3.TGRC and MTU3.TGRA (MTU6.TGRC and MTU6.TGRA) should be set to 1/2 the PWM carrier cycle + 1, and TDDRA (TDDRB) should be set to 1.

Set the respective initial PWM duty values in three buffer registers A (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD)).

Set the respective (initial PWM duty – 1) values in three buffer registers B (MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF)) only when the double buffer function is used.

The values set in the five buffer registers excluding TDDRA (TDDRB) are transferred to the corresponding compare registers as soon as complementary PWM mode is set.

Set MTU4.TCNT (MTU7.TCNT) to H’0000 before setting complementary PWM mode.

Table 16.77 Registers and Counters Requiring Initial Setting

Register and Counter	Setting
TOCR1A, TOCR2A, TOCR1B, TOCR2B	PWM output level
MTU3.TGRC MTU6.TGRC	1/2 PWM cycle + dead time Td (1/2 PWM cycle + 1 when dead time generation is disabled by the TDERA or TDERB setting)
TDDRA, TDDRB	Dead time Td (1 when dead time generation is disabled by the TDERA or TDERB setting)
TCBRA, TCBRB	1/2 PWM cycle
MTU3.TGRD, MTU4.TGRC, MTU4.TGRD MTU6.TGRD, MTU7.TGRC, MTU7.TGRD	Initial PWM duty ratio value for each phase
MTU3.TGRE, MTU4.TGRE, MTU4.TGRF MTU6.TGRE, MTU7.TGRE, MTU7.TGRF	Initial PWM duty ratio – 1 value for each phase (only when double buffer function is used)
MTU4.TCNT MTU7.TCNT	H’0000

Note: The value set in MTU3.TGRC (MTU6.TGRC) should be the sum of 1/2 the PWM cycle set in TCBRA (TCBRB) and dead time Td set in TDDRA (TDDRB). When dead time generation is disabled by TDERA (TDERB), TGRC should be set to 1/2 the PWM cycle + 1.

(d) PWM Output Level Setting

In complementary PWM mode, the PWM output level is set with bits OLSN and OLSP in timer output control register 1 (TOCR1A or TOCR1B) or bits OLS1P to OLS3P and OLS1N to OLS3N in timer output control register 2 (TOCR2A or TOCR2B).

The output level can be set for each of the three positive phases and three negative phases of 6-phase output. Complementary PWM mode should be cleared before setting or changing output levels.

(e) Dead Time Setting

In complementary PWM mode, dead time can be set for PWM output.

The dead time is set in the timer dead time data register (TDDRA or TDDRB). The value set in TDDRA (TDDRB) is used as the MTU3.TCNT (MTU6.TCNT) counter start value and creates a non-overlapping interval between MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT). Complementary PWM mode should be cleared before changing the contents of TDDRA (TDDRB).

(f) Dead Time Suppressing

Dead time generation is suppressed by clearing the TDER bit in the timer dead time enable register (TDERA or TDERB) to 0. TDERA (TDERB) can be cleared to 0 only when 0 is written to it after reading TDER = 1.

MTU3.TGRA and MTU4.TGRC (MTU6.TGRA and MTU7.TGRC) should be set to 1/2 PWM cycle + 1 and the timer dead time data register (TDDRA or TDDRB) should be set to 1.

By the above settings, PWM waveforms without dead time can be obtained. **Figure 16.51** shows an example of operation without dead time (MTU3 and MTU4).

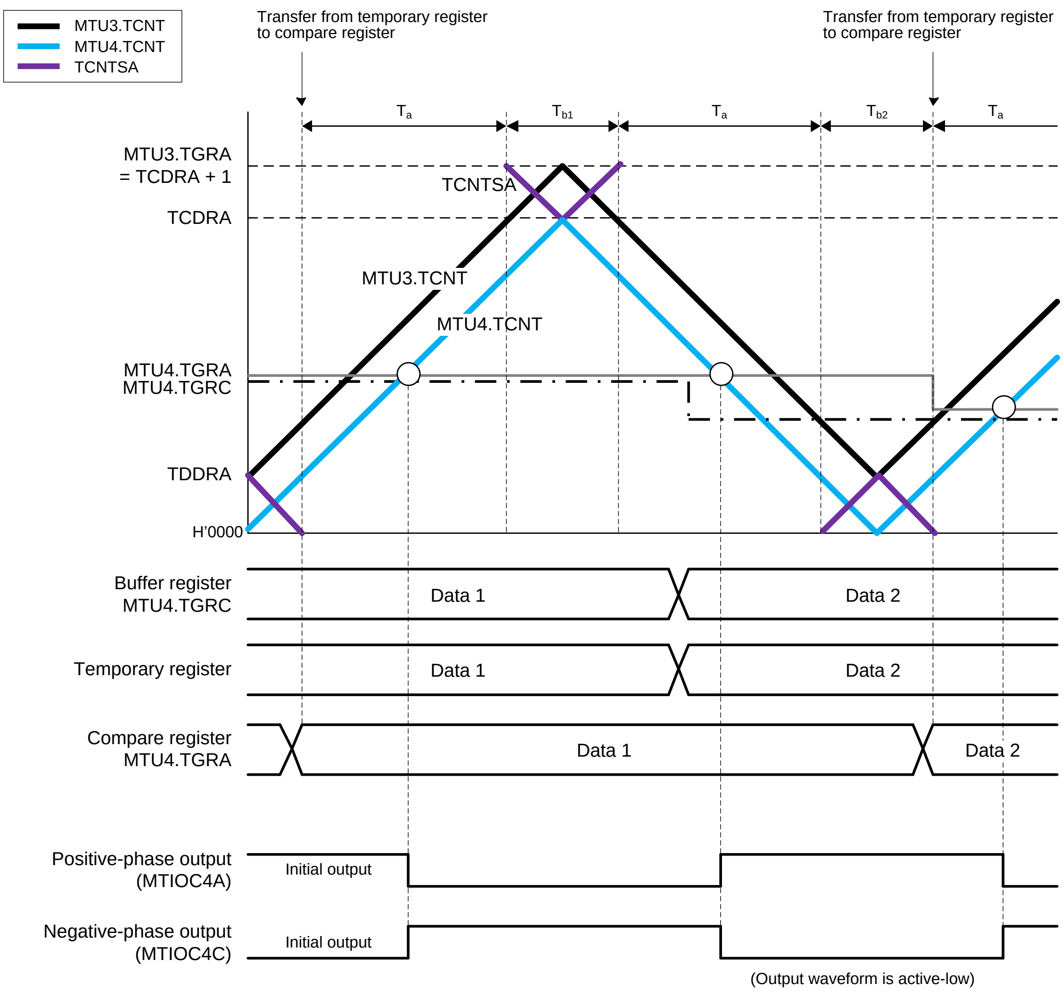

Figure 16.51 Example of Operation without Dead Time (MTU3 and MTU4)

(g) PWM Cycle Setting

In complementary PWM mode, the PWM cycle is set in two registers—MTU3.TGRA (MTU6.TGRA), in which the MTU3.TCNT (MTU6.TCNT) upper limit value is set, and TCDRA (TCDRB), in which the MTU4.TCNT (MTU7.TCNT) upper limit value is set. The settings should be made so as to achieve the following relationship between these two registers:

With dead time: MTU3.TGRA (MTU6.TGRA) setting = TCDRA (TCDRB) setting + TDDRA (TDDRB) setting
Without dead time: MTU3.TGRA (MTU6.TGRA) setting = TCDRA (TCDRB) setting + 1

In addition, the settings should be made so as to achieve the following relationship between the TCDRA (TCDRB) register and the TDDRA (TDDRB) register:

TCDRA (TCDRB) setting > TDDRA (TDDRB) setting × 2 + 2

The MTU3.TGRA and TCDRA (MTU6.TGRA and TCDRB) settings are made by setting values in buffer registers MTU3.TGRC and TCBRA (MTU6.TGRC and TCBRB). When data is written to MTU4.TGRD (MTU7.TGRD) to enable transfers, the values set in MTU3.TGRC and TCBRA (MTU6.TGRC and TCBRB) are transferred simultaneously to the MTU3.TGRA and TCDRA (MTU6.TGRA and TCDRB) with the transfer timing selected with the MTU3.TMDR1.MD[3:0] (MTU6.TMDR1.MD[3:0]) bits.

The new PWM cycle is reflected from the next cycle when data is updated at the crest, or from the current cycle when updated in the trough. **Figure 16.52** illustrates the operation when the PWM cycle is updated at the crest.

See the following **Section 16.3.8(2)(h), Register Data Updating**, for the method of updating the data in each buffer register.

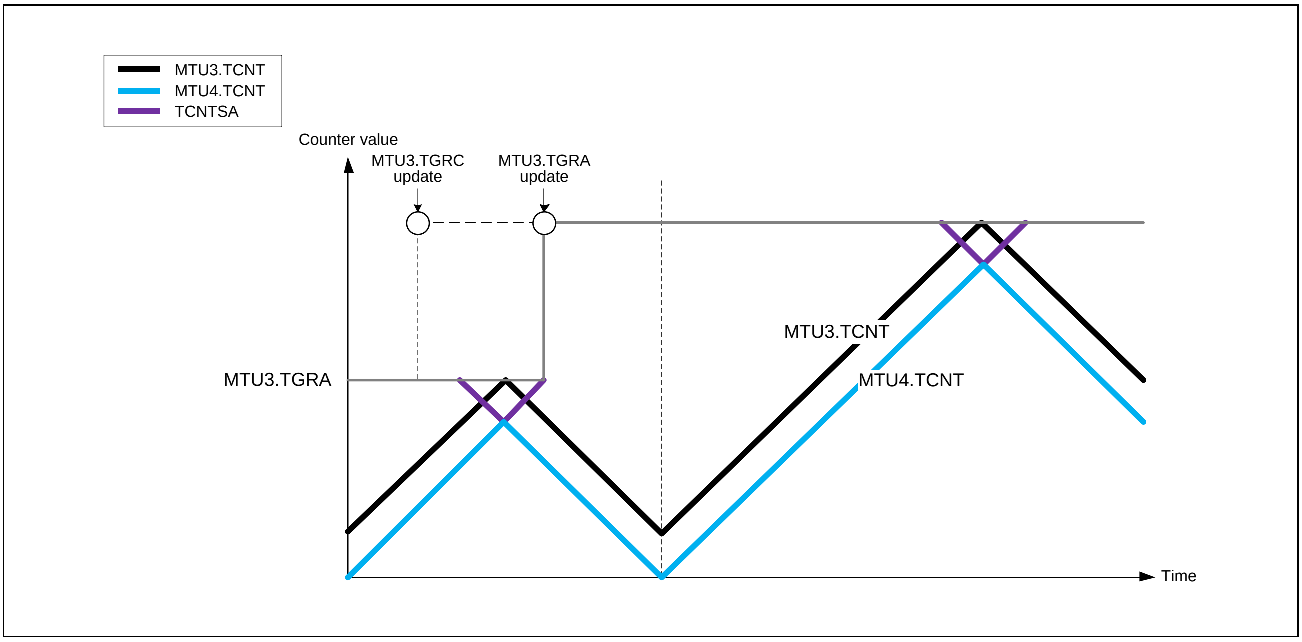

Figure 16.52 Example of PWM Cycle Updating (MTU3 and MTU4)

(h) Register Data Updating

In complementary PWM mode, buffer registers are used to update the data in five compare registers for PWM duty and PWM cycle. The update data can be written to the buffer registers at any time.

There is a temporary register between each of these registers and its buffer register. While subcounter TCNTSA (TCNTSB) is not counting, if buffer register data is updated, the temporary register value also changes. Data is not transferred from buffer registers to temporary registers while TCNTSA (TCNTSB) is counting; in this case, the value written to a buffer register is transferred after TCNTSA (TCNTSB) halts.

The temporary register value is transferred to the compare register at the data update timing set with MTU3.TMDR1.MD[3:0] (MTU6.TMDR1.MD[3:0]) bits. **Figure 16.53** shows an example of data updating in complementary PWM mode (MTU3 and MTU4). This example shows the mode in which data is updated at both the counter crest and trough.

When updating buffer register data, be sure to write to MTU4.TGRD (MTU7.TGRD) at the end of the update. Data is transferred from buffer registers to the temporary registers simultaneously for all five registers after the write to MTU4.TGRD (MTU7.TGRD).

Even when not updating all five registers or when not updating the MTU4.TGRD (MTU7.TGRD) data, be sure to write to MTU4.TGRD (MTU7.TGRD) after writing data to the registers to be updated. In this case, the data written to MTU4.TGRD (MTU7.TGRD) should be the same as the data prior to the write operation.

See **Section 16.3.8(2)(s), Double Buffer Function in Complementary PWM Mode**, for data updating when the double buffer function is used.

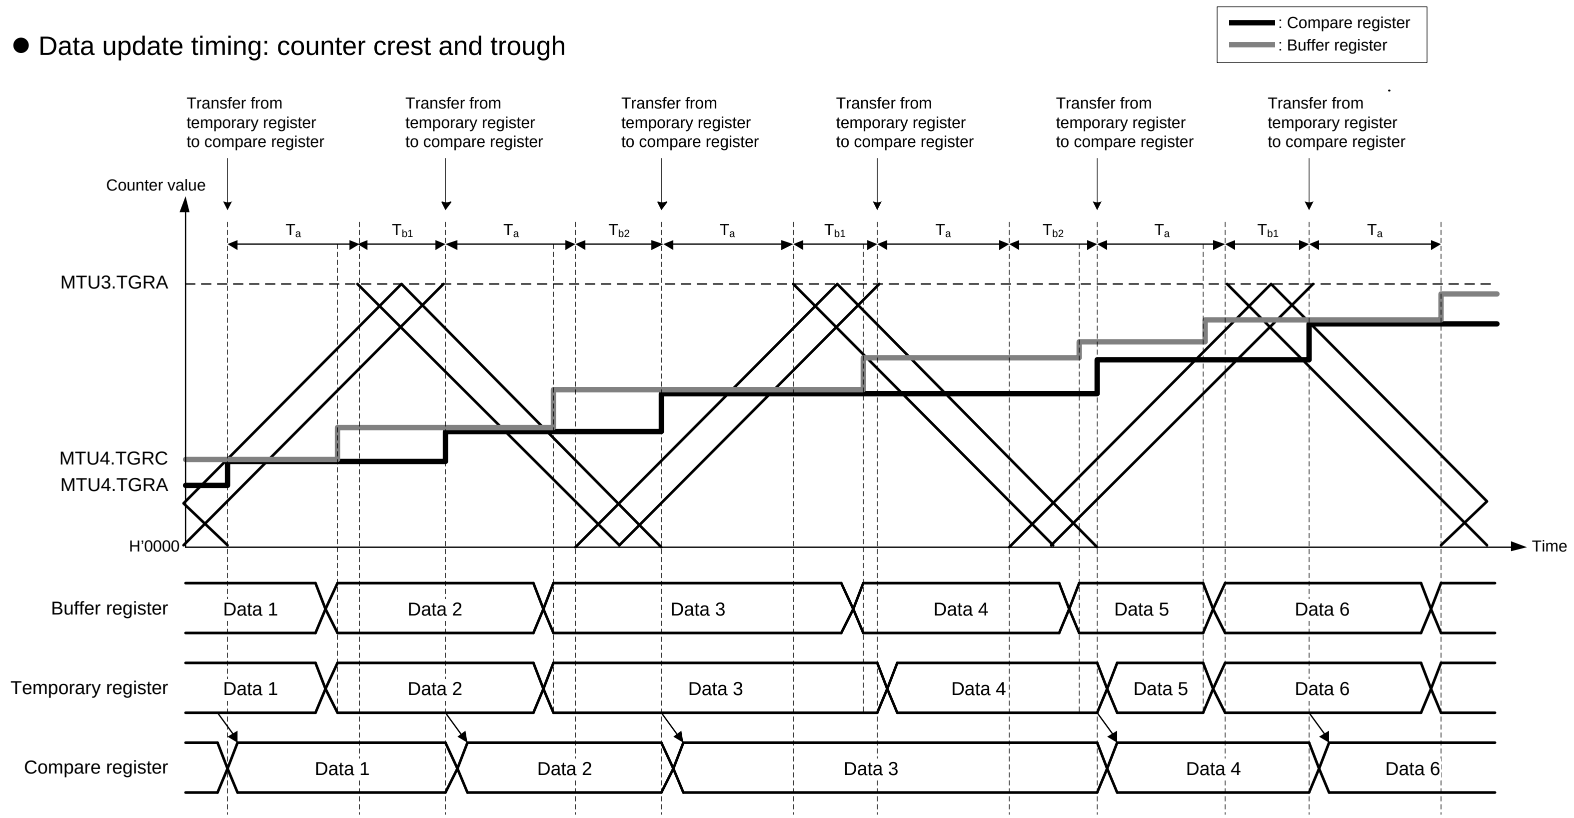

Figure 16.53 Example of Data Updating in Complementary PWM Mode (MTU3 and MTU4)

(i) Initial Output in Complementary PWM Mode

In complementary PWM mode, the initial output is determined by the setting of the OLSN and OLSP bits in the TOCR1A (TOCR1B) register or the OLS1N to OLS3N and OLS1P to OLS3P bits in the TOCR2A register (TOCR2B). This initial output is the non-active level of the PWM output and continues from when complementary PWM mode is set with the MTU3.TMDR1 (MTU6.TMDR1) until MTU4.TCNT (MTU7.TCNT) exceeds the value set in the TDDRA (TDDRB) register. **Figure 16.54** shows an example of the initial output in complementary PWM mode.

An example of the waveform when the initial PWM duty ratio value is smaller than the TDDRA (TDDRB) value is shown in **Figure 16.55**.

● Timer output control register settings

TOCR1A.OLSN bit = 0 (initial output: high; active level: low)
TOCR1A.OLSP bit = 0 (initial output: high; active level: low)

TOCR1A.OLSP bit = 0 (initial output: high; active level: low)

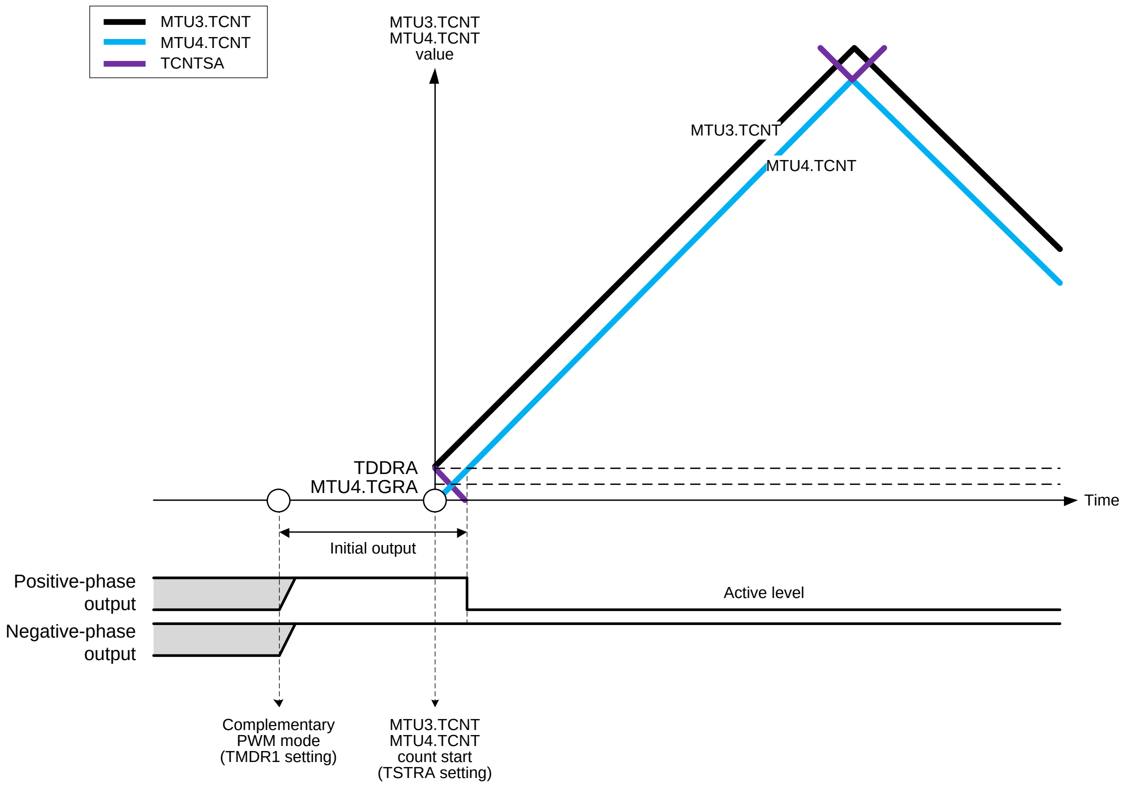

Figure 16.55 Example of Initial Output in Complementary PWM Mode (MTU3 and MTU4) (2)

(j) Method for Generating PWM Output in Complementary PWM Mode

In complementary PWM mode, six phases (three positive and three negative) PWM waveforms can be output. Dead time can be set for PWM waveforms to be output.

A PWM waveform is generated by output of the level selected in the timer output control register in the event of a compare match between a counter and a compare register. While TCNTSA (TCNTSB) is counting, the compare register and temporary register values are simultaneously compared to create consecutive PWM output from 0 to 100% duty ratio. The relative timing of turn-on and turn-off compare match occurrence may vary, but the compare match that turns off each phase takes precedence to secure the dead time and ensure that the positive-phase and negative-phase turn-on times do not overlap. **Figure 16.56** to **Figure 16.58** show examples of waveform generation in complementary PWM mode.

The positive-phase and negative-phase turn-off timing is generated by a compare match with the counter indicated by a solid line, and the turn-on timing is generated by a compare match with the counter indicated by a dotted line, which operates with a delay equal to the dead time behind the counter indicated by a solid line. In the T1 period, compare match a that turns off the negative phase has the highest priority, and compare matches before a are ignored. In the T2 period, compare match c that turns off the positive phase has the highest priority, and compare matches before c are ignored.

In most cases, compare matches occur in the order a → b → c → d (or c → d → a' → b') as shown in **Figure 16.56**.

If compare matches deviate from the a → b → c → d order, since the time for which the negative phase is off is shorter than twice the dead time, the positive phase is not turned on. If compare matches deviate from the c → d → a' → b' order, since the time for which the positive phase is off is shorter than twice the dead time, the negative phase is not turned on. As shown in **Figure 16.57**, if compare match c follows compare match a before compare match b, compare match b is ignored and the negative phase is turned on by compare match d. This is because turning off the positive phase has priority due to the occurrence of compare match c (positive-phase off timing) before compare match b (positive-phase on timing) (consequently, the waveform does not change because the positive phase goes from off to off).

Similarly, in the example in **Figure 16.58**, turning off the negative phase has priority due to the occurrence of compare match a' (negative-phase off timing) before compare match d (negative-phase on timing). As a result, the negative phase is not turned on.

Thus, in complementary PWM mode, compare matches at turn-off timings take precedence, and turn-on timing compare matches that occur before a turn-off timing compare match are ignored.

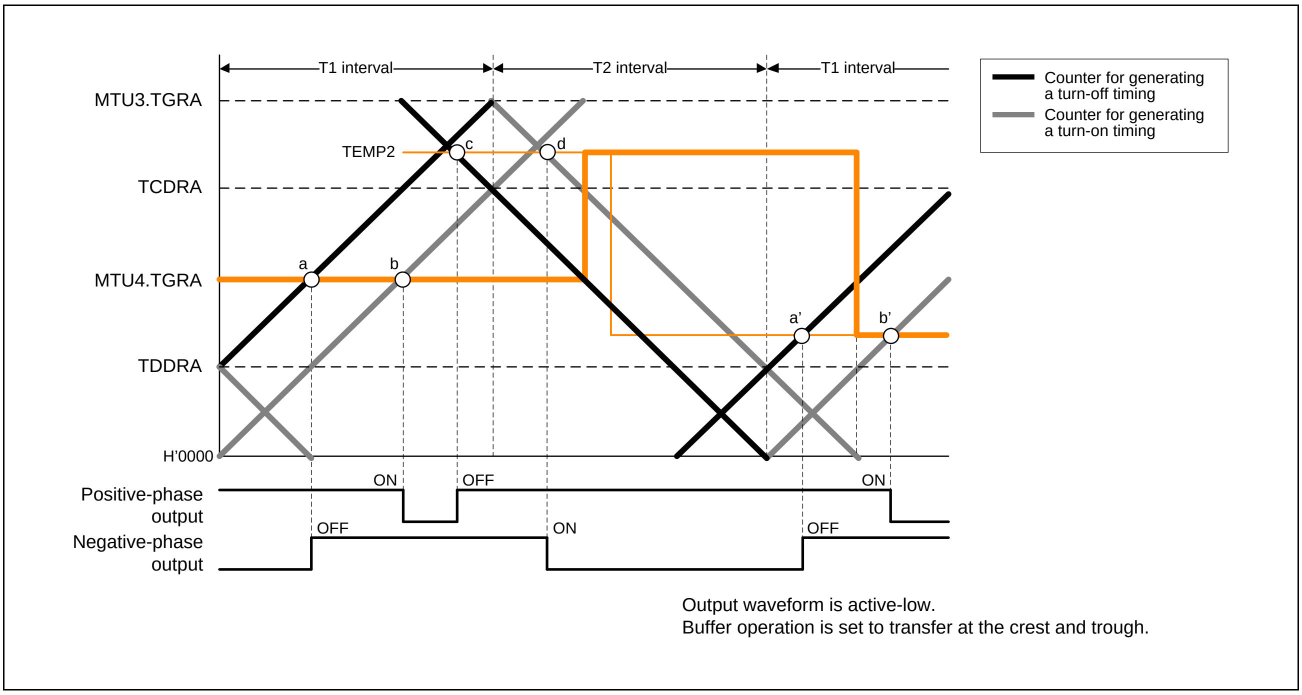

Figure 16.56 Example of Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (1)

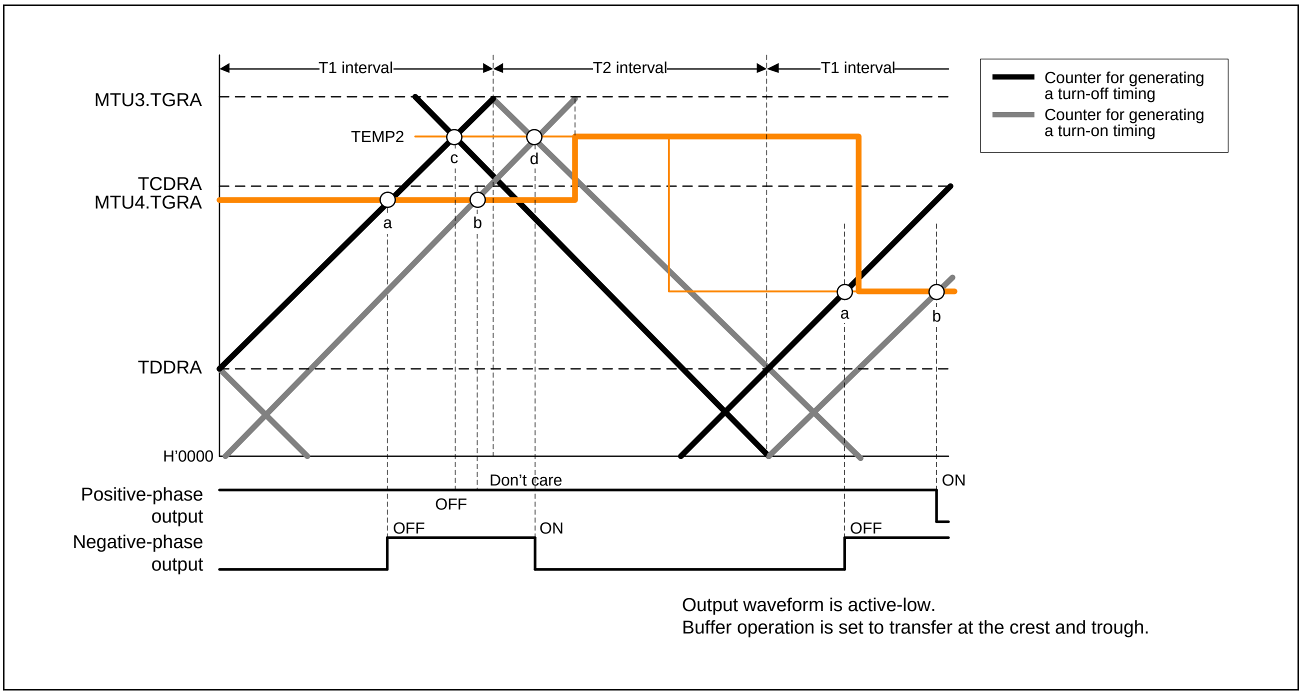

Figure 16.57 Example of Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (2)

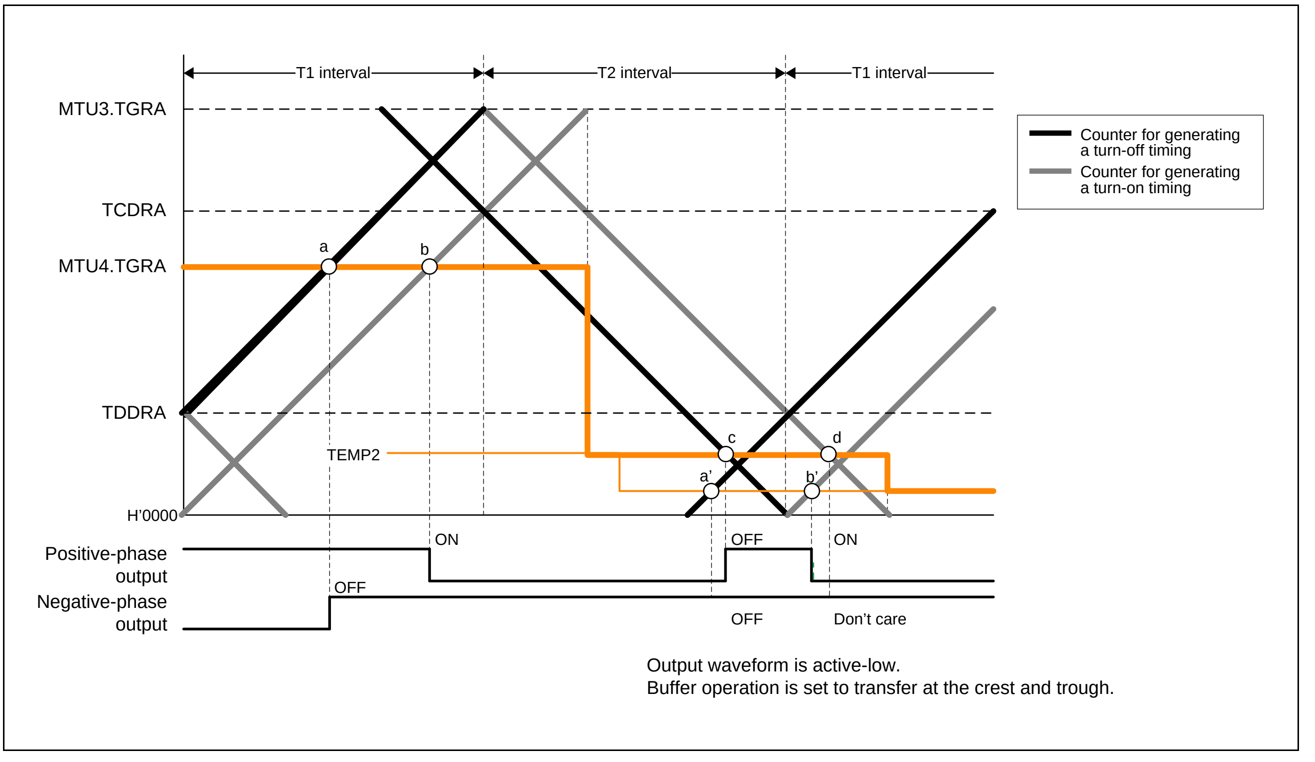

Figure 16.58 Example of Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (3)

(k) 0% and 100% Duty Ratio Output in Complementary PWM Mode

In complementary PWM mode, 0% and 100% duty PWM output can be output as required. **Figure 16.59** to **Figure 16.63** show output examples.

A 100% duty waveform is output when the compare register value is set to H'0000. The waveform in this case has a positive phase with a 100% on-state. A 0% duty waveform is output when the compare register value is set to the same value as MTU3.TGRA (MTU6.TGRA). The waveform in this case has a positive phase with a 100% off-state.

Turn-on and turn-off compare matches occur simultaneously, but if a turn-on compare match and turn-off compare match for the same phase occur simultaneously, both compare matches are ignored and the waveform does not change.

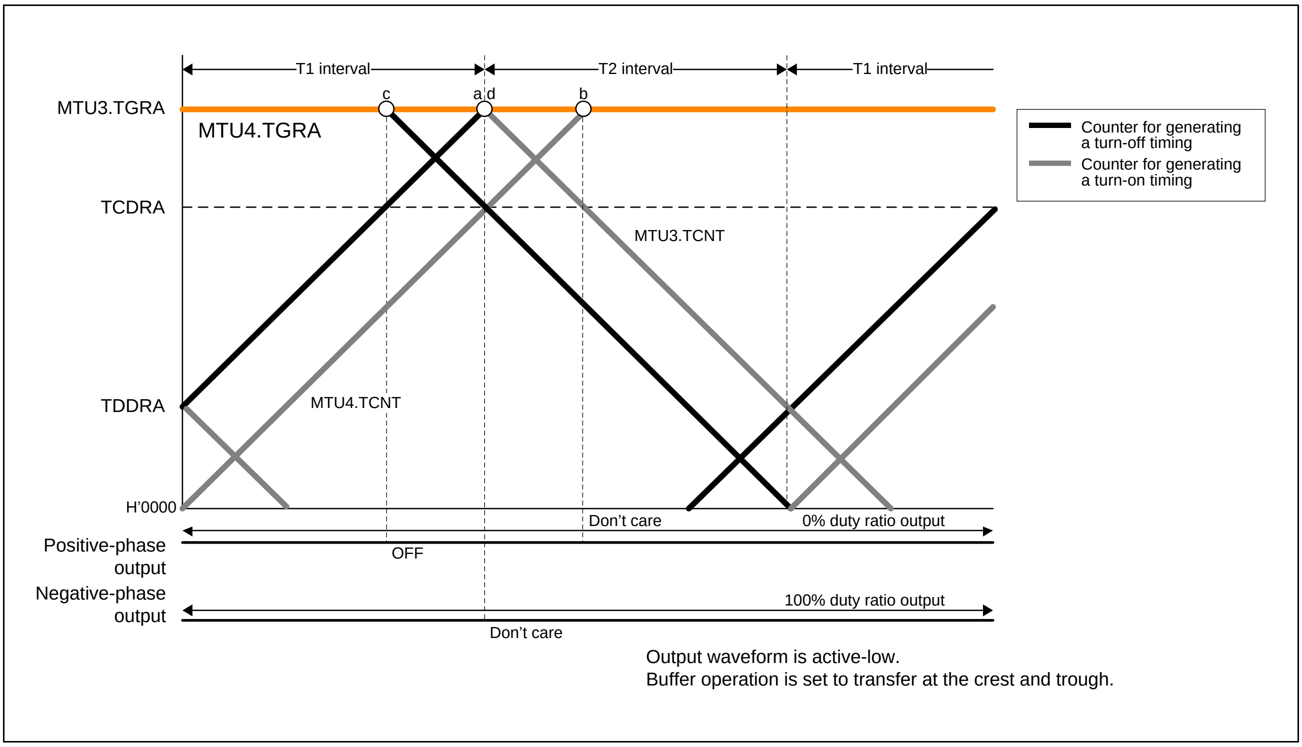

Figure 16.63 Example of 0% and 100% Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (5)

(l) Toggle Output Synchronized with PWM Cycle

In complementary PWM mode, toggle output from the PWM output pin in synchronization with the PWM cycle can be enabled by setting the PSYE bit in the TOCR1A (TOCR1B) register to 1. An example of a toggle output waveform is shown in **Figure 16.64**.

This output is toggled by a compare match between MTU3.TCNT and MTU3.TGRA (MTU6.TCNT and MTU6.TGRA) and a compare match between MTU4.TCNT (MTU7.TCNT) and H’0000.

The MTIOC3A (MTIOC6A) pin is assigned for this toggle output. The initial output is high-level output.

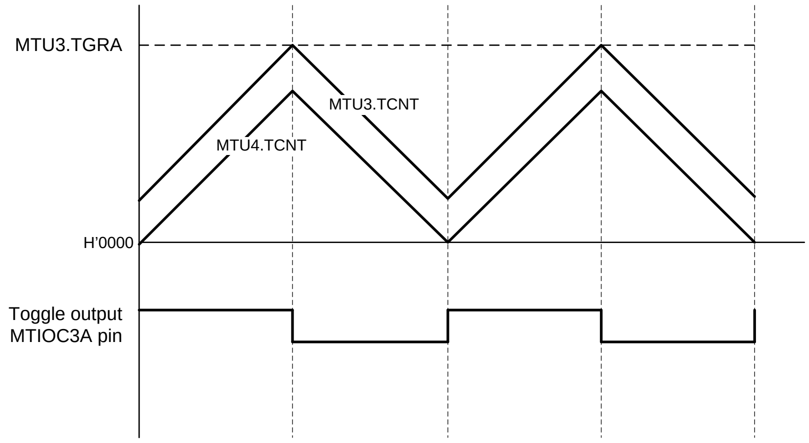

Figure 16.64 Example of Toggle Output Waveform Synchronized with PWM Output (MTU3 and MTU4)

(m) Counter Clearing by Another Channel

In complementary PWM mode, MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) can be cleared by another channel source when a mode for synchronization with another channel is specified through the TSYRA (TSYRB) register and synchronous clearing is selected with MTU3.TCR.CCLR[2:0] (MTU6.TCR.CCLR[2:0]) bits.

Figure 16.65 illustrates an example of this operation.

Use of this function enables a counter to be cleared and restarted through an external signal.

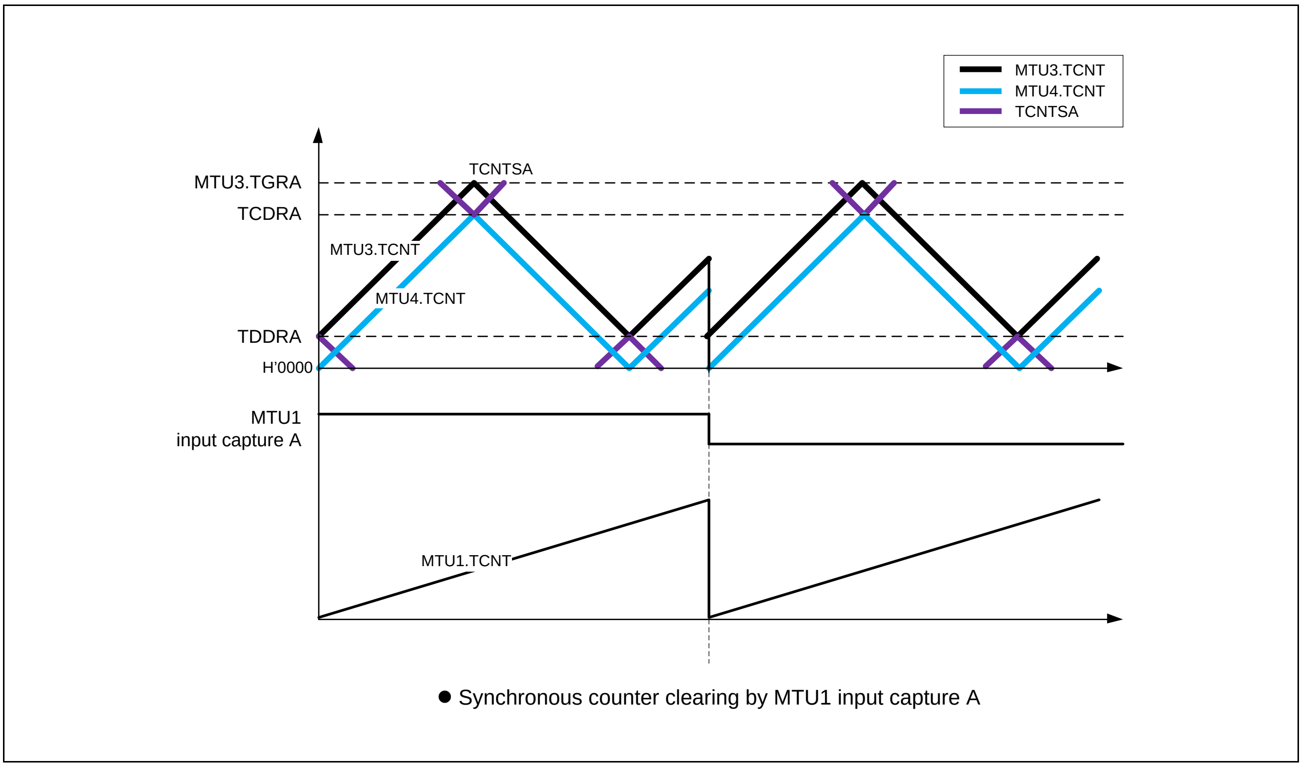

Figure 16.65 Counter Clearing Synchronized with Another Channel (MTU3 and MTU4)

(n) Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

Setting the WRE bit in TWCRA (TWCRB) to 1 suppresses initial output when synchronous counter clearing occurs in the Tb interval (Tb2 interval) at the trough in complementary PWM mode and controls abrupt change in duty cycle at synchronous counter clearing.

Initial output suppression through the WRE bit = 1 is applicable only when synchronous clearing occurs in the Tb2 interval as indicated by (10) or (11) in **Figure 16.66**. When synchronous clearing occurs outside that interval, the initial value specified by the OLSN and OLSP bits in TOCR1A (TOCR1B) is output. Even in the Tb2 interval, if synchronous clearing occurs in the initial value output period (indicated by (1) in **Figure 16.66**) immediately after the counters start operation, initial value output is not suppressed.

This function can be used in both channel combinations of MTU 3 and MTU4 and MTU6 and MTU7. In MTU3 and MTU4, synchronous clearing in MTU0, MTU1, and MTU2 can cause counter clearing; in MTU6 and MTU7, compare match or input capture generated in MTU0, MTU1, and MTU2 can cause counter clearing.

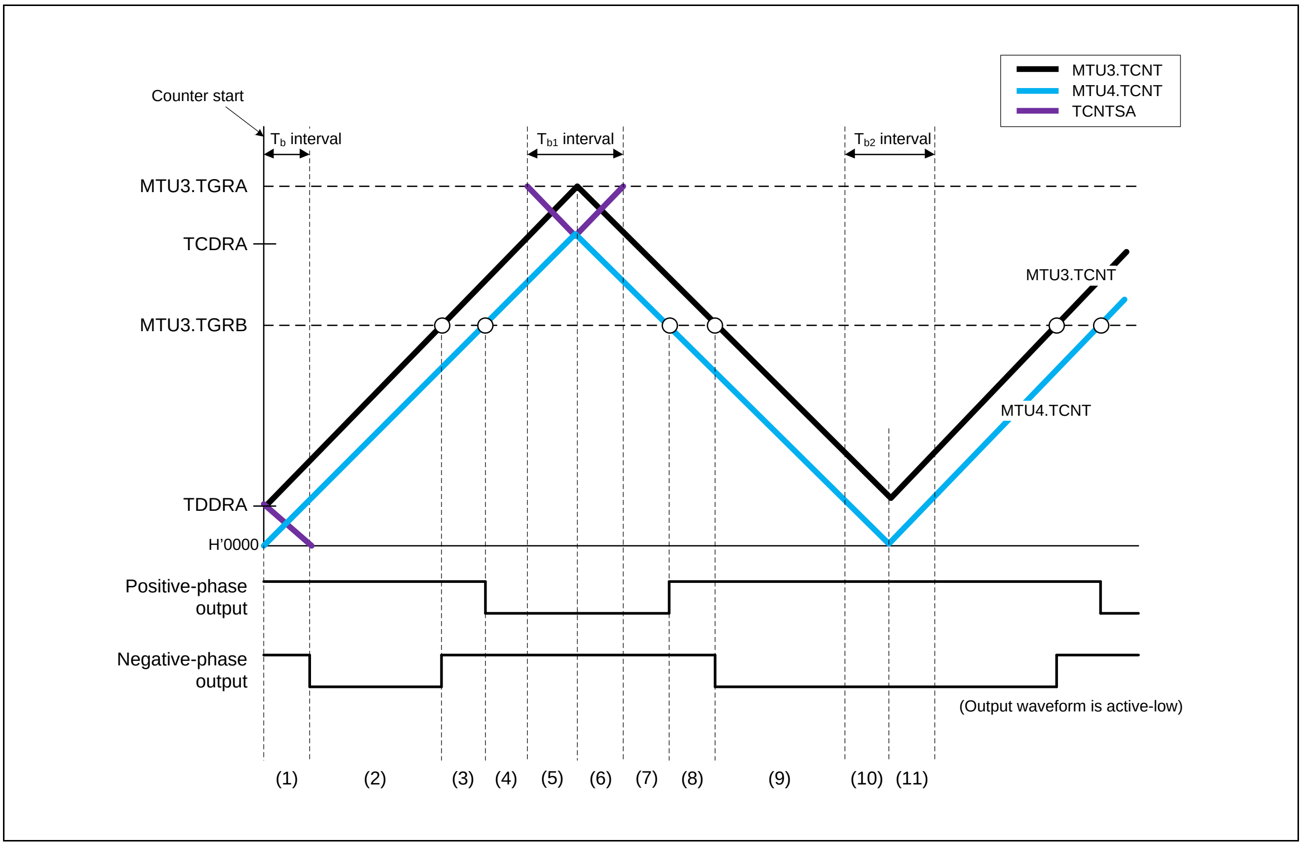

Figure 16.66 Timing for Synchronous Counter Clearing (MTU3 and MTU4)

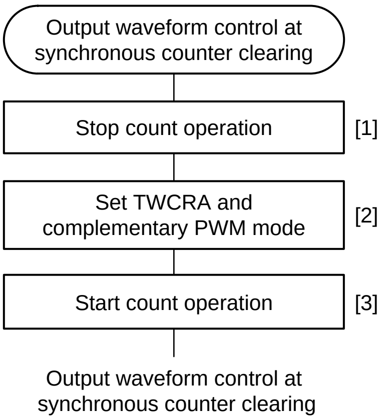
- Example of Procedure for Setting Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode.

  An example of the procedure for setting output waveform control at synchronous counter clearing in complementary PWM mode is shown in **Figure 16.67**.



[1] Clear bits CST3 and CST4 in TSTRA to 0 to stop count operation. Set up the TWCRA register while the TCNT counters in MTU3 and MTU4 are stopped.

[2] Read bit WRE in TWCRA and then write 1 to it to suppress initial value output at counter clearing.

[3] Set bits CST3 and CST4 in TSTRA to 1 at the same time to start count operation.

Figure 16.67 Example of Procedure for Setting Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode (MTU3 and MTU4)

- Examples of Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

Figure 16.68 to **Figure 16.71** show examples of output waveform control in which MTU3 and MTU4 operate in complementary PWM mode and synchronous counter clearing is generated while the WRE bit in TWCRA is set to 1. In the examples shown in **Figure 16.68** to **Figure 16.71**, synchronous counter clearing occurs at timing (3), (6), (8), and (11) shown in **Figure 16.66**, respectively.
In MTU6 and MTU7, these examples are equivalent to the cases when MTU6 and MTU7 operate in complementary PWM mode and synchronous counter clearing is generated while the SCC bit is cleared to 0 and the WRE bit is set to 1 in TWCRB.

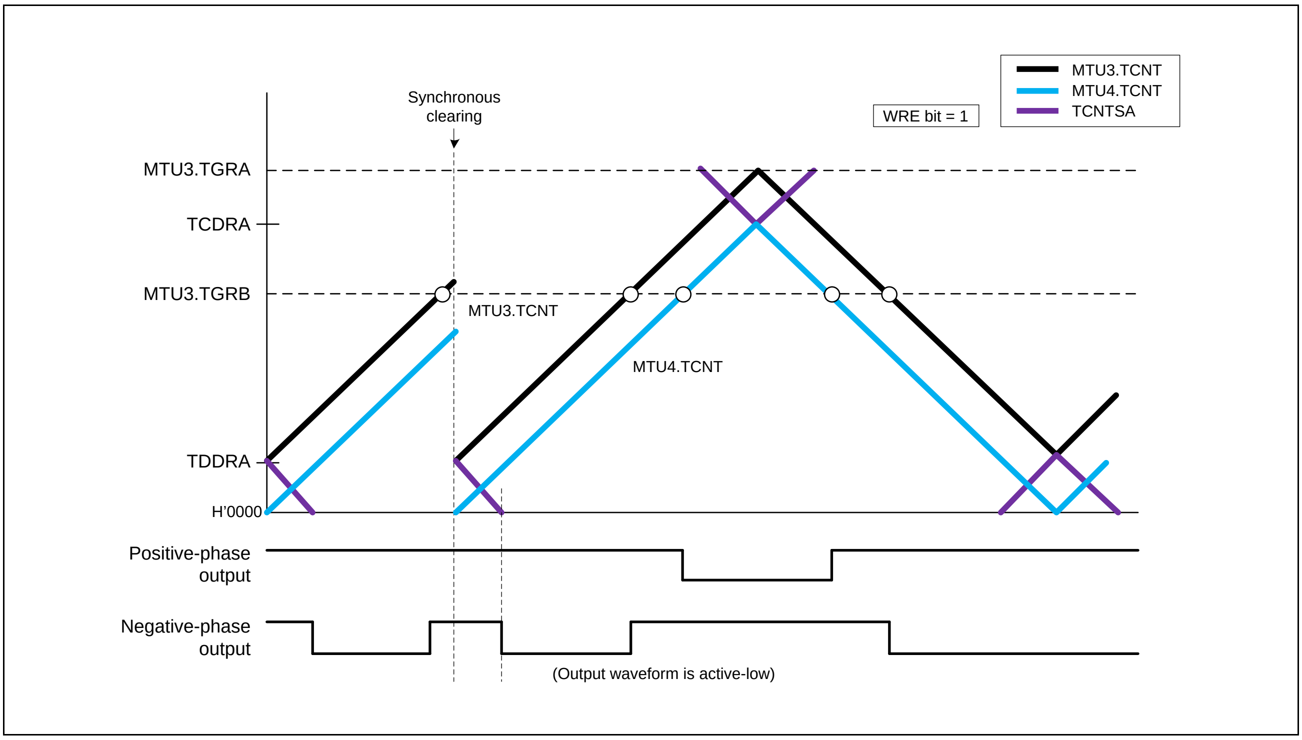


Figure 16.68 Example of Synchronous Clearing in Dead Time during Up-Counting (Timing (3) in **Figure 16.66**; TWCRA.WRE Bit is 1)

(o) Suppressing Synchronous Counter Clearing for MTU0 to MTU2 and MTU6 and MTU7

In MTU6 and MTU7, setting the SCC bit in TWCRB to 1 suppresses synchronous counter clearing caused by MTU0 to MTU2.

Synchronous counter clearing is suppressed only within the interval shown in **Figure 16.72**. When using this function, MTU6 and MTU7 should be set to complementary PWM mode.

For details of synchronous clearing caused by MTU0 to MTU2, refer to **Section 16.3.10(2), Synchronous Counter Clearing for MTU6 and MTU7**.

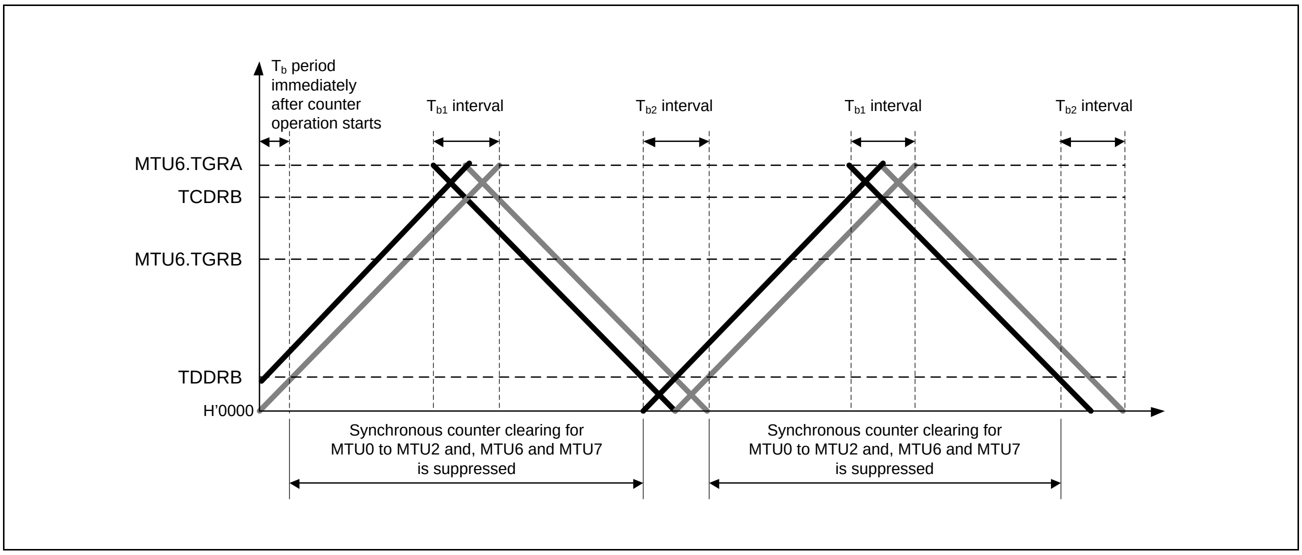

Figure 16.72 Synchronous Clearing-Suppressed Interval Specified by TWCRB.SCC Bit for MTU0, MTU1 and MTU2, and MTU6 and MTU7

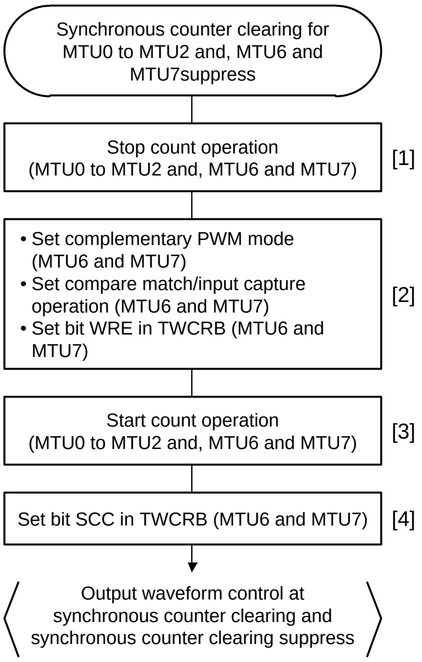
- Example of Procedure for Suppressing Synchronous Counter Clearing for MTU0 to MTU2, and MTU6 and MTU7

An example of the procedure for suppressing synchronous counter clearing for MTU0 to MTU2, and MTU6 and MTU7 is shown in **Figure 16.73**.



[1] Clear bits CSTn of the timer start register (TSTRB) in MTU6 and MTU7 to 0 to stop count operation. Clear bits CSTn of TSTRA in MTU0 to MTU2 to 0 to stop count operation.

[2] Set the complementary PWM mode in MTU6 and MTU7 and compare match/input capture operation in MTU0 to MTU2. When bit WRE in TWCRA or TWCRB should be set, make appropriate setting here.

[3] Set bits CST6 and CST7 in MTU6 and MTU7 to 1 to start count operation. For synchronous counter clearing for MTU0 to MTU2 and MTU6 and MTU7, set bits CSTn of TSTRA in MTU0 to MTU2 to 1 to start count operation in any one of MTU0.TCNT to MTU2.TCNT.

[4] Read TWCRB and then set bit SCC in TWCRB to 1 to suppress synchronous counter clearing for MTU0 to MTU2 and MTU6 and MTU7*1. Here, do not modify the CCE and WRE bit values in TWCRB of MTU6 and MTU7. Synchronous counter clearing for MTU0 to MTU2 and MTU6 and MTU7 is suppressed in the synchronous counter clearing-suppressed periods.

Note 1. The TWCRB.SCC bit value can be modified during count operation. However, if a synchronous clearing occurs when bit TWCRB.SCC is modified from 0 to 1, the synchronous clearing may not be suppressed. If a synchronous clearing occurs when bit TWCRB.SCC is modified from 1 to 0, the synchronous clearing may be suppressed.

Figure 16.73 Example of Procedure for Suppressing Synchronous Counter Clearing for MTU0 to MTU2, and MTU6 and MTU7

- Examples of Suppression of Synchronous Counter Clearing for MTU 0 to MTU2, and MTU6 and MTU7

Figure 16.74 to **Figure 16.77** show examples of operation in which MTU6 and MTU7 operate in complementary PWM mode and synchronous counter clearing for MTU 0 to MTU2, and MTU6 and MTU7 is suppressed by setting the SCC bit in TWCRB in MTU6 and MTU7 to 1. In the examples shown in **Figure 16.74** to **Figure 16.77**, synchronous counter clearing occurs at timing (3), (6), (8), and (11) shown in **Figure 16.66**, respectively. In these examples, the WRE bit in TWCRB in MTU6 and MTU7 is set to 1.

(p) Counter Clearing by MTU3.TGRA (MTU6.TGRA) Compare Match

In complementary PWM mode, MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) can be cleared by MTU3.TGRA (MTU6.TGRA) compare match when the TWCRA.CCE (TWCRB.CCE) bit.

Figure 16.78 illustrates an operation example.

NOTES

1. Use this function only in complementary PWM mode 1 (transfer at crest).
2. Do not specify synchronous clearing by another channel (do not set 1 in the SYNC0 to SYNC4 or SYNC6 to SYNC7 bits in the timer synchronous register (TSYRA or TSYRB) and the CEOA to CEOD or CEIA to CEID bits in TSYCR).
3. Do not set the PWM duty value to H’0000.
4. Do not set the PSYE bit in timer output control register 1 (TOCR1A or TOCR1B) to 1.

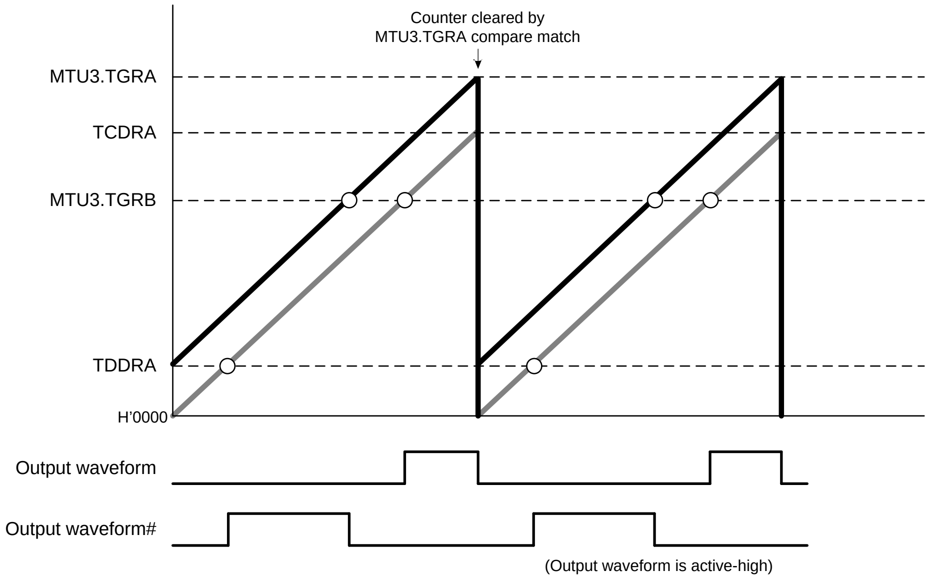

Figure 16.78 Example of Counter Clearing Operation by MTU3.TGRA Compare Match

(q) Example of Waveform Output for Driving AC Synchronous Motor (Brushless DC Motor)

In complementary PWM mode when MTU3 and MTU4 are used, a brushless DC motor can easily be controlled using TGCRA. **Figure 16.79** to **Figure 16.82** show examples of brushless DC motor driving waveforms created using TGCRA.

To switch the output phases for a 3-phase brushless DC motor by means of external signals detected with a Hall element, etc., clear the TGCRA.FB bit to 0. In this case, the external signals indicating the magnetic pole position should be input to pins MTIOC0A, MTIOC0B, and MTIOC0C in MTU0 (make appropriate settings with the port mode registers (PMn) and Pmn port function control register (PFCm) of the GPIO ports). When an edge is detected at pin MTIOC0A, MTIOC0B, or MTIOC0C, the output on/off state is switched automatically.

When the TGCRA.FB bit is 1, the output on/off state is switched when the UF, VF, or WF bit in TGCRA is cleared to 0 or set to 1.

The driving waveforms are output from the 6-phase PWM output pins for complementary PWM mode.

With this 6-phase output, while the output is turned on, chopping output is available through complementary PWM mode output function by setting the N bit or P bit in TGCRA to 1. When the N bit or P bit is 0, the level output is selected.

The active level of the 6-phase output (on output level) can be set with the TOCR1A.OLSN and TOCR1A.OLSP bits regardless of the setting of the N and P bits.

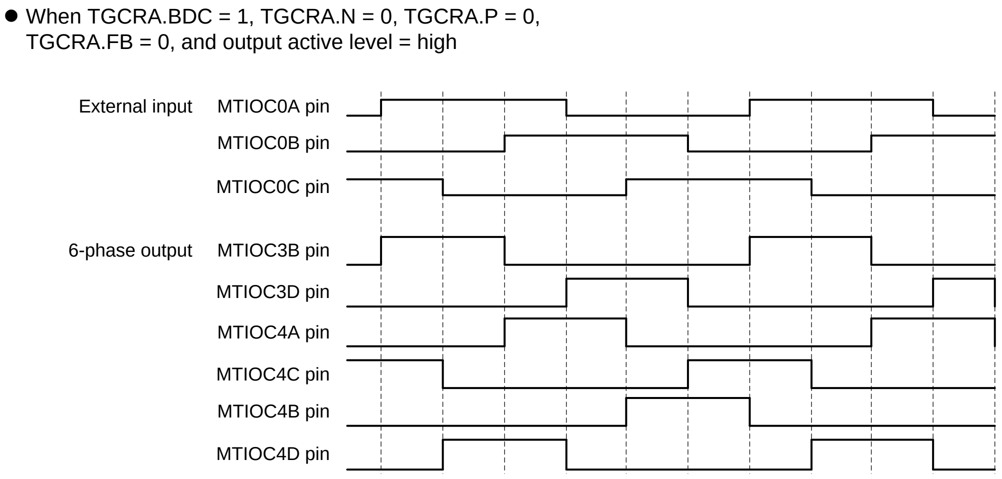

Figure 16.79 Example of Output Phase Switching by External Input (1)

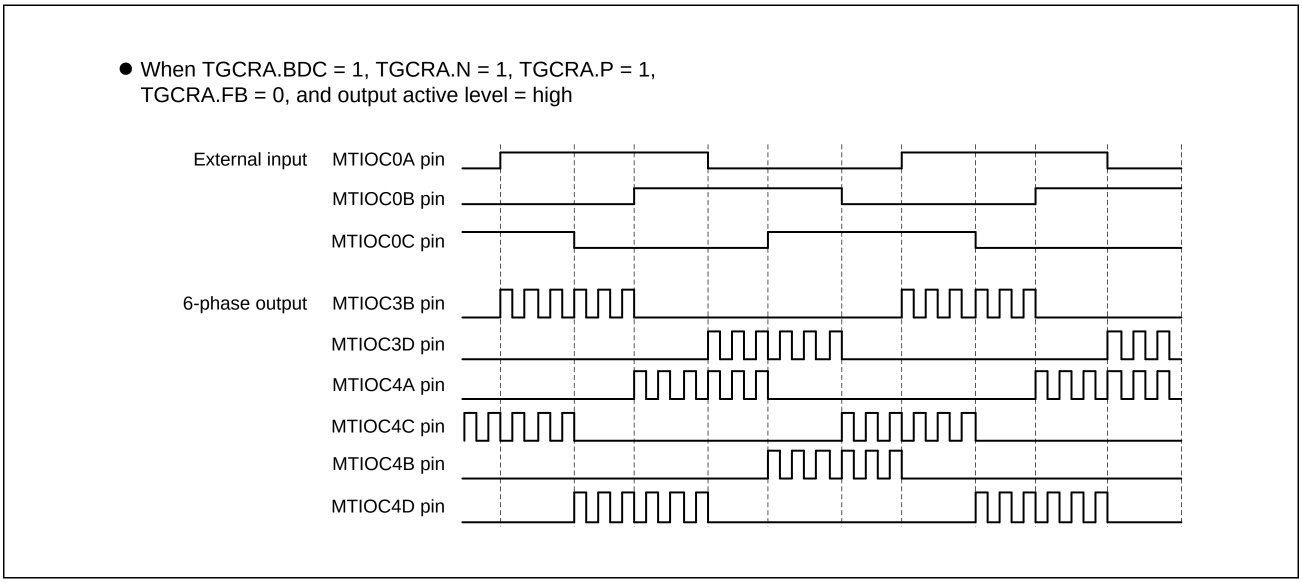

Figure 16.80 Example of Output Phase Switching by External Input (2)

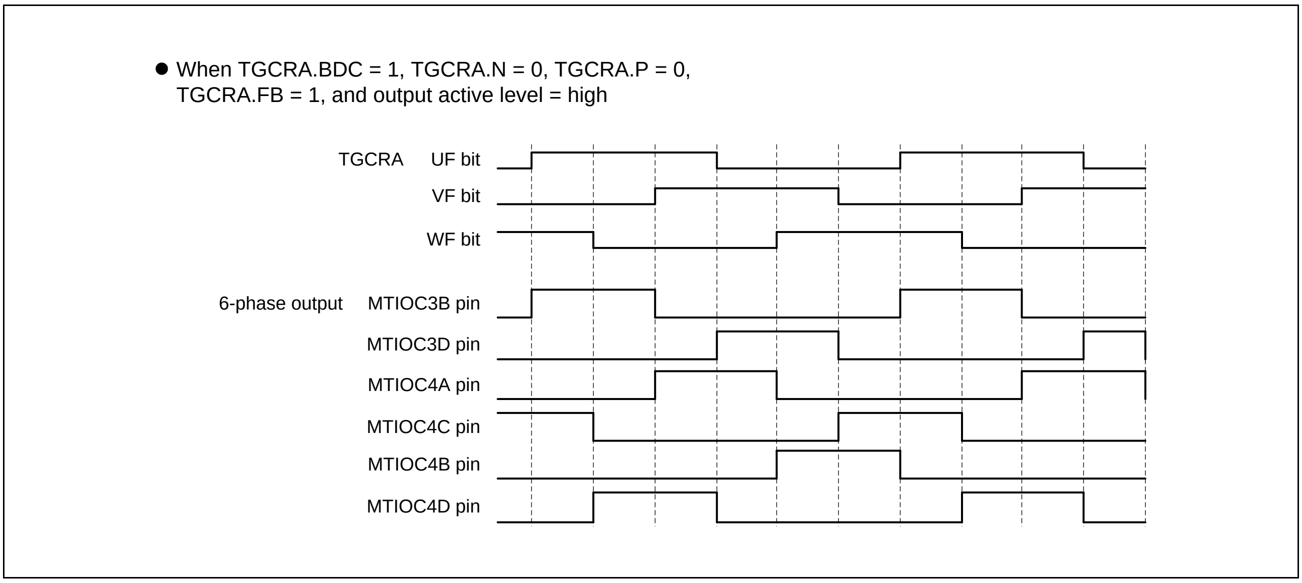

Figure 16.81 Example of Output Phase Switching through UF, VF, and WF Bit Settings (1)

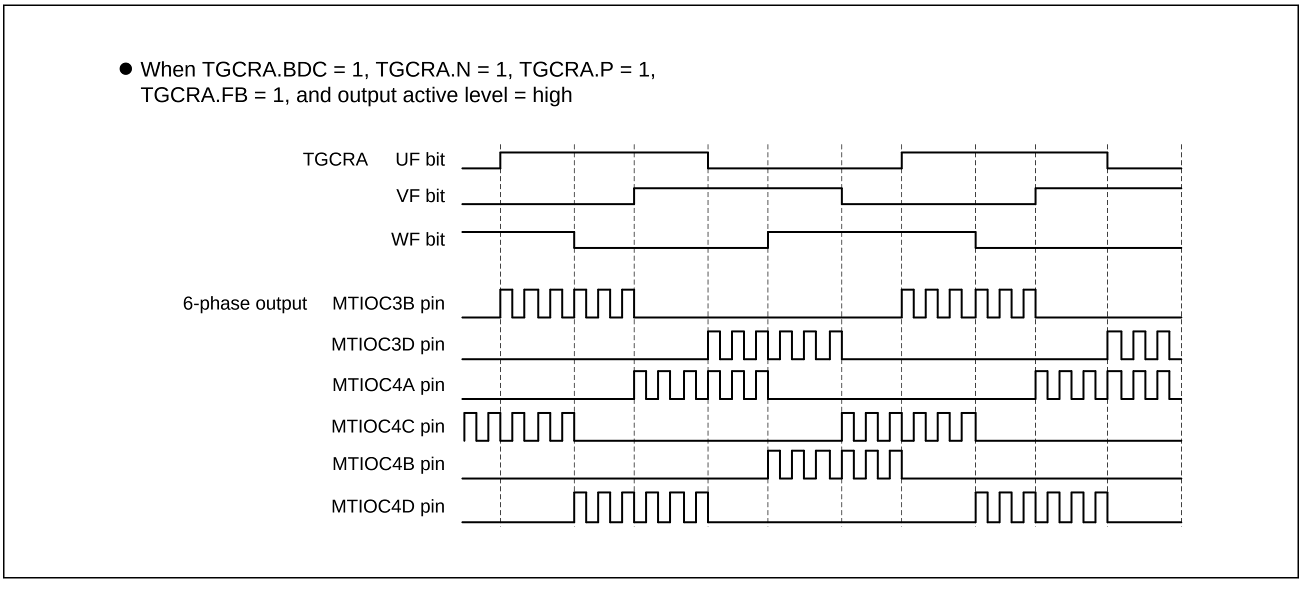

Figure 16.82 Example of Output Phase Switching through UF, VF, and WF Bit Settings (2)

(r) A/D Converter Start Request Setting

In complementary PWM mode, an A/D converter start request can be issued using MTU3.TGRA (MTU6.TGRA) compare match, MTU4.TCNT (MTU7.TCNT) underflow (trough), or compare match on a channel other than MTU3 and MTU4 (MTU6 and MTU7).

When start requests using MTU3.TGRA (MTU6.TGRA) compare match are specified, A/D conversion can be started at the crest of the MTU3.TCNT (MTU6.TCNT) count.

A/D converter start requests can be specified by setting the TIER.TTGE bit. To issue an A/D converter start request at an MTU4.TCNT (MTU7.TCNT) underflow (trough), set the MTU4.TIER.TTGE2 (MTU7.TIER.TTGE2) bit to 1.

(s) Double Buffer Function in Complementary PWM Mode

In complementary PWM mode 3 (transfer at the crest and trough), the PWM output setting resolution can be improved from ±2 to ±1 by setting the TMDR2A.DRS (TMDR2B.DRS) bit to 1.

When setting buffer registers A (TGRD in MTU3, TGRC and TGRD in MTU4, TGRD in MTU6, and TGRC and TGRD in MTU7), set also buffer registers B (TGRE in MTU3, TGRE and TGRF in MTU4, TGRE in MTU6, and TGRE and TGRF in MTU7) at the same time. Each buffer register B should be set to the buffer register A value or (buffer register A value – 1). For details of the setting procedure, refer to **Section 16.3.8(1), Example of Complementary PWM Mode Setting Procedure**.

NOTE

When a buffer register B is set to the buffer register A value, symmetric PWM waveforms are output. When a buffer register B is set to (buffer register A value – 1), asymmetric PWM waveforms are output.

Figure 16.83 shows an example of double buffer operation. Each register data is transferred as follows.

- After TGRD (buffer A) in MTU4 or MTU7 is written to, data is transferred from TGRD (buffer A) in MTU4 or MTU7 to Temp3A or Temp6A (temporary A) and from TGRF (buffer B) in MTU4 or MTU7 to Temp3B or Temp6B (temporary B).
- With timing (1) in the figure, data is transferred from Temp3A or Temp6A (temporary A) to TGRB (compare) in MTU4 or MTU7.
- With timing (2) in the figure, data is transferred from Temp3B or Temp6B (temporary B) to TGRB (compare) in MTU4 or MTU7.

In the crest interval (Tb1 interval), the compare register and temporary register A are valid; in the trough interval (Tb2 interval), the compare register and temporary register B are valid.

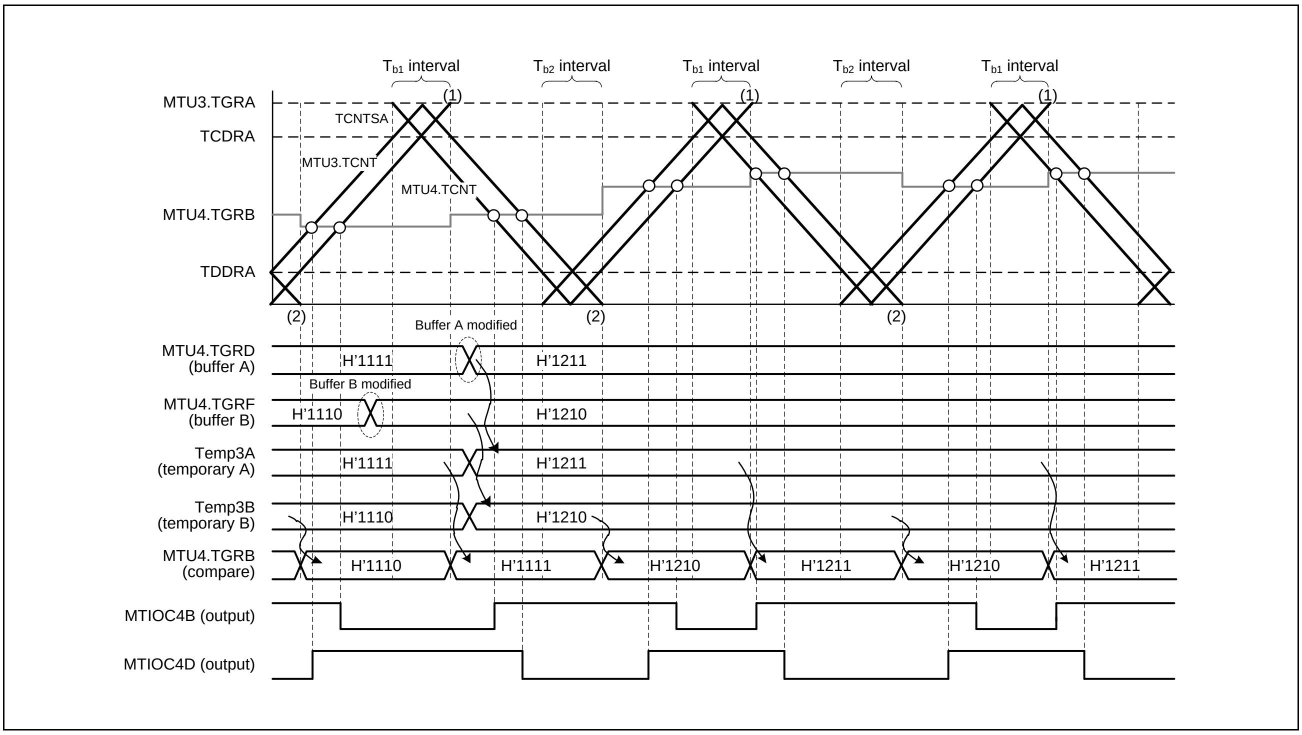

Figure 16.83 Example of Double Buffer Operation

Figure 16.84 shows an example when the buffer write value is smaller than the TDDRA (TDDRB) value, and **Figure 16.85** shows an example when the write value is greater than TCDRA (TCDRB).

In the crest interval, the output is controlled according to the compare match with the compare register or temporary register A; in the trough interval, the output is controlled according to the compare match with the compare register or temporary register B.

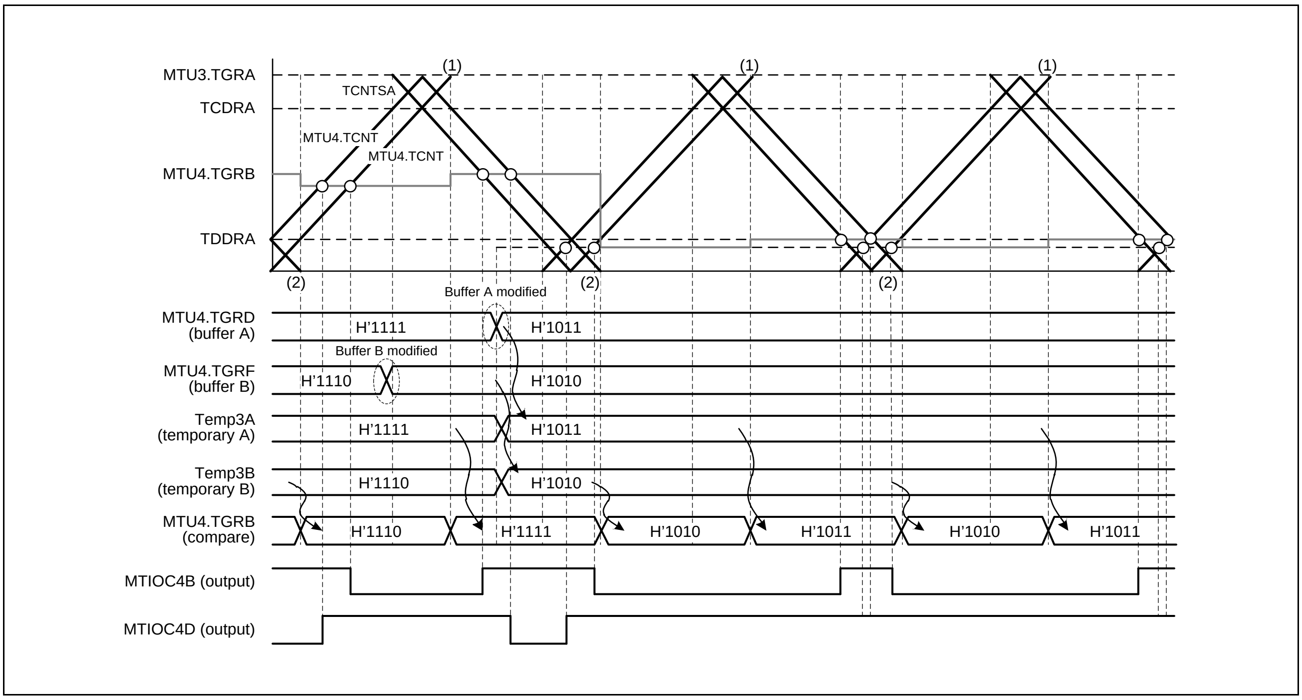

Figure 16.84 Example of Double Buffer Operation (Buffer Write Value is Smaller than TDDRA)

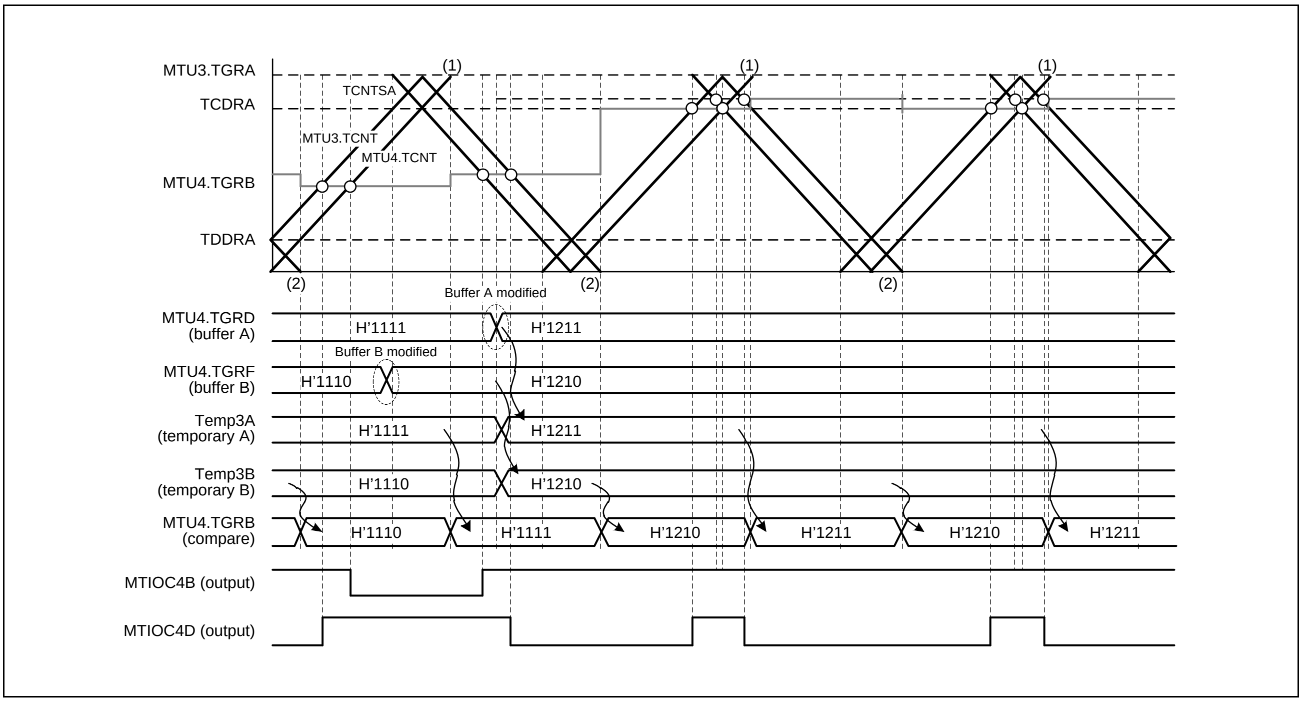

Figure 16.85 Example of Double Buffer Operation (Buffer Write Value is Greater than TCDRA)

(3) Interrupt Skipping Function 1 in Complementary PWM Mode

Interrupts TGIA3 (TGIA6) (at the crest) and TCIV4 (TCIV7) (at the trough) in MTU3 and MTU4 (MTU6 and MTU7) can be skipped up to seven times by making settings in the TITCR1A (TITCR1B) register.

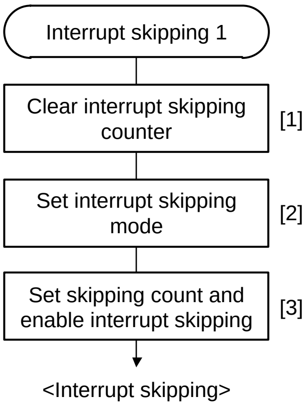
Transfers from a buffer register to a temporary register or a compare register can be skipped in coordination with interrupt skipping by making settings in the TBTERA (TBTERB) register. For the linkage with buffer registers, refer to description (c), Buffer Transfer Control Linked with Interrupt Skipping, below.

A/D converter start requests generated by the A/D converter start request delaying function can also be skipped in coordination with interrupt skipping by making settings in the MTU4.TADCR (MTU7.TADCR) register. For the linkage with the A/D converter start request delaying function, refer to **Section 16.3.9, A/D Converter Start Request Delaying Function**.

The TITCR1A (TITCR1B) register should be set while interrupt skipping function 1 is selected by setting the TITM bit in the timer interrupt skipping mode register (TITMRA or TITMRB) to 0, TGIA3 (TGIA6) interrupt requests are disabled by setting the MTU3.TIER (MTU6.TIER) register, TCIV4 (TCIV7) interrupt requests are disabled by setting the MTU4.TIER (MTU7.TIER) register, and a compare match is not generated. Before changing the skipping count, be sure to clear the T3AEN (T6AEN) and T4VEN (T7VEN) bits to 0 to clear the skipping counter.

(a) Example of Interrupt Skipping Function 1 Setting Procedure

Figure 16.86 shows an example of the interrupt skipping function 1 setting procedure. **Figure 16.87** shows the periods during which interrupt skipping count can be changed.



[1] Set bits T3AEN and T4VEN in the timer interrupt skipping set register 1 (TITCR1A) to 0 to clear the skipping counter.

[2] Set bit TITM in the timer interrupt skipping mode register (TITMRA) to 0 to select interrupt skipping function 1.

[3] Specify the interrupt skipping count within the range from 0 to 7 times in bits T3ACOR2 to T3ACOR0 and T4VCOR2 to T4VCOR0 in TITCR1A, and enable interrupt skipping through bits T3AEN and T4VEN.

Note: The setting of TITCR1A must be done while the TGIA3 and TCIV4 interrupt requests are disabled by the settings of MTU3.TIER and MTU4.TIER under the conditions in which a compare match is not generated. Before changing the skipping count, be sure to clear the T3AEN and T4VEN bits to 0 to clear the skipping counter.

Figure 16.86 Example of Interrupt Skipping Function 1 Setting Procedure

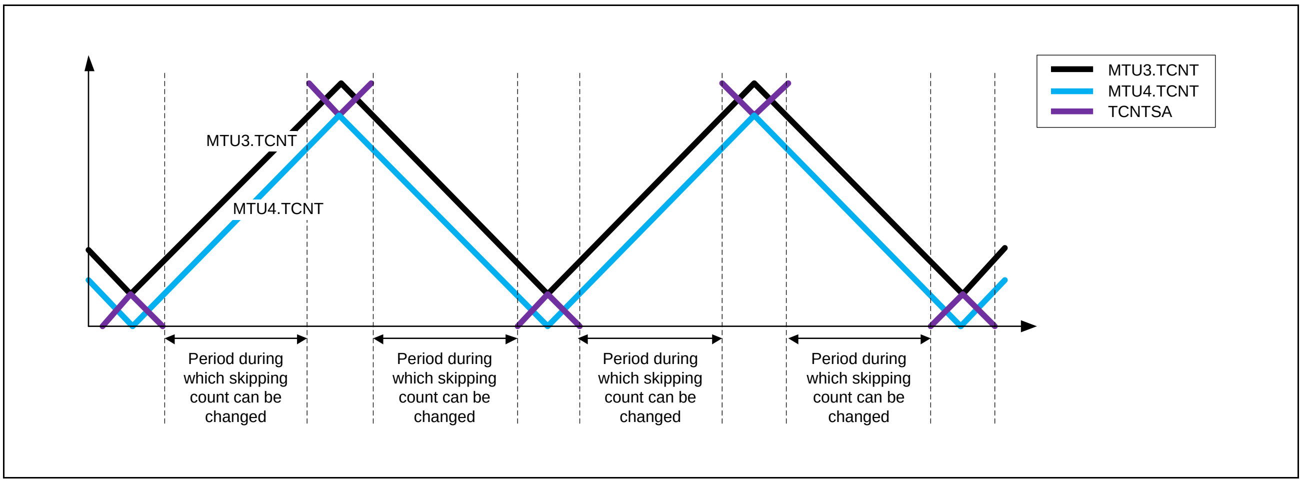


Figure 16.87 Periods during which Interrupt Skipping Count can be Changed

(b) Example of Interrupt Skipping Function 1

Figure 16.88 shows an example of TGIA3 (TGIA6) interrupt skipping in which the interrupt skipping count is set to three by the T3ACOR (T6ACOR) bits and the T3AEN (T6AEN) bit is set to 1 in the TITCR1A (TITCR1B) register.

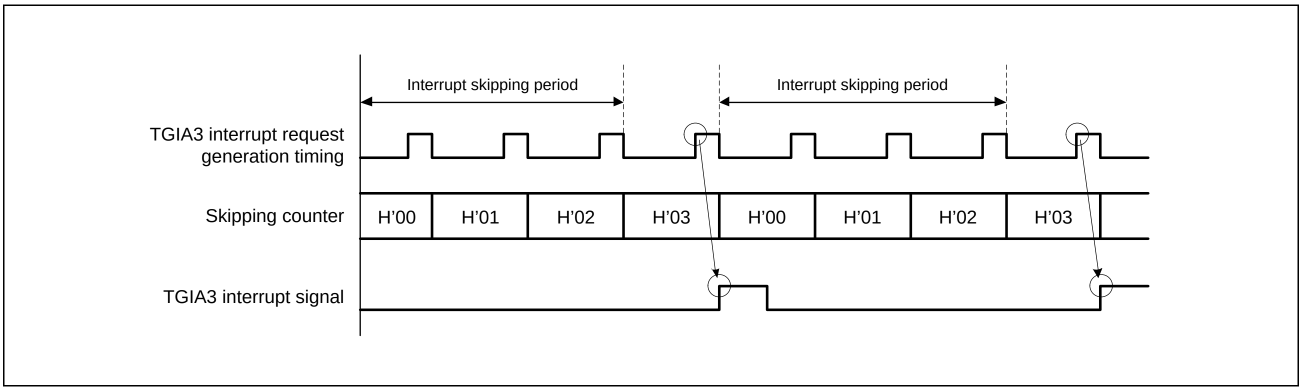

Figure 16.88 Example of Interrupt Skipping Function 1

(c) Buffer Transfer Control Linked with Interrupt Skipping

In complementary PWM mode, whether to transfer data from a buffer register to a temporary register and whether to link the transfer with interrupt skipping can be specified with the BTE[1:0] bits in the TBTERA (TBTERB) register.

Figure 16.89 shows an example of operation when buffer transfer is disabled (BTE[1:0] = 01b). While this setting is valid, data is not transferred from the buffer register to the temporary register.

Figure 16.90 shows an example of operation when buffer transfer is linked with interrupt skipping (BTE[1:0] = 10b). While this setting is valid, data is not transferred from the buffer register outside the buffer transfer-enabled period.

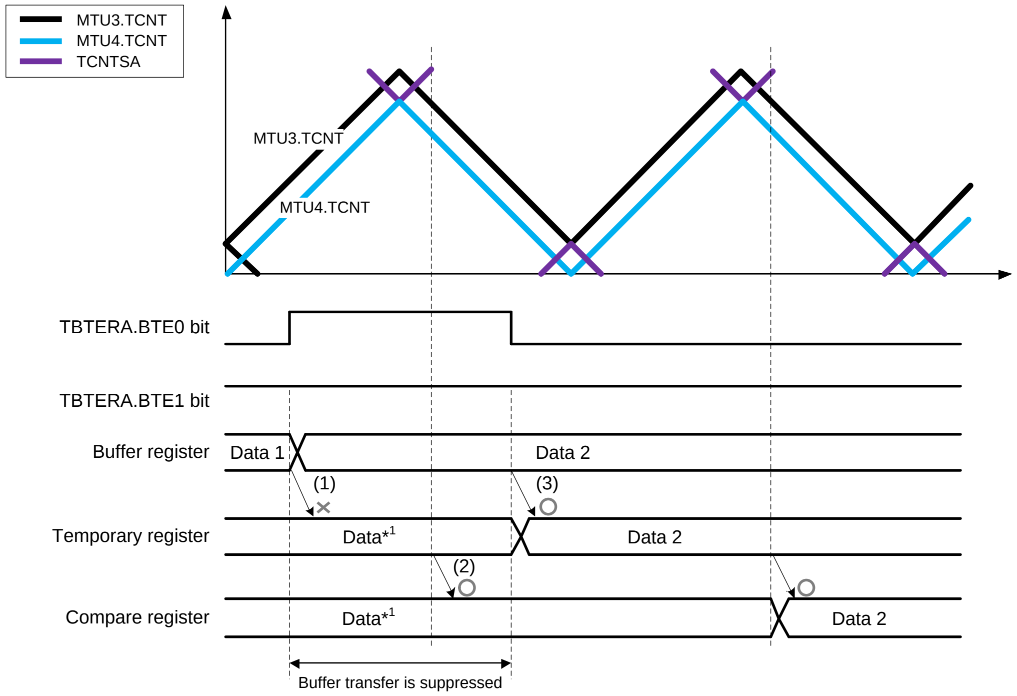
Note that the buffer transfer-enabled period differs depending on whether only the T3AEN (T6AEN) bit in the TITCR1A (TITCR1B) register is set to 1, only the T4VEN (T7VEN) bit in the TITCR1A (TITCR1B) register is set to 1, or both the T3AEN and T4VEN (T6AEN and T7VEN) bits are set to 1. **Figure 16.91** shows the relationship between the T3AEN (T6AEN) and T4VEN (T7VEN) bit settings in TITCR1A (TITCR1B) and buffer transfer-enabled period.

NOTE

This function must be used in combination with interrupt skipping function 1.

When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits in the timer interrupt skipping set register 1 (TITCR1A or TITCR1B) are cleared to 0 or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are cleared to 0), make sure that buffer transfer is not linked with interrupt skipping (clear the BTE1 bit in TBTERA or TBTERB to 0).

If buffer transfer is linked with interrupt skipping while interrupt skipping is disabled, buffer transfer is never performed.



(1) No data is transferred from the buffer register to the temporary register in the buffer transfer-disabled period (bits BTE[1:0] in TBTERA are set to 01b).

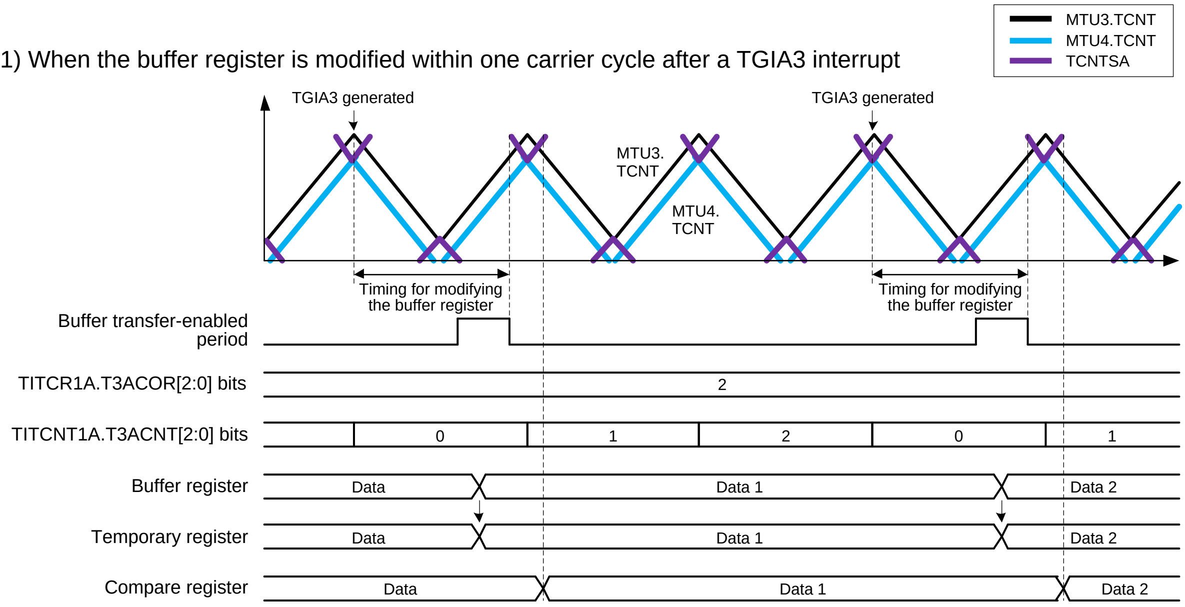
(2) Data is transferred from the temporary register to the compare register even in the buffer transfer-disabled period.

(3) After buffer transfer is enabled, data is transferred from the buffer register to the temporary register.

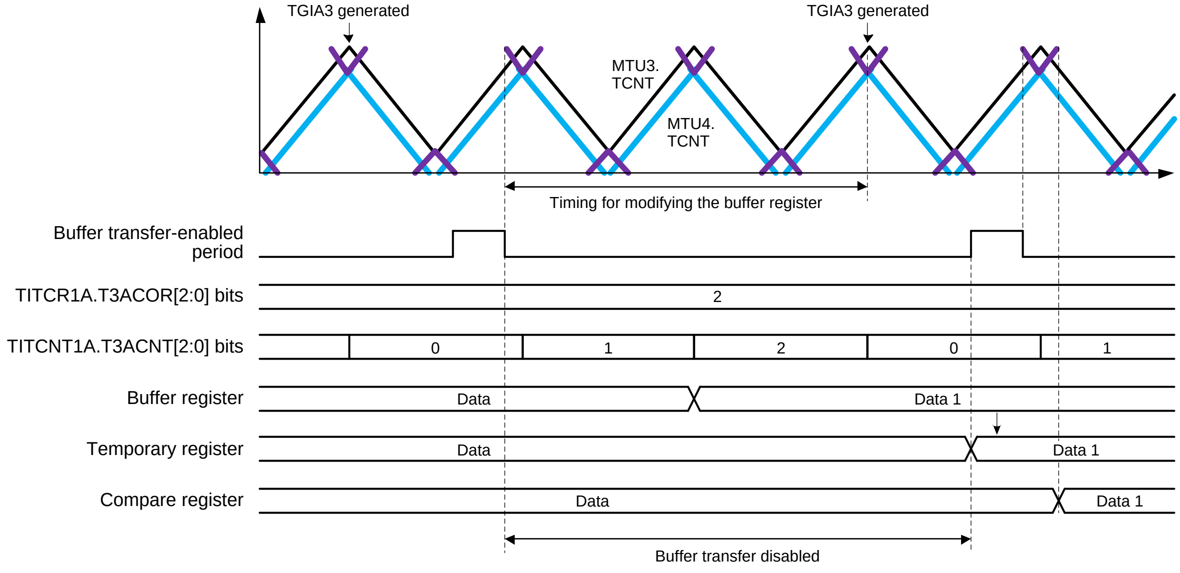
Note 1. When buffer transfer at the crest is selected.

Figure 16.89 Example of Operation When Buffer Transfer is Disabled (BTE[1:0] = 01b)

(1) When the buffer register is modified within one carrier cycle after a TGIA3 interrupt

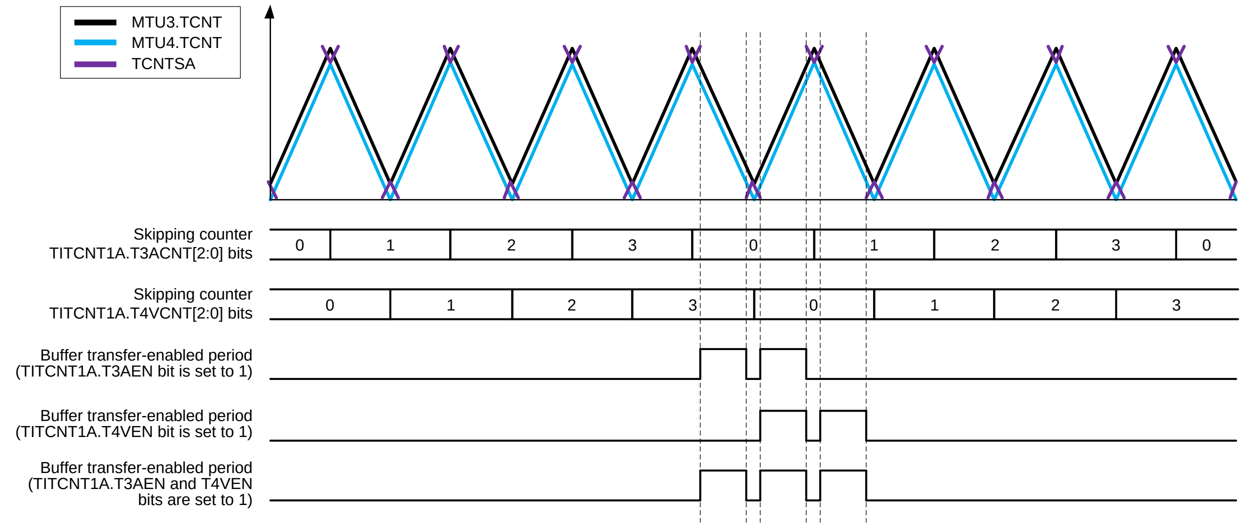


(2) When the buffer register is modified after one carrier cycle has elapsed after a TGIA3 interrupt



Note: Buffer transfer at the crest is selected.
The skipping count is set to two. The TITCR1A.T3AEN bit is set to 1.

Figure 16.90 Example of Operation When Buffer Transfer is Linked with Interrupt Skipping (BTE[1:0] = 10b)



Note: The skipping count is set to three.
Buffer operation is set to transfer at the crest and trough.

Figure 16.91 Relationship between Bits T3AEN and T4VEN in TITCR1A and Buffer Transfer-Enabled Period

(4) Complementary PWM Mode Output Protection Functions

The following output protection functions are provided for complementary PWM mode.

(a) Register and Counter Miswrite Prevention Function

Access from the CPU to the mode registers, control registers, compare registers, and counters can be enabled or disabled by setting the RWE bit in the TRWERA (TRWERB) register. The applicable registers are some of the registers in MTU3, MTU4, MTU6, and MTU7 shown below:

> MTU3.TCR, MTU4.TCR, MTU3.TCR2, MTU4.TCR2, MTU3.TMDR1, MTU4.TMDR1, MTU3.TIORH, MTU4.TIORH, MTU3.TIORL, MTU4.TIORL, MTU3.TIER, MTU4.TIER, MTU3.TCNT, MTU4.TCNT, MTU3.TGRA, MTU4.TGRA, MTU3.TGRB, MTU4.TGRB, MTU.TOERA, MTU.TOCR1A, MTU.TOCR2A, MTU.TGCRA, MTU.TCDRA, MTU.TDDRA MTU6.TCR, MTU7.TCR, MTU6.TCR2, MTU7.TCR2, MTU6.TMDR1, MTU7.TMDR1, MTU6.TIORH, MTU7.TIORH, MTU6.TIORL, MTU7.TIORL, MTU6.TIER, MTU7.TIER, MTU6.TCNT, MTU7.TCNT, MTU6.TGRA, MTU7.TGRA, MTU6.TGRB, MTU7.TGRB, MTU.TOERB, MTU.TOCR1B, MTU.TOCR2B, MTU.TCDRB, and MTU.TDDRB

47 registers in total

This function can disable CPU access to the mode registers, control registers, and counters to prevent miswriting due to CPU runaway. In the access-disabled state, the applicable registers are read as undefined and writing to these registers is ignored.

(b) Halting of PWM Output by External Signal

The PWM output pins of MTU0, MTU3, MTU4, MTU6, and MTU7 can be set to the high-impedance state automatically.

See **Section 17, Port Output Enable 3 (POE3)**, for details.

16.3.9 A/D Converter Start Request Delaying Function

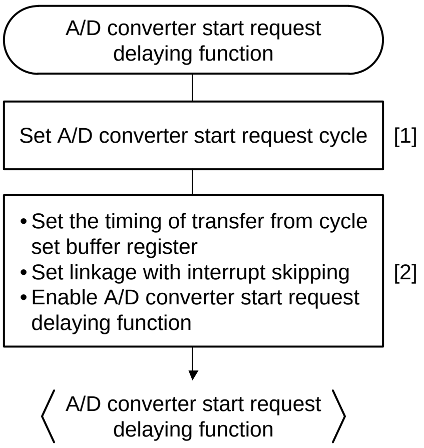
A/D converter start requests can be issued in MTU4 or MTU7 by making settings in the timer A/D converter start request control register (MTU4.TADCR or MTU7.TADCR), timer A/D converter start request cycle set registers (MTU4.TADCORA and MTU4.TADCORB, or MTU7.TADCORA and MTU7.TADCORB), and timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA and MTU4.TADCOBRB, or MTU7.TADCOBRA and MTU7.TADCOBRB).

The A/D converter start request delaying function compares MTU4.TCNT with MTU4.TADCORA or MTU4.TADCORB (MTU7.TCNT with MTU7.TADCORA or MTU7.TADCORB), and when their values match, the function issues a respective A/D converter start request (TRG4AN or TRG4BN (TRG7AN or TRG7BN)).

A/D converter start requests (TRG4AN and TRG4BN (TRG7AN and TRG7BN)) can be skipped in coordination with interrupt skipping by making settings in the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in the TADCR register in MTU4 (the ITA6AE, ITA7VE, ITB6AE, and ITB7VE bits in the TADCR register in MTU7).

(1) Example of Procedure for Specifying A/D Converter Start Request Delaying Function

Figure 16.92 shows an example of procedure for specifying the A/D converter start request delaying function.



[1] Set the cycle in the timer A/D converter start request cycle buffer register (MTU4.TADCOBRA or MTU4.TADCOBRB) and timer A/D converter start request cycle register (MTU4.TADCORA or MTU4.TADCORB).
(When the timing of transfer from the cycle buffer register to cycle register is set to the trough, or both trough and crest in step [2] below, the same initial value must be specified in the cycle buffer register and cycle register because transfer is performed immediately after counting starts.)

[2] Use bits BF[1:0] in the timer A/D converter start request control register (TADCR in MTU4) to specify the timing of transfer from the timer A/D converter start request cycle buffer register to the A/D converter start request cycle register.

- Specify whether to link with interrupt skipping through bits ITA3AE, ITA4VE, ITB3AE, and ITB4VE.
- Use bits UT4AE, DT4AE, UT4BE, and DT4BE to enable A/D converter start requests (TRG4AN or TRG4BN).

Note 1. Set up TADCR in MTU4 while TCNT in MTU4 is stopped.

Note 2. Set bit BF1 of TADCR in MTU4 to 0 when complementary PWM mode is not selected.

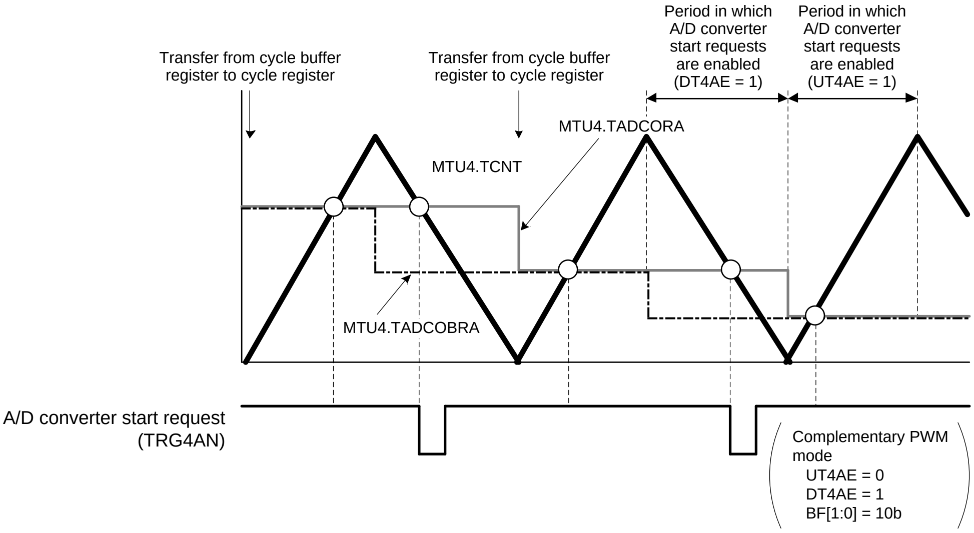
Note 3. Set bits ITA3AE, ITA4VE, ITB3AE, ITB4VE, DT4AE, and DT4BE to 0 when complementary PWM mode is not selected.

Note 4. Set bits ITA3AE, ITA4VE, ITB3AE, and ITB4VE to 0 when interrupt skipping is disabled.

Figure 16.92 Example of Procedure for Specifying A/D Converter Start Request Delaying Function (MTU3 and MTU4)

(2) Basic Example of A/D Converter Start Request Delaying Function Operation

Figure 16.93 shows a basic example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when the trough of MTU4.TCNT (MTU7.TCNT) is specified for the buffer transfer timing and an A/D converter start request signal is output during MTU4.TCNT (MTU7.TCNT) down-counting.



Period in which A/D converter start requests are enabled (UT4AE = 1): 0 ≤ MTU4.TCNT ≤ TCDR – 1
Period in which A/D converter start requests are enabled (DT4AE = 1): TCDR ≥ MTU4.TCNT ≥ 1
UT4AE, DT4AE, BF[1:0]: Bits in TADCR

Figure 16.93 Basic Example of A/D Converter Start Request Signal (TRG4AN) Operation

(3) Period in which A/D Converter Start Requests are Enabled

An A/D converter start request (TRG4AN or TRG4BN) can be issued when the TCNT counter value in MTU4 (MTU7) matches the value of the corresponding cycle set register (TADCORA or TADCORB) in MTU4 (MTU7) within the period specified by the UT4AE or UT4BE (UT7AE or UT7BE) bit of TADCR in MTU4 (MTU7).

When the UT4AE or UT4BE (UT7AE or UT7BE) bit is set to 1 in complementary PWM mode, issuing of AD converter start requests is enabled for the period of TCNT up-counting (0 ≤ TCNT ≤ TCDR - 1) in MTU4 (MTU7). When the DT4AE or DT4BE (DT7AE or DT7BE) bit is set to 1, issuing of AD converter start requests is enabled for the period of TCNT down-counting (TCDR ≥ TCNT ≥ 1) in MTU4 (MTU7) (**Figure 16.93**).

(4) Buffer Transfer

The data in the timer A/D converter start request cycle set registers (MTU4.TADCORA and MTU4.TADCORB, or MTU7.TADCORA and MTU7.TADCORB) is updated by writing data to the timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA and MTU4.TADCOBRB, or MTU7.TADCOBRA and MTU7.TADCOBRB). Data is transferred from the buffer registers to the respective cycle set registers at the timing selected with the BF[1:0] bits in the MTU4.TADCR (MTU7.TADCR) register.

In complementary PWM mode, data is also transferred from the timer A/D converter start request cycle set buffer registers to the timer A/D converter start request cycle set registers when MTU4.TGRD (MTU7.TGRD) register is updated.

When using buffer transfer in complementary PWM mode, pay attention to the buffer transfer timing. For details, refer to **Section 16.6.26, Notes on A/D Converter Start Request Delaying Function in Complementary PWM Mode**. When complementary PWM mode is not selected, be sure to clear the BF1 bit of the TADCR register in MTU4 or MTU7.

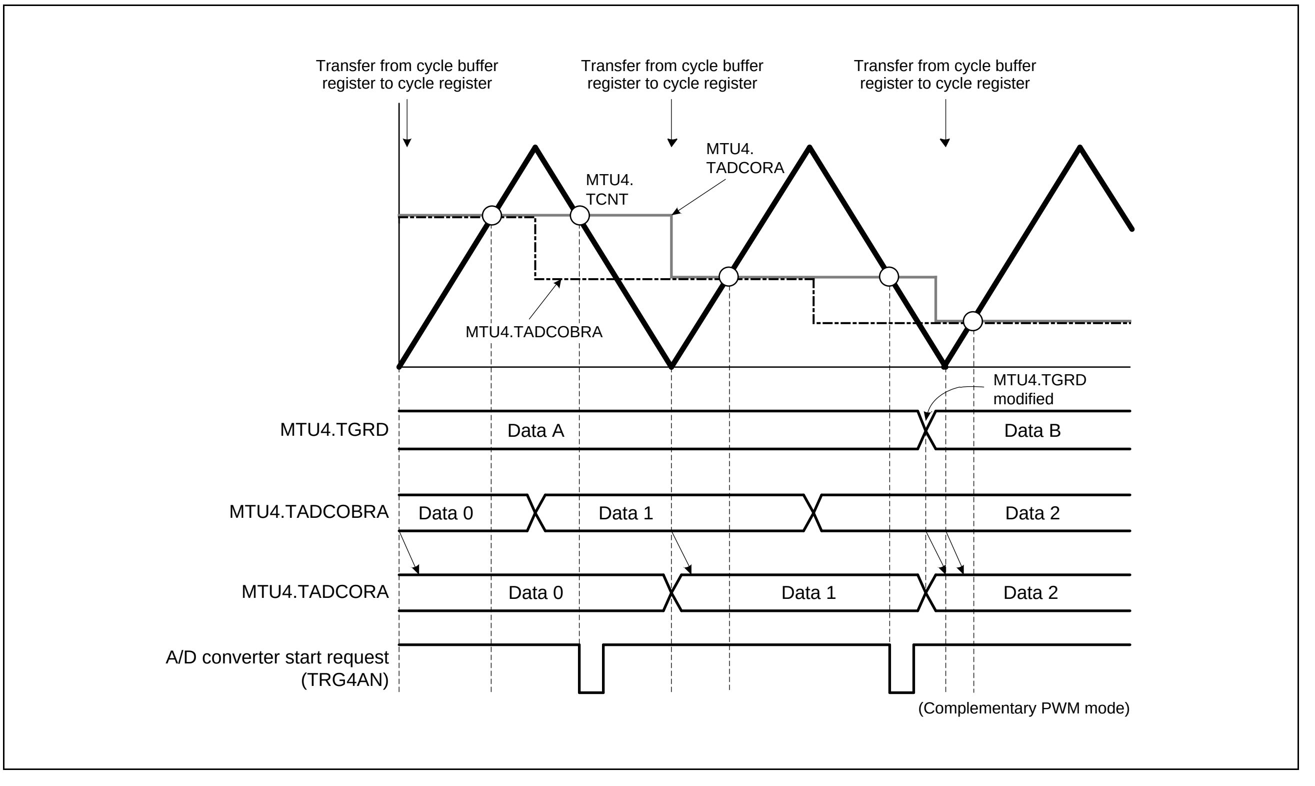


Figure 16.94 Example of A/D Converter Start Request Signal (TRG4AN) and Buffer Transfer Operation

(5) A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 1

In complementary PWM mode, A/D converter start requests (TRG4AN and TRG4BN (TRG7AN and TRG7BN)) can be issued in coordination with interrupt skipping 1 by setting the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits of the TADCR register in MTU4 (MTU7).

Figure 16.95 shows an example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when TRG4AN (TRG7AN) output is enabled during MTU4.TCNT (MTU7.TCNT) up-counting and down-counting and A/D converter start requests are linked with interrupt skipping 1.

Figure 16.96 shows another example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when TRG4AN (TRG7AN) output is enabled during MTU4.TCNT (MTU7.TCNT) up-counting and A/D converter start requests are linked with interrupt skipping 1.

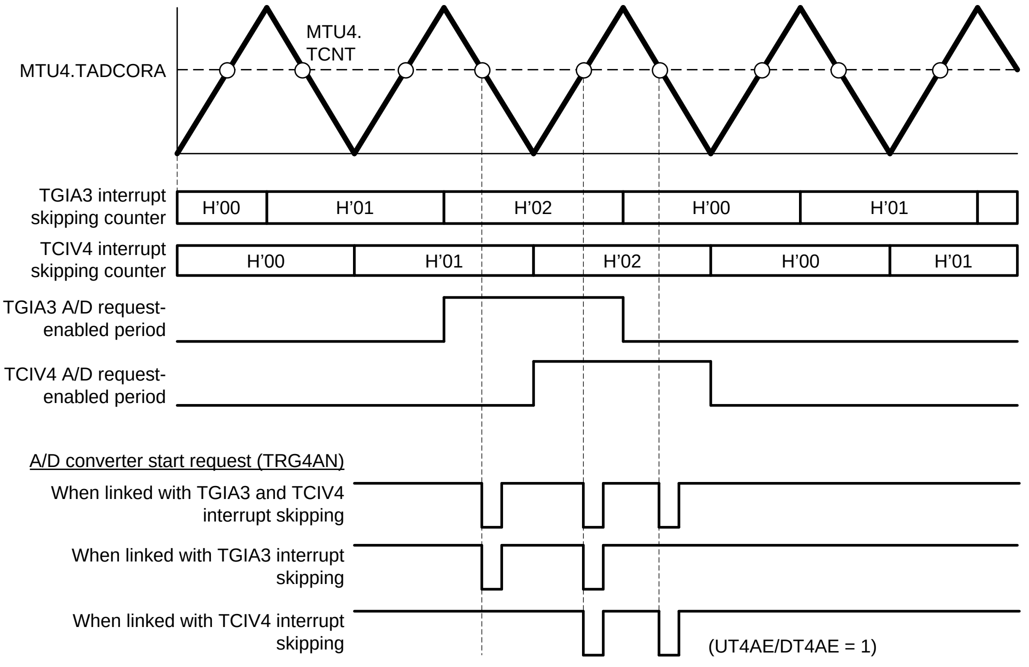
When complementary PWM mode is not selected, A/D converter start request delaying function cannot be used in coordination with interrupt skipping 1; clear the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits of the TADCR register to 0 in MTU4 (MTU7).

NOTE

This function should be used in combination with interrupt skipping 1.

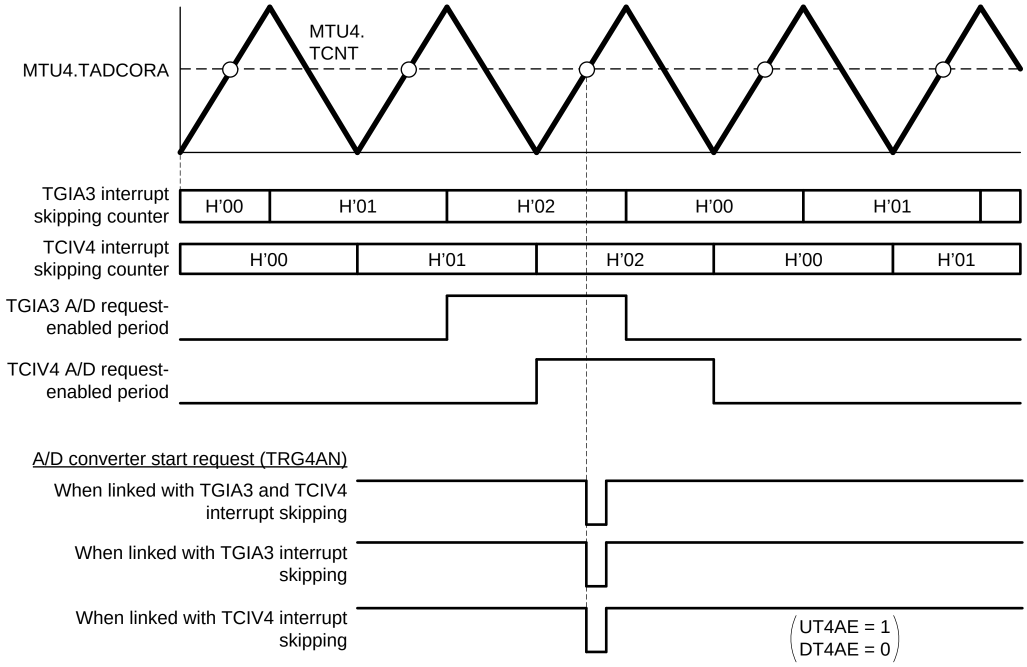
When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits in the timer interrupt skipping set register (TITCR1A (TITCR1B)) are cleared to 0 or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are cleared to 0), make sure that A/D converter start requests are not linked with interrupt skipping 1 (clear the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits in the timer A/D converter start request control register (MTU4.TADCR (MTU7.TADCR)) to 0).

When this function is used, MTU4.TADCORA and MTU4.TADCORB (MTU7.TADCORA and MTU7.TADCORB) should be set with the value ranging H’0002 to the value set in TCDRA minus 2 (value set in TCDRB minus 2).



Note: When the interrupt skipping count is set to two.

Figure 16.95 Example of A/D Converter Start Request Signal (TRG4AN) Operation Linked with Interrupt Skipping Function 1 (UT4AE and DT4AE = 1)



Note: When the interrupt skipping count is set to two.

Figure 16.96 Example of A/D Converter Start Request Signal (TRG4AN) Operation Linked with Interrupt Skipping Function 1 (UT4AE = 1, DT4AE = 0)

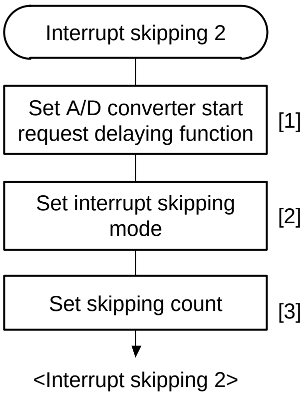
(6) A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 2

By setting the TITM bit to 1 in the TITMRA (TITMRB) register, the counter starts down-counting from the value (0 to 7) set in the TRG4COR[2:0] (TRG7COR[2:0]) bits in TITCR2A (TITCR2B) register every time an A/D converter start trigger (TRG4AN or TRG4BN (TRG7AN or TRG7BN)) is generated. When the counter value reaches 0 and is reloaded, the TRG4AN and TRG4BN (TRG7AN and TRG7BN) interrupts become valid and an A/D converter start request signal (TRG4ABN (TRG7ABN)) is output.

This function is valid only when the A/D converter request delaying function is enabled.

(a) Example of Procedure for Setting Interrupt Skipping Function 2

Figure 16.97 shows an example of procedure for setting interrupt skipping function 2.



[1] Set the A/D converter start request delaying function. For details, refer to **Section 16.3.9(1), Example of Procedure for Specifying A/D Converter Start Request Delaying Function**.

[2] Set bit TITM in the TITMRA (TITMRB) register to 1 to select interrupt skipping function 2.

[3] Specify the interrupt skipping count within the range from 0 to 7 times in bits TRG4COR[2:0] in TITCR2A (TITCR2B) register.

Figure 16.97 Example of Procedure for Setting Interrupt Skipping Function 2

(b) Example of Interrupt Skipping Function 2 Operation

Figure 16.98 shows an example of interrupt skipping 2 operation.

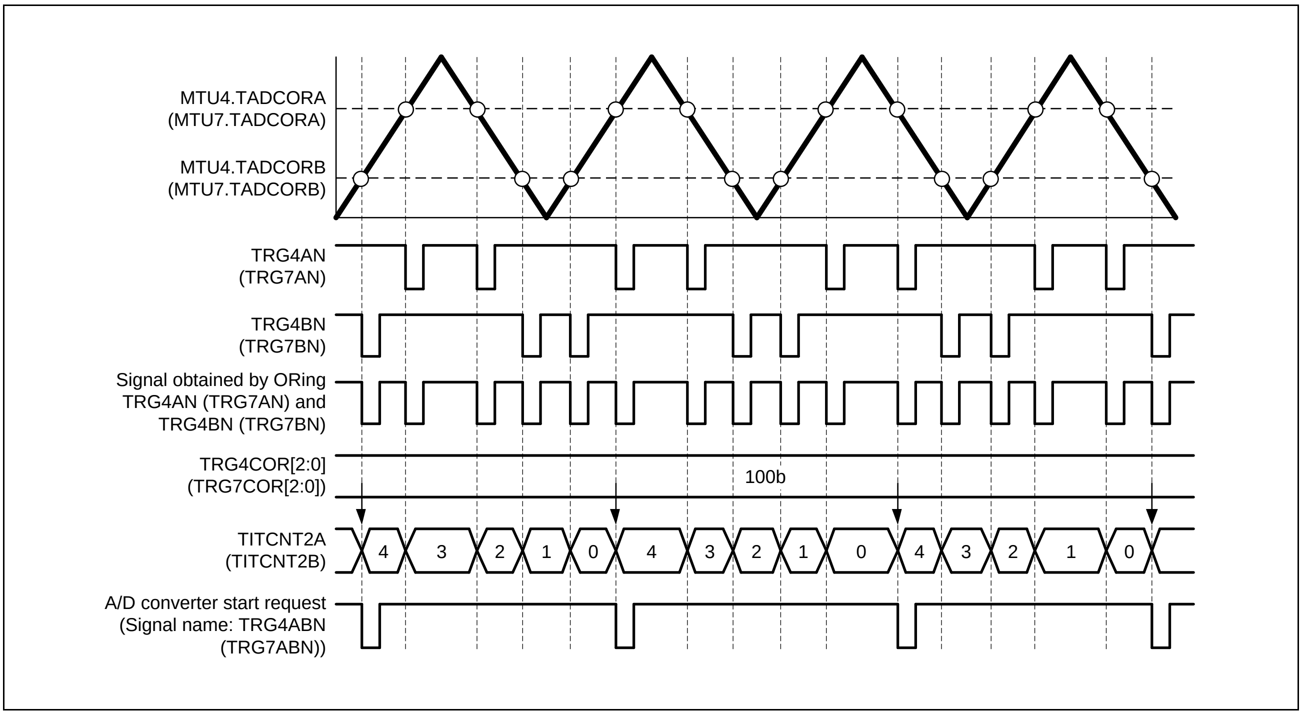


Figure 16.98 Example of Interrupt Skipping 2 Operation (Skipping Count is Set to Four)

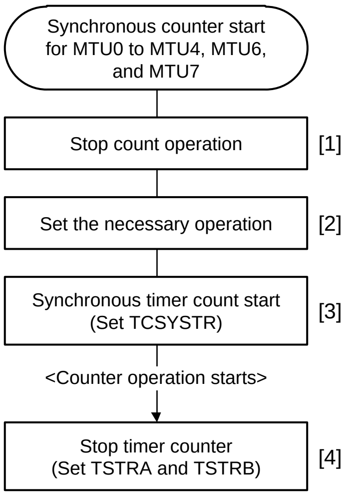
16.3.10 Synchronous Operation of MTU0 to MTU4, MTU6, and MTU7

(1) Synchronous Counter Start for MTU0 to MTU4, MTU6, and MTU7

The counters in MTU0 to MTU4, MTU6, and MTU7 can be started synchronously by making the TCSYSTR settings.

(a) Example of Procedure for Setting Synchronous Counter Start for MTU0 to MTU4, MTU6, and MTU7

Figure 16.99 shows an example of the procedure for specifying synchronous counter start in MTU0 to MTU4, MTU6, and MTU7.



[1] Set TSTRA and TSTRB to stop the counters used for synchronous start operation.

[2] Specify the necessary operation with appropriate registers such as TCR, TMDR1, and TMDR2.

[3] In TCSYSTR, set the bits corresponding to the counters to be started synchronously to 1 at the same time. When TCSYSTR is set, TSTRA and TSTRB for the target timer counters are automatically set appropriately, the counters start synchronously, and TCSYSTR is automatically cleared.

[4] To stop a timer counter, clear the bit in TSTRA or TSTRB that corresponds to the counter to 0.

Note 1. Clearing a bit in TCSYSTR corresponding to an operating counter to 0 does not stop the counter.

Note 2. To start counters synchronously in reset-synchronized PWM mode or complementary PWM mode using MTU3 and MTU4 or MTU6 and MTU7, set the bits in TCSYSTR that correspond to MTU 3 to MTU4, MTU6, and MTU7 to 1 at the same time.

Figure 16.99 Example of Procedure for Specifying Synchronous Counter Start in MTU0 to MTU4, MTU6, and MTU7

(b) Examples of Synchronous Counter Start Operation

Figure 16.100 shows an example of the synchronous counter start operation in MTU0 to MTU4, MTU6, and MTU7.

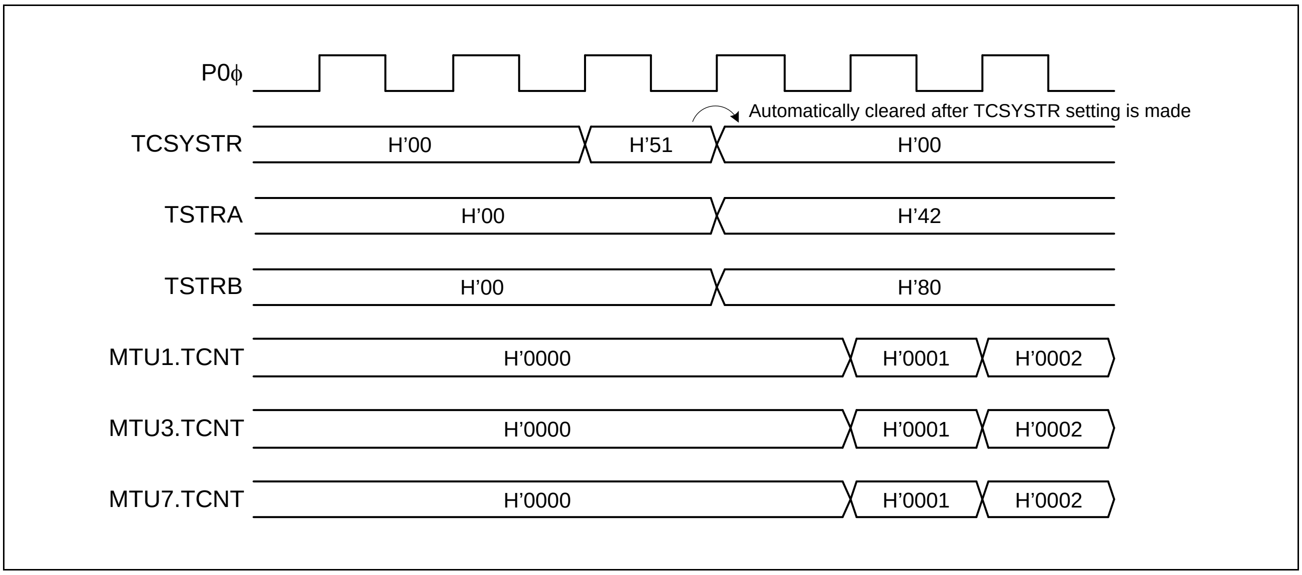


Figure 16.100 Example of Synchronous Counter Start Operation in MTU0 to MTU4, MTU6, and MTU7

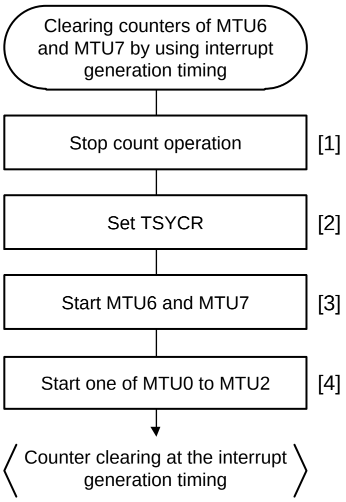
(2) Synchronous Counter Clearing for MTU6 and MTU7

The counters in MTU6 and MTU7 can be cleared by the TGImn interrupt generation timing (m = A to D; n = 0 to 2) through the TSYCR setting.

(a) Example of Procedure for Specifying Synchronous Counter Clearing for MTU6 and MTU7

Figure 16.101 shows an example of the procedure for specifying synchronous counter clearing in MTU6 and MTU7 by using the interrupt generation timing.



[1] Set TSTRA and TSTRB to stop the counters used for this function.

[2] Use TSYCR to specify the source to be used for the MTU6.TCNT and MTU7.TCN counter clearing.

[3] Start MTU6.TCNT or MTU7.TCNT.

[4] Start MTU0.TCNT, MTU1.TCNT, or MTU2.TCNT.

Note: The TSYCR setting is ignored while the counter is stopped. The setting becomes valid after MTU6.TCNT or MTU7.TCNT is started.

Figure 16.101 Example of Procedure for Specifying Synchronous Counter Clearing in MTU6 and MTU7

(b) Examples of Synchronous Counter Clearing in MTU6 and MTU7

Figure 16.102 and **Figure 16.103** show examples of synchronous counter clearing in MTU6 and MTU7 by using the interrupt generation timing.

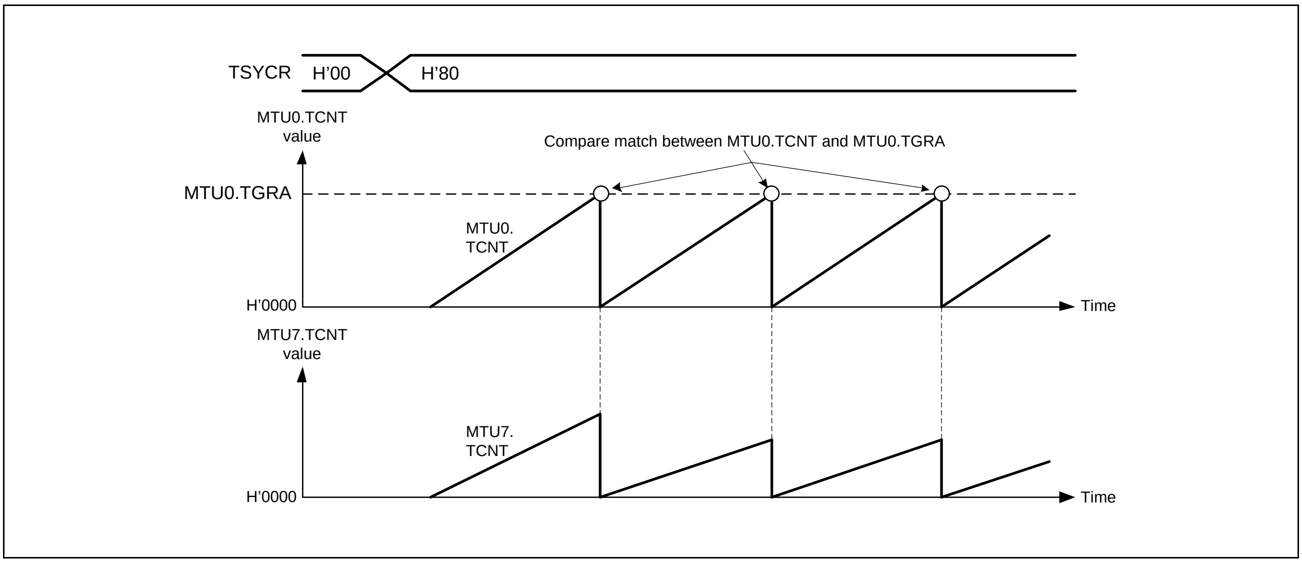


Figure 16.102 Example of Synchronous Counter Clearing in MTU6 and MTU7 (1)

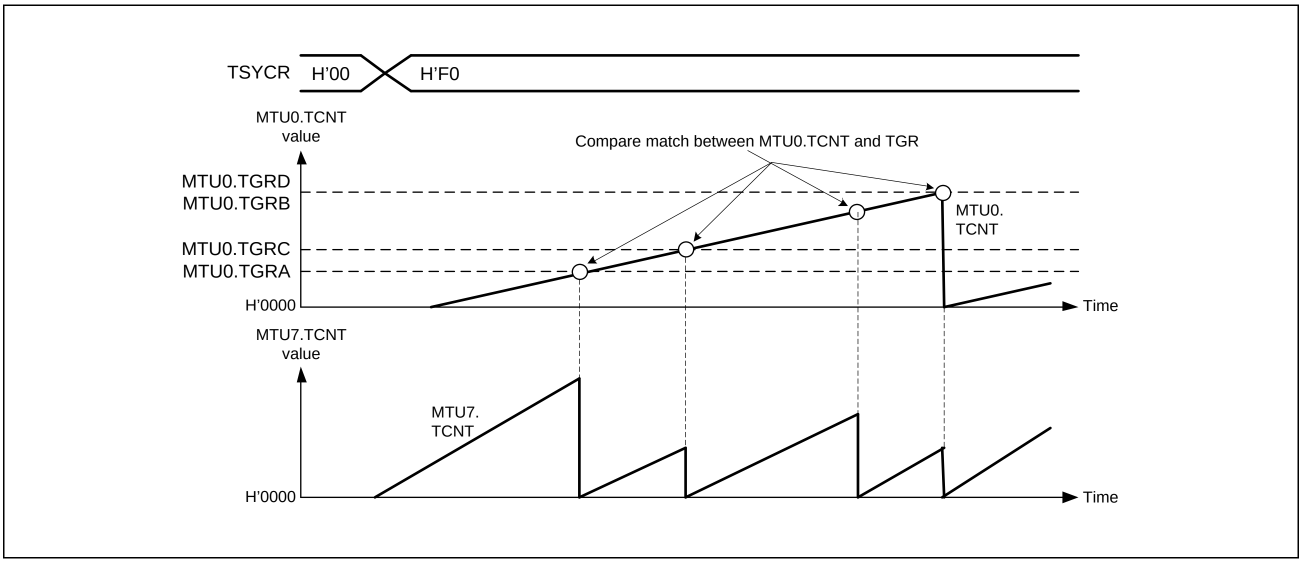

Figure 16.103 Example of Synchronous Counter Clearing in MTU6 and MTU7 (2)

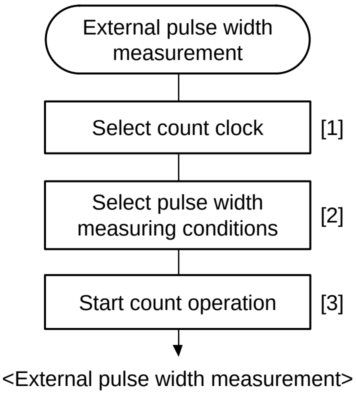
16.3.11 External Pulse Width Measurement

The pulse widths of up to three external input lines can be measured in MTU5.

When the IOC[4:0] bits in MTU5.TIORU, MTU5.TIORV, MTU5.TIORW are set for pulse width measurement, the pulse width of the signal input to the MTIC5U, MTIC5V, and MTIC5W pins are measured. TCNTU, TCNTV, and TCNTW count up while the level specified by the IOC[4:0] bits is input.

Figure 16.104 shows an example of setting external pulse width measurement, and **Figure 16.105** an example of external pulse width measurement.



[1] Use the TPSC1 and TPSC0 bits in MTU5.TCRU, MTU5.TCRV, or MTU5.TCRW to select the count clock.

[2] In MTU5.TIORU, MTU5.TIORV, or MTU5.TIORW, select the high level or low level for the pulse width measuring condition.

[3] Set bit CSTU5, CSTV5, or CSTW5 in MTU5.TSTR to 1 to start count operation.

Note: When MTU6 and MTU7 are not operating in complementary PWM mode, note the following 1 to 3.

1. Set the CMPCLR5U, CMPCLR5V, and CMPCLR5W bits in the TCNTCMPCLR register to 0.
2. Set the TGIE5U, TGIE5V, and TGIE5W bits in MTU5.TIER to 0.
3. The TCNT value is not captured in the TGR register.

Figure 16.104 Example of External Pulse Width Measurement Setting Procedure

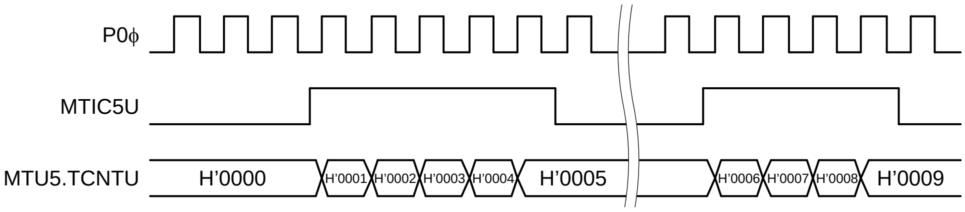


Figure 16.105 Example of External Pulse Width Measurement (Measuring High Pulse Width)

16.3.12 Dead Time Compensation

MTU5 to MTU7 can be used in combination to compensate for the delay in the dead time (the delay between complementary PWM output and inverter output).

Figure 16.106 shows an example of a motor control circuit in which the combination of MTU5 to MTU7 is used to compensate for the dead time delay.

The external pulse measurement function of MTU5 allows the specification of a correction to the duty cycle specified in the PWM output compare registers by measuring the delay between the complementary PWM output and inverter output. This can be used for dead time compensation for the PWM output waveform during complementary PWM operation of MTU6 and MTU7 (**Figure 16.107**).

Figure 16.108 shows the procedure for setting dead time compensation using MTU5 to MTU7. For details on MTU5 operation at this time, refer to **Section 16.3.13, TCNTU, TCNTV, and TCNTW Capture at Crest and/or Trough in Complementary PWM Mode**.

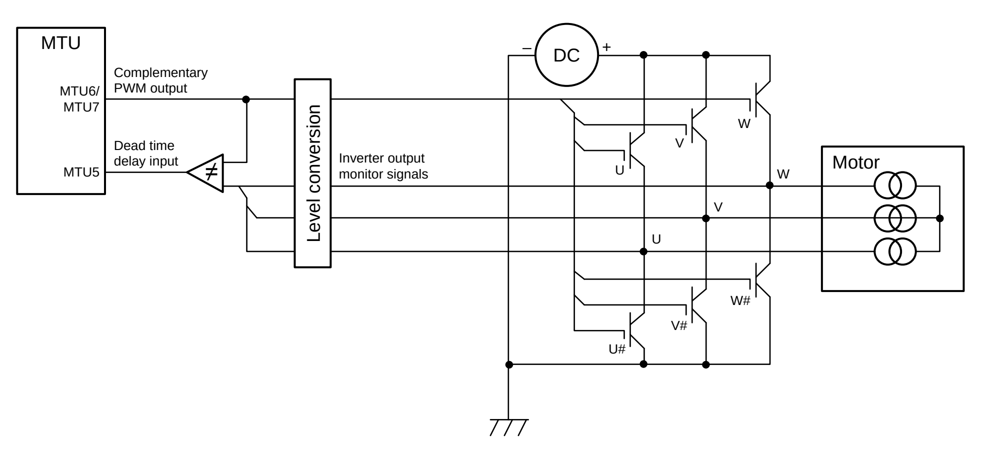

Figure 16.106 Motor Control Circuit Example

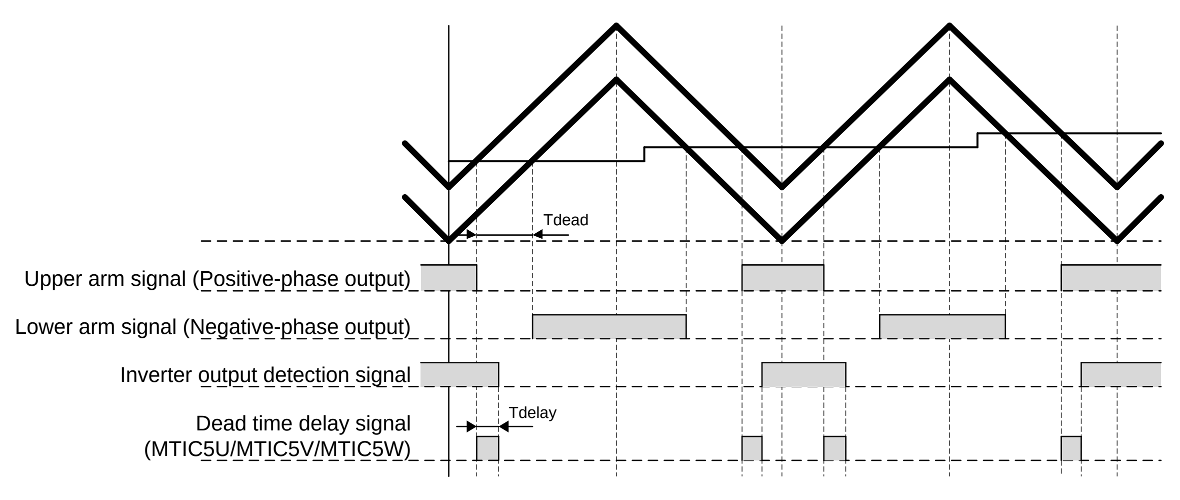

Figure 16.107 Delay in Dead Time in Complementary PWM Operation

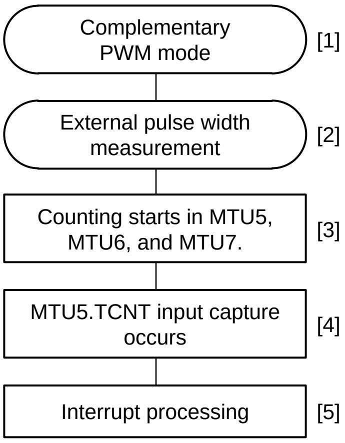
(1) Example of Dead Time Compensation Setting Procedure

Figure 16.108 shows an example of dead time compensation setting procedure by using three counters in MTU5.



[1] Set MTU6 and MTU7 to complementary PWM mode. For details, refer to **Section 16.3.8, Complementary PWM Mode**.

[2] Specify the external pulse width measurement function for the target TIOR in MTU5. For details, refer to **Section 16.3.11, External Pulse Width Measurement**.

[3] Set bits CST6 and CST7 in TSTRB and bits CSTU5, CSTV5, and CSTW5 in MTU5.TSTR to 1 to start count operation.

[4] When the capture condition specified in TIOR is satisfied, the MTU5.TCNT value is captured in MTU5.TGR.
To prevent the generation of the MTU5.TGIm5 interrupt (m = U, V, W) request under the capture condition specified in TIOR, do not enable interrupt requests in MTU5.TIER.

[5] For U-phase dead time compensation, when an interrupt is generated at the crest (TGIA6) or trough (TCIV7) in complementary PWM mode, read the MTU5.TGRU value, calculate the difference in time between MTU6.TGRB and MTU5.TGRU, and write the corrected value to MTU6.TGRD in the interrupt processing.
For the V phase and W phase, read the MTU5.TGRV and MTU5.TGRW values and write the corrected values to MTU7.TGRC and TGRD, respectively, in the same way as for U-phase compensation.
The MTU5.TCNT value should be cleared through the TCNTCMPCLR setting or by software.

Note: The port mode registers (PMn) and Pmn port function control register (PFCm) of the GPIO ports should be set up in advance.
As the interrupt flag is set under the capture condition specified in TIOR, do not enable interrupt requests in MTU5.TIER.

Figure 16.108 Example of Dead Time Compensation Setting Procedure

16.3.13 TCNTU, TCNTV, and TCNTW Capture at Crest and/or Trough in Complementary PWM Mode

The external pulse width measurement function of MTU5 can be used to transfer the values of TCNTU, TCNTV, and TCNTW to TGRU, TGRV, and TGRW at the crests, troughs, or both crests and troughs of the complementary PWM output when MTU6 and MTU7 are being used in complementary PWM mode. The type of transfer timing is specified in TIORU, TIORV, and TIORW. When the CMPCLR5U, CMPCLR5V, and CMPCLR5W bits in the TCNTCNPCLR register are set to 1, TCNTU, TCNTV, and TCNTW are cleared to H’0000 at the timing for transfer to TGRU, TGRV, and TGRW.

Note that the TCNTU, TCNTV, and TCNTW capture operation at the crest and/or trough of complementary PWM output in MTU5 is not available when MTU3 and MTU4 are used in complementary PWM mode.

Figure 16.109 shows an operation example in which TCNTU is used as a free-running counter without being cleared and the value is captured in TGRU at the crest and trough in complementary PWM mode.

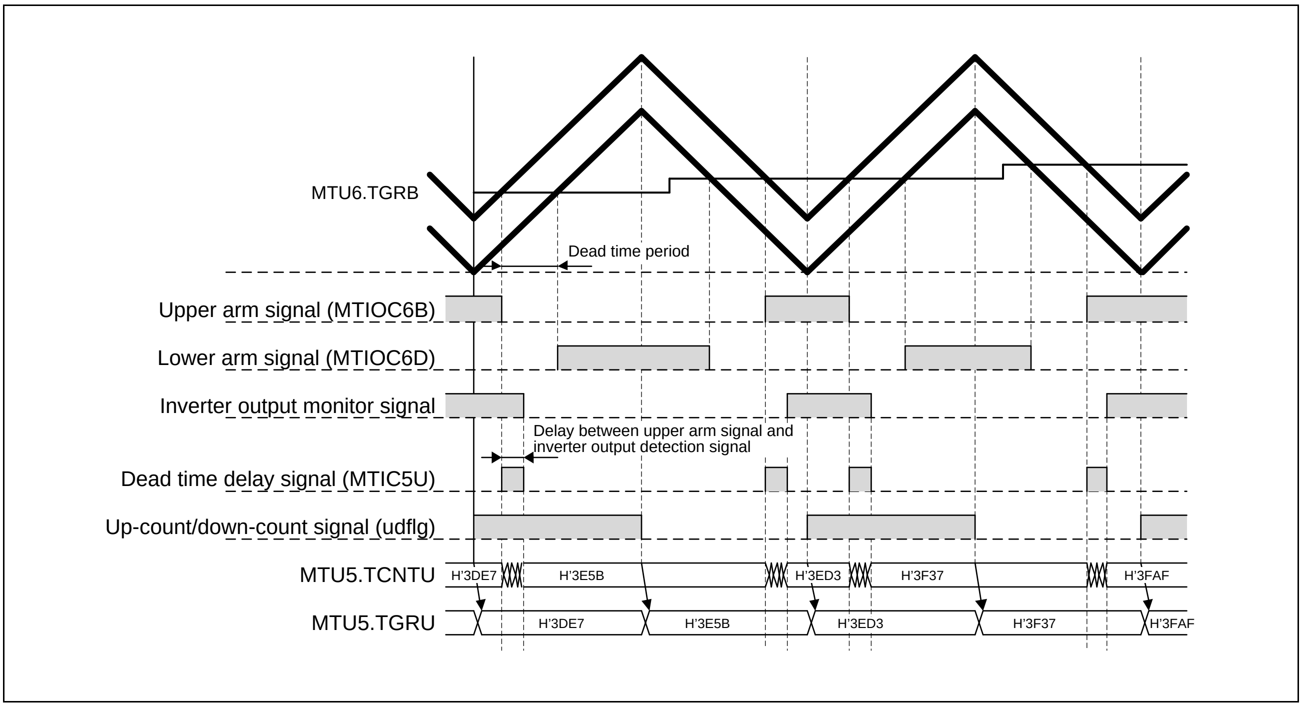


Figure 16.109 TCNTU Capture at Crest and Trough in Complementary PWM Operation

16.3.14 Noise Filter Function

The input capture input pins and external pulse input pins have a noise filter function.

Set the NFCRn register (n = 0 to 7, C) to enable or disable the noise filter function and set the sampling clock. The noise filter for each pin can be enabled or disabled individually, and the sampling clock can be set for each channel.

Figure 16.110 shows the timing of noise filtering.

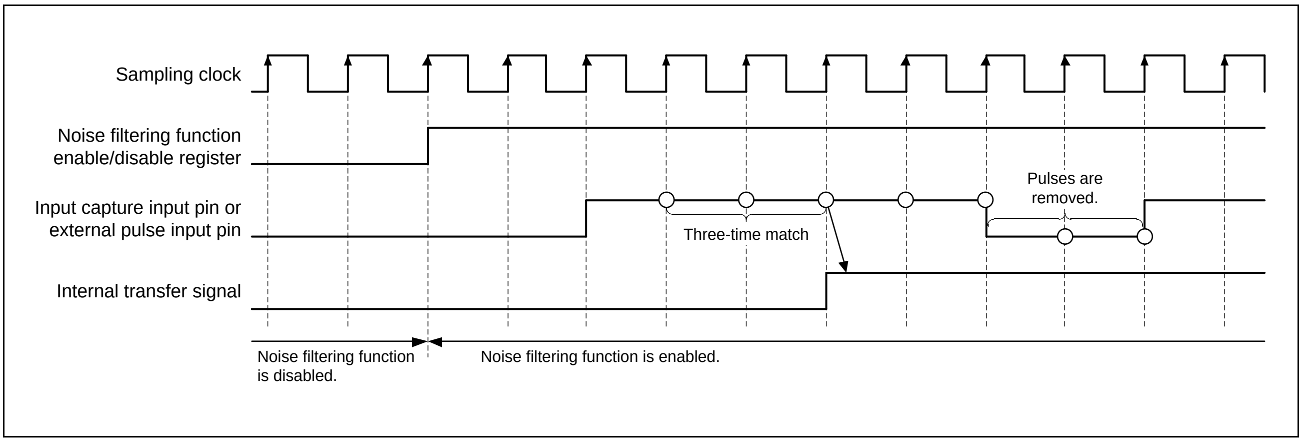

Figure 16.110 Timing of Noise Filtering

16.4 Interrupt Sources

16.4.1 Interrupt Sources and Priorities

There are three kinds of interrupt source; TGR input capture/compare match, TCNT overflow, and TCNT underflow. Each interrupt source has its own enable/disable bit, allowing the generation of interrupt request signals to be enabled or disabled individually.

When an interrupt source is generated, if the corresponding enable/disable bit in TIER is set to 1, an interrupt is requested.

Relative channel priorities can be changed by the interrupt controller; however the priority within a channel is fixed. For details, refer to **Section 8, Interrupt Controller**. **Table 16.78** lists the MTU interrupt sources.

Table 16.78 MTU Interrupt Sources (1/2)

Channel	Name	Interrupt Source	DMAC Activation
MTU0	TGIA0	MTU0.TGRA input capture/compare match	Possible
	TGIB0	MTU0.TGRB input capture/compare match	Possible
	TGIC0	MTU0.TGRC input capture/compare match	Possible
	TGID0	MTU0.TGRD input capture/compare match	Possible
	TCIV0	MTU0.TCNT overflow	Not possible
	TGIE0	MTU0.TGRE compare match	Not possible
	TGIF0	MTU0.TGRF compare match	Not possible
MTU1	TGIA1	MTU1.TGRA input capture/compare match	Possible
	TGIB1	MTU1.TGRB input capture/compare match	Possible
	TCIV1	MTU1.TCNT overflow	Not possible
	TCIU1	MTU1.TCNT underflow	Not possible
MTU2	TGIA2	MTU2.TGRA input capture/compare match	Possible
	TGIB2	MTU2.TGRB input capture/compare match	Possible
	TCIV2	MTU2.TCNT overflow	Not possible
	TCIU2	MTU2.TCNT underflow	Not possible
MTU3	TGIA3	MTU3.TGRA input capture/compare match	Possible
	TGIB3	MTU3.TGRB input capture/compare match	Possible
	TGIC3	MTU3.TGRC input capture/compare match	Possible
	TGID3	MTU3.TGRD input capture/compare match	Possible
	TCIV3	MTU3.TCNT overflow	Not possible
MTU4	TGIA4	MTU4.TGRA input capture/compare match	Possible
	TGIB4	MTU4.TGRB input capture/compare match	Possible
	TGIC4	MTU4.TGRC input capture/compare match	Possible
	TGID4	MTU4.TGRD input capture/compare match	Possible
	TCIV4	MTU4.TCNT overflow/underflow*[1]	Possible
MTU5	TGIU5	MTU5.TGRU input capture/compare match	Possible
	TGIV5	MTU5.TGRV input capture/compare match	Possible
	TGIW5	MTU5.TGRW input capture/compare match	Possible
MTU6	TGIA6	MTU6.TGRA input capture/compare match	Possible
	TGIB6	MTU6.TGRB input capture/compare match	Possible
	TGIC6	MTU6.TGRC input capture/compare match	Possible
	TGID6	MTU6.TGRD input capture/compare match	Possible
	TCIV6	MTU6.TCNT overflow	Not possible

Table 16.78 MTU Interrupt Sources (2/2)

Channel	Name	Interrupt Source	DMAC Activation
MTU7	TGIA7	MTU7.TGRA input capture/compare match	Possible
	TGIB7	MTU7.TGRB input capture/compare match	Possible
	TGIC7	MTU7.TGRC input capture/compare match	Possible
	TGID7	MTU7.TGRD input capture/compare match	Possible
	TCIV7	MTU7.TCNT overflow/underflow*[1]	Possible
MTU8	TGIA8	MTU8.TGRA input capture/compare match	Possible
	TGIB8	MTU8.TGRB input capture/compare match	Possible
	TGIC8	MTU8.TGRC input capture/compare match	Possible
	TGID8	MTU8.TGRD input capture/compare match	Possible
	TCIV8	MTU8.TCNT overflow	Possible

Note: This table shows the initial state immediately after a reset. The relative channel priorities can be changed by the interrupt controller.

Note 1. The underflow interrupt source is valid only in complementary PWM mode.

(1) Input Capture/Compare Match Interrupt

If the TIER.TGIE bit is set to 1 when a TGR input capture/compare match occurs on a channel, an interrupt is requested. The MTU has 33 input capture/compare match interrupts (six for MTU0, four each for MTU3, MTU4, MTU6, MTU7, and MTU8, two each for MTU1 and MTU2, and three for MTU5).

(2) Overflow Interrupt

If the TIER.TCIEV bit is set to 1 when a TCNT overflow occurs on a channel, clearing an interrupt is requested. The MTU provides a total of eight overflow interrupts (one for each channel except MTU5).

In complementary PWM mode, an overflow interrupt is generated even when an underflow occurs in TCNT in MTU4 or MTU7.

(3) Underflow Interrupt

If the TIER.TCIEU bit is set to 1 when a TCNT underflow occurs on a channel, an interrupt is requested. The MTU has two underflow interrupts (one each for MTU1, and MTU2).

16.4.2 DMAC Activation

(1) DMAC Activation

The DMAC can be activated by the TGR input capture/compare match interrupt and the overflow interrupt in MTU4 and MTU7. For details, see **Section 14, Direct Memory Access Controller**.

The MTU provides a total of 33 interrupts (input capture/compare match and overflow interrupts) that can be used as DMAC activation sources: four each for MTU0, MTU3, MTU6, and MTU8, two each for MTU1 and MTU2, five each for MTU4 and MTU7, and three for MTU5.

16.4.3 A/D Converter Activation

The A/D converter can be activated by one of the following three methods in the MTU. **Table 16.79** shows the relationship between interrupt sources and A/D converter start request signals.

(1) A/D Converter Activation by TGRA Input Capture/Compare Match or at MTU4.TCNT (MTU7.TCNT) Trough in Complementary PWM Mode

The A/D converter can be activated by the occurrence of a TGRA input capture/compare match in each channel. In addition, if complementary PWM operation is performed while the TTGE2 bit in MTU4.TIER (MTU7.TIER) is set to 1, the A/D converter can be activated at the trough of MTU4.TCNT (MTU7.TCNT) count (MTU4.TCNT (MTU7.TCNT) = H’0000).

A/D converter start request signal TRGAnN is issued to the A/D converter under either of the following conditions (n = 0 to 4, 6, or 7).

- When a TGRA input capture/compare match occurs on a channel while the TIER.TTG bit is set to 1
- When the MTU4.TCNT (MTU7.TCNT) count reaches the trough (MTU4.TCNT (MTU7.TCNT) = H’0000) during complementary PWM operation while the TTGE2 bit in MTU4.TIER (MTU7.TIER) is set to 1

When either condition is satisfied, if A/D converter start signal TRGAnN from the MTU is selected as the trigger in the A/D converter, A/D conversion will start.

(2) A/D Converter Activation by Compare Match between MTU0.TCNT and MTU0.TGRE

A/D converter start request signal TRG0N is issued to the A/D converter when a compare match occurs between MTU0.TCNT and MTU0.TGRE.

When a compare match occurs between MTU0.TCNT and MTU0.TGRE in MTU0 while the TTGE2 bit.TIER2 is set to 1, A/D converter start request TGR0N is issued to the A/D converter. If A/D converter start signal TRG0N from the MTU is selected as the trigger in the A/D converter, A/D conversion will start.

(3) A/D Converter Activation by A/D Converter Start Request Delaying Function

The A/D converter can be activated by generating A/D converter start request signal TRG4AN or TRG4BN (TRG7AN or TRG7BN) when the MTU4.TCNT (MTU7.TCNT) count matches the MTU4.TADCORA or MTU4.TADCORB (MTU7.TADCORA or MTU7.TADCORB) value if the UT4AE, DT4AE, UT4BE, or DT4BE (UT7AE, DT7AE, UT7BE, or DT7BE) bit in the A/D converter start request control register (MTU4.TADCR (MTU7.TADCR)) is set to 1. For details, refer to **Section 16.3.9, A/D Converter Start Request Delaying Function**.

A/D conversion will start when TRG4AN (TRG7AN) is generated if A/D converter start signal TRG4AN (TRG7AN) from the MTU is selected as the trigger in the A/D converter, when TRG4BN (TRG7BN) is generated if TRG4BN (TRG7BN) from the MTU is selected as the trigger in the A/D converter, or when TRG4ABN (TRG7ABN) is generated if TRG4ABN (TRG7ABN) from the MTU is selected as the trigger in the A/D converter.

Table 16.79 Interrupt Sources and A/D Converter Start Request Signals

Target Registers	Interrupt Source	A/D Converter Start Request Signal
MTU0.TGRA and MTU0.TCNT	Input capture/compare match	TRGA0N
MTU1.TGRA and MTU1.TCNT		TRGA1N
MTU2.TGRA and MTU2.TCNT		TRGA2N
MTU3.TGRA and MTU3.TCNT		TRGA3N
MTU4.TGRA and MTU4.TCNT*1		TRGA4N
MTU4.TCNT	MTU4.TCNT trough in complementary PWM mode	
MTU6.TGRA and MTU6.TCNT	Input capture/compare match	TRGA6N
MTU7.TGRA and MTU7.TCNT*1		TRGA7N
MTU7.TCNT	MTU7.TCNT trough in complementary PWM mode	
MTU0.TGRE and MTU0.TCNT	Compare match	TRG0N
MTU4.TADCORA and MTU4.TCNT		TRG4AN
MTU4.TADCORB and MTU4.TCNT		TRG4BN
MTU7.TADCORA and MTU7.TCNT		TRG7AN
MTU7.TADCORB and MTU7.TCNT		TRG7BN
MTU4.TADCORA and MTU4.TCNT, MTU4.TADCORB and MTU4.TCNT	Compare match (interrupt skipping function 2)	TRG4ABN
MTU7.TADCORA and MTU7.TCNT, MTU7.TADCORB and MTU7.TCNT		TRG7ABN

Note 1. Since PWM waveforms are generated in complementary PWM mode, MTU4.TGRA (MTU7.TGRA) compare match not only with MTU4.TCNT (MTU7.TCNT) but also with MTU3.TCNT (MTU6.TCNT) and TCNTSA (TCNTSB) is detected. Accordingly, when compare match with MTU3.TCNT (MTU6.TCNT) and TCNTSA (TCNTSB) occurs, TRGA4N (TRGA7N) is also generated.

When MTU3 and MTU 4 (MTU 6 and MTU7) are made to operate in complementary PWM mode for generating an A/D converter start request, use the A/D converter start request by compare match between MTU4.TCNT (MTU7.TCNT) and MTU4.TADCORA or TADCORB (MTU7.TADCORA or TADCORB).

16.5 Operation Timing

16.5.1 Input/Output Timing

(1) TCNT Count Timing

Figure 16.111 and **Figure 16.112** show the TCNT count timing in internal clock operation, **Figure 16.113** shows the TCNT count timing in external clock operation (normal mode), and **Figure 16.114** shows the TCNT count timing in external clock operation (phase counting mode).

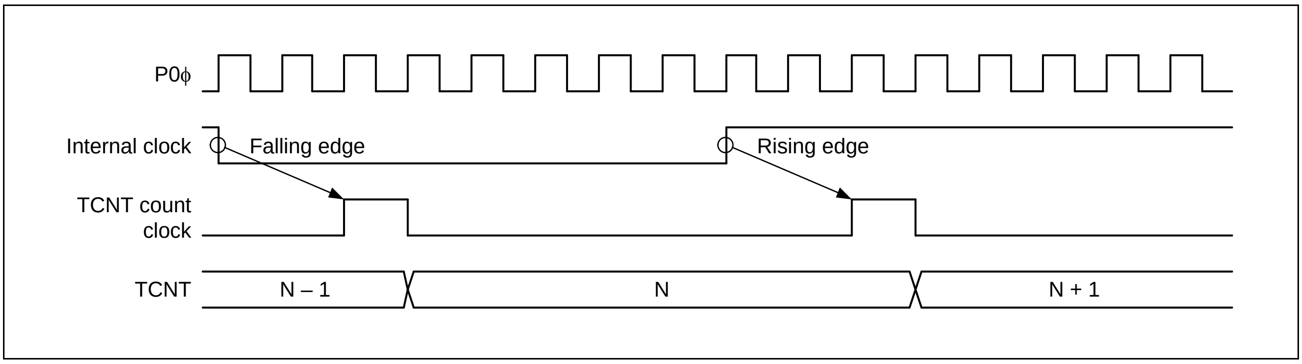

Figure 16.111 Count Timing in Internal Clock Operation (MTU0 to MTU4 and MTU6 to MTU8)

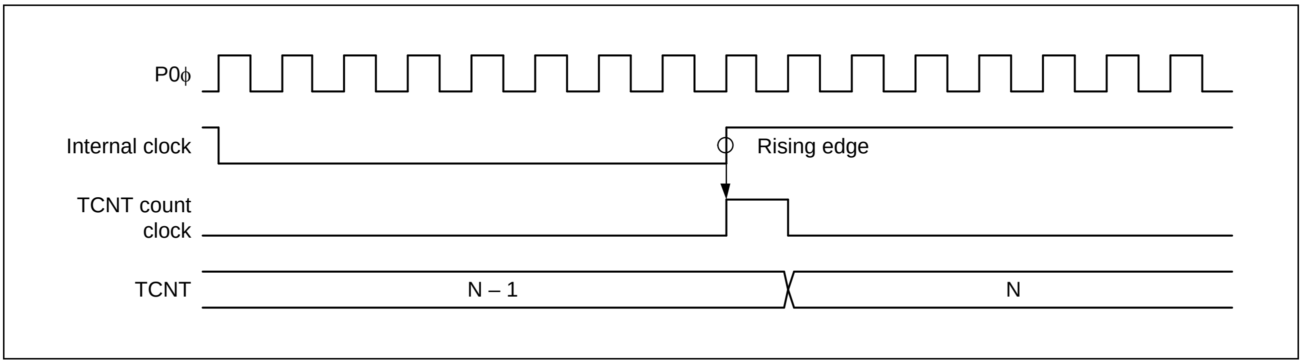

Figure 16.112 Count Timing in Internal Clock Operation (MTU5)

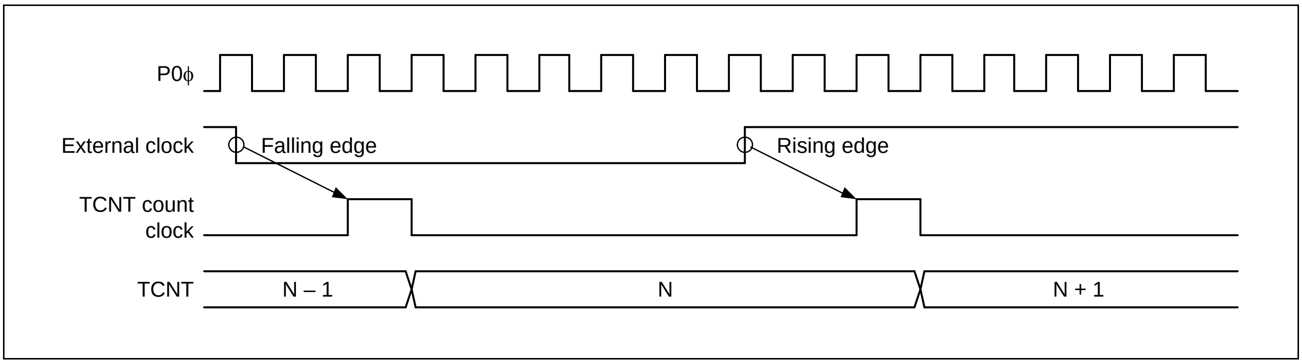

Figure 16.113 Count Timing in External Clock Operation (MTU0 to MTU4, MTU6 to MTU8)

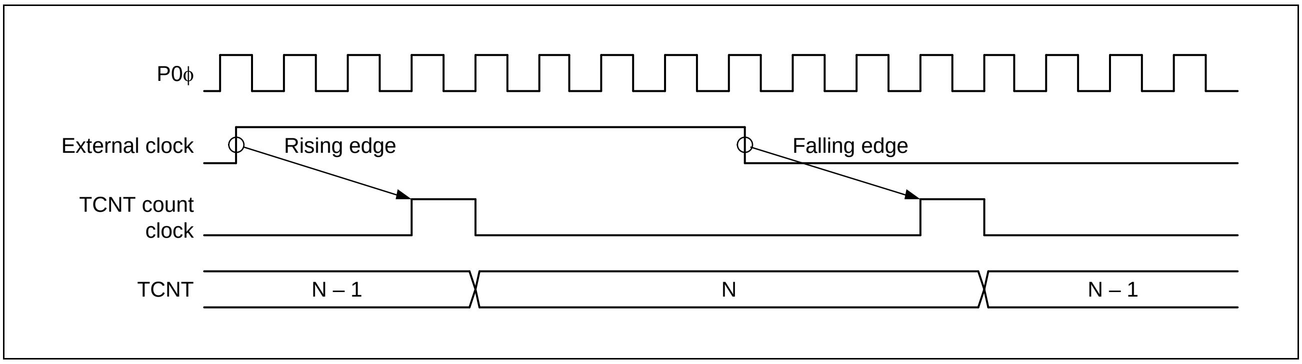

Figure 16.114 Count Timing in External Clock Operation (Phase Counting Mode)

(2) Output Compare Output Timing

A compare match signal is generated in the final state in which TCNT and TGR match (the point at which the count value matched by TCNT is updated). When a compare match signal is generated, the value set in TIOR is output from MTIOCnm pin (n = 0 to 4, 6, 7, 8; m = A to D). After a match between TCNT and TGR, the compare match signal is not generated until the TCNT count clock is generated.

Figure 16.115 shows the output compare output timing (normal mode or PWM mode) and **Figure 16.116** shows the output compare output timing (complementary PWM mode or reset-synchronized PWM mode).

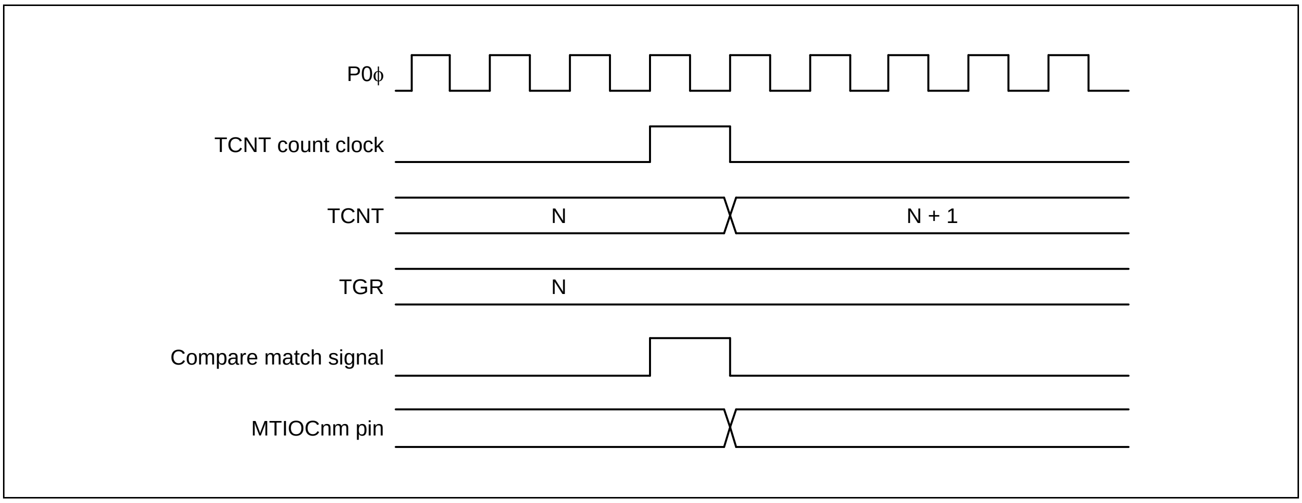

Figure 16.115 Output Compare Output Timing (Normal Mode or PWM Mode) (n = 0 to 4, 6, 7, 8; m = A to D)

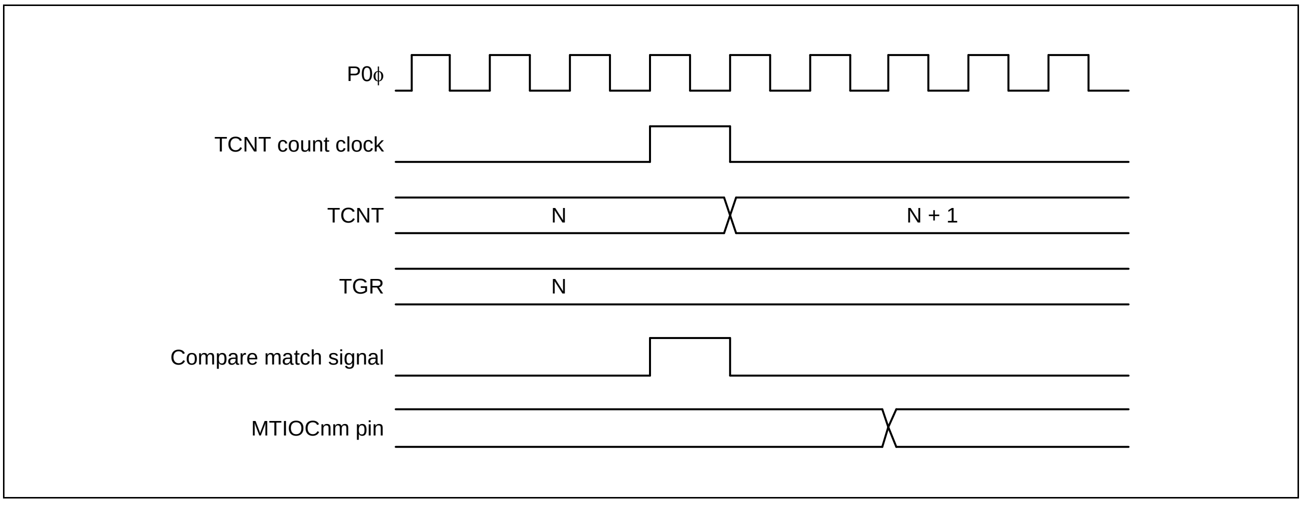

Figure 16.116 Output Compare Output Timing (Complementary PWM Mode or Reset-Synchronized PWM Mode) (n = 0 to 4, 6, 7, 8; m = A to D)

(3) Input Capture Signal Timing

Figure 16.117 shows the input capture signal timing.

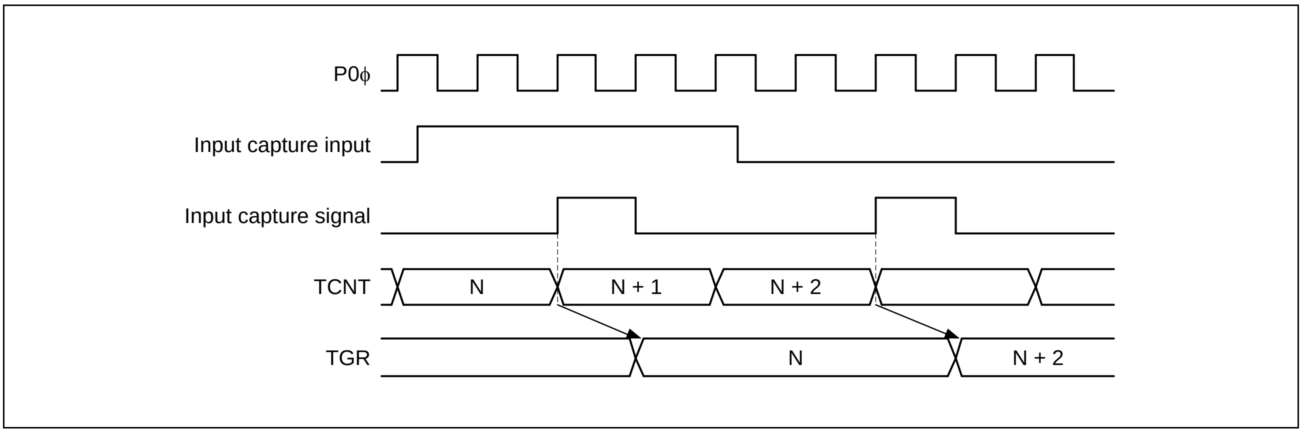

Figure 16.117 Input Capture Input Signal Timing

(4) Timing for Counter Clearing by Compare Match/Input Capture

Figure 16.118 and **Figure 16.119** show the timing when counter clearing on compare match is specified, and **Figure 16.120** shows the timing when counter clearing on input capture is specified.

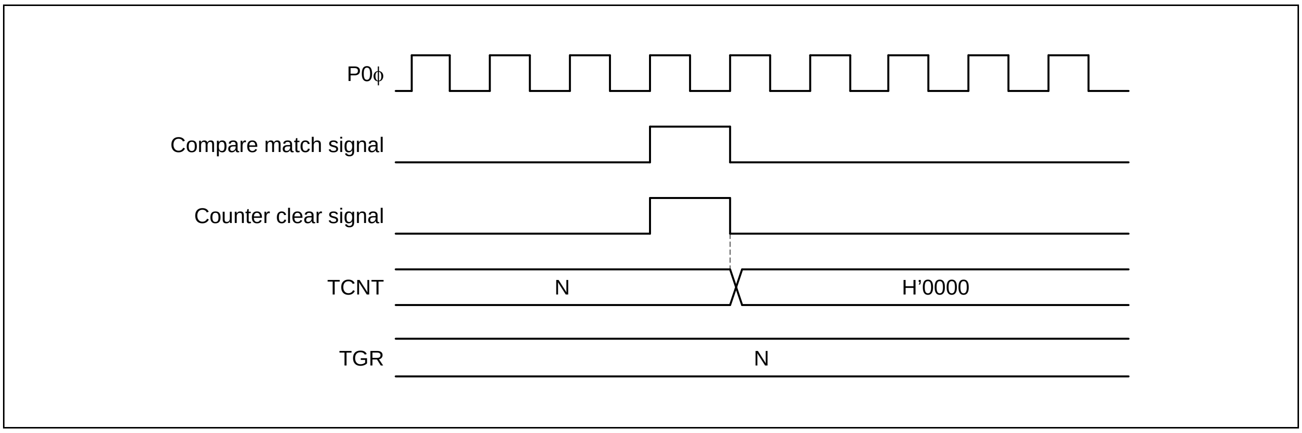

Figure 16.118 Counter Clear Timing (Compare Match) (MTU0 to MTU4 and MTU6 to MTU8)

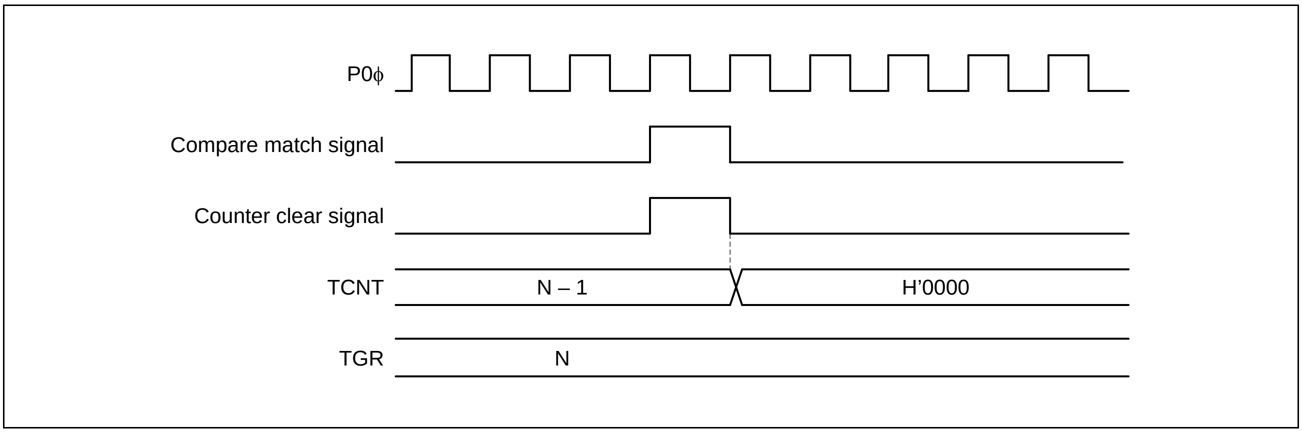

Figure 16.119 Counter Clear Timing (Compare Match) (MTU5)

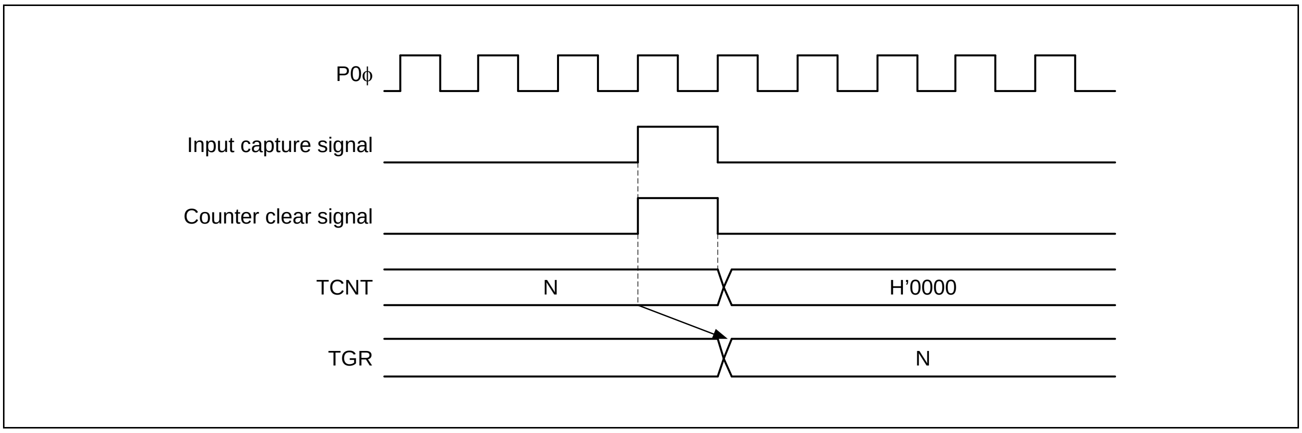

Figure 16.120 Counter Clear Timing (Input Capture) (MTU0 to MTU8)

(5) Buffer Operation Timing

Figure 16.121 to **Figure 16.123** show the timing in buffer operation.

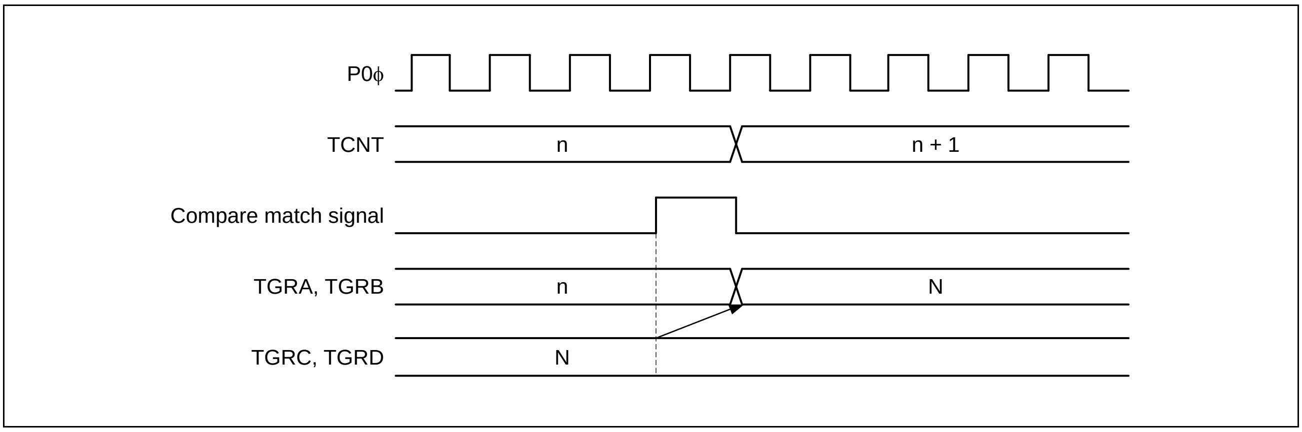

Figure 16.121 Buffer Operation Timing (Compare Match)

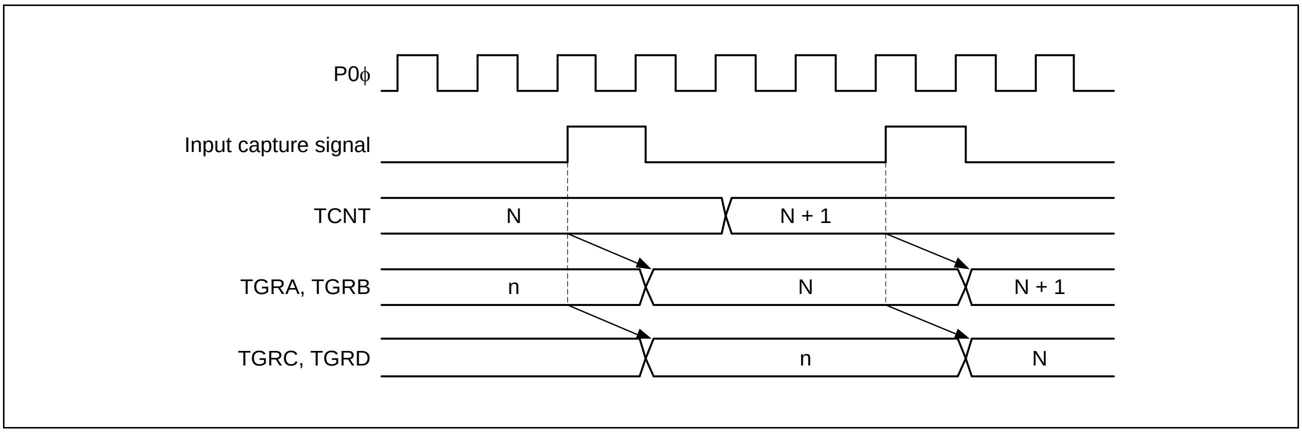

Figure 16.122 Buffer Operation Timing (Input Capture)

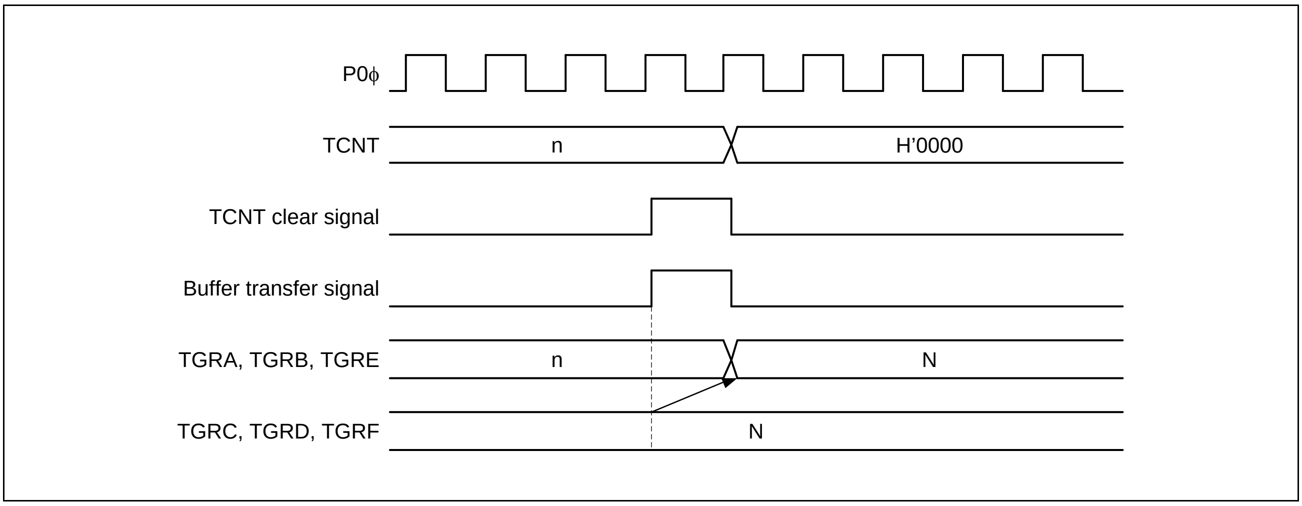

Figure 16.123 Buffer Operation Timing (When TCNT Cleared)

(6) Buffer Transfer Timing (Complementary PWM Mode)

Figure 16.124 to **Figure 16.126** show the buffer transfer timing in complementary PWM mode.

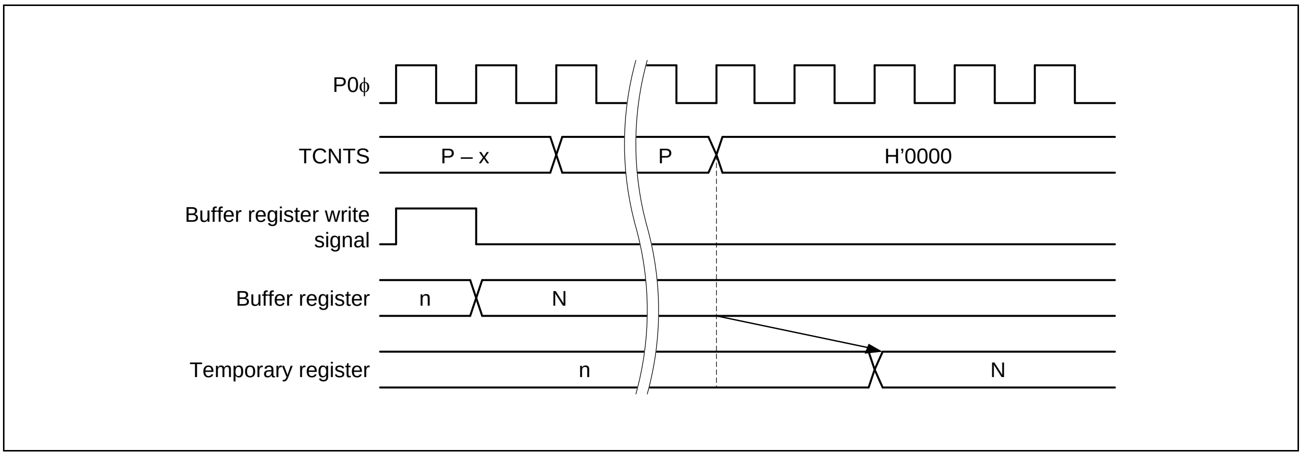

Figure 16.125 Transfer Timing from Buffer Register to Temporary Register (TCNTSA Operating)

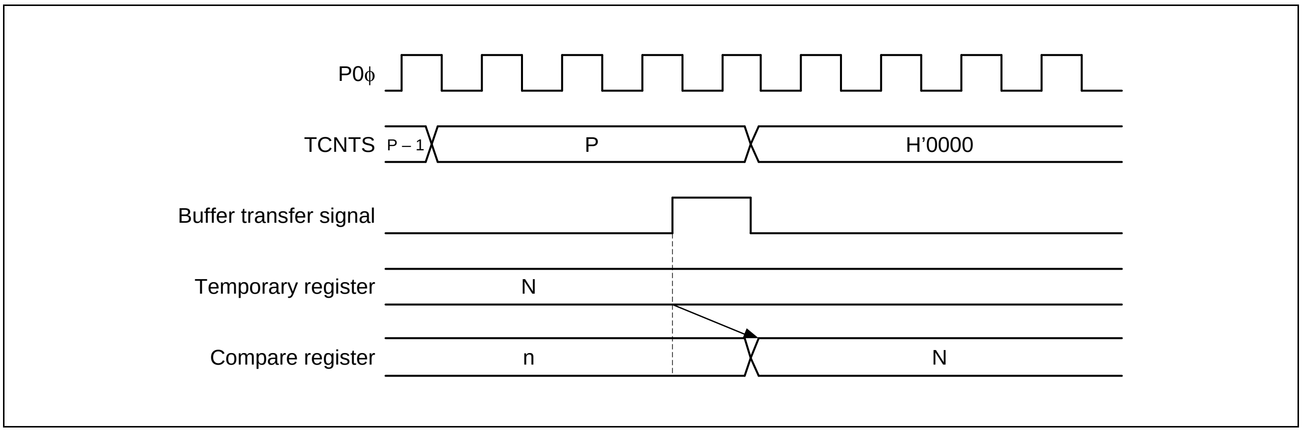

Figure 16.126 Transfer Timing from Temporary Register to Compare Register

16.5.2 Interrupt Signal Timing

(1) TGI Interrupt Timing by Compare Match

Figure 16.127 and **Figure 16.128** show the TGI interrupt request signal timing when a compare match occurs.

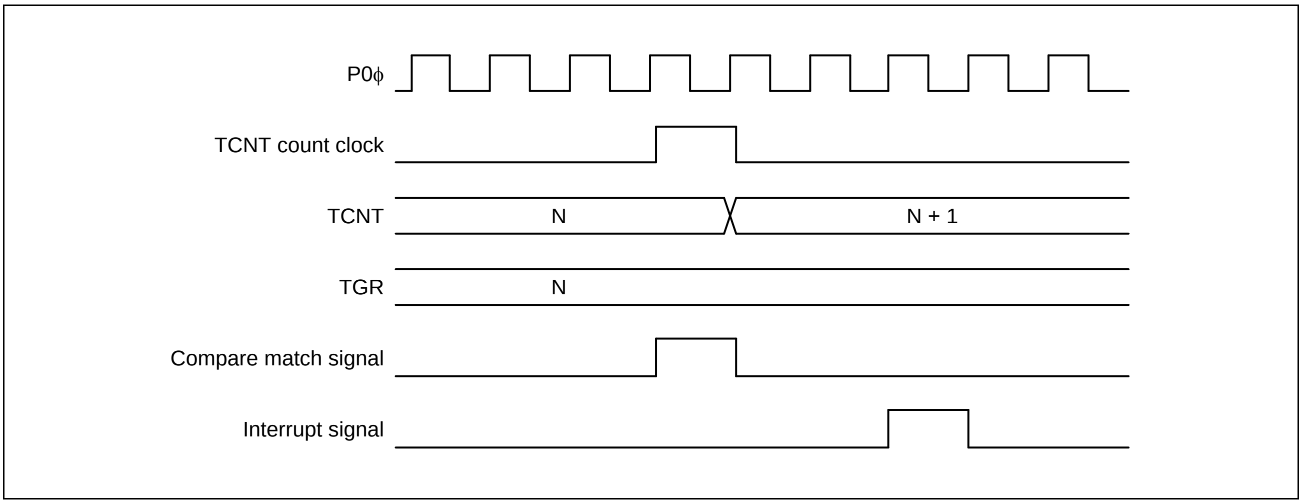

Figure 16.127 TGI Interrupt Timing (Compare Match) (MTU0 to MTU4 and MTU6 to MTU8)

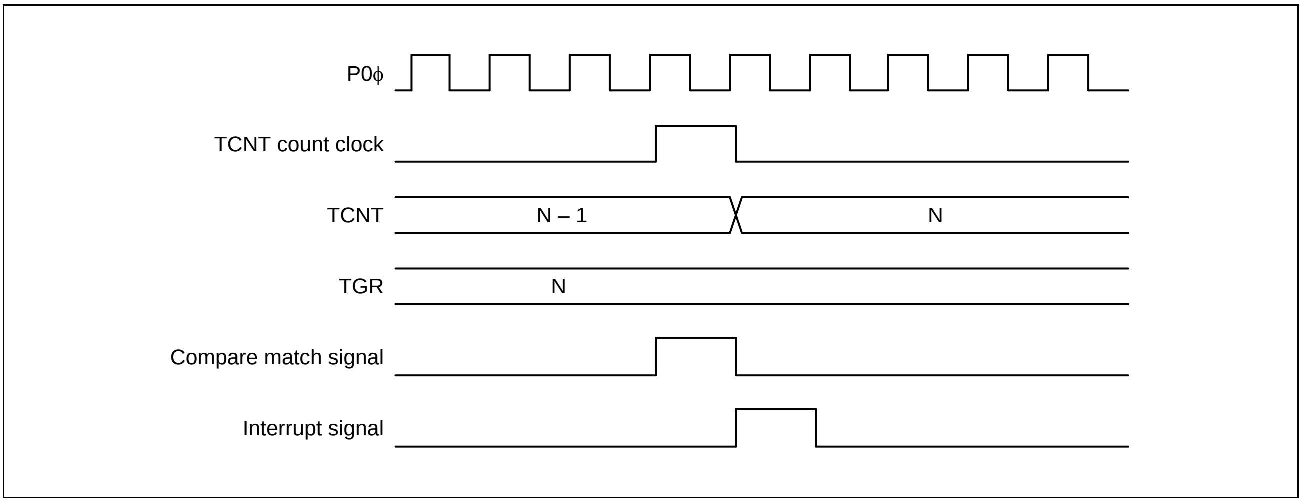

Figure 16.128 TGI Interrupt Timing (Compare Match) (MTU5)

(2) TGI Interrupt Timing by Input Capture

Figure 16.129 and **Figure 16.130** show the TGI interrupt request signal timing when an input capture occurs.

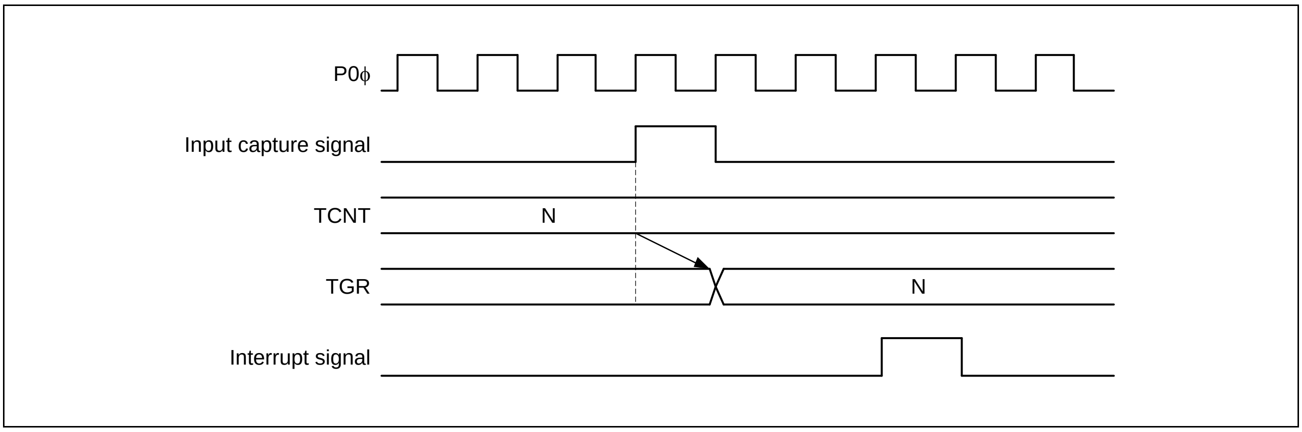

Figure 16.129 TGI Interrupt Timing (Input Capture) (MTU0 to MTU4 and MTU6 to MTU8)

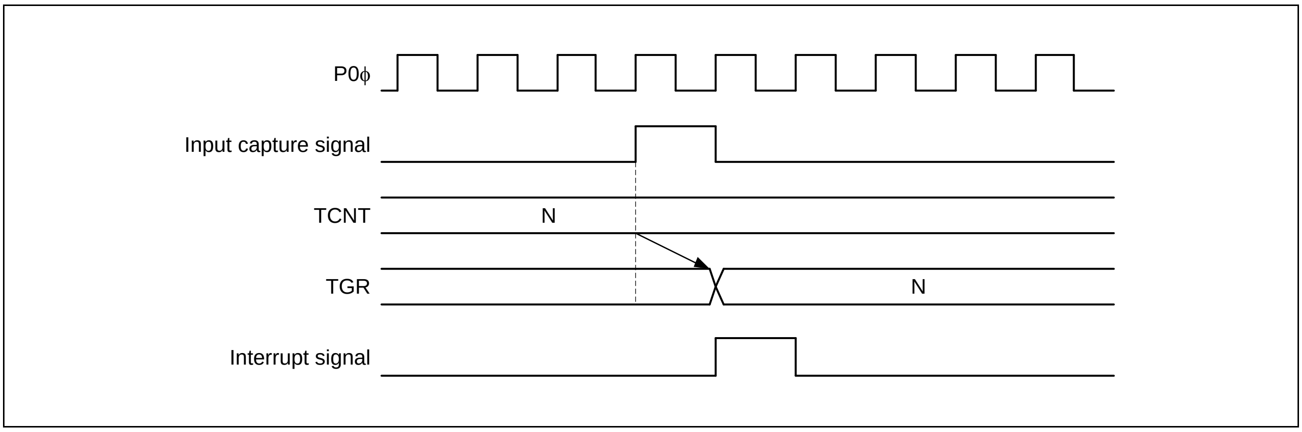

Figure 16.130 TGI Interrupt Timing (Input Capture) (MTU5)

(3) TCFV and TCFU Interrupt Timing

Figure 16.131 shows the TCIV interrupt request signal timing when an overflow is generated.

Figure 16.132 shows the TCIU interrupt request signal timing when an underflow is generated.

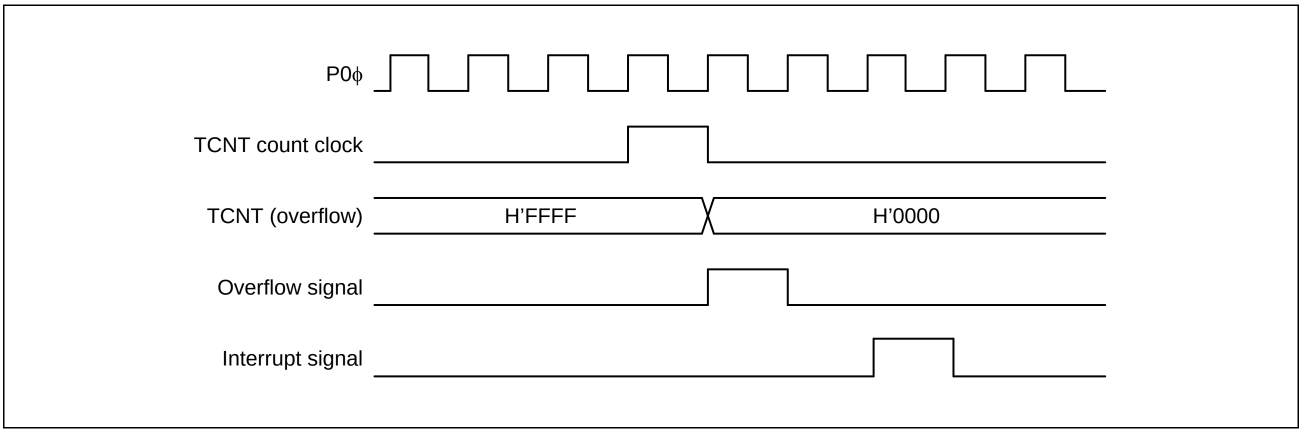

Figure 16.131 TCIV Interrupt Timing

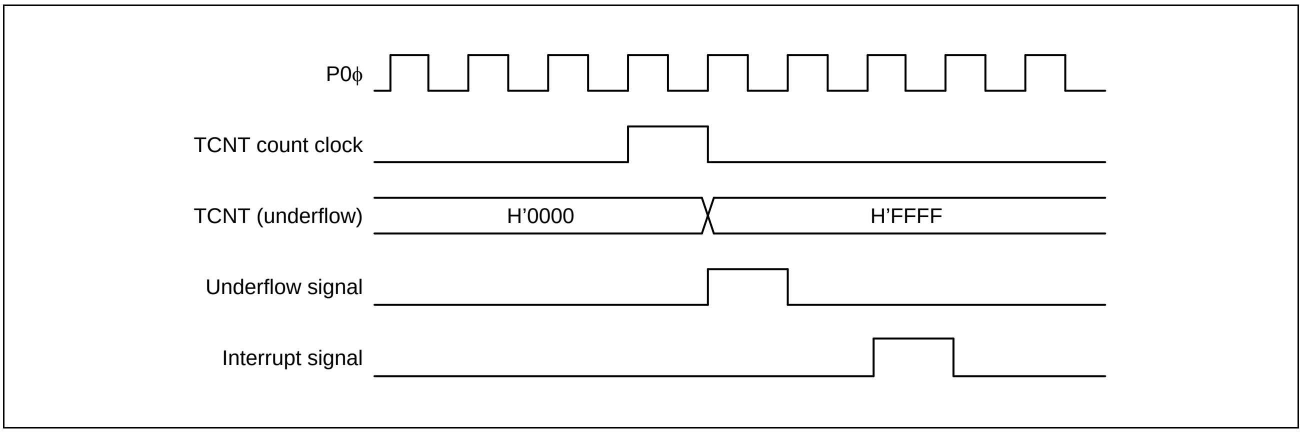

Figure 16.132 TCIU Interrupt Timing

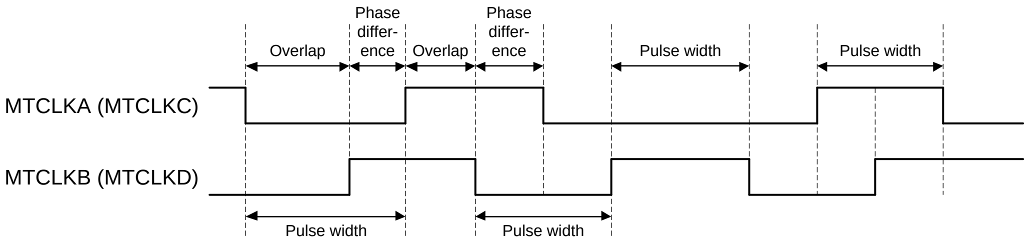
16.6 Usage Note

16.6.1 Count Clock Restrictions

The count clock source pulse width must be at least three P0ϕ clock cycles for single-edge detection, and at least five P0ϕ clock cycles for both-edge detection. The MTU will not operate properly at narrower pulse widths.

In phase counting mode, the phase difference and overlap between the two input clocks must be at least three P0ϕ clock cycles, and the pulse width must be at least 5P0ϕ clock cycles. **Figure 16.133** shows the input clock conditions in phase counting mode.



Note: Phase difference and overlap: 3 P0ϕ clock cycles or more

Note: Pulse width: 5 P0ϕ clock cycles or more

Figure 16.133 Phase Difference, Overlap, and Pulse Width in Phase Counting Mode

16.6.2 Note on Cycle Setting

When counter clearing on compare match is set, TCNT is cleared in the final state in which it matches the TGR value (the point at which TCNU updates the matched count value). Consequently, the actual counter frequency is given by the following formula:

- MTU0 to MTU4 and MTU6 to MTU8

$$f = \frac{\mathrm{CNTCLK}}{\mathrm{N}+1}$$

- MTU5

$$f = \frac{\mathrm{CNTCLK}}{\mathrm{N}}$$

f: Counter frequency

CNTCLK: The count clock frequency set by TCR.TPSC[2:0] and TCR2.TPSC2[2:0]

N: TGR setting

16.6.3 Contention between TCNT Write and Clear Operations

If the counter clear signal is generated in the TCNT write cycle, TCNT clearing takes precedence and TCNT write operation is not performed.

Figure 16.134 shows the timing in this case.

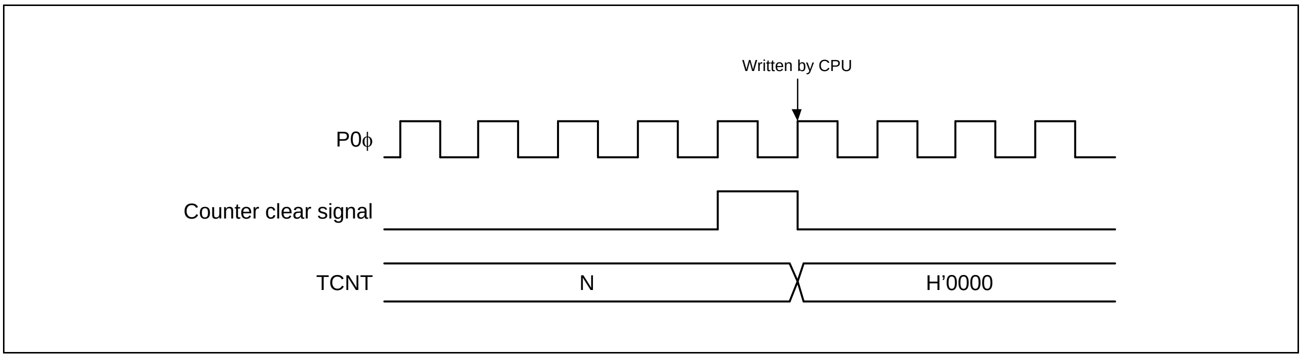


Figure 16.134 Contention between TCNT Write and Clear Operations

16.6.4 Contention between TCNT Write and Increment Operations

If incrementing occurs in a TCNT write cycle, TCNT write operation takes precedence and TCNT is not incremented.

Figure 16.135 shows the timing in this case.

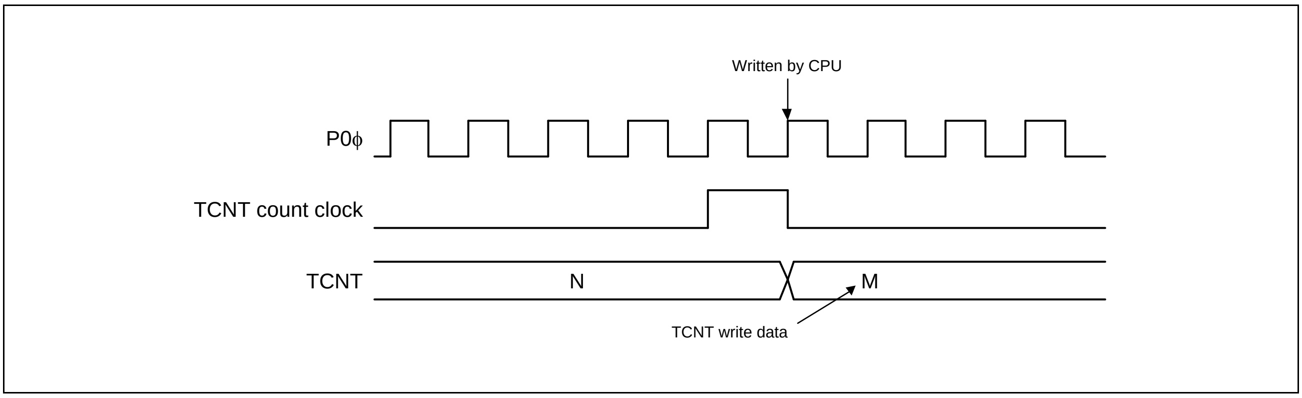

Figure 16.135 Contention between TCNT Write and Increment Operations

16.6.5 Contention between TGR Write Operation and Compare Match

If a compare match occurs in a TGR write cycle, TGR write operation is executed and the compare match signal is also generated.

Figure 16.136 shows the timing in this case.

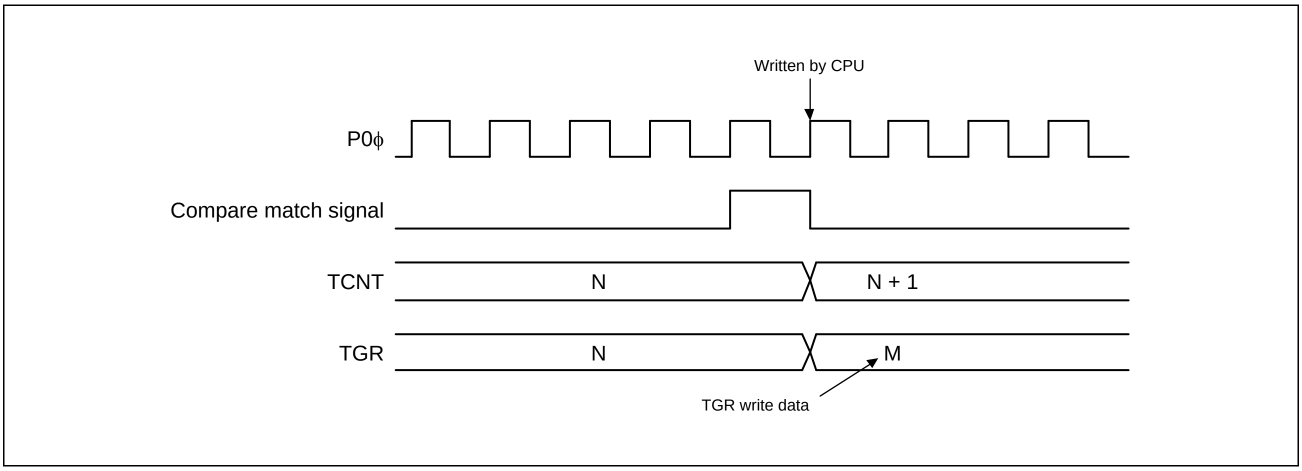

Figure 16.136 Contention between TGR Write Operation and Compare Match

16.6.6 Contention between Buffer Register Write Operation and Compare Match

If a compare match occurs in the T2 state in a TGR write cycle, the data before write operation is transferred to TGR by the buffer operation.

Figure 16.137 shows the timing in this case.

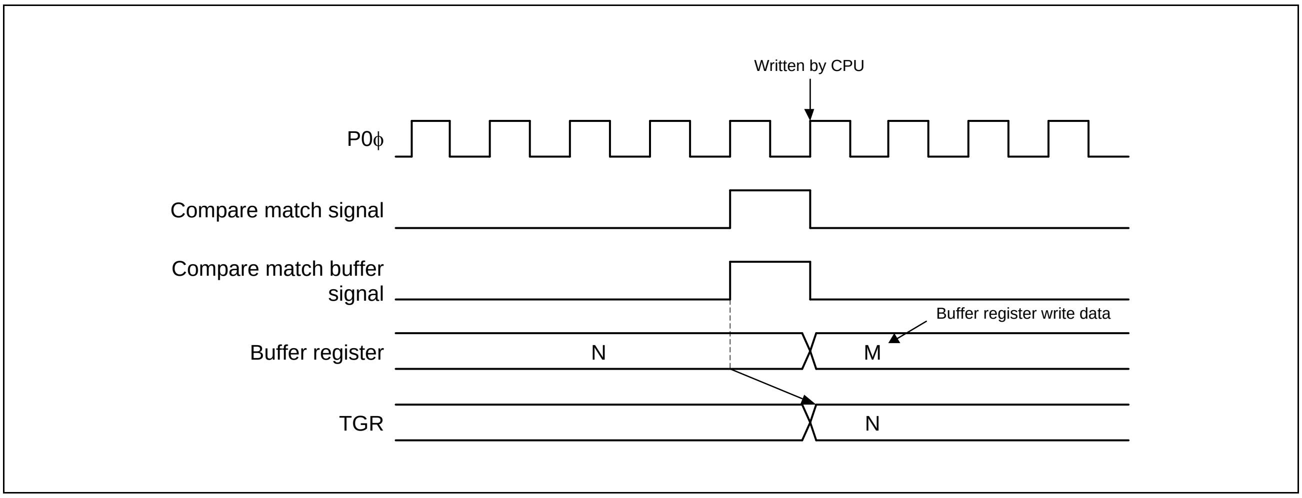

Figure 16.137 Contention between Buffer Register Write Operation and Compare Match

16.6.7 Contention between Buffer Register Write and TCNT Clear Operations

When the buffer transfer timing is set to the TCNT clear timing by the timer buffer transfer mode register (TBTM), if TCNT is cleared during the TGR write cycle, the data before write operation is transferred to TGR by the buffer operation.

Figure 16.138 shows the timing in this case.

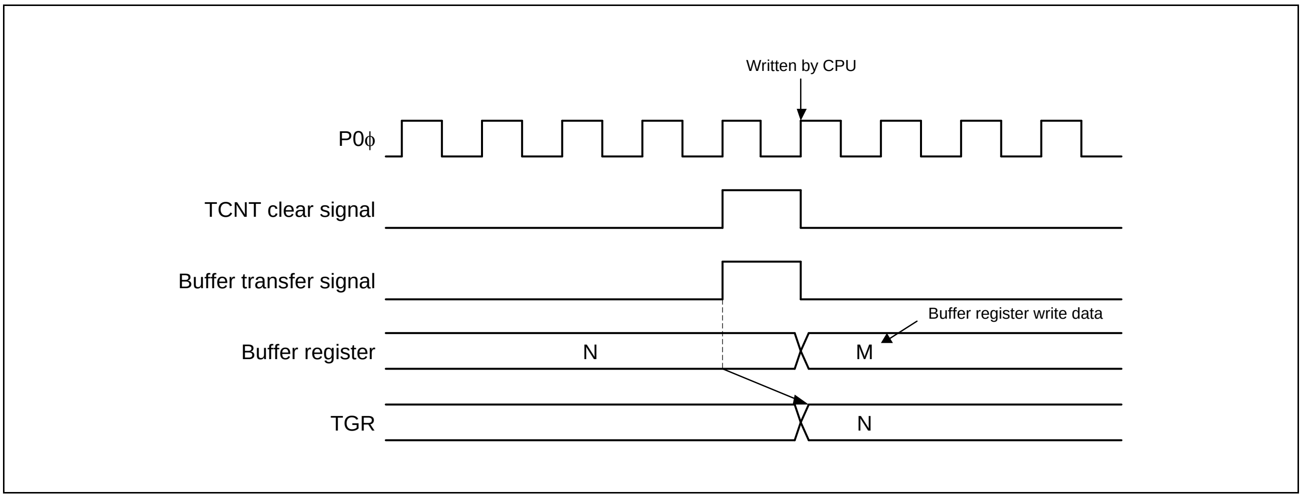

Figure 16.138 Contention between Buffer Register Write and TCNT Clear Operations

16.6.8 Contention between TGR Read Operation and Input Capture

If an input capture signal is generated in a TGR read cycle, the data before input capture transfer is read.

Figure 16.139 shows the timing in this case.

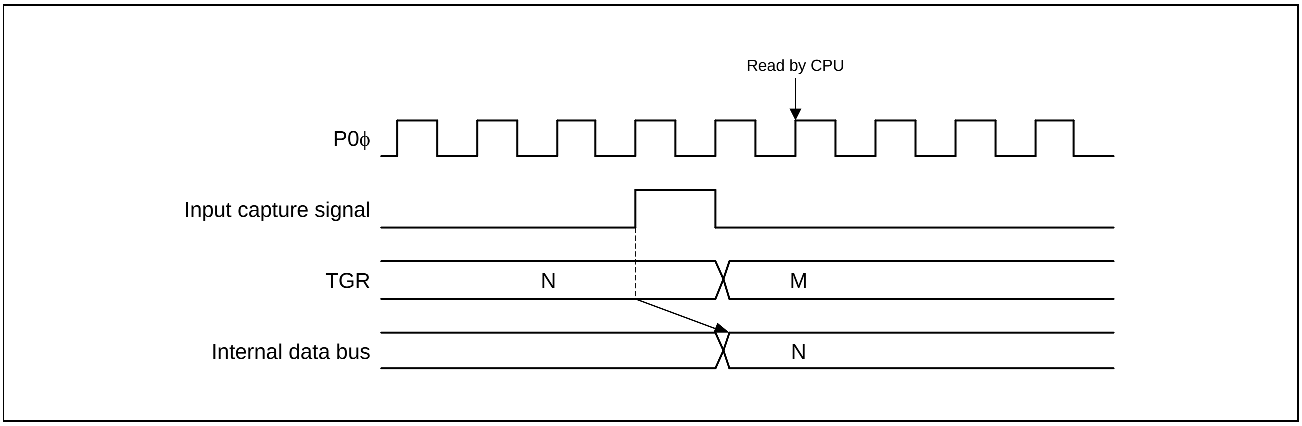

Figure 16.139 Contention between TGR Read Operation and Input Capture (MTU0 to MTU8)

16.6.9 Contention between TGR Write Operation and Input Capture

If an input capture signal is generated in the TGR write cycle, the input capture operation takes precedence and the TGR write operation is not performed in MTU0 to MTU4 and MTU6 to MTU8. In MTU5, the TGR write operation is performed and the input capture signal is generated.

Figure 16.140 and **Figure 16.141** show the timing in this case.

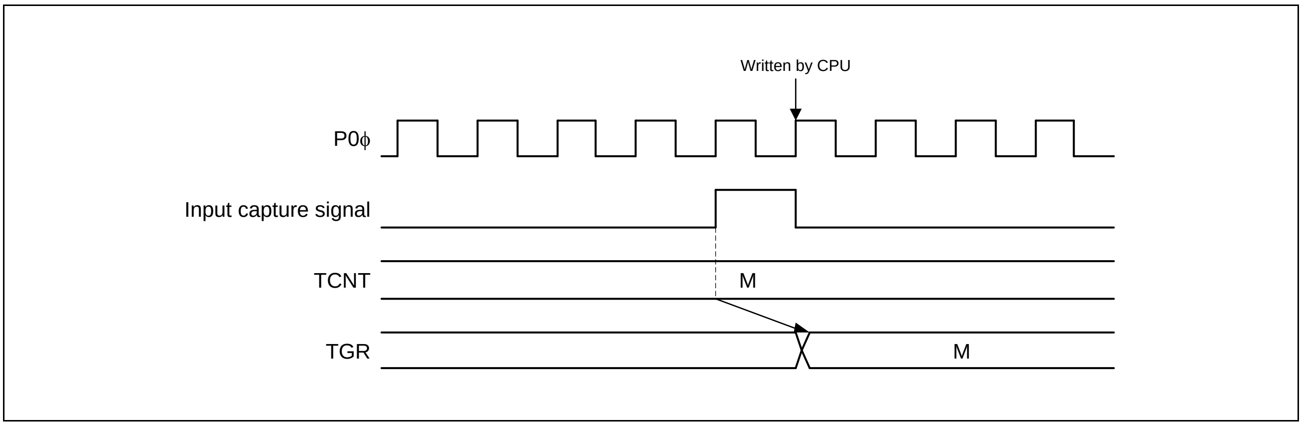

Figure 16.140 Contention between TGR Write Operation and Input Capture (MTU0 to MTU4 and MTU6 to MTU8)

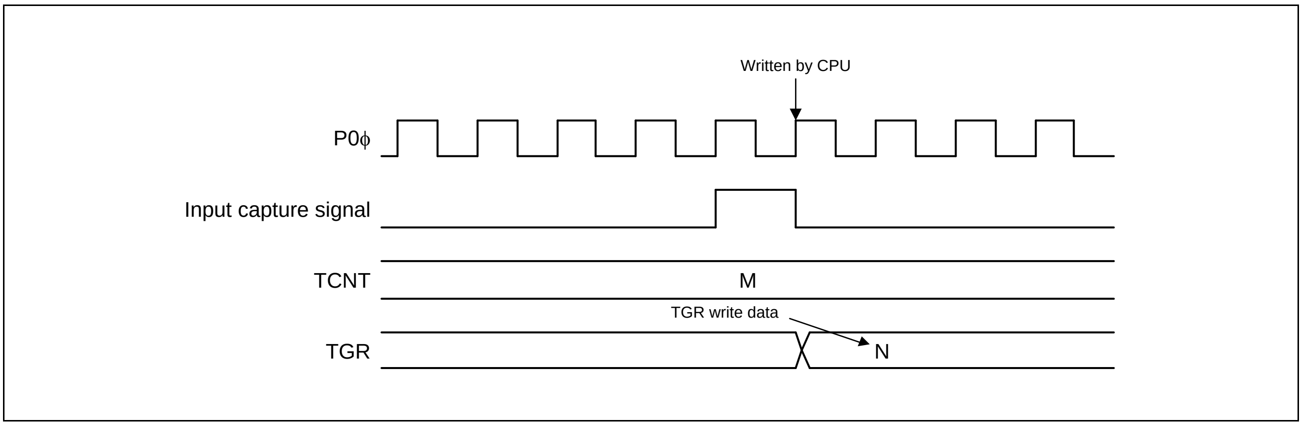

Figure 16.141 Contention between TGR Write Operation and Input Capture (MTU5)

16.6.10 Contention between Buffer Register Write Operation and Input Capture

If an input capture signal is generated in the buffer register write cycle, the buffer operation takes precedence and the buffer register write operation is not performed.

Figure 16.142 shows the timing in this case.

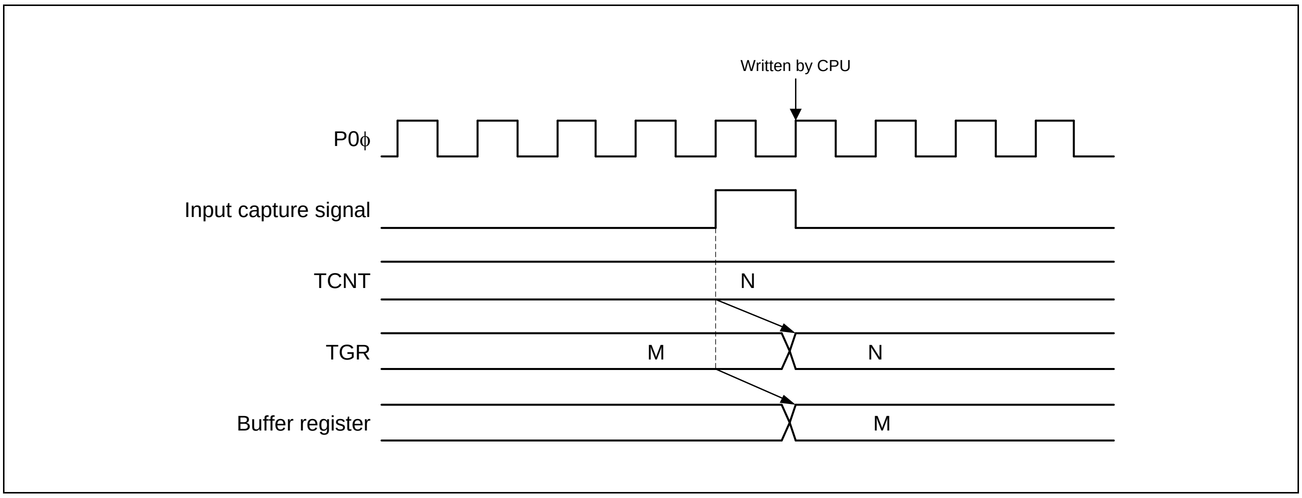

Figure 16.142 Contention between Buffer Register Write Operation and Input Capture

16.6.11 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation

With timer counters TCNT in MTU1 and MTU2 cascaded, when a contention occurs between the counting by TCNT in MTU1 (a TCNT overflow/underflow in MTU2) and the writing to TCNT in MTU2, the TCNT write operation is performed in MTU2 and the TCNT count signal in MTU1 is disabled. In this case, if TGRA in MTU1 works as a compare match register and there is a match between the values of TGRA and TCNT in MTU1, a compare match signal is issued.

Furthermore, when the TCNT count clock in MTU1 is selected as the input capture source of MTU0, TGRA to TGRD in MTU0 work in input capture mode. In addition, when the TGRC compare match/input capture in MTU0 is selected as the input capture source of TGRB in MTU1, TGRB in MTU1 works in input capture mode.

Figure 16.143 shows the timing in this case.

When setting the TCNT clearing function in cascaded operation, be sure to synchronize MTU1 and MTU2.

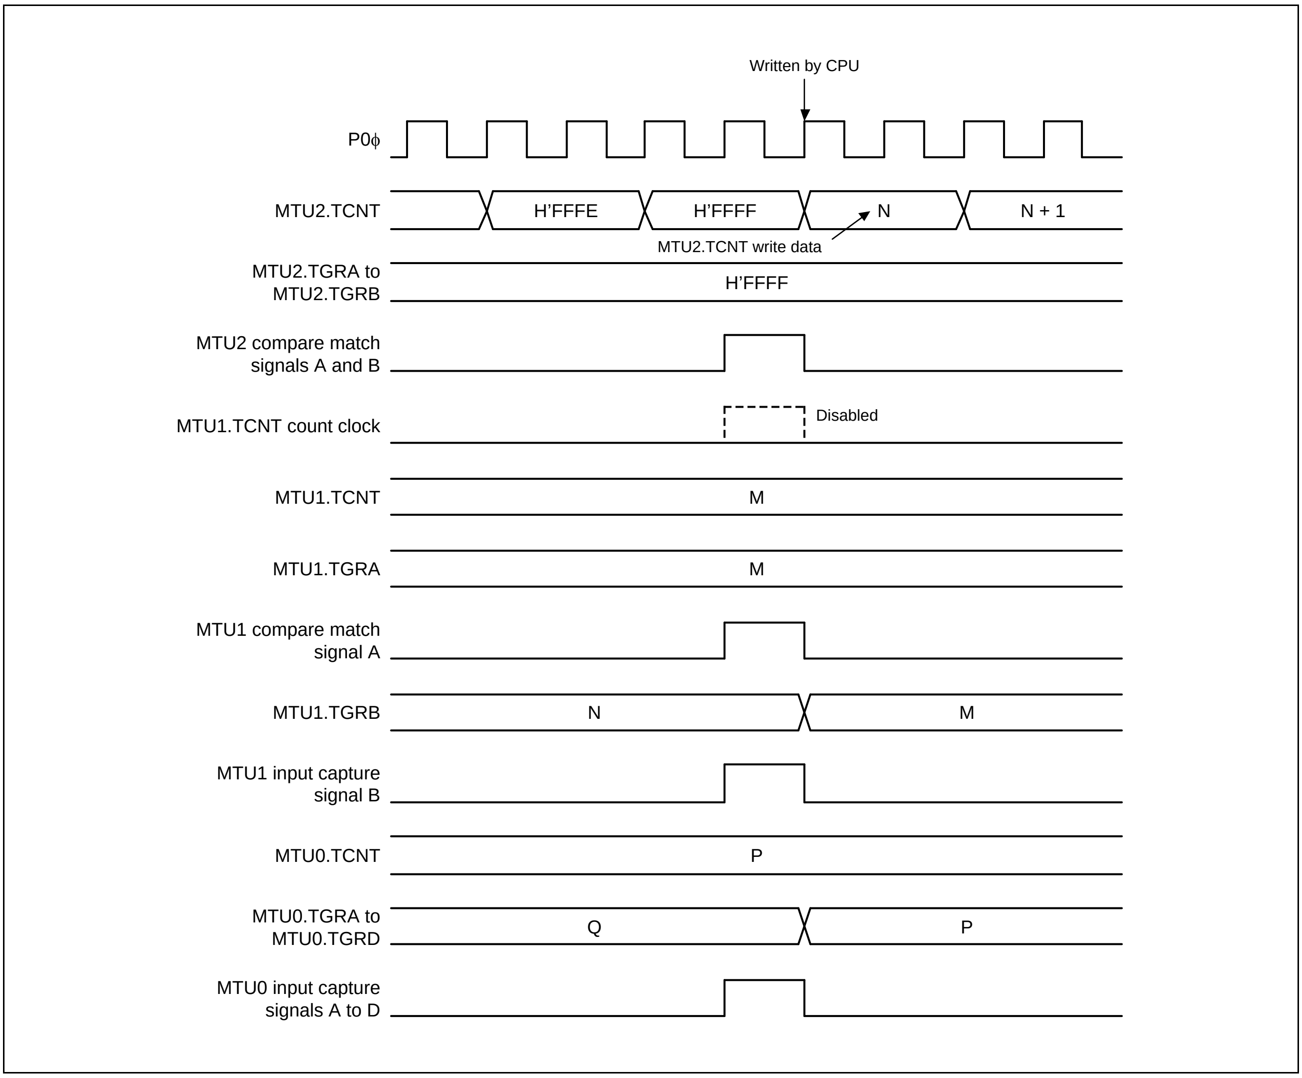

Figure 16.143 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation

16.6.12 Counter Value When Count Operation is Stopped in Complementary PWM Mode

When counting operation in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) is stopped in complementary PWM mode, the MTU3.TCNT (MTU6.TCNT) value is set to the timer dead time register (TDDRA (TDDRB)) value and MTU4.TCNT (MTU7.TCNT) is set to H’0000.

When operation is restarted in complementary PWM mode, counting begins automatically from the initial setting state.

Figure 16.144 shows this operation.

When counting begins in another operating mode, be sure to make initial settings in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT).

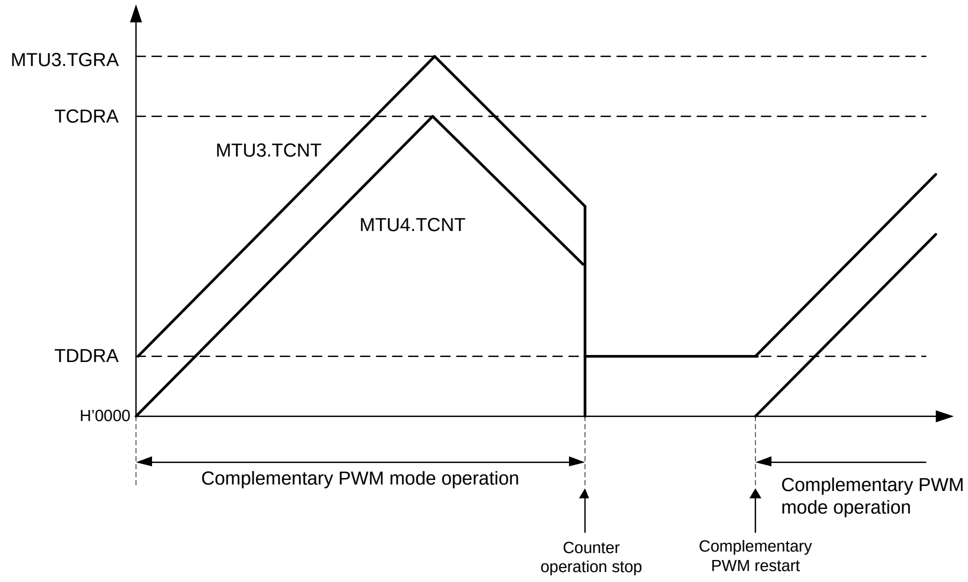

Figure 16.144 Counter Value When Stopped in Complementary PWM Mode

16.6.13 Buffer Operation Setting in Complementary PWM Mode

When modifying the PWM cycle set register (MTU3.TGRA or MTU6.TGRA), timer cycle data register (TCDRA or TCDRB), and duty set registers (MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB)) in complementary PWM mode, be sure to use buffer operation. In addition, set the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) to 0. The MTIOC4C (MTIOC7C) pin cannot output waveforms if the BFA bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1. Likewise, the MTIOC4D (MTIOC7D) pin cannot output waveforms if the BFB bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1.

In complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in bits BFA and BFB of MTU3.TMDR1 (MTU6.TMDR1). When the BFA bit in MTU3.TMDR1 (MTU6.TMDR1) is set to 1, MTU3.TGRC (MTU6.TGRC) functions as a buffer register for MTU3.TGRA (MTU6.TGRA). At the same time, MTU4.TGRC (MTU7.TGRC) functions as a buffer register for MTU4.TGRA (MTU7.TGRA), and TCBRA (TCBRB) functions as a buffer register for TCDRA (TCDRB).

16.6.14 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode

When setting buffer operation in reset-synchronized PWM mode, set the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) to 0. The MTIOC4C (MTIOC7C) pin cannot output waveforms if the BFA bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1. Likewise, the MTIOC4D (MTIOC7D) pin cannot output waveforms if the BFB bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1.

In reset-synchronized PWM mode, buffer operation in MTU3 and MTU4 (or MTU 6 and MTU7) depends on the settings in the BFA and BFB bits of MTU3.TMDR1 (MTU6.TMDR1). For example, if the BFA bit in MTU3.TMDR1 (MTU6.TMDR1) is set to 1, MTU3.TGRC (MTU6.TGRC) functions as a buffer register for MTU3.TGRA (MTU6.TGRA). At the same time, MTU4.TGRC (MTU7.TGRC) functions as a buffer register for MTU4.TGRA (MTU7.TGRA).

While the MTU3.TGRC (MTU6.TGRC) and MTU3.TGRD (MTU6.TGRD) are operating as buffer registers, a TGImn interrupt (m = C or D; n = 3, 4, 6, or 7) is not generated.

Figure 16.145 shows an example of MTU3.TGR (MTU6.TGR), MTU4.TGR (MTU7.TGR), MTIOC3 (MTIOC6), and MTIOC4 (MTIOC7) operation with the BFA and BFB bits in MTU3.TMDR1 (MTU6.TMDR1) set to 1 and the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) set to 0.

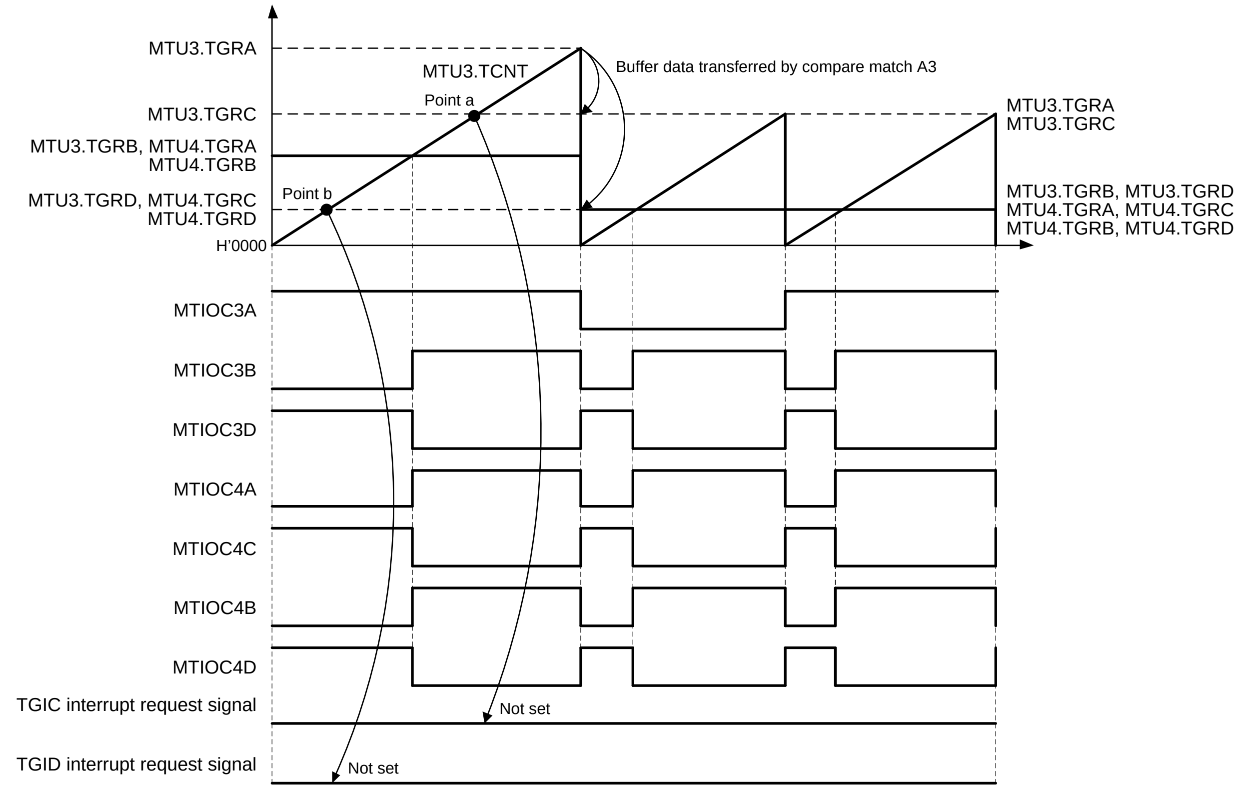

Figure 16.145 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode

16.6.15 Overflow in Reset-Synchronized PWM Mode

After reset-synchronized PWM mode is selected, the TCNT counters in MTU3 and MTU4 (MTU6 and MTU7) start counting when the CST3 (CST6) bit of TSTRA (TSTRB) is set to 1. In this state, the TCNT count clock source and count edge in MTU4 (MTU7) are determined by the setting of TCR in MTU3 (MTU6).

In reset-synchronized PWM mode, with cycle register TGRA in MTU3 (MTU6) set to H’FFFF and the TGRA compare match in MTU3 (MTU6) selected as the counter clearing source, the TCNT counters in MTU3 and MTU4 (MTU6 and MTU7) count up to H’FFFF, then a compare match occurs with TGRA in MTU3 (MTU6), and the TCNT counters in MTU3 and MTU4 (MTU6 and MTU7) are both cleared. In this case, a TCIVn interrupt (n = 3, 4, 6, or 7) is not generated.

Figure 16.146 shows an example of the operation in reset-synchronized PWM mode with cycle register TGRA in MTU3 (MTU6) set to H’FFFF and the TGRA compare match in MTU3 (MTU6) specified for the counter clearing source.

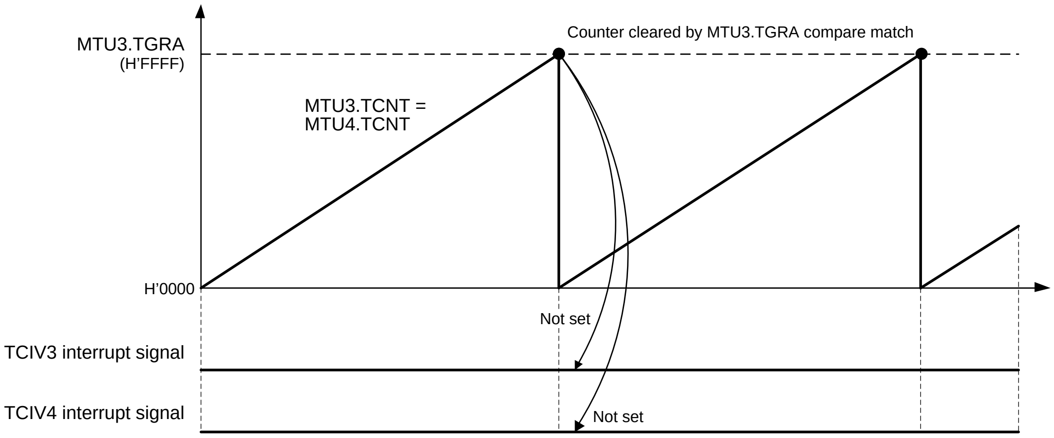

Figure 16.146 Overflow in Reset-Synchronized PWM Mode

16.6.16 Contention between Overflow/Underflow and Counter Clearing

If an overflow/underflow and counter clearing occur simultaneously, a TCIVn interrupt (n = 0 to 4 or 6 to 8) nor a TCIUn interrupt (n = 1 or 2) is not generated and TCNT clearing takes precedence.

Figure 16.147 shows the operation timing when a TGR compare match is specified as the clearing source and TGR is set to H’FFFF.

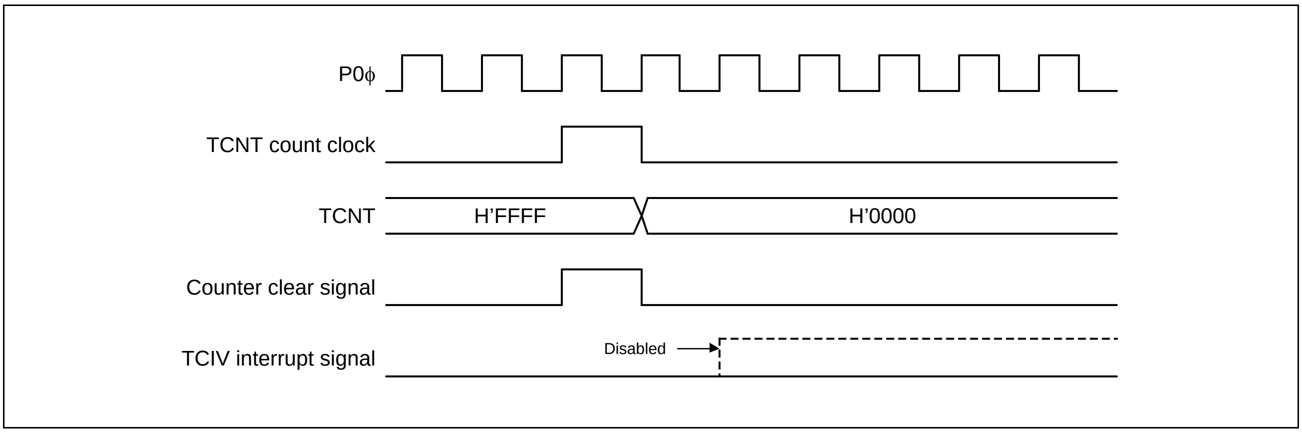

Figure 16.147 Contention between Overflow and Counter Clearing

16.6.17 Contention between TCNT Write Operation and Overflow/Underflow

If TCNT counts up or down in a TCNT write cycle and an overflow or an underflow occurs, the TCNT write operation takes precedence. A TCIVn interrupt (n = 0 to 4 or 6 to 8) nor a TCIUn interrupt (n = 1 or 2) is not generated.

Figure 16.148 shows the operation timing when there is contention between TCNT write operation and overflow.

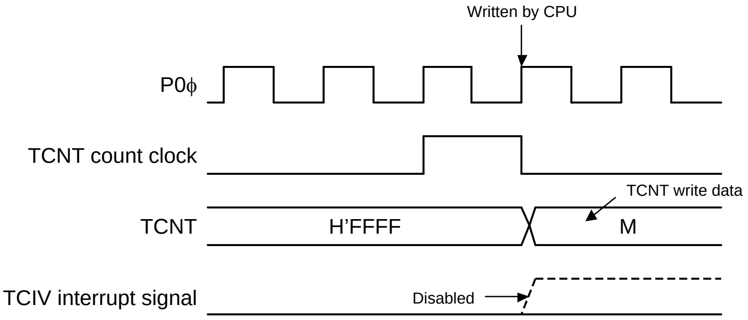

Figure 16.148 Contention between TCNT Write Operation and Overflow

16.6.18 Note on Transition from Normal Mode or PWM Mode 1 to Reset-Synchronized PWM Mode

When making a transition from normal mode or PWM mode 1 to reset-synchronized PWM mode in MTU3 and MTU4 (or MTU6 and MTU7), if the counter is stopped while the output pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, and MTIOC7D) are held at a high level and then operation is started after a transition to reset-synchronized PWM mode, the initial pin output will not be correct.

When making a transition from normal mode to reset-synchronized PWM mode, write H’11 to MTU3.TIORH, MTU3.TIORL, MTU4.TIORH, and MTU4.TIORL (MTU6.TIORH, MTU6.TIORL, MTU7.TIORH, and MTU7.TIORL) to initialize the output pin state to a low level, then set the registers to the initial value (H’00) before making the mode transition.

When making a transition from PWM mode 1 to reset-synchronized PWM mode, switch to normal mode, initialize the output pin state to a low level, and then set the registers to the initial value (H’00) before making the transition to reset-synchronized PWM mode.

16.6.19 Output Level in Complementary PWM Mode and Reset-Synchronized PWM Mode

When MTU3 and MTU4 (or MTU6 and MTU7) are in complementary PWM mode or reset-synchronized PWM mode, the PWM waveform output level is determined by the OLSP and OLSN bits in the timer output control register (TOCR1A or TOCR1B). In complementary PWM mode or reset-synchronized PWM mode, TIOR should be set to H’00. The output level in negative phase when the TDER bit in TDERA (TDERB) is set to 0 in complementary PWM mode (the dead time is not generated) does not depend on the setting of the OLSN bit in TOCR1A (TOCR1B). It is equivalent to the inverted level of positive phase output based on the setting of the OLSP bit in TOCR1A (TOCR1B).

16.6.20 Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection

When timer counters 1 and 2 (MTU1.TCNT and MTU2.TCNT) operate as a 32-bit counter in cascade connection, the cascaded counter value cannot be captured successfully in some cases even if input-capture input is simultaneously done to MTIOC1A and MTIOC2A or to MTIOC1B and MTIOC2B. This is because the input timing of MTIOC1A and MTIOC2A or to MTIOC1B and MTIOC2B may not be the same when external input-capture signals input into MTU1.TCNT and MTU2.TCNT are taken in synchronization with the internal clock.

For example, MTU1.TCNT (the counter for upper 16 bits) does not capture the count-up value by an overflow from MTU2.TCNT (the counter for lower 16 bits) but captures the count value before the up-counting. In this case, the values of MTU1.TCNT = H’FFF1 and MTU2.TCNT = H’0000 should be transferred to MTU1.TGRA and MTU2.TGRA or to MTU1.TGRB and MTU2.TGRB, but the values of MTU1.TCNT = H’FFF0 and MTU2.TCNT = H’0000 are erroneously transferred.

The MTU has a function that allows simultaneous capture of MTU1.TCNT and MTU2.TCNT with a single input capture input. This function can be used to read the 32-bit counter such that MTU1.TCNT and MTU2.TCNT are captured at the same time. For details, see **Section 16.2.11, Timer Input Capture Control Register (TICCR)**.

16.6.21 Interrupt-Skipping Function 2

When interrupt-skipping function 2 is in use and the difference between the values in MTU4.TADCORA and MTU4.TADCORB is small, correct counting of the number skipped may not be possible, in which case requests for A/D conversion will not be generated with the expected timing. The conditions listed below thus apply to these settings.

For MTU6 and MTU7, the same conditions apply to the settings of MTU7.TADCORA and MTU7.TADCORB.

(1) When the number skipped is zero for skipping function 2

- The difference between the values in MTU4.TADCORA and MTU4.TADCORB must be at least four.
- The interval of comparison for MTU4.TADCORA must be at least four cycles of P0ϕ clock (the updated value of MTU4.TADCORA is set to the previous value plus or minus at least four).
- The interval of comparison for MTU4.TADCORB must be at least four cycles of P0ϕ clock (the updated value of MTU4.TADCORB is set to the previous value plus or minus at least four).

(2) When the number skipped is one or more for skipping function 2

- The difference between the values in MTU4.TADCORA and MTU4.TADCORB must be at least two.
- The interval of comparison for MTU4.TADCORB must be at least two cycles of P0ϕ (the updated value of MTU4.TADCORB is set to the previous value plus or minus at least two).

16.6.22 Notes When Complementary PWM Mode Output Protection Function is Not Used

The complementary PWM mode output protection function is initially enabled. For details, refer to **Section 17, Port Output Enable 3 (POE3)**.

16.6.23 Notes Regarding Timer Counter (MTU5.TCNT) and Timer General Register (MTU5.TGR)

Do not set TGRj (j = U, V, or W) in MTU5 to the value of the corresponding TCNTj in MTU5 plus one while counting by TCNTj in MTU5 is stopped. If such a setting is made, a compare match will be generated even though counting is stopped.

In this case, if the value of the compare match enable bit (TGIE5j bit of TIER in MTU5) is 1 (enabled), a compare match interrupt will also be generated. If the value of the timer compare match clear register is 1 (enabled), the TCNTj counter in MTU5 is automatically cleared to H’0000 when the compare match is generated, regardless of whether compare match interrupts are enabled or disabled.

16.6.24 Notes to Prevent Malfunctions in Synchronous Clearing for Complementary PWM Mode

If control of the output waveform is enabled (the WRE bit of TWCRA or TWCRB is 1) at the time of synchronous counter clearing in complementary PWM mode, satisfaction of either condition 1 or 2 below has the following effects.

- Dead time on the PWM output pins is shortened (or disappears).
- The active level is output on the negative phase PWM output pins beyond the period for active-level output.

Condition 1:

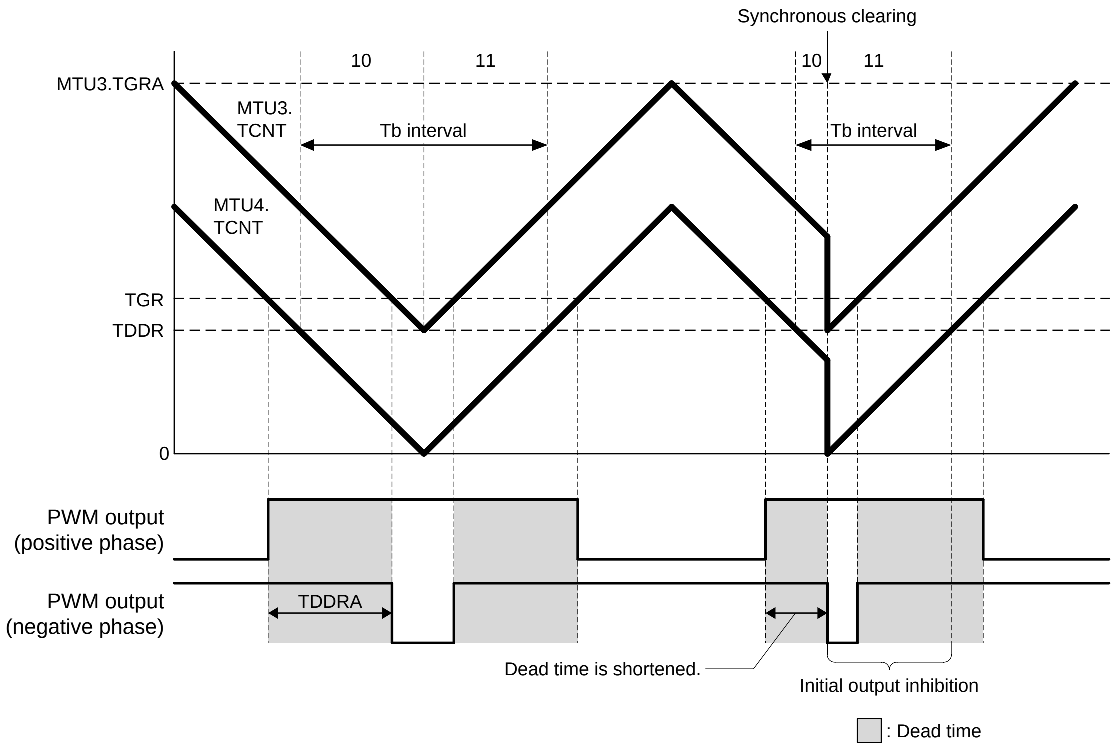
In portion (10) of the initial output inhibition period in **Figure 16.149**, synchronous clearing occurs within the dead-time period for PWM output.

Condition 2:

In portions (10) and (11) of the initial output inhibition period in **Figure 16.150**, synchronous clearing occurs when any condition from among TGRB in MTU3 (MTU6) ≤ TDDR (TDDRB), TGRA in MTU4 (MTU7) ≤ TDDR (TDDRB), and TGRB in MTU4 (MTU7) ≤ TDDR (TDDRB) is satisfied.

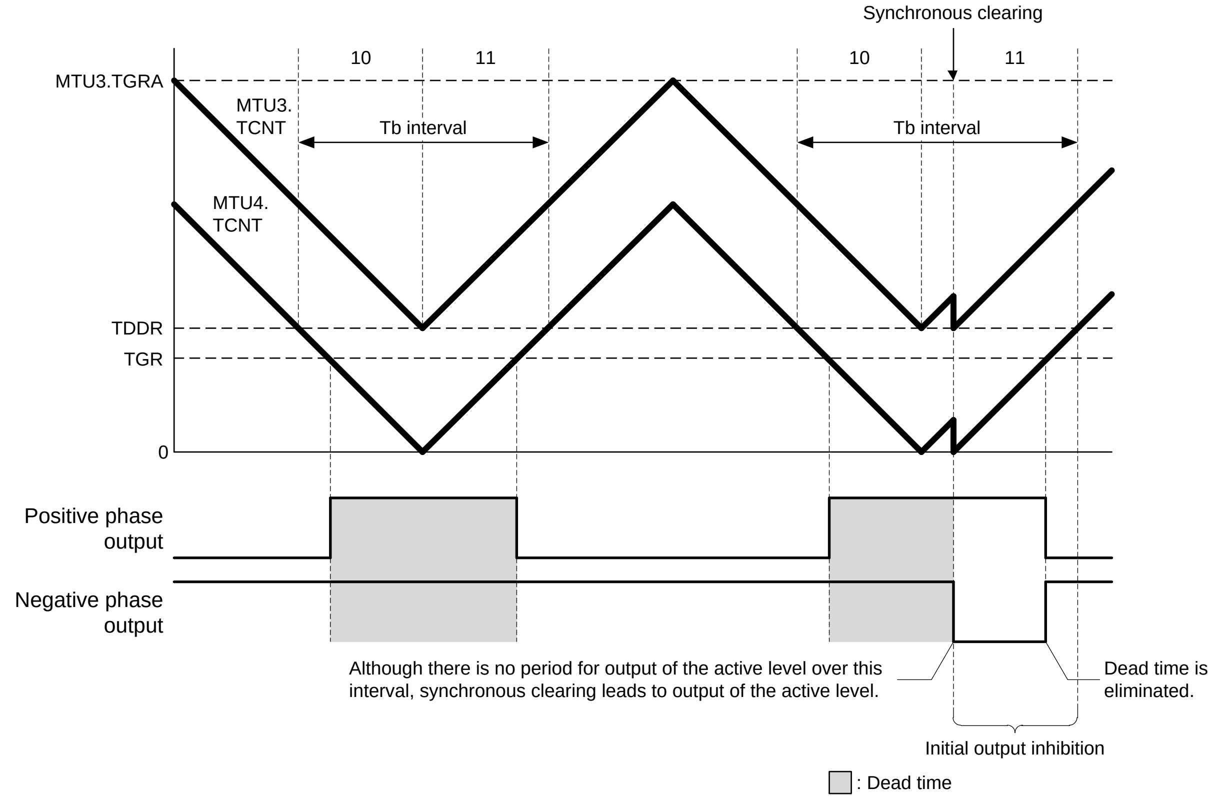
The following method avoids the above phenomena.

Ensure that synchronous clearing proceeds with the value of each comparison register (TGRB in MTU3 (MTU6), TGRA in MTU4 (MTU7), and TGRB in MTU4 (MTU7)) set to at least double the value of the TDDRA register (TDDRB register).



Note: PWM output is active low.

Figure 16.149 Example of Synchronous Clearing (When Condition 1 Applies)



Note: PWM output is active low.

Figure 16.150 Example of Synchronous Clearing (When Condition 2 Applies)

16.6.25 Continuous Output of Interrupt Signal in Response to a Compare Match

When the TGR register is set to H’0000, the P0ϕ/1 clock is set as the count clock, and compare match is set as the trigger for clearing of the count clock, the value of the TCNT counter remains H’0000, and the interrupt signal will be output continuously (i.e. its level will be flat) rather than output over a single cycle. Consequently, interrupts will not be detected in response to second and subsequent compare matches.

Figure 16.151 shows the timing for continuous output of the interrupt signal in response to a compare match.

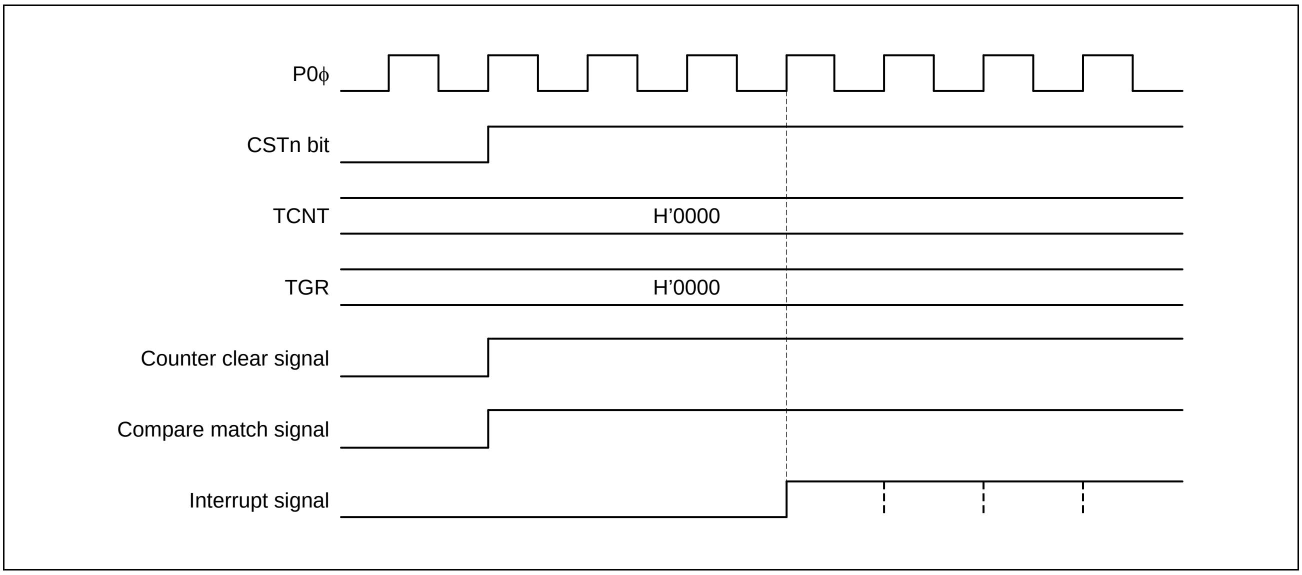


Figure 16.151 Continuous Output of Interrupt Signal in Response to a Compare Match

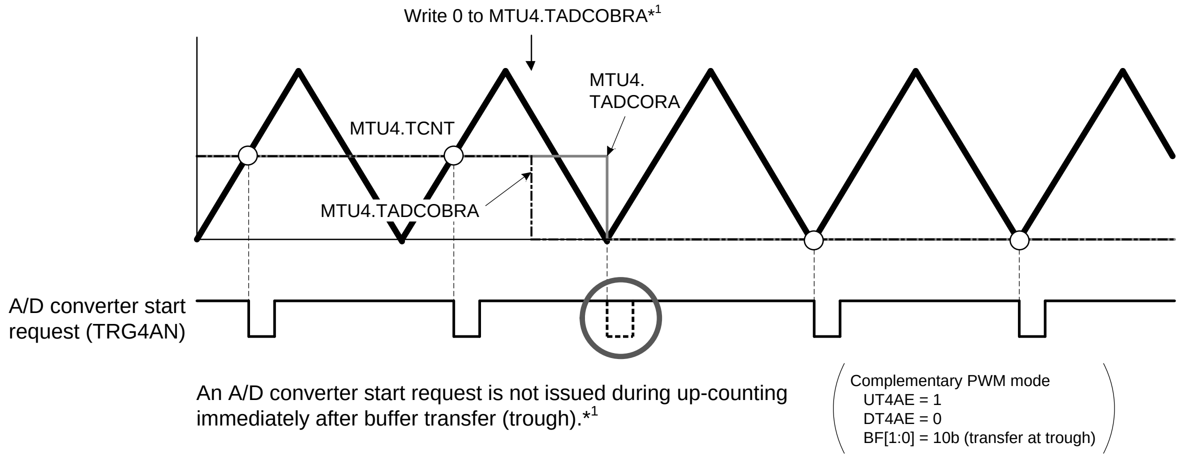
16.6.26 Notes on A/D Converter Start Request Delaying Function in Complementary PWM Mode

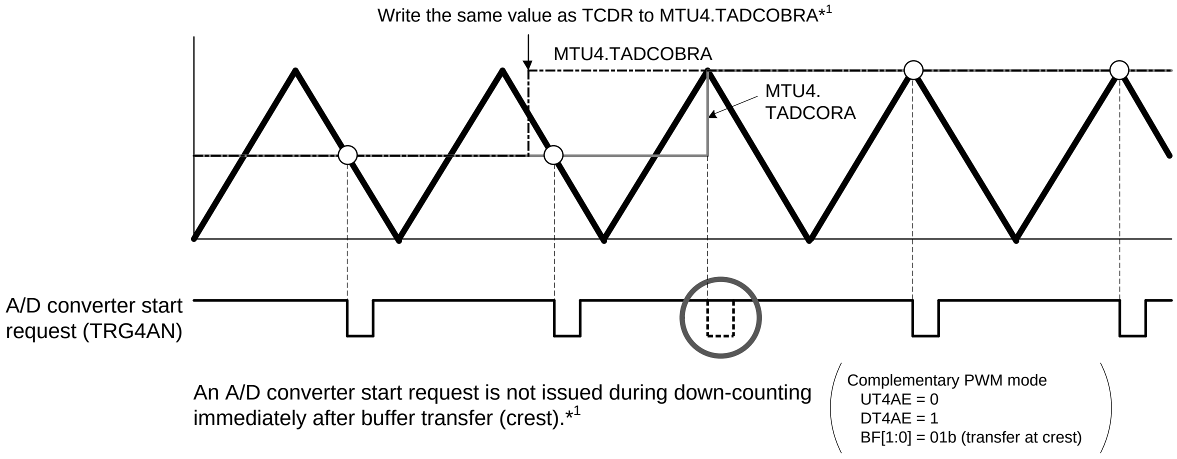
- When the TADCOBRA or TADCOBRB register in MTU4 (MTU7) is set to 0, the UT4AE or UT4BE (UT7AE or UT7BE) bit of TADCR in MTU4 (MTU7) is set to 1, and buffer transfer is performed at the trough of the value of the TCNT counter in MTU4 (MTU7), an A/D converter start request is not issued during up-counting immediately after the transfer (**Figure 16.152**).
- When the TADCOBRA or TADCOBRB register in MTU4 (MTU7) is set to the same value as that in the TCDR register, the DT4AE or DT4BE (DT7AE or DT7BE) bit of TADCR in MTU4 (MTU7) is set to 1, and buffer transfer is performed at the crest of the value of the TCNT counter in MTU4 (MTU7), an A/D converter start request is not issued during down-counting immediately after the transfer (**Figure 16.153**).
- When using A/D converter start requests in coordination with the interrupt skipping function, set up the TADCORA or TADCORB register in MTU4 (MTU7) so that the setting satisfies the condition "2 ≤ TADCORA or TADCORB in MTUn ≤ TCDR - 2" (n = 4 or 7).



Note: UT4AE, DT4AE, BF[1:0]: Bits in TADCR

Note 1. An A/D converter start request is issued when TCDR − 1 ≥ MTU4.TADCOBRA/TADCOBRB ≥ 1 is written.

Figure 16.152 A/D Converter Start Request when TADCOBRA is Set to 0 in MTU4



An A/D converter start request is not issued during down-counting immediately after buffer transfer (crest).*1

Note: UT4AE, DT4AE, BF[1:0]: Bits in TADCR

Note 1. An A/D converter start request is issued when TCDR −1 ≥ MTU4.TADCOBRA/TADCOBRB ≥ 1 is written.

16.7 MTU Output Pin Initialization

16.7.1 Operating Modes

The MTU has the following six operating modes. Waveforms can be output in any of these modes.

- Normal mode (MTU0 to MTU4 and MTU6 to MTU8)
- PWM mode 1 (MTU0 to MTU4, MTU6, and MTU)
- PWM mode 2 (MTU0 to MTU2)
- Phase counting modes 1 to 5 (MTU1 and MTU2)
- Complementary PWM mode (MTU3, MTU4, MTU6, and MTU7)
- Reset-synchronized PWM mode (MTU3, MTU4, MTU6, and MTU7)

This section describes how to initialize the MTU output pins in each of these modes.

16.7.2 Operation in Case of Re-Setting Due to Error during Operation

If an error occurs during MTU operation, MTU output should be cut off by the system. The output can be cut off by allowing non-active level output from the pins by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports. MTU output can be disabled through TIOR settings. Complementary PWM output (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D) should be specified through TOERA and TOERB settings. For PWM output pins, output can also be cut by hardware, using port output enable 3 (POE3). The pin initialization procedures for re-setting due to an error during operation and the procedures for restarting in a different mode after re-setting are described below.

The MTU has six operating modes, as stated above. There are thus 36 mode transition combinations, but some transitions are not available with certain channel and mode combinations. Available mode transition combinations are shown in **Table 16.80**.

Table 16.80 Mode Transition Combinations

	Normal	PWM1	PWM2	PCM	CPWM	RPWM
Normal	(1)	(2)	(3)	(4)	(5)	(6)
PWM1	(7)	(8)	(9)	(10)	(11)	(12)
PWM2	(13)	(14)	(15)	(16)	Not available	Not available
PCM	(17)	(18)	(19)	(20)	Not available	Not available
CPWM	(21)	(22)	Not available	Not available	(23) (24)	(25)
RPWM	(26)	(27)	Not available	Not available	(28)	(29)

Note: Normal: Normal mode
PWM1: PWM mode 1
PWM2: PWM mode 2
PCM: Phase counting modes 1 to 5
CPWM: Complementary PWM mode
RPWM: Reset-synchronized PWM mode

16.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation

- When making a transition to a mode (Normal, PWM1, PWM2, or PCM) in which the pin output level is selected by the timer I/O control register (TIOR) setting, initialize the pins by means of TIOR setting.
- In PWM mode 1, waveforms are not output to the MTIOCnB and MTIOCnD pins (n = 3, 4, 6, or 7). If the MTIOCnB or MTIOCnD output is selected as the function of the pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.
- In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers. If the MTIOCnm output (n = 0 to 2 and m = A to D) is selected as the function of the pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.
- In normal mode or PWM mode 2, if TGRC and TGRD operate as buffer registers, waveforms are not output to the corresponding MTIOCnC and MTIOCnD pins (n = 0, 3, 4, 6, or 7). If the MTIOCnC or MTIOCnD output is selected as the function of the pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.
- In PWM mode 1, if either TGRC or TGRD operates as a buffer register, waveforms are not output to the corresponding MTIOCnC and MTIOCnD pins (n = 0, 3, 4, 6, or 7). If the MTIOCnC or MTIOCnD output is selected as the function of the pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.
- When making a transition to a mode (CPWM or RPWM) in which the pin output level is selected by the timer output control register (TOCR1A, TOCR2A, TOCR1B, or TOCR2B) setting, temporarily disable output in MTU3 and MTU4 (or MTU6 and MTU7) with the timer output master enable register (TOERA or TOERB). If the MTIOCnm output (n =3, 4, 6, or 7 and m = A to D) is selected as the function of pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports. Switch to normal mode, perform initialization with TIOR, restore TIOR to its initial value, then operate the MTU in accordance with the mode setting procedure (TOCR1A setting, TOCR2A setting, TMDR1 setting, and TOERA setting (TOCR1B setting, TOCR2B setting, TMDR1 setting, and TOERB setting)).

NOTE

Channel number is substituted for “n” indicated in this section.

Pin initialization procedures are described below for the numbered combinations in **Table 16.80**. The active level is assumed to be low.

(1) Operation When Error Occurs in Normal Mode and Operation is Restarted in Normal Mode

Figure 16.154 shows a case in which an error occurs in normal mode and operation is restarted in normal mode after re- setting.

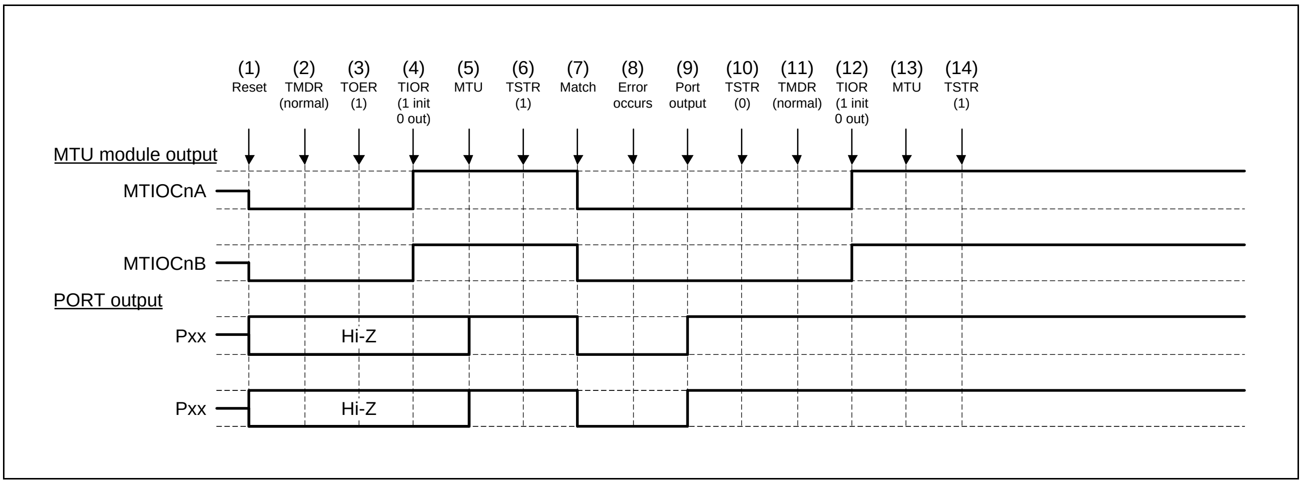

Figure 16.154 Error Occurrence in Normal Mode, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) After a reset, the TMDR1 setting is for normal mode.

(3) For MTU3 and MTU4 (MTU6 and MTU7), enable output with TOERA (TOERB) before initializing the pins with TIOR.

(4) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence.)

(5) Set MTU output using the port mode control registers (PMCn) and port function control registers (PFCm) corresponding to the GPIO ports.

(6) Start count operation by setting TSTRA (TSTRB).

(7) Output goes low on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.

(10) Stop count operation by setting TSTRA (TSTRB).

(11) This step is not necessary when restarting in normal mode.

(12) Initialize the pins with TIOR.

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

(2) Operation When Error Occurs in Normal Mode and Operation is Restarted in PWM Mode 1

Figure 16.155 shows a case in which an error occurs in normal mode and operation is restarted in PWM mode 1 after re-setting.

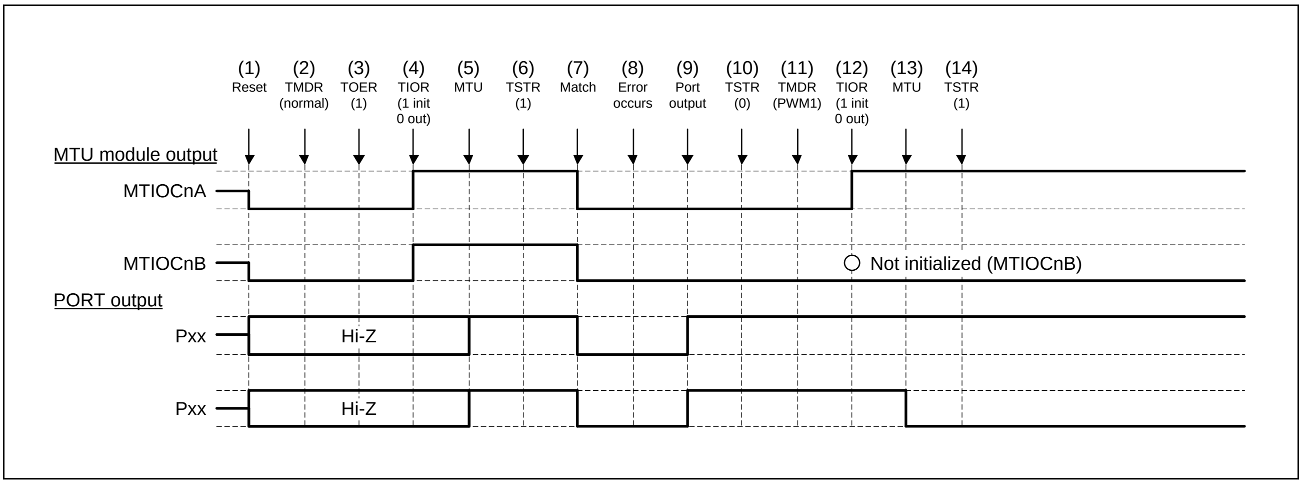

Figure 16.155 Error Occurrence in Normal Mode, Recovery in PWM Mode 1

(1) to (10) are the same as in **Figure 16.154**.

(11) Set PWM mode 1.

(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

(3) Operation When Error Occurs in Normal Mode and Operation is Restarted in PWM mode 2

Figure 16.156 shows a case in which an error occurs in normal mode and operation is restarted in PWM mode 2 after re-setting.

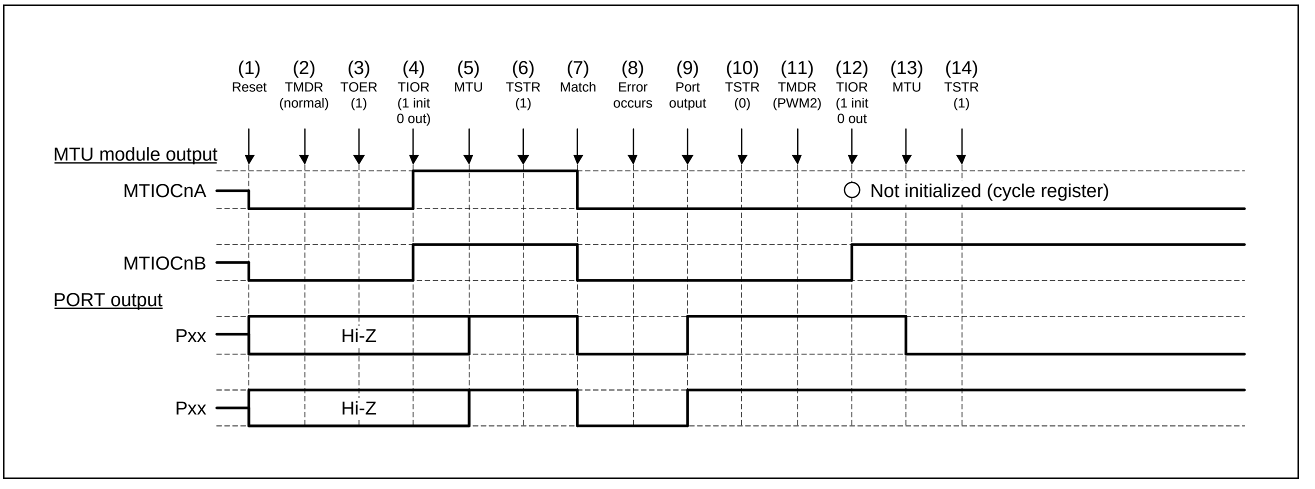

Figure 16.156 Error Occurrence in Normal Mode, Recovery in PWM Mode 2

(1) to (10) are the same as in **Figure 16.154**.

(11) Set PWM mode 2.

(12) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers. To output a specified level, set up the general output ports with the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA.

NOTE

PWM mode 2 can only be selected for MTU0 to MTU2, and therefore TOERA setting is not necessary.

(4) Operation When Error Occurs in Normal Mode and Operation is Restarted in Phase Counting Mode

Figure 16.157 shows a case in which an error occurs in normal mode and operation is restarted in phase counting mode after re-setting.

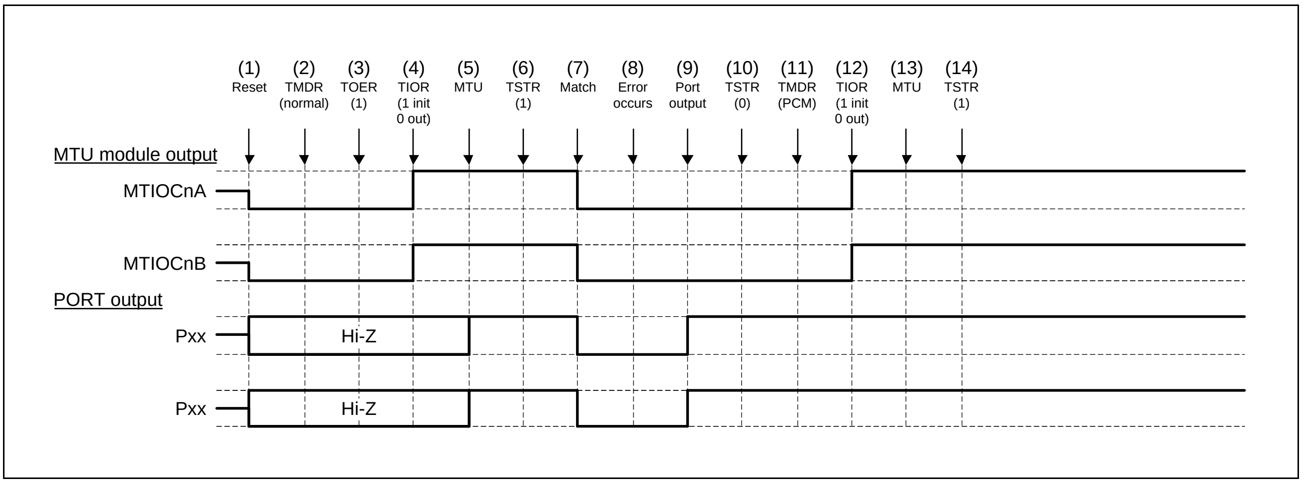

Figure 16.157 Error Occurrence in Normal Mode, Recovery in Phase Counting Mode

(1) to (10) are the same as in **Figure 16.154**.

(11) Set the phase counting mode.

(12) Initialize the pins with TIOR.

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA.

NOTE

The phase counting mode can only be selected for MTU1 and MTU2, and therefore TOERA setting is not necessary.

(5) Operation When Error Occurs in Normal Mode and Operation is Restarted in Complementary PWM Mode

Figure 16.158 shows a case in which an error occurs in normal mode and operation is restarted in complementary PWM mode after re-setting.

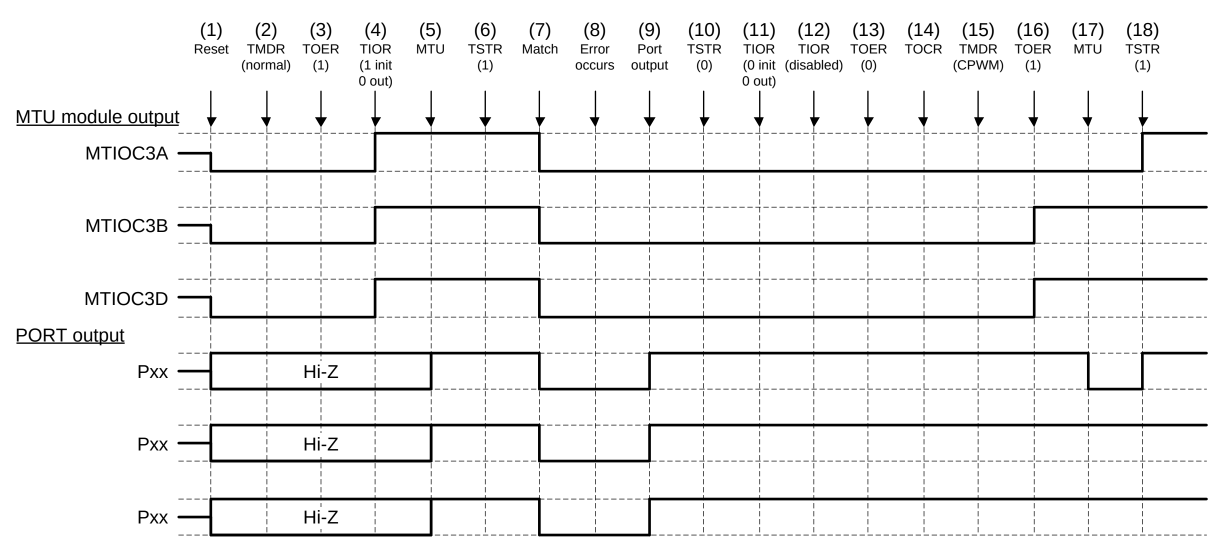

Figure 16.158 Error Occurrence in Normal Mode, Recovery in Complementary PWM Mode

(1) to (10) are the same as in **Figure 16.154**.

(11) Initialize the normal mode waveform generation section with TIOR.

(12) Disable operation of the normal mode waveform generation section with TIOR.

(13) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(14) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(15) Set complementary PWM mode.

(16) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(17) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(18) Restart operation by setting TSTRA (TSTRB).

(6) Operation When Error Occurs in Normal Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 16.159 shows a case in which an error occurs in normal mode and operation is restarted in reset-synchronized PWM mode after re-setting.

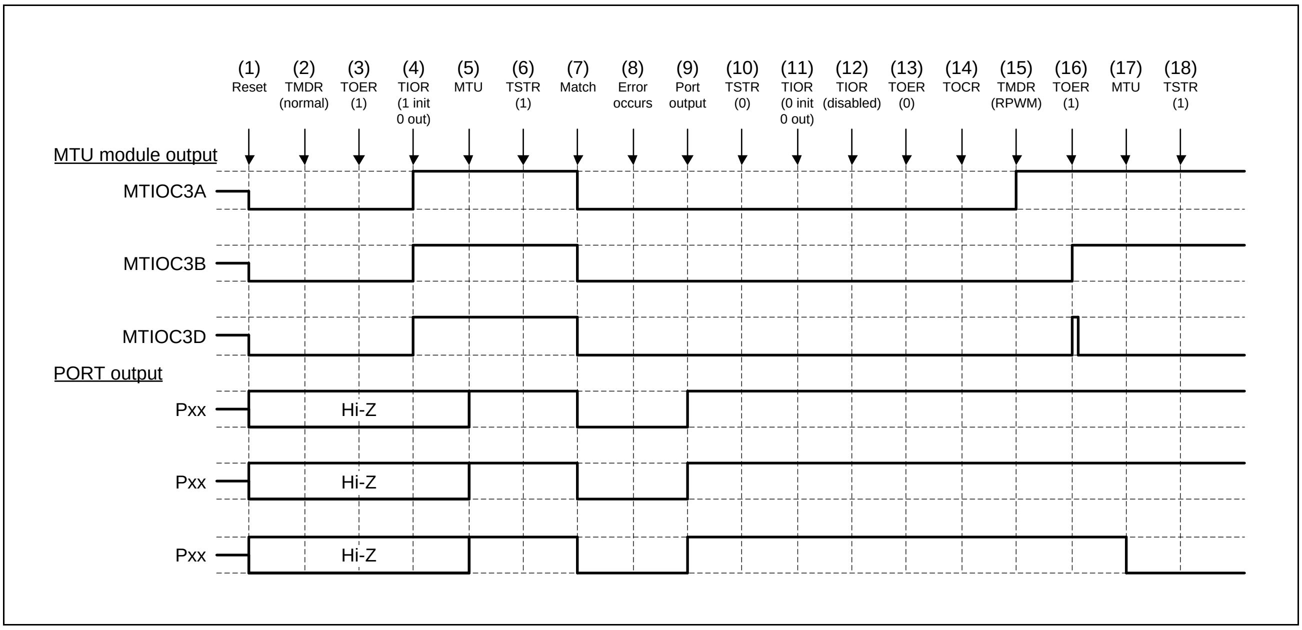

Figure 16.159 Error Occurrence in Normal Mode, Recovery in Reset-Synchronized PWM Mode

(1) to (13) are the same as in **Figure 16.156**.

(14) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(15) Set reset-synchronized PWM mode.

(16) Enable output from MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(17) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(18) Restart operation by setting TSTRA (TSTRB).

(7) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Normal Mode

Figure 16.160 shows a case in which an error occurs in PWM mode 1 and operation is restarted in normal mode after re-setting.

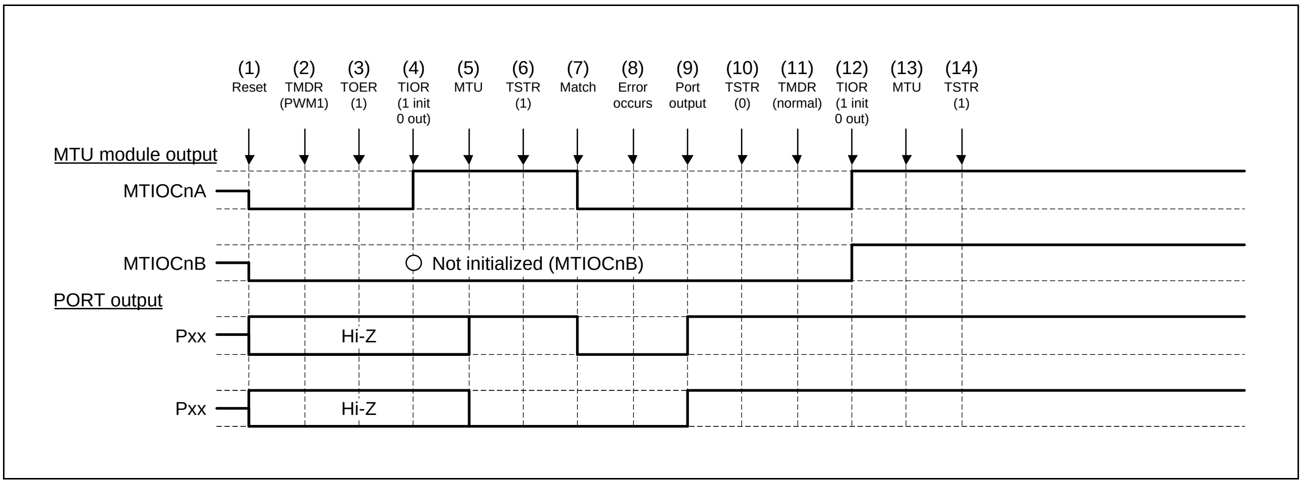

Figure 16.160 Error Occurrence in PWM Mode 1, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Set PWM mode 1.

(3) For MTU3 and MTU4 (MTU6 and MTU7), enable output with TOERA (TOERB) before initializing the pins with TIOR.

(4) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence. In PWM mode 1, the MTIOCnB side is not initialized.)

(5) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(6) Start count operation by setting TSTRA (TSTRB).

(7) Output goes low on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.

(10) Stop count operation by setting TSTRA (TSTRB).

(11) Set normal mode.

(12) Initialize the pins with TIOR.

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

(8) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in PWM mode 1

Figure 16.161 shows a case in which an error occurs in PWM mode 1 and operation is restarted in PWM mode 1 after re-setting.

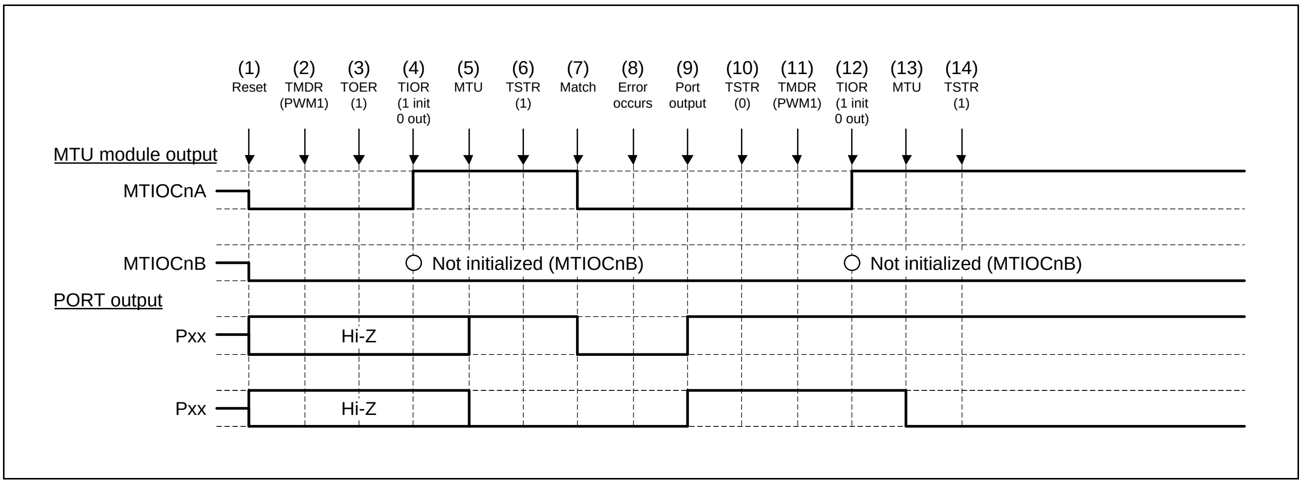

Figure 16.161 Error Occurrence in PWM Mode 1, Recovery in PWM Mode 1

(1) to (10) are the same as in **Figure 16.160**.

(11) This step is not necessary when restarting in PWM mode 1.

(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

(9) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in PWM mode 2

Figure 16.162 shows a case in which an error occurs in PWM mode 1 and operation is restarted in PWM mode 2 after re-setting.

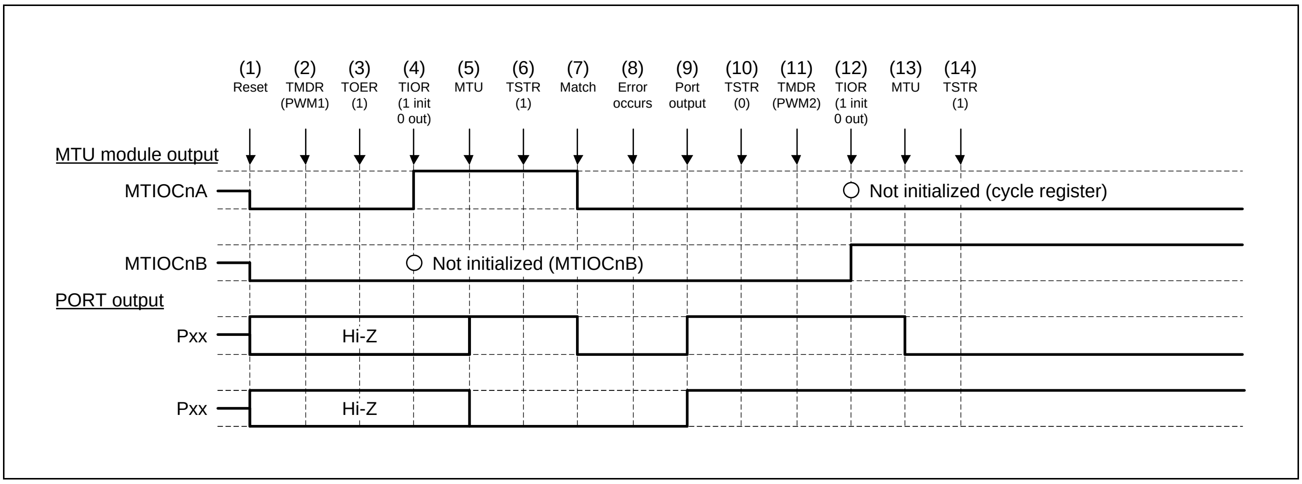

Figure 16.162 Error Occurrence in PWM Mode 1, Recovery in PWM Mode 2

(1) to (10) are the same as in **Figure 16.160**.

(11) Set PWM mode 2.

(12) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers.
To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA.

NOTE

PWM mode 2 can only be selected for MTU0 to MTU2, and therefore TOERA setting is not necessary.

(10) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Phase Counting Mode

Figure 16.163 shows a case in which an error occurs in PWM mode 1 and operation is restarted in phase counting mode after re-setting.

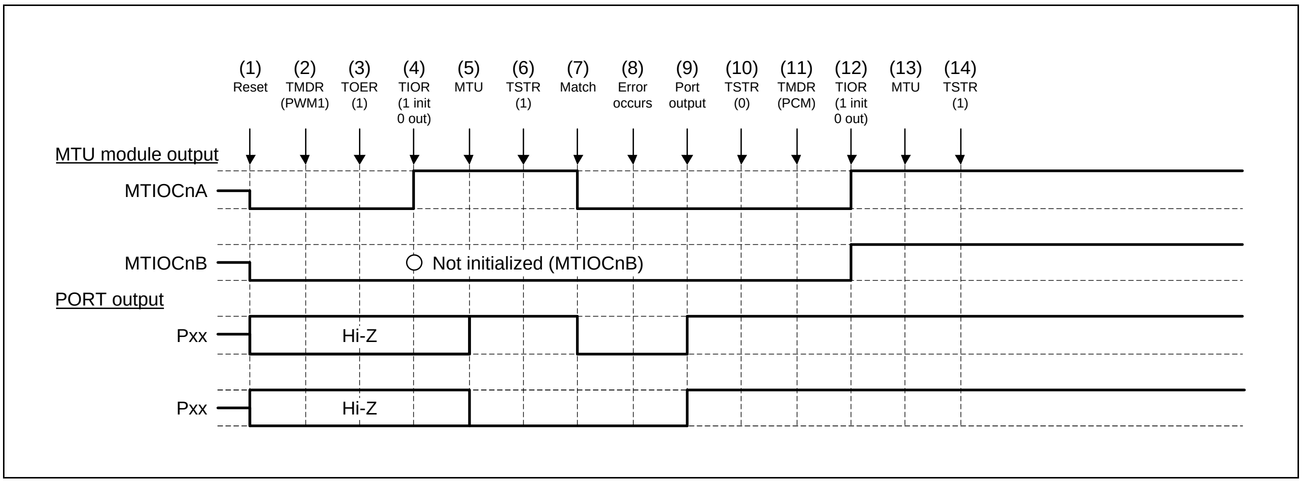

Figure 16.163 Error Occurrence in PWM Mode 1, Recovery in Phase Counting Mode

(1) to (10) are the same as in **Figure 16.160**.

(11) Set the phase counting mode.

(12) Initialize the pins with TIOR.

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA.

NOTE

The phase counting mode can only be selected for MTU1 and MTU2, and therefore TOERA setting is not necessary.

(11) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Complementary PWM Mode

Figure 16.164 shows a case in which an error occurs in PWM mode 1 and operation is restarted in complementary PWM mode after re-setting.

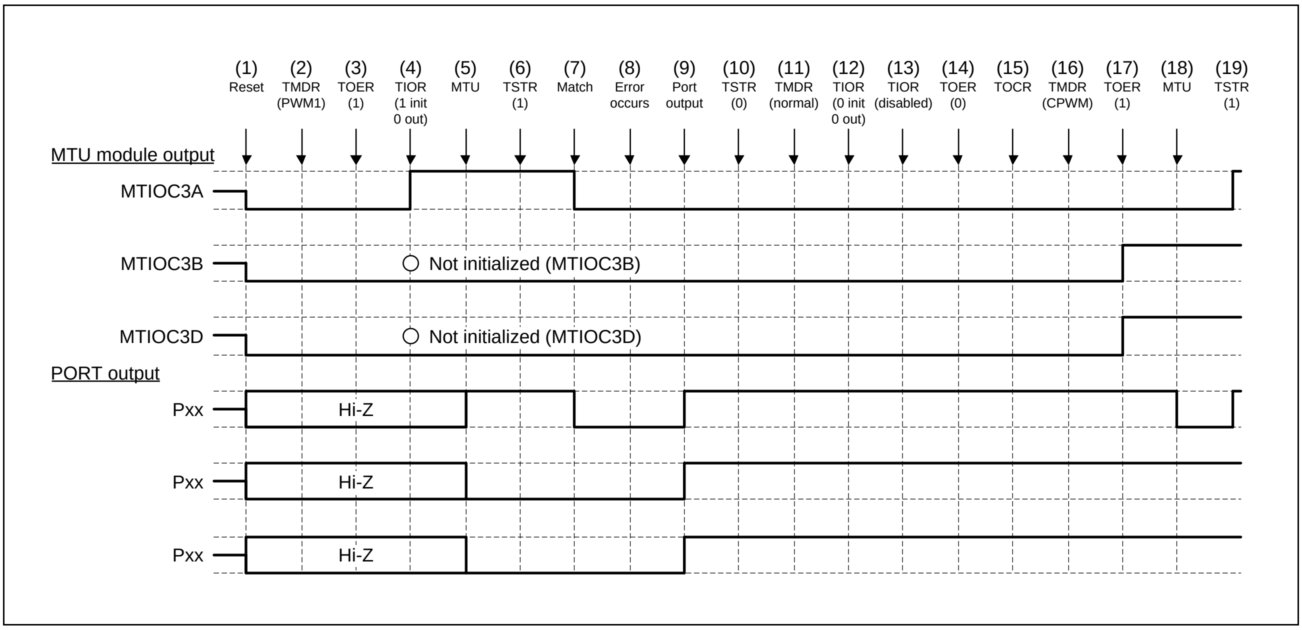

Figure 16.164 Error Occurrence in PWM Mode 1, Recovery in Complementary PWM Mode

(1) to (10) are the same as in **Figure 16.160**.

(11) Set normal mode to initialize the normal mode waveform generation section.

(12) Initialize the PWM mode 1 waveform generation section with TIOR.

(13) Disable operation of the PWM mode 1 waveform generation section with TIOR

(14) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(15) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(16) Set complementary PWM mode.

(17) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(18) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(19) Restart operation by setting TSTRA (TSTRB).

(12) Operation When Error Occurs in PWM Mode 1 and Operation is Restarted in Reset- Synchronized PWM Mode

Figure 16.165 shows a case in which an error occurs in PWM mode 1 and operation is restarted in reset-synchronized PWM mode after re-setting.

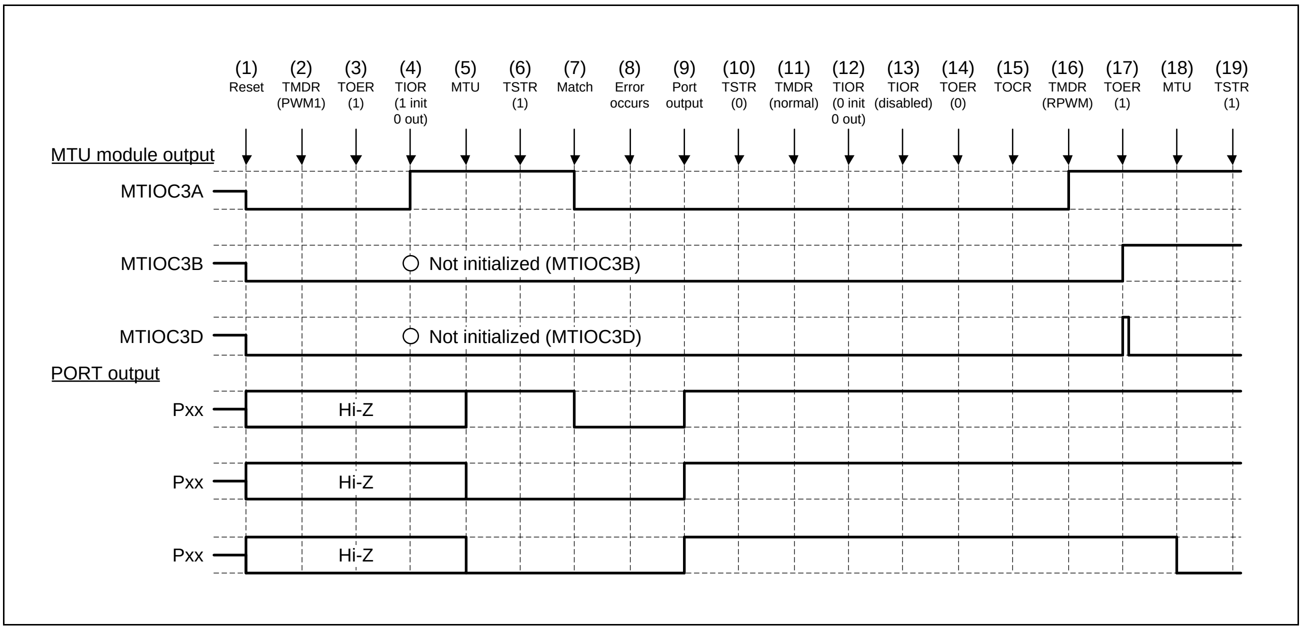

Figure 16.165 Error Occurrence in PWM Mode 1, Recovery in Reset-Synchronized PWM Mode

(1) to (14) are the same as in **Figure 16.164**.

(15) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(16) Set reset-synchronized PWM mode.

(17) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(18) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(19) Restart operation by setting TSTRA (TSTRB).

(13) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in Normal Mode

Figure 16.166 shows a case in which an error occurs in PWM mode 2 and operation is restarted in normal mode after re-setting.

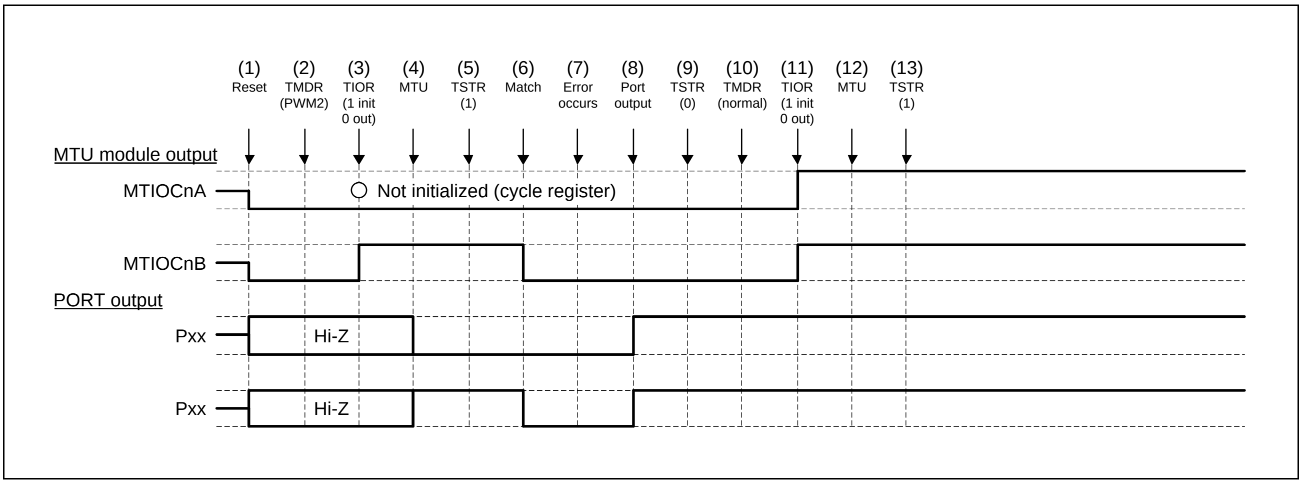

Figure 16.166 Error Occurrence in PWM Mode 2, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Set PWM mode 2.

(3) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence. In PWM mode 2, the pins corresponding to the TGR registers used as cycle registers are not initialized. In the example, TGRA in MTUn is used as a cycle register.)

(4) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(5) Start count operation by setting TSTRA.

(6) Output goes low on compare match occurrence.

(7) An error occurs.

(8) Allow non-active level output by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.

(9) Stop count operation by setting TSTRA.

(10) Set normal mode.

(11) Initialize the pins with TIOR.

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

(14) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in PWM Mode 1

Figure 16.167 shows a case in which an error occurs in PWM mode 2 and operation is restarted in PWM mode 1 after re-setting.

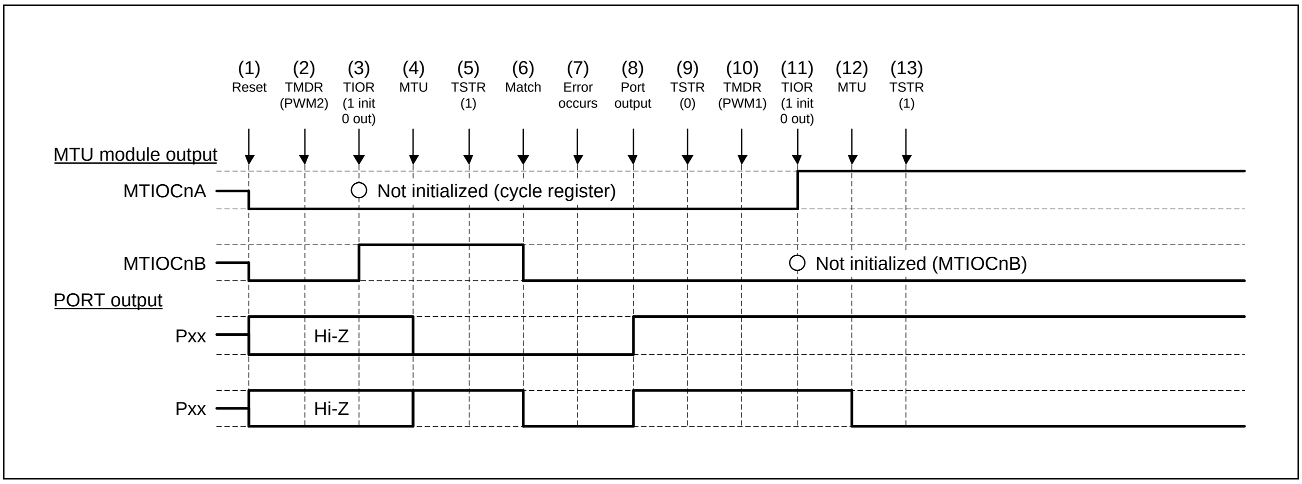

Figure 16.167 Error Occurrence in PWM Mode 2, Recovery in PWM Mode 1

(1) to (9) are the same as in **Figure 16.166**.

(10) Set PWM mode 1.

(11) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

(15) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in PWM Mode 2

Figure 16.168 shows a case in which an error occurs in PWM mode 2 and operation is restarted in PWM mode 2 after re-setting.

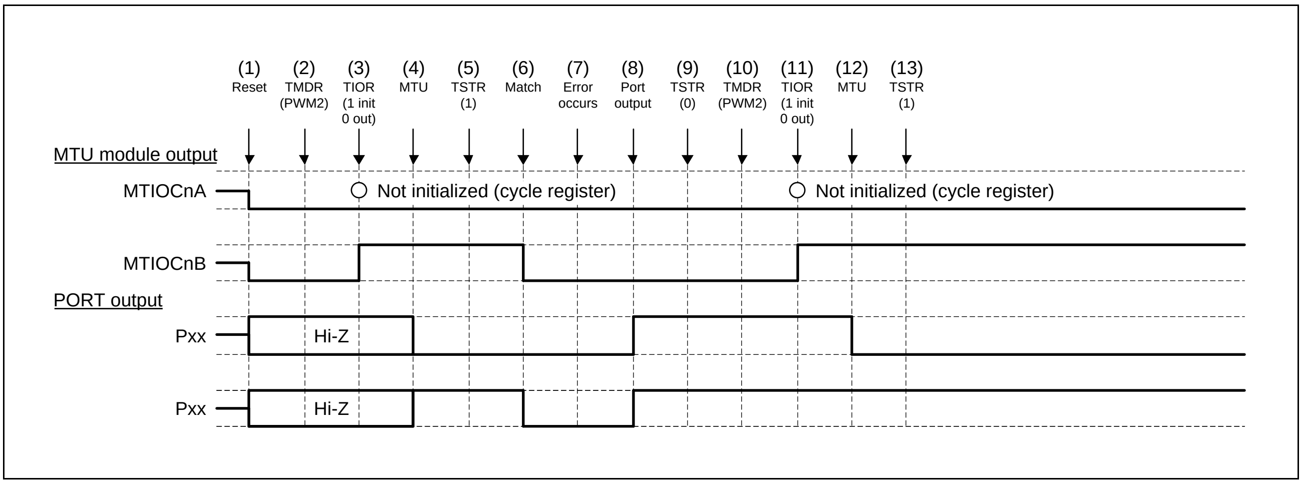

Figure 16.168 Error Occurrence in PWM Mode 2, Recovery in PWM Mode 2

(1) to (9) are the same as in **Figure 16.166**.

(10) This step is not necessary when restarting in PWM mode 2.

(11) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers.
To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

(16) Operation When Error Occurs in PWM Mode 2 and Operation is Restarted in Phase Counting Mode

Figure 16.169 shows a case in which an error occurs in PWM mode 2 and operation is restarted in phase counting mode after re-setting.

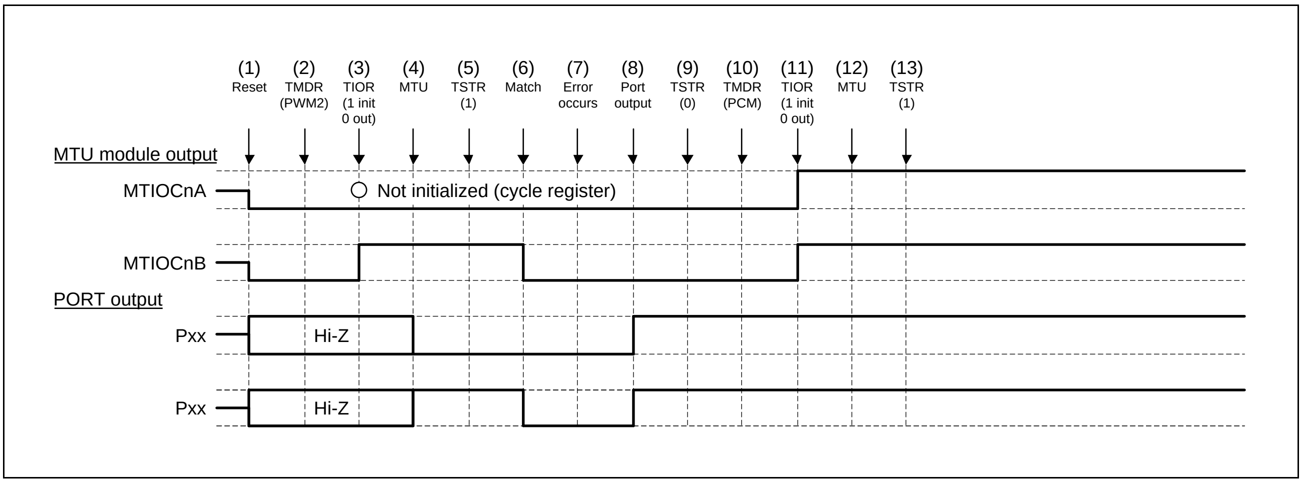

Figure 16.169 Error Occurrence in PWM Mode 2, Recovery in Phase Counting Mode

(1) to (9) are the same as in **Figure 16.166**.

(10) Set the phase counting mode.

(11) Initialize the pins with TIOR.

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

(17) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in Normal Mode

Figure 16.170 shows a case in which an error occurs in phase counting mode and operation is restarted in normal mode after re-setting.

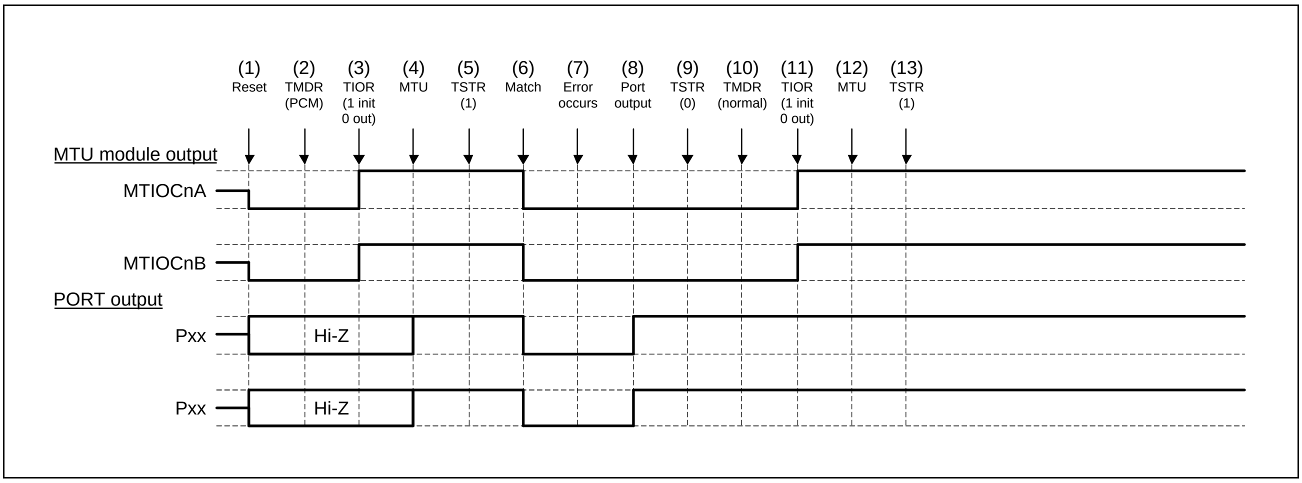

Figure 16.170 Error Occurrence in Phase Counting Mode, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Set phase counting mode.

(3) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence.)

(4) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(5) Start count operation by setting TSTRA.

(6) Output goes low on compare match occurrence.

(7) An error occurs.

(8) Allow non-active level output by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.

(9) Stop count operation by setting TSTRA.

(10) Set normal mode.

(11) Initialize the pins with TIOR.

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

(18) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in PWM Mode 1

Figure 16.171 shows a case in which an error occurs in phase counting mode and operation is restarted in PWM mode 1 after re-setting.

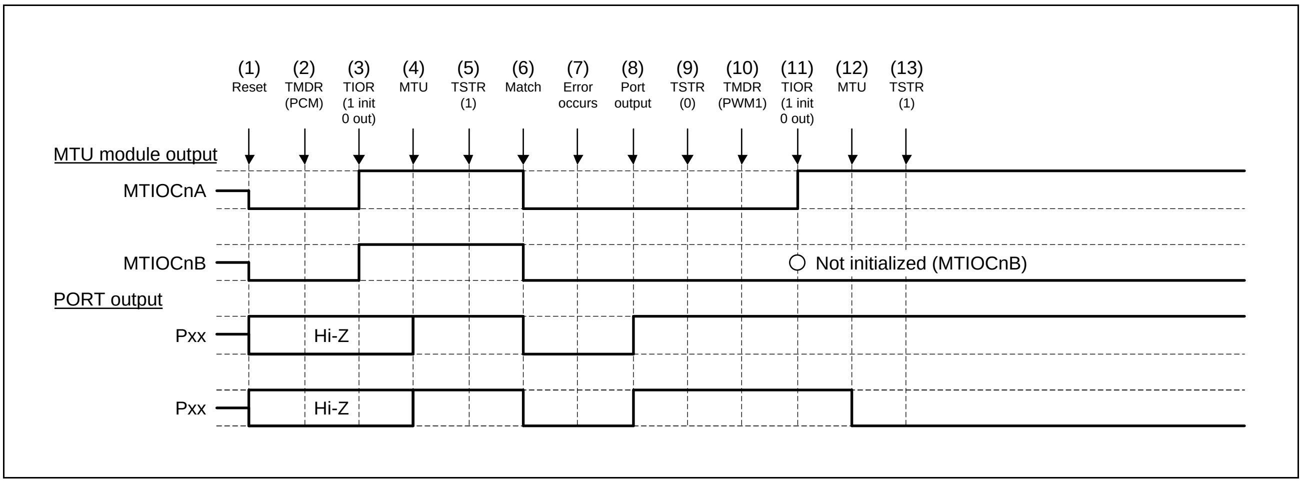

Figure 16.171 Error Occurrence in Phase Counting Mode, Recovery in PWM Mode 1

(1) to (9) are the same as in **Figure 16.170**.

(10) Set PWM mode 1.

(11) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

(19) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in PWM Mode 2

Figure 16.172 shows a case in which an error occurs in phase counting mode and operation is restarted in PWM mode 2 after re-setting.

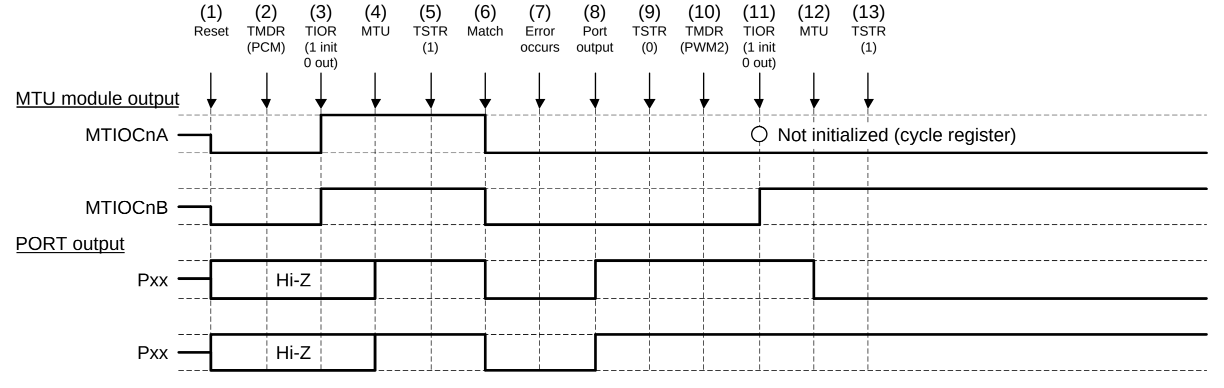

Figure 16.172 Error Occurrence in Phase Counting Mode, Recovery in PWM Mode 2

(1) to (9) are the same as in **Figure 16.170**.

(10) Set PWM mode 2.

(11) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the pins corresponding to the TGR registers used as cycle registers.
To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

(20) Operation When Error Occurs in Phase Counting Mode and Operation is Restarted in Phase Counting Mode

Figure 16.173 shows a case in which an error occurs in phase counting mode and operation is restarted in phase counting mode after re-setting.

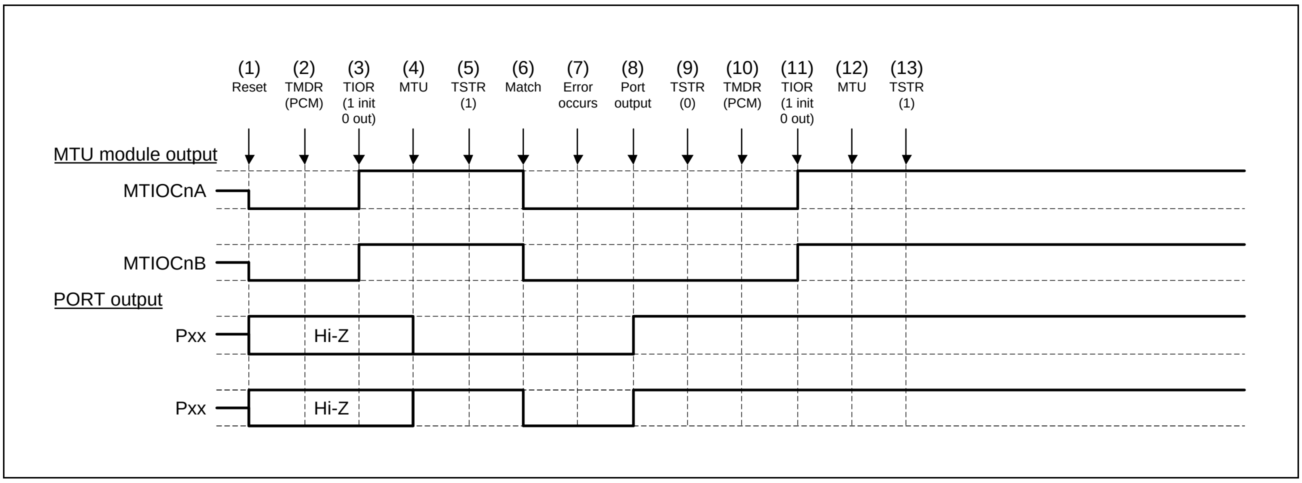

Figure 16.173 Error Occurrence in Phase Counting Mode, Recovery in Phase Counting Mode

(1) to (9) are the same as in **Figure 16.170**.

(10) This step is not necessary when restarting in phase counting mode.

(11) Initialize the pins with TIOR.

(12) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(13) Restart operation by setting TSTRA.

(21) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Normal Mode

Figure 16.174 shows a case in which an error occurs in complementary PWM mode and operation is restarted in normal mode after re-setting.

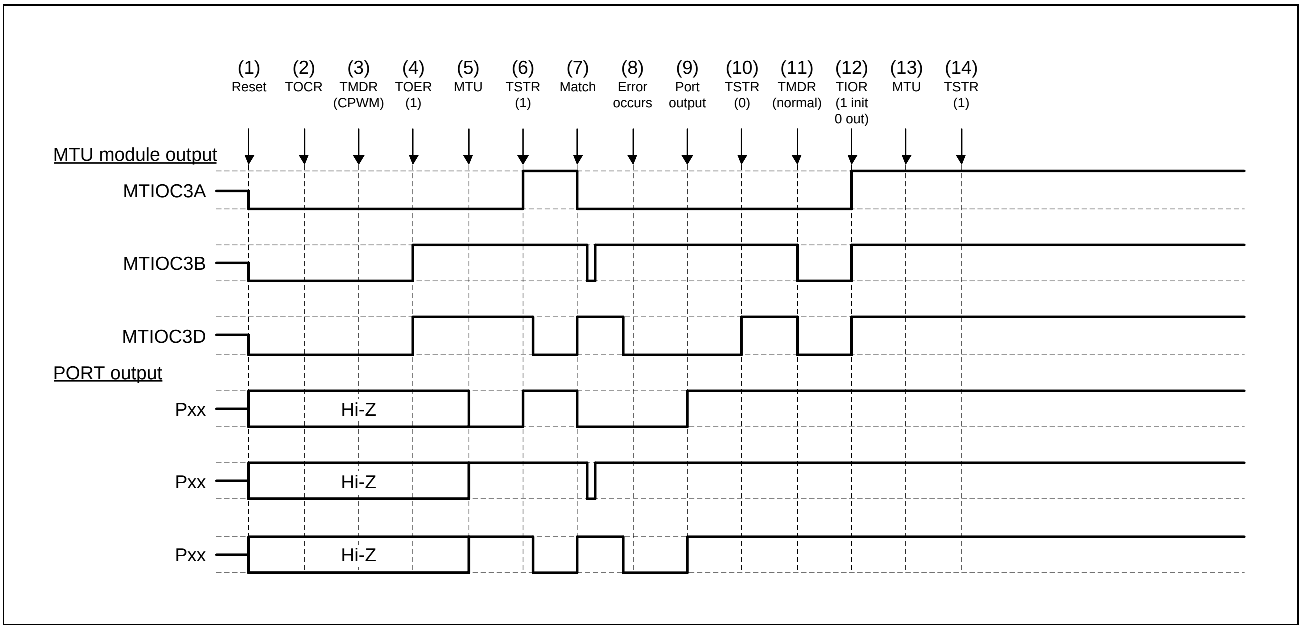

Figure 16.174 Error Occurrence in Complementary PWM Mode, Recovery in Normal Mode

(1) After a reset, the MTU3 output goes low and the ports enter high-impedance state.

(2) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(3) Set complementary PWM mode.

(4) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(5) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(6) Start count operation by setting TSTRA (TSTRB).

(7) The complementary PWM waveform is output on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.

(10) Stop count operation by setting TSTRA (TSTRB). (MTU output becomes the initial complementary PWM output value).

(11) Set normal mode (MTU output goes low).

(12) Initialize the pins with TIOR.

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

(22) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in PWM Mode 1

Figure 16.175 shows a case in which an error occurs in complementary PWM mode and operation is restarted in PWM mode 1 after re-setting.

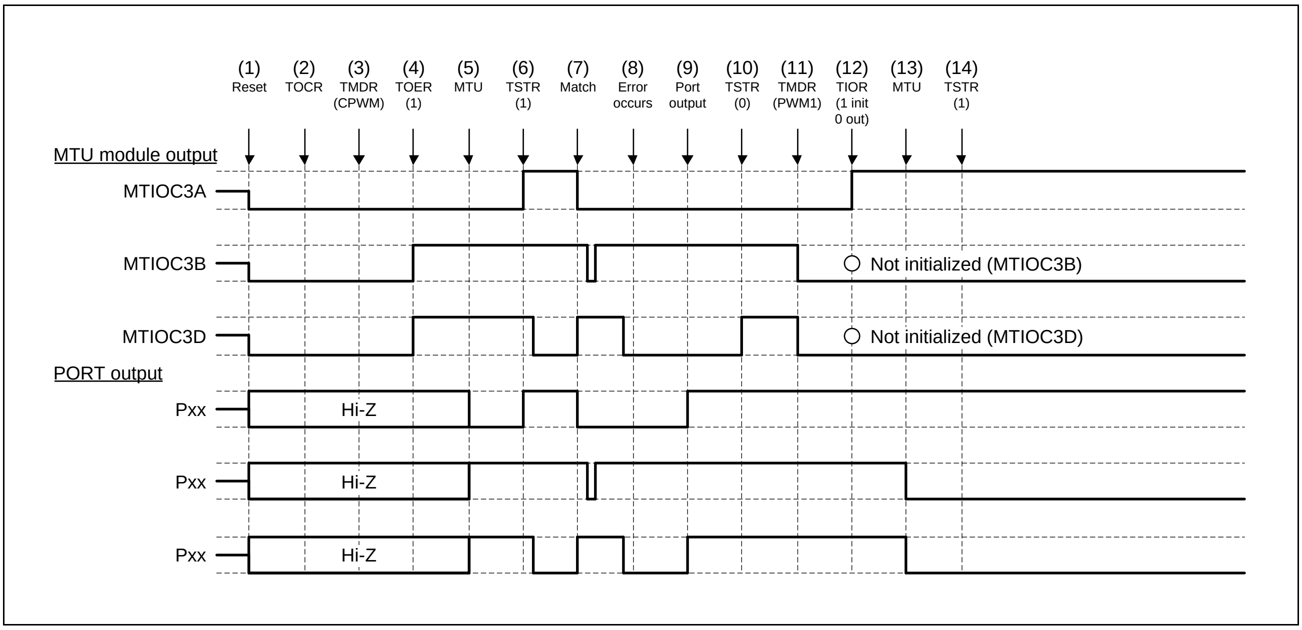

Figure 16.175 Error Occurrence in Complementary PWM Mode, Recovery in PWM Mode 1

(1) to (10) are the same as in **Figure 16.174**.

(11) Set PWM mode 1 (MTU output goes low).

(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

(23) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Complementary PWM Mode

Figure 16.176 shows a case in which an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (when operation is restarted using the cycle and duty settings at the time of stopping the counter).

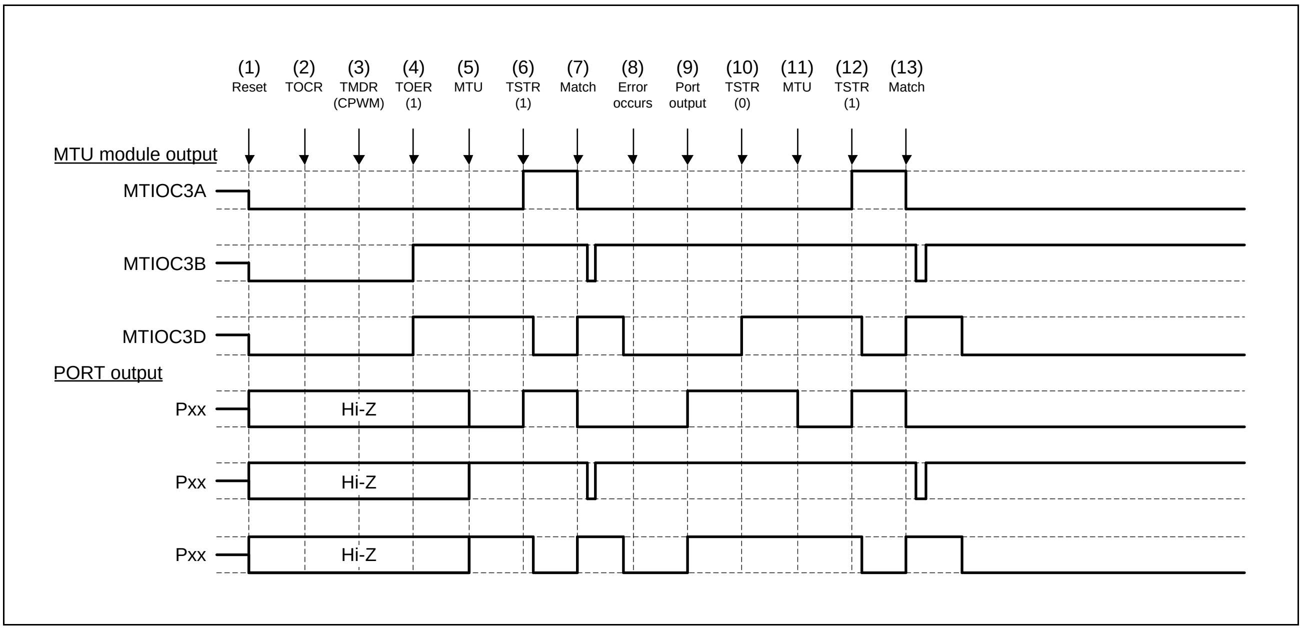

Figure 16.176 Error Occurrence in Complementary PWM Mode, Recovery in Complementary PWM Mode (1)

(1) to (10) are the same as in **Figure 16.174**.

(11) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(12) Restart operation by setting TSTRA (TSTRB).

(13) The complementary PWM waveform is output on compare match occurrence.

(24) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Complementary PWM Mode with New Settings

Figure 16.177 shows a case in which an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (operation is restarted using new cycle and duty ratio settings).

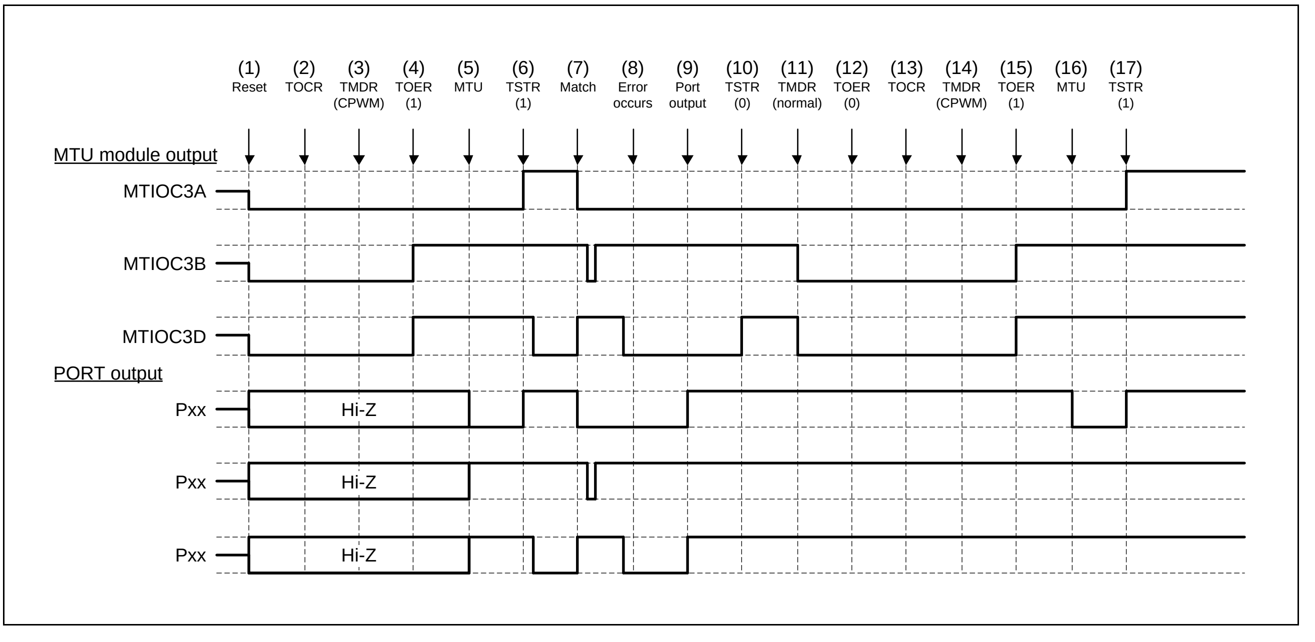

Figure 16.177 Error Occurrence in Complementary PWM Mode, Recovery in Complementary PWM Mode (2)

(1) to (10) are the same as in **Figure 16.174**.

(11) Set normal mode and make new settings (MTU output goes low).

(12) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(13) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(14) Set complementary PWM mode.

(15) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(16) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(17) Restart operation by setting TSTRA (TSTRB).

(25) Operation When Error Occurs in Complementary PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 16.178 shows a case in which an error occurs in complementary PWM mode and operation is restarted in reset- synchronized PWM mode after re-setting.

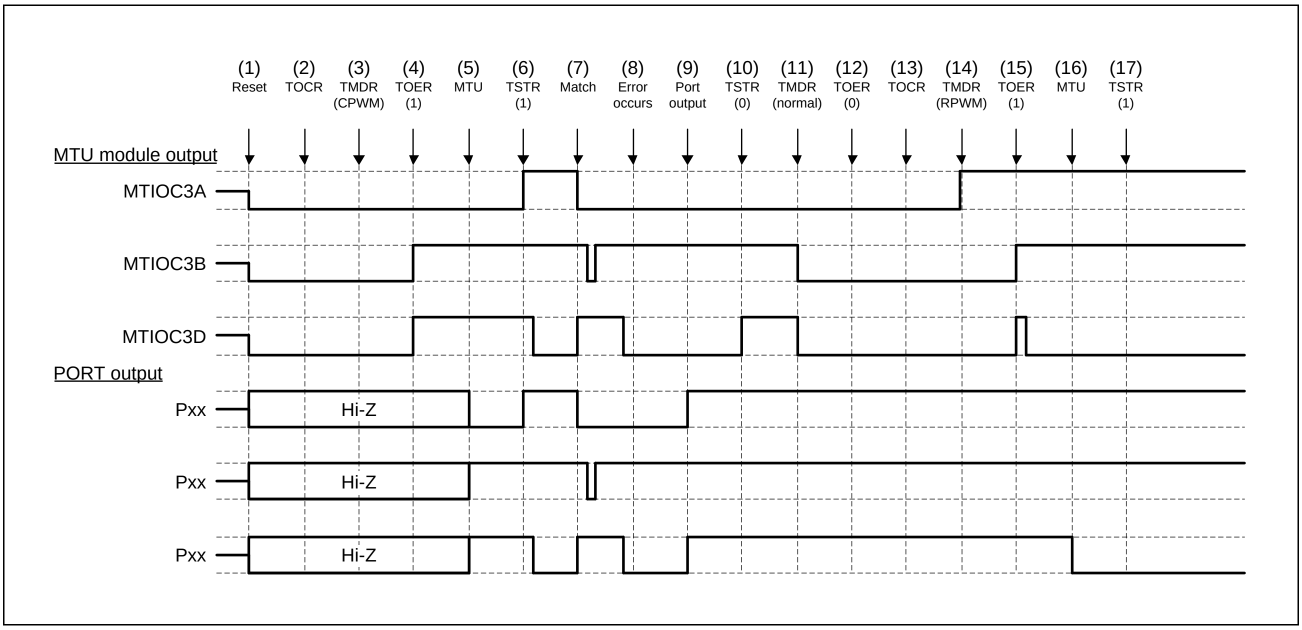

Figure 16.178 Error Occurrence in Complementary PWM Mode, Recovery in Reset-Synchronized PWM Mode

(1) to (10) are the same as in **Figure 16.174**.

(11) Set normal mode (MTU output goes low).

(12) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(13) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(14) Set reset-synchronized PWM mode.

(15) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(16) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(17) Restart operation by setting TSTRA (TSTRB).

(26) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Normal Mode

Figure 16.179 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in normal mode after re-setting.

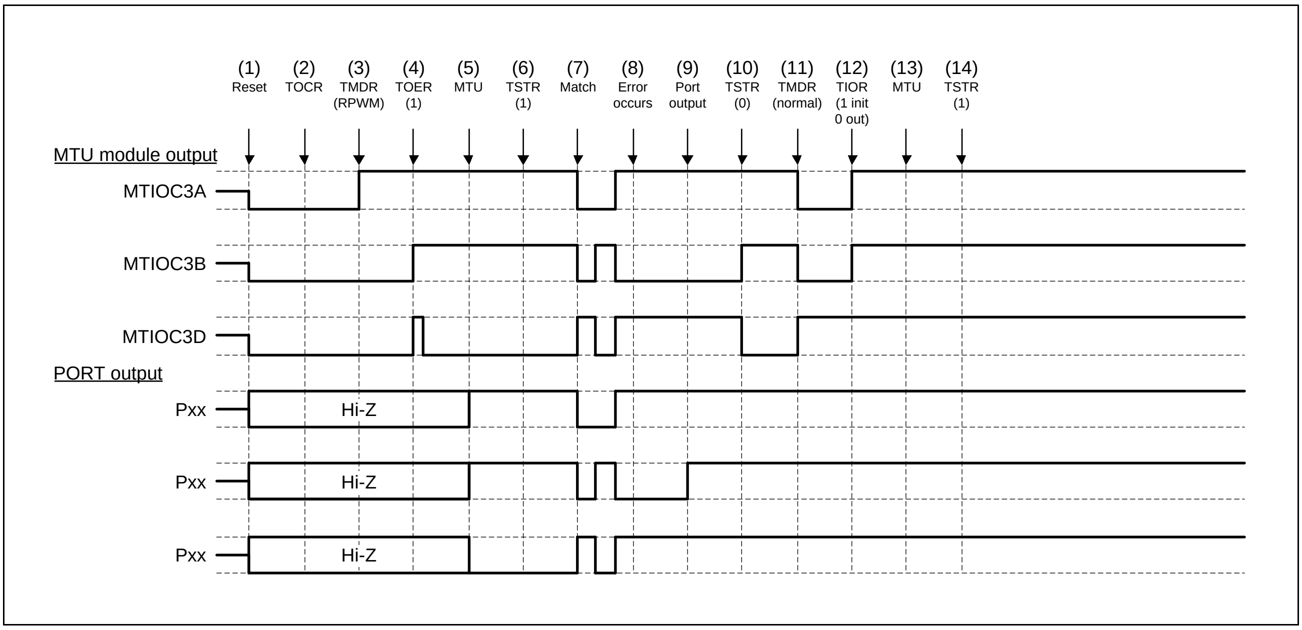

Figure 16.179 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.

(2) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(3) Set reset-synchronized PWM mode.

(4) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(5) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(6) Start count operation by setting TSTRA (TSTRB).

(7) The reset-synchronized PWM waveform is output on compare match occurrence.

(8) An error occurs.

(9) Allow non-active level output by setting the pins as general output ports using the port mode registers (PMn), port registers (Pn), and port mode control registers (PMCn) of the I/O ports.

(10) Stop count operation by setting TSTRA (TSTRB). (MTU output becomes the initial reset-synchronized PWM output value.)

(11) Set normal mode (positive-phase MTU output goes low, and negative-phase output goes high).

(12) Initialize the pins with TIOR.

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

(27) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in PWM Mode 1

Figure 16.180 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in PWM mode 1 after re-setting.

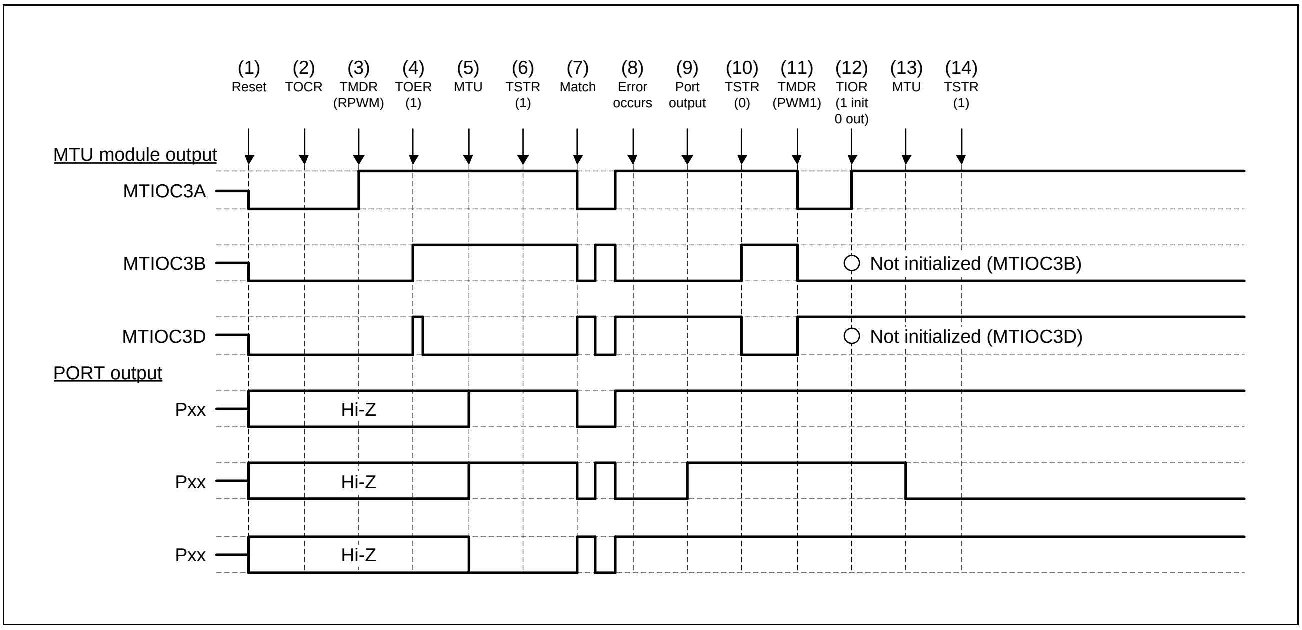

Figure 16.180 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in PWM Mode 1

(1) to (10) are the same as in **Figure 16.179**.

(11) Set PWM mode 1 (positive-phase MTU output goes low, and negative-phase output goes high).

(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port mode registers (PMn) and port registers (Pn) of the I/O ports.)

(13) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(14) Restart operation by setting TSTRA (TSTRB).

(28) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Complementary PWM Mode

Figure 16.181 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in complementary PWM mode after re-setting.

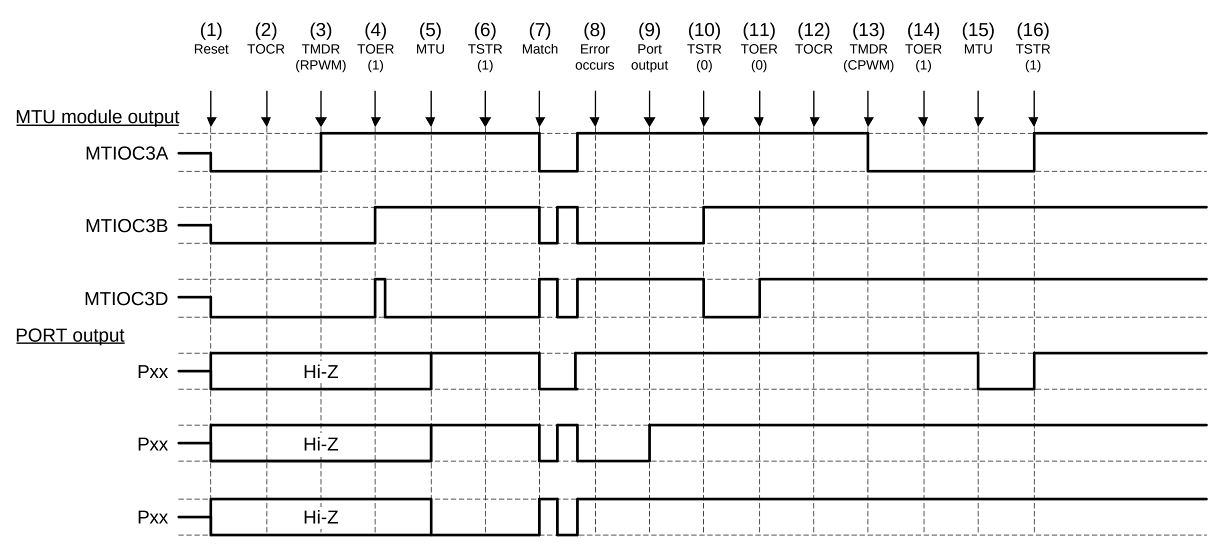

Figure 16.181 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Complementary PWM Mode

(1) to (10) are the same as in **Figure 16.179**.

(11) Disable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(12) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A (TOCR1B and TOCR2B).

(13) Set complementary PWM mode (MTU cyclic output pin goes low).

(14) Enable output in MTU3 and MTU4 (MTU6 and MTU7) with TOERA (TOERB).

(15) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(16) Restart operation by setting TSTRA (TSTRB).

(29) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 16.182 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in reset-synchronized PWM mode after re-setting.

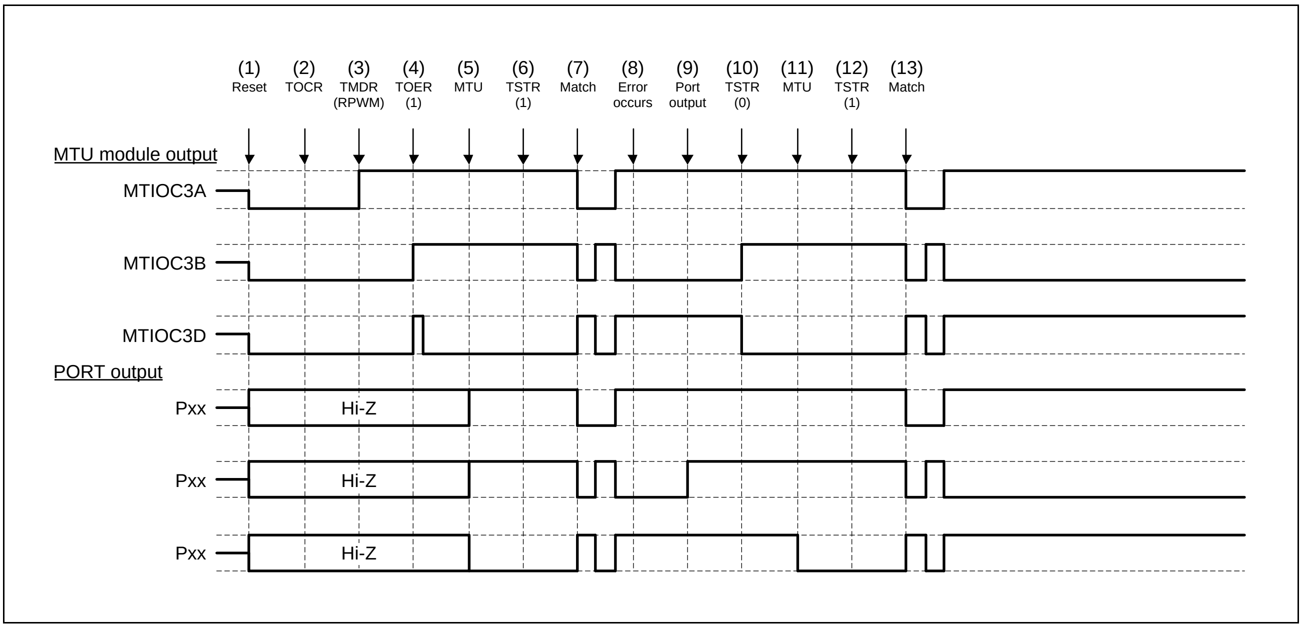

Figure 16.182 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Reset-Synchronized PWM Mode

(1) to (10) are the same as in **Figure 16.179**.

(11) Set MTU output using the port mode control registers (PMCn) and Port function control registers (PFCm) corresponding to the GPIO ports.

(12) Restart operation by setting TSTRA (TSTRB).

(13) The reset-synchronized PWM waveform is output on compare match occurrence.

17. Port Output Enable 3 (POE3)

The port output enable 3 (POE3) can be used to place output pins for the MTU3a in the high-impedance state in response to various conditions.

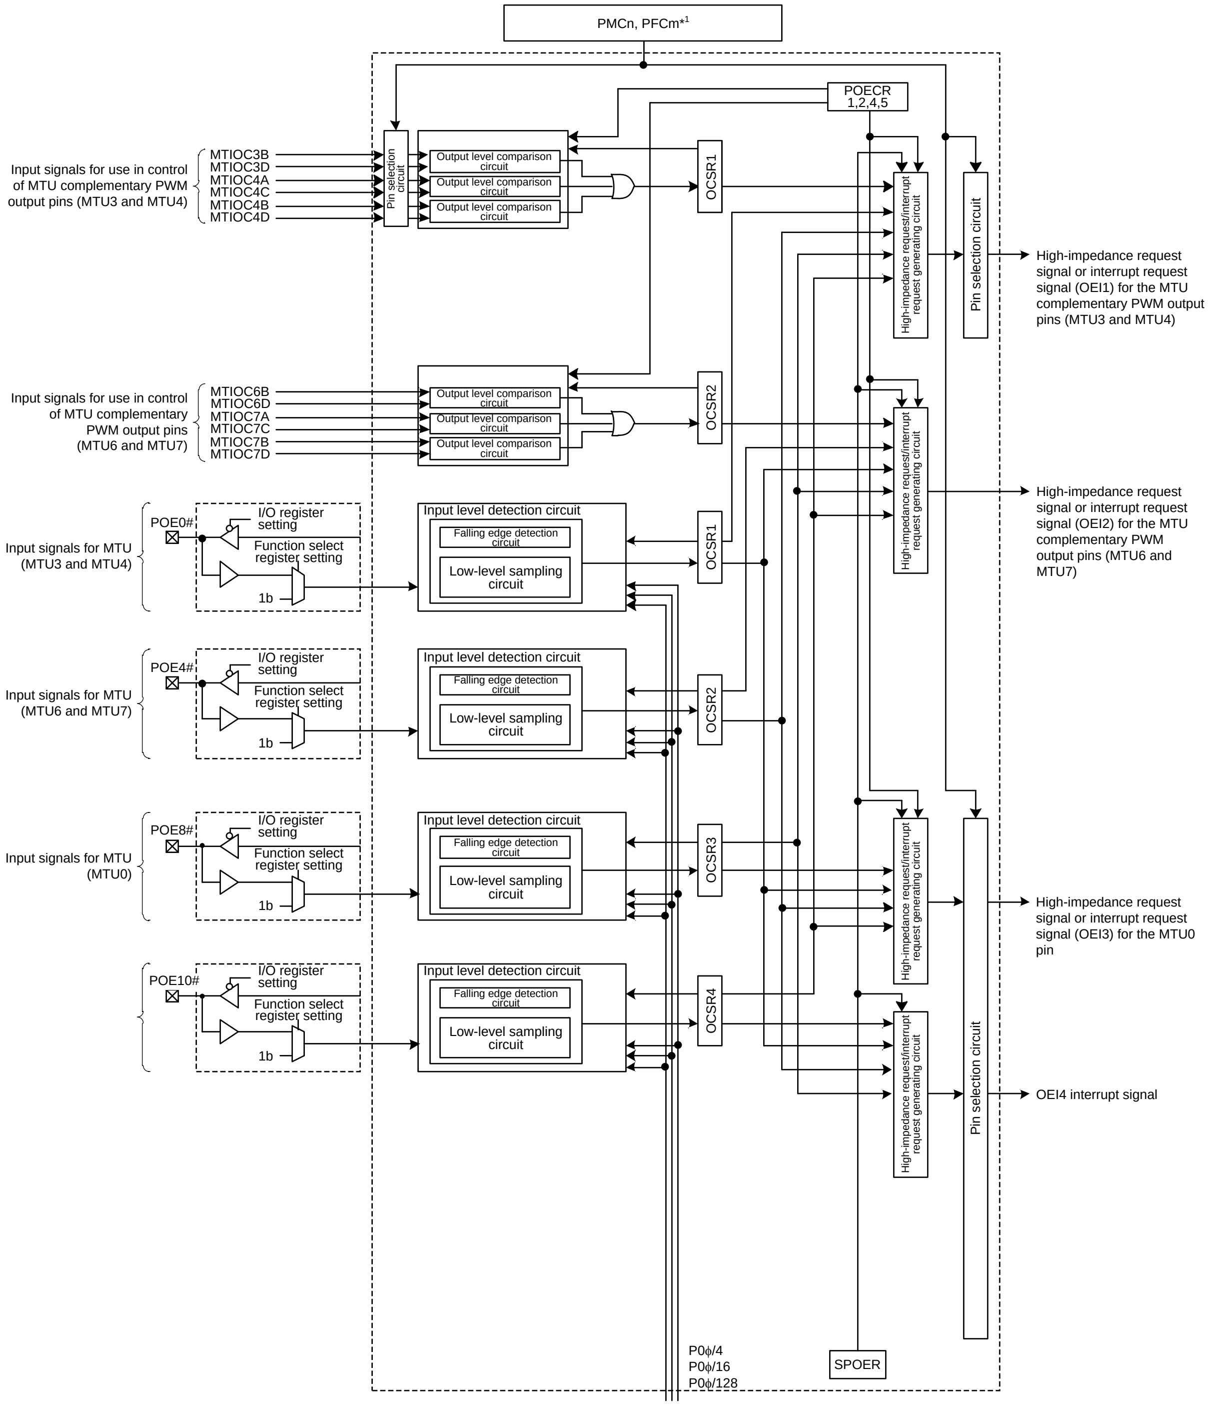
17.1 Overview

Table 17.1 lists the specifications of the POE3, and **Figure 17.1** shows a block diagram of the POE3.

Table 17.1 POE3 Specifications

<table>
<tr><th>Item</th><th>Description</th></tr>
<tr><td>Target pins to be placed in the high-impedance state</td><td>● MTU3a output pins
MTU0 pin (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D)
MTU3 pin (MTIOC3B, MTIOC3D)
MTU4 pin (MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D)
MTU6 pin (MTIOC6B, MTIOC6D)
MTU7 pin (MTIOC7A, MTIOC7B, MTIOC7C, MTIOC7D)</td></tr>
<tr><td>Conditions for the high-impedance state</td><td>● Setting pins as inputs: setting the POE0#, POE4#, POE8#, or POE10# pins as inputs (falling edge or low- level sampling).
● Short-circuits between output pins: A match (short circuit) between the output signal levels at the active level over one or more cycle on (the following combination of pins)
<table>
<tr><th></th><th>MTU complementary PWM output pins</th></tr>
<tr><td>1</td><td>MTIOC3B and MTIOC3D</td></tr>
<tr><td>2</td><td>MTIOC4A and MTIOC4C</td></tr>
<tr><td>3</td><td>MTIOC4B and MTIOC4D</td></tr>
<tr><td>4</td><td>MTIOC6B and MTIOC6D</td></tr>
<tr><td>5</td><td>MTIOC7A and MTIOC7C</td></tr>
<tr><td>6</td><td>MTIOC7B and MTIOC7D</td></tr>
</table>
● SPOER register setting being made</td></tr>
<tr><td>Function</td><td>● Each of the POE0#, POE4#, POE8#, and POE10# input pins can be set for falling edge, P0ϕ/4 × 16, P0ϕ/ 16 × 16, or P0ϕ/128 × 16 low-level sampling.
● Pins for the MTU complementary PWM output, and MTU0 pin can be placed in high-impedance state by POE0#, POE4#, POE8#, and POE10# pin falling-edge or low-level sampling.
● Pins for the MTU complementary PWM output can be placed in high-impedance state when output levels of the MTU complementary PWM output pins are compared and simultaneous active-level output continues for one cycle or more.
● Pins for the MTU complementary PWM output, and MTU0 can be placed in the high-impedance state by modifying the settings of the SPOER register of POE3.
● Interrupts can be generated by input-level sampling or output level comparison results.</td></tr>
</table>

The POE3 has input level detection circuits, pin selection circuits, output level comparison circuits, and a high-impedance request/interrupt request generating circuit as shown in **Figure 17.1**.



Note 1. Refer to chapter of GPIO.

Figure 17.1 POE3 Block Diagram

Table 17.2 shows input/output pins to be used by the POE3.

Table 17.2 POE3 Input/Output Pins

Pin Name	I/O	Description
POE0#	Input	Input pin for the request signal to place the MTU3 and MTU4 pins for MTU complementary PWM output in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU0, MTU6, and MTU7 pins in the high-impedance state.
POE4#	Input	Input pin for the request signal to place the MTU6 and MTU7 pins for MTU complementary PWM output in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU0, MTU3, and MTU4 pins in the high-impedance state.
POE8#	Input	Input pin for the request signal to place the pins for MTU0 in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU3 and MTU4 pins or MTU6 and MTU7 pins for MTU complementary PWM output in high-impedance state.
POE10#	Input	In accord with register settings, this pin is also capable of placing the MTU3 and MTU4 pins or MTU6 and MTU7 pins for MTU complementary PWM output, and MTU0 pins in high-impedance state.

Table 17.3 shows output level comparisons with pin combinations.

Table 17.3 Pin Combinations

Pin Combination	I/O	Description
MTIOC3B and MTIOC3D	Output	The MTU3 and MTU4 pins for MTU complementary PWM output set in the M3SELR, M4SELR1, and M4SELR2 registers are placed in high-impedance state when both pins of a pair simultaneously output the active level*[1] for one or more cycles.of the POE3_CLKM_POE (P0ϕ). Pin combinations for output comparison and high-impedance control can be selected by registers of POE3. *Note 1.* The low level is output when the OLSP bit in TOCR1A of MTUn is 0 with the TOCS bit in TOCR1A of MTUn cleared to 0, or the high level is output when the OLSP bit is 1. Otherwise, the low level is output when the OLS3N, OLS3P, OLS2N, OLS2P, OLS1N, and OLS1P bits in TOCR2A of MTUn are 0 with the TOCS bit in TOCR1A of MTUn set to 1, or the high level is output when these bits are 1.
MTIOC4A and MTIOC4C	Output	
MTIOC4B and MTIOC4D	Output	
MTIOC6B and MTIOC6D	Output	The MTU6 and MTU7 pins for MTU complementary PWM output are placed in high-impedance state when both pins of a pair simultaneously output the active level*[1] for one or more cycles.of the POE3_CLKM_POE (P0ϕ). Pin combinations for output comparison and high-impedance control can be selected by registers of POE3. *Note 1.* The low level is output when the OLSP bit in TOCR1B of MTUn is 0 with the TOCS bit in TOCR1B of MTUn cleared to 0, or the high level is output when the OLSP bit is 1. Otherwise, the low level is output when the OLS3N, OLS3P, OLS2N, OLS2P, OLS1N, and OLS1P bits in TOCR2B of MTUn are 0 with the TOCS bit in TOCR1B of MTUn set to 1, or the high level is output when these bits are 1.
MTIOC7A and MTIOC7C	Output	
MTIOC7B and MTIOC7D	Output	

17.2 Register Descriptions

Table 17.4 shows the register configuration. The POE3 registers are initialized by a reset.

Base Address : H’0_1004_9800 (Cortex-A55 Address Space)
Base Address : H’4004_9800 (Cortex-M33 Address Space Non-Secure)
Base Address : H’5004_9800 (Cortex-M33 Address Space Secure)

Table 17.4 Register configuration

Register Name	Abbreviation	Offset Address	Access size
Input level control/status register 1	ICSR1	H’00	16
Output level control/status register 1	OCSR1	H’02	16
Input level control/status register 2	ICSR2	H’04	16
Output level control/status register 2	OCSR2	H’06	16
Input level control/status register 3	ICSR3	H’08	16
Software port output enable register	SPOER	H’0A	8
Port output enable control register 1	POECR1	H’0B	8
Port output enable control register 2	POECR2	H’0C	16
Port output enable control register 4	POECR4	H’10	16
Port output enable control register 5	POECR5	H’12	16
Input level control/status register 4	ICSR4	H’16	16

17.2.1 Input Level Control/Status Register 1 (ICSR1)

ICSR1 selects the input modes for the POE0# pins, controls the enable/disable of interrupts, and indicates status.

Address(es): H'1004_9800

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	POE0F	—	—	—	PIE1	—	—	—	—	—	—	POE0M[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/(W)*2	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	POE0M[1:0]	All 0	R/W*1	POE0 Mode Select b1 b0 0 0: Accepts a request on the falling edge of POE0# input. 0 1: Accepts a request when POE0# input has been sampled 16 times at P0ϕ/4 clock pulses and all are low level. 1 0: Accepts a request when POE0# input has been sampled 16 times at P0ϕ/16 clock pulses and all are low level. 1 1: Accepts a request when POE0# input has been sampled 16 times at P0ϕ/128 clock pulses and all are low level.
b7 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b8	PIE1	0	R/W	Port Interrupt Enable 1 0: Interrupt requests disabled 1: Interrupt requests enabled
b11 to b9	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b12	POE0F	0	R/(W)*2	POE0 Flag 0: Indicates that a high-impedance request has not been input to the POE0# pin. 1: Indicates that a high-impedance request has been input to the POE0# pin.
b15 to b13	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

POE0M[1:0] Bits (POE0 Mode Select)

These bits select the input mode of the POE0# pin.

PIE1 Bit (Port Interrupt Enable 1)

This bit enables or disables interrupt requests when any one of the POE0F bit of the ICSR1 is set to 1.

POE0F Flag (POE0 Flag)

This flag indicates that a high-impedance request has been input to the POE0# pin.

[Setting condition]

- When the input set by POE0M[1:0] occurs at the POE0# pin

[Clearing condition]

- By writing 0 to POE0F after reading POE0F = 1

17.2.2 Input Level Control/Status Register 2 (ICSR2)

ICSR2 selects the input mode for the POE4# pin, controls the enable/disable of interrupts, and indicates status.

Address(es): H'1004_9804

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	POE4F	—	—	—	PIE2	—	—	—	—	—	—	POE4M[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/(W)*2	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	POE4M[1:0]	All 0	R/W*1	POE4 Mode Select b1 b0 0 0: Accepts a request on the falling edge of POE4# input 0 1: Accepts a request when POE4# input has been sampled 16 times at P0ϕ/4 clock pulses and all are low level. 1 0: Accepts a request when POE4# input has been sampled 16 times at P0ϕ/16 clock pulses and all are low level. 1 1: Accepts a request when POE4# input has been sampled 16 times at P0ϕ/128 clock pulses and all are low level.
b7 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b8	PIE2	0	R/W	Port Interrupt Enable 2 0: Interrupt requests disabled 1: Interrupt requests enabled
b11 to b9	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b12	POE4F	0	R/(W)*2	POE4 Flag 0: Indicates that a high-impedance request has not been input to the POE4# pin. 1: Indicates that a high-impedance request has been input to the POE4# pin.
b15 to b13	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

POE4M[1:0] Bits (POE4 Mode Select)

These bits select the input mode of the POE4# pin.

PIE2 Bit (Port Interrupt Enable 2)

This bit enables or disables interrupt requests when the POE4F flag in ICSR2 is set to 1.

POE4F Flag (POE4 Flag)

This flag indicates that a high-impedance request has been input to the POE4# pin.

[Setting condition]

- When the input set by POE4M[1:0] occurs at the POE4# pin

[Clearing condition]

- By writing 0 to POE4F after reading POE4F = 1

17.2.3 Input Level Control/Status Register 3 (ICSR3)

ICSR3 selects the input mode for the POE8# pin, controls the enable/disable of interrupts, and indicates status.

Address(es): H’1004_9808

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	POE8F	—	—	POE8E	PIE3	—	—	—	—	—	—	POE8M[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/(W)*2	R/W	R/W	R/W*1	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	POE8M[1:0]	All 0	R/W*1	POE8 Mode Select b1 b0 0 0: Accepts a request on the falling edge of POE8# input 0 1: Accepts a request when POE8# input has been sampled 16 times at P0ϕ/4 clock pulses and all are low level. 1 0: Accepts a request when POE8# input has been sampled 16 times at P0ϕ/16 clock pulses and all are low level. 1 1: Accepts a request when POE8# input has been sampled 16 times at P0ϕ/128 clock pulses and all are low level.
b7 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b8	PIE3	0	R/W	Port Interrupt Enable 3 0: Interrupt requests disabled 1: Interrupt requests enabled
b9	POE8E	0	R/W*1	POE8 High- Impedance Enable 0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.
b11, b10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b12	POE8F	0	R/(W)*2	POE8 Flag 0: Indicates that a high-impedance request has not been input to the POE8# pin. 1: Indicates that a high-impedance request has been input to the POE8# pin.
b15 to b13	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

POE8M[1:0] Bits (POE8 Mode Select)

These bits select the input mode of the POE8# pin.

PIE3 Bit (Port Interrupt Enable 3)

This bit enables or disables interrupt requests when the POE8F bit in ICSR3 is set to 1.

POE8E Bit (POE8 High-Impedance Enable)

This bit specifies whether to place the corresponding pin in high-impedance state when the POE8F bit is set to 1.

POE8F Flag (POE8 Flag)

This flag indicates that a high-impedance request has been input to the POE8# pin.

[Setting condition]

- When the input set by POE8M[1:0] occurs at the POE8# pin

[Clearing condition]

- By writing 0 to POE8F after reading POE8F = 1

17.2.4 Input Level Control/Status Register 4 (ICSR4)

ICSR4 selects the POE10# pin input mode, controls the enable/disable of interrupts, and indicates status.

Address(es): H'1004_9816

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	POE10F	—	—	POE10E	PIE4	—	—	—	—	—	—	POE10M[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/(W)*2	R/W	R/W	R/W*1	R/W*1	R/W	R/W	R/W	R/W	R/W	R/W	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	POE10M[1:0]	All 0	R/W*1	POE10 Mode Select b1 b0 0 0: Accepts a request on the falling edge of POE10# input 0 1: Accepts a request when POE10# input has been sampled 16 times at P0ϕ/4 clock pulses and all are low level. 1 0: Accepts a request when POE10# input has been sampled 16 times at P0ϕ/16 clock pulses and all are low level. 1 1: Accepts a request when POE10# input has been sampled 16 times at P0ϕ/128 clock pulses and all are low level.
b7 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b8	PIE4	0	R/W	Port Interrupt Enable 4 0: Interrupt requests disabled 1: Interrupt requests enabled
b9	POE10E	0	R/W*1	POE10 High- Impedance Enable 0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.
b11, b10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b12	POE10F	0	R/(W)*2	POE10 Flag 0: Indicates that a high-impedance request has not been input to the POE10# pin. 1: Indicates that a high-impedance request has been input to the POE10# pin.
b15 to b13	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

POE10M[1:0] Bits (POE10 Mode Select)

These bits select the input mode of the POE10# pin.

PIE4 Bit (Port Interrupt Enable 4)

This bit enables or disables interrupt requests when the POE10F bit is set to 1.

POE10E Bit (POE10 High-Impedance Enable)

This bit specifies whether to place the corresponding pin in high-impedance state when the POE10F bit is set to 1.

POE10F Bit (POE10 Flag)

This flag indicates that a request for the high-impedance state has been input to the POE10# pin.

[Setting condition]

- When the input set by POE10M[1:0] occurs at the POE10# pin

[Clearing condition]

- By writing 0 to POE10F after reading POE10F = 1

17.2.5 Output Level Control/Status Register 1 (OCSR1)

OCSR1 controls the enable/disable of output level comparison and interrupts, and indicates status.

Address(es): H'1004_9802

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OSF1	—	—	—	—	—	OCE1	OIE1	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/(W)*2	R/W	R/W	R/W	R/W	R/W	R/W*1	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b7 to b0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b8	OIE1	0	R/W	Output Short Interrupt Enable 1 0: Interrupt requests disabled 1: Interrupt requests enabled
b9	OCE1	0	R/W*1	Output Short High-Impedance Enable 1 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b14 to b10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b15	OSF1	0	R/(W)*2	Output Short Flag 1 0: Indicates that outputs have not simultaneously become an active level. 1: Indicates that outputs have simultaneously become an active level.

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

OIE1 Bit (Output Short Interrupt Enable 1)

This bit enables or disables interrupt requests when the OSF1 bit in OCSR1 is set to 1.

OCE1 Bit (Output Short High-Impedance Enable 1)

This bit specifies whether to place the pins in high-impedance state when the OSF1 bit in OCSR1 is set to 1.

OSF1 Flag (Output Short Flag 1)

This flag indicates that any one of the three pairs of two-phase MTU3 and MTU4 pins for MTU complementary PWM output to be compared has simultaneously become an active level.

[Setting condition]

- When any one of the three pairs of two-phase outputs has simultaneously become an active level

[Clearing condition]

- By writing 0 to OSF1 after reading OSF1 = 1

17.2.6 Output Level Control/Status Register 2 (OCSR2)

OCSR2 controls the enable/disable of output level comparison and interrupts, and indicates status.

Address(es): H'1004_9806

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OSF2	—	—	—	—	—	OCE2	OIE2	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/(W)*2	R/W	R/W	R/W	R/W	R/W	R/W*1	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b7 to b0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b8	OIE2	0	R/W	Output Short Interrupt Enable 2 0: Interrupt requests disabled 1: Interrupt requests enabled
b9	OCE2	0	R/W*1	Output Short High-Impedance Enable 2 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b14 to b10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b15	OSF2	0	R/(W)*2	Output Short Flag 2 0: Indicates that outputs have not simultaneously become an active level. 1: Indicates that outputs have simultaneously become an active level.

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

OIE2 Bit (Output Short Interrupt Enable 2)

This bit enables or disables interrupt requests when the OSF2 bit in OCSR2 is set to 1.

OCE2 Bit (Output Short High-Impedance Enable 2)

This bit specifies whether to place the pins in high-impedance state when the OSF2 bit in OCSR2 is set to 1.

OSF2 Flag (Output Short Flag 2)

This flag indicates that any one of the three pairs of two-phase MTU6 and MTU7 pins for MTU complementary PWM output to be compared has simultaneously become an active level.

[Setting condition]

- When any one of the three pairs of two-phase outputs has simultaneously become an active level

[Clearing condition]

- By writing 0 to OSF2 after reading OSF2 = 1

17.2.7 Software Port Output Enable Register (SPOER)

SPOER controls high-impedance state of the pins.

Address(es): H'1004_980A

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	MTUCH0HIZ	MTUCH67HIZ	MTUCH34HIZ
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	MTUCH34HIZ	0	R/W	MTU3 or MTU4 Output High-Impedance Enable 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b1	MTUCH67HIZ	0	R/W	MTU6 and MTU7 Output High- Impedance Enable 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b2	MTUCH0HIZ	0	R/W	MTU0 Output High-Impedance Enable 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b7 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

MTUCH34HIZ Bit (MTU3 or MTU4 Output High-Impedance Enable)

This bit specifies whether to place the MTU complementary PWM output pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D) in high-impedance state.

[Setting condition]

- By writing 1 to MTUCH34HIZ

[Clearing conditions]

- Reset
- By writing 0 to MTUCH34HIZ after reading MTUCH34HIZ = 1*[1]

Note 1. To write 0 to this bit, be sure to read 1 and then write 0.

MTUCH67HIZ Bit (MTU6 and MTU7 Output High-Impedance Enable)

This bit specifies whether to place the MTU complementary PWM output pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D) in high-impedance state.

[Setting condition]

- By writing 1 to MTUCH67HIZ

[Clearing conditions]

- Reset
- By writing 0 to MTUCH67HIZ after reading MTUCH67HIZ = 1*[1]

Note 1. To write 0 to this bit, be sure to read 1 and then write 0.

MTUCH0HIZ Bit (MTU0 Output High-Impedance Enable)

This bit specifies whether to place the MTU0 pins in high-impedance state.

[Setting condition]

- By writing 1 to MTUCH0HIZ

[Clearing conditions]

- Reset
- By writing 0 to MTUCH0HIZ after reading MTUCH0HIZ = 1*[1]

Note 1. To write 0 to this bit, be sure to read 1 and then write 0.

17.2.8 Port Output Enable Control Register 1 (POECR1)

POECR1 controls high-impedance state of the MTU0 pins.

Address(es): H'1004_980B

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	MTU0DZE	MTU0CZE	MTU0BZE	MTU0AZE
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W*1	R/W*1	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b0	MTU0AZE	0	R/W*1	MTIOC0A High-Impedance Enable 0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.
b1	MTU0BZE	0	R/W*1	MTIOC0B High-Impedance Enable 0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.
b2	MTU0CZE	0	R/W*1	MTIOC0C High-Impedance Enable 0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.
b3	MTU0DZE	0	R/W*1	MTIOC0D High-Impedance Enable 0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.
b7 to b4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

MTU0AZE Bit (MTIOC0A High-Impedance Enable)

This bit specifies whether to place the MTIOC0A output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4; m = 0, 4, 10) flag in ICSRn, is set to 1.

MTU0BZE Bit (MTIOC0B High-Impedance Enable)

This bit specifies whether to place the MTIOC0B output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4; m = 0, 4, 10) flag in ICSRn, is set to 1.

MTU0CZE Bit (MTIOC0C High-Impedance Enable)

This bit specifies whether to place the MTIOC0C output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4; m = 0, 4, 10) flag in ICSRn, is set to 1.

MTU0DZE Bit (MTIOC0D High-Impedance Enable)

This bit specifies whether to place the MTIOC0D output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4; m = 0, 4, 10) flag in ICSRn, is set to 1.

17.2.9 Port Output Enable Control Register 2 (POECR2)

POECR2 controls high-impedance state of the MTU complementary PWM output pins (MTU3, MTU4, MTU6, and MTU7 pins).

Address(es): H'1004_980C

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	MTU3B DZE	MTU4A CZE	MTU4B DZE	—	—	—	—	—	MTU6B DZE	MTU7A CZE	MTU7B DZE
Initial Value	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W*1	R/W*1	R/W*1	R/W	R/W	R/W	R/W	R/W	R/W*1	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b0	MTU7BDZE	1	R/W*1	MTIOC7B/7D High-Impedance Enable*2 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b1	MTU7ACZE	1	R/W*1	MTIOC7A/7C High-Impedance Enable*2 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b2	MTU6BDZE	1	R/W*1	MTIOC6B/6D High-Impedance Enable*2 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b7 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b8	MTU4BDZE	1	R/W*1	MTIOC4B/4D High-Impedance Enable 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b9	MTU4ACZE	1	R/W*1	MTIOC4A/4C High-Impedance Enable 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b10	MTU3BDZE	1	R/W*1	MTIOC3B/3D High-Impedance Enable 0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.
b15 to b11	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

Note 2. Set this bit to 0 when MTU6 or MTU7 is not used.

MTU7BDZE Bit (MTIOC7B/7D High-Impedance Enable)

This bit specifies whether to place the MTIOC7B output and MTIOC7D output for the MTU3 pin in high-impedance state when any one of the OSF2 flag in OCSR2, POE4F flag in ICSR2, MTUCH67HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 1, 3, 4; m = 0, 8, 10) flag in ICSRn, is set to 1.

MTU7ACZE Bit (MTIOC7A/7C High-Impedance Enable)

This bit specifies whether to place the MTIOC7A output and MTIOC7C output for the MTU3 pin in high-impedance state when any one of the OSF2 flag in OCSR2, POE4F flag in ICSR2, MTUCH67HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 1, 3, 4; m = 0, 8, 10) flag in ICSRn, is set to 1.

MTU6BDZE Bit (MTIOC6B/6D High-Impedance Enable)

This bit specifies whether to place the MTIOC6B output and MTIOC6D output for the MTU3 pin in high-impedance state when any one of the OSF2 flag in OCSR2, POE4F flag in ICSR2, MTUCH67HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 1, 3, 4; m = 0, 8, 10) flag in ICSRn, is set to 1.

MTU4BDZE Bit (MTIOC4B/4D High-Impedance Enable)

This bit specifies whether to place the MTIOC4B output and MTIOC4D output for the MTU4 pin in high-impedance state when any one of the OSF1 flag in OCSR1, POE0F flag in ICSR1, MTUCH34HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 2 to 4; m = 4, 8, 10) flag in ICSRn, is set to 1.

MTU4ACZE Bit (MTIOC4A/4C High-Impedance Enable)

This bit specifies whether to place the MTIOC4A output and MTIOC4C output for the MTU4 pin in high-impedance state when any one of the OSF1 flag in OCSR1, POE0F flag in ICSR1, MTUCH34HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 2 to 4; m = 4, 8, 10) flag in ICSRn, is set to 1.

MTU3BDZE Bit (MTIOC3B/3D High-Impedance Enable)

This bit specifies whether to place the MTIOC3B output and MTIOC3D output for the MTU3 pin in high-impedance state when any one of the OSF1 flag in OCSR1, POE0F flag in ICSR1, MTUCH34HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 2 to 4; m = 4, 8, 10) flag in ICSRn, is set to 1.

17.2.10 Port Output Enable Control Register 4 (POECR4)

The POECR4 is used to extend the control conditions of the high-impedance state for the MTU3, MTU4, MTU6, and MTU7 pins for the MTU complementary PWM output.

For details about the targets and conditions of high-impedance control, see **Figure 17.2**.

Address(es): H'1004_9810

b1	—	1	R/W	Reserved This bit is read as 1. The write value should be 1.
b2	IC2ADDMT34ZE	0	R/W*1	MTU3 and MTU4 High- Impedance POE4F Add 0: Does not add the pins to the high-impedance control conditions. 1: Adds the pins to the high-impedance control conditions.
b3	IC3ADDMT34ZE	0	R/W*1	MTU3 and MTU4 High- Impedance POE8F Add 0: Does not add the pins to the high-impedance control conditions. 1: Adds the pins to the high-impedance control conditions.
b4	IC4ADDMT34ZE	0	R/W*1	MTU3 and MTU4 High- Impedance POE10F Add 0: Does not add the pins to the high-impedance control conditions. 1: Adds the pins to the high-impedance control conditions.
b8 to b5	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0
b9	IC1ADDMT67ZE	0	R/W*1	MTU6 and MTU7 High- Impedance POE0F Add 0: Does not add the pins to the high-impedance control conditions. 1: Adds the pins to the high-impedance control conditions.
b10	—	1	R/W	Reserved This bit is read as 1. The write value should be 1.
b11	IC3ADDMT67ZE	0	R/W*1	MTU6 and MTU7 High- Impedance POE8F Add 0: Does not add the pins to the high-impedance control conditions. 1: Adds the pins to the high-impedance control conditions.
b12	IC4ADDMT67ZE	0	R/W*1	MTU6 and MTU7 High- Impedance POE10F Add 0: Does not add the pins to the high-impedance control conditions. 1: Adds the pins to the high-impedance control conditions.
b15 to b13	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

IC2ADDMT34ZE Bit (MTU3 and MTU4 High-Impedance POE4F Add)

Adds the POE4F flag in ICSR2 (POE4#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B/MTIOC3D/MTIOC4A/MTIOC4C/MTIOC4B/MTIOC4D).

IC3ADDMT34ZE Bit (MTU3 and MTU4 High-Impedance POE8F Add)

Adds the POE8F flag in ICSR3 (POE8#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B/MTIOC3D/MTIOC4A/MTIOC4C/MTIOC4B/MTIOC4D).

IC4ADDMT34ZE Bit (MTU3 and MTU4 High-Impedance POE10F Add)

Adds the POE10F flag in ICSR4 (POE10#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B/MTIOC3D/MTIOC4A/MTIOC4C/MTIOC4B/MTIOC4D).

IC1ADDMT67ZE Bit (MTU6 and MTU7 High-Impedance POE0F Add)

Adds the POE0F flag in ICSR1 (POE0#) to the high-impedance control conditions for the MTU6, and MTU7 pins (MTIOC6B/MTIOC6D/MTIOC7A/MTIOC7C/MTIOC7B/MTIOC7D).

IC3ADDMT67ZE Bit (MTU6 and MTU7 High-Impedance POE8F Add)

Adds the POE8F flag in ICSR3 (POE8#) to the high-impedance control conditions for the MTU6, and MTU7 pins (MTIOC6B/MTIOC6D/MTIOC7A/MTIOC7C/MTIOC7B/MTIOC7D).

IC4ADDMT67ZE Bit (MTU6 and MTU7 High-Impedance POE10F Add)

Adds the POE10F flag in ICSR4 (POE10#) to the high-impedance control conditions for the MTU6, and MTU7 pins (MTIOC6B/MTIOC6D/MTIOC7A/MTIOC7C/MTIOC7B/MTIOC7D).

17.2.11 Port Output Enable Control Register 5 (POECR5)

The POECR5 is used to extend the control conditions of the high-impedance for the MTU0 pin.

For details about the targets and conditions of high-impedance control, see **Figure 17.2**.

Address(es): H'1004_9812

b4	IC4ADDMT0ZE	0	R/W*1	MTU0 High-Impedance POE10F Add 0: Does not add the pins to the high-impedance control conditions. 1: Adds the pins to the high-impedance control conditions.
b15 to b5	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

IC1ADDMT0ZE Bit (MTU0 High-Impedance POE0F Add)

Adds the POE0F flag in ICSR1 (POE0#) to the high-impedance control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

IC2ADDMT0ZE Bit (MTU0 High-Impedance POE4F Add)

Adds the POE4F flag in ICSR2 (POE4#) to the high-impedance control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

IC4ADDMT0ZE Bit (MTU0 High-Impedance POE10F Add)

Adds the POE10F flag in ICSR4 (POE10#) to the high-impedance control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

17.3 Operation

Table 17.5 shows the target pins for high-impedance control and conditions to place the pins in high-impedance state.

Table 17.5 Target Pins and Conditions for High-Impedance Control (1/2)

Pins	Conditions	Detailed Conditions
MTU3 pins (MTIOC3B and MTIOC3D)	● Operation for detection of the POE0# input level ● Operation for comparison of the output levels on the MTIOC3B and MTIOC3D pins ● SPOER setting ● Additional conditions of the POECR4	MTU3BDZE• ((POE0F) +(OSF1•OCE1) +(MTUCH34HIZ) +(IC2ADDMT34ZE•POE4F) +(IC3ADDMT34ZE•POE8E•POE8F) +(IC4ADDMT34ZE•ICSR4.POE10E•ICSR4.POE10F)

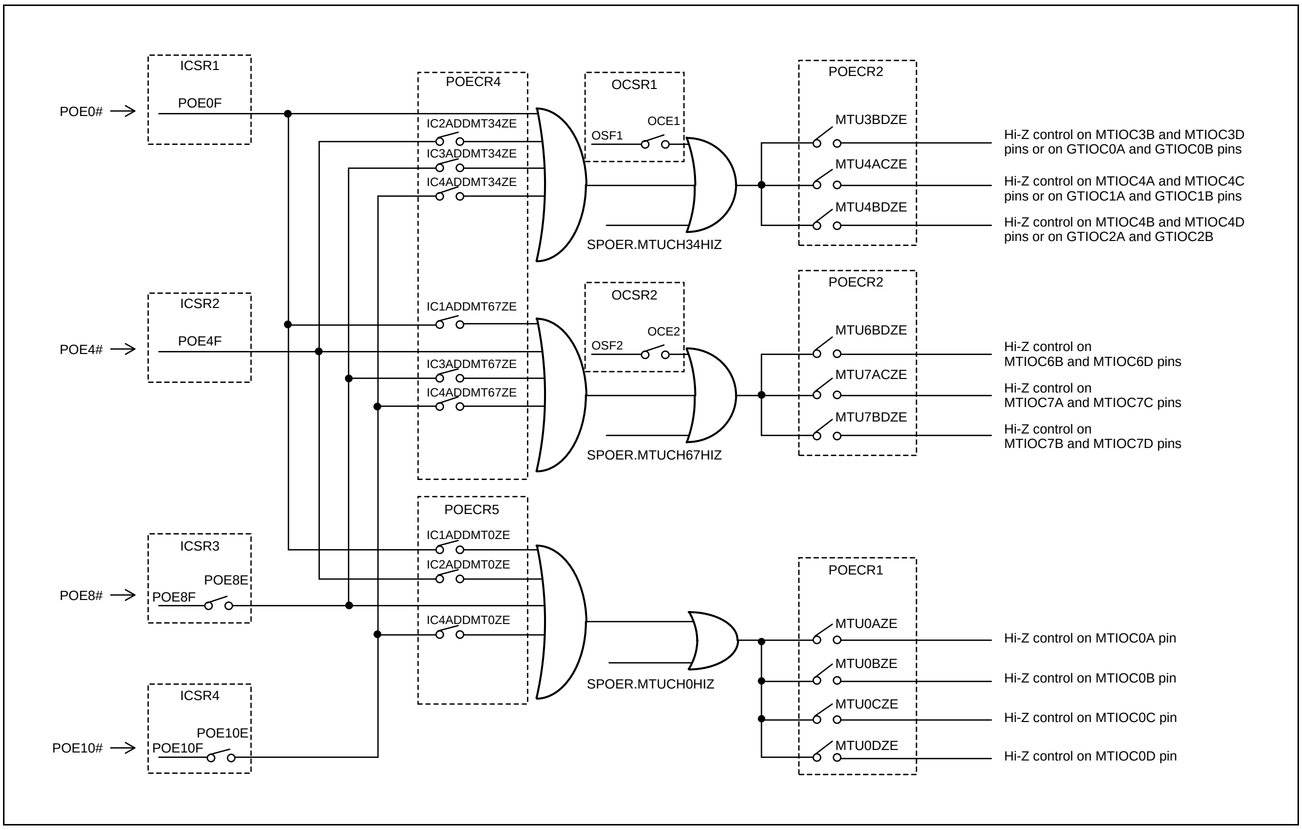

Figure 17.2 Target Pins and Conditions for High-Impedance Control

High-impedance requests to individual pins can be controlled by the settings in the POECR1 to POECR2 registers.

The following input pins can be added to high-impedance control conditions by the settings in the POECR4 to POECR5 registers: input pins other than the POE0# pin for the MTU3 and MTU4 pins; input pins other than the POE4# pin for the MTU6 and MTU7 pins; input pins other than the POE8# pin for the MTU0 pins.

For example, setting the IC2ADDMT34ZE bit in POECR4 to 1 outputs high-impedance requests to the MTU3 and MTU4 pins even when the POE4# input is detected.

High-impedance requests due to the detection of POE8# input or POE10# input can be controlled by the settings in the ICSR3 to ICSR4 registers. (The ICSR1 and ICSR2 registers do not control enabling or disabling of output of high-impedance requests.)

High-impedance requests to the MTU3, MTU4, MTU6, and MTU7 pins as the results of output level comparison can be controlled by the settings in the OCSR1 and OCSR2 registers.

17.3.1 MTU Pin Selection

In this LSI, each terminal function for MTU is assigned to multiple ports. **Table 17.6** shows the correspondence table of MTU terminal functions and compatible ports. The pin used as the MTU must be set separately in the general-purpose I / O port register. (Set by PMCn and PFCm registers of IO_TOP)

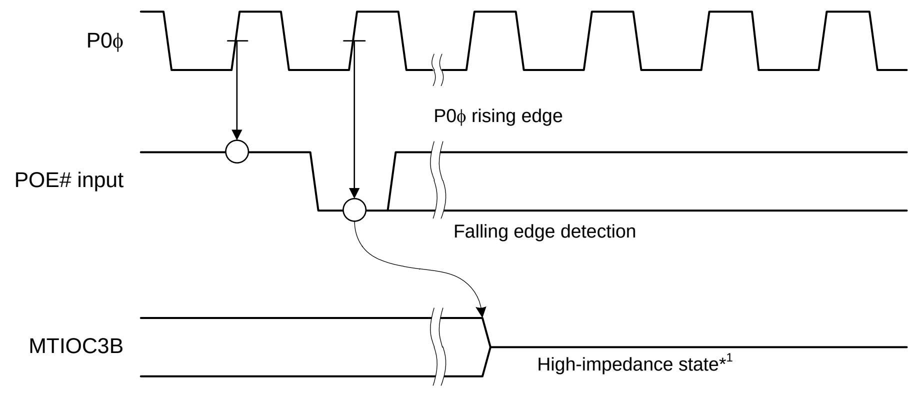
17.3.2 Input Level Detection Operation

If the input conditions set by ICSR1 to ICSR4 occur on the POE0#, POE4#, POE8#, and POE10# pins, the MTU3 and MTU4 or MTU6 and MTU7 pins for the MTU complementary PWM output, and MTU0 pin are placed in high-impedance state. Note however, that these pins are still placed in the high-impedance state even when the MTU functions are not selected for the pins.

(1) Falling Edge Detection

When a change from a high to low level is input to the POE0#, POE4#, POE8#, and POE10# pins, the pins for the MTU complementary PWM output, and pin functions multiplexed with the MTU0 pins are placed in highimpedance state.

Figure 17.3 shows a sample timing after the level changes in input to the POE0#, POE4#, POE8#, and POE10# pins until the respective pins enter high-impedance state.

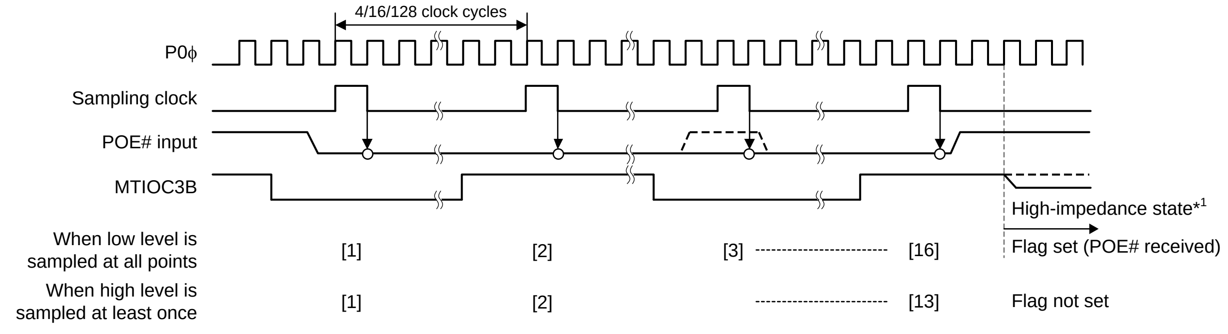


Note 1. Other pins also enter the high-impedance state at the same timing.

Figure 17.3 Falling Edge Detection

(2) Low-Level Detection

Figure 17.4 shows the low-level detection operation. Sixteen continuous low levels are sampled with the sampling clock selected by ICSR1 to ICSR4. If even one high level is detected during this interval, the low level is not accepted. The timing when pins for the MTU complementary PWM output, and MTU0 pins enter the highimpedance state after the sampling clock is input is the same in both falling-edge detection and in low-level detection.



Note 1. Other pins also enter the high-impedance state at the same timing.

Figure 17.4 Low-Level Detection Operation

17.3.3 Output Level Compare Operation

Figure 17.5 shows an example of the output level compare operation for the combination of MTIOC3B and MTIOC3D. The operation is the same for the other pin combinations.

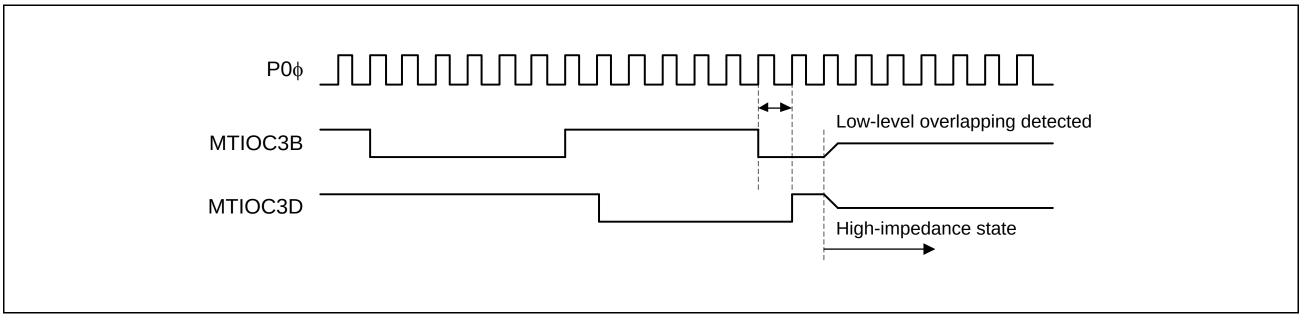


Figure 17.5 Output Level Compare Operation

17.3.4 High-Impedance Control Using Registers

The high-impedance state of the MTU pins (MTU0, MTU3, MTU4, MTU6, and MTU7) can be directly controlled by using the software port output enable register (SPOER).

For instance, setting the MTUCH34HIZ bit in SPOER to 1 places the MTU3 and MTU4 pins specified by the port output enable control register 2 (POECR2) in the high-impedance state.

The high-impedance state of other pins can also be controlled by setting the appropriate bits in SPOER.

17.3.5 Additional Functions for Controlling High-Impedance States

Settings in port enable registers 4 to 5 (POECR4 and POECR5) can add further high-impedance control conditions for the MTU complementary PWM output and MTU0 pins.

For instance, the settings listed below can be added as high-impedance control conditions for the MTU3 and MTU4 pins.

- Setting the IC2ADDMT34ZE bit in POECR4 to 1 adds the input level detection by the POE4#
- Setting the IC3ADDMT34ZE bit in POECR4 to 1 and adds the input level detection by the POE8#
- Setting the IC4ADDMT34ZE bit in POECR4 to 1 and adds the input level detection by the POE10# (ICSR4.POE10F)

The high-impedance state of other pins can also be controlled by setting the appropriate bits in the POECR4 and POECR5.

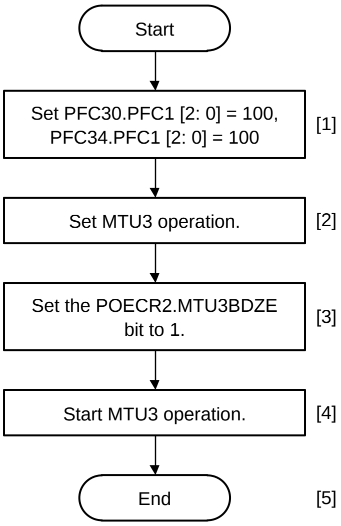
17.3.6 Release from High-Impedance State

MTU pins which have entered high-impedance state due to input-level detection can be released from the state either by returning them to their initial state with a reset, or by clearing all of the ICSR1.POE0F, ICSR2.POE4F, ICSR3.POE8F, and ICSR4.POE10F flags. However, note that when low-level sampling is selected with the ICSR1.POE0M[1:0], ICSR2.POE4M[1:0], ICSR3.POE8M[1:0], ICSR4.POE10M[1:0], and ICSR5.POE10M[1:0] bits, just writing 0 to a flag is ignored (the flag is not cleared); flags can be cleared by writing 0 to it only after a high level is input to the POE0#, POE4#, POE8#, and POE10# pins and is sampled.

MTU pins which have entered high-impedance state due to output level detection can be released from the state either by returning them to their initial state with a reset, or by clearing the OCSR1.OSF1 flag or the OCSR2.OSF2 flag.

17.4 POE3 Setting Procedure

Figure 17.6 shows the POE3 configuration procedure. As an example, high impedance control by comparing the output levels of the MTU 3 terminals (MTIOC3B / MTIOC3D) is shown. In **Figure 17.6**, select P32_1 for the MTIOC3B terminal and P36_1 for the MTIOC3D terminal.



Set the MTU3 pin (P32_1, P36_1) to the control mode (combined function) with PMCn (port mode control register) in advance, and then make the following settings.

[1] Select P32_1 as the MTIOC3B pin and P36_1 as the MTIOC3D pin by setting the PFC30 register and PFC34 register of the general-purpose I/O port (IO_TOP).

[2] Set MTU3 operation.

[3] Enable the high -impedance control for MTIOC3B and MTIOC3D pin by setting POECR2.MTU3BDZE bit to 1.

[4] Start MTU3 operation.

After making the above settings, if MTIOC3B (P32_1) and MTIOC3D (P36_1) go low at the same time, the same terminal becomes high impedance and the OCSR1.OSF1 bit is set.

For the method for releasing high-impedance, refer to **Section 17.3.6, Release from High-Impedance State**.

Figure 17.6 Procedure for Setting POE3

17.5 Interrupts

The POE3 issues a request to generate an interrupt when the specified condition is satisfied during input level detection or output level comparison. **Table 17.7** shows the interrupt sources and their conditions.

Table 17.7 Interrupt Sources and Conditions

Name	Interrupt Source	Interrupt Flag	Condition
OEI1	Output enable interrupt 1	POE0F and OSF1	PIE1•POE0F+OIE1•OSF1
OEI2	Output enable interrupt 2	POE4F and OSF2	PIE2•POE4F+OIE2•OSF2
OEI3	Output enable interrupt 3	POE8F	PIE3•POE8F
OEI4	Output enable interrupt 4	ICSR4.POE10F	PIE4•ICSR4.POE10F

17.6 Usage Notes

17.6.1 High-Impedance Control when MTU6 and MTU7 are not Used

When MTU6 and MTU7 are not to be used, set the POECR2.MTU6BDZE, MTU7ACZE, and MTU7BDZE bits to 0 to disable high-impedance control.

18. General PWM Timer (GPT)

18.1 Overview

This LSI has a general purpose PWM timer (GPT) composed of 8 channels of 32-bit timer (GPT32E). **Table 18.1** lists the GPT specifications, **Table 18.2** shows the GPT functions, **Figure 18.1** shows the block diagram, and **Table 18.3** lists the I/O pins.

Table 18.1 GPT specifications

Parameter	Specifications
Functions	● 32 bits × 8 channels ● Up-counting or down-counting (saw waves) or up/down-counting (triangle waves) for each counter. ● Clock sources independently selectable for each channel ● Two I/O pins per channel ● Two output compare/input capture registers per channel ● For the two output compare/input capture registers of each channel, four registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use. ● In output compare operation, buffer switching can be at crests or troughs, enabling the generation of laterally asymmetric PWM waveforms. ● Registers for setting up frame cycles in each channel (with capability for generating interrupts at overflow or underflow) ● Generation of dead times in PWM operation ● Synchronous starting, stopping and clearing counters for arbitrary channels ● Starting, stopping, clearing and up/down counters in response to input level comparison ● Starting, clearing, stopping and up/down counters in response to a maximum of four external triggers ● Output pin disable function by dead time error and detected short-circuits between output pins ● A/D converter start triggers can be generated (GPT32E0 to GPT32E3) ● Enables the noise filter for input capture and external trigger operation

18.2.1 General PWM Timer Write-Protection Register (GTWP)

Address(es): GPT32Em.GTWP H’1004_8000 + H’0100 × m (m = 0 to 7)

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PRKEY[7:0]								—	—	—	—	—	—	—	WP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	WP	0	R/W	Register Write Disable 0: Enable writes to the register 1: Disable writes to the register.
b7 to b1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b15 to b8	PRKEY[7:0]	All 0	R/W	GTWP Key Code When H’A5 is written to these bits, the writes to the WP bit are permitted. These bits are read as 0.
b31 to b16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

To prevent accidental changes, the GTWP enables or disables writing to following registers:

- GTSSR
- GTPSR
- GTCSR
- GTUPSR
- GTDNSR
- GTICASR
- GTICBSR
- GTCR
- GTUDDTYC
- GTIOR
- GTINTAD
- GTST
- GTBER
- GTITC
- GTCNT
- GTCCRA
- GTCCRB
- GTCCRC
- GTCCRD
- GTCCRE
- GTCCRF
- GTPR
- GTPBR
- GTPDBR
- GTADTRA
- GTADTBRA
- GTADTDBRA
- GTADTRB
- GTADTBRB
- GTADTDBRB
- GTDTCR
- GTDVU
- GTDVD
- GTDBU
- GTDBD
- GTSOS
- GTSOTR.

18.2.2 General PWM Timer Software Start Register (GTSTR)

Address(es): GPT32Em.GTSTR H'1004_8004 + H'0100 × m (m = 0 to 7)

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	—	—	—	—	—	—	—	—	CSTRT7	CSTRT6	CSTRT5	CSTRT4	CSTRT3	CSTRT2	CSTRT1	CSTRT0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The GTSTR starts the GTCNT counter operation for each channel x, where x = 0 to 7.

The GTSTR bit number represents the channel number. The GTSTR register is shared by all of the channels. The GTCNT counter starts for the channel associated with the GTSTR bit number where 1 is written. Writing 0 has no effect on the status of the GTCNT counter and the value of GTSTR register.

CSTRTx bit (channel x GTCNT Count Start) (x = 0 to 7)

The CSTRTx bit starts channel x of the GTCNT counter operation. Writing to GTSTR.CSTRTx bit has no effect unless GPTx.GTSSR.CSTRT bit is set to 1.

Read data shows the counter status of each channel (GTCR.CST bit). Zero means the counter stops and 1 means the counter is running.

18.2.3 General PWM Timer Software Stop Register (GTSTP)

Address(es): GPT32Em.GTSTP H’1004_8008 + H’0100 × m (m = 0 to 7)

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	CSTOP 7	CSTOP 6	CSTOP 5	CSTOP 4	CSTOP 3	CSTOP 2	CSTOP 1	CSTOP 0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The GTSTP stops the GTCNT counter operation for each channel x, where x = 0 to 7.

The GTSTP bit number represents the channel number. The GTSTP register is shared by all of the channels. The GTCNT counter stops for the channel associated with the GTSTP bit number where 1 is written. Writing 0 has no effect on the status of GTCNT counter and the value of GTSTP register.

CSTOPx bit (channel x GTCNT Count Stop) (x = 0 to 7)

The CSTOPx bit stops channel x of the GTCNT counter operation. Writing to GTSTP.CSTOPx bit has no effect unless GPTx.GTPSR.CSTOP bit is set to 1. Read data shows the counter status of each channel (invert of GTCR.CST bit). Zero means the counter is running and 1 means the counter stops.

18.2.4 General PWM Timer Software Clear Register (GTCLR)

Address(es): GPT32Em.GTCLR H’1004_800C + H’0100 × m (m = 0 to 7)

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	CCLR7	CCLR6	CCLR5	CCLR4	CCLR3	CCLR2	CCLR1	CCLR0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

GTCLR is a write-only register that clears the GTCNT counter operation for each channel x, where x = 0 to 7. The GTCLR bit number represents the channel number. The GTCLR register is shared by all of the channels. The

GTCNT counter is cleared for the channel associated with the GTCLR bit number where 1 is written. Writing 0 has no effect on the status of the GTCNT counter.

CCLRx bit (channel x GTCNT Count Clear) (x = 0 to 7).

Channel x of the GTCNT counter value is cleared on writing 1 to the CCLRx bit. This bit is read as 0.

18.2.5 General PWM Timer Start Source Select Register (GTSSR)

Address(es): GPT32Em.GTSSR H’1004_8010 + H’0100 × m (m = 0 to 7)

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b30 to b16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b31	CSTRT	0	R/W	Software Source Counter Start Enable 0: Disable counter start by the GTSTR register 1: Enable counter start by the GTSTR register

GTSSR sets the source to start the GTCNT counter.

SSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Start Enable)

The SSGTRGAR bit enables or disables GTCNT counter start on the rising edge of GTETRGA pin input.

SSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Start Enable)

The SSGTRGAF bit enables or disables GTCNT counter start on the falling edge of GTETRGA pin input.

SSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Start Enable)

The SSGTRGBR bit enables or disables GTCNT counter start on the rising edge of GTETRGB pin input.

SSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Start Enable)

The SSGTRGBF bit enables or disables GTCNT counter start on the falling edge of GTETRGB pin input.

SSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Start Enable)

The SSGTRGCR bit enables or disables GTCNT counter start on the rising edge of GTETRGC pin input.

SSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Start Enable)

The SSGTRGCF bit enables or disables GTCNT counter start on the falling edge of GTETRGC pin input.

SSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Start Enable)

The SSGTRGDR bit enables or disables GTCNT counter start on the rising edge of GTETRGD pin input.

SSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Start Enable)

The SSGTRGDF bit enables or disables GTCNT counter start on the falling edge of GTETRGD pin input.

SSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Start Enable)

The SSCARBL bit enables or disables GTCNT counter start on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

SSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Start Enable)

The SSCARBH bit enables or disables GTCNT counter start on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

SSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Start Enable)

The SSCAFBL bit enables or disables GTCNT counter start on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

SSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Start Enable)

The SSCAFBH bit enables or disables GTCNT counter start on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

SSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Start Enable)

The SSCBRAL bit enables or disables GTCNT counter start on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

SSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Start Enable)

The SSCBRAH bit enables or disables GTCNT counter start on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

SSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Start Enable)

The SSCBFAL bit enables or disables GTCNT counter start on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

SSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Start Enable)

The SSCBFAH bit enables or disables GTCNT counter start on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

CSTRT bit (Software Source Counter Start Enable)

The CSTRT bit enables or disables GTCNT counter start by GTSTR register.

18.2.6 General PWM Timer Stop Source Select Register (GTPSR)

b31	CSTOP	0	R/W	Software Source Counter Stop Enable 0: Disable counter stop by the GTSTP register 1: Enable counter stop by the GTSTP register

GTPSR sets the source to stop the GTCNT counter.

PSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Stop Enable)

The PSGTRGAR bit enables or disables GTCNT counter stop on the rising edge of GTETRGA pin input.

PSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Stop Enable)

The PSGTRGAF bit enables or disables GTCNT counter stop on the falling edge of GTETRGA pin input.

PSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Stop Enable)

The PSGTRGBR bit enables or disables GTCNT counter stop on the rising edge of GTETRGB pin input.

PSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Stop Enable)

The PSGTRGBF bit enables or disables GTCNT counter stop on the falling edge of GTETRGB pin input.

PSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Stop Enable)

The PSGTRGCR bit enables or disables GTCNT counter stop on the rising edge of GTETRGC pin input.

PSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Stop Enable)

The PSGTRGCF bit enables or disables GTCNT counter stop on the falling edge of GTETRGC pin input.

PSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Stop Enable)

The PSGTRGDR bit enables or disables GTCNT counter stop on the rising edge of GTETRGD pin input.

PSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Stop Enable)

The PSGTRGDF bit enables or disables GTCNT counter stop on the falling edge of GTETRGD pin input.

PSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Stop Enable)

The PSCARBL bit enables or disables GTCNT counter stop on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

PSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Stop Enable)

The PSCARBH bit enables or disables GTCNT counter stop on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

PSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Stop Enable)

The PSCAFBL bit enables or disables GTCNT counter stop on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

PSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Stop Enable)

The PSCAFBH bit enables or disables GTCNT counter stop on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

PSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Stop Enable)

The PSCBRAL bit enables or disables GTCNT counter stop on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

PSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Stop Enable)

The PSCBRAH bit enables or disables GTCNT counter stop on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

PSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Stop Enable)

The PSCBFAL bit enables or disables GTCNT counter stop on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

PSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Stop Enable)

The PSCBFAH bit enables or disables GTCNT counter stop on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

CSTOP bit (Software Source Counter Stop Enable)

The CSTOP bit enables or disables GTCNT counter stop by GTSTP register.

GTCSR sets the source to clear the GTCNT counter.

CSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Clear Enable)

The CSGTRGAR bit enables or disables GTCNT counter clear on the rising edge of GTETRGA pin input.

CSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Clear Enable)

The CSGTRGAF bit enables or disables GTCNT counter clear on the falling edge of GTETRGA pin input.

CSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Clear Enable)

The CSGTRGBR bit enables or disables GTCNT counter clear on the rising edge of GTETRGB pin input.

CSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Clear Enable)

The CSGTRGBF bit enables or disables GTCNT counter clear on the falling edge of GTETRGB pin input.

CSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Clear Enable)

The CSGTRGCR bit enables or disables GTCNT counter clear on the rising edge of GTETRGC pin input.

CSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Clear Enable)

The CSGTRGCF bit enables or disables GTCNT counter clear on the falling edge of GTETRGC pin input.

CSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Clear Enable)

The CSGTRGDR bit enables or disables GTCNT counter clear on the rising edge of GTETRGD pin input.

CSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Clear Enable)

The CSGTRGDF bit enables or disables GTCNT counter clear on the falling edge of GTETRGD pin input.

CSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Clear Enable)

The CSCARBL bit enables or disables GTCNT counter clear on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

CSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Clear Enable)

The CSCARBH bit enables or disables GTCNT counter clear on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

CSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Clear Enable)

The CSCAFBL bit enables or disables GTCNT counter clear on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

CSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Clear Enable)

The CSCAFBH bit enables or disables GTCNT counter clear on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

CSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Clear Enable)

The CSCBRAL bit enables or disables GTCNT counter clear on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

CSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Clear Enable)

The CSCBRAH bit enables or disables GTCNT counter clear on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

CSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Clear Enable)

The CSCBFAL bit enables or disables GTCNT counter clear on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

CSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Clear Enable)

The CSCBFAH bit enables or disables GTCNT counter clear on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

CCLR bit (Software Source Counter Clear Enable)

The CCLR bit enables or disables GTCNT counter clear by GTCLR register.

b31 to b16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

GTUPSR sets the source to count up the GTCNT counter.

When at least 1 bit in the GTUPSR register is set to 1, the GTCNT counter is counted up by the source that is set to 1 in this register. In such cases, the setting of GTCR.TPCS has no effect.

USGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Up Enable)

The USGTRGAR bit enables or disables GTCNT counter count up on the rising edge of GTETRGA pin input.

USGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Up Enable)

The USGTRGAF bit enables or disables GTCNT counter count up on the falling edge of GTETRGA pin input.

USGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Up Enable)

The USGTRGBR bit enables or disables GTCNT counter count up on the rising edge of GTETRGB pin input.

USGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Up Enable)

The USGTRGBF bit enables or disables GTCNT counter count up on the falling edge of GTETRGB pin input.

USGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Up Enable)

The USGTRGCR bit enables or disables GTCNT counter count up on the rising edge of GTETRGC pin input.

USGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Up Enable)

The USGTRGCF bit enables or disables GTCNT counter count up on the falling edge of GTETRGC pin input.

USGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Up Enable)

The USGTRGDR bit enables or disables GTCNT counter count up on the rising edge of GTETRGD pin input.

USGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Up Enable)

The USGTRGDF bit enables or disables GTCNT counter count up on the falling edge of GTETRGD pin input.

USCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Count Up Enable)

The USCARBL bit enables or disables GTCNT counter count up on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

USCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Count Up Enable)

The USCARBH bit enables or disables GTCNT counter count up on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

USCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Count Up Enable)

The USCAFBL bit enables or disables GTCNT counter count up on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

USCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Count Up Enable)

The USCAFBH bit enables or disables GTCNT counter count up on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

USCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Count Up Enable)

The USCBRAL bit enables or disables GTCNT counter count up on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

USCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Count Up Enable)

The USCBRAH bit enables or disables GTCNT counter count up on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

USCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Count Up Enable)

The USCBFAL bit enables or disables GTCNT counter count up on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

USCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Count Up Enable)

The USCBFAH bit enables or disables GTCNT counter count up on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

b31 to b16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

GTDNSR sets the source to count down the GTCNT counter.

When at least 1 bit in the GTDNSR register is set to 1, the GTCNT counter is counted down by the source that is set to 1 in this register. In such cases, the setting of GTCR.TPCS has no effect.

DSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Down Enable)

The DSGTRGAR bit enables or disables GTCNT counter count down on the rising edge of GTETRGA pin input.

DSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Down Enable)

The DSGTRGAF bit enables or disables GTCNT counter count down on the falling edge of GTETRGA pin input.

DSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Down Enable)

The DSGTRGBR bit enables or disables GTCNT counter count down on the rising edge of GTETRGB pin input.

DSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Down Enable)

The DSGTRGBF bit enables or disables GTCNT counter count down on the falling edge of GTETRGB pin input.

DSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Down Enable)

The DSGTRGCR bit enables or disables GTCNT counter count down on the rising edge of GTETRGC pin input.

DSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Down Enable)

The DSGTRGCF bit enables or disables GTCNT counter count down on the falling edge of GTETRGC pin input.

DSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Down Enable)

The DSGTRGDR bit enables or disables GTCNT counter count down on the rising edge of GTETRGD pin input.

DSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Down Enable)

The DSGTRGDF bit enables or disables GTCNT counter count down on the falling edge of GTETRGD pin input.

DSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Count Down Enable)

The DSCARBL bit enables or disables GTCNT counter count down on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

DSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Count Down Enable)

The DSCARBH bit enables or disables GTCNT counter count down on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

DSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Count Down Enable)

The DSCAFBL bit enables or disables GTCNT counter count down on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

DSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Count Down Enable)

The DSCAFBH bit enables or disables GTCNT counter count down on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

DSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Count Down Enable)

The DSCBRAL bit enables or disables GTCNT counter count down on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

DSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Count Down Enable)

The DSCBRAH bit enables or disables GTCNT counter count down on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

DSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Count Down Enable)

The DSCBFAL bit enables or disables GTCNT counter count down on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

DSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Count Down Enable)

The DSCBFAH bit enables or disables GTCNT counter count down on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

18.2.10 General PWM Timer Input Capture Source Select Register A (GTICASR)

b31 to b16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

GTICASR sets the source of input capture for GTCCRA.

ASGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGAR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGA pin input.

ASGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGAF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGA pin input.

ASGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGBR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGB pin input.

ASGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGBF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGB pin input.

ASGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGCR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGC pin input.

ASGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGCF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGC pin input.

ASGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGDR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGD pin input.

ASGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGDF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGD pin input.

ASCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source GTCCRA Input Capture Enable)

The ASCARBL bit enables or disables input capture for GTCCRA on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

ASCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source GTCCRA Input Capture Enable)

The ASCARBH bit enables or disables input capture for GTCCRA on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

ASCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source GTCCRA Input Capture Enable)

The ASCAFBL bit enables or disables input capture for GTCCRA on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

ASCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source GTCCRA Input Capture Enable)

The ASCAFBH bit enables or disables input capture for GTCCRA on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

ASCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source GTCCRA Input Capture Enable)

The ASCBRAL bit enables or disables input capture for GTCCRA on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

ASCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source GTCCRA Input Capture Enable)

The ASCBRAH bit enables or disables input capture for GTCCRA on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

ASCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source GTCCRA Input Capture Enable)

The ASCBFAL bit enables or disables input capture for GTCCRA on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

ASCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source GTCCRA Input Capture Enable)

The ASCBFAH bit enables or disables input capture for GTCCRA on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

b31 to b16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

GTICBSR sets the source of input capture for GTCCRB.

BSGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGAR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGA pin input.

BSGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGAF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGA pin input.

BSGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGBR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGB pin input.

BSGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGBF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGB pin input.

BSGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGCR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGC pin input.

BSGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGCF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGC pin input.

BSGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGDR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGD pin input.

BSGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGDF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGD pin input.

BSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source GTCCRB Input Capture Enable)

The BSCARBL bit enables or disables input capture for GTCCRB on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

BSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source GTCCRB Input Capture Enable)

The BSCARBH bit enables or disables input capture for GTCCRB on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

BSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source GTCCRB Input Capture Enable)

The BSCAFBL bit enables or disables input capture for GTCCRB on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

BSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source GTCCRB Input Capture Enable)

The BSCAFBH bit enables or disables input capture for GTCCRB on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

BSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source GTCCRB Input Capture Enable)

The BSCBRAL bit enables or disables input capture for GTCCRB on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

BSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source GTCCRB Input Capture Enable)

The BSCBRAH bit enables or disables input capture for GTCCRB on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

BSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source GTCCRB Input Capture Enable)

The BSCBFAL bit enables or disables input capture for GTCCRB on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

BSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source GTCCRB Input Capture Enable)

The BSCBFAH bit enables or disables input capture for GTCCRB on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

GTCR controls GTCNT.

CST bit (Count Start)

The CST bit controls the GTCNT counter start and stop.

[Setting conditions]

- GTSTR value where the channel number associated with the bit number is set to 1 with the GTSSR.CSTRT bit being 1.
- among input on the GTIOCA, GTIOCB, or GTETRGA to GTETRGD pins that is enabled in the GTSSR register as a source for the start of counting
- 1 is written by software directly.

[Clearing conditions]

- GTSTP value where the channel number associated with the bit number is set to 1 with the GTPSR.CSTOP bit being 1.
- among input on the GTIOCA, GTIOCB, or GTETRGA to GTETRGD pins that is enabled in the GTPSR register as a source for the stop of counting
- 0 is written by software directly.

MD[2:0] bits (Mode Select)

The MD[2:0] bits select the GPT operating mode. The MD[2:0] bits must be set while the GTCNT operation is stopped.

TPCS[2:0] bits (Timer Prescaler Select)

The TPCS[2:0] bits select the clock for GTCNT. A clock prescaler can be selected independently for each channel. The TPCS[2:0] bits must be set while the GTCNT operation is stopped.

Bit	Bit Name	Initial Value	R/W	Description
b31 to b28	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Remarks: x: Don't care

GTUDDTYC sets the direction in which GTCNT counts (up-counting or down-counting) and sets the duty of GTIOCA/ GTIOCB pin output.

Count direction:

- In saw-wave mode

  When the UD value is set to 0 during up-counting, the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value is set to 1 during down- counting, the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).

  When the UD value changes from 1 to 0 with the UDF bit being 0 and while counting is stopped, the counter starts up- counting and the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes GTPR value). When the UD value changes from 0 to 1 with the UDF bit being 0 and while counting stops, the counter starts down-counting and the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).

  When the UDF bit is set to 1 while counting stops, the UD bit value is reflected in the count direction when counting starts.

- In triangle-wave mode

  When the UD value changes during counting, the count direction does not change. When the UD value changes while the UDF bit is 0 and counting stops, the change is not reflected in the count direction when counting starts.

  When the UDF bit is set to 1 while counting stops, the UD value is reflected in the count direction when counting starts.

UD bit (Count Direction Setting)

The UD bit sets the count direction for up-counting or down-counting, for GTCNT.

UDF bit (Forcible Count Direction Setting)

The UDF bit forcibly sets the count direction when GTCNT starts operation as the UD value. Only write 0 to this bit during counter operation. When 1 is written to this bit while counting stops, return this bit to 0 before counting starts.

Output duty:

- In saw-wave mode

  When the OADTY/OBDTY value changes during up-counting, the duty is reflected at an overflow (GTCNT = GTPR). When the OADTY/OBDTY value changes during down-counting, the duty is reflected at an underflow (GTCNT = 0). When the OADTY/OBDTY value changes to 1 with the OADTYF/OBDTYF bit being 0 and while counting is stopped, the output duty is not reflected at starting counter operation. When the count direction is up, the output duty is reflected at an overflow (GTCNT = GTPR). When the count direction is down, the output duty is reflected at an underflow (GTCNT = 0). When the OADTY/OBDTY value changes to 0 with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at the starting counter operation.

- In triangle-wave mode

  When the OADTY/OBDTY value changes during counting, the duty is reflected at an underflow. When the OADTY/OBDTY value changes to 1 with the OADTYF/OBDTYF bit being 0 and while counting stops, the output duty is not reflected at the starting counter operation, however the output duty is reflected at an underflow.

  When the OADTY/OBDTY value changes to 0 with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at starting counter operation.

OmDTY[1:0] bits (GTIOCm Output Duty Setting) (m = A, B)

The OmDTY[1:0] bits set the output duty (0%, 100% or compare match control) of the GTIOCm pin.

OmDTYF bit (Forcible GTIOCm Output Duty Setting) (m = A, B)

The OmDTYF bit forcibly sets the output duty cycle to the OmDTY setting. Set this bit to 0 during counter operation. When this bit is set to 1 while counting is stopped, return this bit to 0 until the first period ends after the counter starts.

OmDTYR bit (GTIOCm Output Value Selecting after Releasing 0%/100% Duty Setting) (m = A, B)

The OmDTYR bits select the value that is the object of output retained or toggled at cycle end, when the control changes from 0%/100% duty setting to compare match for GTIOCm pin and GTIOR.GTIOm[3:2] are set to 00b (output retained at cycle end) or GTIOR.GTIOm[3:2] are set to 11b (output toggled at cycle end).

GPT32 internally continues the compare match operation in performing 0%/100% duty operation. When the OmDTYR bit is set to 1, the GTCIOm pin outputs the value specified in the GTIOR.GTIOm[3:2] bits at the end of compare match cycle.

18.2.14 General PWM Timer I/O Control Register (GTIOR)

GTIOR sets the functions of the GTIOCA and GTIOCB pins.

GTIOA[4:0] bits (GTIOCA Pin Function Select)

The GTIOA[4:0] bits select the GTIOCA pin function. For details, see **Table 18.5**

OADFLT bit (GTIOCA Pin Output Value Setting at the Count Stop)

The OADFLT bit sets whether the GTIOCA pin outputs high or low when counting stops.

OAHLD bit (GTIOCA Pin Output Setting at the Start/Stop Count)

The OAHLD bit specifies whether the GTIOCA pin output level is retained or the level at the start/stop of counting depends on the register setting.

[When the OAHLD bit is set to 0]

- The value specified in bit [4] of the GTIOA[4:0] bits is output when counting starts
- The value specified in the OADFLT bit is output when counting stops
- If the OADFLT bit is modified while counting stops, it is immediately reflected in the output.

[When the OAHLD bit is set to 1]

- The output is retained when counting starts or stops.

OAE bit (GTIOCA Pin Output Enable)

The OAE bit disables or enables the GTIOCA pin output.

When the GTCCRA register is in use as an input capture register (at least one bit in the GTICASR register is set to 1), signals will not be output from the GTIOCA pin regardless of the setting of this bit.

OADF[1:0] bits (GTIOCA Pin Disable Value Setting)

The OADF bits select a value to be output from the GTIOCA pin in response to the output disable requests.

NFAEN bit (Noise Filter A Enable)

The NFAEN bit disables or enables the noise filter for input from the GTIOCA pin. Because changing the value of the bit might lead to internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

NFCSA[1:0] bits (Noise Filter A Sampling Clock Select)

The NFCSA[1:0] bits set the sampling interval for the noise filter of the GTIOCA pin. When setting these bits, wait for two cycles of the selected sampling interval before setting the input-capture function.

GTIOB[4:0] bits (GTIOCB Pin Function Select)

The GTIOB[4:0] bits select the GTIOCB pin function. For details, see **Table 18.5**

OBDFLT bit (GTIOCB Pin Output Value Setting at the Count Stop)

The OBDFLT bit sets whether the GTIOCB pin outputs high or low when counting stops.

OBHLD bit (GTIOCB Pin Output Setting at the Start/Stop Count)

The OBHLD bit specifies whether the GTIOCB pin output level is retained or the level at the start/stop of counting depends on the register setting.

[When the OBHLD bit is set to 0]

- The value specified in bit [4] of the GTIOB[4:0] bits is output when counting starts
- The value specified in the OBDFLT bit is output when counting stops
- If the OBDFLT bit is modified while counting stops, it is immediately reflected in the output.

[When the OBHLD bit is set to 1]

- The output is retained when counting starts or stops.

OBE bit (GTIOCB Pin Output Enable)

The OBE bit disables or enables the GTIOCB pin output.

When the GTCCRB register is in use as an input capture register (at least one bit in the GTICBSR register is set to 1), signals will not be output from the GTIOCB pin regardless of the setting of this bit.

OBDF[1:0] bits (GTIOCB Pin Disable Value Setting)

The OBDF bits select a value to be output from the GTIOCB pin in response to the output disable requests.

NFBEN bit (Noise Filter B Enable)

The NFBEN bit disables or enables the noise filter for input from the GTIOCB pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

NFCSB[1:0] bits (Noise Filter B Sampling Clock Select)

The NFCSB[1:0] bits set the sampling interval for the noise filter of the GTIOCB pin. When setting these bits, wait for two cycles of the selected sampling interval before setting the input-capture function.

Table 18.5 Settings of GTIOA[4:0] and GTIOB[4:0] bits

GTIOA/GTIOB[4:0] bits					Function		
b4	b3	b2	b1	b0	b4	b3, b2	b1, b0
0	0	0	0	0	Set initial output low	Retain output at cycle end	Retain output at GTCCRA/GTCCRB compare match
0	0	0	0	1			Output low at GTCCRA/GTCCRB compare match
0	0	0	1	0			Output high at GTCCRA/GTCCRB compare match
0	0	0	1	1			Toggle output at GTCCRA/GTCCRB compare match
0	0	1	0	0		Output low at cycle end	Retain output at GTCCRA/GTCCRB compare match
0	0	1	0	1			Output low at GTCCRA/GTCCRB compare match
0	0	1	1	0			Output high at GTCCRA/GTCCRB compare match
0	0	1	1	1			Toggle output at GTCCRA/GTCCRB compare match
0	1	0	0	0		Output high at cycle end	Retain output at GTCCRA/GTCCRB compare match
0	1	0	0	1			Output low at GTCCRA/GTCCRB compare match
0	1	0	1	0			Output high at GTCCRA/GTCCRB compare match
0	1	0	1	1			Toggle output at GTCCRA/GTCCRB compare match
0	1	1	0	0		Toggle output at cycle end	Retain output at GTCCRA/GTCCRB compare match
0	1	1	0	1			Output low at GTCCRA/GTCCRB compare match
0	1	1	1	0			Output high at GTCCRA/GTCCRB compare match
0	1	1	1	1			Toggle output at GTCCRA/GTCCRB compare match
1	0	0	0	0	Set initial output high	Retain output at cycle end	Retain output at GTCCRA/GTCCRB compare match
1	0	0	0	1			Output low at GTCCRA/GTCCRB compare match
1	0	0	1	0			Output high at GTCCRA/GTCCRB compare match
1	0	0	1	1			Toggle output at GTCCRA/GTCCRB compare match
1	0	1	0	0		Output low at cycle end	Retain output at GTCCRA/GTCCRB compare match
1	0	1	0	1			Output low at GTCCRA/GTCCRB compare match
1	0	1	1	0			Output high at GTCCRA/GTCCRB compare match
1	0	1	1	1			Toggle output at GTCCRA/GTCCRB compare match
1	1	0	0	0		Output high at cycle end	Retain output at GTCCRA/GTCCRB compare match
1	1	0	0	1			Output low at GTCCRA/GTCCRB compare match
1	1	0	1	0			Output high at GTCCRA/GTCCRB compare match
1	1	0	1	1			Toggle output at GTCCRA/GTCCRB compare match
1	1	1	0	0		Toggle output at cycle end	Retain output at GTCCRA/GTCCRB compare match
1	1	1	0	1			Output low at GTCCRA/GTCCRB compare match
1	1	1	1	0			Output high at GTCCRA/GTCCRB compare match
1	1	1	1	1			Toggle output at GTCCRA/GTCCRB compare match

Note 1. The cycle end means an overflow (GTCNT is changed from GTPR to 0 in up-counting) or underflow (GTCNT is changed from 0 to GTPR in down-counting). In this case, the GTCNT counter is cleared for saw waves and for the trough (GTCNT is changed from 0 to 1) for triangle waves.

Note 2. When the timing of a cycle end and the timing of a GTCCRA/GTCCRB compare match are the same in a compare-match operation, the b3 and b2 settings are given priority in saw-wave PWM mode, and the b1 and b0 settings are given priority in any other mode.

Note 3. In event count operation where at least 1 bit in GTUPSR or GTDNSR is set to 1, the setting of b3 and b2 is ignored.

b31	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.

GTINTAD enables or disables interrupt requests, A/D converter start requests and output disable requests.

GTINTA bit (GTCCRA Compare Match/Input Capture Interrupt Enable)

The GTINTA bit enables and disables the interrupt request (CCMPAn) in response to compare matches with or input capture by the GTCCRA register.

GTINTB bit (GTCCRB Compare Match/Input Capture Interrupt Enable)

The GTINTB bit enables and disables the interrupt request (CCMPBn) in response to compare matches with or input capture by the GTCCRB register.

GTINTC bit (GTCCRC Compare Match Interrupt Enable)

The GTINTC bit enables and disables the interrupt request (CMPCn) in response to compare matches with the GTCCRC register.

GTINTD bit (GTCCRD Compare Match Interrupt Enable)

The GTINTD bit enables and disables the interrupt request (CMPDn) in response to compare matches with the GTCCRD register.

GTINTE bit (GTCCRE Compare Match Interrupt Enable)

The GTINTE bit enables and disables the interrupt request (CMPEn) in response to compare matches with the GTCCRE register.

GTINTF bit (GTCCRF Compare Match Interrupt Enable)

The GTINTF bit enables and disables the interrupt request (CMPFn) in response to compare matches with the GTCCRF register.

GTINTPR[1:0] bits (GTPR Compare Match Interrupt Enable)

The GTINTPR[1:0] bits enable and disable the interrupt requests (OVFn and UNFn) in response to compare matches with the GTPR register (and overflows of the GTCNT counter) and underflows of the GTCNT counter.

ADTRAUEN bit (GTADTRA Compare Match (Up-Counting) A/D Converter Start Request Enable)

The ADTRAUEN bit enables or disables A/D converter start requests generated by GTADTRA compare matches during GTCNT up-counting.

ADTRADEN bit (GTADTRA Compare Match (Down-Counting) A/D Converter Start Request Enable)

The ADTRADEN bit enables or disables A/D converter start requests generated by GTADTRA compare matches during GTCNT down-counting.

ADTRBUEN bit (GTADTRB Compare Match (Up-Counting) A/D Converter Start Request Enable)

The ADTRBUEN bit enables or disables A/D converter start requests generated by GTADTRB compare matches during GTCNT up-counting.

ADTRBDEN bit (GTADTRB Compare Match (Down-Counting) A/D Converter Start Request Enable)

The ADTRBDEN bit enables or disables A/D converter start requests generated by GTADTRB compare matches during GTCNT down-counting.

GRP[1:0] bits (Output Disable Source Select)

The GRP[1:0] bits select GTIOCA pin and GTIOCB pin output disable source. The output disable requests to the POEG are output to the group selected by the GRP[1:0] bits. Each of the output disable sources, a dead time error, simultaneous output of high-level, and low-level signal, is also output in accord with the setting of its enabling bit. GTST.ODF shows the request of output disable source group that is selected with the GRP[1:0] bits. Set the GRP[1:0] bits when GTIOR.OAE and OBE bits are both 0.

GRPDTE bit (Dead Time Error Output Disable Request Enable)

The GRPDTE bit enables or disables dead time error output disable request.

GRPABH bit (Same Time Output Level High Disable Request Enable)

The GRPABH bit enables or disables output disable request when GTIOCA pin and GTIOCB pin output 1 at the same time.

GRPABL bit (Same Time Output Level Low Disable Request Enable)

The GRPABL bit enables or disables output disable request when GTIOCA pin and GTIOCB pin output 0 at the same time.

Bit	Bit Name	Initial Value	R/W	Description
b17	ADTRADF	0	R/(W) *1	GTADTRA Compare Match (Counting Down) A/D Converter Start Request Flag 0: A compare match with the GTADTRA register has not occurred during counting down. 1: A compare match with the GTADTRA register has occurred during counting down.
b18	ADTRBUF	0	R/(W) *1	GTADTRB Compare Match (Counting Up) A/D Converter Start Request Flag 0: A compare match with the GTADTRB register has not occurred during counting up. 1: A compare match with the GTADTRB register has occurred during counting up.
b19	ADTRBDF	0	R/(W) *1	GTADTRB Compare Match (Counting Down) A/D Converter Start Request Flag 0: A compare match with the GTADTRB register has not occurred during counting down. 1: A compare match with the GTADTRB register has occurred during counting down.
b23 to b20	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b24	ODF	0	R	Output Disable Flag 0: No output disable request occurred 1: Output disable request occurred.
b27 to b25	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b28	DTEF	0	R	Dead Time Error Flag 0: No dead time error occurred 1: Dead time error occurred.
b29	OABHF	0	R	Same Time Output Level High Flag 0: GTIOCA pin and GTIOCB pin did not output 1 at the same time 1: GTIOCA pin and GTIOCB pin output 1 at the same time.
b30	OABLF	0	R	Same Time Output Level Low Flag 0: GTIOCA pin and GTIOCB pin did not output 0 at the same time 1: GTIOCA pin and GTIOCB pin output 0 at the same time.
b31	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.

Note 1. Only 0 can be written to this bit. Do not write 1.

GTST indicates the status of the GPT.

TCFA flag (Input Capture/Compare Match Flag A)

The TCFS flag indicates the status for the input capture or compare match of GTCCRA.

[Setting conditions]

- GTCNT = GTCCRA, when the GTCCRA register functions as a compare match register
- GTCNT counter value is transferred to GTCCRA by the input capture signal when the GTCCRA register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFB flag (Input Capture/Compare Match Flag B)

The TCFB flag indicates the status for the input capture or compare match of GTCCRB.

[Setting conditions]

- GTCNT = GTCCRB, when the GTCCRB register functions as a compare match register
- GTCNT counter value is transferred to GTCCRB by the input capture signal when the GTCCRB register function as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFC flag (Compare Match Flag C)

The TCFC flag indicates the status for the compare match of GTCCRC.

[Setting condition]

- GTCNT = GTCCRC

[Clearing condition]

- 0 is written to this flag. [Not comparing condition]
- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (GTCCRC performs buffer operation).

TCFD flag (Compare Match Flag D)

The TCFD flag indicates the status for the compare match of GTCCRD.

[Setting condition]

- GTCNT = GTCCRD.

[Clearing condition]

- 0 is written to this flag. [Not comparing condition]
- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (GTCCRD performs buffer operation).

TCFE flag (Compare Match Flag E)

The TCFE flag indicates the status for the compare match of GTCCRE.

[Setting condition]

- GTCNT = GTCCRE.

[Clearing condition]

- 0 is written to this flag. [Not comparing condition]
- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (GTCCRE performs buffer operation).

TCFF flag (Compare Match Flag F)

The TCFF flag indicates the status for the compare match of GTCCRF.

[Setting condition]

- GTCNT = GTCCRF.

[Clearing condition]

- 0 is written to this flag. [Not comparing condition]
- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (GTCCRF performs buffer operation).

TCFPO flag (Overflow Flag)

The TCFPO flag indicates when an overflow or a crest has occurred.

[Setting conditions]

- In saw-wave mode, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred
- In triangle-wave mode, a crest (GTCNT changes from GTPR to GTPR-1) has occurred
- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

TCFPU flag (Underflow Flag)

The TCFPU flag indicates when an underflow or a trough has occurred.

[Setting conditions]

- In saw-wave mode, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred
- In triangle-wave mode, a crest (GTCNT changes from 0 to 1) has occurred
- In counting by hardware sources, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

ITCNT[2:0] bits (OVFn/UNFn Interrupt Skipping Count Counter)

When the OVFn/UNFn (n=0 to 7) interrupt skipping function is used (the GTITC.IVTC[1:0] bits are set to a value other than 00b), the counter in the ITCNT[2:0] bits increments by 1 every time the OVFn/UNFn interrupt source that is selected in GTITC.IVTC[1:0] is generated.

[Clearing conditions]

- The OVFn/UNFn interrupt skipping function is not used (GTITC.IVTT[2:0] is 000b when GTITC.IVTC[1:0] is 00b)
- The OVFn/UNFn interrupt skipping count matches the specified count (ITCNT[2:0] matches the skipping count specified in GTITC.IVTT[2:0]).

TUCF flag (Count Direction Flag)

The TUCF flag indicates the count direction of GTCNT. In event count operation, this flag is set to 1 in up-counting and is set to 0 in down-counting.

ADTRAUF flag (GTADTRA Compare Match (Counting Up) A/D Converter Start Request Flag)

The ADTRAUF flag indicates whether or not a compare match with the GTADTRA register has occurred during counting up.

[Setting condition]

- GTCNT = GTADTRA during counting up

[Clearing condition]

- 0 is written to this flag.

ADTRADF flag (GTADTRA Compare Match (Counting Down) A/D Converter Start Request Flag)

The ADTRADF flag indicates whether or not a compare match with the GTADTRA register has occurred during counting down.

[Setting condition]

- GTCNT = GTADTRA during counting down

[Clearing condition]

- 0 is written to this flag.

ADTRBUF flag (GTADTRB Compare Match (Counting Up) A/D Converter Start Request Flag)

The ADTRBUF flag indicates whether or not a compare match with the GTADTRB register has occurred during counting up.

[Setting condition]

- GTCNT = GTADTRB during counting up

[Clearing condition]

- 0 is written to this flag.

ADTRBDF flag (GTADTRB Compare Match (Counting Down) A/D Converter Start Request Flag)

The ADTRBDF flag indicates whether or not a compare match with the GTADTRB register has occurred during counting down.

[Setting condition]

- GTCNT = GTADTRB during counting down

[Clearing condition]

- 0 is written to this flag.

ODF flag (Output Disable Flag)

The ODF flag shows the request of the output disable source group that is selected by GRP[1:0] bits. When output is disabled, an output disable control is not released within the same cycle in which an output disable request is negated. It is released in the next cycle.

DTEF flag (Dead Time Error Flag)

The DTEF flag indicates that the timer output toggle point after the automatic addition of dead time has exceeded the timer cycle.

This flag returns to 0 when the timer output toggle point after the automatic addition of dead time is returned to the cycle. This flag is read only. Writing 0 to clear the flag is not allowed.

When an interrupt by the DTEF flag is enabled (GTINTAD.GRPDTE = 1), the DTEF flag is output to POEG as an output disable request each time the DTEF flag changes from 0 to 1.

[Setting condition]

- The timer output toggle point after the automatic addition of dead time has exceeded the timer cycle.
  For triangle wave in up-counting: $GTCCRA - GTDVU \leq 0$
  For triangle wave in down-counting: $GTCCRA - GTDVD < 0$
  For saw wave 1 shot pulse mode in up-counting:
    $GTCCRA - GTDVU < 0$ or $GTCCRA + GTDVD > GTPR$
  For saw wave 1 shot pulse mode in down-counting:
    $GTCCRA + GTDVU > GTPR$ or $GTCCRA - GTDVD < 0$

[Clearing condition]

- The timer output toggle point after the automatic addition of dead time is within the timer cycle.

OABHF flag (Same Time Output Level High Flag)

The OABHF flag indicates that GTIOCA pin and GTIOCB pin output 1 at the same time.

When GTIOCA pin or GTIOCB pin output 0, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is not allowed. When an interrupt by the OABHF flag is enabled (GTINTAD.GRPABH = 1), the OABHF flag is output to POEG as an output disable request.

[Setting condition]

- GTIOCA pin and GTIOCB pin output 1 at the same time when both the OAE and OBE bits are set to 1.

[Clearing conditions]

- GTIOCA pin output value is different from GTIOCB pin output value when both the OAE and OBE bits are set to 1
- GTIOCA pin and GTIOCB pin output 0 at the same time when both the OAE and OBE bits are set to 1
- Either OAE bit or OBE bit is set to 0.

OABLF flag (Same Time Output Level Low Flag)

The OABLF flag indicates that GTIOCA pin and GTIOCB pin output 0 at the same time.

When GTIOCA pin or GTIOCB pin output 1, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is not allowed. When an interrupt by the OABLF flag is enabled (GTINTAD.GRPABL = 1), the OABLF flag is output to POEG as an output disable request.

[Setting condition]

- GTIOCA pin and GTIOCB pin output 0 at the same time when both the OAE and OBE bits are set to 1.

[Clearing conditions]

- GTIOCA pin output value is different from GTIOCB pin output value when both the OAE and OBE bits are set to 1
- GTIOCA pin and GTIOCB pin output 1 at the same time when both the OAE and OBE bits are set to 1
- At least either OAE bit or OBE bit is set to 0.

The compare-target signals to generate the OABHF/OABLF flag are the compare match outputs (PWM outputs) signals before masked by the output disable function. When the output disable state is performed, a compare match also performs continuously in the GPT and the OABHF/OABLF flag is updated in association with the result of the compared values.

18.2.17 General PWM Timer Buffer Enable Register (GTBER)

b31	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.

GTBER provides settings for the buffer operation and must be set while the GTCNT operation stops.

BD[0] bit (GTCCR Buffer Operation Disable)

The BD[0] bit disables buffer operation using GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, and GTCCRF of the combined GPT.

When GTDTCR.TDE is 1 and when BD[0] is set to 0, GTCCRB does not perform buffer operation and the GTCCRB register is automatically set to a compare match value for a negative-phase waveform with dead time.

BD[1] bit (GTPR Buffer Operation Disable)

The BD[1] bit disables buffer operation using GTPR, GTPBR, and GTPDBR of the combined GPT.

BD[2] bit (GTADTR Buffer Operation Disable)

The BD[2] bit disables buffer operation using GTADTRA, GTADTRB, GTADTBRA, GTADTBRB, GTADTDBRA, and GTADTDBRB of the combined GPT. In event count operation, this bit is not available and the GTADTR buffer operation is not performed.

BD[3] bit (GTDV Buffer Operation Disable)

The BD[3] bit disables buffer operation using GTDVU, GTDVD, GTDBD, and GTDBU of the combined GPT.

When the GTDTCR.TDFER bit is set to 1 and when BD[3] is set to 0, buffer operation is not performed and the GTDVD value is set as a value of GTDVU automatically. In event count operation, this bit is not available and the GTDV buffer operation is not performed.

CCRA[1:0] bits (GTCCRA Buffer Operation)

The CCRA[1:0] bits set buffer operation using GTCCRA, GTCCRC, and GTCCRD of the combined GPT. When buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.*1

CCRB[1:0] bits (GTCCRB Buffer Operation)

The CCRB[1:0] bits set buffer operation using GTCCRB, GTCCRE, and GTCCRF of the combined GPT. When buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.* 1

PR[1:0] bits (GTPR Buffer Operation)

The PR[1:0] bits set buffer operation using GTPR, GTPBR, and GTPDBR of the combined GPT.

CCRSWT bit (GTCCRA and GTCCRB Forcible Buffer Operation)

Writing 1 to the CCRSWT bit forcibly performs a buffer transfer of GTCCRA and GTCCRB. This bit automatically returns to 0 after 1 is written. This bit is read as 0 and is only valid when counting is stopped with a specified compare match operation.

ADTTA[1:0] bits (GTADTRA Buffer Transfer Timing Select)

The ADTTA[1:0] bits set the transfer timing for buffer operation of GTADTRA, GTADTBRA, and GTADTDBRA. These bits are not available in event count operation.

ADTDA bit (GTADTRA Double Buffer Operation)

The ADTDA bit sets buffer operation with GTADTRA, GTADTBRA, and GTADTDBRA combined. This bit is not available in event count operation.

ADTTB[1:0] bits (GTADTRB Buffer Transfer Timing Select)

The ADTTB[1:0] bits set the transfer timing for buffer operation of GTADTRB, GTADTBRB, and GTADTDBRB. This bit is not available in event count operation.

ADTDB bit (GTADTRB Double Buffer Operation)

The ADTDB bit sets buffer operation using GTADTRB, GTADTBRB, and GTADTDBRB of the combined GPT. This bit is not available in event count operation.

Note 1. The buffer operation mode is fixed in saw-wave one-shot pulse mode, or triangle-wave PWM mode 3 (64-bit transfer at trough).

18.2.18 General PWM Timer Interrupt and A/D Converter Start Request Skipping Setting Register (GTITC)

Address(es): GPT32Em.GTITC H'1004_8044 + H'0100 × m (m = 0 to 7)

b31 to b15	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

GTITC sets the skipping function for the GTCNT counter overflow (GTPR compare match) interrupt (OVFn) and underflow interrupt (UNFn). It also specifies whether to link other interrupts and A/D converter start requests with the OVFn/UNFn interrupt skipping function. An output disable request to the POEG cannot be linked with the OVFn/UNFn interrupt skipping function. This bit is not available in event count operation.

ITLA bit (GTCCRA Compare Match/Input Capture Interrupt Link)

The ITLA bit specifies whether to link the GTCCRA compare match/input capture interrupt (GTCIA) with the OVFn/UNFn interrupt skipping function.

ITLB bit (GTCCRB Compare Match/Input Capture Interrupt Link)

The ITLB bit specifies whether to link the GTCCRB compare match/input capture interrupt (GTCIB) with the OVFn/UNFn interrupt skipping function.

ITLC bit (GTCCRC Compare Match Interrupt Link)

The ITLC bit specifies whether to link the GTCCRC compare match interrupt (GTCIC) with the OVFn/UNFn interrupt skipping function.

ITLD bit (GTCCRD Compare Match Interrupt Link)

The ITLD bit specifies whether to link the GTCCRD compare match interrupt (GTCID) with the OVFn/UNFn interrupt skipping function.

ITLE bit (GTCCRE Compare Match Interrupt Link)

The ITLE bit specifies whether to link the GTCCRE compare match interrupt (GTCIE) with the OVFn/UNFn interrupt skipping function.

ITLF bit (GTCCRF Compare Match Interrupt Link)

The ITLF bit specifies whether to link the GTCCRF compare match interrupt (GTCIF) with the OVFn/UNFn interrupt skipping function.

IVTC[1:0] bits (OVFn/UNFn Interrupt Skipping Function Select)

The IVTC[1:0] bits set the skipping function for the GTPR compare match (GTCNT overflow) interrupt (OVFn) and GTCNT counter underflow interrupt (UNFn).

IVTT[2:0] bits (OVFn/UNFn Interrupt Skipping Count Select)

The IVTT[2:0] bits set the skipping count for the GTPR compare match (GTCNT overflow) interrupt (OVFn) and GTCNT counter underflow interrupt (UNFn). When modifying the IVTT[2:0] bits, first set the IVTC[1:0] bits to 00b.

ADTAL bit (GTADTRA A/D Converter Start Request Link)

The ADTAL bit specifies whether to link the GTADTRA A/D converter start request with OVFn/UNFn interrupt skipping function.

ADTBL bit (GTADTRB A/D Converter Start Request Link)

The ADTBL bit specifies whether to link the GTADTRB A/D converter start request with OVFn/UNFn interrupt skipping function.

18.2.19 General PWM Timer Counter (GTCNT)

GTCCRn registers are read/write registers.

GTCCRA and GTCCRB are registers used for both output compare and input capture.

GTCCRC and GTCCRE are compare match registers that can also function as buffer registers for GTCCRA and GTCCRB.

GTCCRD and GTCCRF are compare match registers that can also function as buffer registers for GTCCRC and GTCCRE (double-buffer registers for GTCCRA and GTCCRB).

18.2.21 General PWM Timer Cycle Setting Register (GTPR)

Address(es): GPT32Em.GTPR H'1004_8064 + H'0100 × m (m = 0 to 7)

Bit	Bit Name	Initial Value	R/W	Description
b0	TDE	0	R/W	Negative-Phase Waveform Setting 0: Set GTCCRB without using GTDVU and GTDVD. 1: Use GTDVU and GTDVD to set the compare match value for negative-phase waveform with automatic dead time in GTCCRB.
b3 to b1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b4	TDBUE	0	R/W	GTDVU Buffer Operation Enable 0: Disable GTDVU buffer operation 1: Enable GTDVU buffer operation.
b5	TDBDE	0	R/W	GTDVD Buffer Operation Enable 0: Disable GTDVD buffer operation 1: Enable GTDVD buffer operation.
b7, b6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b8	TDFER	0	R/W	GTDVD Setting 0: Set GTDVU and GTDVD separately 1: Automatically set the value written to GTDVU to GTDVD.
b31 to b9	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

GTDTCR enables automatic setting of a compare match value for negative-phase waveform with dead time.

TDE bit (Negative-Phase Waveform Setting)

The TDE bit specifies whether to use GTDVU and GTDVD. When GTDVU and GTDVD are used, the compare match value for a negative-phase waveform with dead time obtained by the compare match value of a positive-phase waveform (GTCCRA) and the dead time value (GTDVU and GTDVD), is automatically set in GTCCRB.

The TDE bit setting is ignored in saw-wave PWM mode, and automatic setting does not take place.

The GTCCRB value is automatically set and has the following upper and lower limit values. If the obtained GTCCRB value is not within the upper or lower limit, the following limit value is set in GTCCRB and the GTST.DTEF flag is set to 1. However, in triangle waves, when the obtained GTCCRB value exceeds the upper limit value, the GTST.DTEF flag is set to 0.

- Triangle waves
  Upper limit value: GTPR – 1
  Lower limit value: 1 in up-counting, 0 in down-counting
- Saw-wave one-shot pulse mode
  Upper limit value: GTPR
  Lower limit value: 0

TDBUE bit (GTDVU Buffer Operation Enable)

The TDBUE bit enables buffer operation with GTDVU and GTDBU combined. The buffer transfer timing is the trough for triangle waves, and an overflow or underflow for saw waves.

TDBDE bit (GTDVD Buffer Operation Enable)

The TDBDE bit enables buffer operation with GTDVD and GTDBD combined. The buffer transfer timing is the trough for triangle waves, and an overflow or underflow for saw waves. When this bit and the TDFER bit are set to 1 simultaneously, the TDFER bit setting is given priority.

TDFER bit (GTDVD Setting)

The TDFER bits sets whether or not the value written to GTDVU is also set to GTDVD automatically.

18.2.28 General PWM Timer Dead Time Value Register n (GTDVn) (n = U, D)

Address(es): GPT32Em.GTDVU H'1004_808C + H'0100 x m (m = 0 to 7)
GPT32Em.GTDVD H'1004_8090 + H'0100 x m (m = 0 to 7)

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

GTDVn is a 32-bit read/write register that sets the dead time for generating PWM waveforms with dead time. GTDVU is used for up-counting and GTDVD is used for down-counting.

It is prohibited to set the GTDVn register with a value larger than or equal to that of the GTPR register.

Do not set the change point of waveform beyond the count cycle period, when the automatic dead time setting function is used. By reading the GTCCRB register, can be seen the change point for the reverse-phase waveform after the dead time added, which is set in the automatic dead time setting function.

When GTDVn is used, writing to GTCCRB is not allowed. When this register is set to 0, waveforms without dead time are output. GTDVn must be accessed in 32-bit units. Access in 8-bit/16-bit units is prohibited.

When GTDVn buffer operation is enabled, GTDBn can be written anytime. The value of GTDBn is transferred to GTDVn at the end of the count cycle period. When the GTDVn buffer operation is disabled, set the CST bit in the GTCR register to stop the GPT with before changing GTDVn to a new value. When GTDVn buffer operation is disabled, to change GTDVn to a new value, stop the GPT with the CST bit in the GTCR register.

18.2.29 General PWM Timer Dead Time Buffer Register n (GTDBn) (n = U, D)

Address(es): GPT32Em.GTDBU H'1004_8094 + H'0100 × m (m = 0 to 7)
GPT32Em.GTDBD H'1004_8098 + H'0100 × m (m = 0 to 7)

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOS[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	SOS[1:0]	All 0	R	Output Protection Function Status b1 b0 0 0: Normal operation 0 1: Protected state (set GTCCRA = 0 during transfer at trough or crest) 1 0: Protected state (set GTCCRA ≥ GTPR during transfer at trough) 1 1: Protected state (set GTCCRA ≥ GTPR during transfer at crest).
b7 to b2	—	All 0	R	Reserved These bits are read as 0.
b9, b8	—	All 0	R	Reserved The read value is undefined.
b31 to b10	—	All 0	R	Reserved These bits are read as 0.

GTSOS is a status register that indicates the status of the output protection function. The output protection function is enabled only when the dead time is automatically set (GTDTCR.TDE bit = 1) in triangle-wave mode.

SOS[1:0] bits (Output Protection Function Status)

The SOS[1:0] bits indicate the status of the output protection function in triangle-wave PWM mode.

18.2.31 General PWM Timer Output Protection Function Temporary Release Register (GTSOTR)

Address(es): GPT32Em.GTSOTR H’1004_80A0 + H’0100 x m (m = 0 to 7)

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOTR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	SOTR	0	R/W	Output Protection Function Temporary Release 0: Do not release protected state 1: Release protected state.
b31 to b1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

GTSOTR temporarily releases the protected state of GTIOCB pin output when output protection is set. The protected state can be released only when GTSOS.SOS[1:0] bits = 10b (protected state in which GTCCRA ≥ GTPR has occurred during transfer at trough). The protected state cannot be released in any other case.

SOTR bit (Output Protection Function Temporary Release)

The SOTR bit specifies whether to temporarily release the protected state of the GTIOCB pin output in an output protected state. When the SOTR bit is set to 1, the output protection function is canceled from the first trough. When the SOTR bit is set to 0, output protection resumes from the first trough.

18.3 Operation

18.3.1 Basic Operation

Each channel has a 32-bit timer that performs a periodic count operation using the count clock and hardware sources. The count function provides both up-counting and down-counting. The GTPR controls the count cycle. When the GTCNT counter value matches the value in GTCCRA or GTCCRB, the output from the associated pin GTIOCA or GTIOCB can be changed. GTCCRA or GTCCRB can be used as an input capture register with hardware resources. GTCCRC and GTCCRD can function as buffer registers for GTCCRA. GTCCRE and GTCCRF can function as buffer registers for GTCCRB.

18.3.1.1 Counter Operation

(1) Counter start and stop

The counter of each channel starts the count operation by setting GTCR.CST to 1. The GTCR.CST bit value is changed by following sources.

- Writing to GTCR register
- Writing 1 to the bit in GTSTR associated with the GPT channel number when the GTSSR.CSTRT bit set to 1
- Writing 1 to the bit in GTSTP associated with the GPT channel number when the GTPSR.CSTOP bit set to 1
- The hardware source selected in the GTSSR register
- The hardware source selected in the GTPSR register.

(2) Periodic count operation in up-counting by count clock

The GTCNT counter in each channel starts up-counting when the associated GTCR.CST bit is set to 1 with GTUPSR and GTDNSR registers set to H’00000000. When the GTCNT value changes from the GTPR value to 0 (overflow), the GTST.TCFPO flag is set to 1. When GTCNT overflows, up-counting resumes from H’00000000.

Figure 18.2 shows an example of a periodic count operation in up-counting.

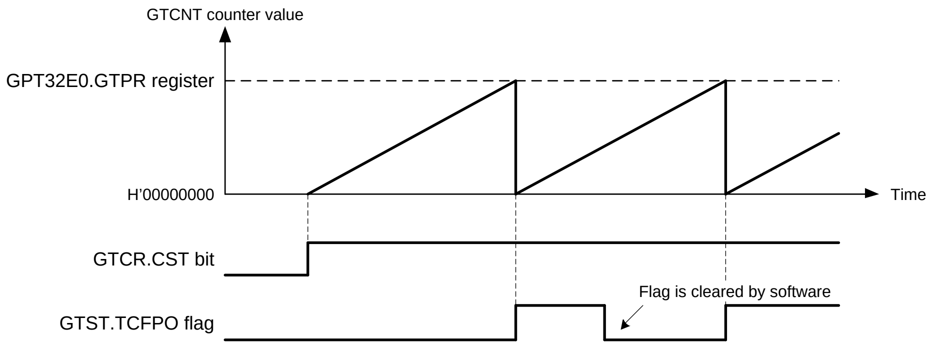

Figure 18.2 Example of periodic count operation in up-counting by the count clock

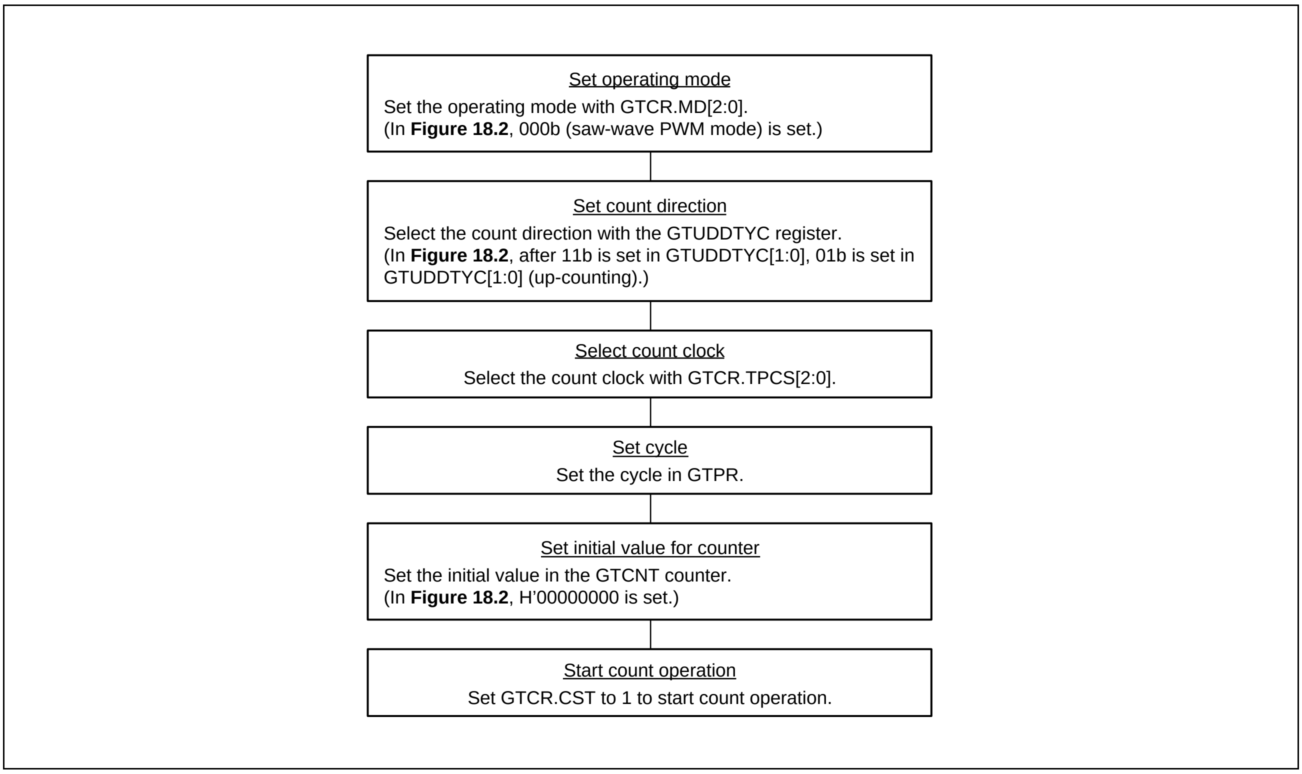
Figure 18.3 shows an example setting for periodic count operation in up-counting.



Set operating mode
Set the operating mode with GTCR.MD[2:0].
(In **Figure 18.2**, 000b (saw-wave PWM mode) is set.)

Set count direction
Select the count direction with the GTUDDTYC register.
(In **Figure 18.2**, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).)

Select count clock
Select the count clock with GTCR.TPCS[2:0].

Set cycle
Set the cycle in GTPR.

Set initial value for counter
Set the initial value in the GTCNT counter.
(In **Figure 18.2**, H'00000000 is set.)

Start count operation
Set GTCR.CST to 1 to start count operation.

Figure 18.3 Example setting for a periodic count operation in up-counting by the count clock

(3) Periodic count operation in down-counting by count clock

The GTCNT counter in each channel can perform down-counting by setting GTUDDTYC.UD with GTUPSR and GTDNSR registers set to H’00000000. When GTCNT changes from 0 to the GTPR value (underflow), GTST.TCFPU is set to 1. When the GTCNT counter underflows, down-counting resumes from the GTPR value.

Figure 18.4 shows an example of periodic count operation in down-counting by the count clock.

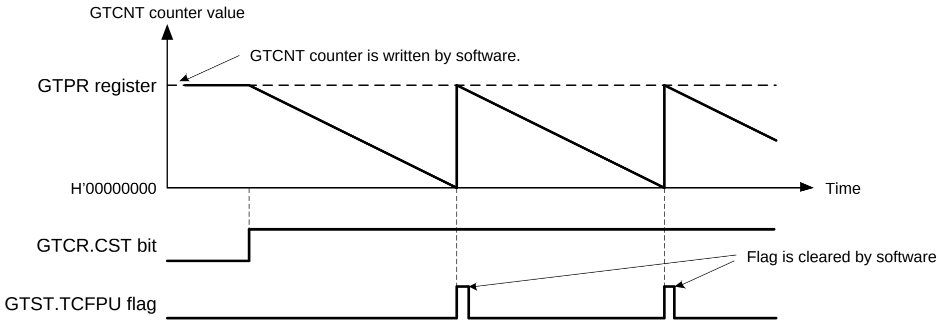


Figure 18.4 Example of periodic count operation in down-counting by the count clock

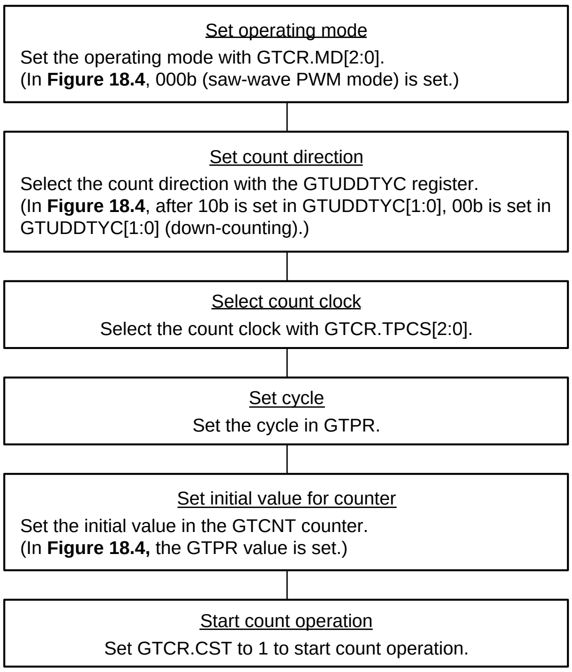
Figure 18.5 shows an example setting for periodic count operation in down-counting by the count clock.



Set operating mode
Set the operating mode with GTCR.MD[2:0].
(In **Figure 18.4**, 000b (saw-wave PWM mode) is set.)

Set count direction
Select the count direction with the GTUDDTYC register.
(In **Figure 18.4**, after 10b is set in GTUDDTYC[1:0], 00b is set in GTUDDTYC[1:0] (down-counting).)

Select count clock
Select the count clock with GTCR.TPCS[2:0].

Set cycle
Set the cycle in GTPR.

Set initial value for counter
Set the initial value in the GTCNT counter.
(In **Figure 18.4,** the GTPR value is set.)

Start count operation
Set GTCR.CST to 1 to start count operation.

Figure 18.5 Example setting for periodic count operation in down-counting by count clock

(4) Event count operation in up-counting using hardware sources

The GTCNT counter in each channel can perform up-counting using hardware sources as set in GTUPSR.

When GTUPSR is set to enable, the count clock selected in GTCR.TPCS[2:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The overflow behavior for up-counting using hardware sources is the same as for up-counting by the count clock.

When GTCR.CST bit is set to 1 to count up using hardware sources, the count operation is enabled. After GTCR.CST is set to 1, the counter cannot count up for 1 clock cycle as specified in GTCR.TPCS[2:0] because the count operation is synchronized by the count clock selected by GTCR.TPCS[2:0]. Set the GTCR.TPCS[2:0] bits to 000b to select counting up of single cycles of the P0ϕ clock with a delay of one clock cycle after the GTCR.CST bit has been set to 1.

Figure 18.6 shows an example of a periodic count operation in up-counting by a hardware resource (rising edge of GTETRGA pin).

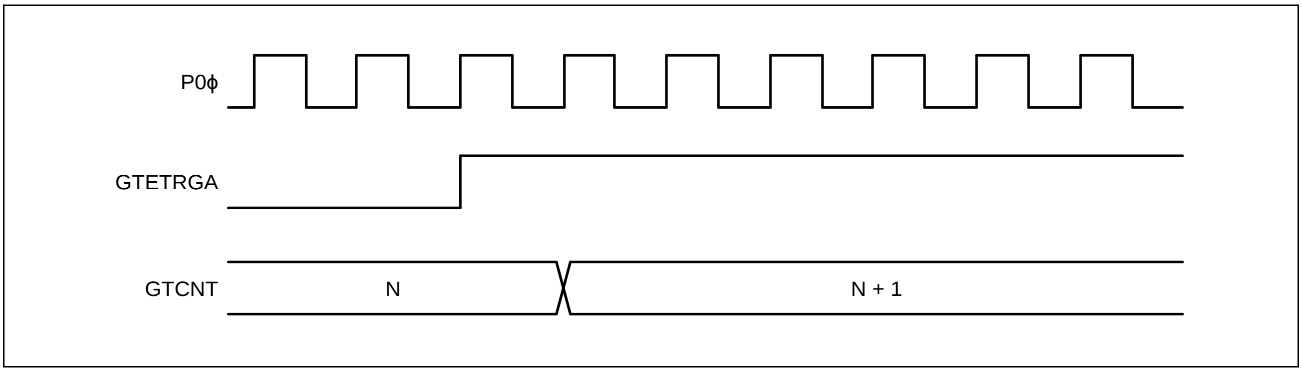


Figure 18.6 Example of periodic count operation in up-counting using hardware sources

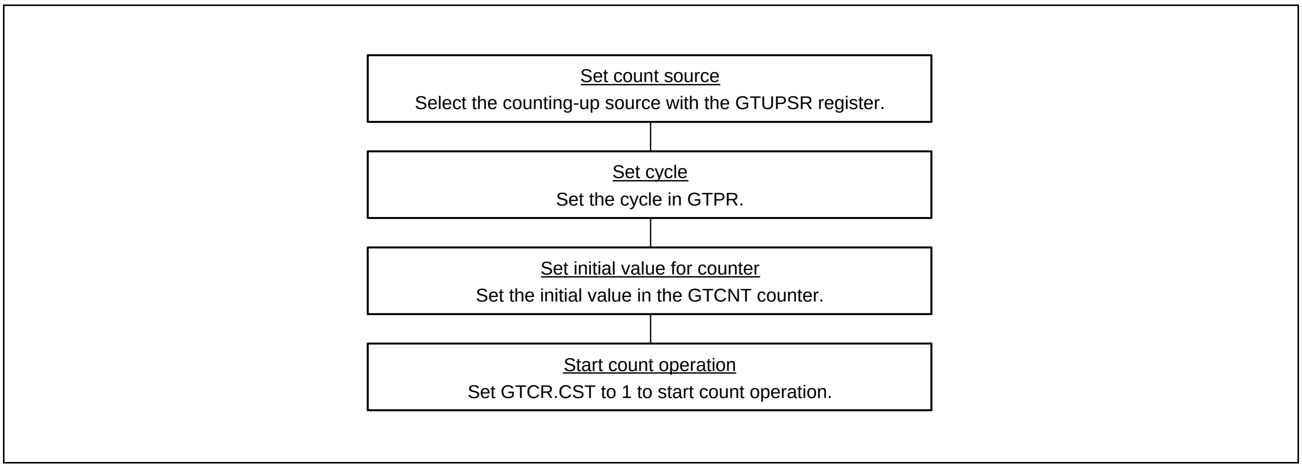
Figure 18.7 shows an example setting for periodic count operation in up-counting by the count clock.



Set count source
Select the counting-up source with the GTUPSR register.

Set cycle
Set the cycle in GTPR.

Set initial value for counter
Set the initial value in the GTCNT counter.

Start count operation
Set GTCR.CST to 1 to start count operation.

Figure 18.7 Example setting for an event count operation in up-counting using hardware sources

(5) Event count operation in down-counting using hardware sources

The GTCNT counter in each channel can perform down-counting using hardware sources set in the GTDNSR. When GTDNSR is set to enable, the count clock selected in GTCR.TPCS[2:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time,

GTCNT counter value does not change. The underflow behavior for down-counting using hardware sources is the same as for down-counting by the count clock.

When GTCR.CST bit is set to 1 to count down using hardware sources, the count operation is enabled. After GTCR.CST is set to 1, the counter cannot count down for 1 clock cycle as specified in GTCR.TPCS[2:0] because the count operation is synchronized with the count clock selected by GTCR.TPCS[2:0]. Set the GTCR.TPCS[2:0] bits to 000b to select counting up of single cycles of the P0ϕ clock with a delay of one clock cycle after the GTCR.CST bit has been set to 1.

Figure 18.8 shows an example of a periodic count operation in down-counting by a hardware resource (rising edge of GTETRGA pin).

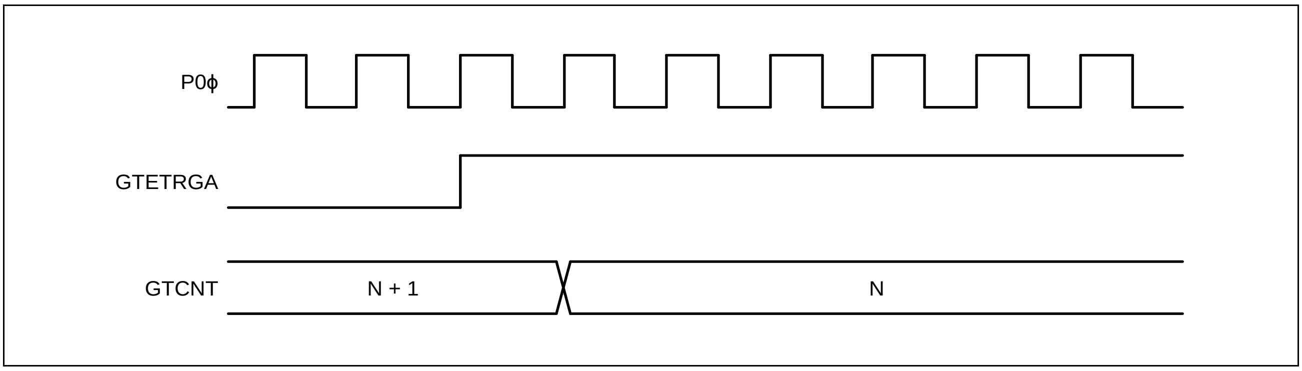


Figure 18.8 Example of event count operation in down-counting using hardware sources

Figure 18.9 shows an example setting for a periodic count operation in down-counting using a hardware resource.

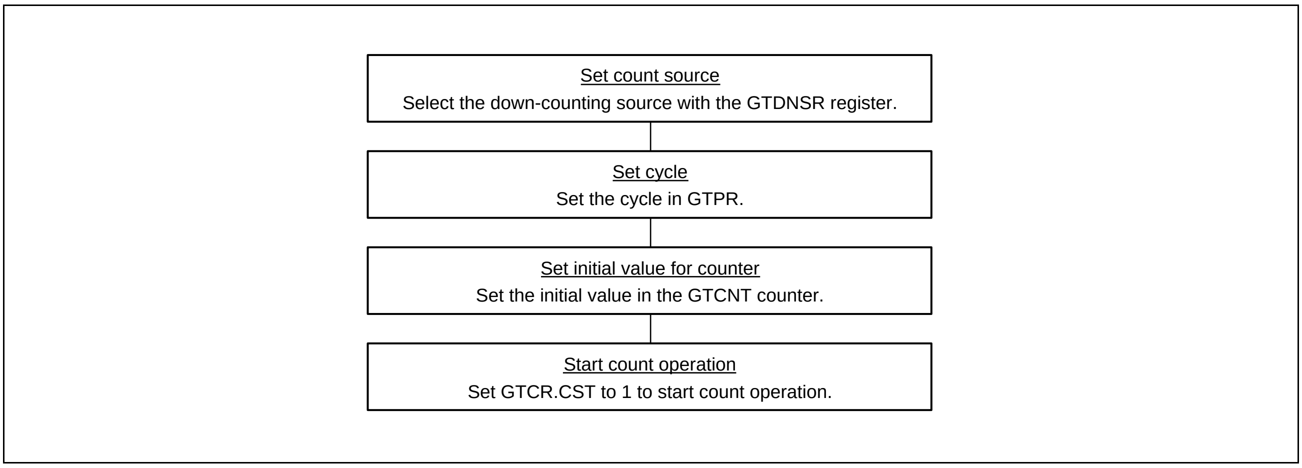

Figure 18.9 Example setting for an event count operation in down-counting using hardware sources

(6) Counter clear operation

The counter of each channel is cleared by either of the following sources.

- Writing 0 to GTCNT register
- Writing 1 to the bit in GTCLR associated with the GPT channel number when the GTCSR.CCLR bit set to 1
- The hardware source selected in GTCSR register.

Writing to the GTCNT register is prohibited during count operation. The GTCNT counter can be cleared both by writing 1 to the GTCLR and by the clear request of hardware sources, whether GTCNT is counting (GTCR.CST = 1) or not (GTCR.CST = 0).

For saw waves selected by setting GTCR.MD[2:0] and the count direction flag showing down-counting (GTST.TUCF = 0), the GTCNT register is set to the value of the GTPR register when the counter is cleared by writing 1 to the GTCLR register or by the hardware source specified in the GTCSR register. When not in saw waves mode and down-counting, the GTCNT register is set to 0 when writing 1 to the GTCLR register and when clearing by hardware sources are performed.

In event count operation when at least 1 bit in GTUPSR or GTDNSR is set to 1, after clear sources occur, both writing to GTCLR register and clearing by hardware sources are performed immediately to synchronize with P0ϕ. If other settings are used, clear is synchronized with the counter clock selected by GTCR.TPCS[2:0].

18.3.1.2 Waveform Output by Compare Match

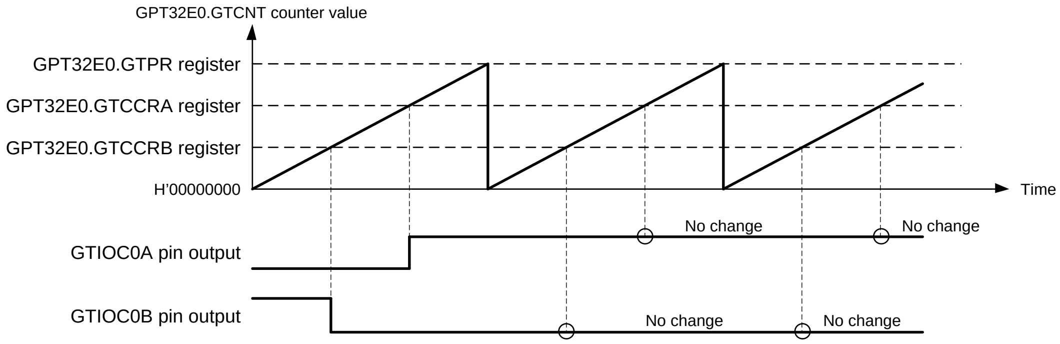
Compare match means that the GTCNT counter value matches the value of GTCCRA or GTCCRB. When a compare match occurs, the compare match flag is generated synchronously with the count clock including the event count. At the same time the GPT can output low, high, or toggle output from the associated GTIOCA or GTIOCB output pin. In addition, the GTIOCA or GTIOCB pin output can be low, high, or toggle at the cycle end which is determined by GTPR. The cycle end is:

- For saw waves in up-counting – when GTCNT changes from the GTPR value to 0 (overflow)
- For saw waves in down-counting – when GTCNT changes from 0 to GTPR value (underflow)
- For saw waves – when the GTCNT counter is cleared
- For triangle waves – when the GTCNT changes from 0 to 1 (trough).

(1) Low and high output

Figure 18.10 shows an example of low and high output operation by a compare match of GTCCRA and GTCCRB.

In this example, the GPT32E0.GTCNT counter performs up-counting, and settings are made so that high is output from the GTIOC0A pin by a GPT32E0.GTCCRA compare match, and low is output from the GTOC0B pin by a GPT32E0.GTCCRB compare match. The pin level does not change when the specified level and pin level match.



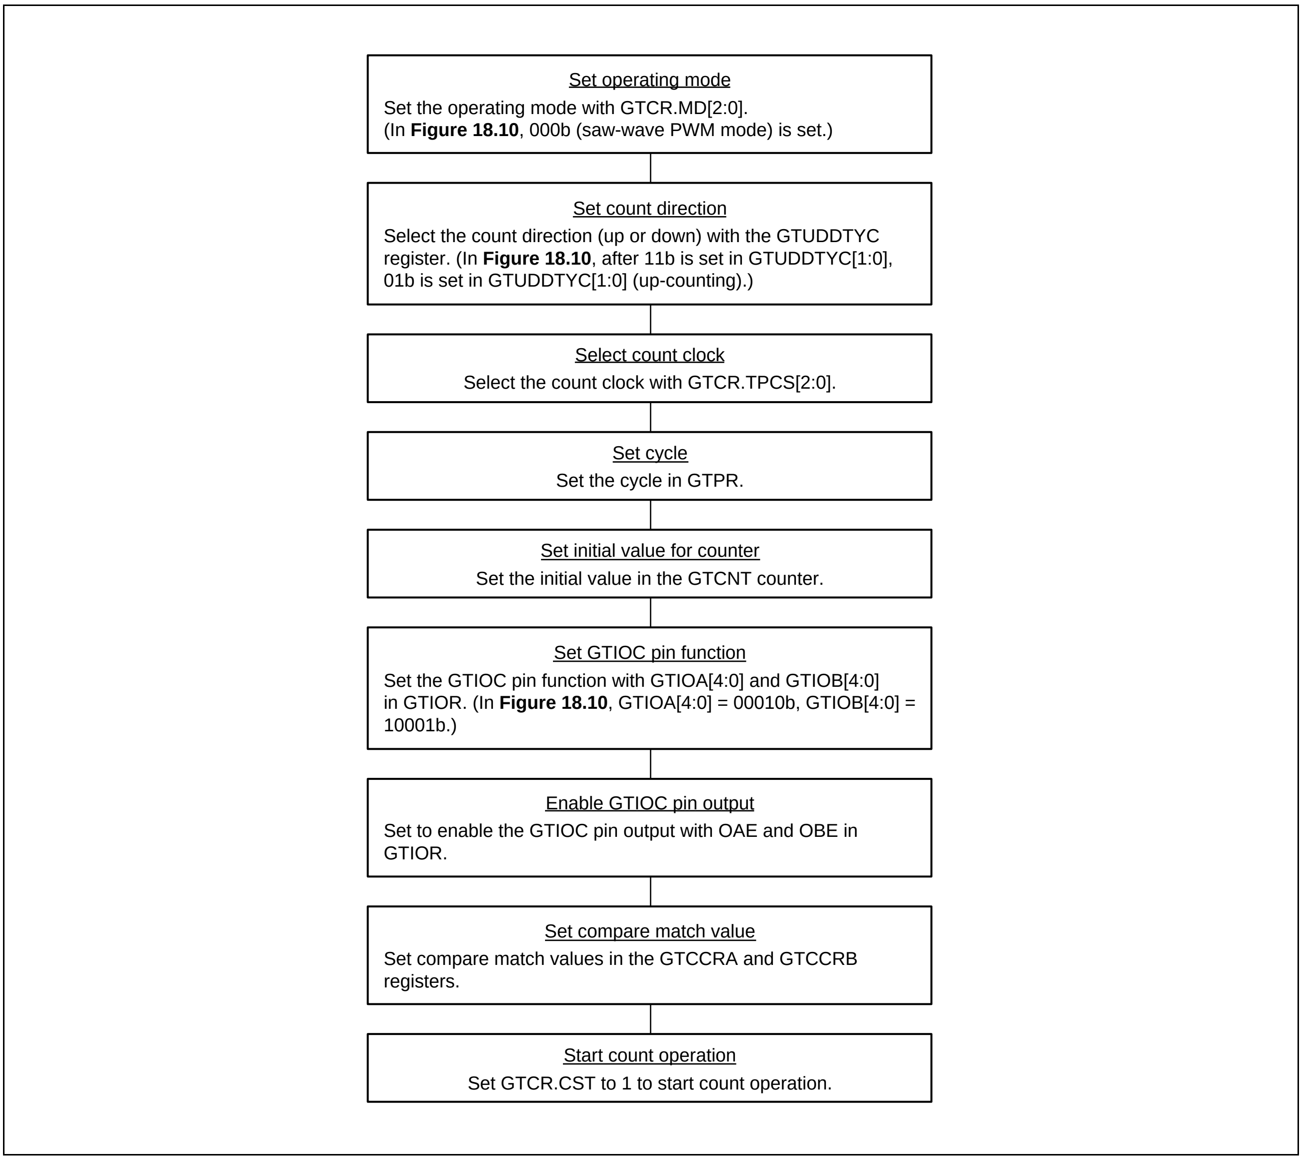
[Setting examples]

GPT32E0.GTIOR.GTIOA[4:0] bits: Initial output is low, high output at compare match, output retained at cycle end

GPT32E0.GTIOR.GTIOB[4:0] bits: Initial output is high, low output at compare match, output retained at cycle end

Figure 18.10 Example of low and high output operation

Figure 18.11 shows an example setting for low output and high output operation.



Set operating mode

Set the operating mode with GTCR.MD[2:0].
(In **Figure 18.10**, 000b (saw-wave PWM mode) is set.)

Set count direction

Select the count direction (up or down) with the GTUDDTYC register. (In **Figure 18.10**, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).)

Select count clock

Select the count clock with GTCR.TPCS[2:0].

Set cycle

Set the cycle in GTPR.

Set initial value for counter

Set the initial value in the GTCNT counter.

Set GTIOC pin function

Set the GTIOC pin function with GTIOA[4:0] and GTIOB[4:0] in GTIOR. (In **Figure 18.10**, GTIOA[4:0] = 00010b, GTIOB[4:0] = 10001b.)

Enable GTIOC pin output

Set to enable the GTIOC pin output with OAE and OBE in GTIOR.

Set compare match value

Set compare match values in the GTCCRA and GTCCRB registers.

Start count operation

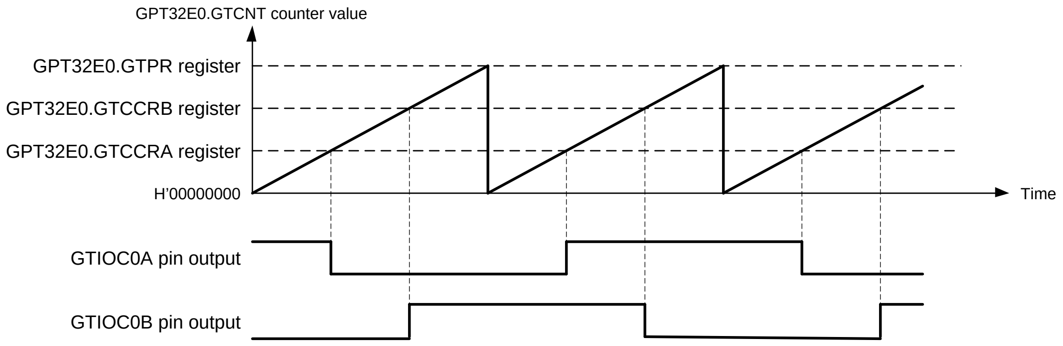
Set GTCR.CST to 1 to start count operation.

Figure 18.11 Example setting for low output and high output operation

(2) Toggled output

Figure 18.12 and **Figure 18.13** show examples of toggled output operation by compare matches of GTCCRA and GTCCRB. In **Figure 18.12**, the GPT32E0.GTCNT counter performs up-counting, and settings are made so that the GTIOC0A pin output by a GPT32E0.GTCCRA compare match and GTIOC0B pin output by a GPT32E0.GTCCRB compare match are toggled.

Figure 18.13, the GPT32E0.GTCNT counter performs up-counting, and settings are made so that the GTIOC0A output is toggled by a compare match of GPT32E0.GTCCRA and the GTIOC0B output is toggled at the cycle end.

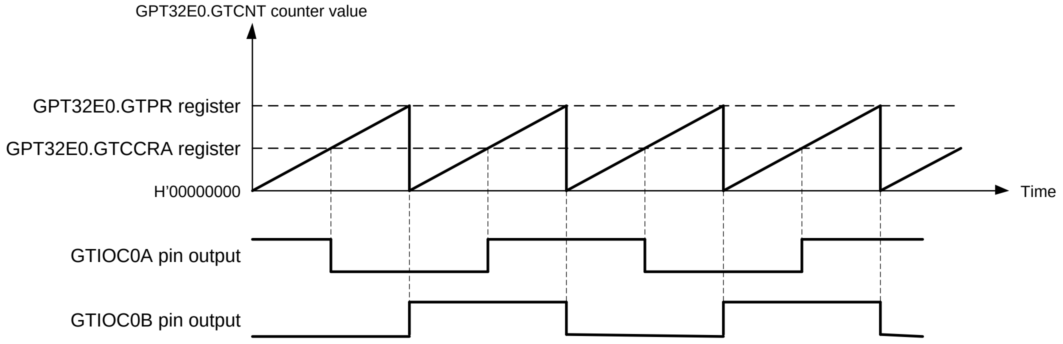


[Setting examples]

GPT32E0.GTIOR.GTIOA[4:0] bits: Initial output is high, output toggled at compare match, output retained at cycle end

GPT32E0.GTIOR.GTIOB[4:0] bits: Initial output is low, output toggled at compare match, output retained at cycle end

Figure 18.12 Example of toggled output operation (1)



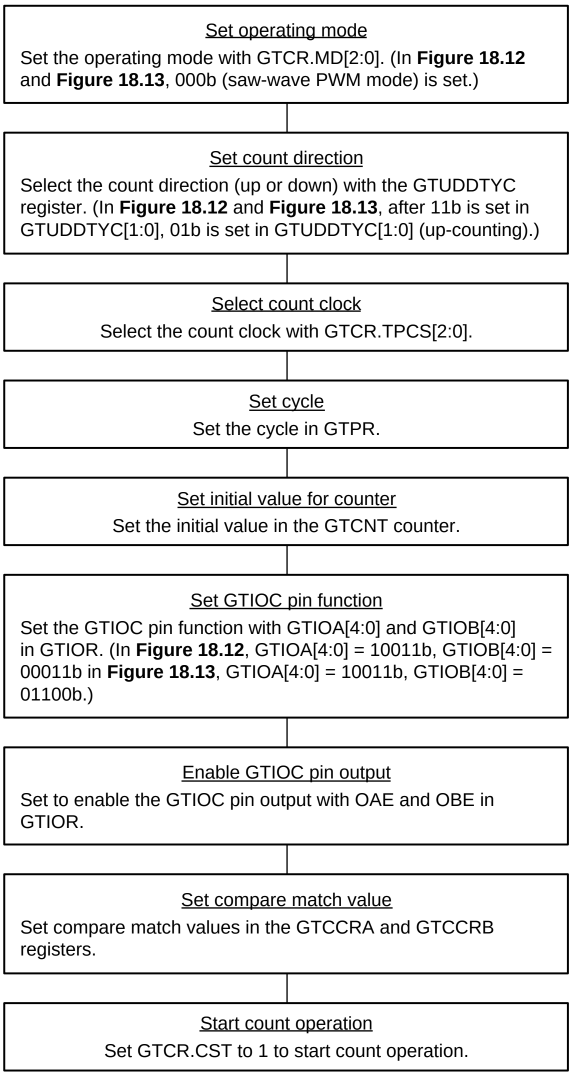
[Setting examples]

GPT32E0.GTIOR.GTIOA[4:0] bits: Initial output is high, output toggled at compare match, output retained at cycle end

GPT32E0.GTIOR.GTIOB[4:0] bits: Initial output is low, output retained at compare match, output toggled at cycle end

Figure 18.13 Example of toggled output operation (2)

Figure 18.14 shows an example setting for toggled output operation.



Set operating mode

Set the operating mode with GTCR.MD[2:0]. (In **Figure 18.12** and **Figure 18.13**, 000b (saw-wave PWM mode) is set.)

Set count direction

Select the count direction (up or down) with the GTUDDTYC register. (In **Figure 18.12** and **Figure 18.13**, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).)

Select count clock

Select the count clock with GTCR.TPCS[2:0].

Set cycle

Set the cycle in GTPR.

Set initial value for counter

Set the initial value in the GTCNT counter.

Set GTIOC pin function

Set the GTIOC pin function with GTIOA[4:0] and GTIOB[4:0] in GTIOR. (In **Figure 18.12**, GTIOA[4:0] = 10011b, GTIOB[4:0] = 00011b in **Figure 18.13**, GTIOA[4:0] = 10011b, GTIOB[4:0] = 01100b.)

Enable GTIOC pin output

Set to enable the GTIOC pin output with OAE and OBE in GTIOR.

Set compare match value

Set compare match values in the GTCCRA and GTCCRB registers.

Start count operation

Set GTCR.CST to 1 to start count operation.

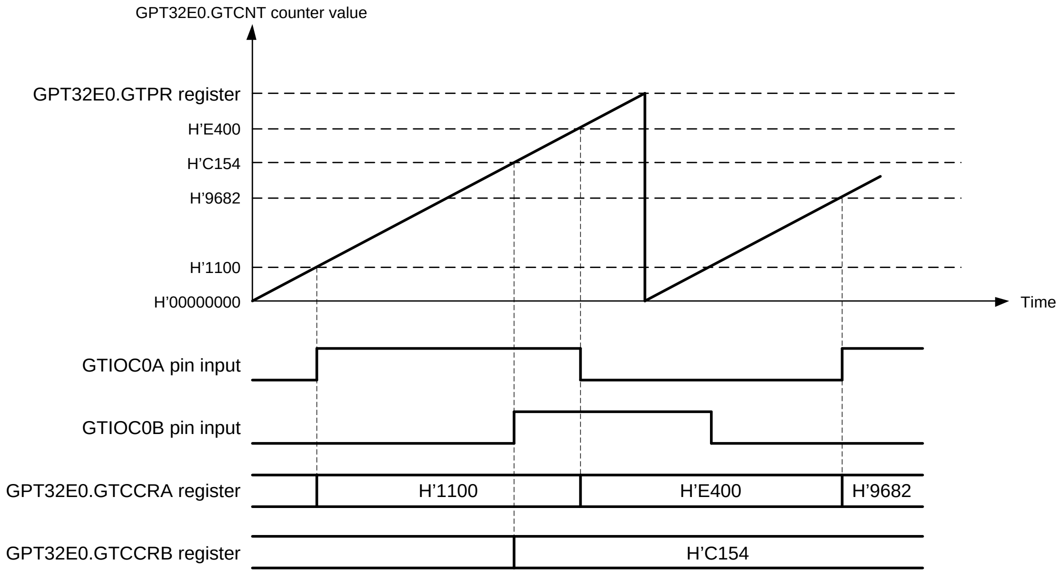
Figure 18.14 Example setting for toggled output operation

18.3.1.3 Input Capture Function

The GTCNT counter value can be transferred to either GTCCRA or GTCCRB on detection of the hardware source that is set in GTICASR and GTICBSR.

Figure 18.15 shows an example of the input capture function.

In this example, the GPT32E0.GTCNT counter performs up-counting by the count clock, and settings are made so that an input capture is performed to GTICCRA at both edges of the GTIOC0A input pin and to GTICCRB on the rising edge of the GTIOC0B input pin.



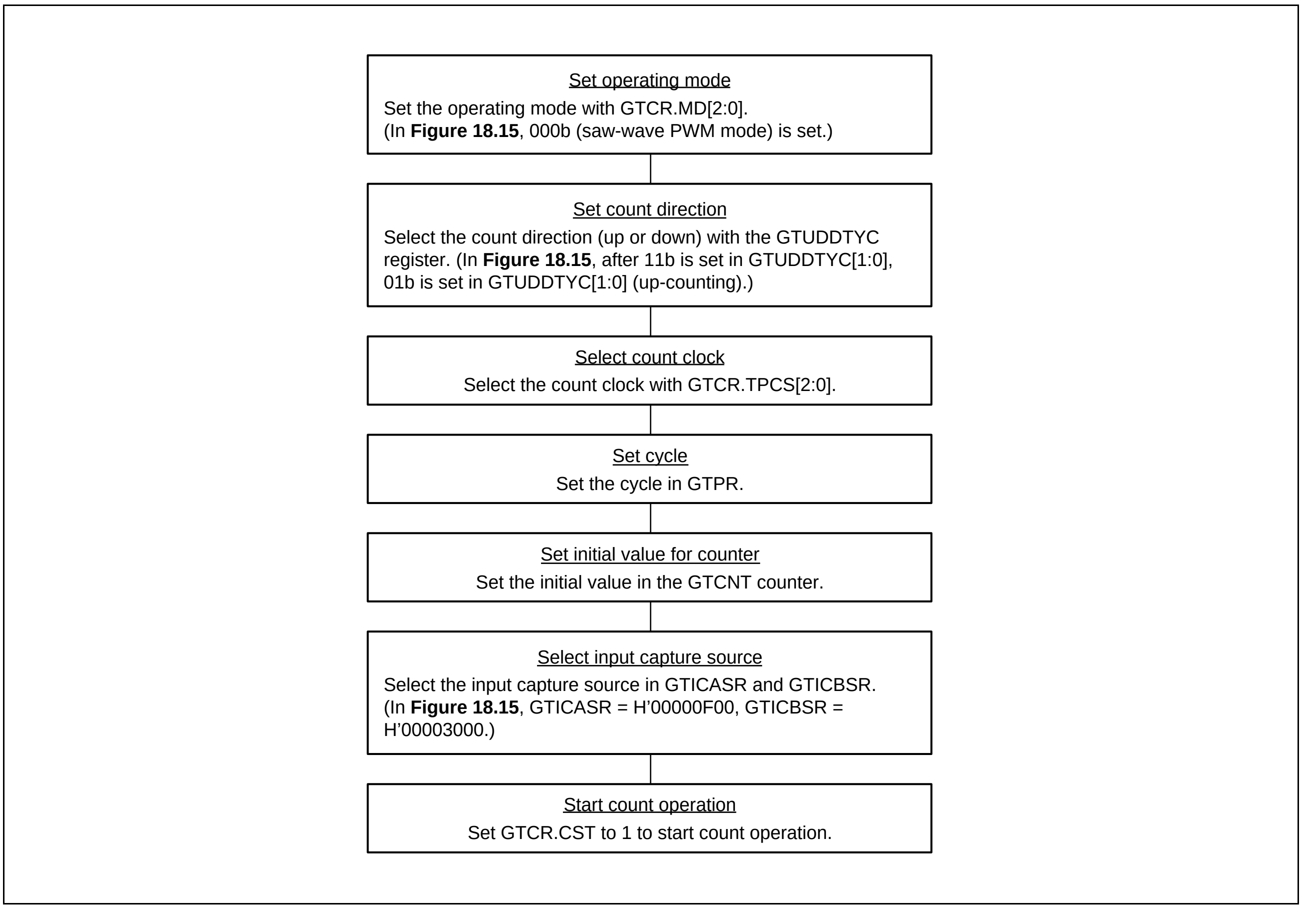
[Setting examples]

GTICASR setting input capture at both edges

GTICBSR setting input capture at the rising edge

Figure 18.15 Example of input capture operation

Figure 18.16 shows an example setting for an input capture operation with count operation by the count clock.



Set operating mode
Set the operating mode with GTCR.MD[2:0].
(In **Figure 18.15**, 000b (saw-wave PWM mode) is set.)

Set count direction
Select the count direction (up or down) with the GTUDDTYC register. (In **Figure 18.15**, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).)

Select count clock
Select the count clock with GTCR.TPCS[2:0].

Set cycle
Set the cycle in GTPR.

Set initial value for counter
Set the initial value in the GTCNT counter.

Select input capture source
Select the input capture source in GTICASR and GTICBSR.
(In **Figure 18.15**, GTICASR = H'00000F00, GTICBSR = H'00003000.)

Start count operation
Set GTCR.CST to 1 to start count operation.

Figure 18.16 Example setting for input capture operation

18.3.2 Buffer Operation

The following buffer operations can be set with GTBER:

- GTPR, GTPBR, and GTPDBR
- GTCCRA, GTCCRC, and GTCCRD
- GTCCRB, GTCCRE, and GTCCRF
- GTADTRA, GTADTBRA, and GTADTDBRA
- GTADTRB, GTADTBRB, and GTADTDBRB.

The following buffer operations can be set with GTDTCR:

- GTDVU and GTDBU
- GTDVD and GTDBD.

18.3.2.1 GTPR Register Buffer Operation

GTPBR can function as a buffer register for GTPR, and GTPDBR can function as a buffer register for GTPBR (double-buffer register for GTPR). The buffer transfer is performed at an overflow during up-counting or an underflow during down-counting in saw-wave mode or in event count, and at a trough in triangle-wave mode.

In saw-wave mode or in event count, the buffer transfer is performed when the following counter clear operations occur during counting:

- Clear by hardware sources (the clear source is selected in GTCSR[23:0])
- Clear by software (when GTCSR.CCLR bit is 1 and GTCLR[n] bit is set to 1, n = channel number).

To set GTPR to function as double buffer, set GTBER.PR[1:0] to 10b or 11b. To set GTPR to not function as a buffer, set GTBER.PR[1:0] to 00b.

Figure 18.17 to **Figure 18.19** show examples of GTPR buffer operation and **Figure 18.20** shows an example setting for GTPR buffer operation.

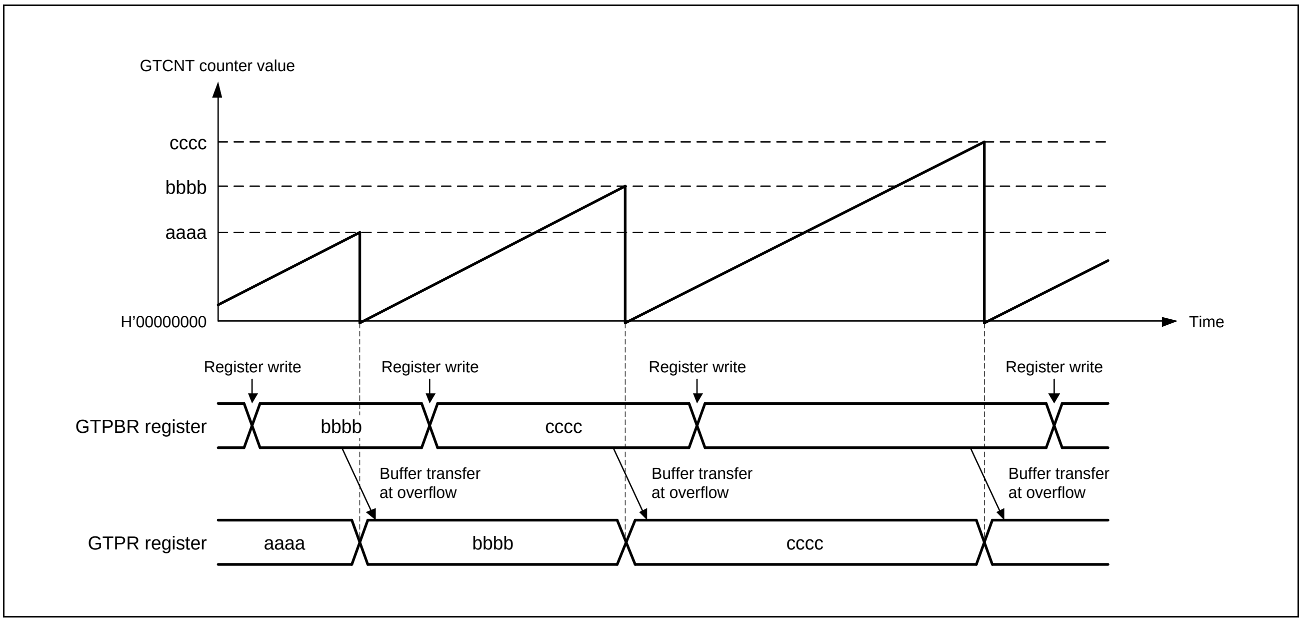


Figure 18.17 Example of GTPR buffer operation with saw waves in up-counting

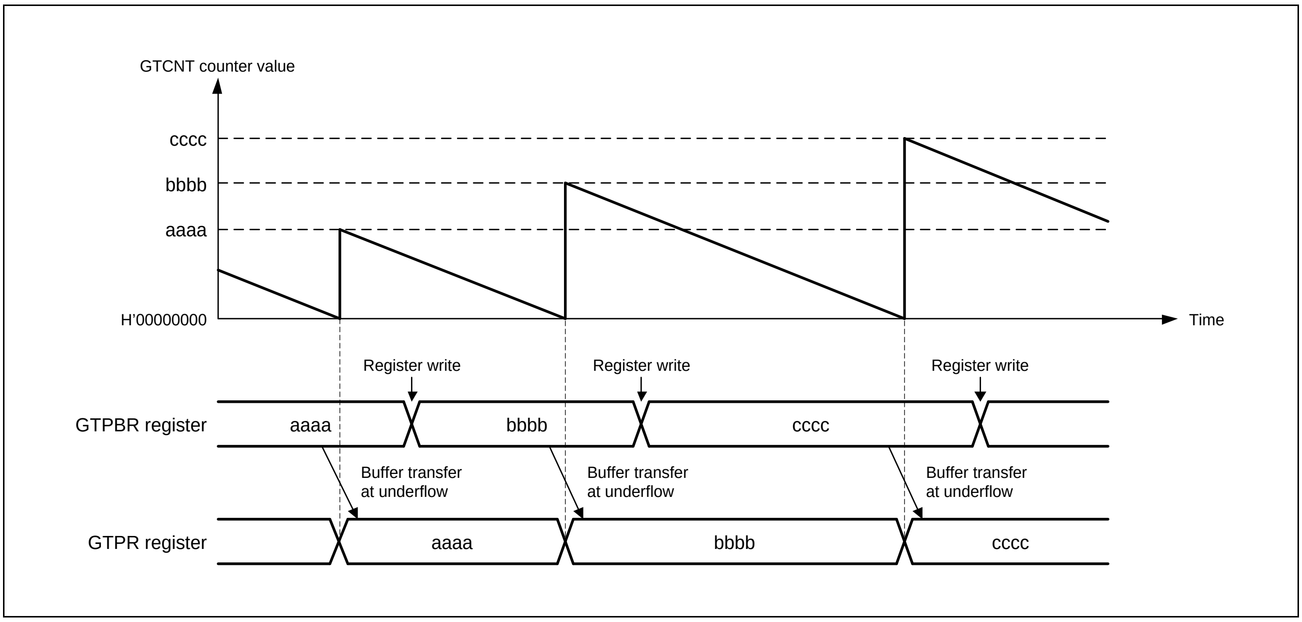

Figure 18.18 Example of GTPR buffer operation with saw waves in down-counting

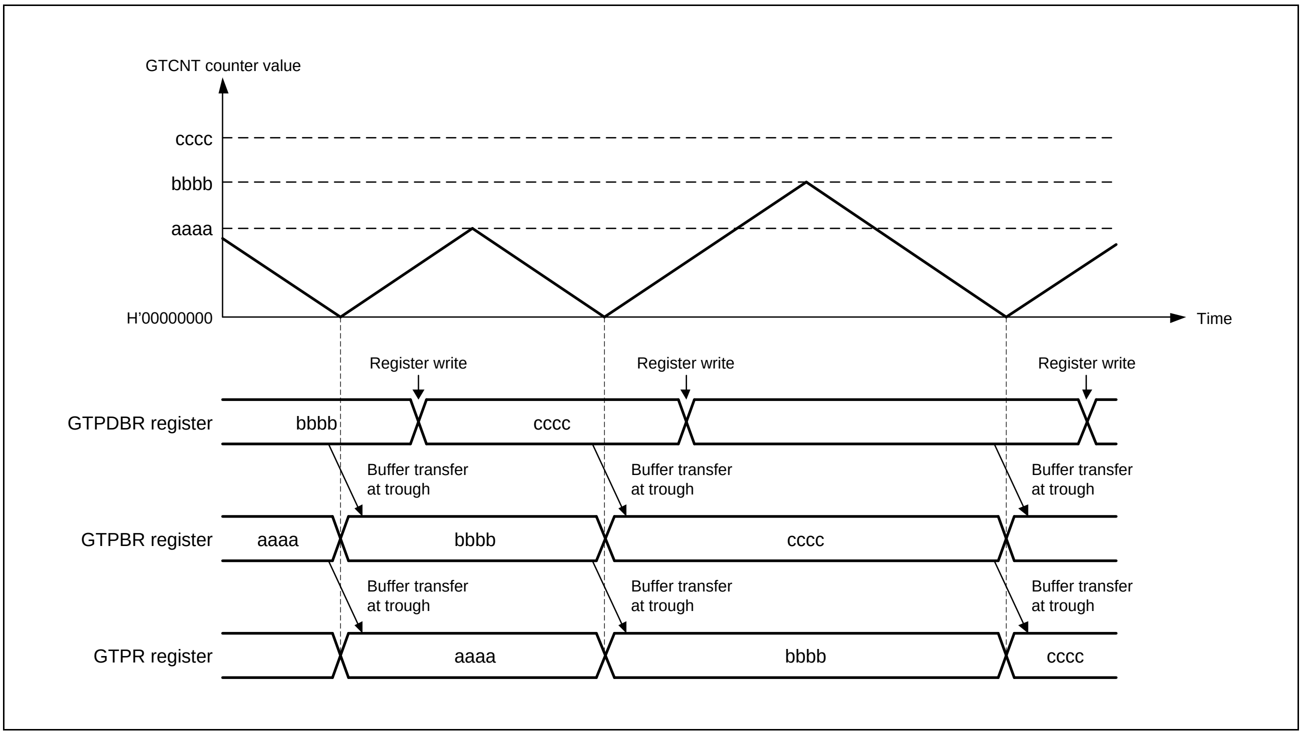

Figure 18.19 Example of GTPR double buffer operation with triangle waves

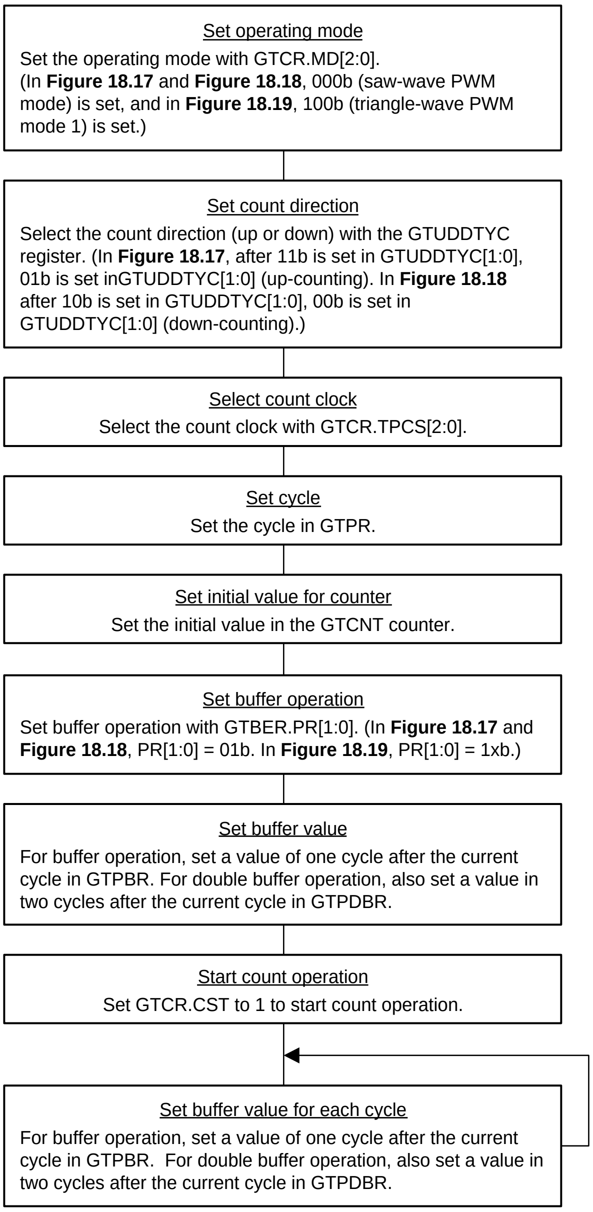

Set operating mode

Set the operating mode with GTCR.MD[2:0]. (In **Figure 18.17** and **Figure 18.18**, 000b (saw-wave PWM mode) is set, and in **Figure 18.19**, 100b (triangle-wave PWM mode 1) is set.)

Set count direction

Select the count direction (up or down) with the GTUDDTYC register. (In **Figure 18.17**, after 11b is set in GTUDDTYC[1:0], 01b is set inGTUDDTYC[1:0] (up-counting). In **Figure 18.18** after 10b is set in GTUDDTYC[1:0], 00b is set in GTUDDTYC[1:0] (down-counting).)

Select count clock

Select the count clock with GTCR.TPCS[2:0].

Set cycle

Set the cycle in GTPR.

Set initial value for counter

Set the initial value in the GTCNT counter.

Set buffer operation

Set buffer operation with GTBER.PR[1:0]. (In **Figure 18.17** and **Figure 18.18**, PR[1:0] = 01b. In **Figure 18.19**, PR[1:0] = 1xb.)

Set buffer value

For buffer operation, set a value of one cycle after the current cycle in GTPBR. For double buffer operation, also set a value in two cycles after the current cycle in GTPDBR.

Start count operation

Set GTCR.CST to 1 to start count operation.

Set buffer value for each cycle

For buffer operation, set a value of one cycle after the current cycle in GTPBR. For double buffer operation, also set a value in two cycles after the current cycle in GTPDBR.

Figure 18.20 Example setting for GTPR buffer operation

18.3.2.2 Buffer Operation for GTCCRA and GTCCRB

GTCCRC can function as the GTCCRA buffer register and GTCCRD can function as the GTCCRC buffer register (double-buffer register for GTCCRA). Similarly, GTCCRE can function as the GTCCRB buffer register and GTCCRF can function as the GTCCRE buffer register (double-buffer register for GTCCRB).

To set GTCCRA or GTCCRB to function as a double buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 10b or 11b. For single buffer operation, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 01b. To set GTCCRA or GTCCRB to not function as a buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 00b.

(1) When GTCCRA or GTCCRB functions as an output compare register

Buffer transfer occurs in the following situations:

- Buffer transfer by overflow or underflow
  Buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count operation. In triangle-wave mode, buffer transfer is performed at a trough (triangle-wave PWM mode 1) or a crest and trough (triangle-wave PWM mode 2).
- Buffer transfer by counter clear
  In saw-wave mode or in event count operation, during counting, buffer transfer (which is the same as an overflow during up-counting or an underflow during down-counting) is performed by the counter clear sources the same as shown in **Section 18.3.2.1, GTPR Register Buffer Operation**. In triangle-wave mode, buffer transfer is not performed by the counter clear.
- Forcible buffer transfer
  When 1 is written to the GTBER.CCRSWT bit while counting is stopped, the GTCCRA and the GTCCRB register buffer transfer are performed forcibly in saw-wave mode, in event count operation and in triangle-wave mode. Additionally, buffer transfer from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B are performed in saw-wave 1 shot pulse mode or triangle-wave PWM mode 3.

Figure 18.21 to **Figure 18.23** show examples of GTCCRA and GTCCRB buffer operation and **Figure 18.24** shows an example setting for GTCCRA and GTCCRB buffer operation.

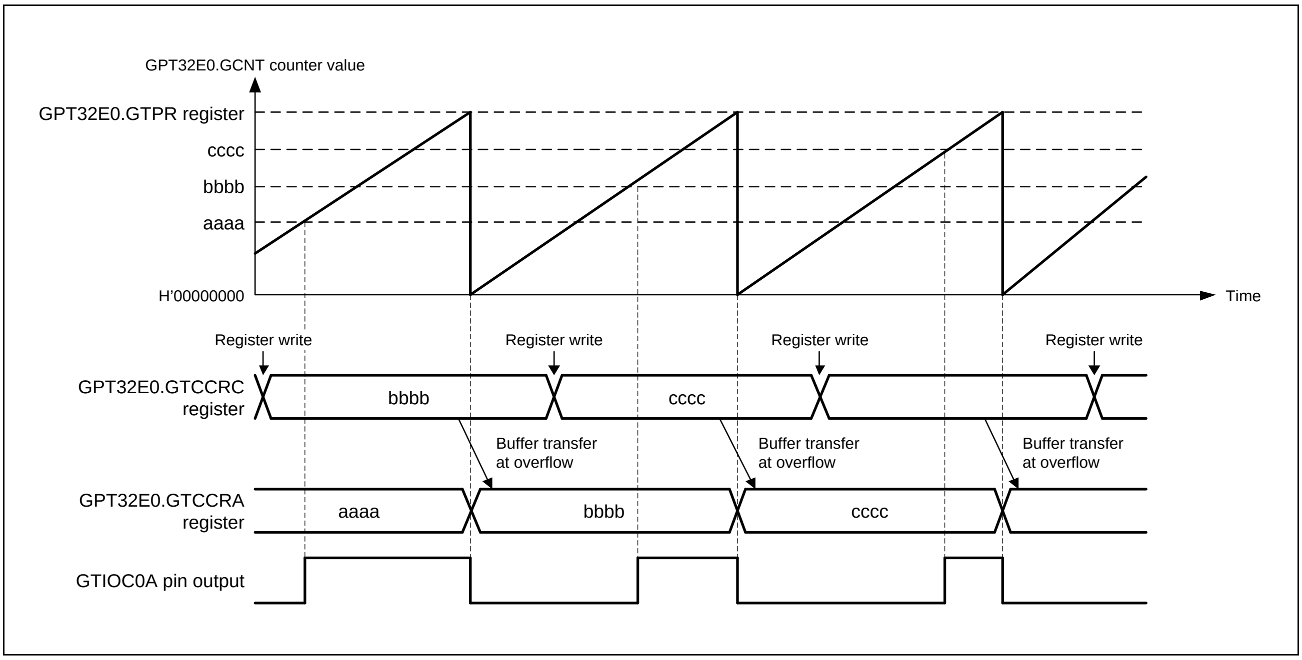

Figure 18.21 Example of GTCCRA and GTCCRB buffer operation with output compare, saw waves in up-counting, high output at GTCCRA compare match, and low output at cycle end

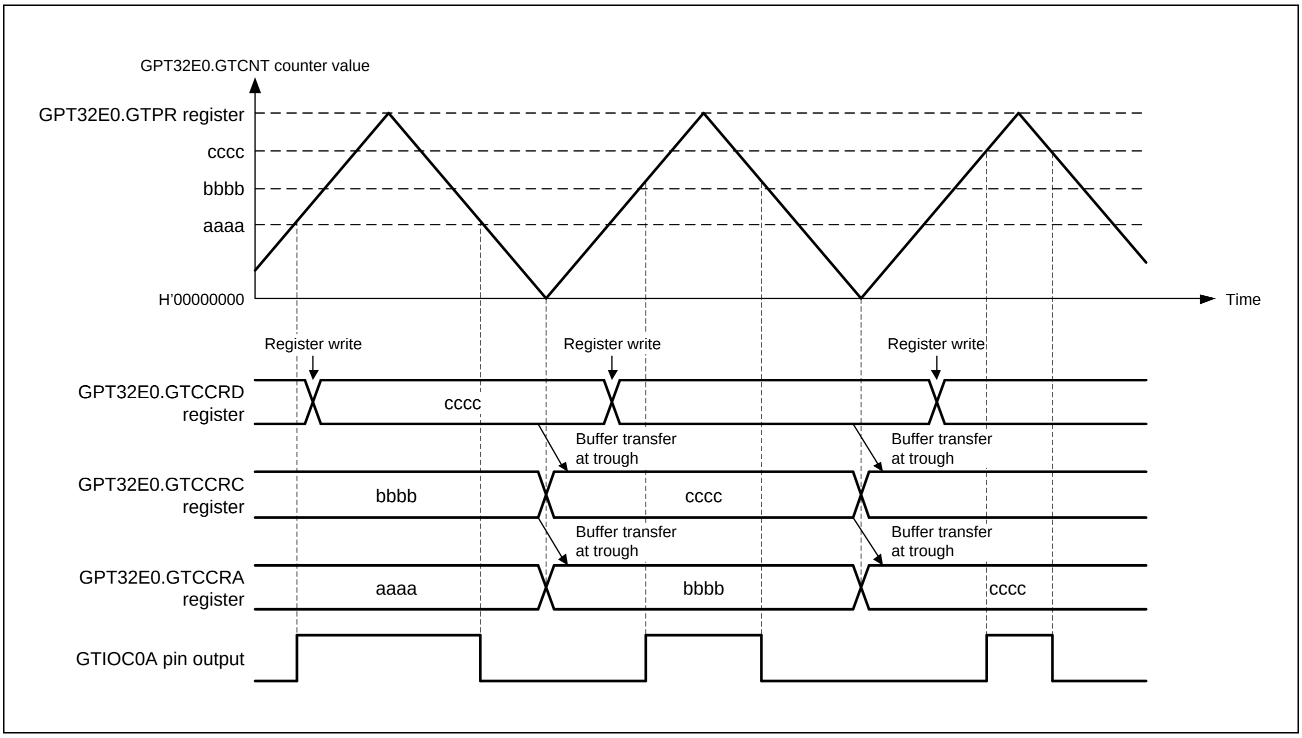

Figure 18.22 Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at trough, output toggled at GTCCRA compare match, and output retained at cycle end

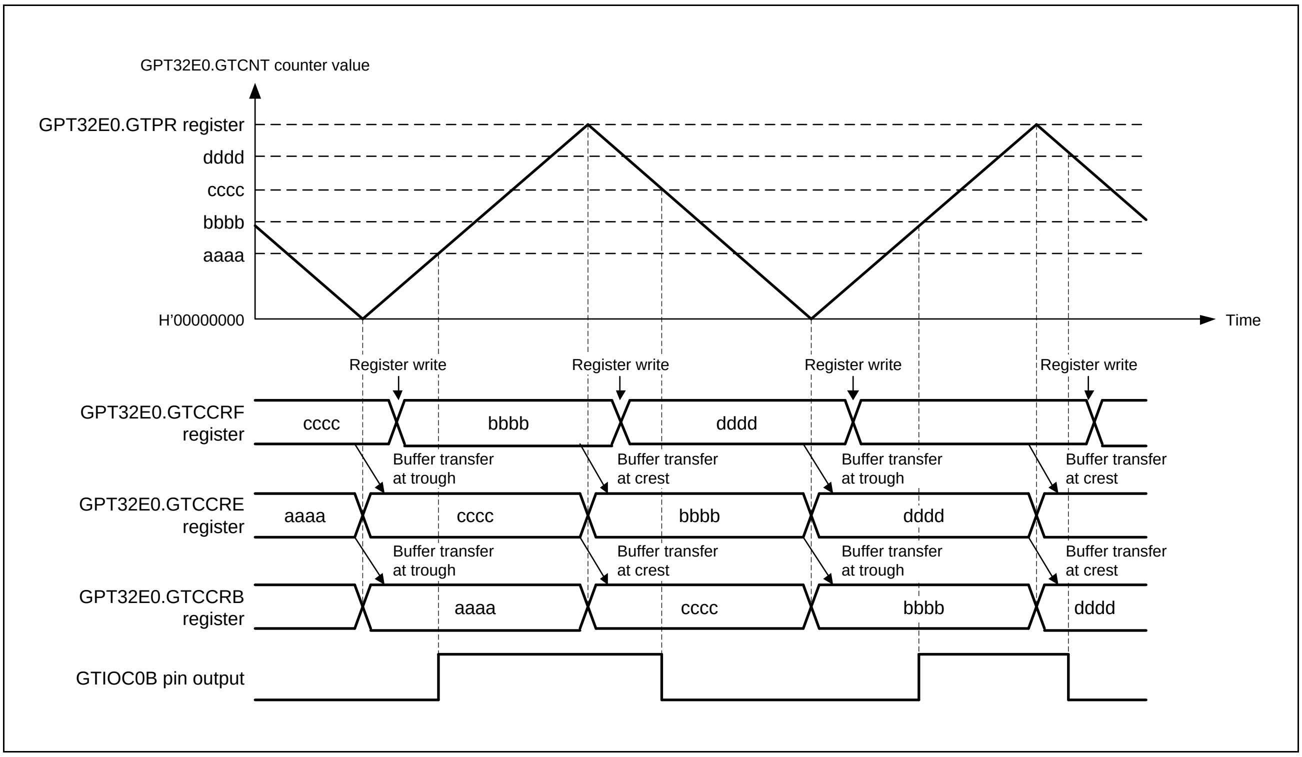

Figure 18.23 Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at both troughs and crests, output toggled at GTCCRB compare match, and output retained at cycle end

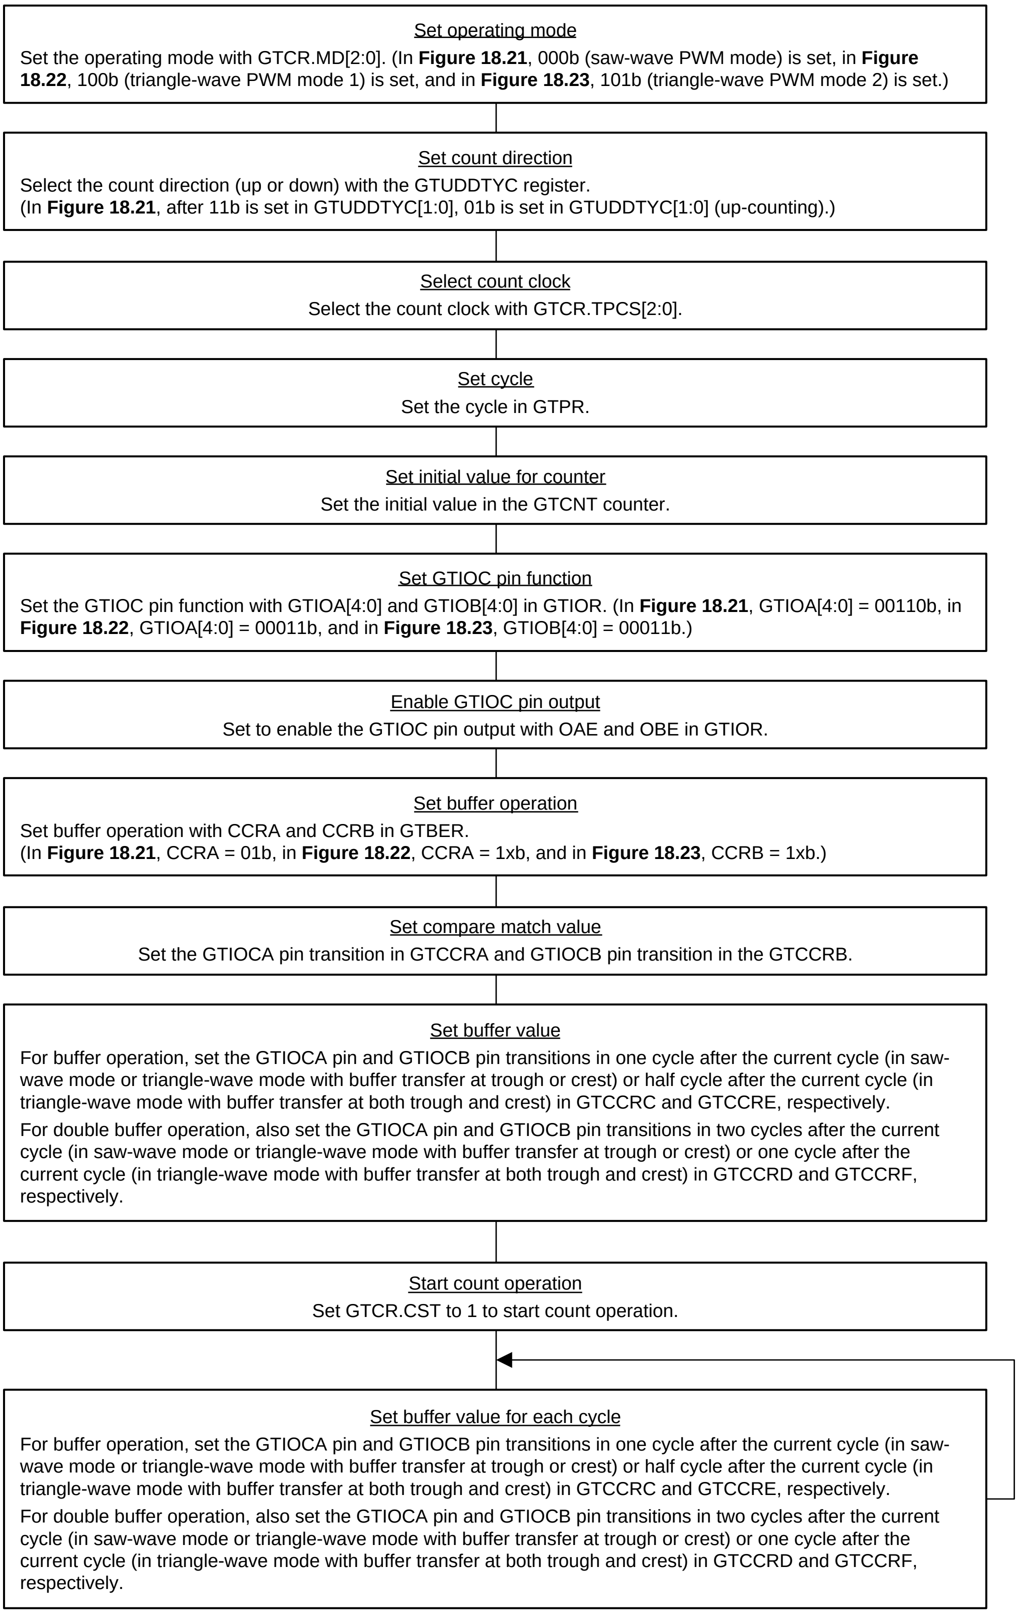

Set operating mode

Set the operating mode with GTCR.MD[2:0]. (In **Figure 18.21**, 000b (saw-wave PWM mode) is set, in **Figure 18.22**, 100b (triangle-wave PWM mode 1) is set, and in **Figure 18.23**, 101b (triangle-wave PWM mode 2) is set.)

Set count direction

Select the count direction (up or down) with the GTUDDTYC register.
(In **Figure 18.21**, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).)

Select count clock

Select the count clock with GTCR.TPCS[2:0].

Set cycle

Set the cycle in GTPR.

Set initial value for counter

Set the initial value in the GTCNT counter.

Set GTIOC pin function

Set the GTIOC pin function with GTIOA[4:0] and GTIOB[4:0] in GTIOR. (In **Figure 18.21**, GTIOA[4:0] = 00110b, in **Figure 18.22**, GTIOA[4:0] = 00011b, and in **Figure 18.23**, GTIOB[4:0] = 00011b.)

Enable GTIOC pin output

Set to enable the GTIOC pin output with OAE and OBE in GTIOR.

Set buffer operation

Set buffer operation with CCRA and CCRB in GTBER.
(In **Figure 18.21**, CCRA = 01b, in **Figure 18.22**, CCRA = 1xb, and in **Figure 18.23**, CCRB = 1xb.)

Set compare match value

Set the GTIOCA pin transition in GTCCRA and GTIOCB pin transition in the GTCCRB.

Set buffer value

For buffer operation, set the GTIOCA pin and GTIOCB pin transitions in one cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in GTCCRC and GTCCRE, respectively.

For double buffer operation, also set the GTIOCA pin and GTIOCB pin transitions in two cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in GTCCRD and GTCCRF, respectively.

Start count operation

Set GTCR.CST to 1 to start count operation.

Set buffer value for each cycle

For buffer operation, set the GTIOCA pin and GTIOCB pin transitions in one cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in GTCCRC and GTCCRE, respectively.

For double buffer operation, also set the GTIOCA pin and GTIOCB pin transitions in two cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in GTCCRD and GTCCRF, respectively.

Figure 18.24 Example setting for GTCCRA and GTCCRB buffer operation with output compare

(2) When GTCCRA or GTCCRB functions as an input capture register

When an input capture is generated, the GTCNT counter value is transferred to GTCCRA and GTCCRB and the stored GTCCRA and GTCCRB register values are transferred to the buffer registers. In input capture operation, the buffer transfer is not performed by the counter clear.

Figure 18.25 and **Figure 18.26** show examples of GTCCRA and GTCCRB buffer operation and **Figure 18.27** shows an example setting for GTCCRA and GTCCRB buffer operation.

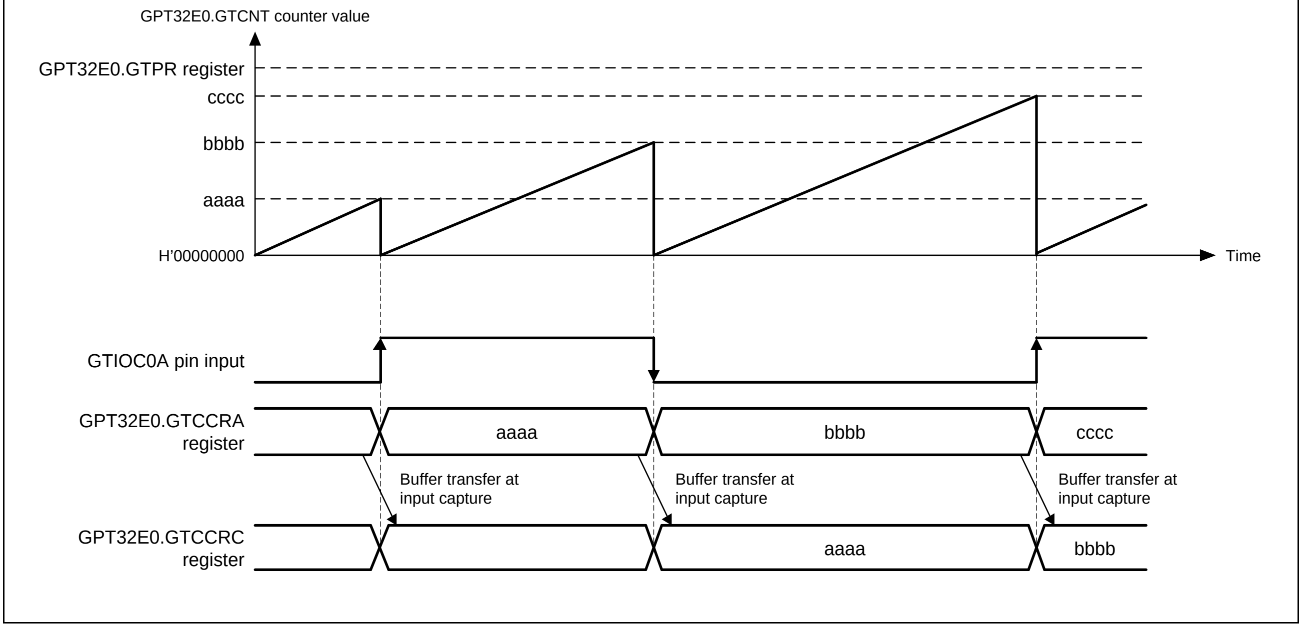

Figure 18.25 Example of GTCCRA and GTCCRB buffer operation with input capture at both edges of GTIOC0A input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOC0A input

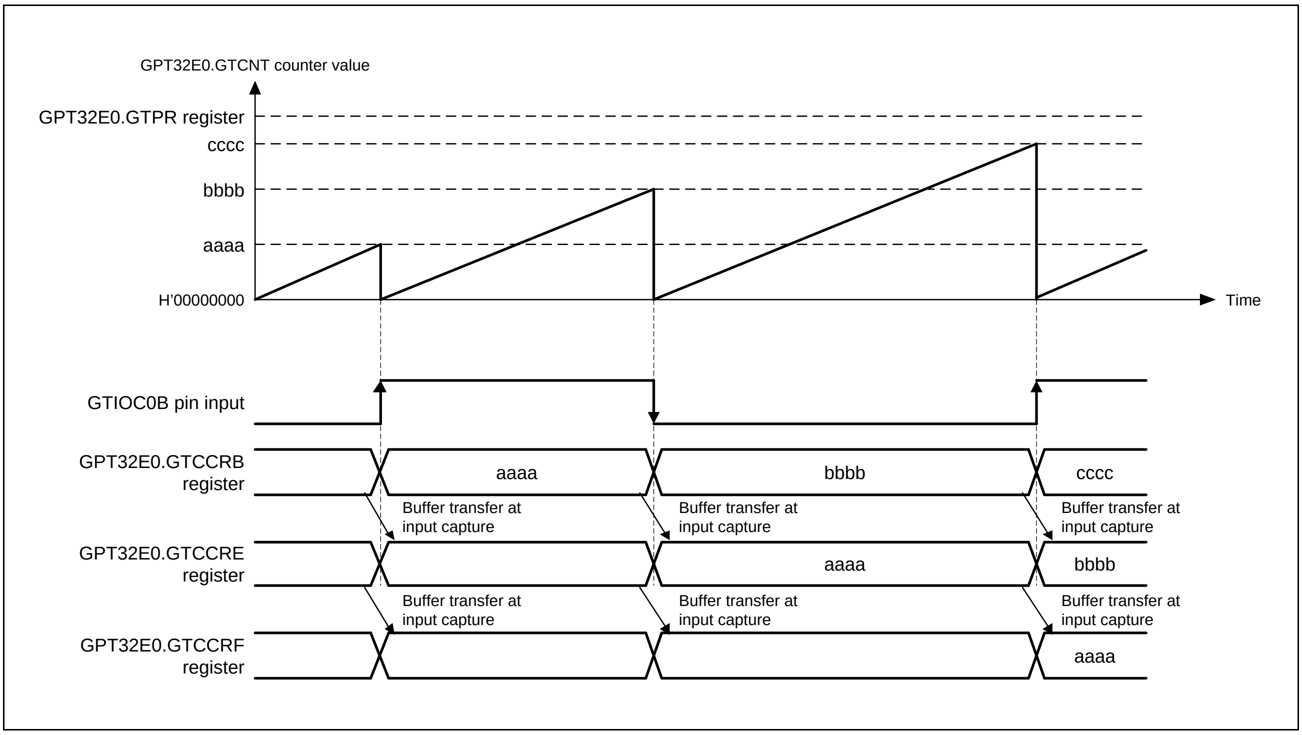

Figure 18.26 Example of GTCCRA and GTCCRB double buffer operation with input capture at both edges of GTIOC0B input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOC0B input

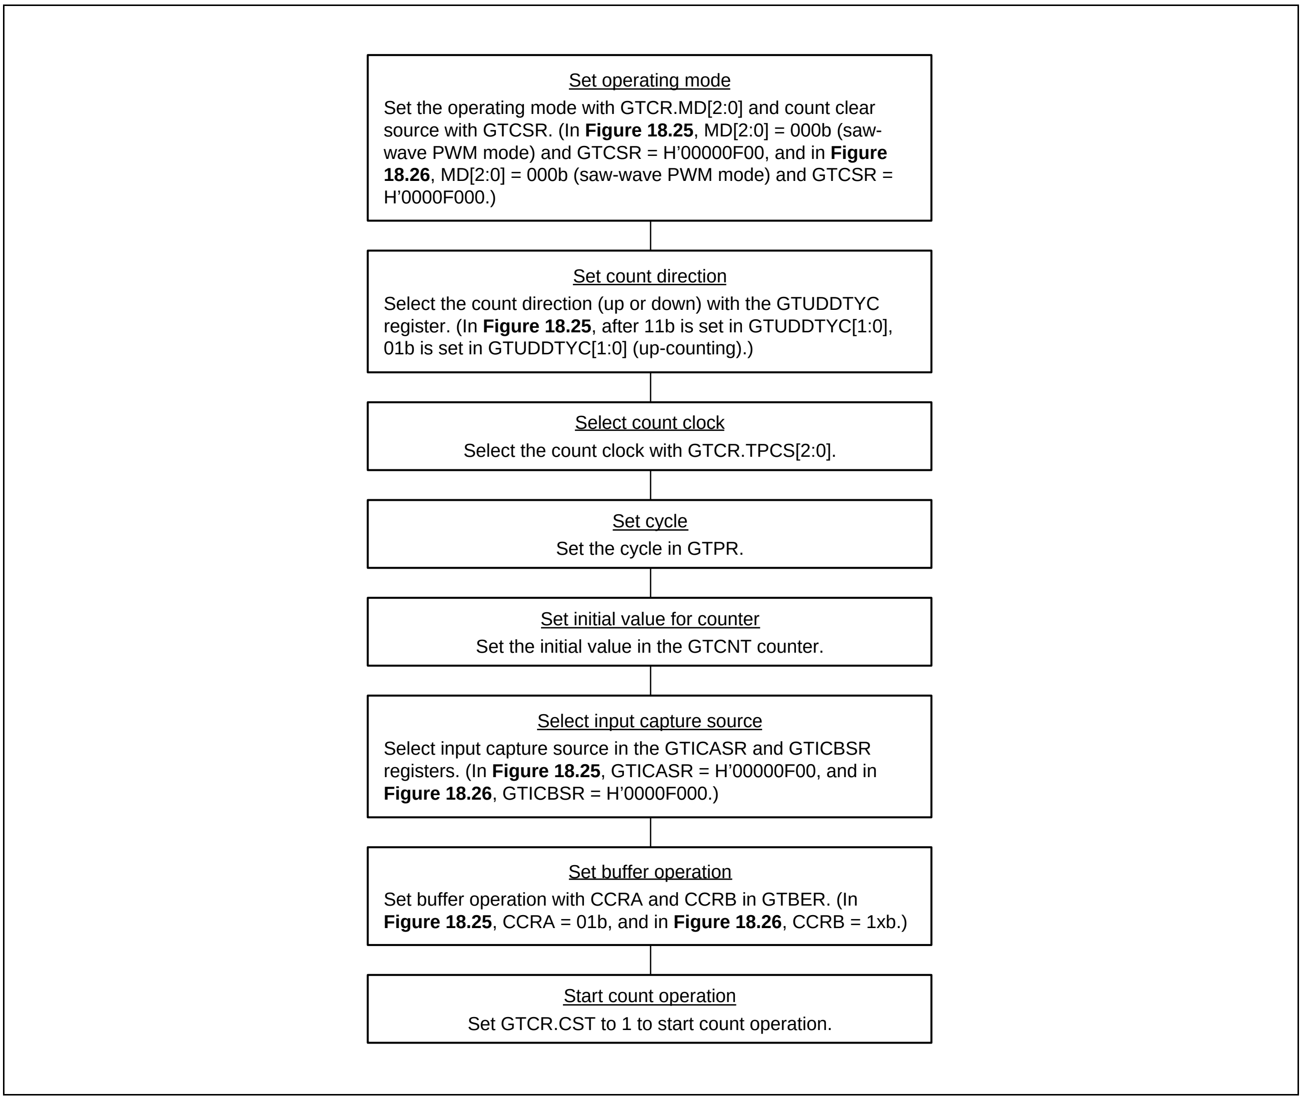

Set operating mode

Set the operating mode with GTCR.MD[2:0] and count clear source with GTCSR. (In **Figure 18.25**, MD[2:0] = 000b (saw-wave PWM mode) and GTCSR = H'00000F00, and in **Figure 18.26**, MD[2:0] = 000b (saw-wave PWM mode) and GTCSR = H'0000F000.)

Set count direction

Select the count direction (up or down) with the GTUDDTYC register. (In **Figure 18.25**, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).)

Select count clock

Select the count clock with GTCR.TPCS[2:0].

Set cycle

Set the cycle in GTPR.

Set initial value for counter

Set the initial value in the GTCNT counter.

Select input capture source

Select input capture source in the GTICASR and GTICBSR registers. (In **Figure 18.25**, GTICASR = H'00000F00, and in **Figure 18.26**, GTICBSR = H'0000F000.)

Set buffer operation

Set buffer operation with CCRA and CCRB in GTBER. (In **Figure 18.25**, CCRA = 01b, and in **Figure 18.26**, CCRB = 1xb.)

Start count operation

Set GTCR.CST to 1 to start count operation.

Figure 18.27 Example setting for GTCCRA and GTCCRB buffer operation with input capture

18.3.2.3 Buffer Operation for GTADTRA and GTADTRB

GTADTBRA can function as the GTADTRA buffer register and GTADTDBRA can function as the GTADTBRA buffer register (double-buffer register for GTADTRA). Similarly, GTADTBRB can function as the GTADTRB buffer register and GTADTDBRB can function as the GTADTBRB buffer register (double-buffer register for GTADTRB).

To set GTADTRA or GTADTRB to function as a double buffer, set GTBER.ADTDA or GTBER.ADTDB to 1. For single buffer operation, set GTBER.ADTDA or GTBER.ADTDB to 0. To set GTADTRA or GTADTRB to not function as a buffer, set GTBER.ADTTA[1:0] or GTBER.ADTTB[1:0] to 00b.

The buffer transfer timing can be set with the GTBER.ADTTA[1:0] bits. For saw waves, overflows (during up-counting) or underflows (during down-counting) can be selected. For triangle waves, crests are selected when GTBER.ADTTA[1:0] = 01b, troughs are selected when GTBER.ADTTA[1:0] = 10b, and both crests and troughs are selected when GTBER.ADTTA[1:0] = 11b.

Figure 18.28 to **Figure 18.30** show examples of GTADTRA and GTADTRB buffer operation and **Figure 18.31** shows an example setting for GTDTRA and GTADTRB buffer operation.

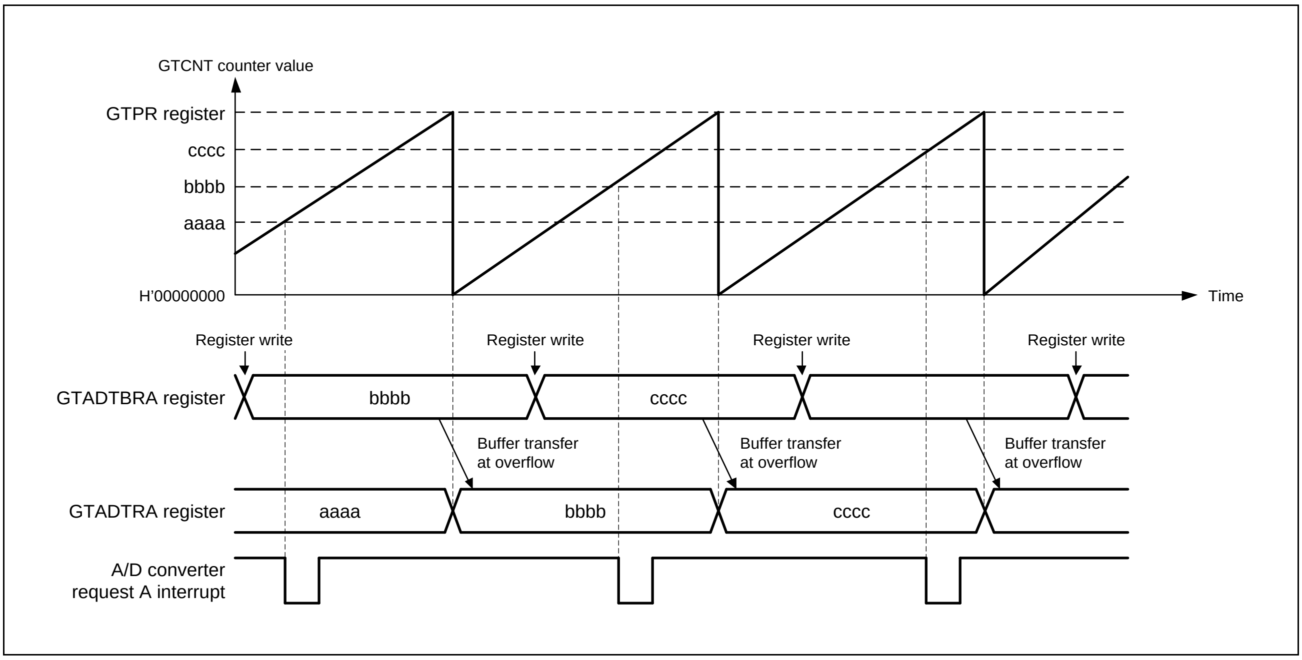

Figure 18.28 Example of GTADTRA and GTADTRB buffer operation with saw waves in up-counting and A/D converter start request interrupt generated by up-counting

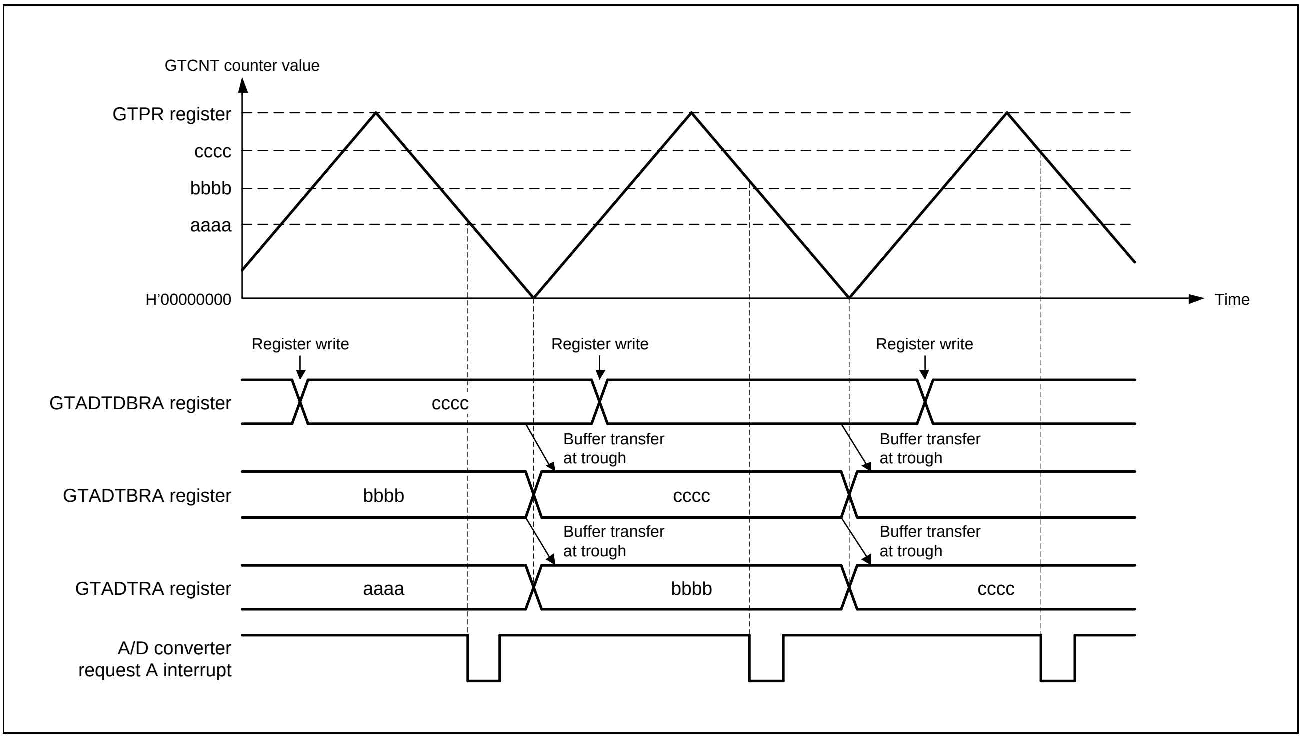

Figure 18.29 Example of GTADTRA and GTADTRB double buffer operation with triangle waves, buffer transfer at troughs, and A/D converter start request interrupt generated by down-counting

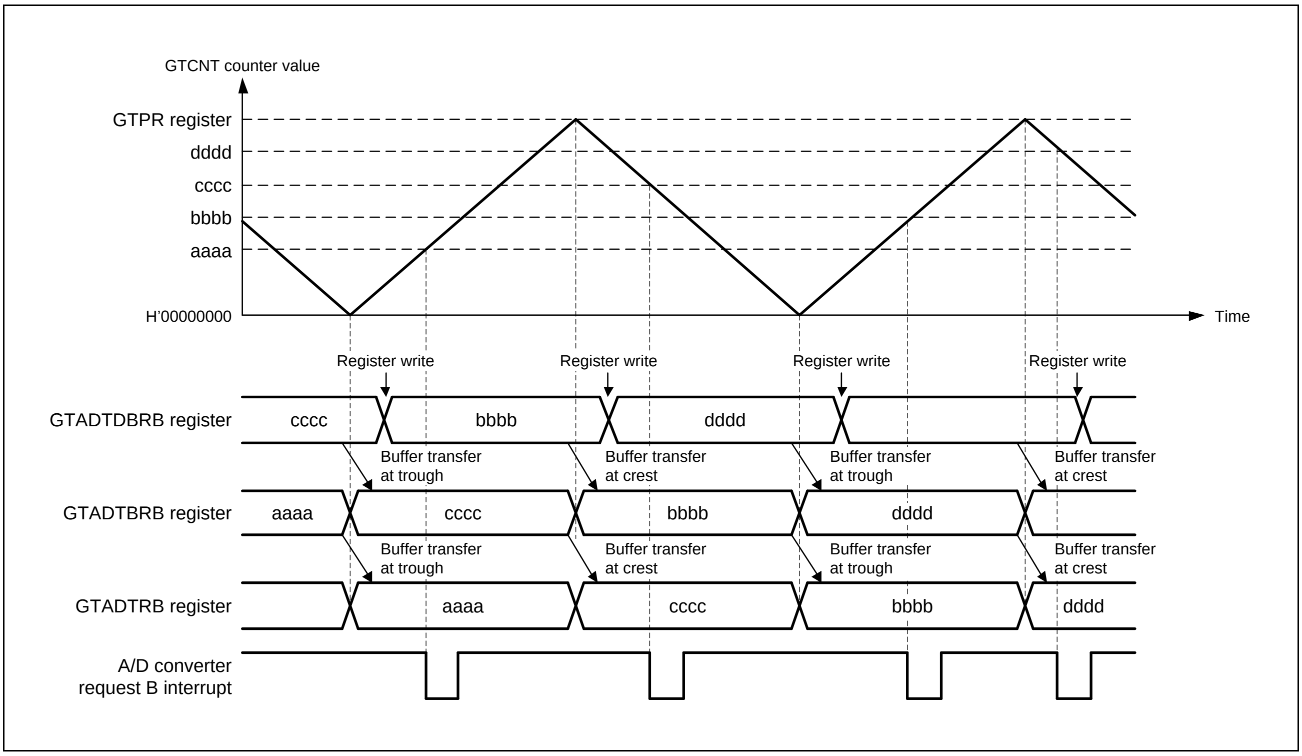

Figure 18.30 Example of GTADTRA and GTADTRB double buffer operation with triangle waves, buffer transfer at both troughs and crests, and A/D converter start request interrupt generated by both up- and down- counting

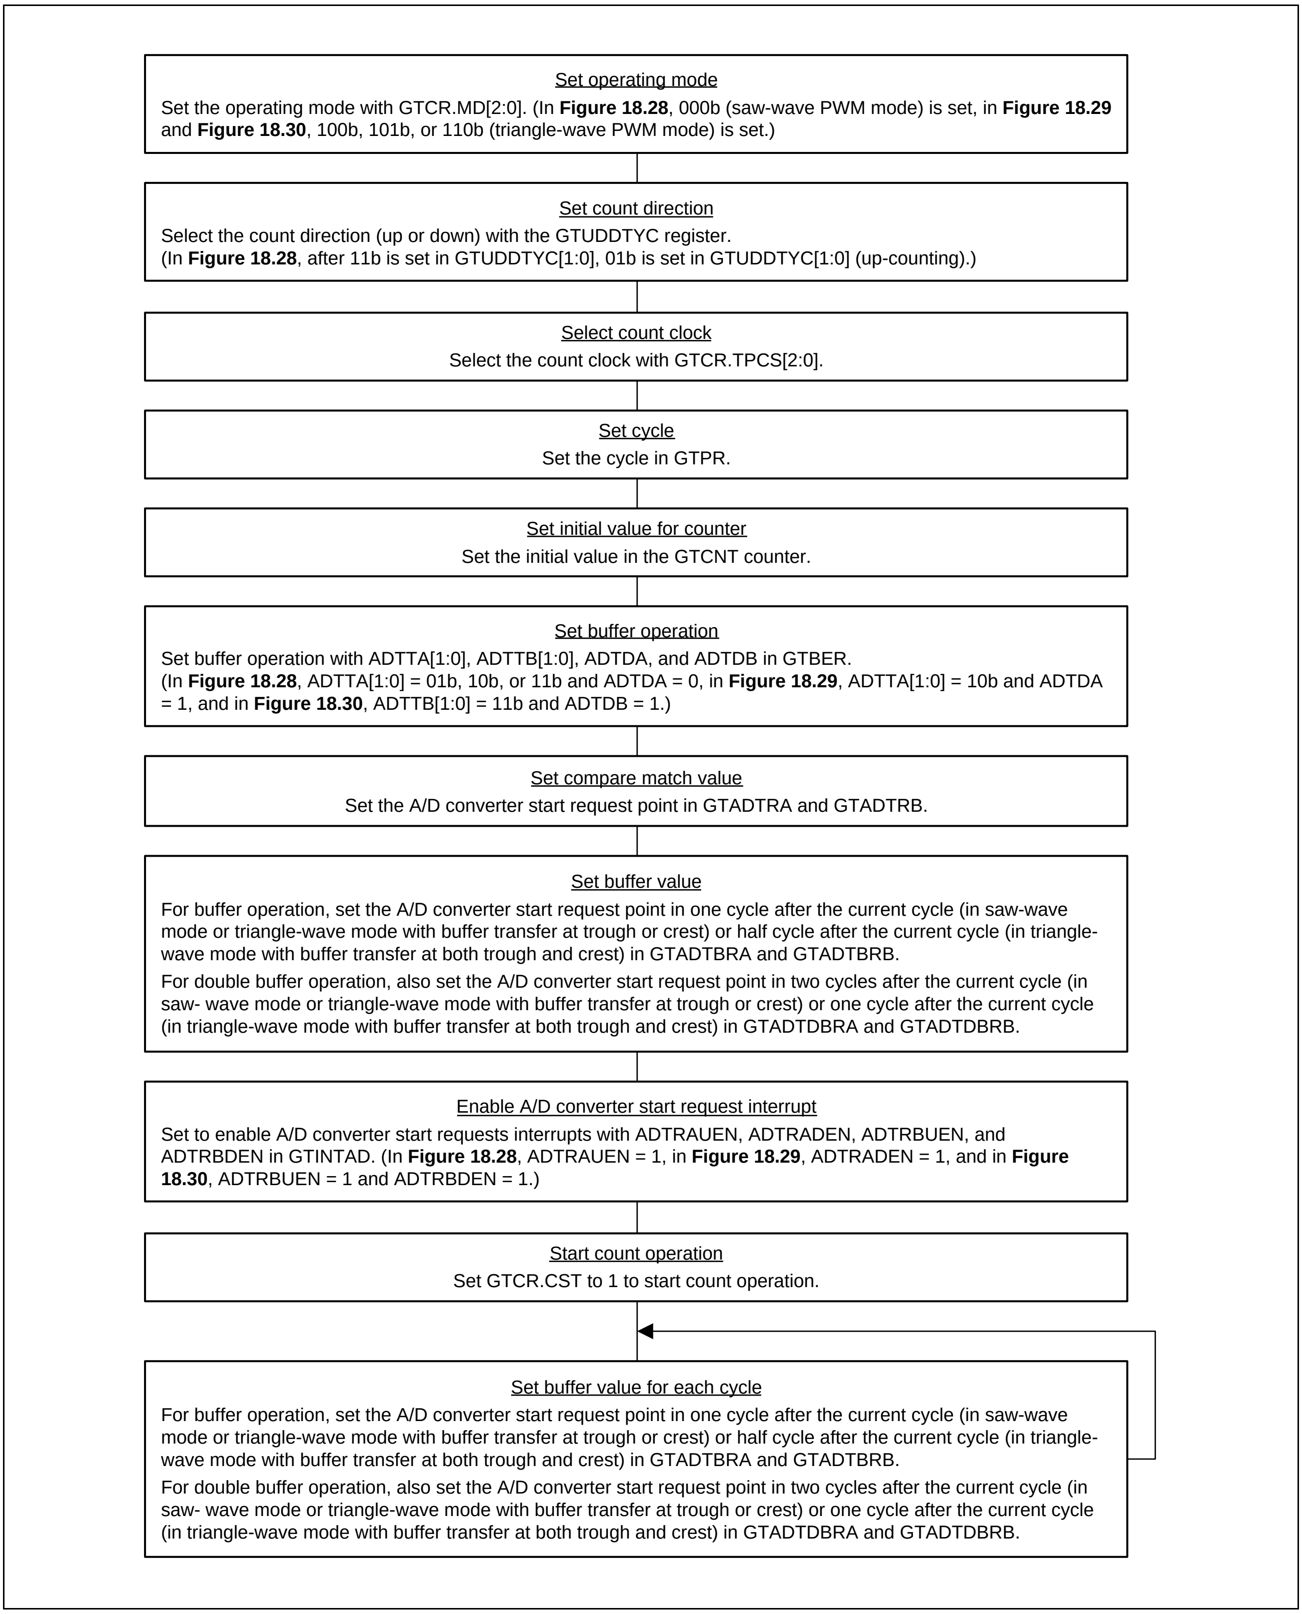

Set operating mode

Set the operating mode with GTCR.MD[2:0]. (In **Figure 18.28**, 000b (saw-wave PWM mode) is set, in **Figure 18.29** and **Figure 18.30**, 100b, 101b, or 110b (triangle-wave PWM mode) is set.)

Set count direction

Select the count direction (up or down) with the GTUDDTYC register.
(In **Figure 18.28**, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).)

Select count clock

Select the count clock with GTCR.TPCS[2:0].

Set cycle

Set the cycle in GTPR.

Set initial value for counter

Set the initial value in the GTCNT counter.

Set buffer operation

Set buffer operation with ADTTA[1:0], ADTTB[1:0], ADTDA, and ADTDB in GTBER.
(In **Figure 18.28**, ADTTA[1:0] = 01b, 10b, or 11b and ADTDA = 0, in **Figure 18.29**, ADTTA[1:0] = 10b and ADTDA = 1, and in **Figure 18.30**, ADTTB[1:0] = 11b and ADTDB = 1.)

Set compare match value

Set the A/D converter start request point in GTADTRA and GTADTRB.

Set buffer value

For buffer operation, set the A/D converter start request point in one cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in GTADTBRA and GTADTBRB.

For double buffer operation, also set the A/D converter start request point in two cycles after the current cycle (in saw- wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in GTADTDBRA and GTADTDBRB.

Enable A/D converter start request interrupt

Set to enable A/D converter start requests interrupts with ADTRAUEN, ADTRADEN, ADTRBUEN, and ADTRBDEN in GTINTAD. (In **Figure 18.28**, ADTRAUEN = 1, in **Figure 18.29**, ADTRADEN = 1, and in **Figure 18.30**, ADTRBUEN = 1 and ADTRBDEN = 1.)

Start count operation

Set GTCR.CST to 1 to start count operation.

Set buffer value for each cycle

For buffer operation, set the A/D converter start request point in one cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in GTADTBRA and GTADTBRB.

For double buffer operation, also set the A/D converter start request point in two cycles after the current cycle (in saw- wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in GTADTDBRA and GTADTDBRB.

Figure 18.31 Example setting for GTADTRA and GTADTRB buffer operation

18.3.3 PWM Output Operating Mode

The GPT can output PWM waveforms to the GTIOCA or GTIOCB pin by a compare match between the GTCNT counter and GTCCRA or GTCCRB.

By setting GTDTCR, GTDVU, and GTDVD, the compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

18.3.3.1 Saw-Wave PWM Mode

In saw-wave PWM mode, GTCNT performs saw-wave (half-wave) operation by setting the cycle in GTPR.A PWM waveform is output to the GTIOCA or GTIOCB pin when a GTCCRA or GTCCRB compare match occurs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting.

Figure 18.32 shows an example of saw-wave PWM mode operation, and **Figure 18.33** shows an example setting for saw-wave PWM mode.

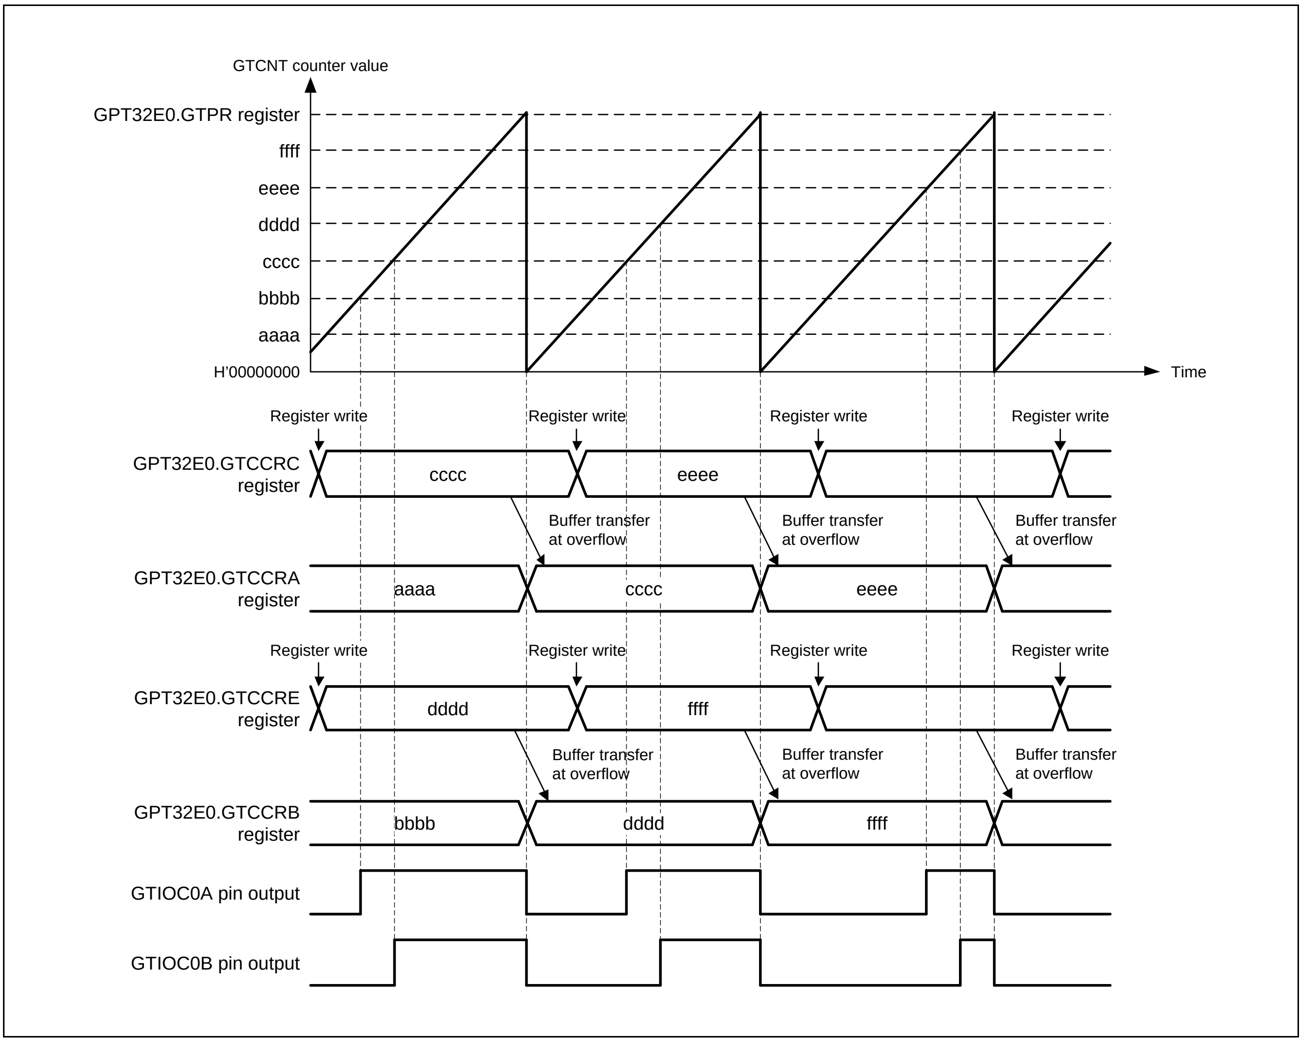

Figure 18.32 Example of saw-wave PWM mode operation with up-counting, buffer operation, high output at GTCCRA/GTCCRB compare match, and low output at cycle end

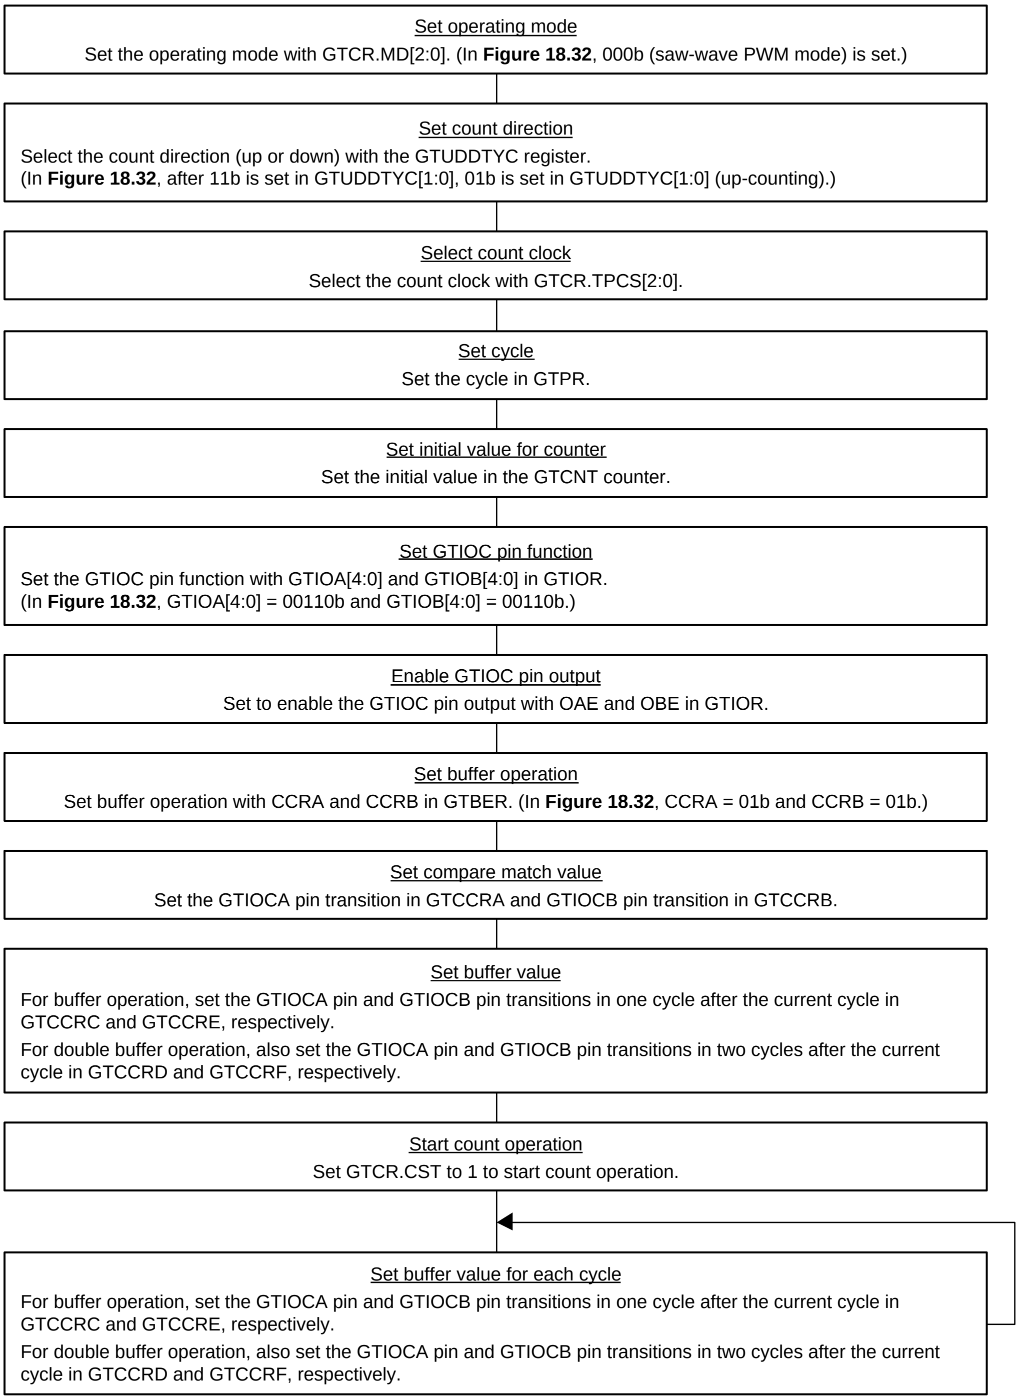

Set operating mode

Set the operating mode with GTCR.MD[2:0]. (In **Figure 18.32**, 000b (saw-wave PWM mode) is set.)

Set count direction

Select the count direction (up or down) with the GTUDDTYC register.
(In **Figure 18.32**, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).)

Select count clock

Select the count clock with GTCR.TPCS[2:0].

Set cycle

Set the cycle in GTPR.

Set initial value for counter

Set the initial value in the GTCNT counter.

Set GTIOC pin function

Set the GTIOC pin function with GTIOA[4:0] and GTIOB[4:0] in GTIOR.
(In **Figure 18.32**, GTIOA[4:0] = 00110b and GTIOB[4:0] = 00110b.)

Enable GTIOC pin output

Set to enable the GTIOC pin output with OAE and OBE in GTIOR.

Set buffer operation

Set buffer operation with CCRA and CCRB in GTBER. (In **Figure 18.32**, CCRA = 01b and CCRB = 01b.)

Set compare match value

Set the GTIOCA pin transition in GTCCRA and GTIOCB pin transition in GTCCRB.

Set buffer value

For buffer operation, set the GTIOCA pin and GTIOCB pin transitions in one cycle after the current cycle in GTCCRC and GTCCRE, respectively.

For double buffer operation, also set the GTIOCA pin and GTIOCB pin transitions in two cycles after the current cycle in GTCCRD and GTCCRF, respectively.

Start count operation

Set GTCR.CST to 1 to start count operation.

Set buffer value for each cycle

For buffer operation, set the GTIOCA pin and GTIOCB pin transitions in one cycle after the current cycle in GTCCRC and GTCCRE, respectively.

For double buffer operation, also set the GTIOCA pin and GTIOCB pin transitions in two cycles after the current cycle in GTCCRD and GTCCRF, respectively.

Figure 18.33 Example setting for saw-wave PWM mode

18.3.3.2 Saw-Wave One-Shot Pulse Mode

The saw-wave one-shot pulse mode is a mode in which the cycle is set in GTPR. The GTCNT counter performs saw-wave (half-wave) operation and a PWM waveform is output to the GTIOCA or GTIOCB pin at a compare match of GTCCRA or GTCCRB with buffer operation fixed.

Buffer operation in saw-wave one-shot pulse mode is different from the usual buffer operation. Buffer transfer is performed from the following:

- GTCCRC to GTCCRA at the cycle end
- GTCCRE to GTCCRB at the cycle end
- GTCCRD to temporary register A at the cycle end
- GTCCRF to temporary register B at the cycle end
- Temporary register A to GTCCRA at a GTCCRA compare match
- Temporary register B to GTCCRB at a GTCCRB compare match.

The pin output value can be selected from low output, high output, or toggle output separately for a compare match and the cycle end based on the GTIOR setting.

When 1 is written to the GTBER.CCRSWT bit while counting is stopped, the values of the GTCCRD and GTCCRF registers are forcibly transferred to the temporary registers A and B, respectively. By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 18.34 shows an example of saw-wave one-shot pulse mode operation, and **Figure 18.35** shows an example setting for saw-wave one-shot pulse mode.

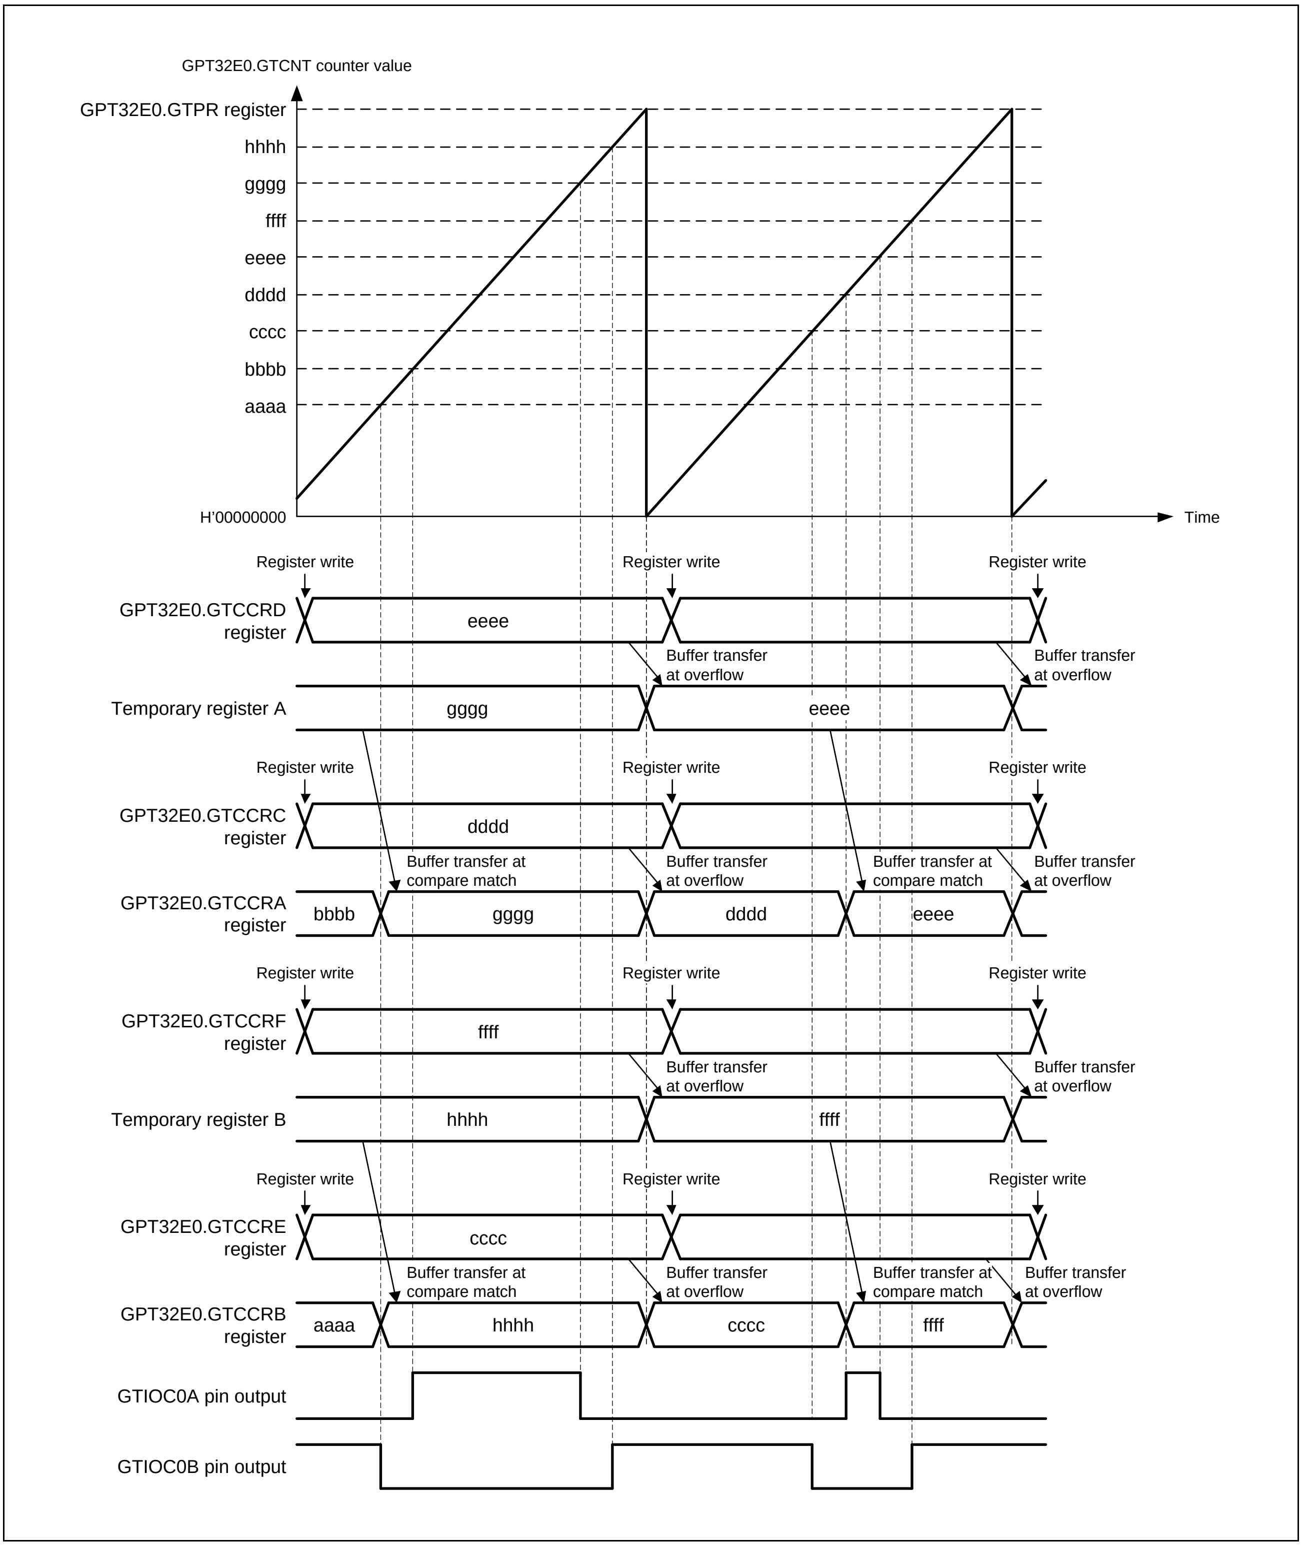

Figure 18.34 Example of saw-wave one-shot pulse mode operation with up-counting, low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end

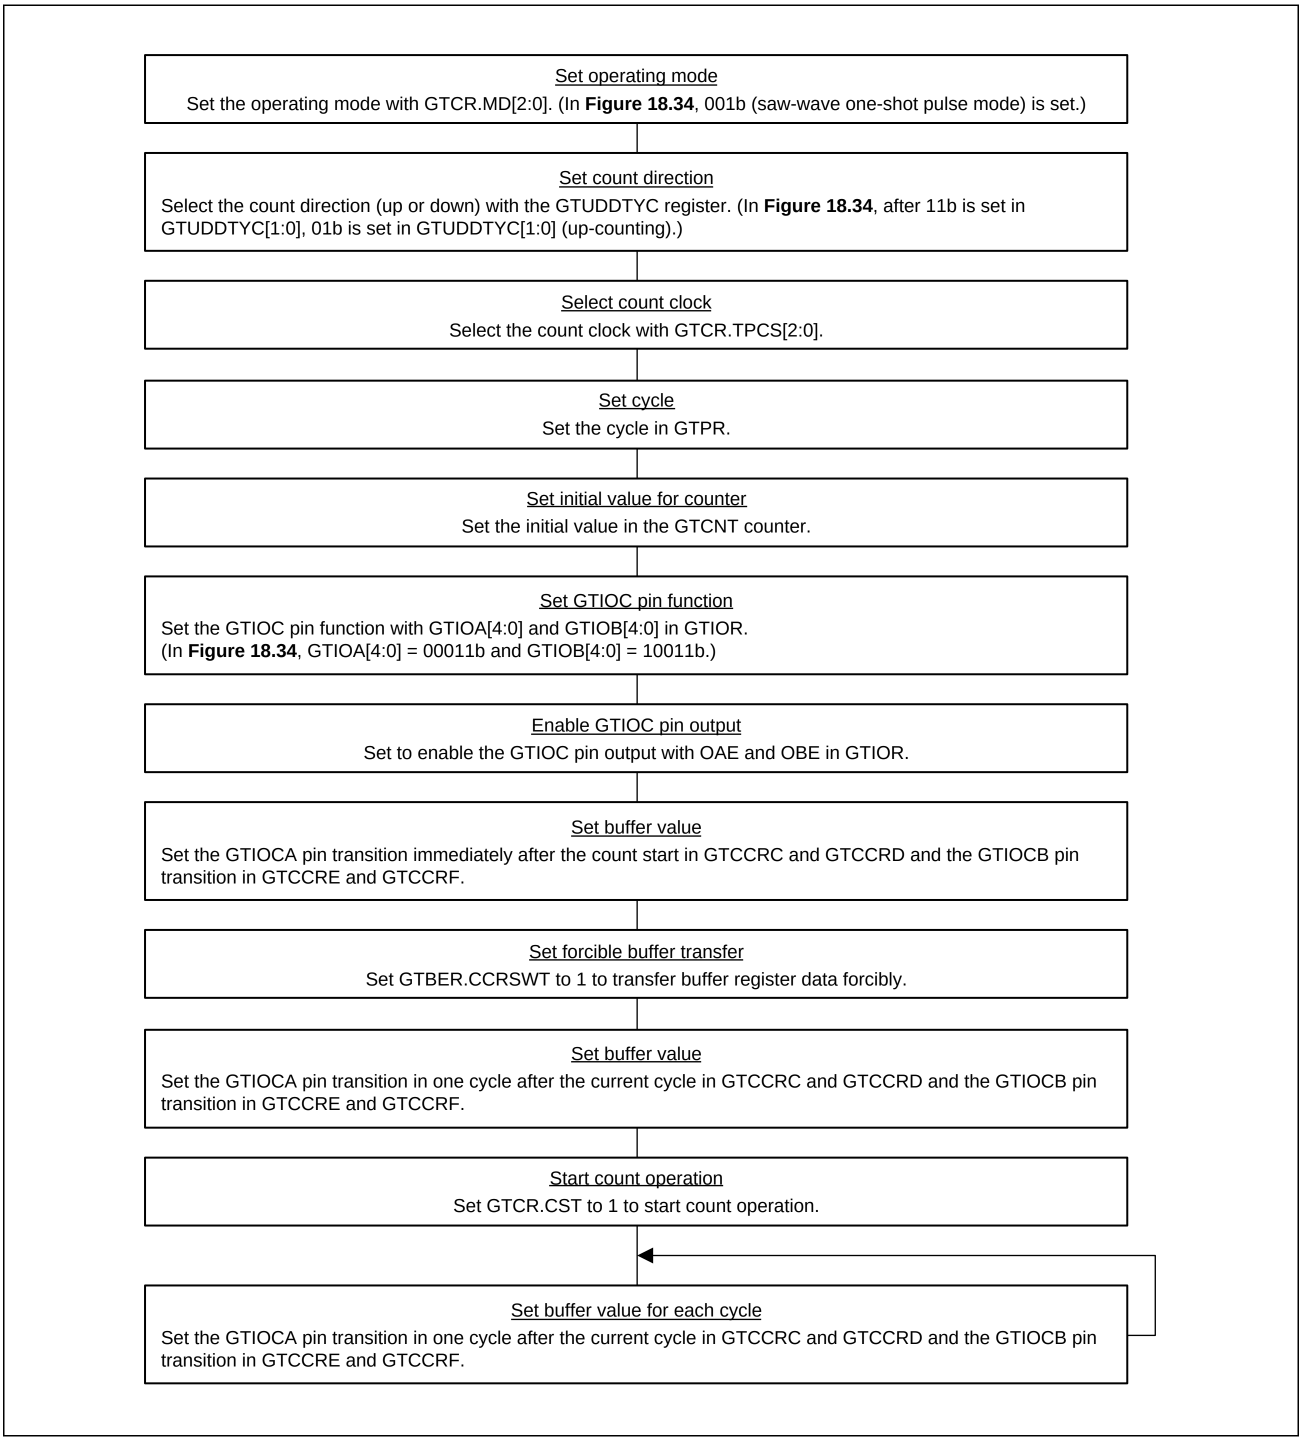

Set operating mode
Set the operating mode with GTCR.MD[2:0]. (In **Figure 18.34**, 001b (saw-wave one-shot pulse mode) is set.)

Set count direction
Select the count direction (up or down) with the GTUDDTYC register. (In **Figure 18.34**, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).)

Select count clock
Select the count clock with GTCR.TPCS[2:0].

Set cycle
Set the cycle in GTPR.

Set initial value for counter
Set the initial value in the GTCNT counter.

Set GTIOC pin function
Set the GTIOC pin function with GTIOA[4:0] and GTIOB[4:0] in GTIOR.
(In **Figure 18.34**, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.)

Enable GTIOC pin output
Set to enable the GTIOC pin output with OAE and OBE in GTIOR.

Set buffer value
Set the GTIOCA pin transition immediately after the count start in GTCCRC and GTCCRD and the GTIOCB pin transition in GTCCRE and GTCCRF.

Set forcible buffer transfer
Set GTBER.CCRSWT to 1 to transfer buffer register data forcibly.

Set buffer value
Set the GTIOCA pin transition in one cycle after the current cycle in GTCCRC and GTCCRD and the GTIOCB pin transition in GTCCRE and GTCCRF.

Start count operation
Set GTCR.CST to 1 to start count operation.

Set buffer value for each cycle
Set the GTIOCA pin transition in one cycle after the current cycle in GTCCRC and GTCCRD and the GTIOCB pin transition in GTCCRE and GTCCRF.

Figure 18.35 Example setting for saw-wave one-shot pulse mode

18.3.3.3 Triangle-Wave PWM Mode 1 (32-bit transfer at trough)

The triangle-wave PWM mode 1 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCA or GTIOCB pin when a GTCCRA or GTCCRB compare match occurs. Buffer transfer is performed at the trough. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 18.36 shows an example of a triangle-wave PWM mode 1 operation, and **Figure 18.37** shows an example setting for a triangle-wave PWM mode 1.

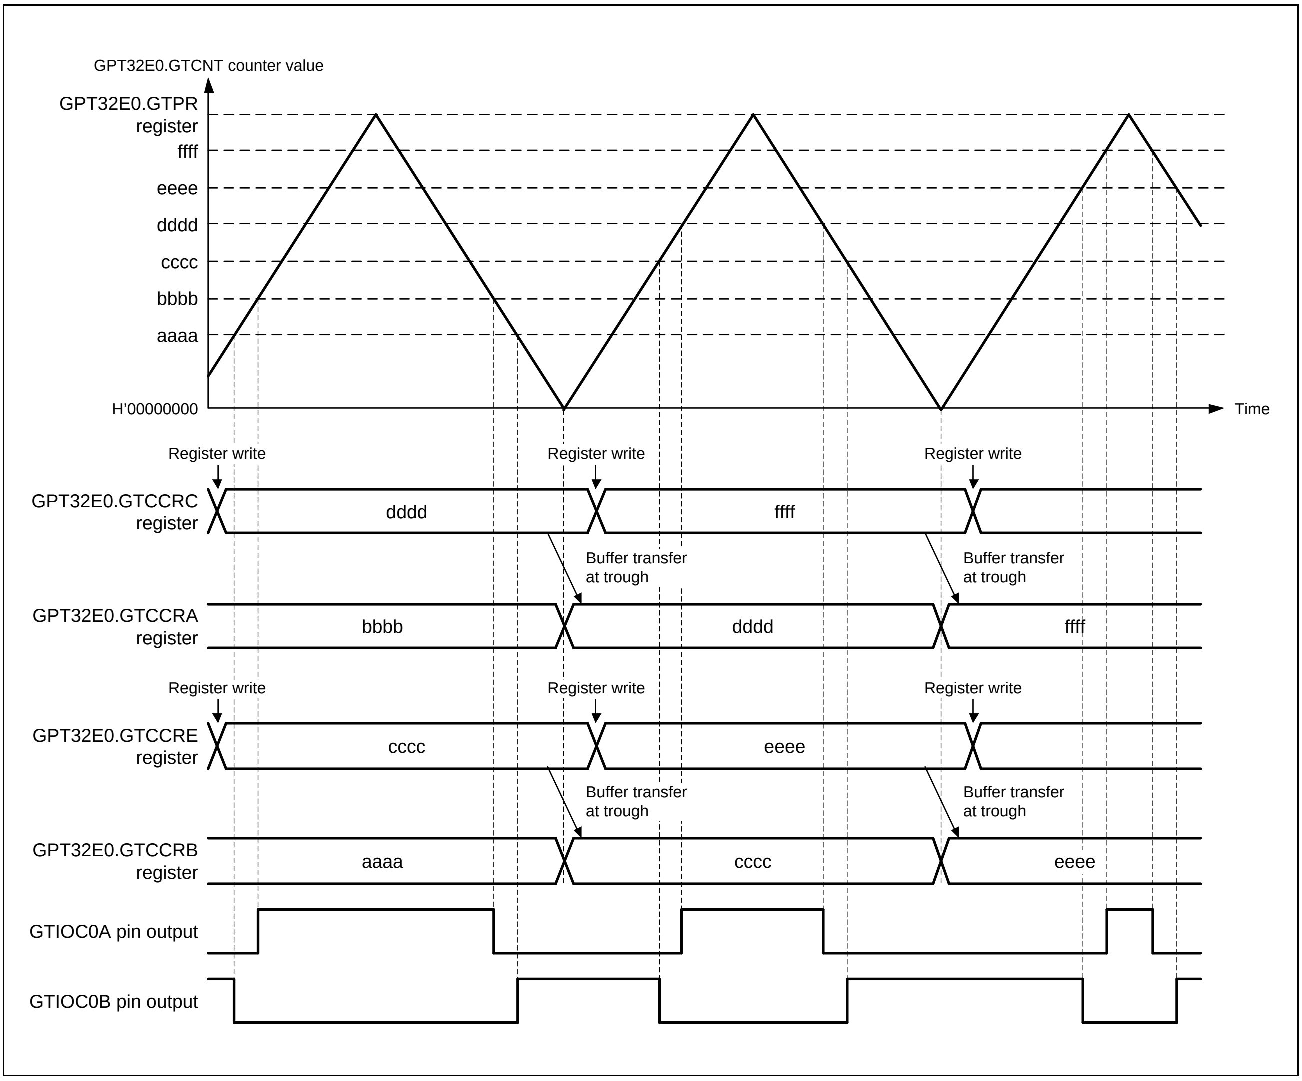

Figure 18.36 Example of triangle-wave PWM mode 1 operation with buffer operation, low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB register compare match, and output retained at cycle end

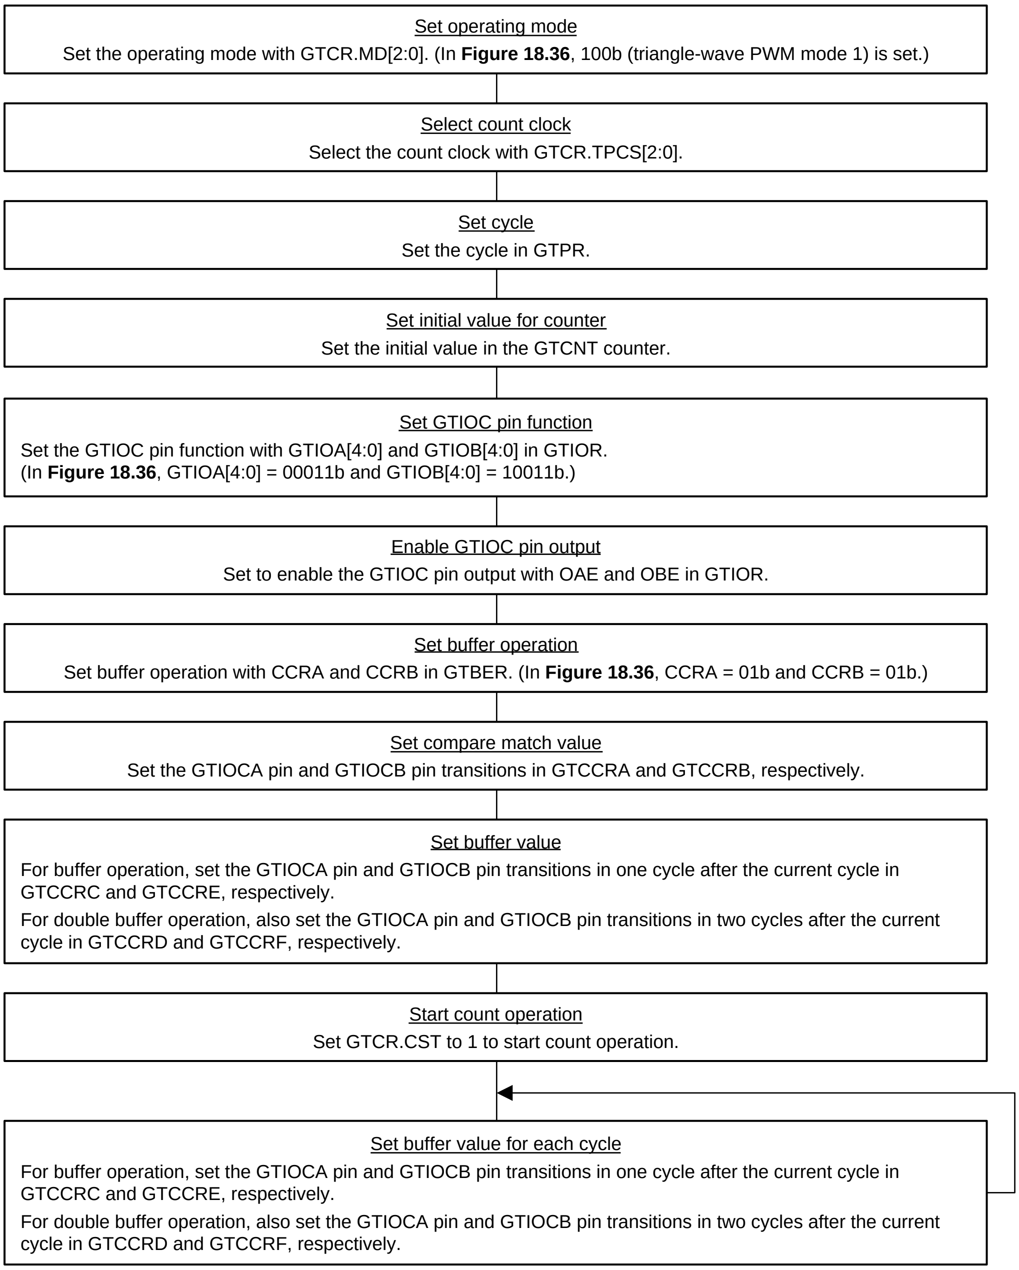

Set operating mode

Set the operating mode with GTCR.MD[2:0]. (In **Figure 18.36**, 100b (triangle-wave PWM mode 1) is set.)

Select count clock

Select the count clock with GTCR.TPCS[2:0].

Set cycle

Set the cycle in GTPR.

Set initial value for counter

Set the initial value in the GTCNT counter.

Set GTIOC pin function

Set the GTIOC pin function with GTIOA[4:0] and GTIOB[4:0] in GTIOR. (In **Figure 18.36**, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.)

Enable GTIOC pin output

Set to enable the GTIOC pin output with OAE and OBE in GTIOR.

Set buffer operation

Set buffer operation with CCRA and CCRB in GTBER. (In **Figure 18.36**, CCRA = 01b and CCRB = 01b.)

Set compare match value

Set the GTIOCA pin and GTIOCB pin transitions in GTCCRA and GTCCRB, respectively.

Set buffer value

For buffer operation, set the GTIOCA pin and GTIOCB pin transitions in one cycle after the current cycle in GTCCRC and GTCCRE, respectively.

For double buffer operation, also set the GTIOCA pin and GTIOCB pin transitions in two cycles after the current cycle in GTCCRD and GTCCRF, respectively.

Start count operation

Set GTCR.CST to 1 to start count operation.

Set buffer value for each cycle

For buffer operation, set the GTIOCA pin and GTIOCB pin transitions in one cycle after the current cycle in GTCCRC and GTCCRE, respectively.

For double buffer operation, also set the GTIOCA pin and GTIOCB pin transitions in two cycles after the current cycle in GTCCRD and GTCCRF, respectively.

Figure 18.37 Example setting for triangle-wave PWM mode 1

18.3.3.4 Triangle-Wave PWM Mode 2 (32-bit transfer at crest and trough)

Similarly to triangle-wave PWM mode 1, in triangle-wave PWM mode 2 the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCA or GTIOCB pin when a GTCCRA or GTCCRB compare match occurs. The buffer transfer is performed at both crests and troughs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 18.38 shows an example of triangle-wave PWM mode 2 operation, and **Figure 18.39** shows an example setting for triangle-wave PWM mode 2.

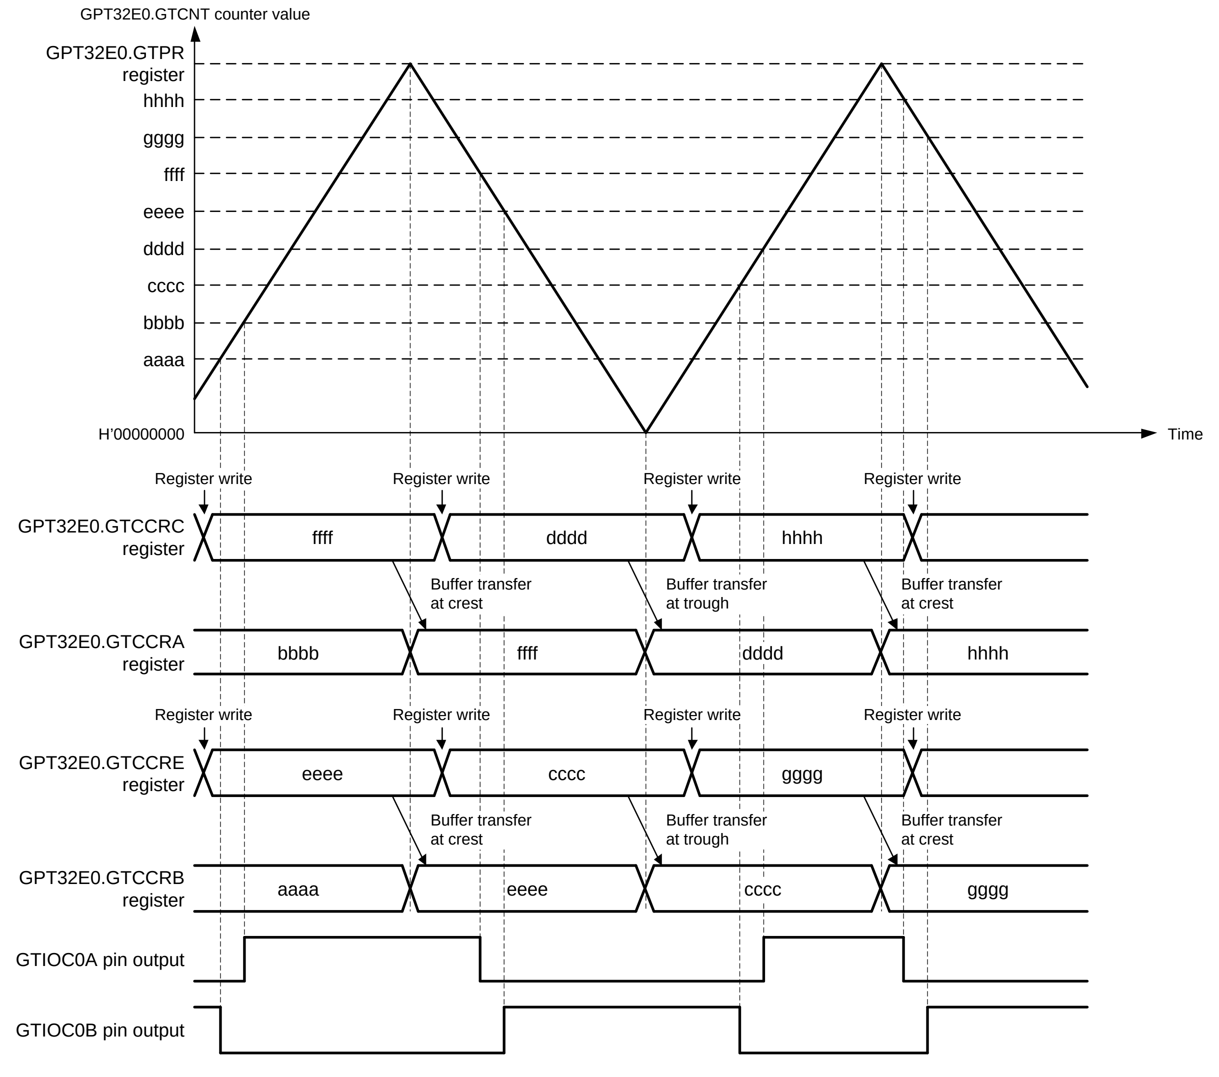

Figure 18.38 Example of triangle-wave PWM mode 2 operation with buffer operation, low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end

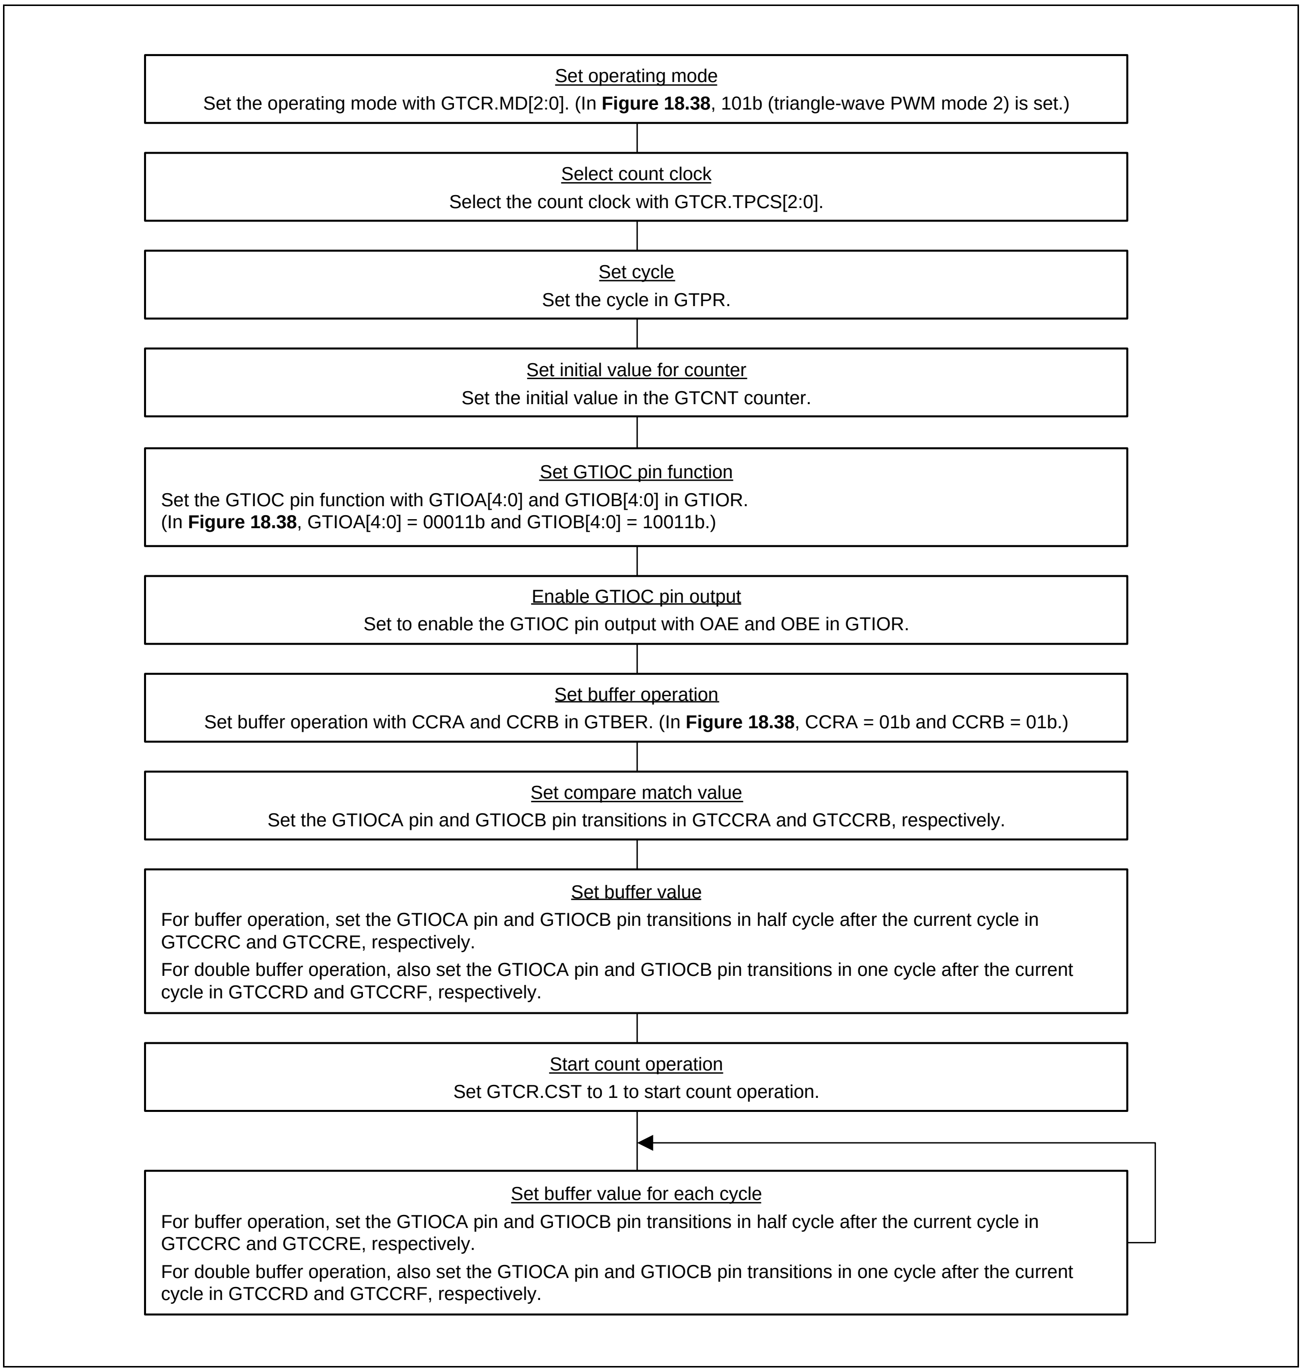

Set operating mode
Set the operating mode with GTCR.MD[2:0]. (In **Figure 18.38**, 101b (triangle-wave PWM mode 2) is set.)

Select count clock
Select the count clock with GTCR.TPCS[2:0].

Set cycle
Set the cycle in GTPR.

Set initial value for counter
Set the initial value in the GTCNT counter.

Set GTIOC pin function
Set the GTIOC pin function with GTIOA[4:0] and GTIOB[4:0] in GTIOR.
(In **Figure 18.38**, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.)

Enable GTIOC pin output
Set to enable the GTIOC pin output with OAE and OBE in GTIOR.

Set buffer operation
Set buffer operation with CCRA and CCRB in GTBER. (In **Figure 18.38**, CCRA = 01b and CCRB = 01b.)

Set compare match value
Set the GTIOCA pin and GTIOCB pin transitions in GTCCRA and GTCCRB, respectively.

Set buffer value
For buffer operation, set the GTIOCA pin and GTIOCB pin transitions in half cycle after the current cycle in GTCCRC and GTCCRE, respectively.
For double buffer operation, also set the GTIOCA pin and GTIOCB pin transitions in one cycle after the current cycle in GTCCRD and GTCCRF, respectively.

Start count operation
Set GTCR.CST to 1 to start count operation.

Set buffer value for each cycle
For buffer operation, set the GTIOCA pin and GTIOCB pin transitions in half cycle after the current cycle in GTCCRC and GTCCRE, respectively.
For double buffer operation, also set the GTIOCA pin and GTIOCB pin transitions in one cycle after the current cycle in GTCCRD and GTCCRF, respectively.

Figure 18.39 Example setting for triangle-wave PWM mode 2

18.3.3.5 Triangle-Wave PWM Mode 3 (64-bit transfer at trough)

The triangle-wave PWM mode 3 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation and a PWM waveform is output to the GTIOCA or GTIOCB pin at a compare match of GTCCRA or GTCCRB with buffer operation fixed. Buffer operation in triangle-wave PWM mode 3 is different from the usual buffer operation. Buffer transfer is performed from the following:

- GTCCRC to GTCCRA at the trough
- GTCCRE to GTCCRB at the trough
- GTCCRD to temporary register A at the trough
- GTCCRF to temporary register B at the trough
- Temporary register A to GTCCRA at the crest
- Temporary register B to GTCCRB at the crest

The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting. By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 18.40 shows an example of triangle-wave PWM mode 3 operation, and **Figure 18.41** shows an example setting for triangle-wave PWM mode 3.

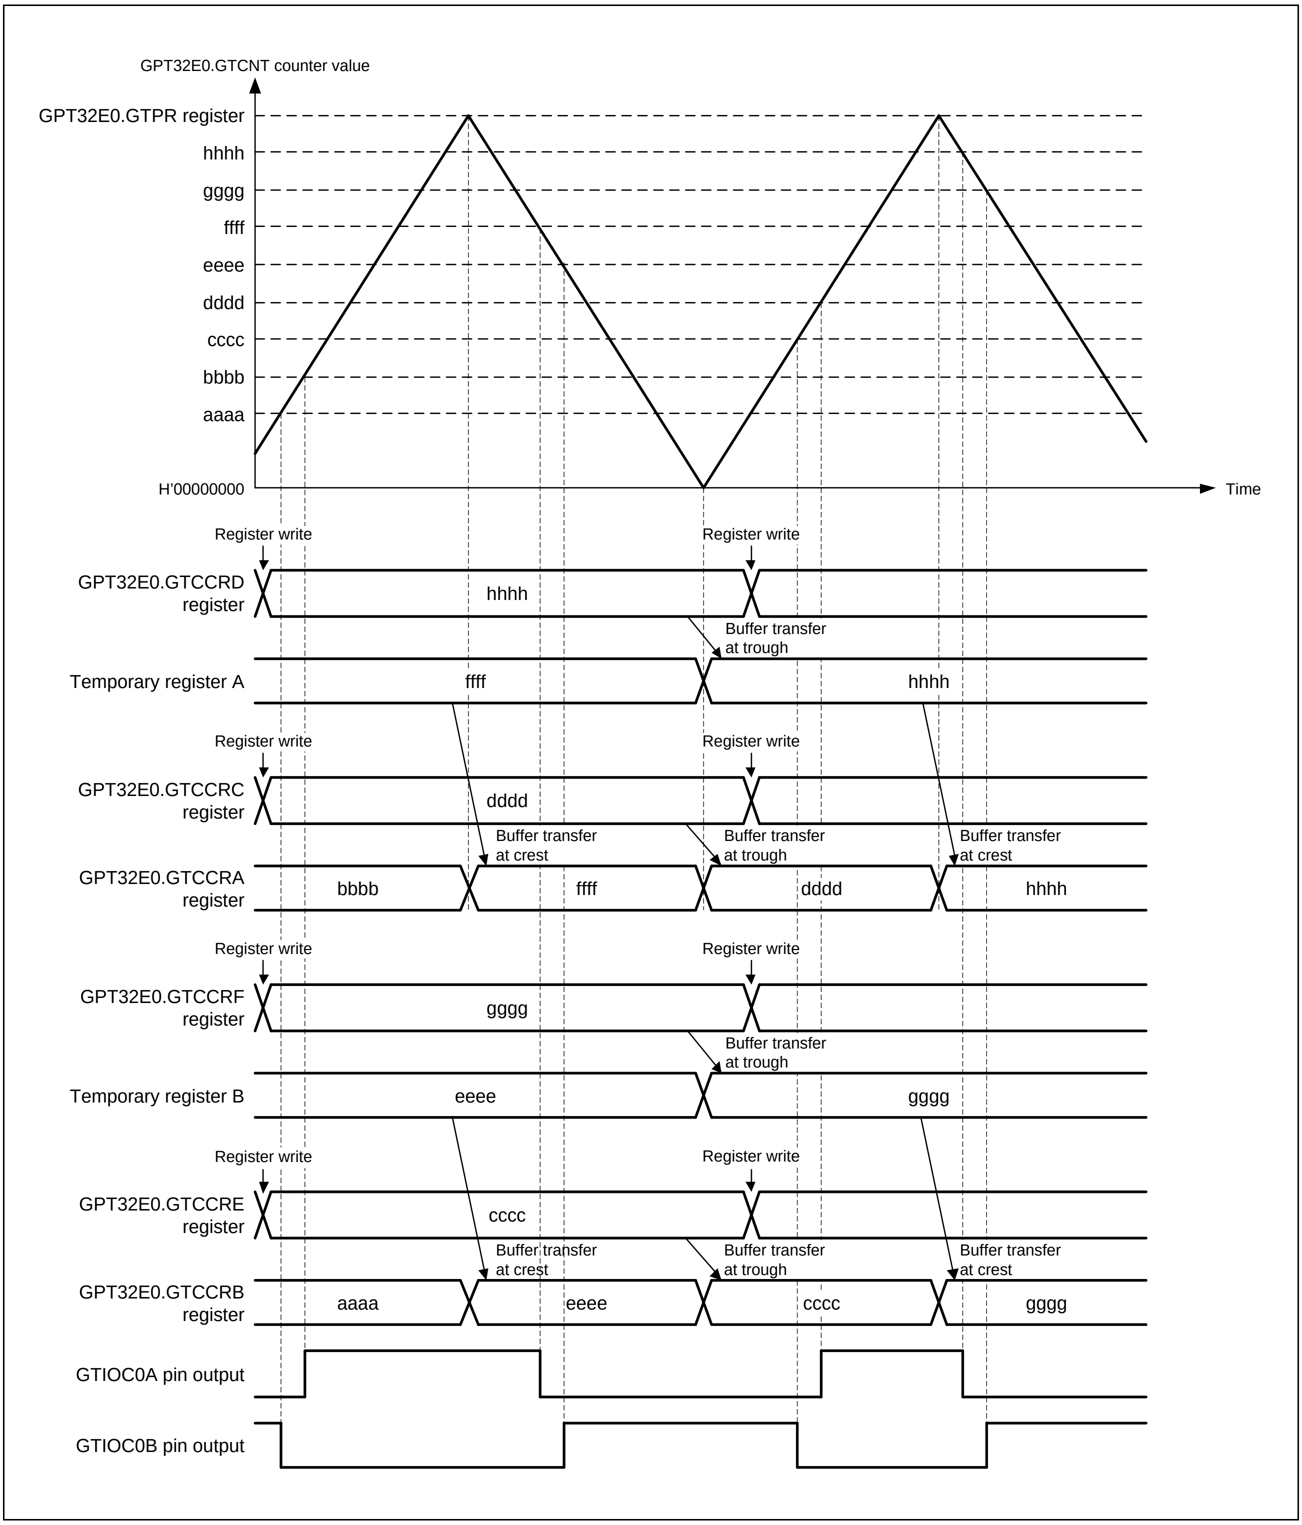

Figure 18.40 Example of triangle-wave PWM mode 3 operation with low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end

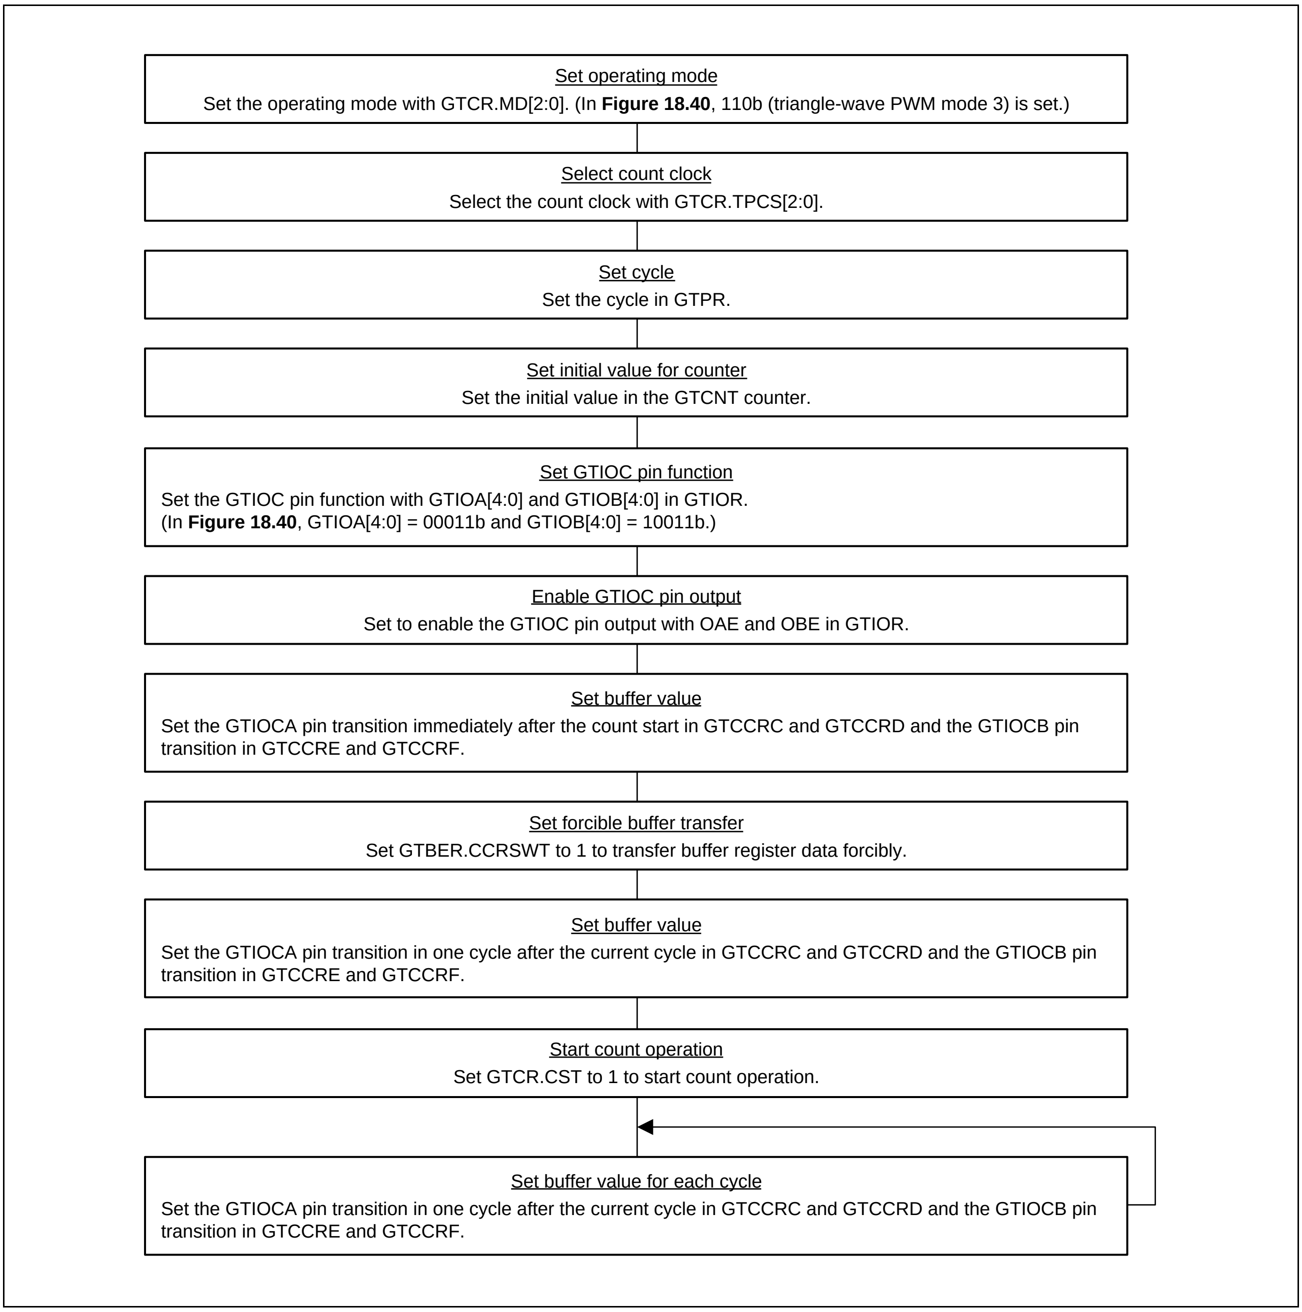

Set operating mode
Set the operating mode with GTCR.MD[2:0]. (In **Figure 18.40**, 110b (triangle-wave PWM mode 3) is set.)

Select count clock
Select the count clock with GTCR.TPCS[2:0].

Set cycle
Set the cycle in GTPR.

Set initial value for counter
Set the initial value in the GTCNT counter.

Set GTIOC pin function
Set the GTIOC pin function with GTIOA[4:0] and GTIOB[4:0] in GTIOR.
(In **Figure 18.40**, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.)

Enable GTIOC pin output
Set to enable the GTIOC pin output with OAE and OBE in GTIOR.

Set buffer value
Set the GTIOCA pin transition immediately after the count start in GTCCRC and GTCCRD and the GTIOCB pin transition in GTCCRE and GTCCRF.

Set forcible buffer transfer
Set GTBER.CCRSWT to 1 to transfer buffer register data forcibly.

Set buffer value
Set the GTIOCA pin transition in one cycle after the current cycle in GTCCRC and GTCCRD and the GTIOCB pin transition in GTCCRE and GTCCRF.

Start count operation
Set GTCR.CST to 1 to start count operation.

Set buffer value for each cycle
Set the GTIOCA pin transition in one cycle after the current cycle in GTCCRC and GTCCRD and the GTIOCB pin transition in GTCCRE and GTCCRF.

Figure 18.41 Example setting for triangle-wave PWM mode 3

18.3.4 Automatic Dead Time Setting Function

By setting GTDTCR, a compare match value for a negative waveform with dead time obtained by a compare match value for a positive waveform (GTCCRA value) and specified dead time values (GTDVU and GTDVD values) can automatically be set to GTCCRB. The automatic dead time setting function can be used in saw-wave one-shot pulse mode and all the triangle PWM modes.

Dead time can be separately set for the first half and second half of a waveform. Dead time for the transition in the first half of a negative waveform is set in GTDVU and that in the second half is set in GTDVD. The same dead time can also be set for the first and second halves by setting the GTDTCR.TDFER bit to 1.

GTDBU can be used as a buffer register of GTDVU, and GTDBD can be used as a buffer register of GTDVD.

In the saw-wave mode, buffer transfer is performed when the GTCND counter overflows (up-counting), underflows (down-counting), or is cleared. In the triangle-wave mode, transfer proceeds at troughs.

The change point of the negative phase waveform with the automatic dead time setting can be confirmed by reading the GTCCRB register value.

Writing to the GTCCRB register is prohibited when using the automatic dead time setting function. It is prohibited to set dead time such that the change point of the waveform exceeds the count cycle.

If there is an error condition on the dead time setting, be able to generate waveforms that secured dead time by correcting the transition points of the positive and negative phase waveforms, as shown in **Table 18.6**.

The transition point of the corrected negative-phase waveform is automatically set in the GTCCRB register. Since the internal signal is used to judge the transition point of the positive phase waveform, the GTCCRA register is not updated with the corrected value.

By correcting the waveform transition point due to a dead time error on the saw-wave one-shot pulse mode, if the order of waveform transition points is disturbed or it exceeds the count cycle period after correction, the complementary relationship between the positive-phase waveform and the negative-phase waveform is not guaranteed.

By setting the GTCCRA equal 0 or greater than or equal to the GTPR of the GTCCRA register in the triangle-wave PWM mode, if the dead time setting exceeds the count cycle period, output transition is suppressed by the output protection function. When GTCCRA ≥ GTPR + GTDVn, GTPR - 1 is set as the upper limit value in the GTCCRB register (Refer to **Section 18.7.4, Output Protection Function for GTIOC Pin Output**).

When GTCCRA ≥ GTPR + GTDVn, GTPR - 1 is set as the upper limit value in the GTCCRB register.

Table 18.6 Correction of waveform transition point at dead time error occurrence

Wave mode	Count direction	Interval	Dead time error condition	Positive-Phase waveform transition point with corrected	Negative-phase waveform transition point with corrected
saw-wave one-shot pulse mode	Up counting	first half	GTCCRA-GTDVU < 0	GTDVU	0
		second half	GTCCRA-GTDVD > GTPR	GTPR-GTDVD	GTPR
	Down counting	first half	GTCCRA-GTDVU > GTPR	GTPR-GTDVU	GTPR
		second half	GTCCRA-GTDVD < 0	GTDVD	0
triangle PWM mode 1/2/3	Up counting	(first half)	GTCCRA-GTDVU ≤ 0	GTDVU+1	1
	Down counting	(second half)	GTCCRA-GTDVD < 0	GTDVD	0

Values for automatic dead time setting can be read from GTCCRB. The automatic dead time value setting to GTCCRB is performed at the next count clock cycle when registers that are used for calculating the automatic dead time value are updated.

The method of writing a new value to a GTDVn register depends on whether buffer operation is enabled or disabled. When GTDVn buffer operation is enabled: The GTDBn register can be written at any time. The value in the GTDBn register is transferred to the GTDVn register at the cycle end.

When GTDVn buffer operation is disabled: Set the GTCR.CST bit to stop the GPT before changing the value of the GTDVn register.

Figure 18.42 to **Figure 18.45** show examples of automatic dead time setting function operation. **Figure 18.46** and **Figure 18.47** show the setting examples.

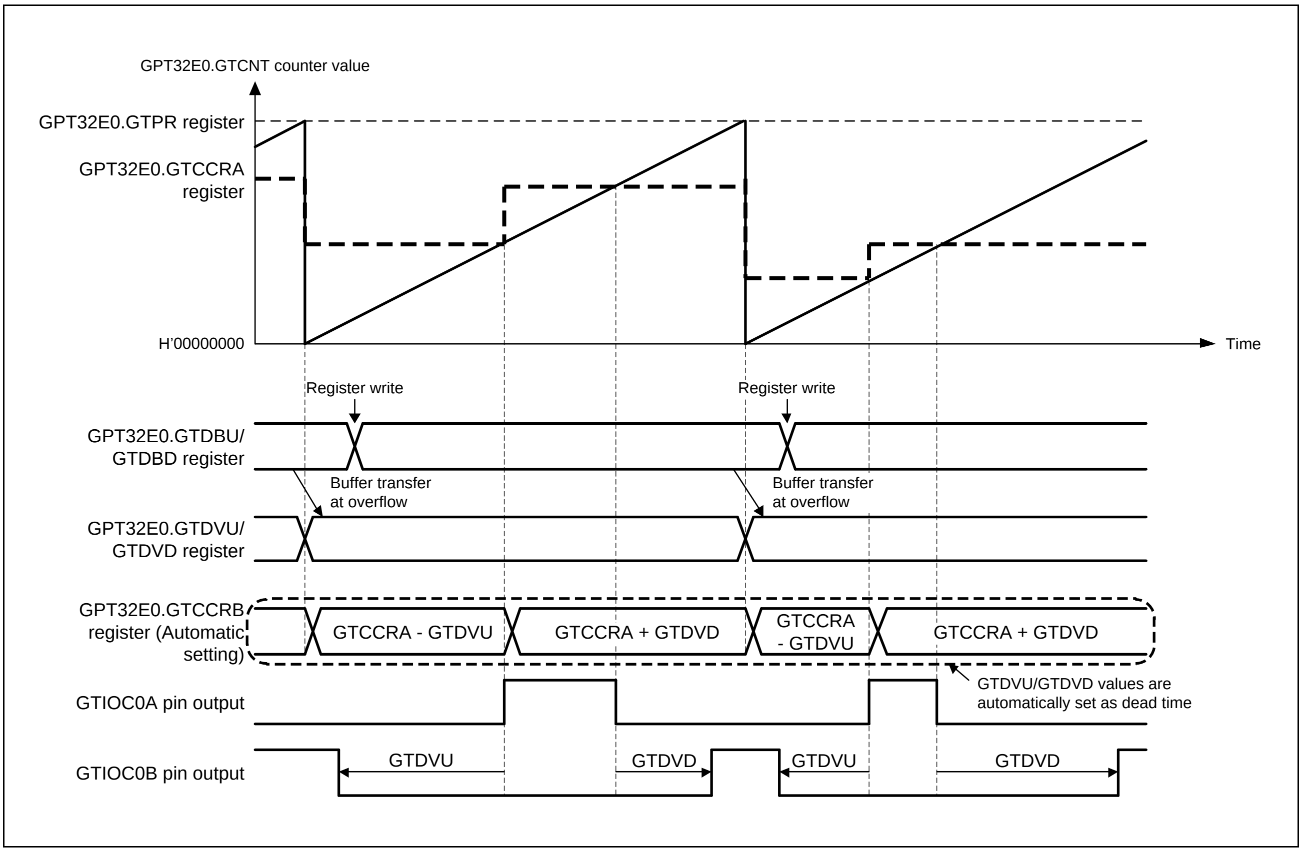

Figure 18.42 Example of automatic dead time setting function operation with saw-wave one-shot pulse mode, up-counting, GTDVU and GTDVD set to buffer operation, and active-high

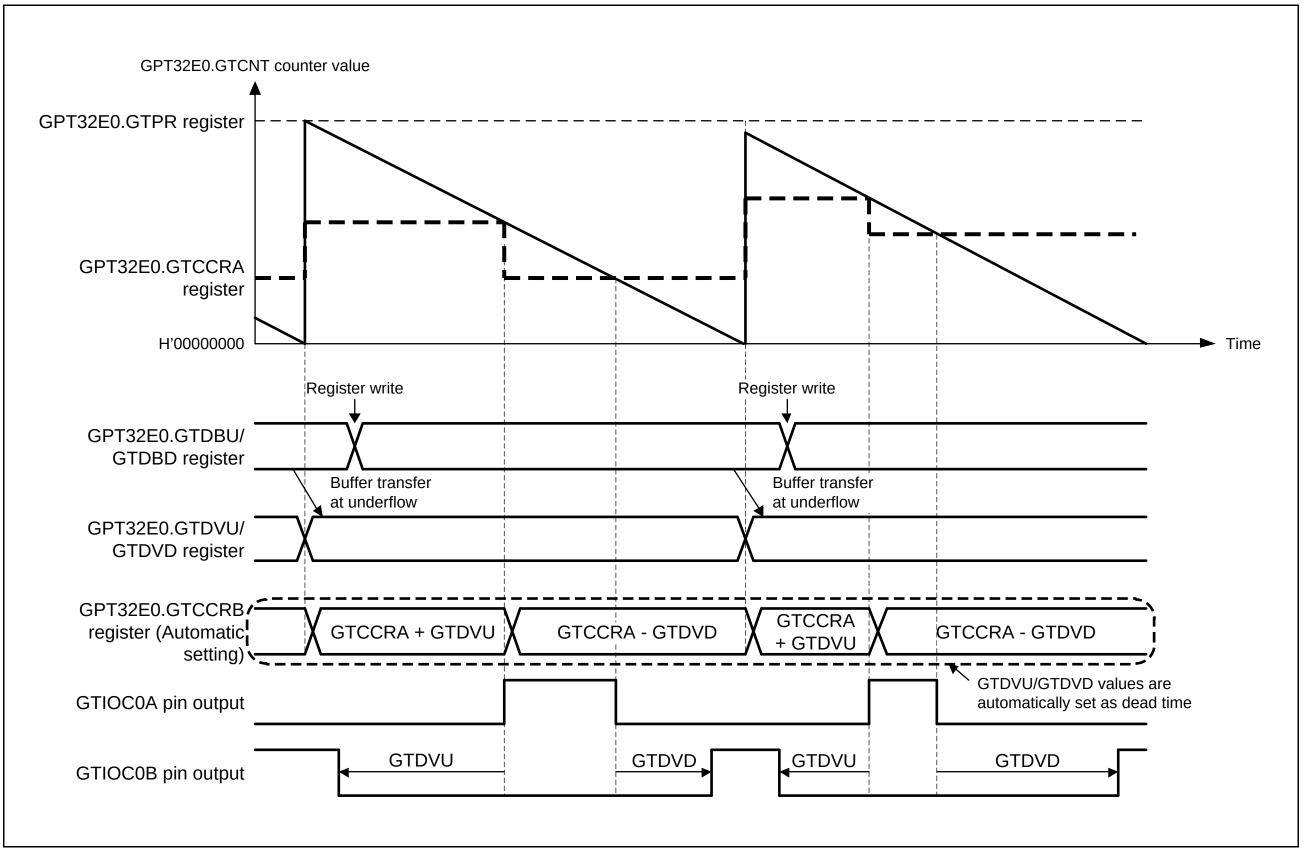

Figure 18.43 Example of automatic dead time setting function operation with saw-wave one-shot pulse mode, down-counting, GTDVU and GTDVD set to buffer operation, and active-high

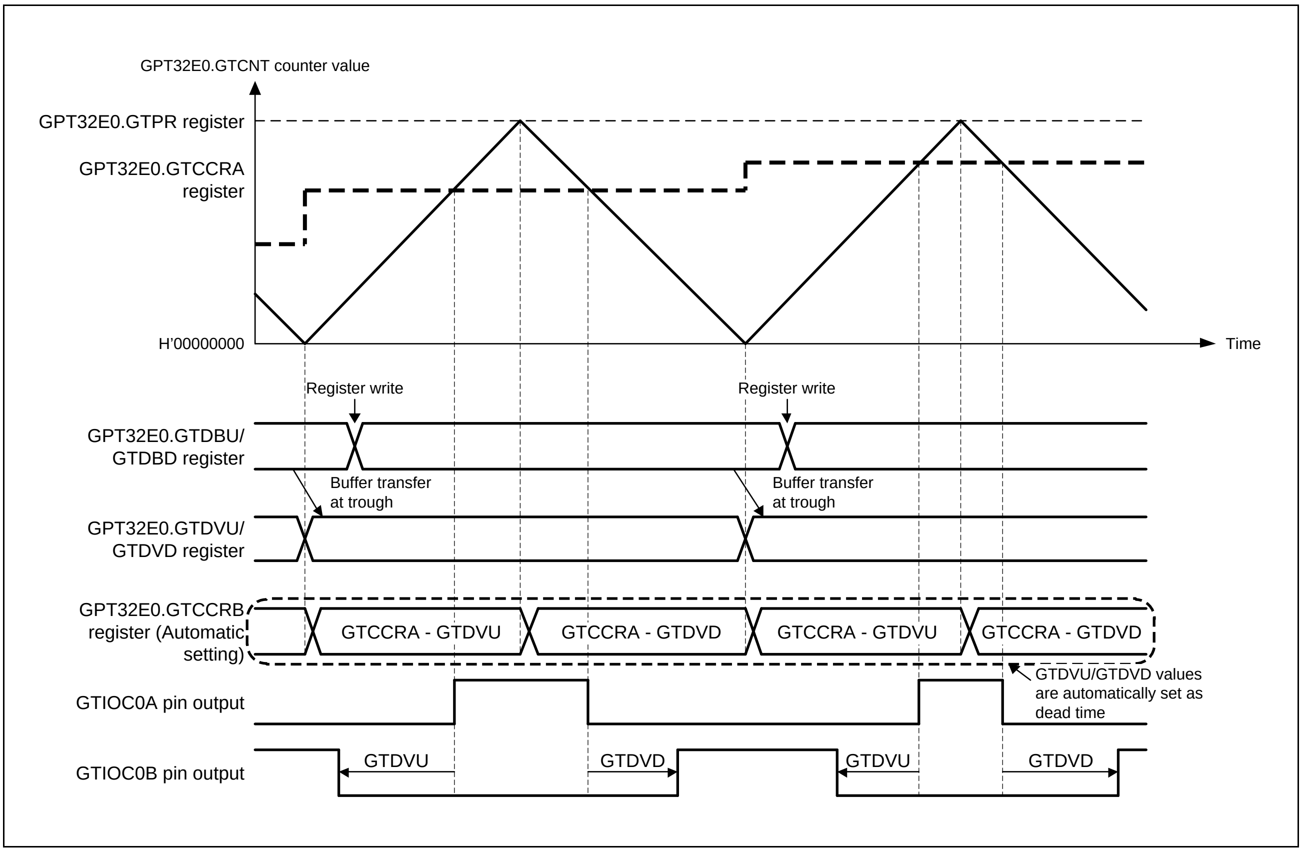

Figure 18.44 Example of automatic compare-match value setting function with dead time with triangle-wave PWM mode 1, GTDVU and GTDVD set to buffer operation, active-high

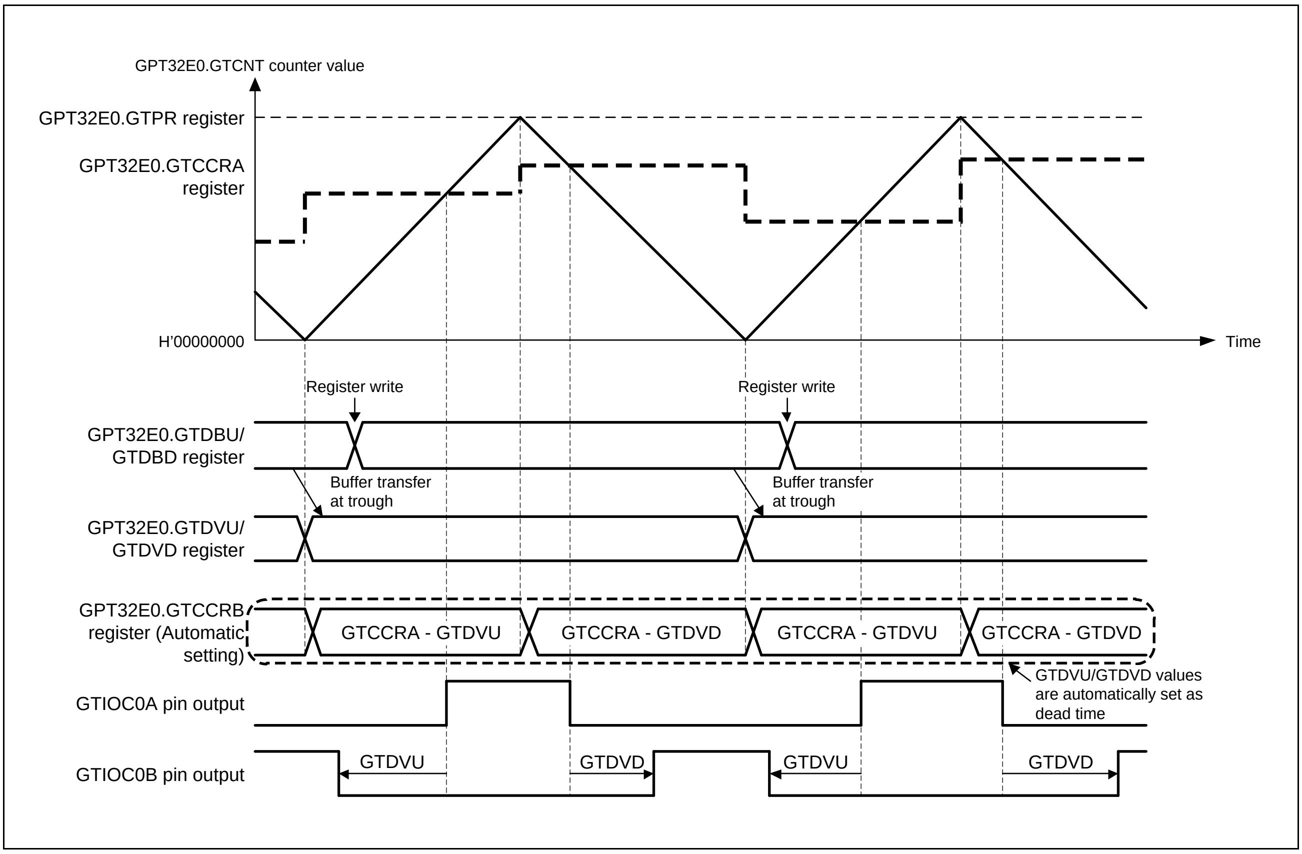

Figure 18.45 Example of automatic compare-match value setting function with dead time, with triangle-wave PWM mode 2 or 3, GTDVU and GTDVD set to buffer operation, and active-high

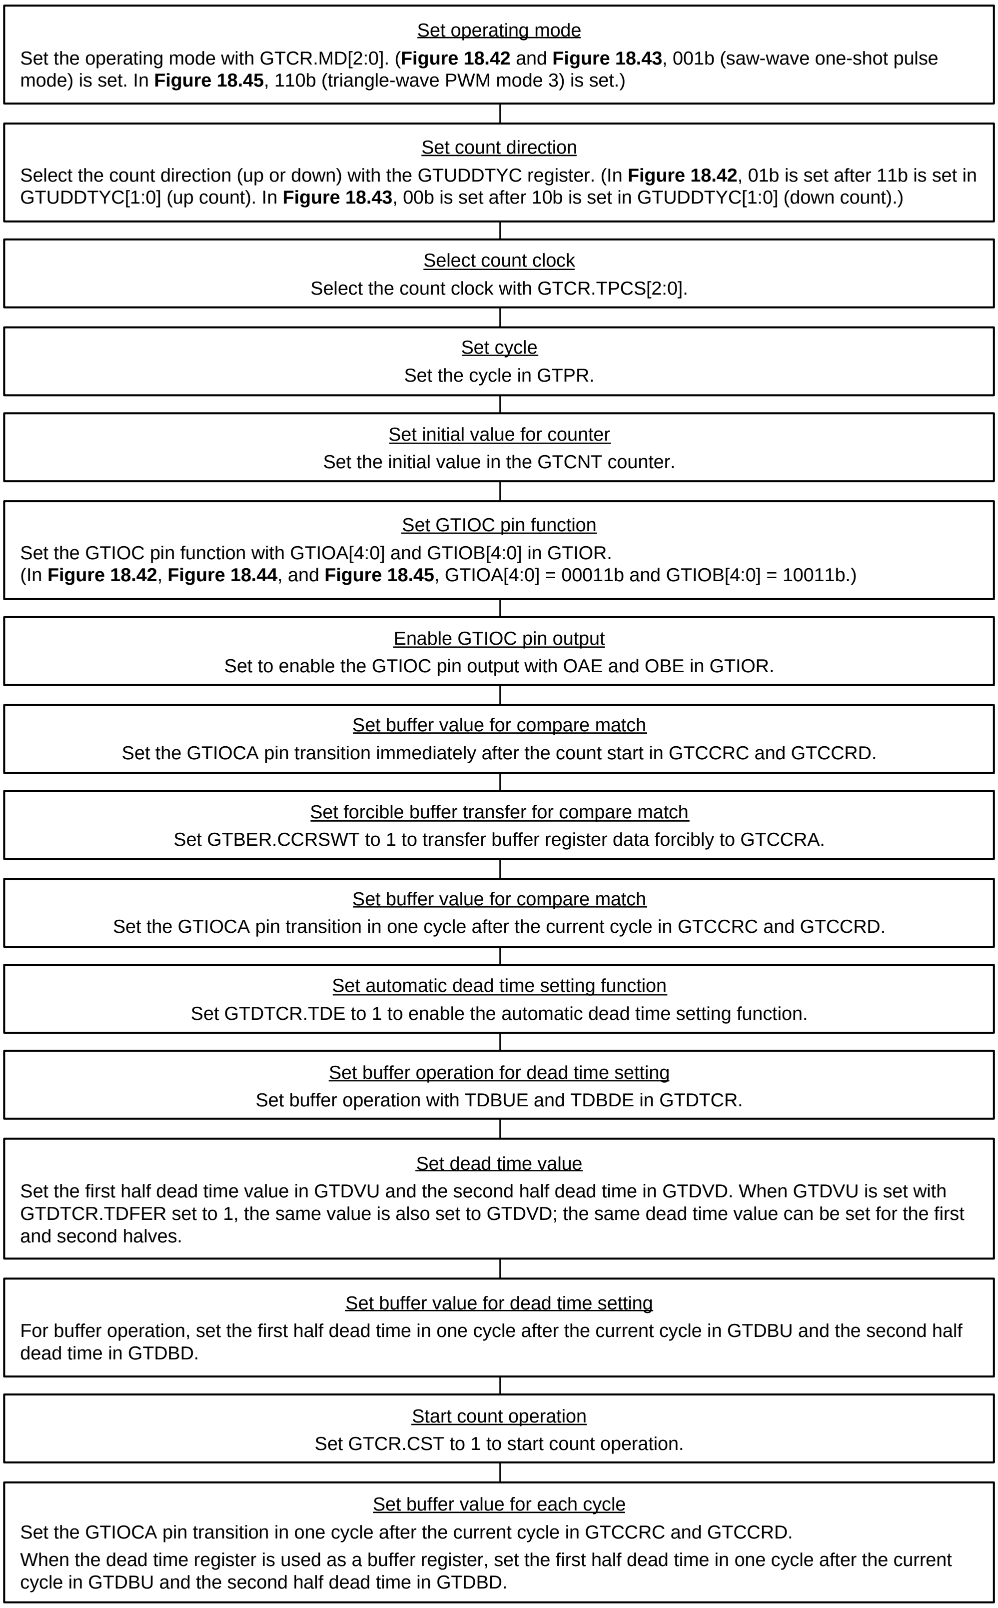


Set operating mode
Set the operating mode with GTCR.MD[2:0]. (**Figure 18.42** and **Figure 18.43**, 001b (saw-wave one-shot pulse mode) is set. In **Figure 18.45**, 110b (triangle-wave PWM mode 3) is set.)

Set count direction
Select the count direction (up or down) with the GTUDDTYC register. (In **Figure 18.42**, 01b is set after 11b is set in GTUDDTYC[1:0] (up count). In **Figure 18.43**, 00b is set after 10b is set in GTUDDTYC[1:0] (down count).)

Select count clock
Select the count clock with GTCR.TPCS[2:0].

Set cycle
Set the cycle in GTPR.

Set initial value for counter
Set the initial value in the GTCNT counter.

Set GTIOC pin function
Set the GTIOC pin function with GTIOA[4:0] and GTIOB[4:0] in GTIOR.
(In **Figure 18.42**, **Figure 18.44**, and **Figure 18.45**, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.)

Enable GTIOC pin output
Set to enable the GTIOC pin output with OAE and OBE in GTIOR.

Set buffer value for compare match
Set the GTIOCA pin transition immediately after the count start in GTCCRC and GTCCRD.

Set forcible buffer transfer for compare match
Set GTBER.CCRSWT to 1 to transfer buffer register data forcibly to GTCCRA.

Set buffer value for compare match
Set the GTIOCA pin transition in one cycle after the current cycle in GTCCRC and GTCCRD.

Set automatic dead time setting function
Set GTDTCR.TDE to 1 to enable the automatic dead time setting function.

Set buffer operation for dead time setting
Set buffer operation with TDBUE and TDBDE in GTDTCR.

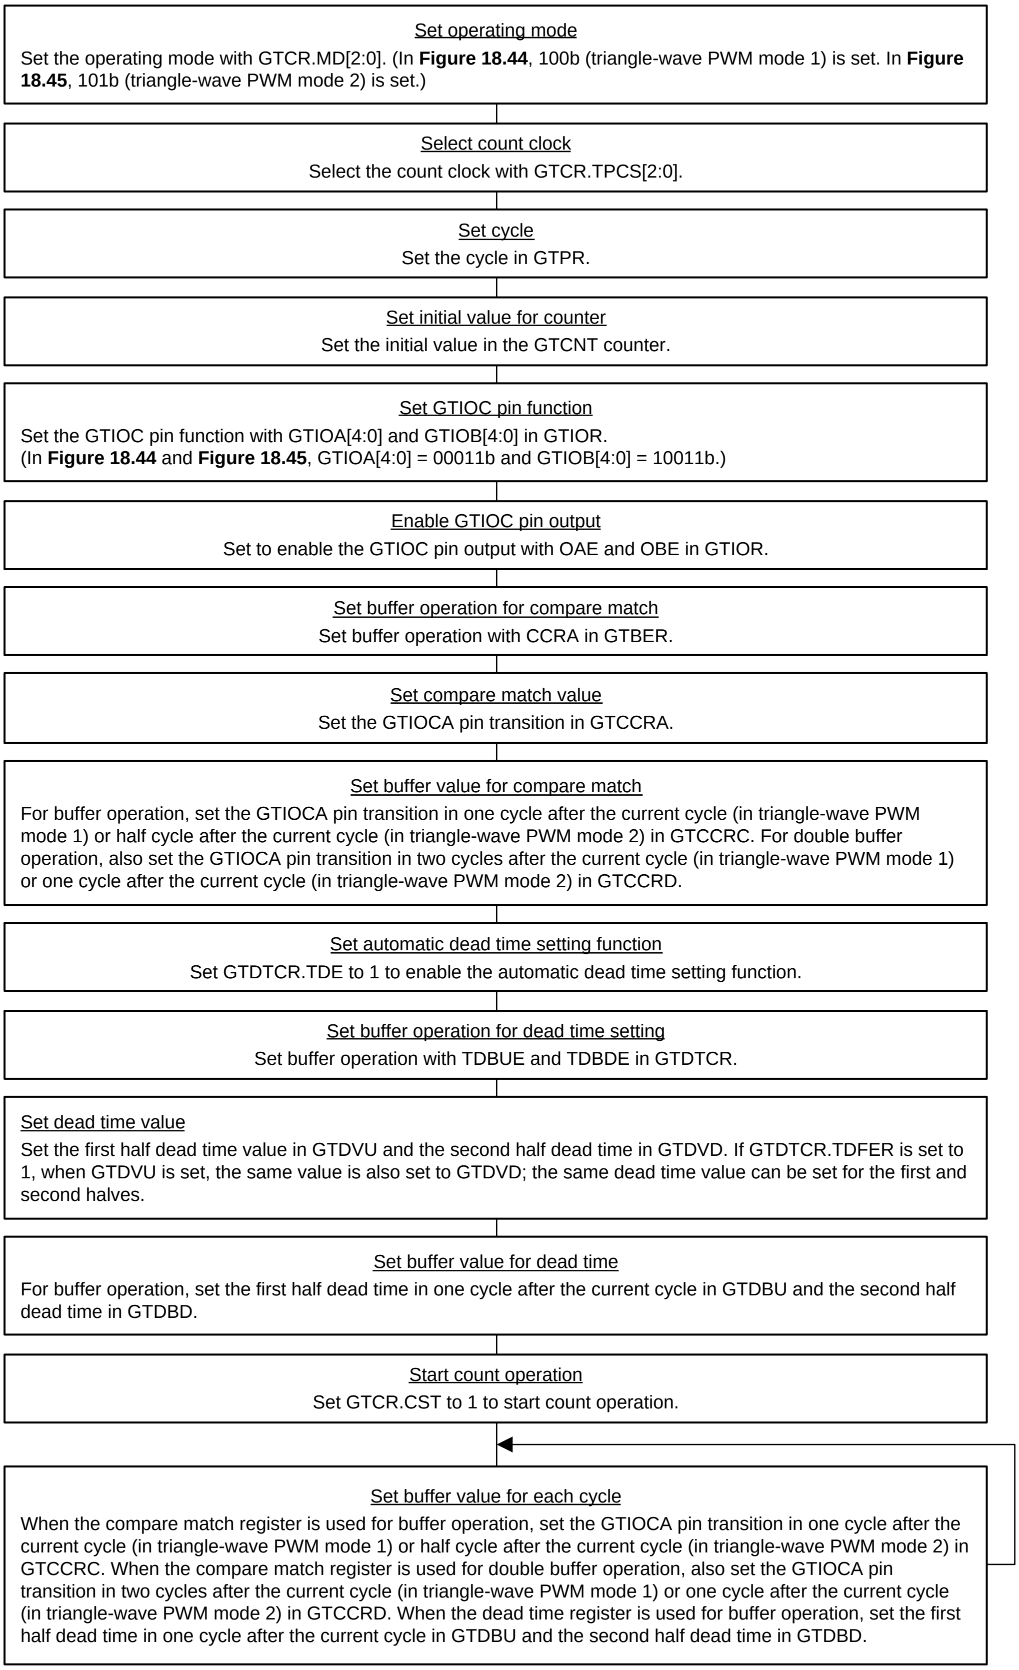
Set dead time value
Set the first half dead time value in GTDVU and the second half dead time in GTDVD. When GTDVU is set with GTDTCR.TDFER set to 1, the same value is also set to GTDVD; the same dead time value can be set for the first and second halves.

Set buffer value for dead time setting
For buffer operation, set the first half dead time in one cycle after the current cycle in GTDBU and the second half dead time in GTDBD.

Start count operation
Set GTCR.CST to 1 to start count operation.

Set buffer value for each cycle
Set the GTIOCA pin transition in one cycle after the current cycle in GTCCRC and GTCCRD.
When the dead time register is used as a buffer register, set the first half dead time in one cycle after the current cycle in GTDBU and the second half dead time in GTDBD.

Figure 18.46 Example setting for automatic dead time setting function with saw-wave one-shot pulse mode, and triangle-wave PWM mode 3



Set operating mode

Set the operating mode with GTCR.MD[2:0]. (In **Figure 18.44**, 100b (triangle-wave PWM mode 1) is set. In **Figure 18.45**, 101b (triangle-wave PWM mode 2) is set.)

Select count clock

Select the count clock with GTCR.TPCS[2:0].

Set cycle

Set the cycle in GTPR.

Set initial value for counter

Set the initial value in the GTCNT counter.

Set GTIOC pin function

Set the GTIOC pin function with GTIOA[4:0] and GTIOB[4:0] in GTIOR.
(In **Figure 18.44** and **Figure 18.45**, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.)

Enable GTIOC pin output

Set to enable the GTIOC pin output with OAE and OBE in GTIOR.

Set buffer operation for compare match

Set buffer operation with CCRA in GTBER.

Set compare match value

Set the GTIOCA pin transition in GTCCRA.

Set buffer value for compare match

For buffer operation, set the GTIOCA pin transition in one cycle after the current cycle (in triangle-wave PWM mode 1) or half cycle after the current cycle (in triangle-wave PWM mode 2) in GTCCRC. For double buffer operation, also set the GTIOCA pin transition in two cycles after the current cycle (in triangle-wave PWM mode 1) or one cycle after the current cycle (in triangle-wave PWM mode 2) in GTCCRD.

Set automatic dead time setting function

Set GTDTCR.TDE to 1 to enable the automatic dead time setting function.

Set buffer operation for dead time setting

Set buffer operation with TDBUE and TDBDE in GTDTCR.

Set dead time value

Set the first half dead time value in GTDVU and the second half dead time in GTDVD. If GTDTCR.TDFER is set to 1, when GTDVU is set, the same value is also set to GTDVD; the same dead time value can be set for the first and second halves.

Set buffer value for dead time

For buffer operation, set the first half dead time in one cycle after the current cycle in GTDBU and the second half dead time in GTDBD.

Start count operation

Set GTCR.CST to 1 to start count operation.

Set buffer value for each cycle

When the compare match register is used for buffer operation, set the GTIOCA pin transition in one cycle after the current cycle (in triangle-wave PWM mode 1) or half cycle after the current cycle (in triangle-wave PWM mode 2) in GTCCRC. When the compare match register is used for double buffer operation, also set the GTIOCA pin transition in two cycles after the current cycle (in triangle-wave PWM mode 1) or one cycle after the current cycle (in triangle-wave PWM mode 2) in GTCCRD. When the dead time register is used for buffer operation, set the first half dead time in one cycle after the current cycle in GTDBU and the second half dead time in GTDBD.

Figure 18.47 Example setting for automatic dead time setting function with triangle-wave PWM mode 1 or 2

18.3.5 Count Direction Changing Function

The count direction of the GTCNT counter can be changed by modifying the UD bit in GTUDDTYC.

In saw-wave mode, if the UD bit in GTUDDTYC is modified during count operation, the count direction is changed at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.UD bit is modified while the count operation stops and the GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit modification is not reflected at the start of counting and the count direction is changed at an overflow or an underflow. If the UDF bit is set to 1 while the count operation stops, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

In triangle-wave mode, the count direction does not change even though the UD bit in GTUDDTYC is modified during the count operation. Similarly, even though the GTUDDTYC.UD bit is modified while the count operation stops and GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit value is not reflected to the count operation. If the GTUDDTYC.UDF bit is set to 1 while the count operation stops, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

If the count direction changes during a saw-wave count operation, the GTPR value after the start of up-counting is reflected to the count cycle during up-counting and the GTPR value before the start of down-counting is reflected during down-counting.

Figure 18.48 shows an example of count direction changing function operation.

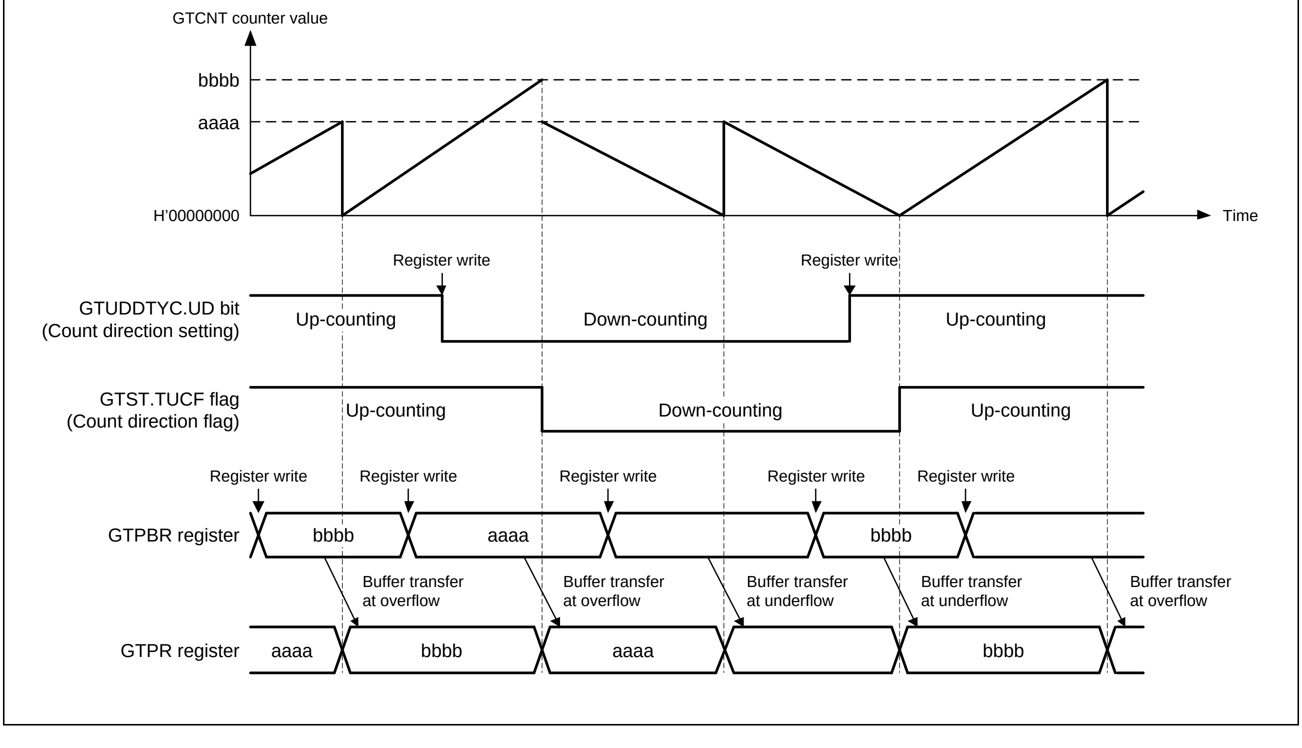


Figure 18.48 Example of count direction changing function operation during buffer operation

18.3.6 Function of Output Duty 0% and 100%

The output duty of the GTIOCA pin and the GTIOCB pin are set to 0% or 100% by changing the GTUDDTYC.OADTY bit or GTUDDTYC.OBDTY bit.

In saw-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation stops and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an overflow or an underflow. If the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is set to 1 while the count operation stops, the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit value at that time is reflected at the start of counting.

In triangle-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected an underflow.

If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation stops and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an underflow. If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation stops and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 1, the output duty modification is reflected at the start of counting.

In performing 0%/100% duty operation, GPT internally continues to:

- Perform compare match operation
- Set compare match flag
- Output interrupt
- Perform buffer operation.

When the control is changed from 0% or 100% duty setting to compare match, the output value of GTIOCA pin at cycle end is decided by GTIOR.GTIOA[3:2] and GTUDDTYC.OADTYR. The output value of GTIOCB pin at cycle end is decided by GTIOR.GTIOB[3:2] and GTUDDTYC.OBDTYR.

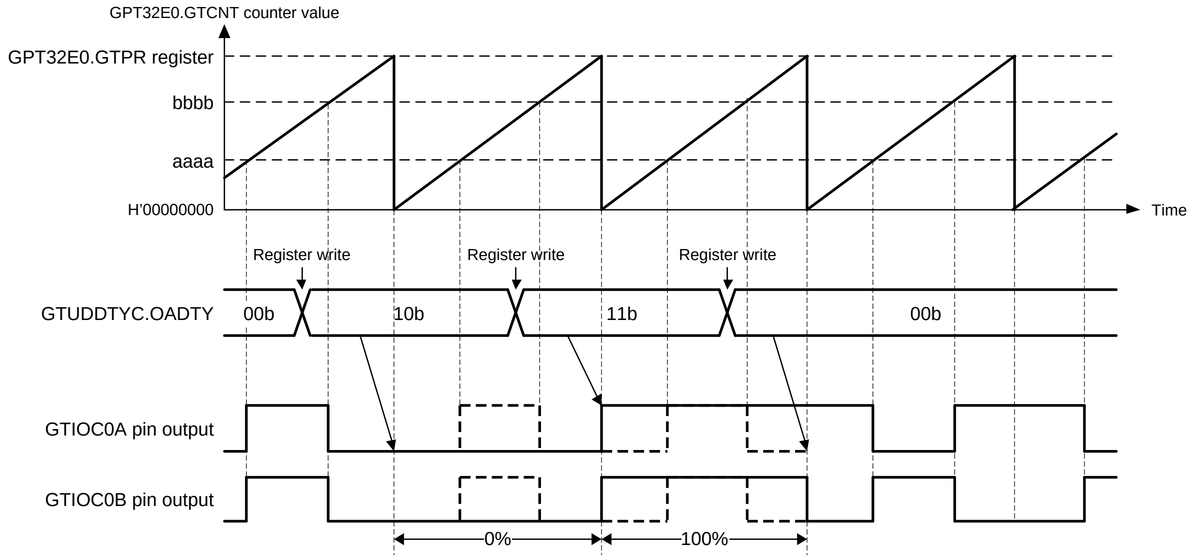
When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 01b, the output pins output low at cycle end. When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 10b, the output pins output high at cycle end.

GTUDDTYC.OADTYR selects the value that is the object of output retained/toggled at cycle end, when GTIOR.GTIOm[3:2] are set to 00b (output retained at cycle end) or when GTIOR.GTIOm[3:2] are set to 11b (output toggled at cycle end). **Table 18.7** shows the values of GTIOCA/GTIOCB pin output at cycle end.

Table 18.7 Output values after releasing 0% or 100% duty setting (m = A, B)

GTIOR.GTIOm[3:2]	Compare match value at cycle end masked by 0% or 100% duty setting	GTUDDTYC.OmDTYR in duty 0% setting		GTUDDTYC.OmDTYR in duty 100% setting	
		0	1	0	1
00 (Output retained at cycle end)	0	0	0	1	0
	1	0	1	1	1
01 (low output at cycle end)	—	0	0	0	0
10 (high output at cycle end)	—	1	1	1	1
11 (Output toggled at cycle end)	0	1	1	0	1
	1	1	0	0	0

Figure 18.49 shows the example of output duty 0% and 100% functions.



[Setting examples]

GPT32E0.GTIOR.GTIOA[4:0] bits:	00011b Initial output of low, output toggled at compare match, output retained at cycle end
GPT32E0.GTUDDTYC.OADTYR bit:	0 Applied the value of duty 0%/100% output to GTIOA[3:2] bits function after 0%/100% duty setting is released.
GPT32E0.GTIOR.GTIOB[4:0] bits:	00011b Initial output of low, output toggled at compare match, output retained at cycle end
GPT32E0.GTUDDTYC.OBDTYR bit:	1 Applied the value of masked compare match output to GTIOB[3:2] bits function after 0%/100% duty setting is released

Figure 18.49 Example of output duty 0% and 100% functions

18.3.7 Hardware Count Start/Count Stop and Clear Operation

The GTCNT counter can be started, stopped, or cleared by the following hardware sources:

- External trigger input
- GTIOCA/GTIOCB pin input.

18.3.7.1 Hardware Start Operation

The GTCNT counter can be started by selecting a hardware source using GTSSR.

Figure 18.50 shows an example of a count start operation by a hardware source. **Figure 18.51** shows the setting example.

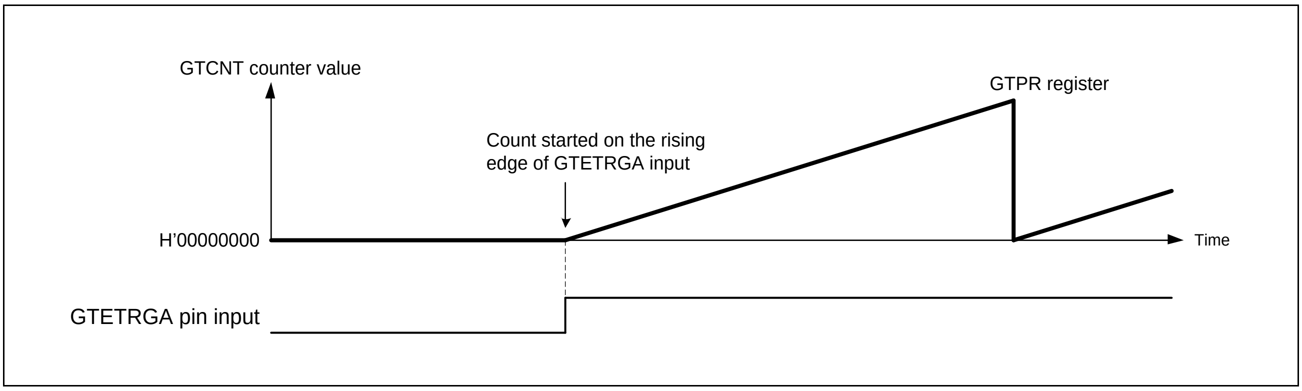


Figure 18.50 Example of count start operation by hardware source, started on the rising edge of GTETRGA pin input

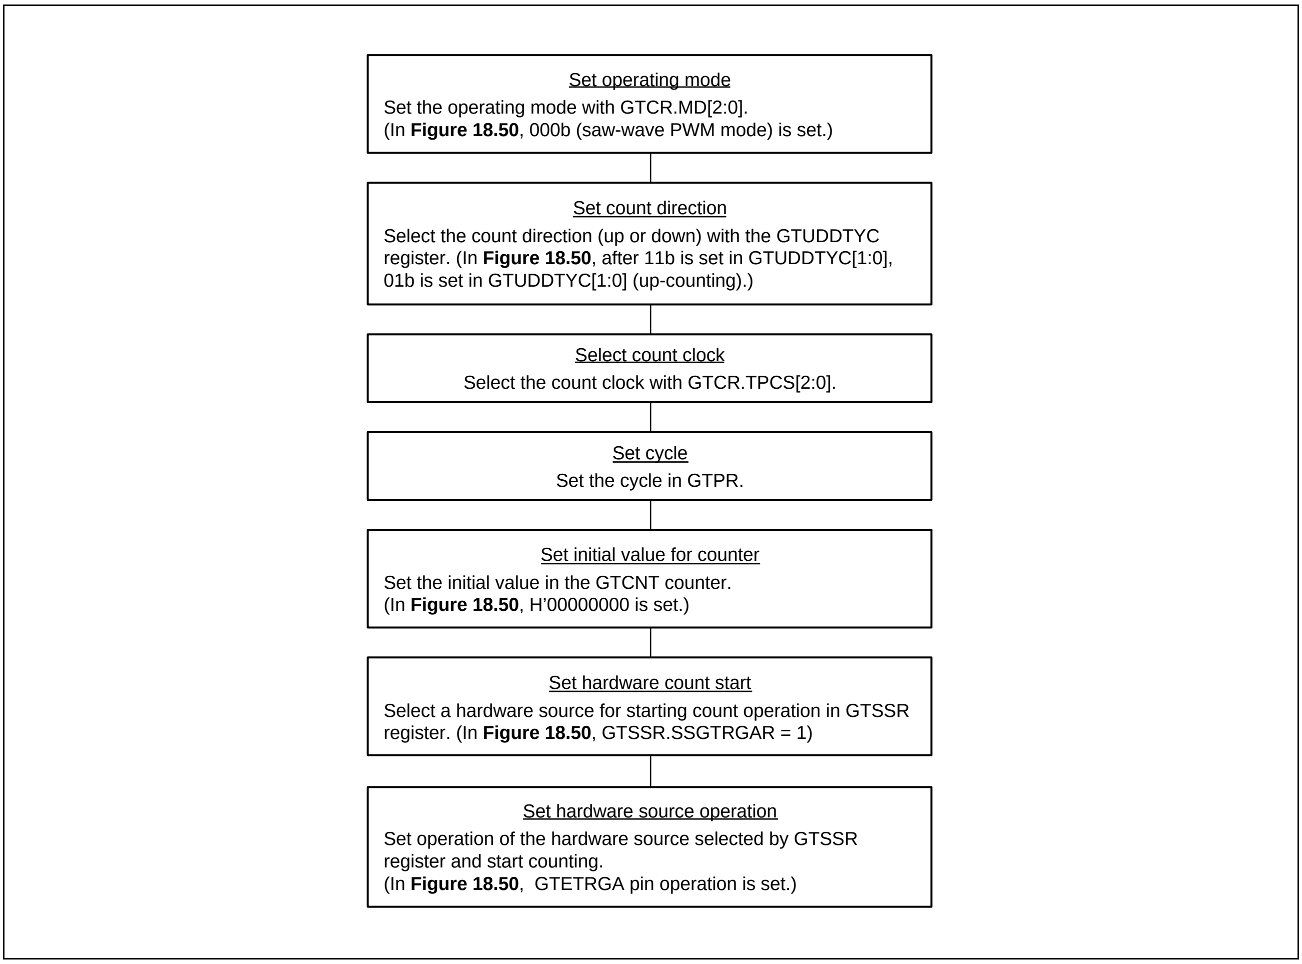

Set operating mode
Set the operating mode with GTCR.MD[2:0].
(In **Figure 18.50**, 000b (saw-wave PWM mode) is set.)

Set count direction
Select the count direction (up or down) with the GTUDDTYC register. (In **Figure 18.50**, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).)

Select count clock
Select the count clock with GTCR.TPCS[2:0].

Set cycle
Set the cycle in GTPR.

Set initial value for counter
Set the initial value in the GTCNT counter.
(In **Figure 18.50**, H’00000000 is set.)

Set hardware count start
Select a hardware source for starting count operation in GTSSR register. (In **Figure 18.50**, GTSSR.SSGTRGAR = 1)

Set hardware source operation
Set operation of the hardware source selected by GTSSR register and start counting.
(In **Figure 18.50**, GTETRGA pin operation is set.)

Figure 18.51 Example setting for count start operation by hardware source

18.3.7.2 Hardware Stop Operation

The GTCNT counter can be stopped by selecting a hardware source using GTPSR. **Figure 18.52** shows an example of a count stop operation by a hardware source. **Figure 18.53** shows the setting example. In this example, the count operation stops at the rising edge of GTETRGA pin input and restarts at the rising edge of GTETRGB pin input.

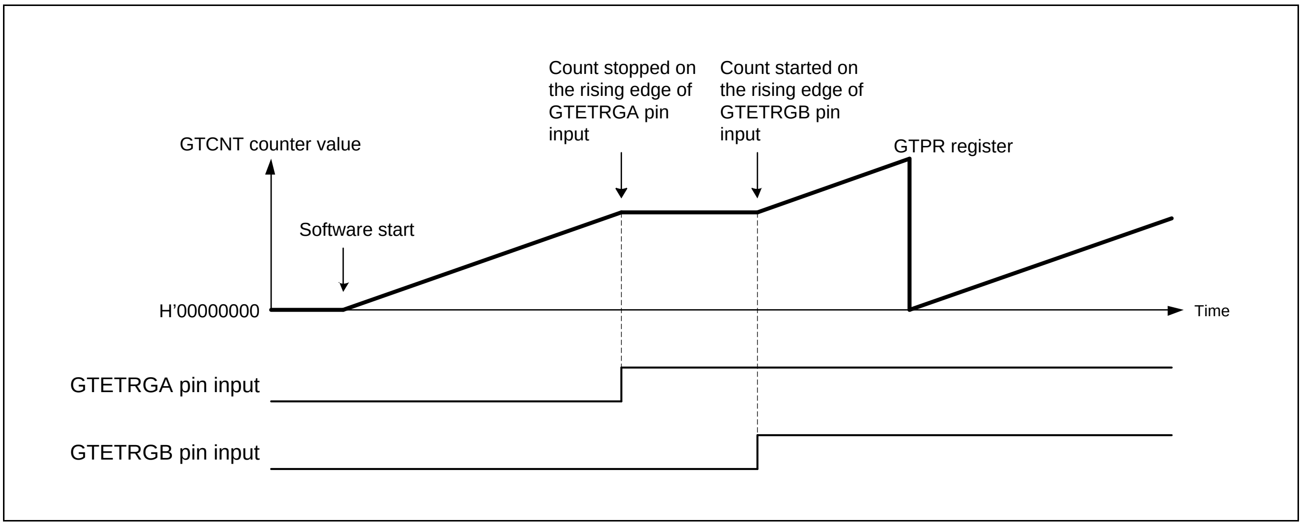

Figure 18.52 Example of count start operation by hardware source, started by software, stopped on the rising edge of GTETRGA pin input, and restarted on the rising edge of GTETRGB pin input

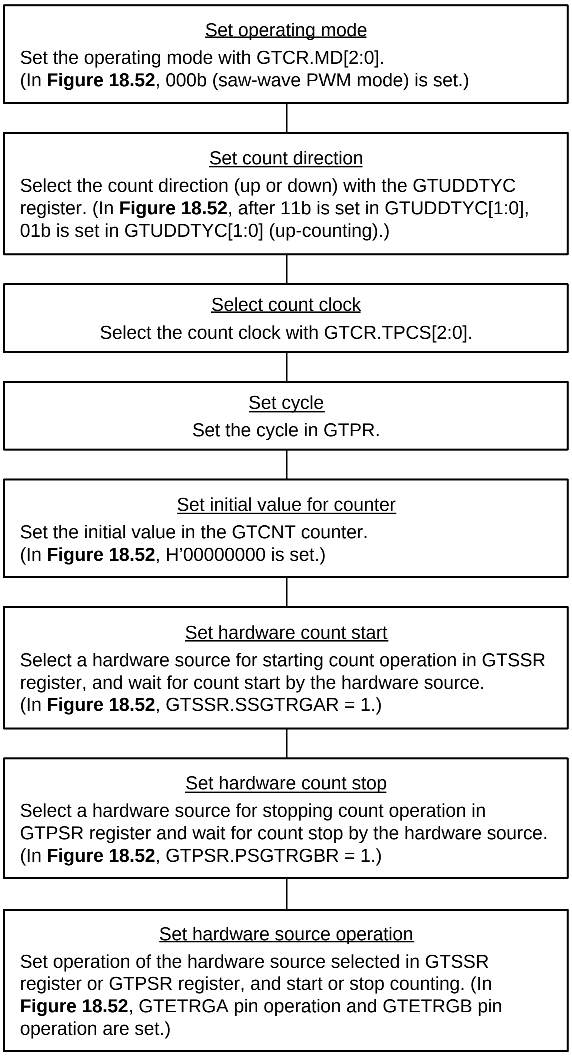

Set operating mode

Set the operating mode with GTCR.MD[2:0]. (In **Figure 18.52**, 000b (saw-wave PWM mode) is set.)

Set count direction

Select the count direction (up or down) with the GTUDDTYC register. (In **Figure 18.52**, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).)

Select count clock

Select the count clock with GTCR.TPCS[2:0].

Set cycle

Set the cycle in GTPR.

Set initial value for counter

Set the initial value in the GTCNT counter. (In **Figure 18.52**, H'00000000 is set.)

Set hardware count start

Select a hardware source for starting count operation in GTSSR register, and wait for count start by the hardware source. (In **Figure 18.52**, GTSSR.SSGTRGAR = 1.)

Set hardware count stop

Select a hardware source for stopping count operation in GTPSR register and wait for count stop by the hardware source. (In **Figure 18.52**, GTPSR.PSGTRGBR = 1.)

Set hardware source operation

Set operation of the hardware source selected in GTSSR register or GTPSR register, and start or stop counting. (In **Figure 18.52**, GTETRGA pin operation and GTETRGB pin operation are set.)

Figure 18.53 Example setting for count stop operation by hardware source

Figure 18.54 shows an example of a count start/stop operation by a hardware source. **Figure 18.55** shows the setting example. In this example, the counter operates during the high-level periods of the external trigger input GTETRGA.

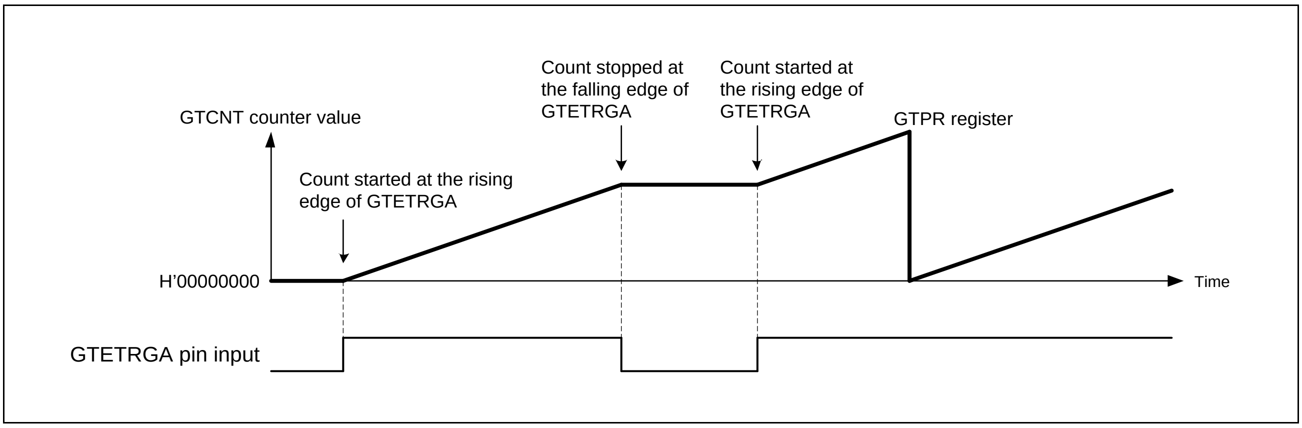

Figure 18.54 Example of count start/stop operation by hardware source, started on the rising edge of the GTETRGA pin input and stopped on the falling edge of the GTETRGA pin input

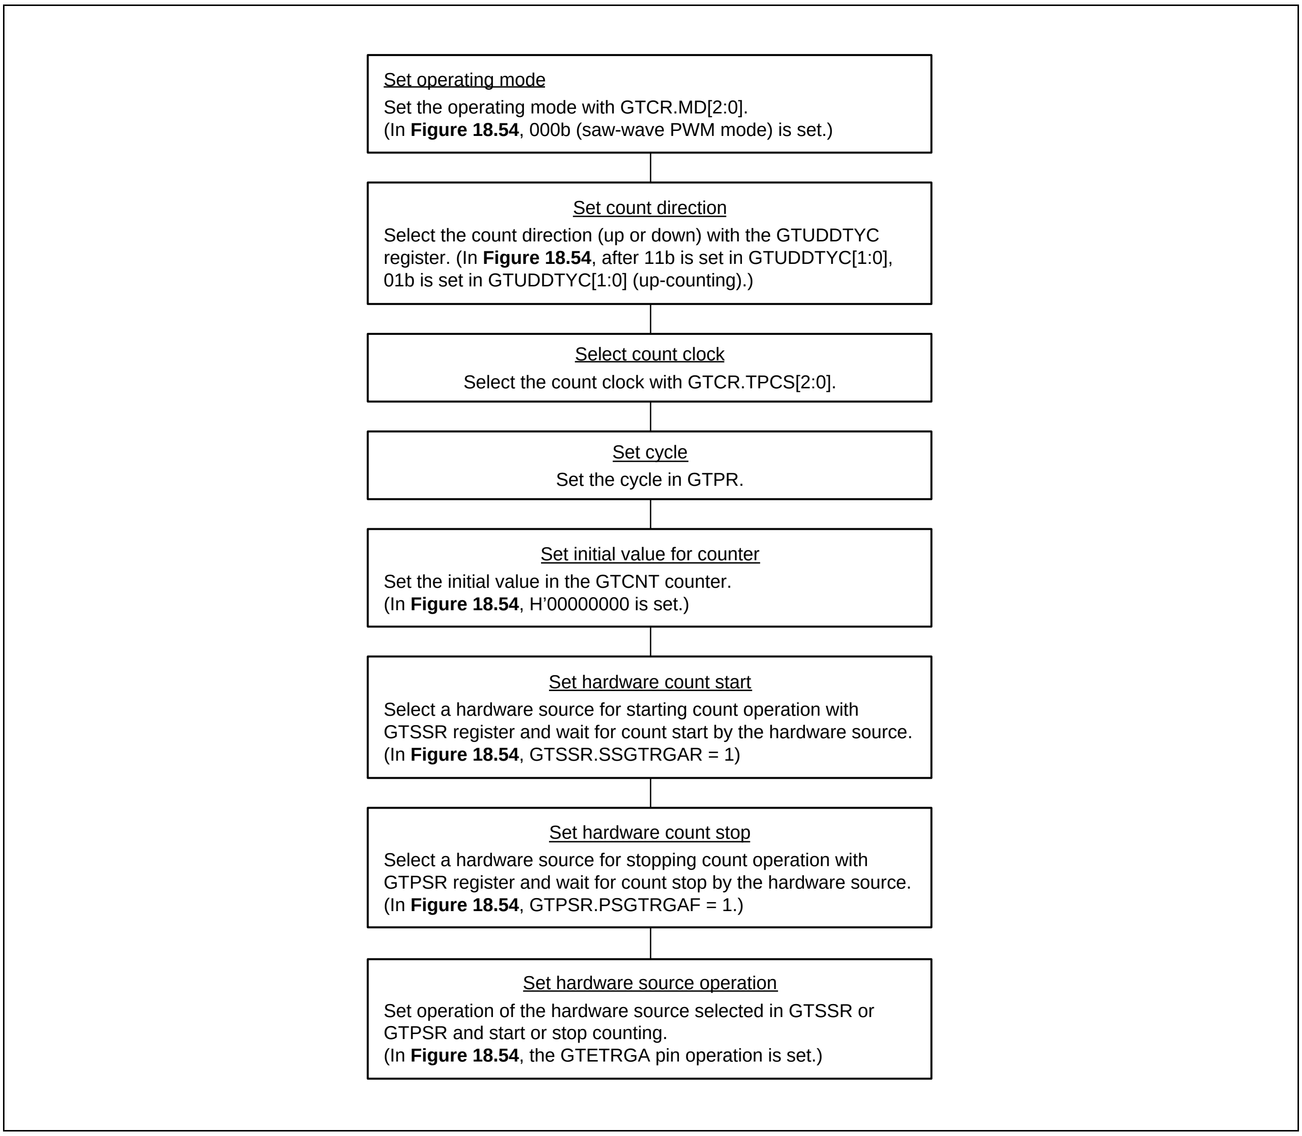

Set operating mode
Set the operating mode with GTCR.MD[2:0].
(In **Figure 18.54**, 000b (saw-wave PWM mode) is set.)

Set count direction
Select the count direction (up or down) with the GTUDDTYC register. (In **Figure 18.54**, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).)

Select count clock
Select the count clock with GTCR.TPCS[2:0].

Set cycle
Set the cycle in GTPR.

Set initial value for counter
Set the initial value in the GTCNT counter.
(In **Figure 18.54**, H'00000000 is set.)

Set hardware count start
Select a hardware source for starting count operation with GTSSR register and wait for count start by the hardware source.
(In **Figure 18.54**, GTSSR.SSGTRGAR = 1)

Set hardware count stop
Select a hardware source for stopping count operation with GTPSR register and wait for count stop by the hardware source.
(In **Figure 18.54**, GTPSR.PSGTRGAF = 1.)

Set hardware source operation
Set operation of the hardware source selected in GTSSR or GTPSR and start or stop counting.
(In **Figure 18.54**, the GTETRGA pin operation is set.)

Figure 18.55 Example setting for count start/stop operation by hardware source

18.3.7.3 Hardware Clear Operation

The GTCNT counter can be cleared by selecting a hardware source using GTCSR. The OVFn/UNFn (n=0 to 7) interrupt (overflow/underflow interrupt) is not generated when the GTCNT counter is cleared by a hardware source or by software.

Figure 18.56 and **Figure 18.57** show examples of the GTCNT counter clearing operation by a hardware source. **Figure 18.58** shows the setting example. In this example, the GTCNT counter starts at the rising edge of GTETRGA pin input, and the counter stops/clears at the falling edge of GTETRGA pin input.

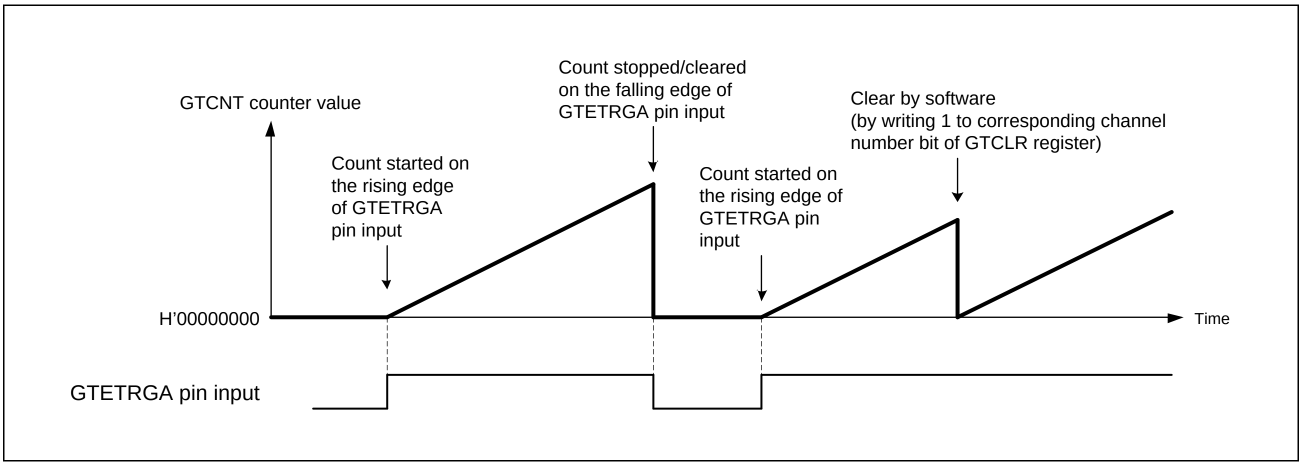

Figure 18.56 Example of count clearing operation by hardware source with saw wave up-counting, started on the rising edge of GTETRGA pin input, and stopped/cleared on the falling edge of GTETRGA pin input

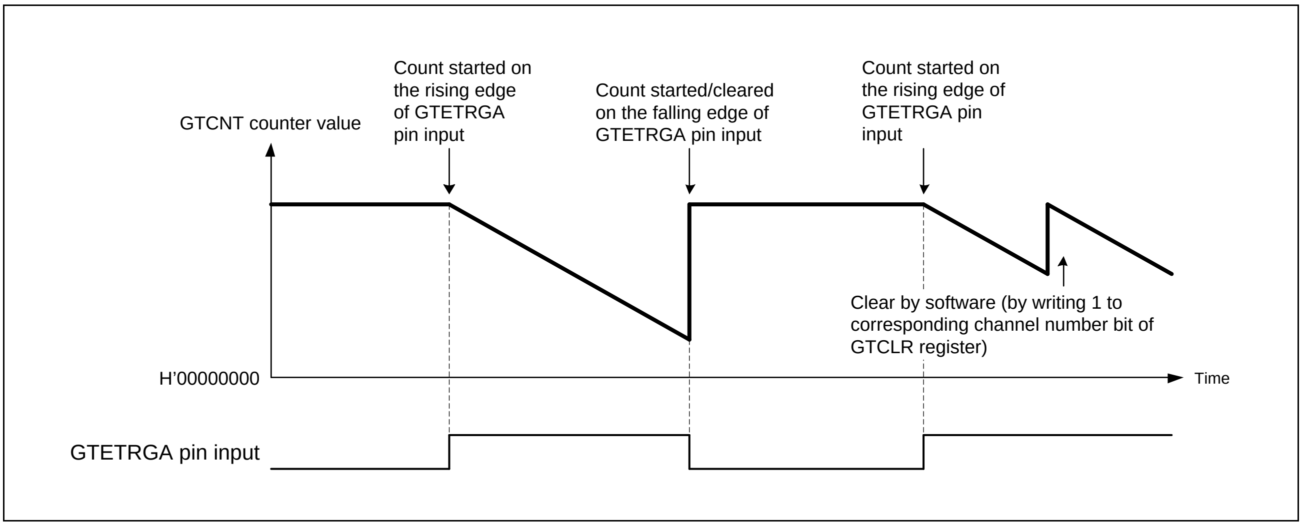

Figure 18.57 Examples of count clearing operation by hardware source with saw wave down-counting, started at event input A, and stopped/cleared at event input B

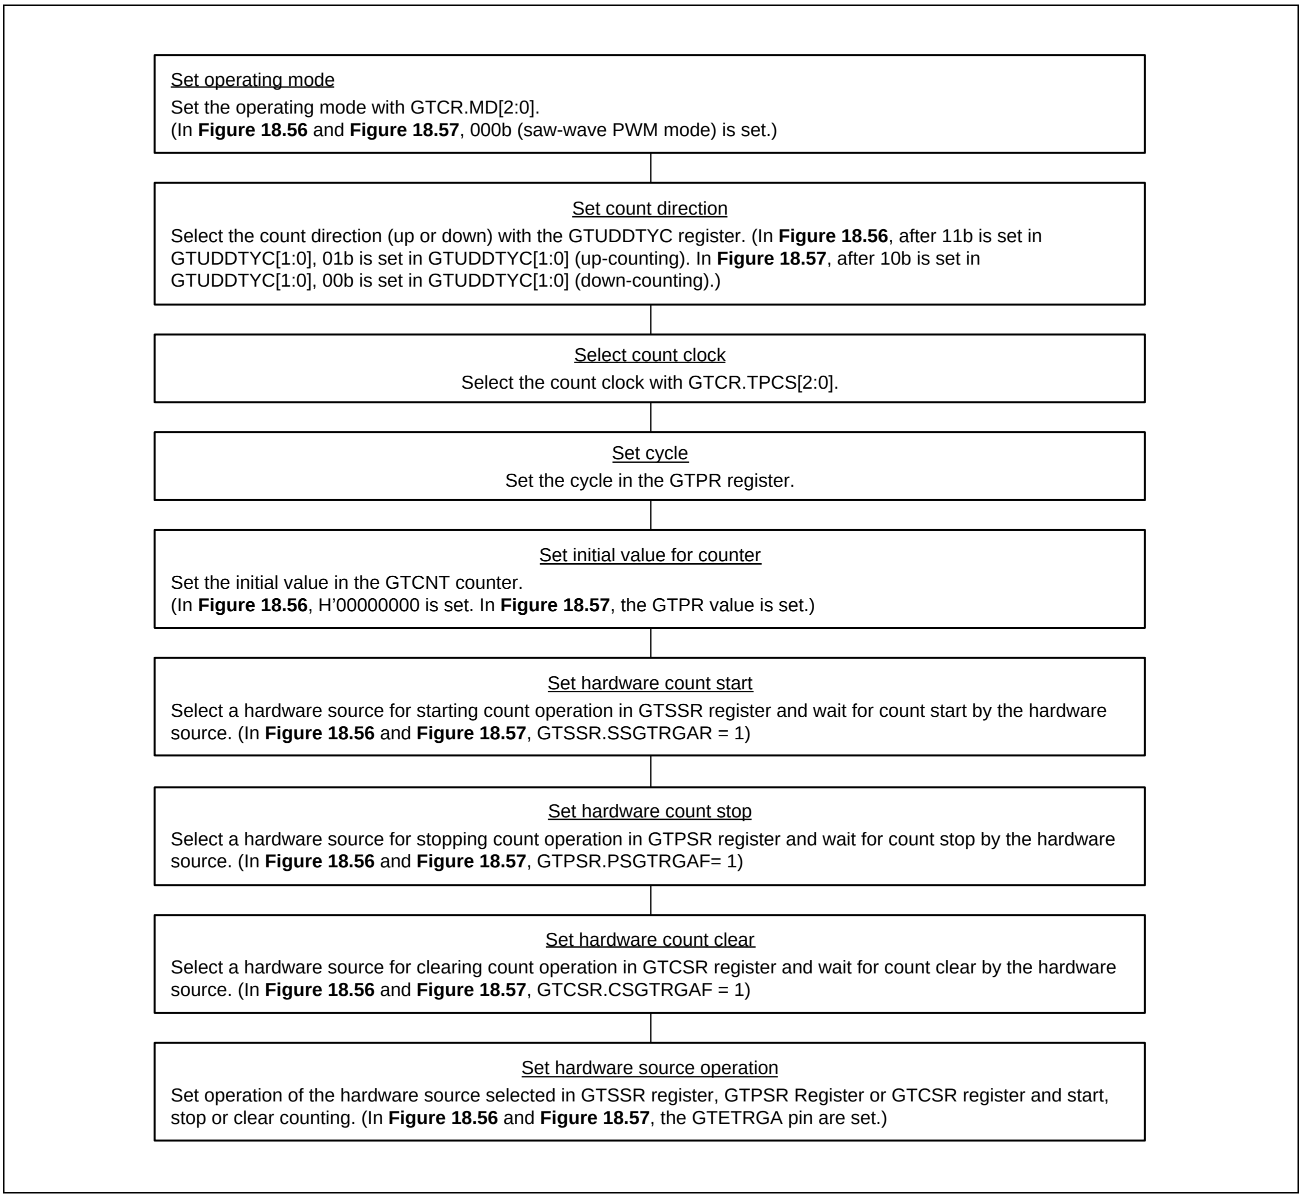

Set operating mode
Set the operating mode with GTCR.MD[2:0].
(In **Figure 18.56** and **Figure 18.57**, 000b (saw-wave PWM mode) is set.)

Set count direction
Select the count direction (up or down) with the GTUDDTYC register. (In **Figure 18.56**, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting). In **Figure 18.57**, after 10b is set in GTUDDTYC[1:0], 00b is set in GTUDDTYC[1:0] (down-counting).)

Select count clock
Select the count clock with GTCR.TPCS[2:0].

Set cycle
Set the cycle in the GTPR register.

Set initial value for counter
Set the initial value in the GTCNT counter.
(In **Figure 18.56**, H'00000000 is set. In **Figure 18.57**, the GTPR value is set.)

Set hardware count start
Select a hardware source for starting count operation in GTSSR register and wait for count start by the hardware source. (In **Figure 18.56** and **Figure 18.57**, GTSSR.SSGTRGAR = 1)

Set hardware count stop
Select a hardware source for stopping count operation in GTPSR register and wait for count stop by the hardware source. (In **Figure 18.56** and **Figure 18.57**, GTPSR.PSGTRGAF= 1)

Set hardware count clear
Select a hardware source for clearing count operation in GTCSR register and wait for count clear by the hardware source. (In **Figure 18.56** and **Figure 18.57**, GTCSR.CSGTRGAF = 1)

Set hardware source operation
Set operation of the hardware source selected in GTSSR register, GTPSR Register or GTCSR register and start, stop or clear counting. (In **Figure 18.56** and **Figure 18.57**, the GTETRGA pin are set.)

Figure 18.58 Example setting for count clearing operation by hardware source

The OVFn/UNFn (n=0 to 7) interrupt (overflow/underflow interrupt) is not generated when the counter is cleared by a hardware source or by software.

Figure 18.59 shows the relationship between the counter clearing by a hardware source and the OVFn (n=0 to 7) interrupt.

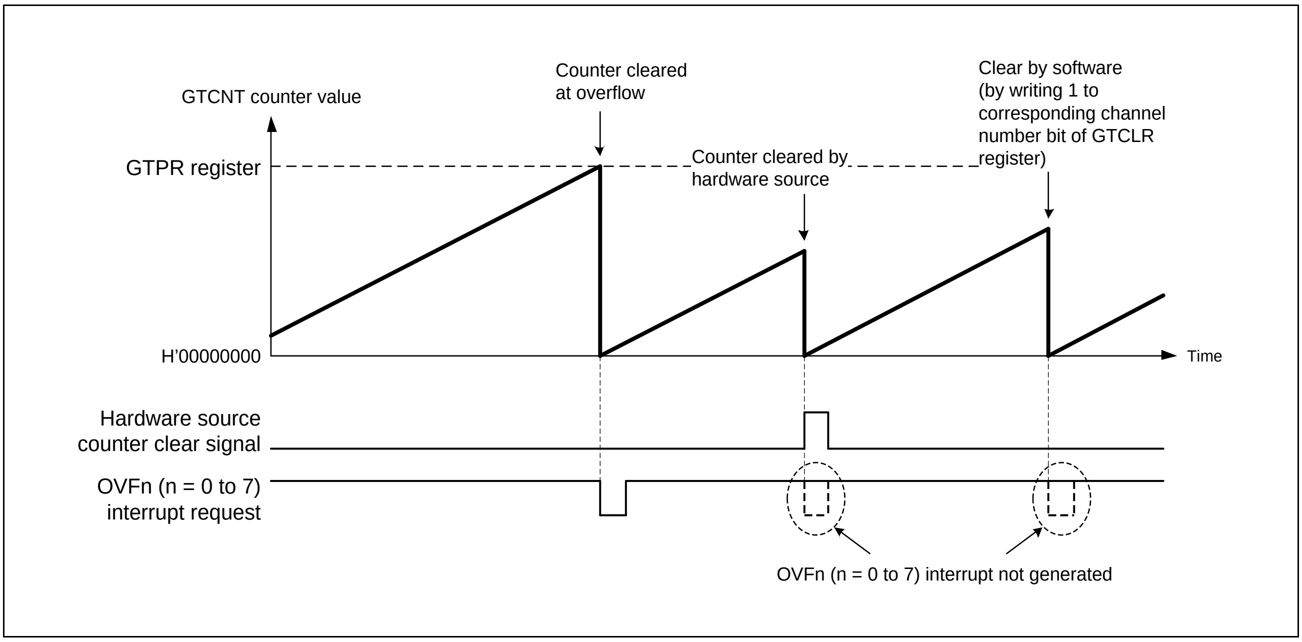

Figure 18.59 Relationship between counter clearing by hardware source and OVFn (n = 0 to 7) interrupt

18.3.8 Synchronized Operation

Synchronized operation on channels such as a synchronized start, stop and clear operation can be performed.

18.3.8.1 Synchronized Operation by Software

The GTCNT counters can be started, stopped, and cleared on multiple channels by setting the associated GTSTR, GTSTP or GTCLR bits simultaneously to 1.

Count start with a phase difference is possible by setting the initial value in the GTCNT counter and setting the associated GTSTR bits simultaneously to 1.

Figure 18.60 shows an example of a simultaneous start, stop and clear by software. **Figure 18.61** shows an example of phase start operation by software.

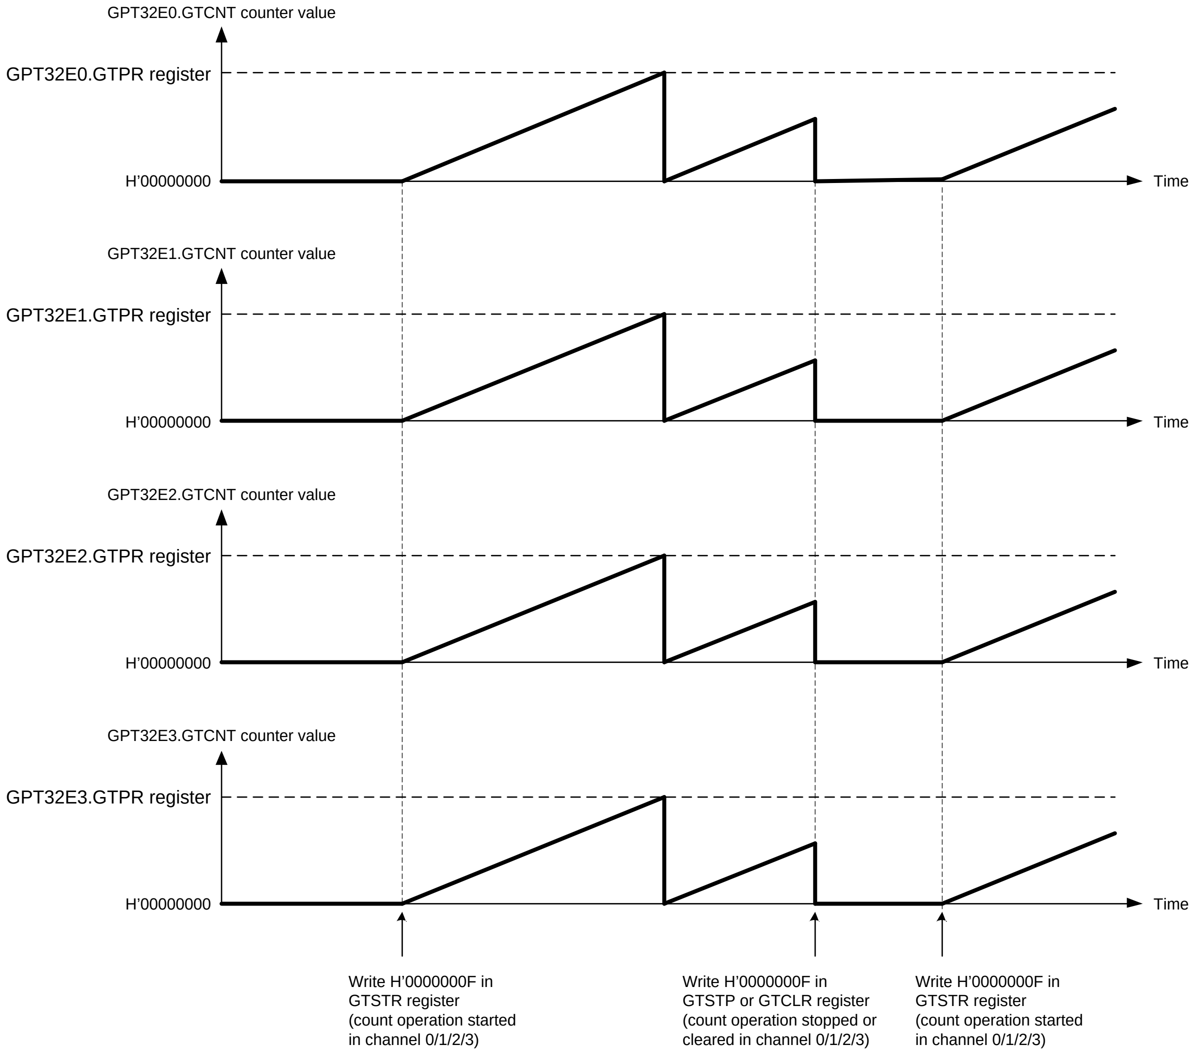

Figure 18.60 Example of a simultaneous start, stop, and clear by software, with the same count cycle (GTPR register value)

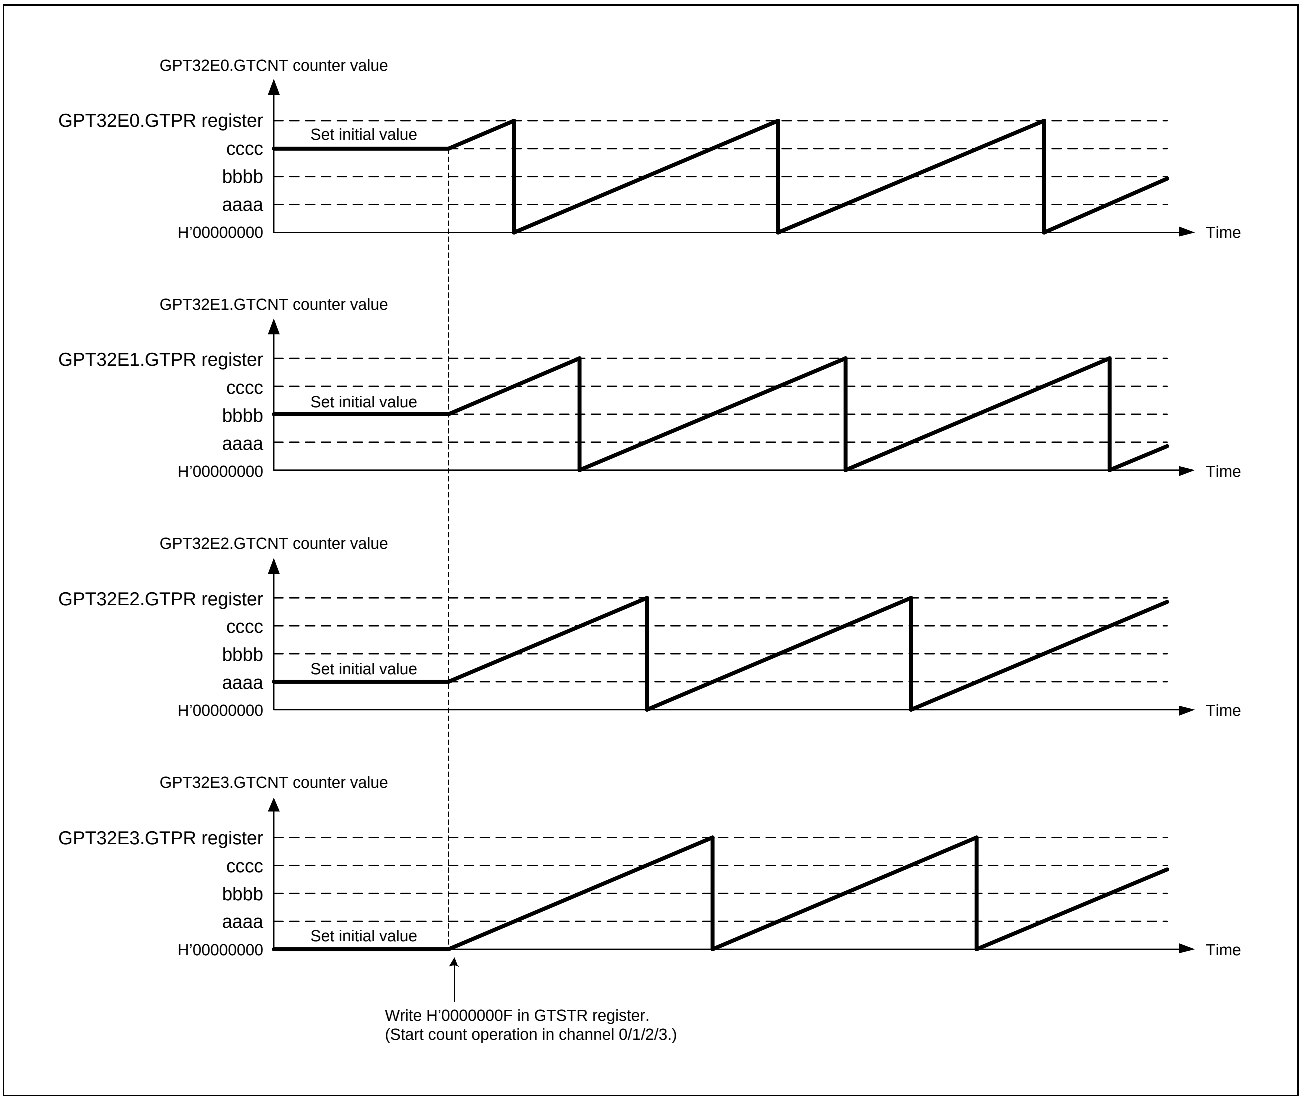

Figure 18.61 Example of software phase start with the same count cycle (GTPR register value)

18.3.8.2 Synchronized Operation by Hardware

The GTCNT counters can be started simultaneously by the following hardware sources:

- External trigger input

Figure 18.62 shows an example of a simultaneous start, stop and clear operation by a hardware source. **Figure 18.63** shows the setting example.

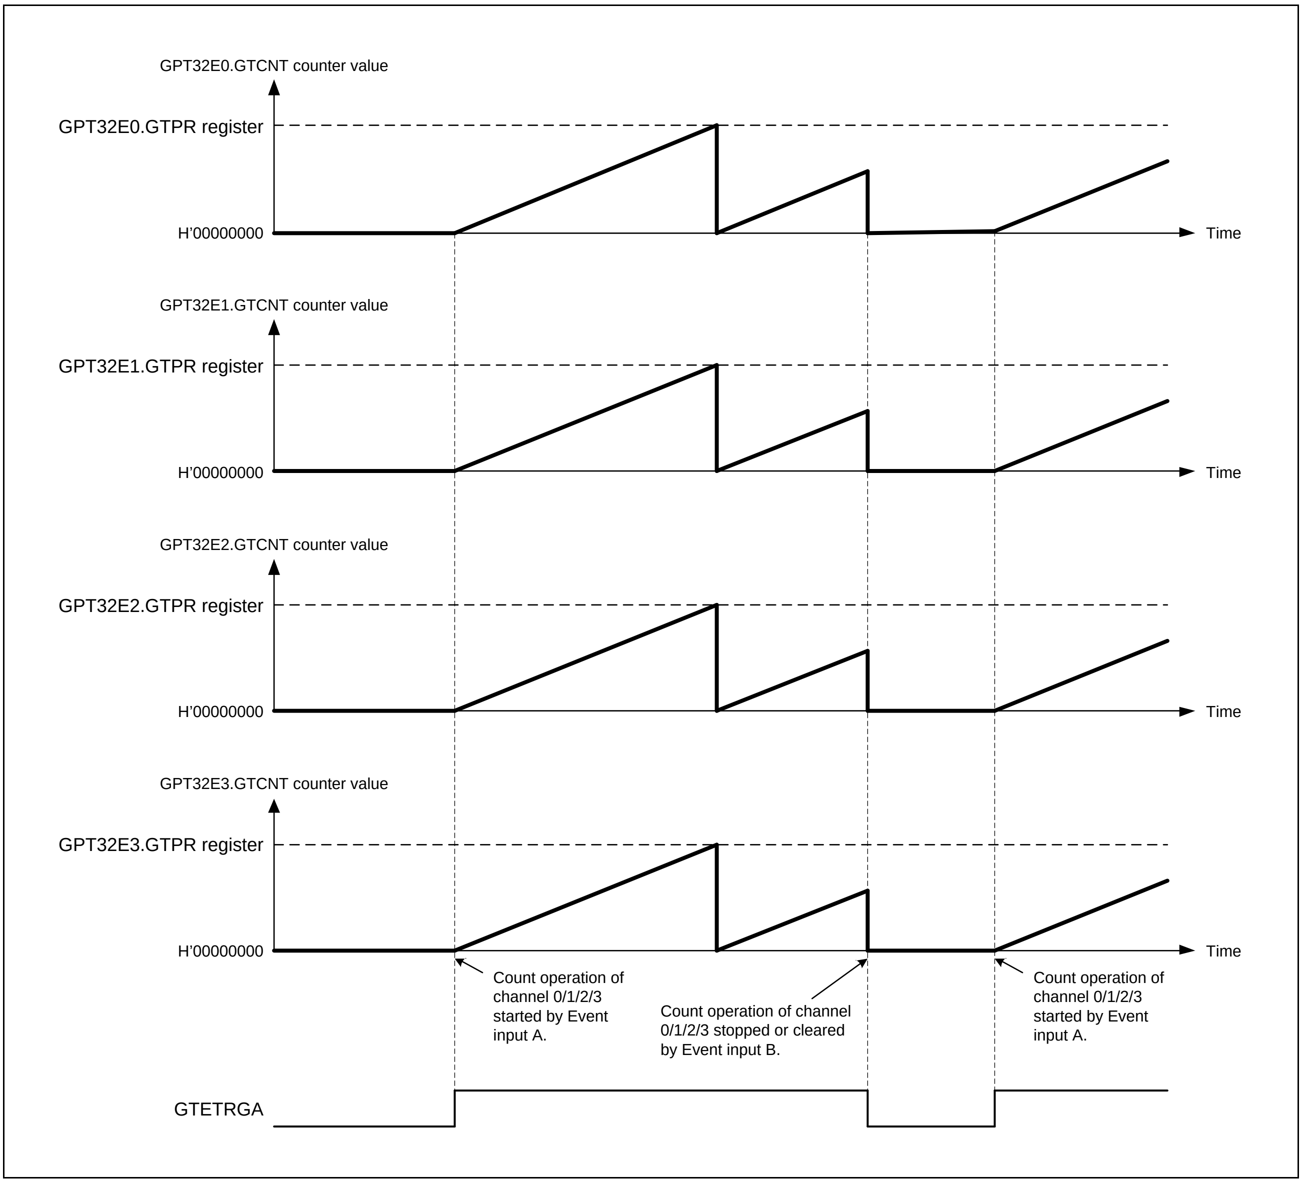

Figure 18.62 Example of a simultaneous start, stop, and clear by the hardware sources, with the same count cycle (GTPR register value)

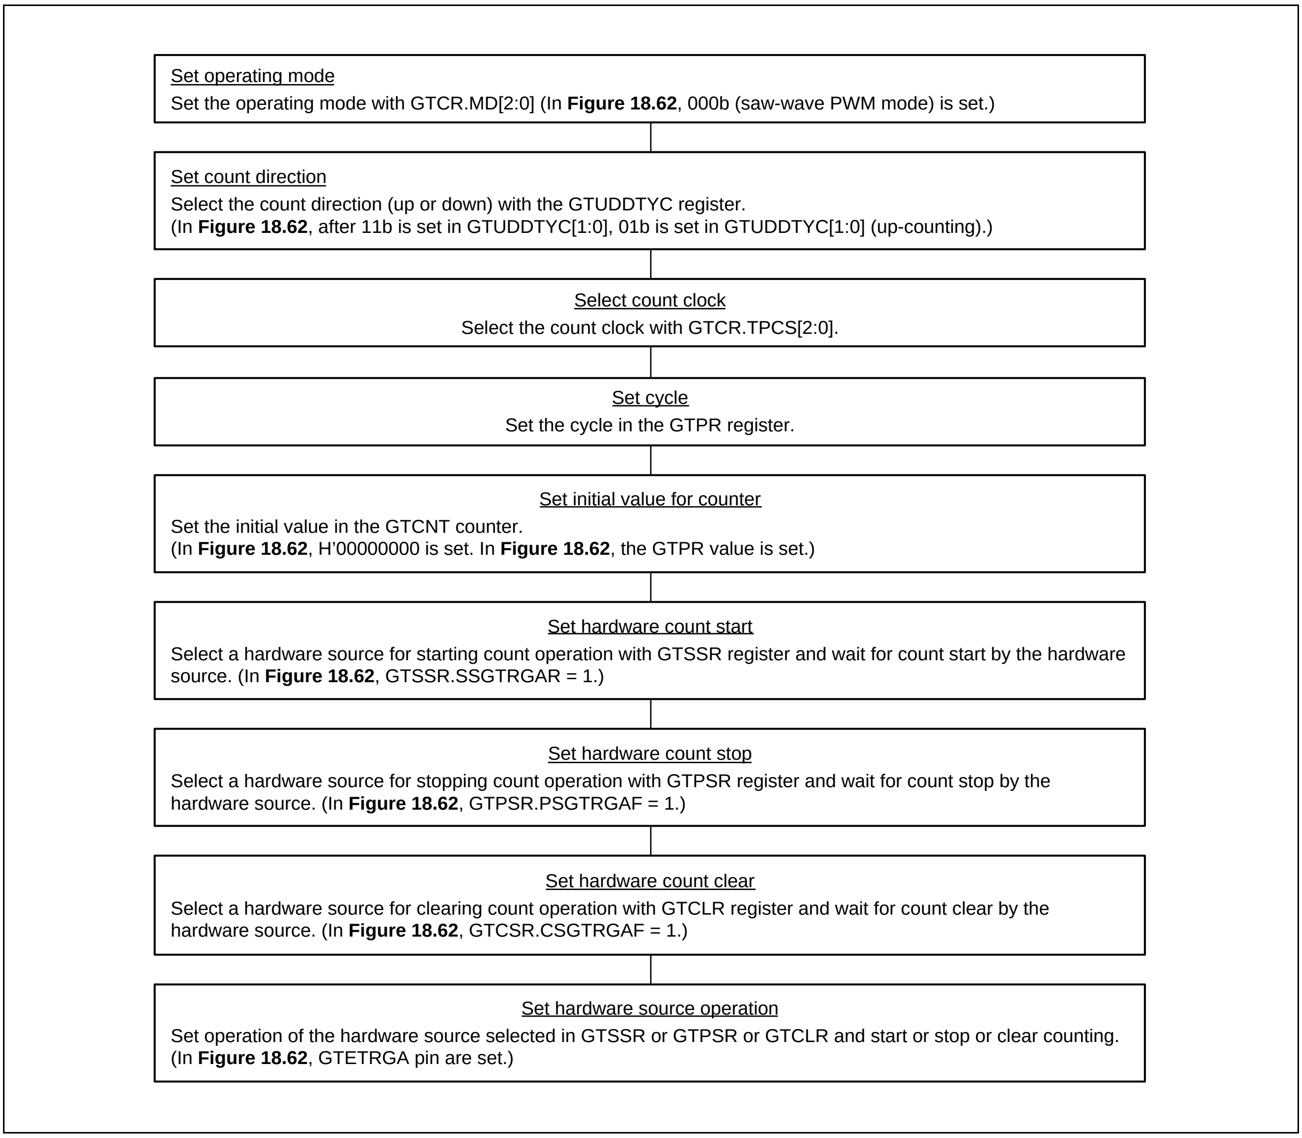

Set operating mode

Set the operating mode with GTCR.MD[2:0] (In **Figure 18.62**, 000b (saw-wave PWM mode) is set.)

Set count direction

Select the count direction (up or down) with the GTUDDTYC register.
(In **Figure 18.62**, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).)

Select count clock

Select the count clock with GTCR.TPCS[2:0].

Set cycle

Set the cycle in the GTPR register.

Set initial value for counter

Set the initial value in the GTCNT counter.
(In **Figure 18.62**, H'00000000 is set. In **Figure 18.62**, the GTPR value is set.)

Set hardware count start

Select a hardware source for starting count operation with GTSSR register and wait for count start by the hardware source. (In **Figure 18.62**, GTSSR.SSGTRGAR = 1.)

Set hardware count stop

Select a hardware source for stopping count operation with GTPSR register and wait for count stop by the hardware source. (In **Figure 18.62**, GTPSR.PSGTRGAF = 1.)

Set hardware count clear

Select a hardware source for clearing count operation with GTCLR register and wait for count clear by the hardware source. (In **Figure 18.62**, GTCSR.CSGTRGAF = 1.)

Set hardware source operation

Set operation of the hardware source selected in GTSSR or GTPSR or GTCLR and start or stop or clear counting.
(In **Figure 18.62**, GTETRGA pin are set.)

Figure 18.63 Example setting for simultaneous start by hardware source

18.3.9 PWM Output Operation Examples

18.3.9.1 Synchronized PWM Output

The GPT output 16 phases of linked PWM waveforms for a maximum of 8 channels by synchronizing operation on channels.

Figure 18.64 shows an example in which four channels perform synchronized operation in saw-wave PWM mode and eight phases of PWM waveforms are output. The GTIOCA is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCB is set so that it outputs low as the initial value, high at a GTCCRB compare match, and low at the cycle end.

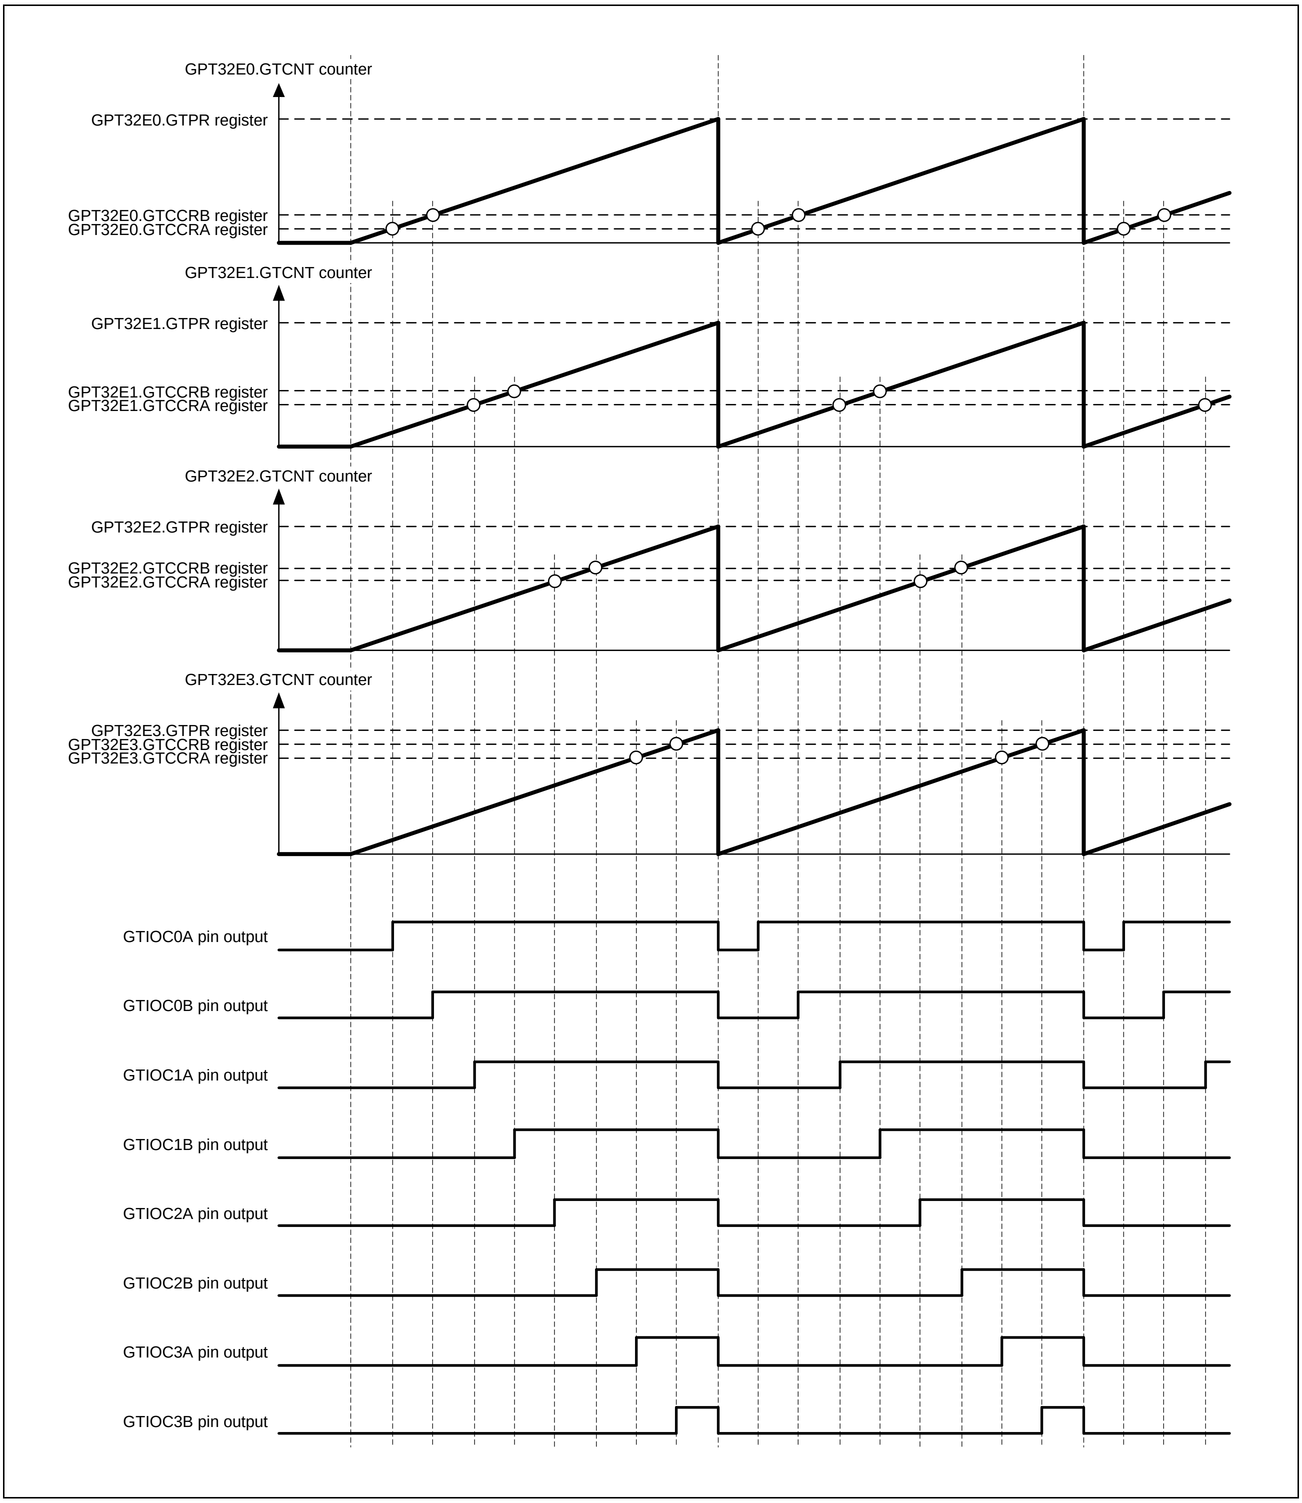

Figure 18.64 Example of synchronized PWM output

18.3.9.2 Three-Phase Saw-Wave Complementary PWM Output

Figure 18.65 shows an example in which three channels perform synchronized operation in saw-wave PWM mode and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, low at a GTCCRB compare match, and high at the cycle end.

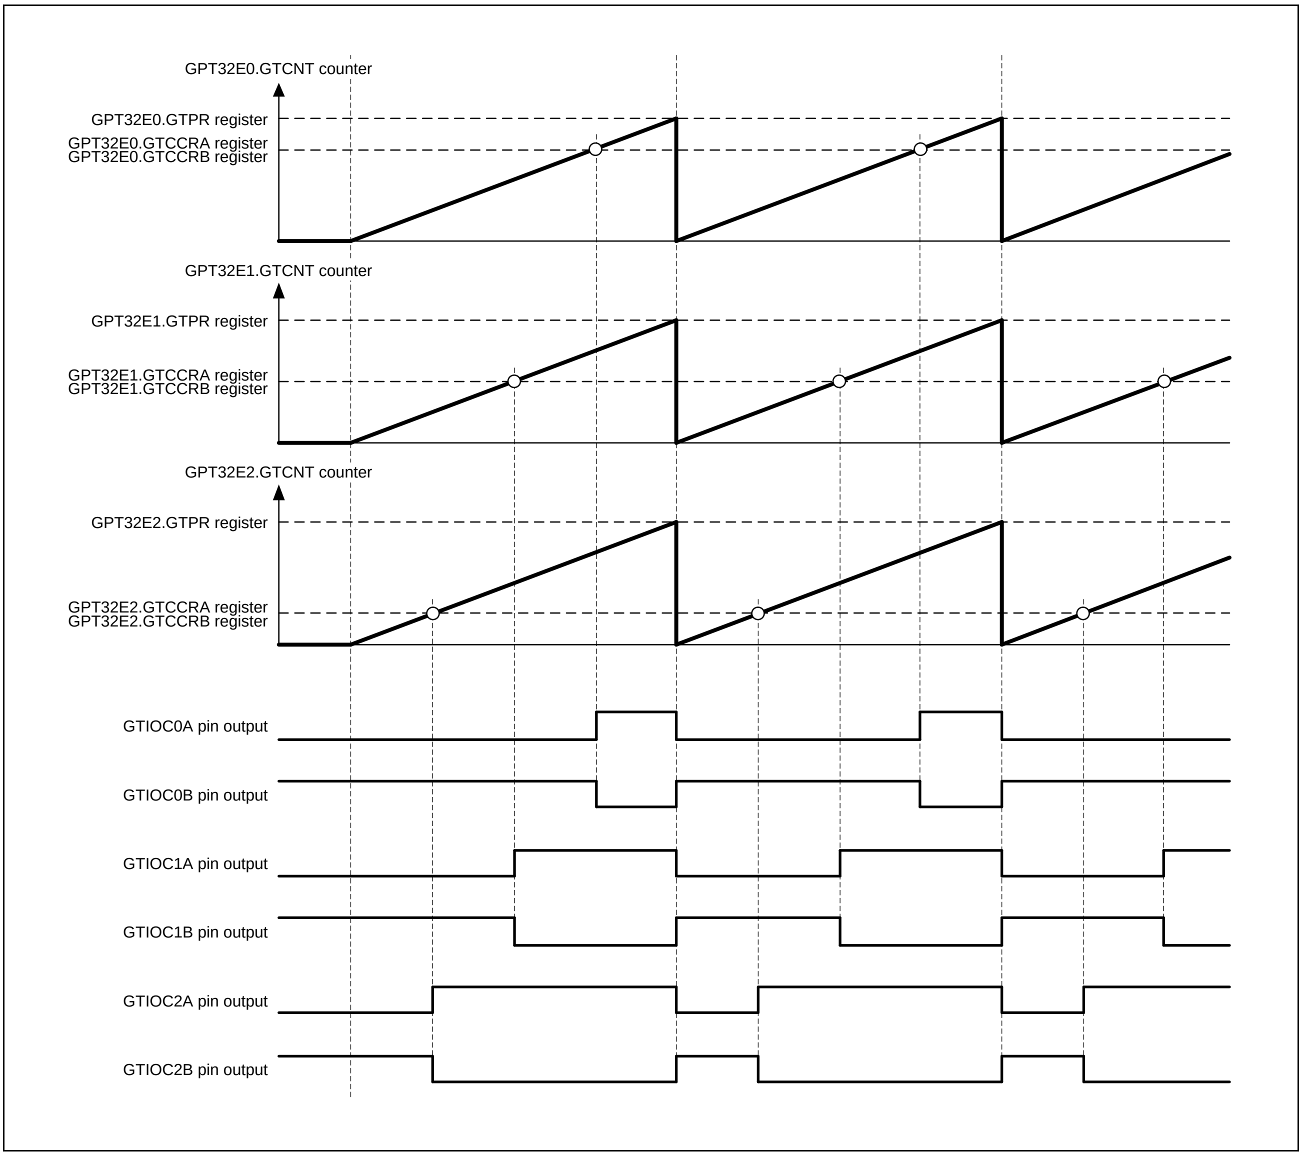

Figure 18.65 Example of 3-phase saw-wave complementary PWM output

18.3.9.3 3-Phase Saw-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 18.66 shows an example in which three channels perform synchronized operation in saw-wave one-shot pulse mode with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, toggle the output at a GTCCRA compare match, and retain the output at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, toggle the output at a GTCCRB compare match, and retain the output at the cycle end.

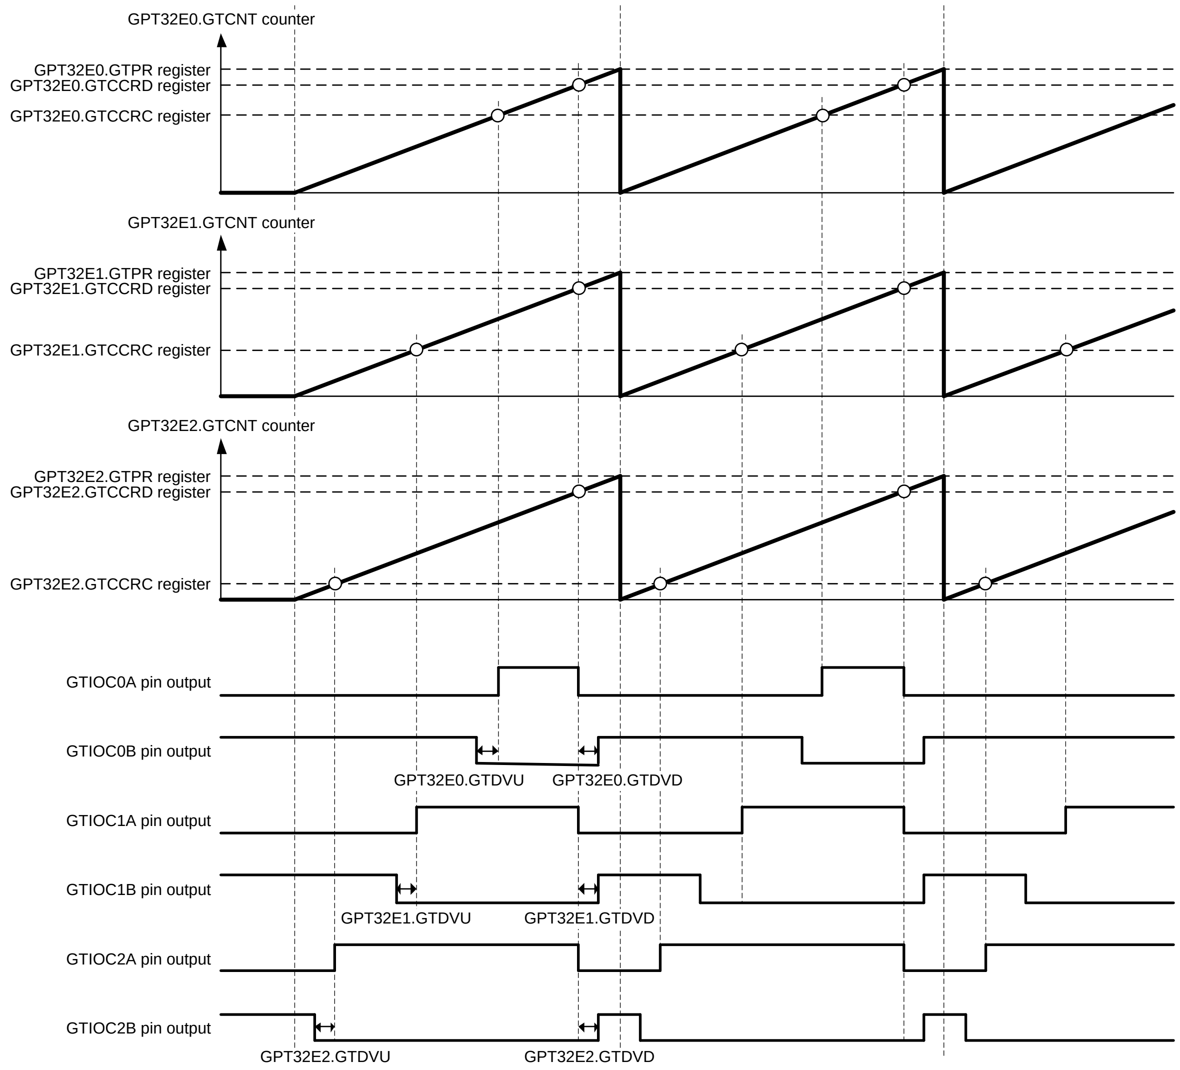

Figure 18.66 Example of 3-phase saw-wave complementary PWM output with automatic dead time setting

18.3.9.4 3-Phase Triangle-Wave Complementary PWM Output

Figure 18.67 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

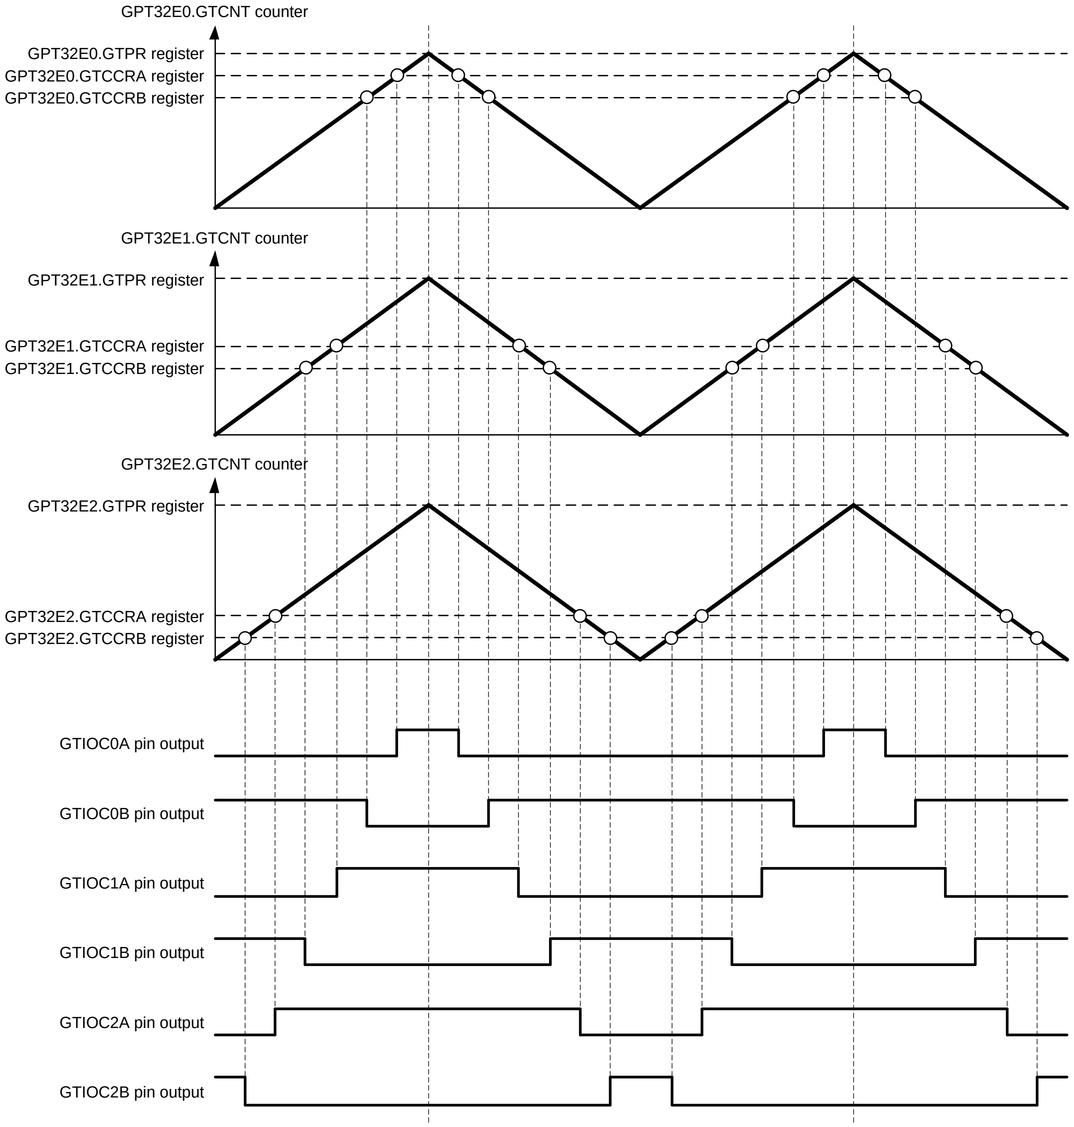

Figure 18.67 Example of 3-phase triangle-wave complementary PWM output

18.3.9.5 3-Phase Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 18.68 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

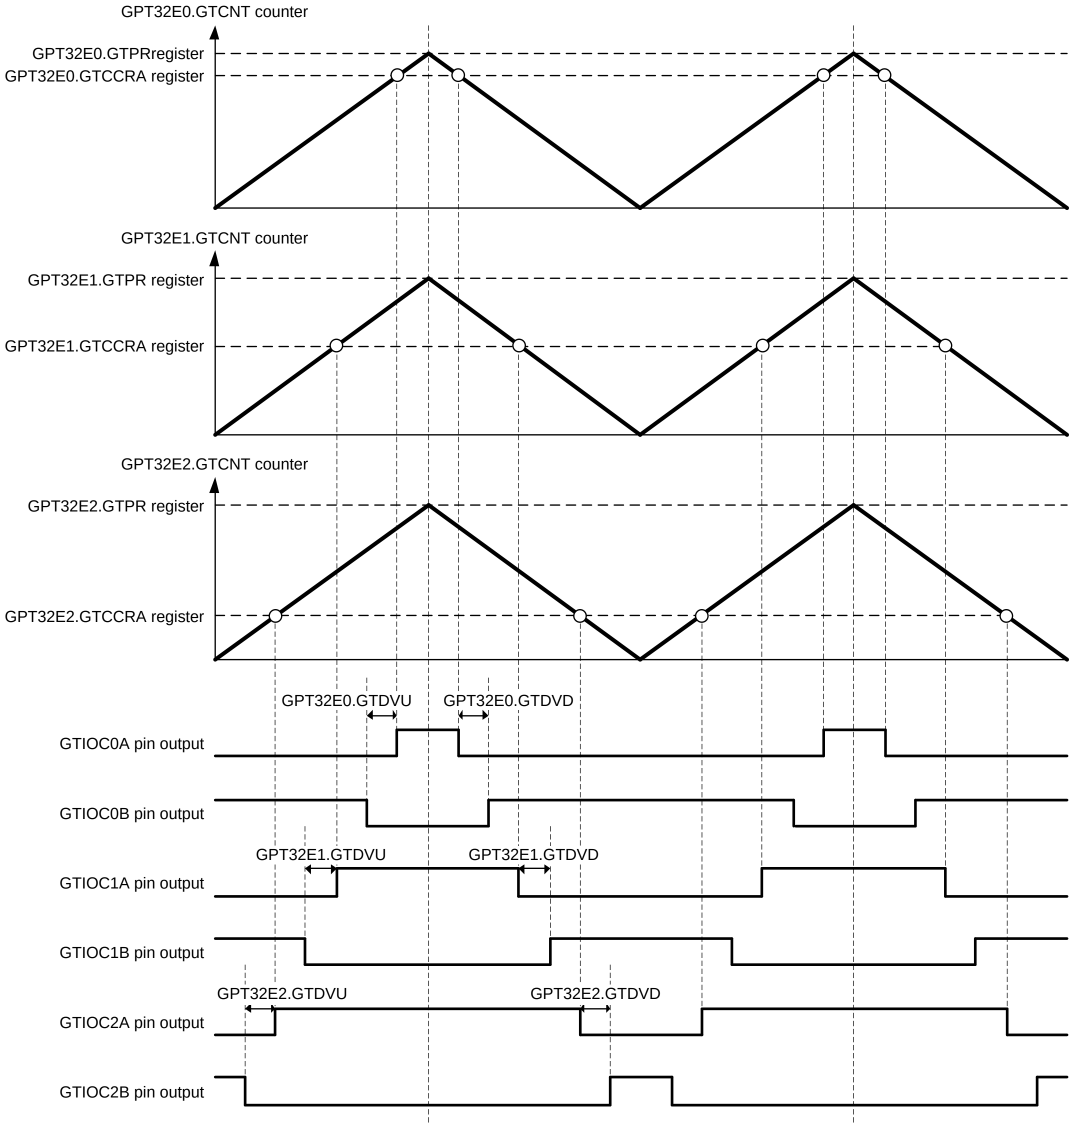

Figure 18.68 Example of 3-phase triangle-wave complementary PWM output with automatic dead time setting

18.3.9.6 3-Phase Asymmetric Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 18.69 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 3 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCA is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCB is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

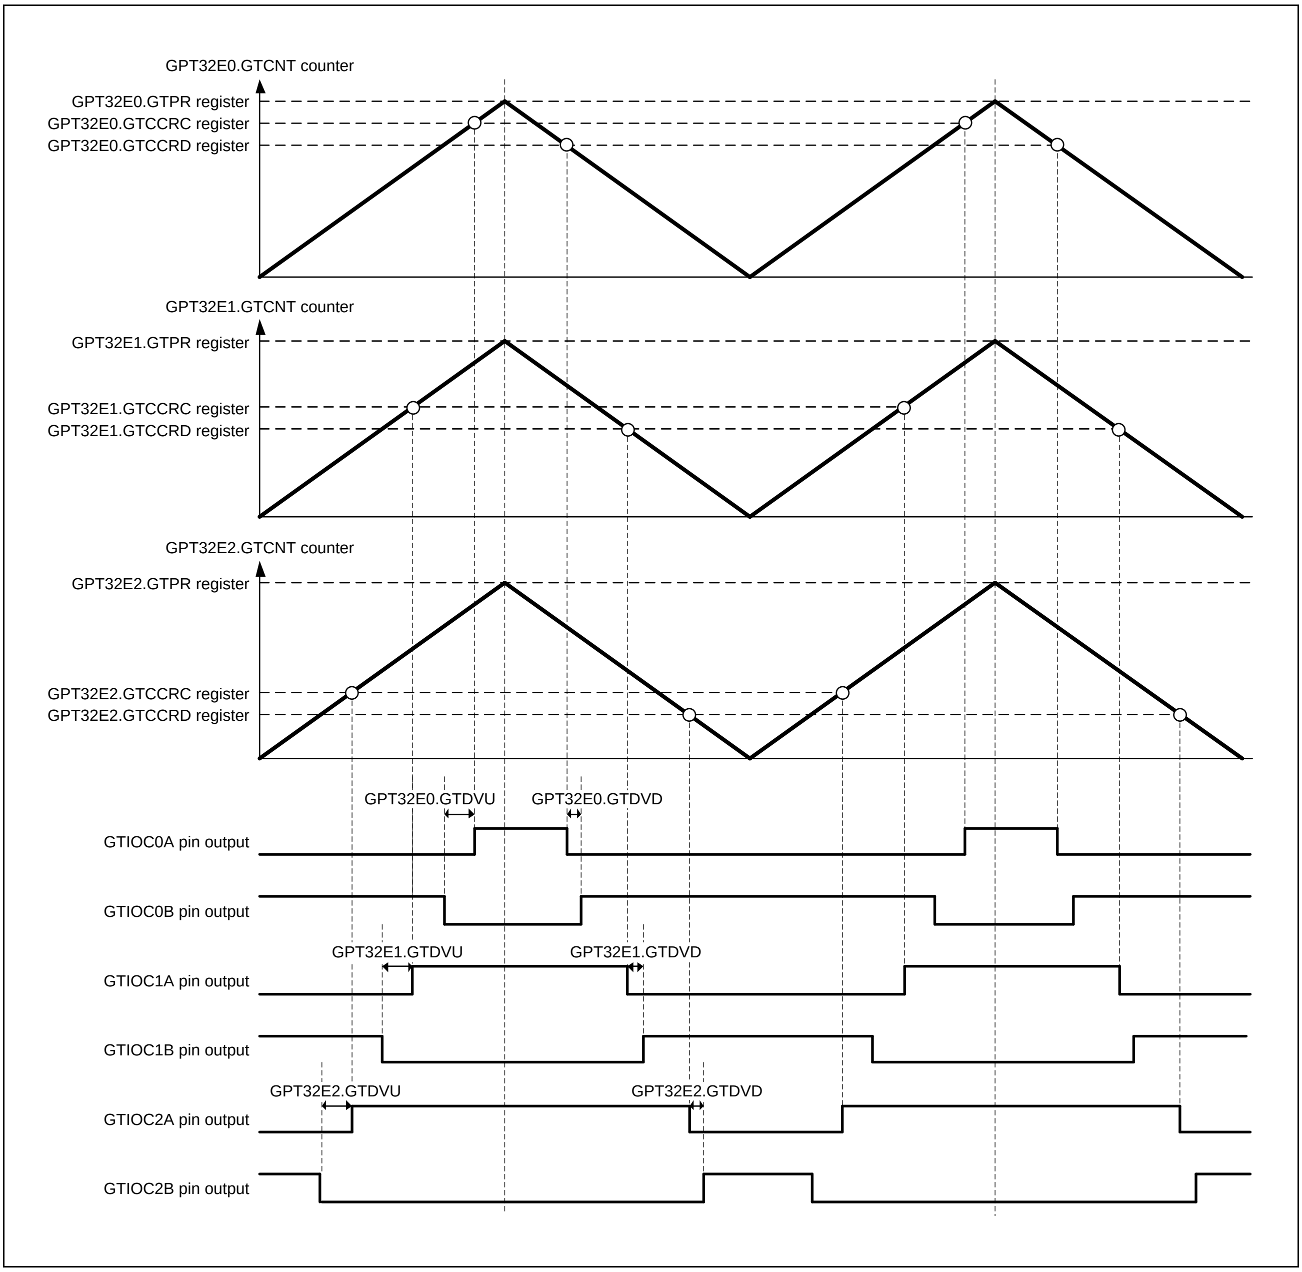

Figure 18.69 Example of 3-phase asymmetric triangle-wave complementary PWM output with automatic dead time setting

18.3.10 Phase Counting Function

The phase difference between the GTIOCA pin input and GTIOCB pin input is detected and the associated GTCNT counts up or counts down. The detectable phase difference is available in any combination with the relationship between the edge and the level of GTIOCA pin and GTIOCB pin input being set in the GTUPSR and GTDNSR registers. For details on count operation, see **Section 18.3.1.1, Counter Operation**.

Figure 18.70 to **Figure 18.79** show phase counting modes 1 to 5. **Table 18.8** to **Table 18.17** show conditions of up- counting or down-counting and lists settings for the GTUPSR and GTDNSR registers.

18.4 Interrupt Sources

18.4.1 Interrupt Sources and Priorities

The GPT provides the following interrupt sources:

- GTCCR input capture/compare match
- GTADTR compare match
- GTCNT counter overflow (GTPR compare match)/underflow.

Each interrupt source has its own status flag. When an interrupt source signal is generated, the associated status flag in GTST is set to 1. The associated status flag in GTST can be cleared by writing 0. If flag set and flag clear happen at the same time, flag clear takes priority over flag set. These flags are automatically updated by internal state. Relative channel priorities can be changed by the Interrupt Controller. However the priority within a channel is fixed. For details, see **Section 8, Interrupt Controller**. **Table 18.18** lists the GPT interrupt sources.

Table 18.18 Interrupt sources (1/3)

Channel	Name	Interrupt source	Interrupt flag	DMAC activation
0	CCMPA0	GPT32E0.GTCCRA input capture/compare match	TCFA	Possible
	CCMPB0	GPT32E0.GTCCRB input capture/compare match	TCFB	Possible
	CMPC0	GPT32E0.GTCCRC compare match	TCFC	Possible
	CMPD0	GPT32E0.GTCCRD compare match	TCFD	Possible
	CMPE0	GPT32E0.GTCCRE compare match	TCFE	Possible
	CMPF0	GPT32E0.GTCCRF compare match	TCFF	Possible
	ADTRGA0	GPT32E0.GTADTRA compare match	ADTRAUF ADTRADF	Possible
	ADTRGB0	GPT32E0.GTADTRB compare match	ADTRBUF ADTRBDF	Possible

Note: This table shows the initial state immediately after a reset. The relative channel priorities can be changed by the interrupt controller.

(1) ADTRGAn interrupt (n = 0 to 7)

When the GTCNT counter value matches with the GTADTRA register, an interrupt request is generated under the following condition:

- In up-counting, the interrupt enable bit (ADTRAUEN) in the GTINTAD register is 1
- In down-counting, the interrupt enable bit (ADTRADEN) in the GTINTAD register is 1.

In event count operation performing, this interrupt request is not generated.

(2) ADTRGBn interrupt (n = 0 to 7)

When the GTCNT counter value matches with the GTADTRB register, an interrupt request is generated under the following condition:

- In up-counting, the interrupt enable bit (ADTRBUEN) in the GTINTAD register is 1
- In down-counting, the interrupt enable bit (ADTRBDEN) in the GTINTAD register is 1.

In event count operation performing, this interrupt request is not generated.

(3) CCMPAn interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRA register functions as a compare match register, the GTCNT counter value matches with the GTCCRA register.
- When the GTCCRA register functions as an input capture register, the GTCNT counter value is transferred to the GTCCRA register by an input capture signal.

(4) CCMPBn interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRB register functions as a compare match register, the GTCNT counter value matches with the GTCCRB register.
- When the GTCCRB register functions as an input capture register, the GTCNT counter value is transferred to the GTCCRB register by an input capture signal.

(5) CMPCn interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRC register functions as a compare match register, the GTCNT counter value matches with the GTCCRC register.

A compare match is not performed and an interrupt is not requested under the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRC register).

(6) CMPDn interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRD register functions as a compare match register, the GTCNT counter value matches with the GTCCRD register.

A compare match is not performed and therefore interrupt is not requested under the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (buffer operation with the GTCCRD register).

(7) CMPEn interrupt (n = 0 to 7)

An interrupt request is generated under the following condition.

- When the GTCCRE register functions as a compare match register, the GTCNT counter value matches with the GTCCRE register.

A compare match is not performed and an interrupt is not requested under the following conditions.

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRE register)

(8) CMPFn interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRF register functions as a compare match register, the GTCNT counter value matches with the GTCCRF register.

A compare match is not performed and therefore interrupt is not requested under the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (buffer operation with the GTCCRF register).

(9) OVFn interrupt (n = 0 to 7)

An interrupt request is generated under the following conditions:

- In saw-wave mode, interrupt requests are enabled at overflows (when the GTCNT counter value changes from GTPR to 0 during up-counting)
- In triangle-wave mode, interrupt requests are enabled at crests (GTCNT changes from GTPR to GTPR-1)
- In counting by hardware sources, overflow (GTCNT changes from GTPR to 0 in up count) has occurred.

(10) UNFn interrupt (n = 0 to 7)

An interrupt request is generated under the following conditions:

- In saw-wave mode, interrupt requests are enabled at underflows (when the GTCNT counter value changes from 0 to GTPR during down-counting).
- In triangle-wave mode, interrupt requests are enabled at troughs (GTCNT changes from 0 to 1).
- In counting by hardware sources, underflow (GTCNT changes from 0 to GTPR in down count) has occurred.

Table 18.19 Interrupt signals, interrupt permission bits, and interrupt status flags

Interrupt signal	Interrupt permission bit	Interrupt status flag
UNFn	GTINTAD[7:6] (GTINTPR[1:0])	GTST[7] (TCFPU)
OVFn		GTST[6] (TCFPO)
ADTRGBn	GTINTAD[19] (ADTRBDEN) GTINTAD[18] (ADTRBUEN)	GTST[19] (ADTRBDF) GTST[18] (ADTRBUF)
ADTRGAn	GTINTAD[17] (ADTRADEN) GTINTAD[16] (ADTRAUEN)	GTST[17] (ADTRADF) GTST[16] (ADTRAUF)
CMPFn	GTINTAD[5] (GTINTF)	GTST[5] (TCFF)
CMPEn	GTINTAD[4] (GTINTE)	GTST[4] (TCFE)
CMPDn	GTINTAD[3] (GTINTD)	GTST[3] (TCFD)
CMPCn	GTINTAD[2] (GTINTC)	GTST[2] (TCFC)
CCMPBn	GTINTAD[1] (GTINTB)	GTST[1] (TCFB)
CCMPAn	GTINTAD[0] (GTINTA)	GTST[0] (TCFA)

18.4.2 DMAC Activation

The DMAC can be activated by the interrupt in each channel. For details, see **Section 14, Direct Memory Access Controller**.

18.4.3 Interrupt and A/D Conversion Request Skipping Function

By setting the GTITC register, the GTCNT counter overflow (GTPR compare match) interrupt (OVFn) and underflow interrupt (UNFn) can be skipped. Other interrupts and A/D converter start request signals can be skipped in coordination with the OVFn/UNFn skipping function.

The interrupt request skipping function only depends on the setting of GTITC register and is independent of the setting of interrupt permission bits in the GTINTAD register.

When both troughs and crests are counted and skipped in triangle-wave mode, if the number of times of skipping is odd, OVFn/UNFn interrupt requests cannot be generated at troughs only or at crests only depending on the skipping counter start timing. To count both troughs and crests and generate the OVFn/UNFn interrupts at troughs only or crests only in triangle-wave mode, you must set an even number of skips.

Similarly, in saw-wave mode, when both overflows and underflows are counted and skipped with the count direction changed, OVFn interrupt requests cannot be generated on either overflows or underflows only. To count both overflows and underflows with the count direction changed and generate the OVFn/UNFn interrupts on either overflows or underflows only in saw wave mode, first check the skipping state carefully.

Before changing the skipping count, you must release the skipping count setting (GTITC.IVTC[1:0] bits = 00b).

Figure 18.80 to **Figure 18.85** show examples of skipping function operation.

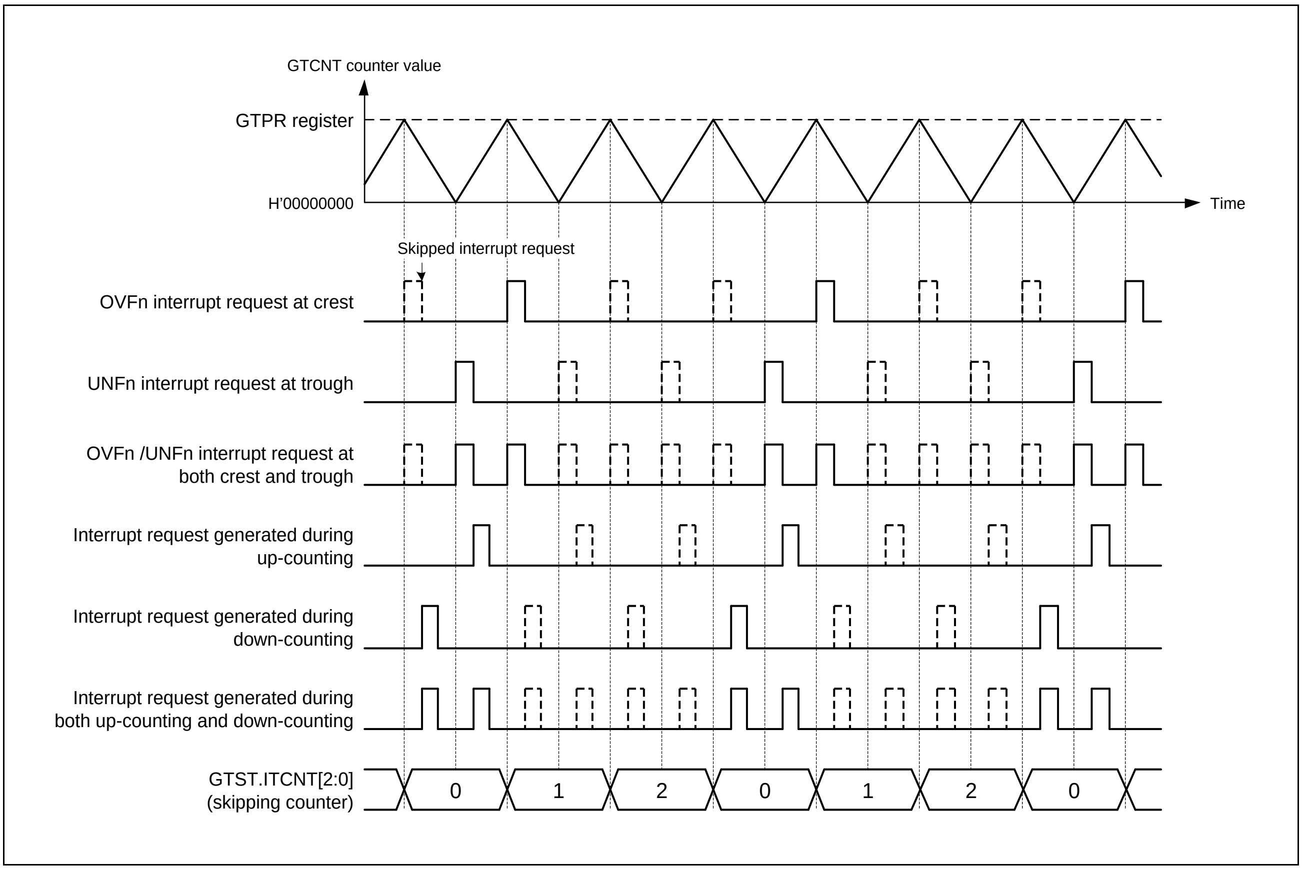

Figure 18.80 Example of interrupt skipping function operation with triangle waves, counting and skipping crests, and skipping count = 2

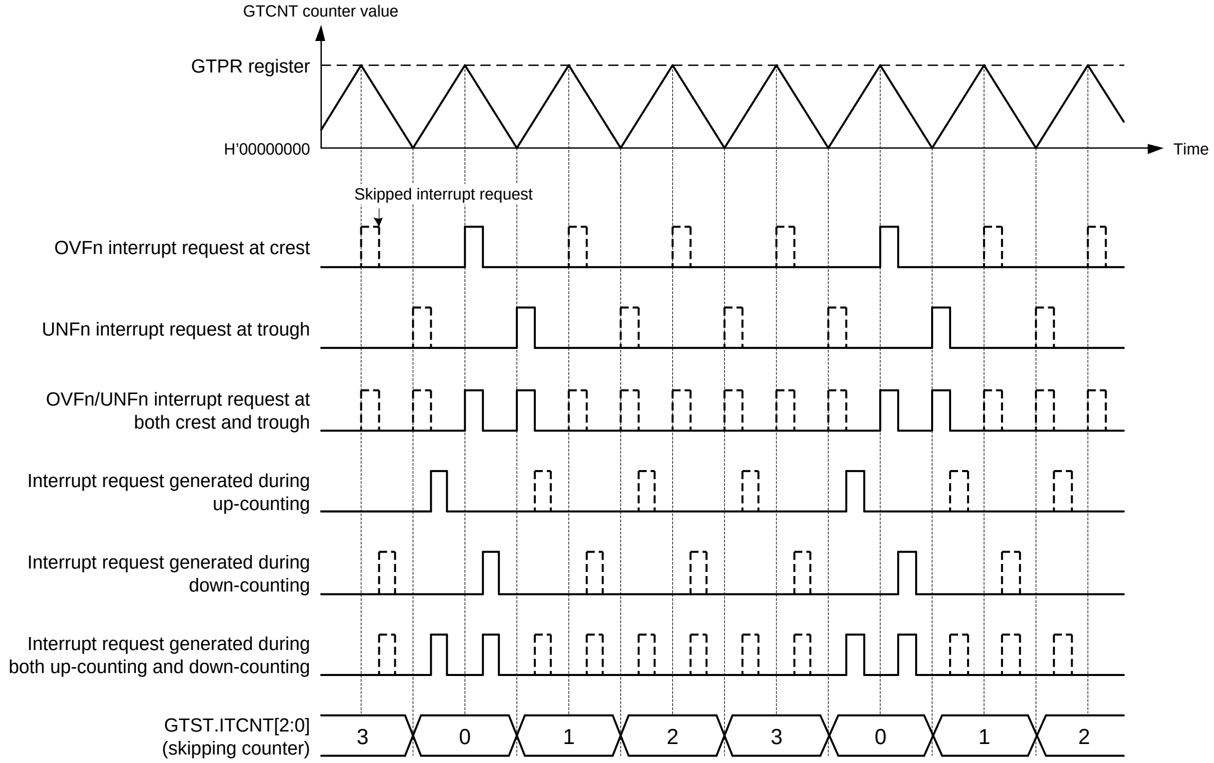

Figure 18.81 Example of interrupt skipping function operation with triangle waves, counting and skipping troughs, and skipping count = 3

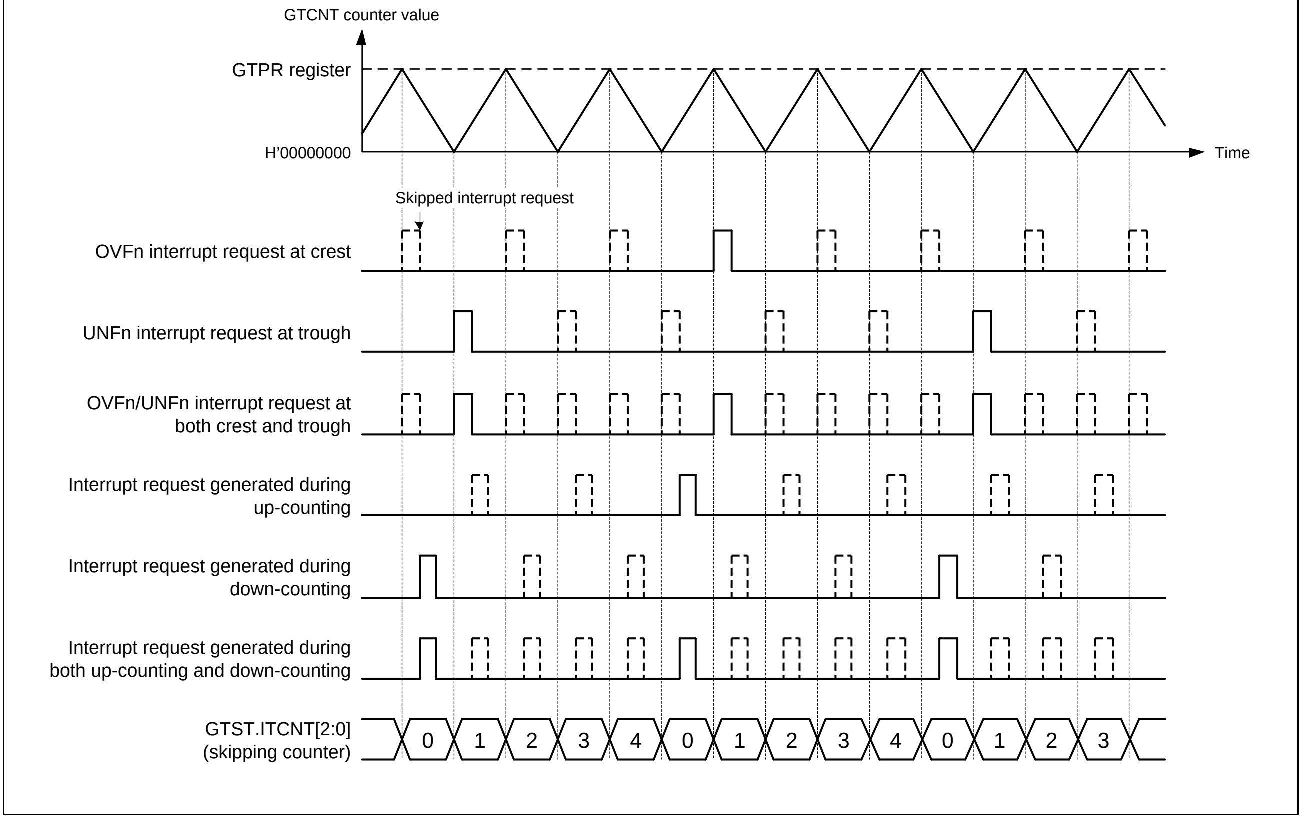

Figure 18.82 Example of interrupt skipping function operation with triangle waves, counting and skipping both troughs and crests, and skipping count = 4

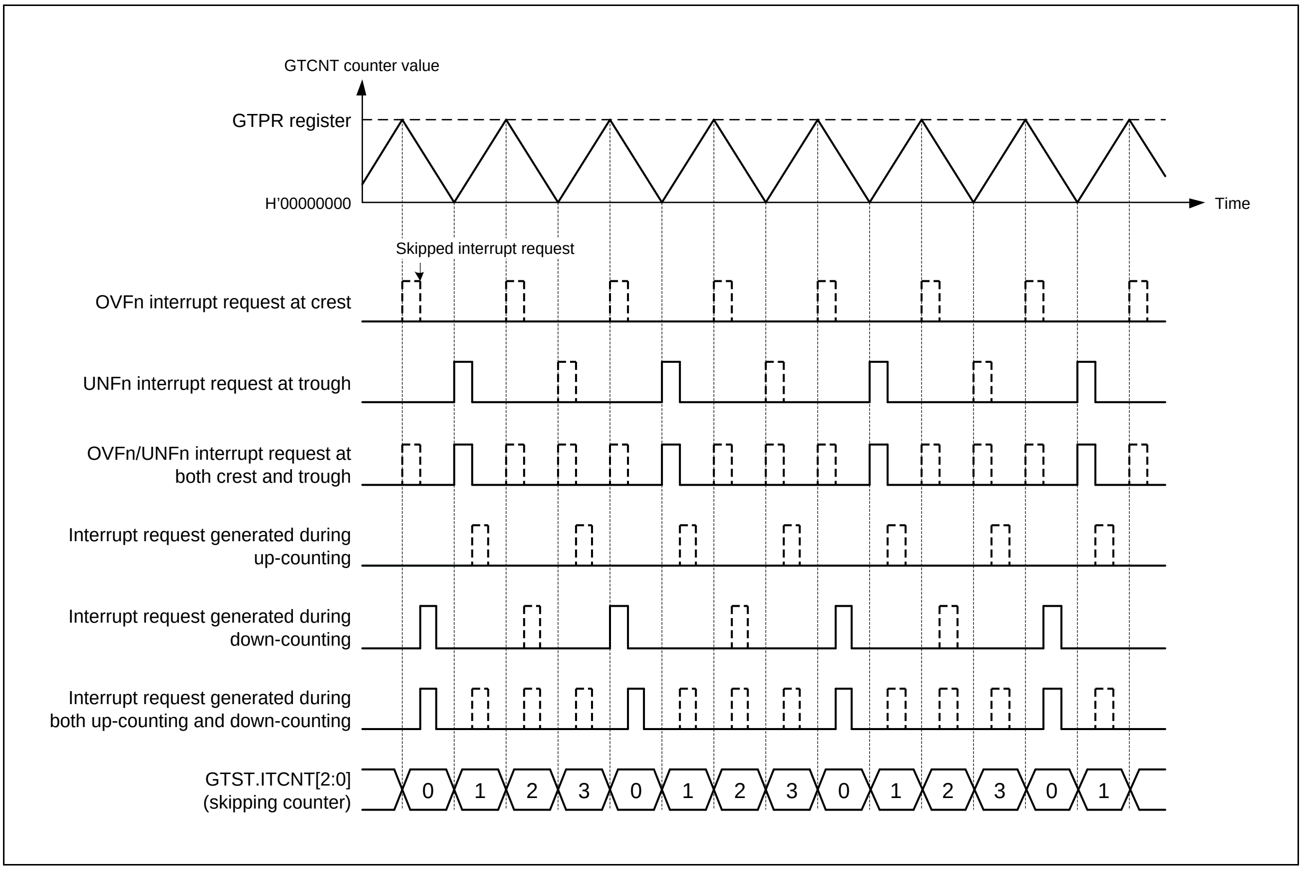

Figure 18.83 Example of interrupt skipping function operation with triangle waves, counting and skipping both troughs and crests, skipping count = 3, and skipping started at up-counting

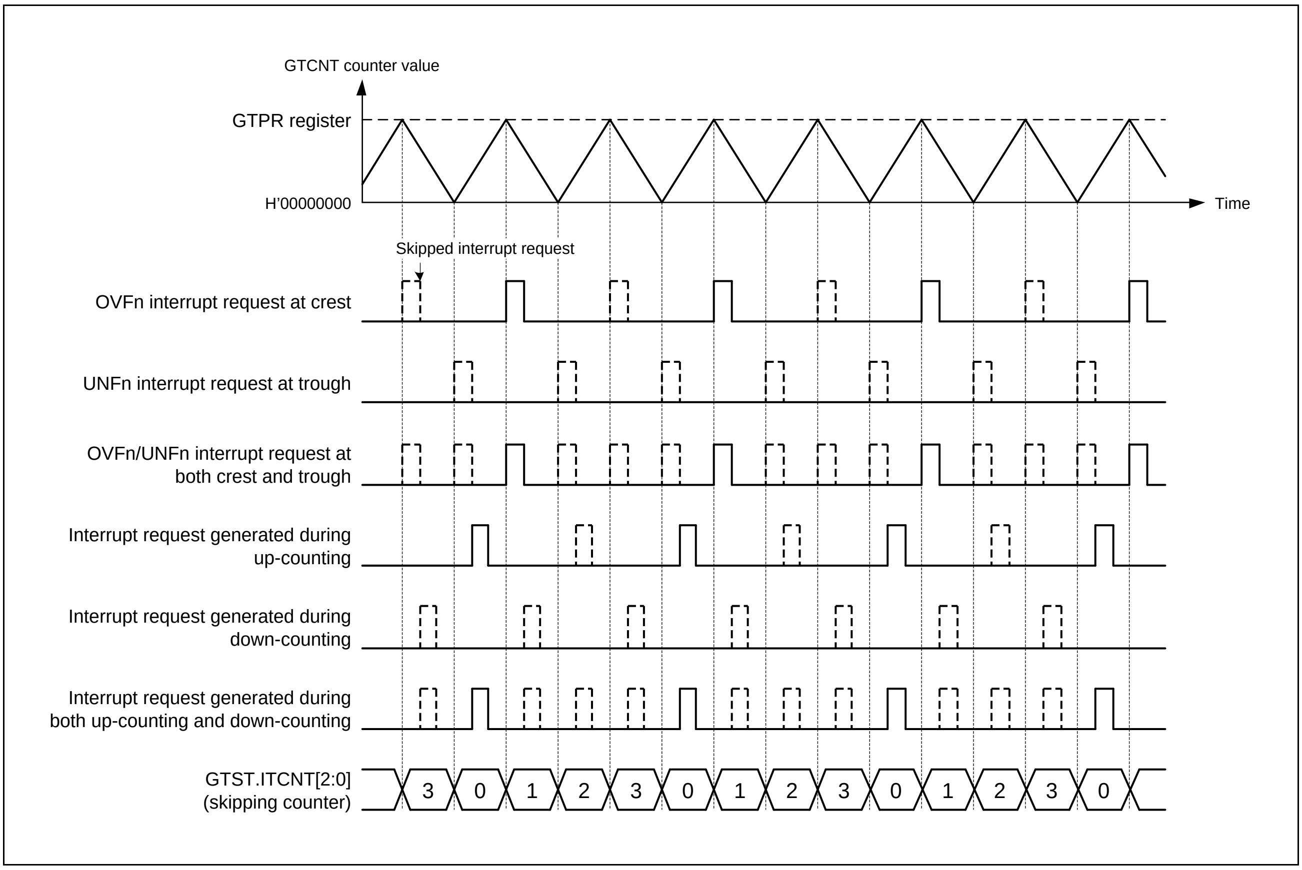

Figure 18.84 Example of interrupt skipping function operation with triangle waves, counting and skipping both troughs and crests, skipping count = 3, and skipping started at down-counting

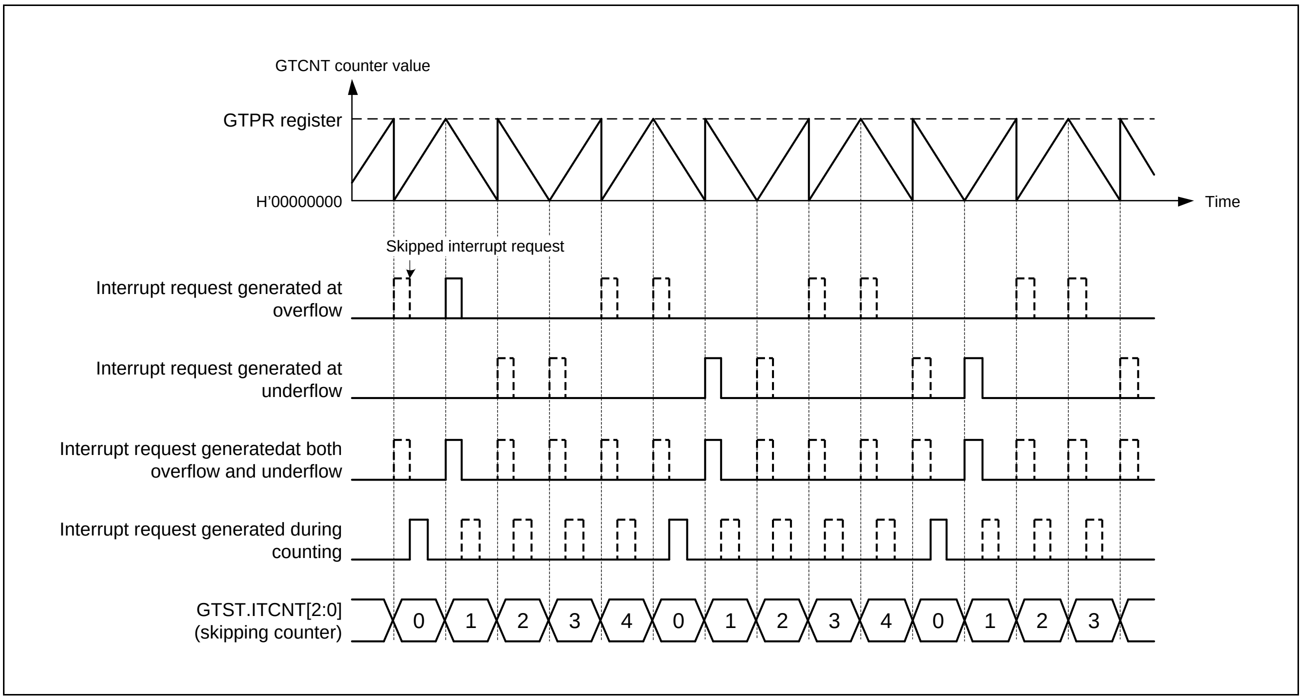

Figure 18.85 Example of interrupt skipping function operation with saw waves, operation with count direction changed, counting and skipping both overflows and underflows, and skipping count = 4

18.5 A/D Converter Start Request

An A/D converter start request can be issued at a compare match between the GTCNT counter and GTADTRA or GTADTRB, and up-counting only, down-counting only, or both up-counting and down-counting can be specified. In event count operation performing, A/D converter start requests interrupt cannot be generated.

GTADTRA and GTADTRB each has two buffer registers. Buffer operation with GTADTRA combined with GTADTBRA and GTADTDBRA, and buffer operation with GTADTRB combined with GTADTBRB and GTADTDBRB can be performed.

Figure 18.86 shows an example of A/D converter start request operation, and **Figure 18.87** shows an example setting for A/D converter start request operation.

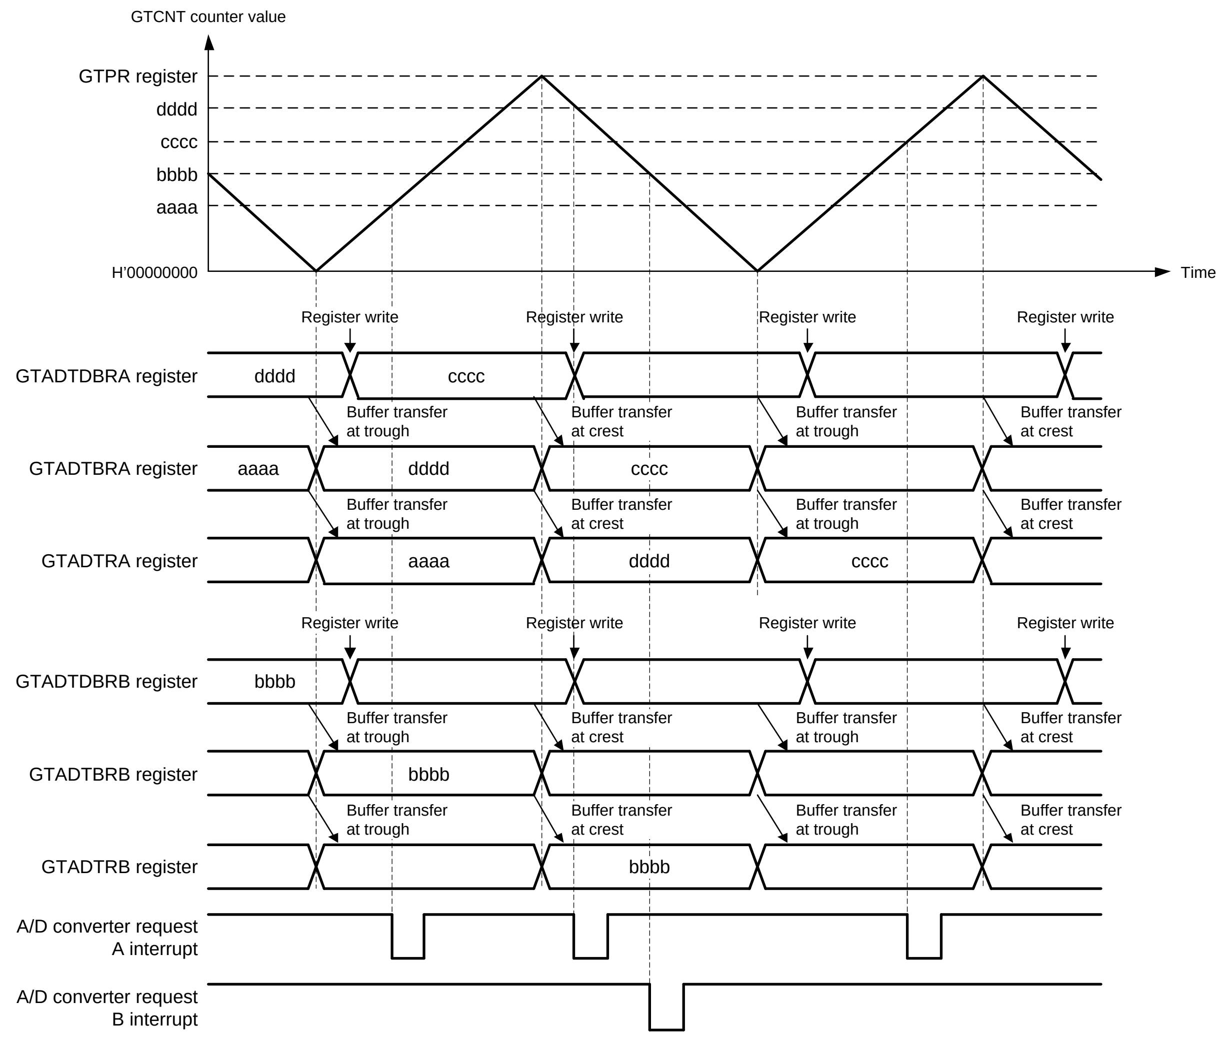

Figure 18.86 Example of A/D converter start request timing operation with triangle waves, double buffer operation, buffer transfer at both troughs and crests, A/D converter start request interrupt by GTADTRA at both up-counting and down-counting, and A/D converter start request interrupt by GTADTRB at down-counting

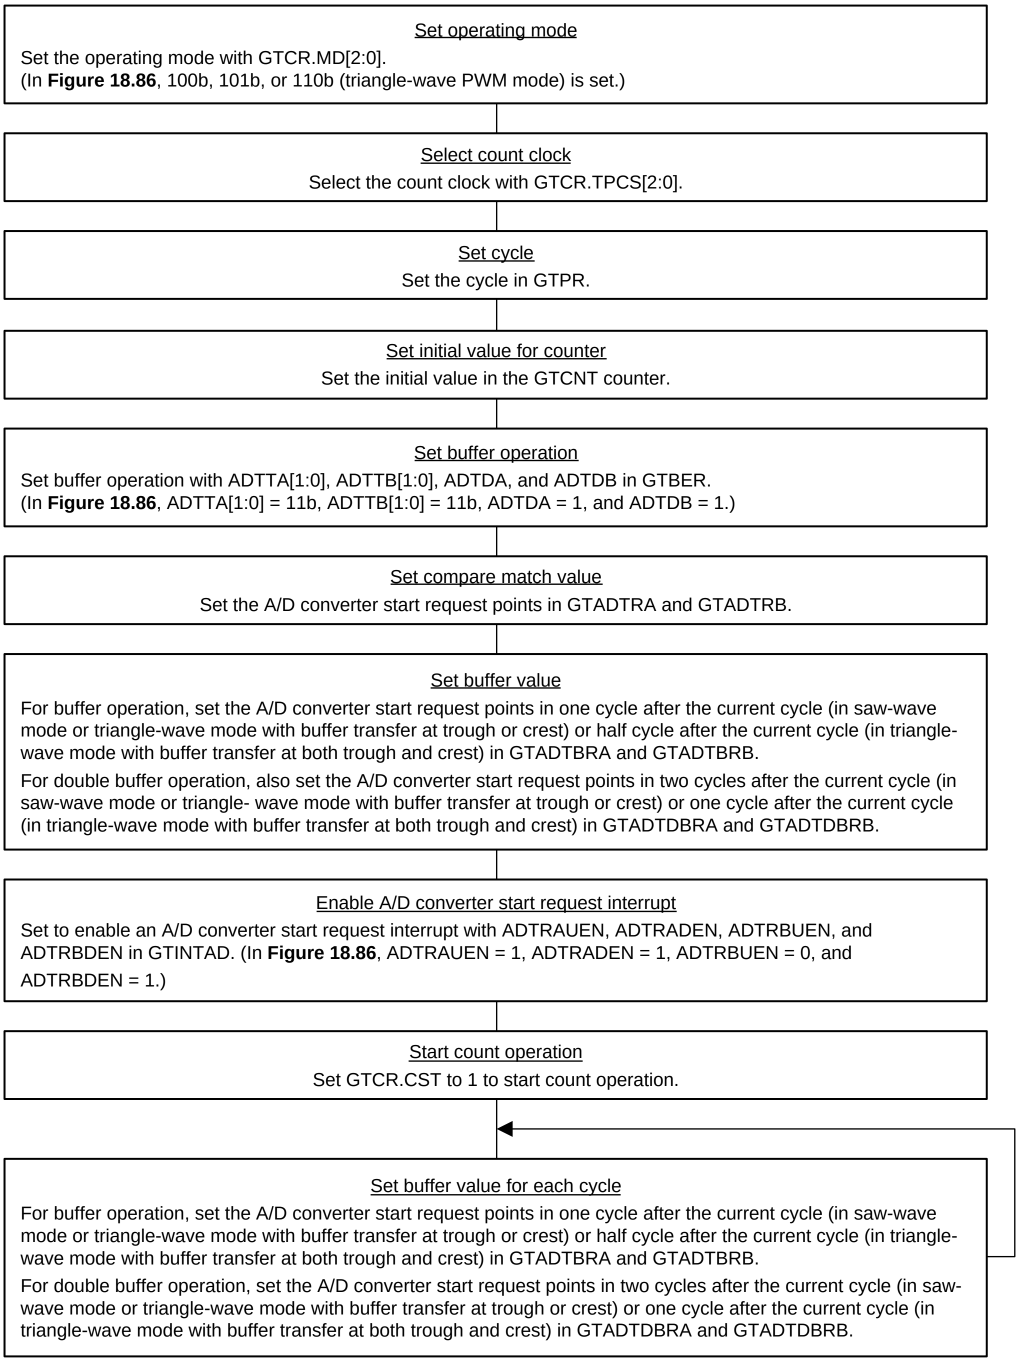

Figure 18.87 Example setting for A/D converter start request timing operation

18.6 Noise Filter Function

Each pin for use in input capture to the GPT is equipped with a noise filter. The noise filter samples input signals at the sampling clock and removes the pulses whose length is less than three sampling cycles.

The noise filter functionality includes enabling and disabling the noise filter for each pin and setting of the sampling clock for each channel.

Figure 18.88 shows the timing of noise filtering.

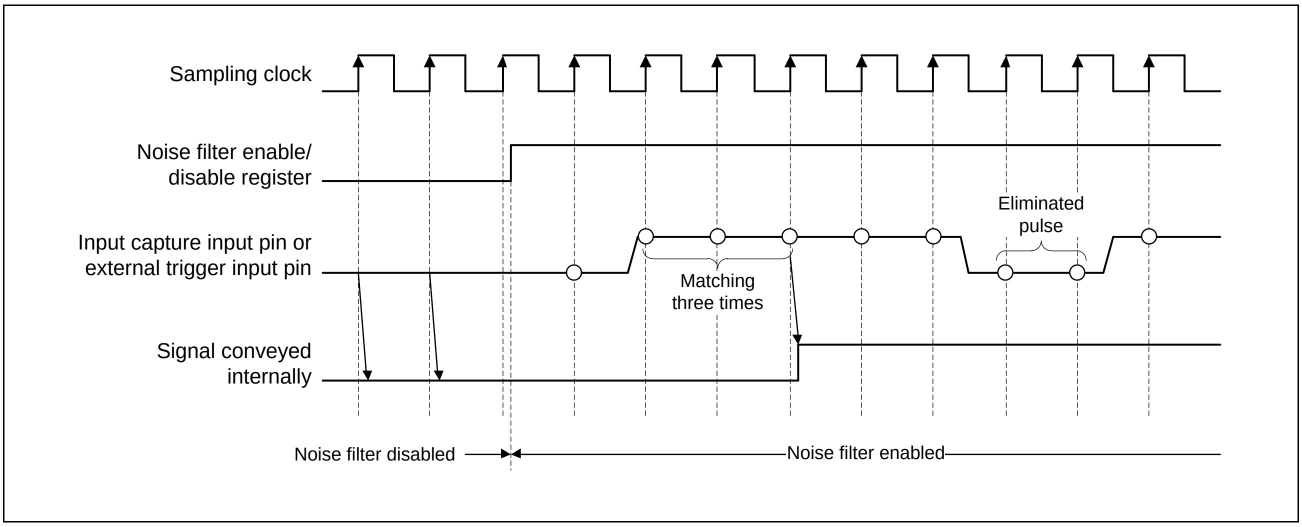

Figure 18.88 Timing of noise filtering

If noise filtering is enabled, the input capture operation or external trigger operation performs on the edges of the noise filtered signal after a delay of a sampling interval × 3 + P0ϕ. This is caused by the noise filtering for the input capture input or external trigger operation.

18.7 Protection Function

18.7.1 Write-Protection for Registers

To prevent registers from being accidentally modified, registers can be write-protected in channel units by setting GTWP.WP. Write-protection can be set for the following registers:

> GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD,GTST, GTBER, GTITC, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTPDBR, GTADTRA, GTADTBRA, GTADTDBRA, GTADTRB, GTADTBRB, GTADTDBRB, GTDTCR, GTDVU, GTDVD, GTDBU, GTDBD, GTSOS, GTSOTR.

18.7.2 Disabling of Buffer Operation

If the timing of buffer register write is delayed in relative to the timing for the buffer transfer, buffer operation can be suspended with the GTBER.BD setting. Buffer transfer can be temporarily disabled even when a buffer transfer condition is generated during a buffer register write. This can be done by setting the associated GTBER.BD bit to 1 (buffer operation disabled) before a buffer register write and clearing the bit to 0 (buffer operation enabled) after completion of writing to all buffer registers. **Figure 18.89** shows an example of operation for disabling buffer operation.

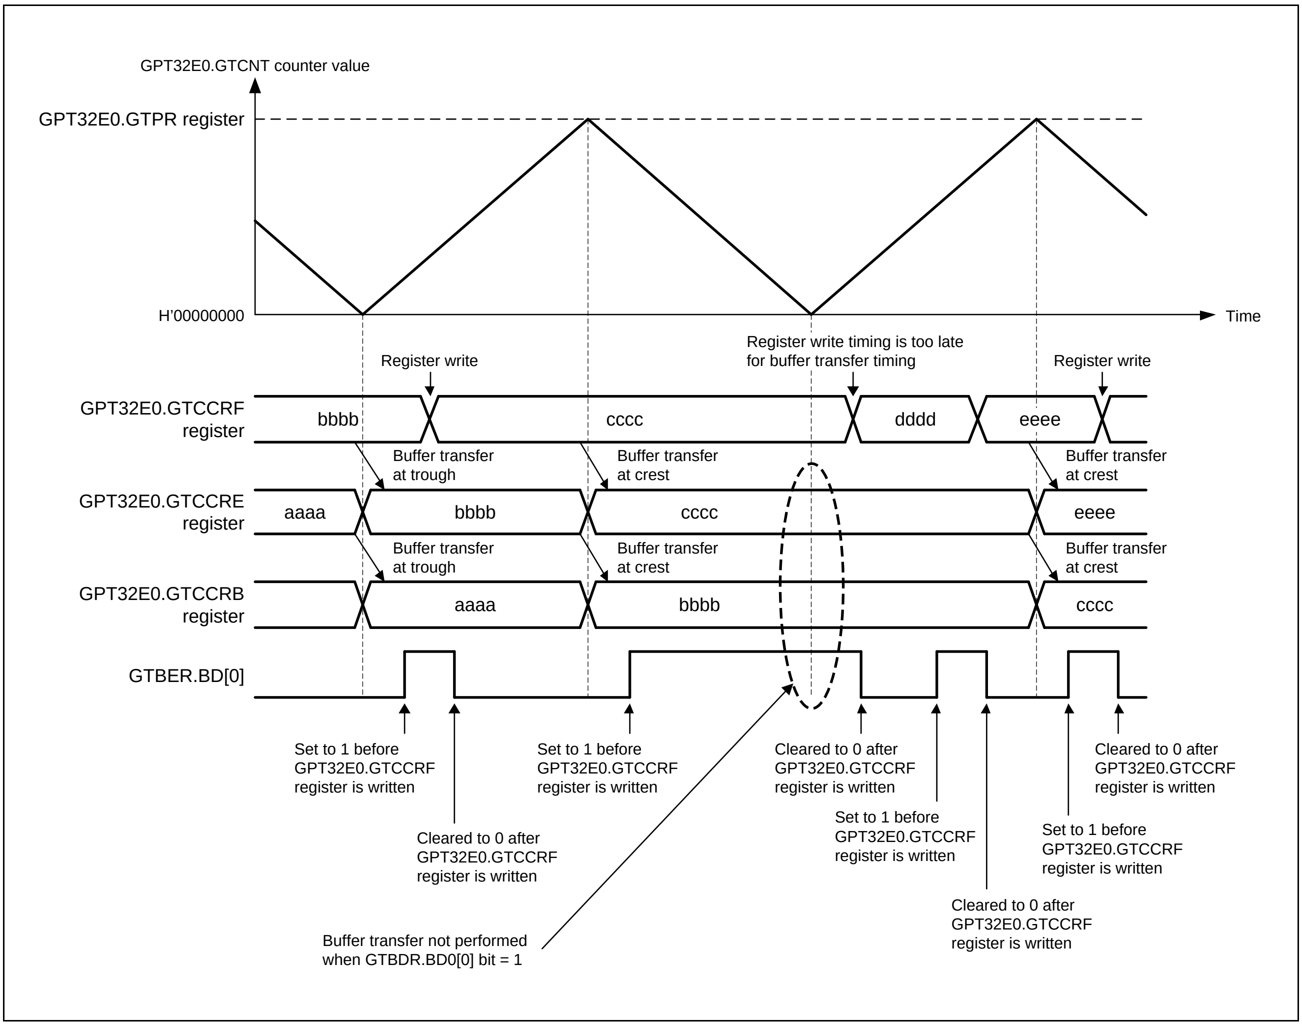

Figure 18.89 Example of operation for disabling buffer operation with triangle waves, double buffer operation, and buffer transfer at both troughs and crests

18.7.3 GTIOC Pin Output Negate Control

For protection from system failure, the output disable control that changes the GTIOC pin output value forcibly is provided for GTIOC pin output by the request of output disable from POEG.

When dead time error occurs or the GTIOCA pin output value is the same as the GTIOCB pin output value, output protection is required. GPT detects this condition and generates output disable requests to POEG based on the settings in the output disable request permission bits, such as GTINTAD.GRPDTE, GTINTAD.GRPABH, GTINTAD.GRPABL. After the POEG receives output disable requests from each channel and calculates external input using an OR operation, the POEG generates output disable requests to GPT.

One output disable signal (representing the shared output disable request signal of the GTIOCA pin and the GTIOCB pin) out of four* output disable requests generated by the POEG is selected by setting GTINTAD.GRP[1:0]. The status of the selected output disable request is monitored by reading the GTST.ODF bit. The output level during output disable is based on the GTIOR.OADF[1:0] setting for the GTIOCA pin and the GTIOR.OBDF[1:0] setting for the GTIOCB pin. The change to the output disable state is performed asynchronously by generating the output disable request from the POEG. The release of the output disable state is performed at end of cycle by terminating the output disable request. The timing of release of the output disable state is a minimum of 3 P0ϕ cycles after terminating the output disable request. To perform output disable control reliably, allow at least 4 P0ϕ cycles after generating the output disable request (by clearing the output disable request flag in POEG) until the output disable request is terminated.

When event count is performed or when the output disable state is to be released immediately without waiting for an end of cycle, GTIOR.OADF[1:0] must be set to 00b (for GTIOCA pin) or GTIOR.OBDF[1:0] must be set to 00b (for GTIOCB pin).

Figure 18.90 shows an example of the GTIOC pin output disable control operation.

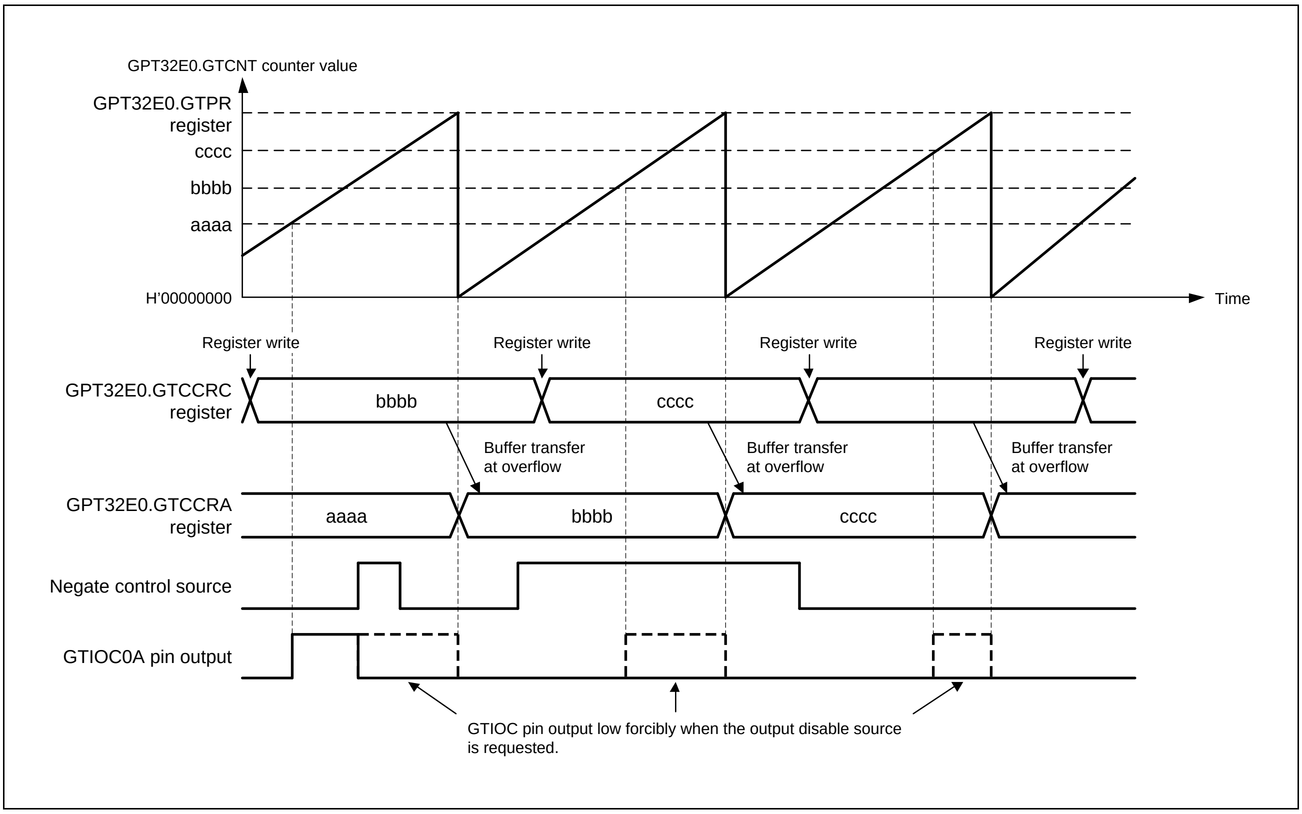

Figure 18.90 Example of GTIOC pin output disable control operation with saw-wave up-counting, buffer operation, active level 1, high output at GTCCRA compare match, low output at cycle end, and low output at output disable

18.7.4 Output Protection Function for GTIOC Pin Output

In preparation for incorrect settings of the GTCCRA register (settings outside the range of 0 < GTCCRA < GTPR), the output protection function for the GTIOC pin output (disabling function) is activated when the automatic dead time setting (GTDTCR.TDE = 1) is made in triangle-wave mode. The status of the output protection function can be read from GTSOS.SOS[1:0].

Figure 18.91 shows the output protection function state transition.

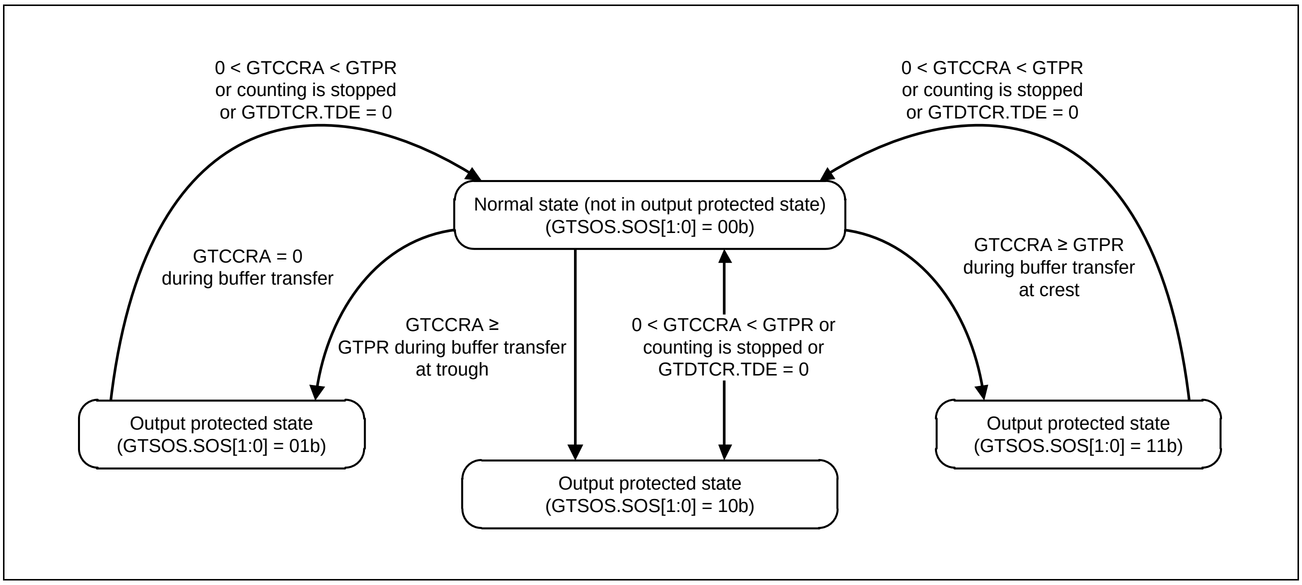

Figure 18.91 Output protection function

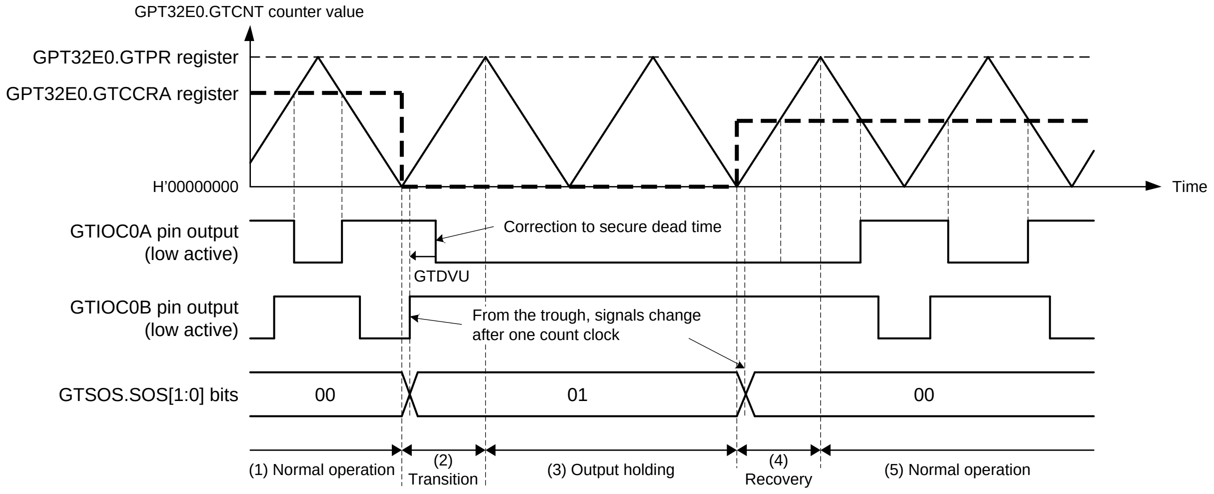
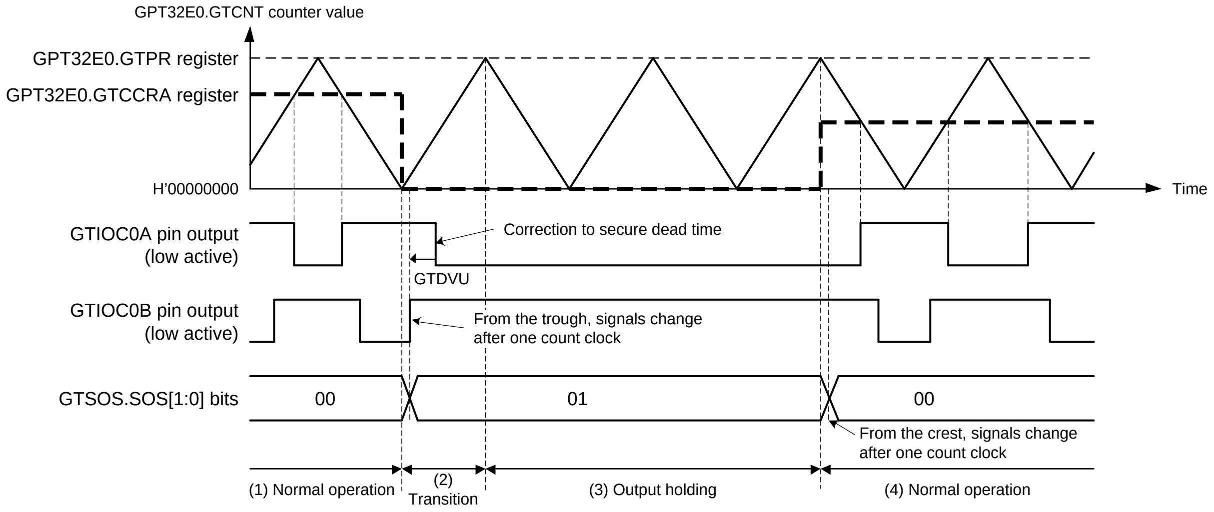
18.7.4.1 Output Protection Function When the GTCCRA Register is Set to 0 during Buffer Transfer

Figure 18.92 and **Figure 18.93** show examples of output protection function operation when the GTCCRA register is set to 0 during buffer transfer at troughs, and **Figure 18.94** and **Figure 18.95** show examples when the GTCCRA register is set to 0 during buffer transfer at crests.



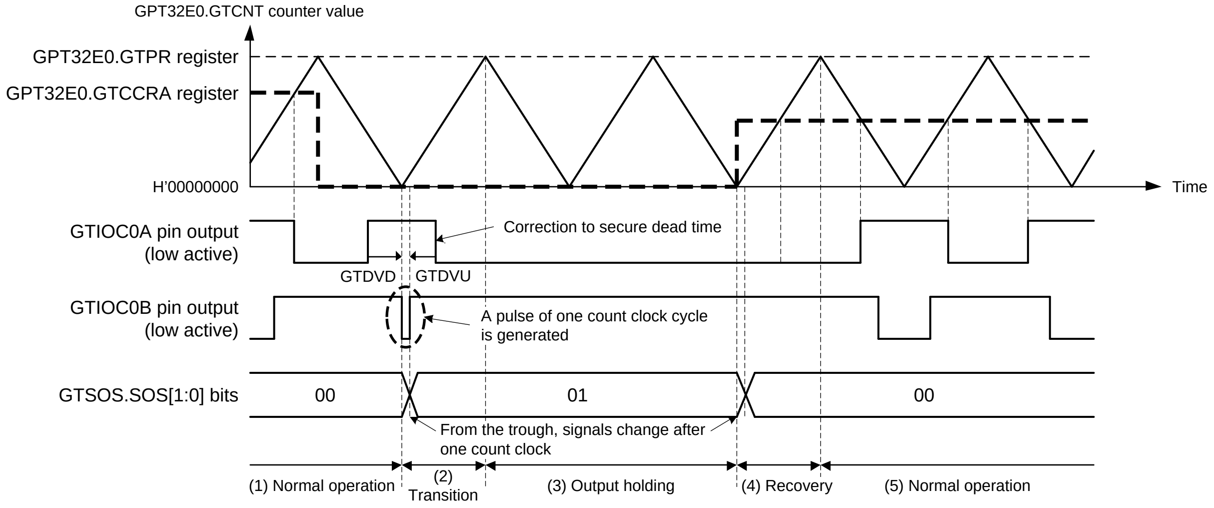
(1) Normal operation period:	Toggle output due to a compare match is performed normally.
(2) Transition period:	When GTCCRA register = 0 is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 01b, and toggle output is continued up to the next crest.
(3) Output holding period:	The output is held while GTCCRA register = 0.
(4) Recovery period:	When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and holding output is maintained up to the next crest.
(5) Normal operation period:	Toggle output due to a compare match isperformed normally.

Figure 18.92 Example of output protection operation when GTCCRA is set to 0 during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low



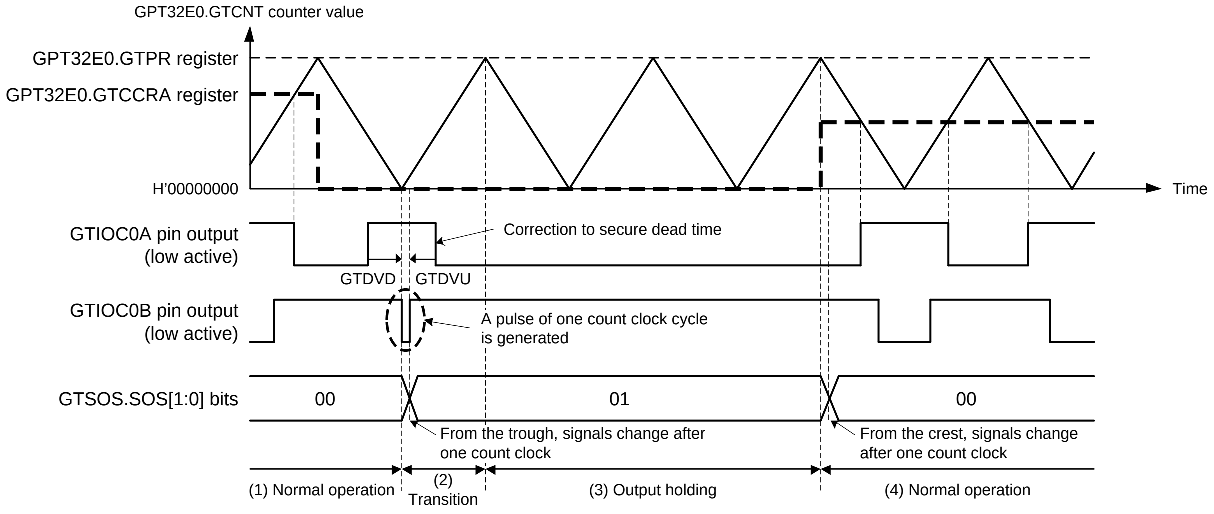
(1) Normal operation period:	Toggle output due to a compare match is performed normally.
(2) Transition period:	When GTCCRA register = 0 is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 01b, and toggle output is continued up to the next crest.
(3) Output holding period:	The output is held while GTCCRA register = 0.
(4) Normal operation period:	When 0 < GTCCRA register < GTPR register is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 18.93 Example of output protection operation when GTCCRA is set to 0 during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at crests, and active-low



(1) Normal operation period:	Toggle output due to a compare match is performed normally.
(2) Transition period:	When GTCCRA register = 0 is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 01b, and toggle output is continued up to the next crest.
(3) Output holding period:	The output is held while GTCCRA register = 0.
(4) Recovery period:	When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and holding output is maintained up to the next crest.
(5) Normal operation period:	Toggle output due to a compare match is performed normally.

Figure 18.94 Example of output protection operation when GTCCRA is set to 0 during buffer transfer at crests, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low

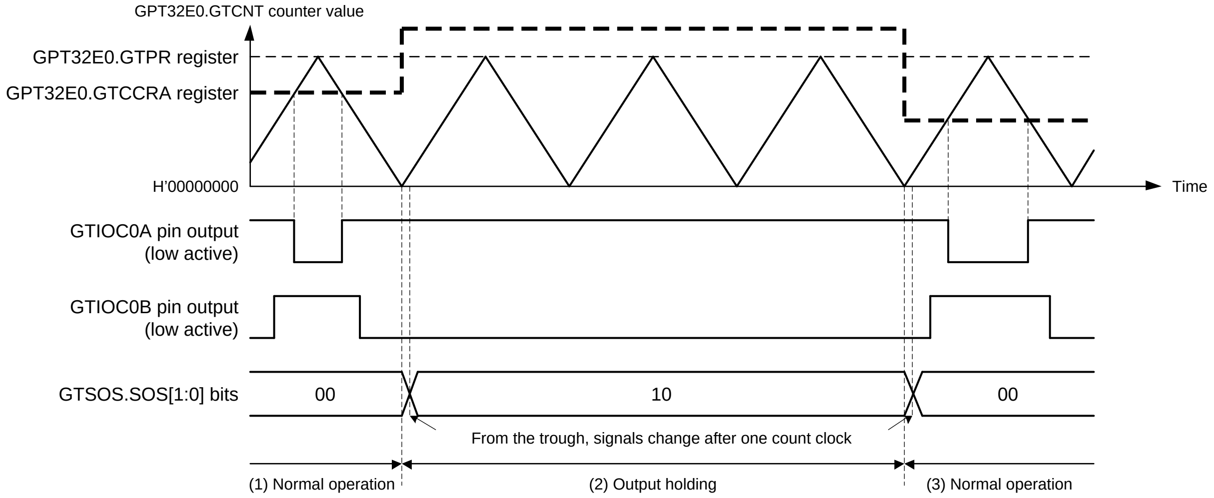


(1) Normal operation period:	Toggle output due to a compare match is performed normally.
(2) Transition period:	When GTCCRA register = 0 is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 01b, and toggle output is continued up to the next crest.
(3) Output holding period:	The output is held while GTCCRA register = 0.
(4) Normal operation period:	When 0 < GTCCRA register < GTPR register is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 18.95 Example of output protection operation when GTCCRA is set to 0 during buffer transfer at crests, with 0 < GTCCRA < GTPR restored during buffer transfer at crests, and active-low

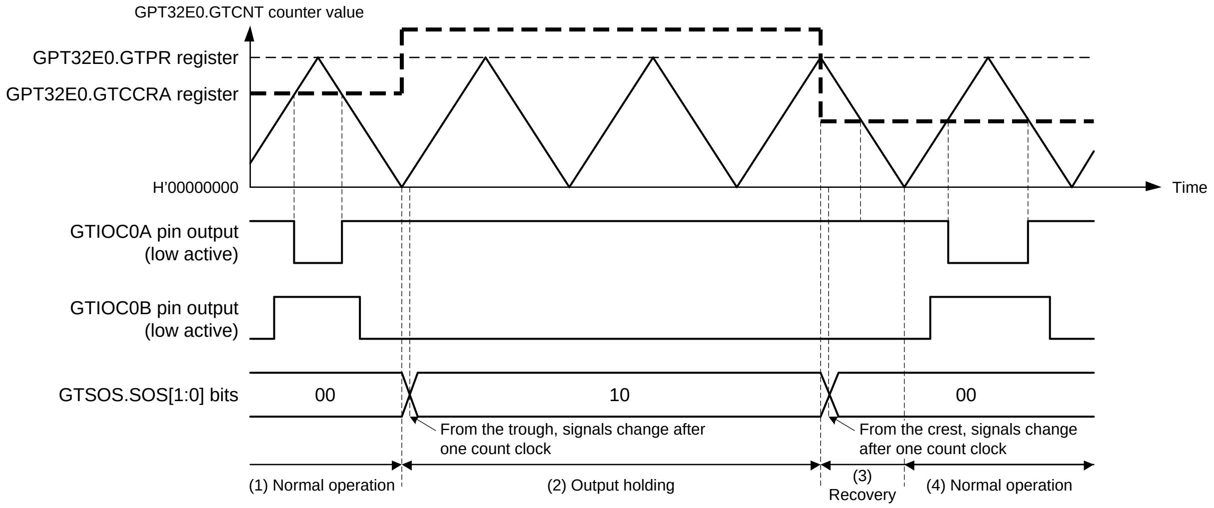
18.7.4.2 Output Protection Function When GTCCRA ≥ GTPR is Set during Buffer Transfer at Troughs

Figure 18.96 and **Figure 18.97** show examples of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at troughs.



(1) Normal operation period:	Toggle output due to a compare match is performed normally.
(2) Output holding:	When GTCCRA register ≥ GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 10b, and the output is held while GTCCRA register ≥ GTPR register.
(3) Normal operation period:	When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 18.96 Example of output protection operation when GTCCRA ≥ GTPR is set during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low

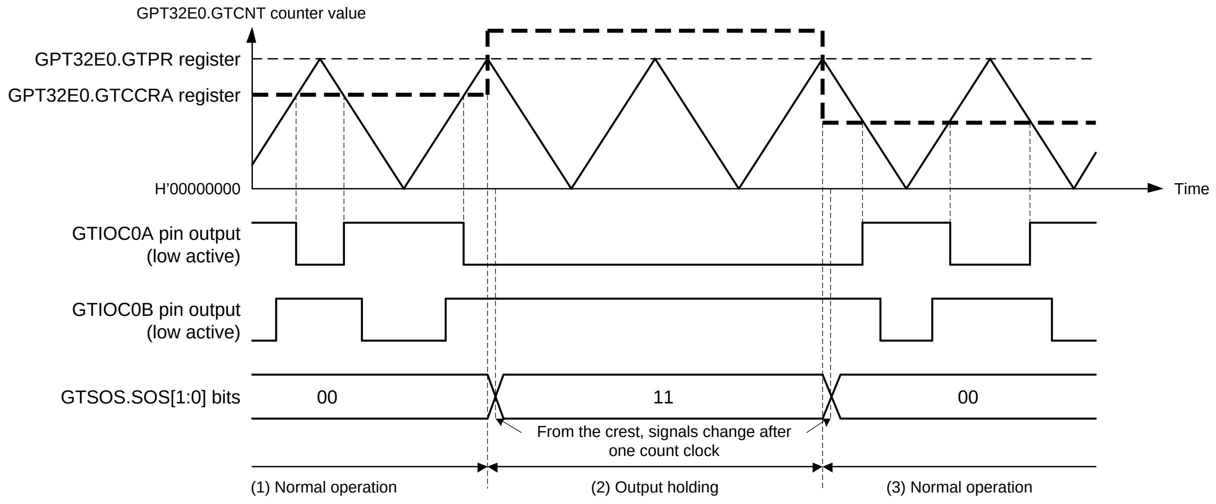


(1) Normal operation period:	Toggle output due to a compare match is performed normally.
(2) Output holding period:	When GTCCRA register ≥ GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 10b, and the output is held while GTCCRA register ≥ GTPR register.
(3) Recovery period:	When 0 < GTCCRA register < GTPR register is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and holding output is maintained up to the next trough.
(4) Normal operation period:	Toggle output due to a compare match is performed normally.

Figure 18.97 Example of output protection operation when GTCCRA ≥ GTPR is set during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at crests, and active-low

18.7.4.3 Output Protection Function When GTCCRA ≥ GTPR is Set during Buffer Transfer at Crests

Figure 18.98 and **Figure 18.99** show examples of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at crests.

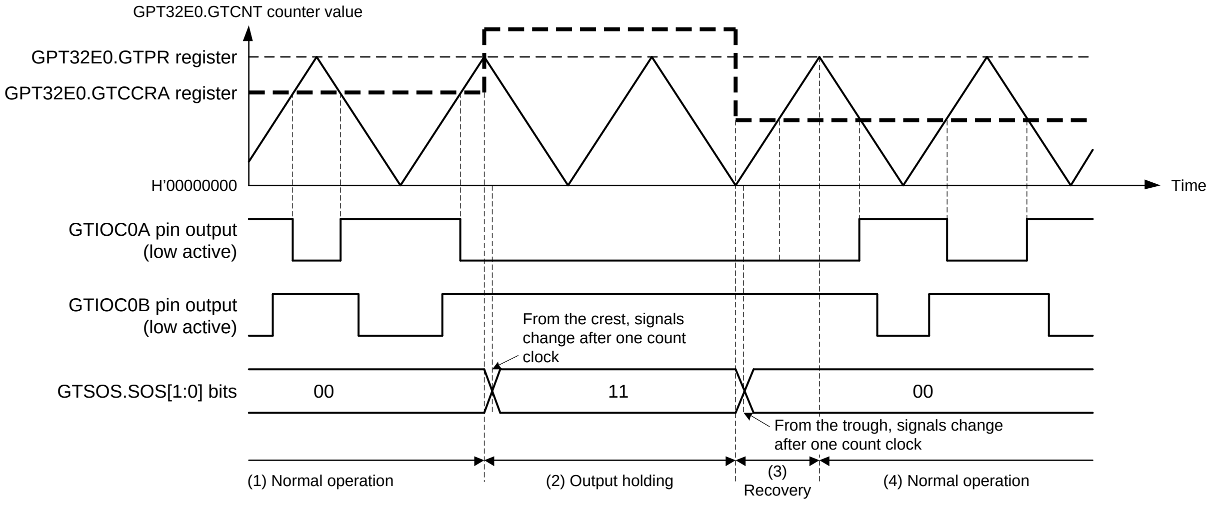


(1) Normal operation period: Toggle output due to a compare match is performed normally.

(2) Output holding period:: When GTCCRA register ≥ GTPR register is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] bits = 11b, and the output is held while GTCCRA register ≥ GTPR register.

(3) Normal operation period: When 0 < GTCCRA register < GTPR register is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 18.98 Example of output protection operation when GTCCRA ≥ GTPR is set during buffer transfer at crests, with 0 < GTCCRA < GTPR restored during buffer transfer at crests, and active- low



(1) Normal operation period: Toggle output due to a compare match is performed normally.

(2) Output holding period: When GTCCRA ≥ GTPR is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] = 11b, and the output is held while GTCCRA ≥ GTPR.

(3) Recovery period: When 0 < GTCCRA < GTPR is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] = 00b, and holding output is maintained up to the next crest.

(4) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 18.99 Example of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at crests, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low

18.7.4.4 Restricted Specification of Output Protection Function

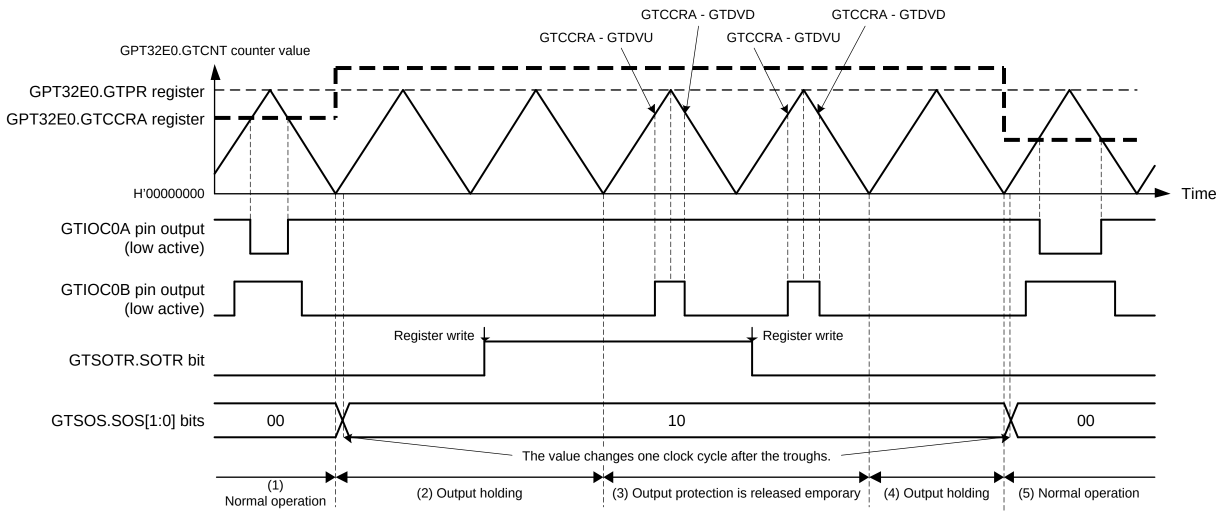
The output protection function deactivates the level of one of the positive and negative outputs, even if an incorrect value is set in the GTCCRA register during counting (a setting outside the range of 0 < GTCCRA < GTPR). However, it will not work properly unless the following conditions are satisfied.

- At count start: The value of the GTCCRA register must be set within the range of (0 < GTCCRA < GTPR).
- During buffer transfer at crest: GTCCRA - GTDVD < GTPR - 1 has to be satisfied..
- During buffer transfer at trough: If GTCCRA ≥ GTPR, GTCCRA - GTDVU > 1 has to be satisfied.

18.7.4.5 Temporary cancellation of Output Protection Function

When the GTSOTR.SOTR bit is set to 1 with GTSOS.SOS[1:0] bits equal to 10b (showing output protection state by GTCCRA ≥ GTPR during buffer transfer at troughs), the output protection function for GTIOCB pin is temporarily canceled. GTSOS.SOS[1:0] bits retain the value of 10b even when the output protection function is canceled. When the SOTR bit is set to 0, the output protection function for GTIOCB pin resumes.

Figure 18.100 shows examples of temporary cancellation of output protection function operation when the GTCCRA ≥ GTPR is set during buffer transfer at troughs.



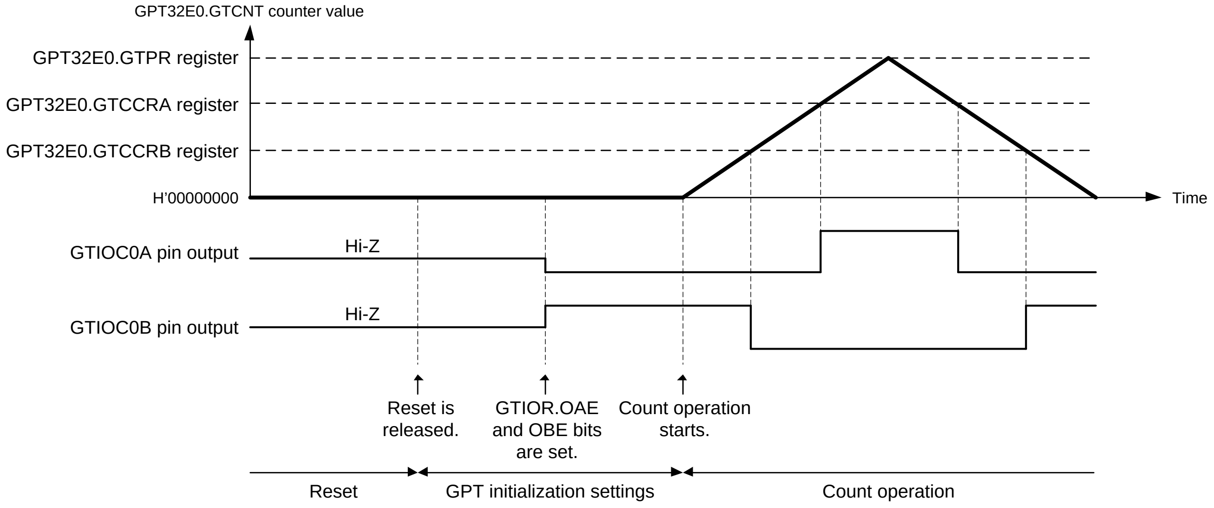
(1) Normal operation period:	Toggle output due to a compare match is performed normally.
(2) Output holding period:	When GTCCRA register ≥ GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 10b, and the output is held while GTCCRA register ≥ GTPR register. If GTSOTR.SOTR is set to 1 during the output holding period, the GTIOCB output is holding until the first trough after the setting.
(3) Output protection releasing period:	After GTSOTR.SOTR is set to 1, the GTIOCB output is performed normally at the first trough after the setting. If GTSOTR.SOTR is set to 0 during the output protection releasing period, the output is holding at the first trough after the setting.
(4) Output holding period:	Until 0 < GTCCRA register < GTPR register is detected in the trough, the output is holding. When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 00b.
(5) Normal operation period:	Toggle output due to a compare match is performed normally.

Figure 18.100 Example of temporary cancellation of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low

18.8 Initialization Method of Output Pins

18.8.1 Pin Settings after Reset

The GPT registers are initialized at a reset. Start counting after selecting the port mode, setting GTIOR.OAE and GTIOR.OBE bits, and outputting the GPT function to external pins.



[Setting examples]

GTIOR.GTIOA[4:0] bits: Initial output of low, output retained at cycle end, output toggled at compare match

GTIOR.GTIOB[4:0] bits: Initial output of high, output retained at cycle end, output toggled at compare match

Figure 18.101 Example of pin settings after reset

18.8.2 Pin Initialization Caused by Error during Operation

If an error occurs during GPT operation, the following four types of pin processing can be performed before pin initialization:

- Set the OAHLD and OBHLD bits in GTIOR to 1 and retain the outputs at count stop.
- Set the OAHLD and OBHLD bits in GTIOR to 0, specify arbitrary output values in OADFLT and OBDFLT in GTIOR, and output the arbitrary values on count stop.
- Set the pin to output an arbitrary value as a general output port by setting the PMn, Pn, and PMCn registers of the I/O port in advance. Set the OAE and OBE bits in GTIOR to 0 and the control bit associated with the pin in the PMCn to 0, to allow arbitrary values to be output from the pin set as a general output port when an error occurs.
- Drive the output to a high impedance state using the POEG function.

When the automatic dead time setting is made, clear the GTDTCR.TDE bit to 0 after counting stops. When counting stops, only the values of registers that are changed by a GPT external source change. If counting resumes, operation continues from where it stops. If counting stops, registers must be initialized before counting starts.

18.9 Usage Notes

18.9.1 GTCCRn Settings during Compare Match Operation (n = A to F)

(1) When automatic dead time setting is made in triangle-wave PWM mode

The GTCCRA register must satisfy the following conditions: GTDVU < GTCCRA, GTDVD < GTCCRA, and GTCCRA < GTPR.

When the setting of GTCCRA = 0 or GTCCRA ≥ GTPR is made during count operation, the output protection function is activated.

However, it will not work properly unless the following conditions are satisfied.

- At count start: The value of the GTCCRA register must be set within the range of (0 < GTCCRA < GTPR).
- During buffer transfer at crest: GTCCRA - GTDVD < GTPR - 1 has to be satisfied..
- During buffer transfer at through: If GTCCRA ≥ GTPR, GTCCRA - GTDVU > 1 has to be satisfied.

For details, see **Section 18.7.4, Output Protection Function for GTIOC Pin Output**.

(2) When automatic dead time setting is not made in triangle-wave PWM mode

The GTCCRA register must be set within the range of 0 < GTCCRA < GTPR. If GTCCRA = 0 or GTCCRA = GTPR is set, a compare match occurs within the cycle only when GTCCRA = 0 or GTCCRA = GTPR is satisfied. When GTCCRA > GTPR, no compare match occurs.

Similarly, GTCCRB must be set within the range of 0 < GTCCRB < GTPR. If GTCCRB = 0 or GTCCRA = GTPR is set, a compare match occurs within the cycle only when GTCCRB = 0 or GTCCRB = GTPR is satisfied. When GTCCRB > GTPR, no compare match occurs.

(3) When automatic dead time setting is made in saw-wave one-shot pulse mode

The GTCCRC and GTCCRD registers must be set to satisfy the following constraints. If the constraints are not satisfied, correct output waveforms with secured dead time might not be obtained.

- In up-counting: GTCCRC < GTCCRD, GTCCRC > GTDVU, GTCCRD < GTPR - GTDVD
- In down-counting: GTCCRC > GTCCRD, GTCCRC < GTPR – GTDVU, GTCCRD > GTDVD

(4) When automatic dead time setting is not made in saw-wave one-shot pulse mode

The GTCCRC and GTCCRD registers must be set to satisfy the following constraints. If the constraints are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRC < GTCCRD < GTPR
- In down-counting: GTPR > GTCCRC > GTCCRD > 0

Similarly, GTCCRE and GTCCRF must be set to satisfy the following constraints. If the constraints are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRE < GTCCRF < GTPR
- In down-counting: GTPR > GTCCRE > GTCCRF > 0

(5) In saw-wave PWM mode

The GTCCRA register must be set with the range of 0 < GTCCRA < GTPR. If GTCCRA = 0 or GTCCRA = GTPR is set, a compare match occurs within the cycle only when GTCCRA = 0 or GTCCRA = GTPR is satisfied. If GTCCRA > GTPR is set, no compare match occurs.

Similarly, GTCCRB must be set with the range of 0 < GTCCRB < GTPR. If GTCCRB = 0 or GTCCRB = GTPR is set, a compare match occurs within the cycle only when GTCCRB = 0 or GTCCRB = GTPR is satisfied. If GTCCRB > GTPR is set, no compare match occurs.

18.9.2 Setting Range for the GTCNT Counter

The GTCNT counter register must be set with the range of 0 ≤ GTCNT ≤ GTPR.

18.9.3 Starting and Stopping the GTCNT Counter

The control timing of starting and stopping the GTCNT counter by the GTCR.CST bit synchronizes the count clock that is selected in GTCR.TPCS[2:0]. When GTCR.CST is updated, the GTCNT counter starts/stops after a count clock that is selected in GTCR.TPCS[2:0]. Therefore, an event generated before the GTCNT counter actually starts is ignored.

Note, however, that an event might be accepted or an interrupt might occur after the GTCR.CST bit is set to 0.

18.9.4 Priority On Conflicts

(1) GTCNT register

Table 18.20 shows a priority order of events updating GTCNT register.

Table 18.20 Priority order of sources updating GTCNT

Source updating GTCNT	Priority order
Writing by CPU (Writing to GTCNT/GTCLR)	High
Clear by hardware sources set in GTCSR	↑
Count up or down by hardware sources set in GTUPSR/GTDNSR	
Count operation	Low

If up-counting and down-counting by hardware sources occur at the same time, the GTCNT counter value does not change. When there is a conflict between updating the GTCNT register and reading by the CPU, pre-update data is read.

(2) GTCR.CST bit

When there is a conflict between starting/stopping by hardware sources set in the GTSSR/GTPSR registers and writing by the CPU (writing to GTCR/GTSTR/GTSTP registers), writing by CPU has a priority over starting/stopping by hardware sources.

When there is a conflict between starting by hardware sources set in the GTSSR register and stopping by hardware sources set in GTPSR register, the GTCR.CST bit value does not change. Where there is a conflict between updating the GTCR.CST bit and reading by the CPU, pre-update data is read.

(3) GTCCRn registers (n = A to F)

When there is a conflict between input capture/buffer transfer operation and writing to GTCCRn registers, writing to GTCCRn registers has a priority over input capture/buffer transfer operation. When there is a conflict between input capture and writing to the counter register by the CPU or updating the counter register by hardware sources, the pre-update counter value is captured. Where there is a conflict between updating the GTCCRn registers and reading by the CPU, pre-update data is read.

(4) GTPR registers

When there is a conflict between buffer transfer operation and writing to the GTPR register, writing to GTPR register has a priority over buffer transfer operation. When there is a conflict between updating GTPR register and reading by the CPU, pre-update data is read.

(5) GTADTRn registers (n = A, B)

When there is a conflict between buffer transfer operation and writing to the GTADTRn registers, writing to the GTADTRn registers has priority over buffer transfer operation. Where there is a conflict between updating GTADTRn registers and reading by the CPU, pre-update data is read.

(6) GTDVn registers (n = U, D)

When there is a conflict between buffer transfer operation and writing to GTDVn registers, writing to GTDVn registers has priority over buffer transfer operation. When there is a conflict between updating GTDVn registers and reading by the CPU, pre-update data is read.

19. Port Output Enable for GPT (POEG)

19.1 Overview

The output pins of the general PWM timer (GPT) can be disabled by using the port output enabling function for the GPT (POEG). Specifically, either of the following ways can be used.

- Input level detection of the GTETRGA to GTETRGD pins
- Output-disable request from the GPT
- Register settings

The GTETRGA to GTETRGD pins can also be used as GPT external trigger input pins.

Table 19.1 lists the POEG specifications, **Figure 19.1** shows the block diagram, and **Table 19.2** lists the input pins.

Table 19.1 POEG Specifications

Parameter	Specifications
Output-disable control through input level detection	GPT output pins can be disabled when a GTETRGA to GTETRGD rising edge or high level is sampled after polarity and filter selection
Output-disable request from the GPT	• When the GTIOCA pin and the GTIOCB pin are driven to an active level simultaneously, the GPT generates an output-disable request to the POEG. Through reception of these requests, the POEG can control whether the GTIOCA and GTIOCB pins are output-disabled • GPT output pins can be set to be disabled when the GPT output pins detect a dead time error or short circuit detection between the output terminals
Output-disable control by software (registers)	GPT output pins can be disabled by modifying the register settings
Interrupt	• Allows output-disable control by input level detection • Allows output-disable requests from the GPT
External trigger output to the GPT (count start, count stop, count clear, up-count, down-count, or input capture function)	GTETRGA to GTETRGD signals can be output to the GPT after polarity and filter selection
Noise filtering	• Three times sampling for every P0ϕ1, P0ϕ8, P0ϕ32, or P0ϕ128 can be set for any of the input pins GTETRGA to GTETRGD • Positive or negative polarity can be selected for any of the input pins, GTETRGA to GTETRGD • Signal state after polarity and filter selection can be monitored

GTETRGn (n = A to D) in the subsequent descriptions indicates the GTETRGA to GTETRGD pins. The signal input from each of the pins corresponds to the POEGGn register for which n matches the n of the pin.

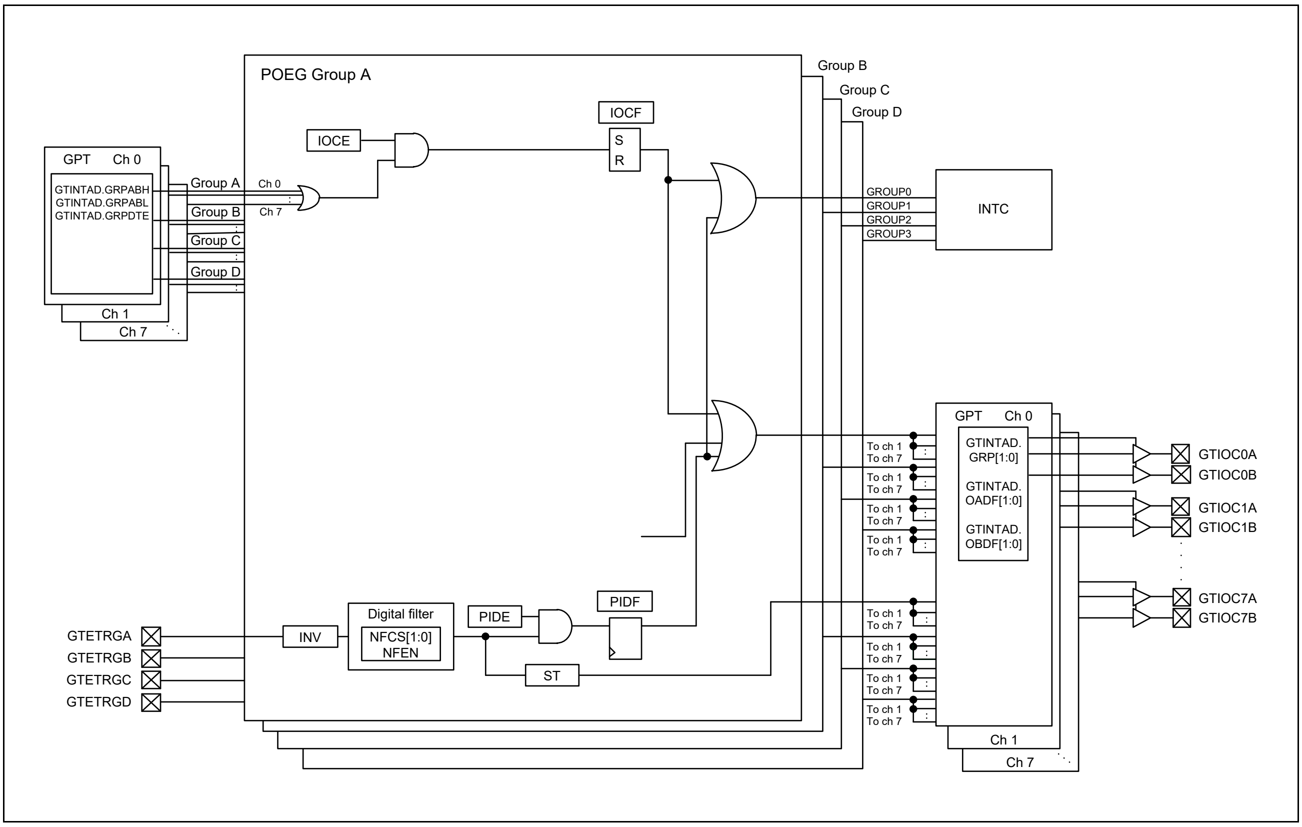


Figure 19.1 POEG Block Diagram

Table 19.2 POEG Input Pins

Pin Name	I/O	Description
GTETRGA	Input	GPT output pin output-disable request signal and GPT external trigger input pin A
GTETRGB	Input	GPT output pin output-disable request signal and GPT external trigger input pin B
GTETRGC	Input	GPT output pin output-disable request signal and GPT external trigger input pin C
GTETRGD	Input	GPT output pin output-disable request signal and GPT external trigger input pin D

19.2 Register Descriptions

Table 19.3 to **Table 19.5** shows the register configuration.

Table 19.3 Register Configuration 1 (Cortex-A55 Address Space)

Register Name	Abbreviation	Address	Access Size
POEG group A setting register	POEGGA	H'0_1004_8800	32
POEG group B setting register	POEGGB	H'0_1004_8C00	32
POEG group C setting register	POEGGC	H'0_1004_9000	32
POEG group D setting register	POEGGD	H'0_1004_9400	32

Table 19.4 Register Configuration 2 (Cortex-M33 Address Space Non-Secure)

Register Name	Abbreviation	Address	Access Size
POEG group A setting register	POEGGA	H'4004_8800	32
POEG group B setting register	POEGGB	H'4004_8C00	32
POEG group C setting register	POEGGC	H'4004_9000	32
POEG group D setting register	POEGGD	H'4004_9400	32

Table 19.5 Register Configuration 3 (Cortex-M33 Address Space Secure)

Register Name	Abbreviation	Address	Access Size
POEG group A setting register	POEGGA	H'5004_8800	32
POEG group B setting register	POEGGB	H'5004_8C00	32
POEG group C setting register	POEGGC	H'5004_9000	32
POEG group D setting register	POEGGD	H'5004_9400	32

19.2.1 POEG Group n Setting Register (POEGGn) (n = A to D)

b0	PIDF	0	R(/W) *1	Port Input Detection Flag 0: No output-disable request from the GTETRGn pin occurred 1: Output-disable request from the GTETRGn pin occurred.
b1	IOCF	0	R(/W) *1	Detection Flag for GPT Output-Disable Request 0: No output-disable request from GPT disable request occurred 1: Output-disable request from GPT disable request occurred.
b2	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.
b3	SSF	0	R/W	Software Stop Flag 0: No output-disable request from software occurred 1: Output-disable request from software occurred.
b4	PIDE	0	R/W*2	Port Input Detection Enable 0: Disable output-disable requests from the GTETRGn pins 1: Enable output-disable requests from the GTETRGn pins.
b5	IOCE	0	R/W*2	Enable for GPT Output-Disable Request 0: Disable output-disable requests from GPT disable request 1: Enable output-disable requests from GPT disable request.
b15 to b6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b16	ST	0	R	GTETRGn Input Status Flag 0: GTETRGn input after filtering was 0 1: GTETRGn input after filtering was 1.
b27 to b17	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b28	INV	0	R/W	GTETRGn Input Reverse 0: Input GTETRGn as-is 1: Input GTETRGn in reverse.
b29	NFEN	0	R/W	Noise Filter Enable 0: Disable noise filtering 1: Enable noise filtering.

Bit	Bit Name	Initial Value	R/W	Description
b31, b30	NFCS[1:0]	All 0	R/W	Noise Filter Clock Select b1 b0 0 0: Sample GTETRGn pin input level three times every P0ϕ 0 1: Sample GTETRGn pin input level three times every P0ϕ8 1 0: Sample GTETRGn pin input level three times every P0ϕ32 1 1: Sample GTETRGn pin input level three times every P0ϕ128.

Note 1. Only 0 can be written, to clear the flag.

Note 2. Can be modified only once after a reset.

The POEGGA to POEGGD registers control the output-disable state of the GPT pins, interrupts, and the external trigger input to the GPT. In the descriptions, POEGGn represents all of the POEGGA to POEGGD registers.

19.3 Output-Disable Control Operation

The output of the GTIOCxA and GTIOCxB pins can be disabled when any of the following conditions are satisfied.

- Input level or edge detection of the GTETRGn pins

  When POEGGn.PIDE is 1, the POEGGn.PIDF flag is set to 1.

- Output-disable request from the GPT

  When POEGGn.IOCE is 1, the POEGGn.IOCF flag is set to 1.
  The output-disable requests enabled by GRPDTE, GRPABH, and GRPABL bits of the GTINTAD register in the GPT are applied to the group selected by GRP[1:0] bits of the GTINTAD register.

- SSF bit setting

  When POEGGn.SSF is set to 1.

The state of the GTIOCxA and the GTIOCxB pins when the output is disabled is controlled by the GPT module.

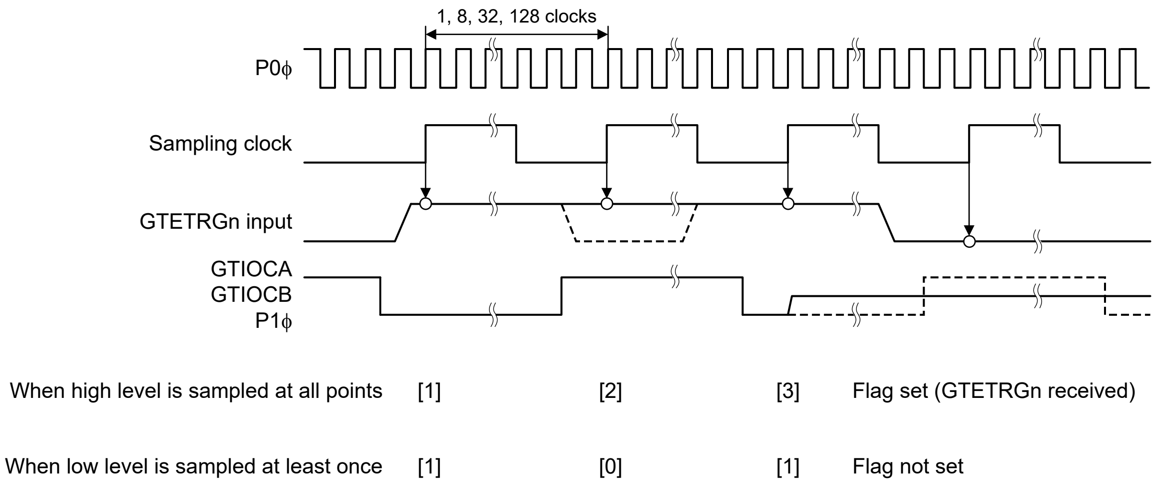
For details, see the descriptions of the GTINTAD.GRP[1:0], GTIOR.OADF[1:0], and GTIOR.OBDF[1:0] bits of the general PWM timer (GPT).

19.3.1 Pin Input Level Detection Operation

If the input conditions set in POEGGn.PIDE, POEGGn.NFCS[1:0], POEGGn.NFEN, and POEGGn.INV occur on the GTETRGn pins, the GPT output pins are output-disabled.

Digital Filter

Figure 19.2 shows high-level detection by the digital filter. When a high level associated with the POEGGn.INV polarity setting is detected three times consecutively with the sampling clock selected in POEGGn.NFCS[1:0] and POEGGn.NFEN, the detected level is recognized as high, and the GPT output pins are output-disabled. If even one low level is detected during this interval, the detected level is not recognized as high. In addition, in an interval where the sampling clock is not being output, changes of the levels on the GTETRGn pins are ignored.



Note: Individual channel output can be set in the GPT settings.
Low level sampling can be selected in POEGGn.INV.

Figure 19.2 Example of Digital Filter Operation

19.3.2 Output-Disable Requests from the GPT

For details on this operation, see the description of **18.7.3, GTIOC Pin Output Negate Control** in **Section 18, General PWM Timer (GPT)**.

19.3.3 Output-Disable Control Using Registers

The GPT output pins can be directly controlled by writing to the software stop flag, POEGGn.SSF.

19.3.4 Release from Output-Disable

To release the GPT output pins placed in the output-disable state, either return them to their initial state with a reset or clear all of the following:

- POEGGn.PIDF flag
- POEGGn.IOCF flag
- POEGGn.SSF flag.

Writing 0 to the POEGGn.PIDF flag is ignored (the flag is not cleared) if the external input pins, GTETRGn, are not disabled and the POEGGn.ST bit is not set to 0.

Writing 0 to the POEGGn.IOCF flag is valid (the flag is cleared) only if all of the GTST.DTEF, GTST.OABHF, and GTST.OABLF flags in the GPT are set to 0.

Figure 19.3 shows the release timing for output-disable. The output-disable is released at the beginning of the next count cycle of the GPT after the flag is cleared.

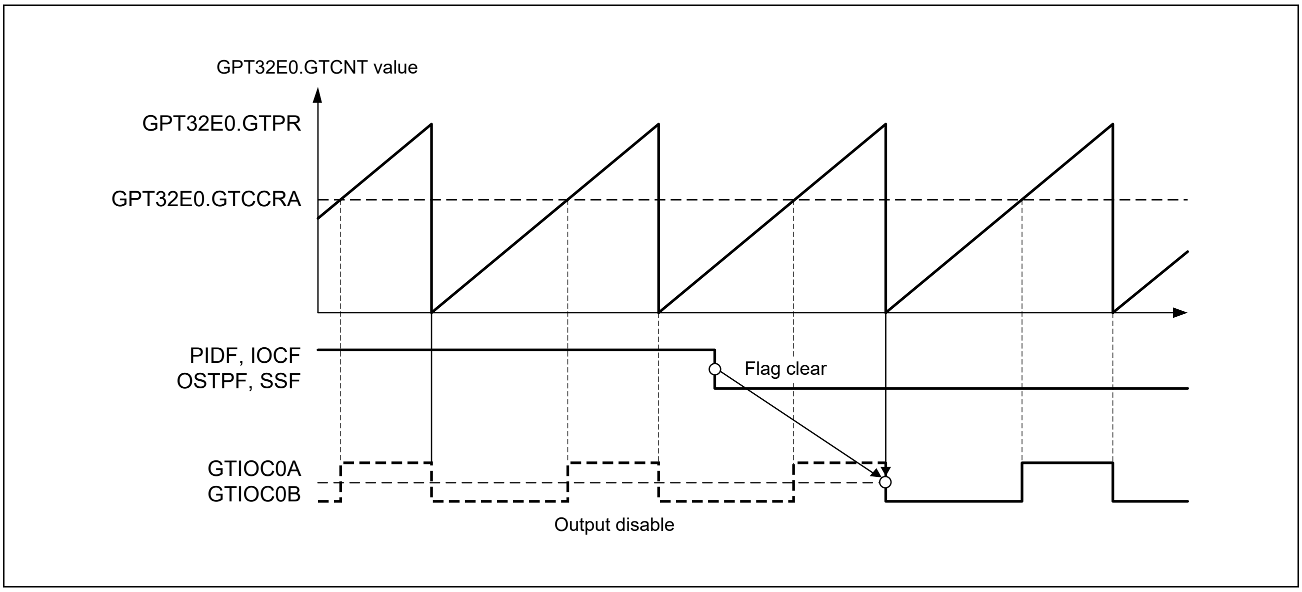


Figure 19.3 Output-Disable Release Timing for GPT Pin Outputs

19.4 Interrupt Sources

The POEG generates an interrupt request when triggered by these sources:

- Output-disable control by input level detection
- Output-disable request from the GPT
- Output-disable control by the registers.

Table 19.6 lists the conditions for interrupt requests.

Table 19.6 Interrupt Sources and Conditions

Interrupt Source	Symbol	Associated Flag	Trigger Conditions
POEG group A interrupt	GROUP0	POEGGA.IOCF	Output-disable request from a GPT disable request occurred
		POEGGA.PIDF	Output-disable request from the GTETRGA pin occurred
POEG group B interrupt	GROUP1	POEGGB.IOCF	Output-disable request from a GPT disable request occurred
		POEGGB.PIDF	Output-disable request from the GTETRGB pin occurred
POEG group C interrupt	GROUP2	POEGGC.IOCF	Output-disable request from a GPT disable request occurred
		POEGGC.PIDF	Output-disable request from the GTETRGC pin occurred
POEG group D interrupt	GROUP3	POEGGD.IOCF	Output-disable request from a GPT disable request occurred
		POEGGD.PIDF	Output-disable request from the GTETRGD pin occurred

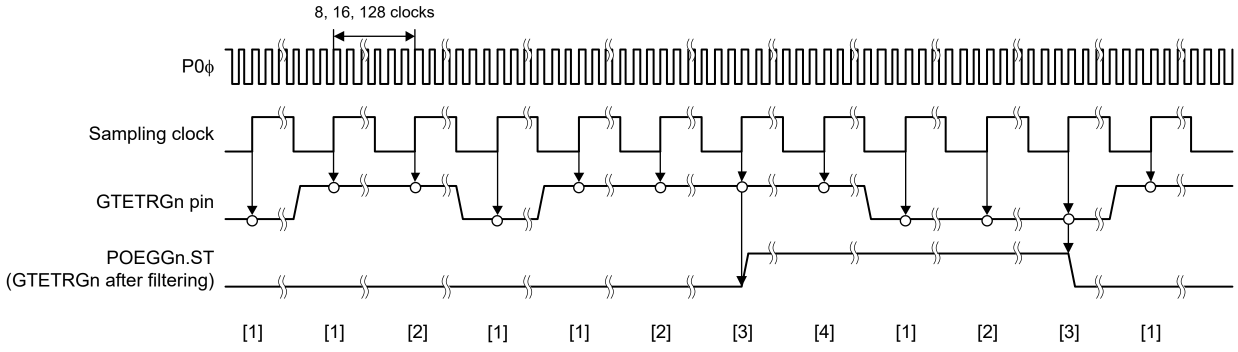
19.5 External Trigger Output to the GPT

The POEG outputs the GTETRGn signals to the GPT as the GPT operation trigger signal for the following:

- Count start
- Count stop
- Count clear
- Up-count
- Down-count
- Input capture.

For the POEGGn.INV polarity setting signal, when the same level is input three times continuously with the sampling clock selected in POEGGn.NFCS[1:0] and POEGGn.NFEN, that value is output. Set the control registers the same as for the input level detection operation described in **Section 19.3.1, Pin Input Level Detection Operation**. The state after filtering can be monitored in POEGGn.ST.

Figure 19.4 shows the output timing of an external trigger to the GPT.



Note: Each channel output can be set in the GPT settings.
Polarity can be reversed in POEGGn.INV.

Figure 19.4 Output Timing of External Trigger to GPT

19.6 Usage Notes

19.6.1 Specifying Pins Associated with the GPT

The POEG controls output-disable only when a pin is associated with the GPT in the PMCn and PFCm register settings of IO_TOP. When the pin is specified as a general I/O pin, the POEG does not perform output-disable control.

20. General Timer (GTM)

20.1 Functional Overview

The General timer has the following features.

- Two operating modes
  - Interval timer mode
  - Free-running comparison mode
- Choice between startup of DMA by compare match and generation of interrupt

20.1.1 Features of GTM

Channels

This product has the following number of channels of the General timer.

Table 20.1 Channels of General Timer

General Timer	
Number of Channels	3
Name	OSTMn

Note: n = 0, 1, 2

Meaning of n

Throughout this section, the individual channels of the General timer are identified by the index “n” (n = 0, 1, 2), for example OSTMnTO for the General timer n output register.

Register address

The register addresses of the General timer are given as offsets from the individual base addresses <OSTMn_base>. The register base addresses of each OSTMn are listed in the following table.

Table 20.2 Register Base Addresses

Base Address Name	Base Address
<OSTM0_base>	H’0_1280_1000 (H’4280_1000*1, H’5280_1000*2)
<OSTM1_base>	H’0_1280_1400 (H’4280_1400*1, H’5280_1400*2)
<OSTM2_base>	H’0_1280_1800 (H’4280_1800*1, H’5280_1800*2)

Note 1. Cortex-M33 Address Space Non-Secure

Note 2. Cortex-M33 Address Space Secure

Interrupts

The General timers can generate the following interrupt requests.

Table 20.3 OSTMn Interrupt Requests

OSTMn Signal	Function	Startup of Direct Memory Access Controller
OSTM0TINT	OSTM0 interrupt	✓
OSTM1TINT	OSTM1 interrupt	✓
OSTM2TINT	OSTM2 interrupt	✓

20.2 Registers

The General timer is controlled by the following registers.

20.2.1 Registers Overview

The list of OSTMn (n = 0, 1, 2) registers and the memory addresses are as follows.

For the base addresses, see **Table 20.2**.

For the actual addresses, the offset values indicated in the following table are added to the base addresses.

Register Name	Function	R/W	Reset Value	Access Unit (bit)			Address
				8	16	32	
OSTMnCMP	OSTM compare register	R/W	H’0000 0000	—	—	✓	<OSTMn_base> + H’00
OSTMnCNT	OSTM counter register	R	H’FFFF FFFF	—	—	✓	<OSTMn_base> + H’04
OSTMnTE	OSTM count enable status register	R	H’00	✓	—	—	<OSTMn_base> + H’10
OSTMnTS	OSTM count start trigger register	W	H’00	✓	—	—	<OSTMn_base> + H’14
OSTMnTT	OSTM count stop trigger register	W	H’00	✓	—	—	<OSTMn_base> + H’18
OSTMnCTL	OSTM control register	R/W	H’00	✓	—	—	<OSTMn_base> + H’20

20.2.2 Details of OSTM Registers

20.2.2.1 OSTMnCMP — OSTM Compare Register

Depending on the mode of operation, this register holds the start value for the down-counter or the value for comparison with that of the counter.

Access Size:	This register is readable/writable in 32-bit units.
Address(es):	<OSTMn_base>
Initial Value:	H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OSTMnCMP[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OSTMnCMP[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OSTMnCMP[31:0]	All 0	R/W	● In interval timer mode: start value of the down-counter ● In free-running comparison mode: value for comparison

20.2.2.2 OSTMnCNT — OSTM Counter Register

This register indicates the counter value of the timer.

Access Size: This register is readable in 32-bit units.

Address(es): <OSTMn_base> + H'4

Initial Value: The initial value depends on the operating mode of the General timer. Refer to **Table 20.4**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OSTMnCNT[31:16]															
Initial Value	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OSTMnCNT[15:0]															
Initial Value	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OSTMnCNT [31:0]	*1	R	32-bit counter value

Note 1. The initial value depends on the operating mode of the General timer. Refer to **Table 20.4**

The following table shows the correspondence between operating mode, counting direction and initial value. The initial value is the value read from the counter after a change to the operating mode.

Table 20.4 Correspondence between Operating Mode, Counting Direction and Initial Value

Timer Operating Mode	OSTMnCTL.OSTMnMD1	Counting Direction	Initial value
Interval timer mode	0*1	Down	H'FFFF FFFF
Free-running comparison mode	1	Up	H'0000 0000

Note 1. Value after reset

20.2.2.3 OSTMnTE — OSTM Count Enable Status Register

This register indicates whether the counter is enabled or disabled.

Access Size: This register is readable in 8-bit units.
Address(es): <OSTMn_base>+ H'10
Initial Value: H'00

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMn TE
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OSTMnTE	0	R	This bit indicates whether the counter is enabled or disabled. 0: Counter disabled 1: Counter enabled This bit is set to 1 in response to OSTMnTS.OSTMnTS being set to 1. This bit is reset to 0 in response to OSTMnTT.OSTMnTT being set to 1.

Note 1. When OSTMnTE = 0, the counter retains its value.
If the counter is restarted, it
- restarts counting down from the value in the OSTMnCMP register if it is in interval timer mode or
- restarts counting up from the counter value H'0000 0000 if it is in free running comparison mode.

Note 2. For debugging, the GTM counter can be paused by the counter stop request.

20.2.2.4 OSTMnTS — OSTM Count Start Trigger Register

This register starts the counter.

Access Size: This register is writable in 8-bit units. It is always read as H'00.
Address(es): <OSTMn_base>+ H'14
Initial Value: H'00

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMn TS
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OSTMnTS	0	W	This bit starts the counter. 0: This setting has no effect. 1: Starts the counter and sets OSTMnTE.OSTMnTE = 1. ● In interval timer mode, a forced restart is executed if this bit is set while OSTMnTE.OSTMnTE = 1. ● In free-running comparison mode, setting this bit is ignored as long as OSTMnTE.OSTMnTE = 1.

20.2.2.5 OSTMnTT — OSTM Count Stop Trigger Register

This register stops the counter.

Access Size: This register is writable in 8-bit units. It is always read as H'00.
Address(es): <OSTMn_base>+ H'18
Initial Value: H'00

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMn TT
Initial Value								
R/W	R	R	R	R	R	R	R	W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OSTMnTT	0	W	Stops the counter. 0: This setting has no effect. 1: Stops the counter and clears the OSTMnTE.OSTMnTE bit.

20.2.2.6 OSTMnCTL — OSTM Control Register

This register specifies the operating mode for the counter and controls enabling/disabling of OSTMnTINT interrupt requests when counting starts.

Access Size:	This register is readable/writable in 8-bit units. Writing to this register is only possible if the counter is disabled (OSTMnTOE.OSTMnTOE = 0).
Address(es):	<OSTMn_base>+ H'20
Initial Value:	H'00

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OSTMn MD1	OSTMn MD0
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	OSTMnMD1	0	R/W	Specifies the operating mode for the counter. 0: Interval timer mode 1: Free-running comparison mode
0	OSTMnMD0	0	R/W	Controls enabling/disabling of OSTMnTINT interrupt requests when counting starts. 0: Disables the interrupts when counting starts. 1: Enables the interrupts when counting starts.

20.3 Functional Description

Each General timer is a 32-bit timer/counter.

The settings for operating mode specify the direction of counting (up or down) and the generation of interrupt requests.

20.3.1 Block Diagram

The following block diagram shows the main components of GTM.

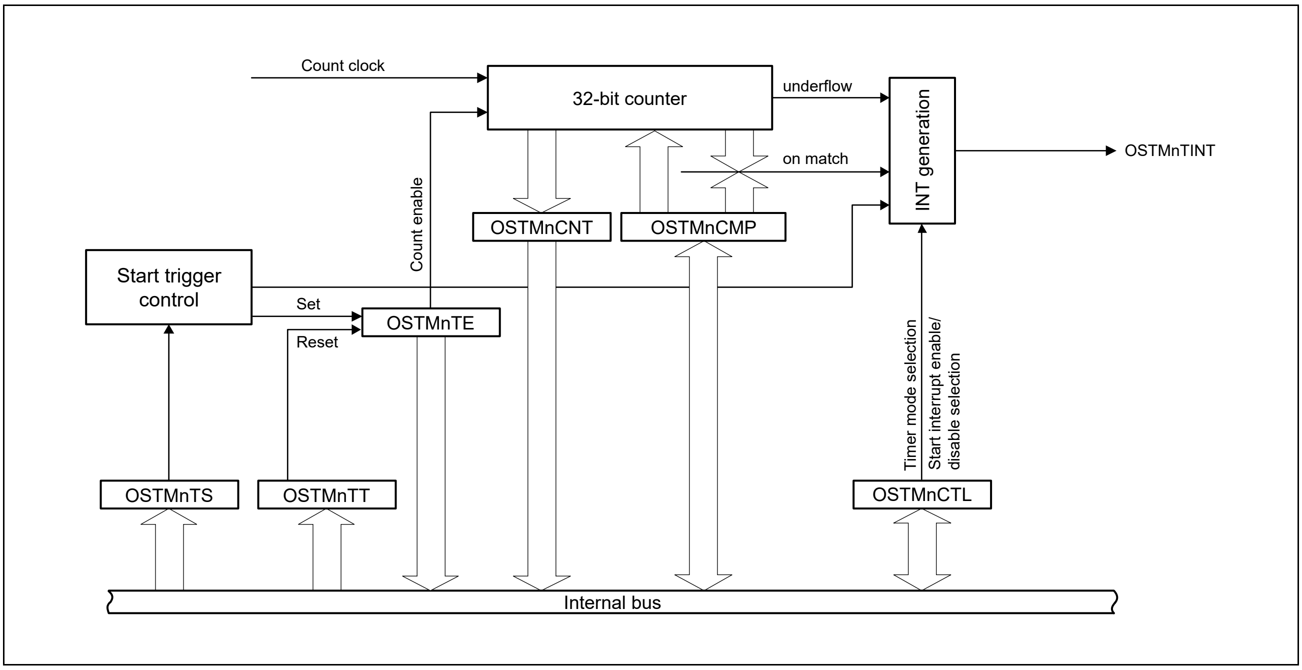


Figure 20.1 Block Diagram of GTM

20.3.2 Count Clock

The count clock of OSTMn is P0ϕ (OSTMn_PCLK).

20.3.3 Generation of Interrupt Request

An OSTMnTINT interrupt request is generated whenever the counter reaches H'0000 0000 (in interval timer mode) or matches the comparison value (in free-running comparison mode).

An interrupt request can also be generated on starting and restarting of the counter. This is controlled by the OSTMnCTL.OSTMnMD0 bit.

This operation is shown in the following figure.

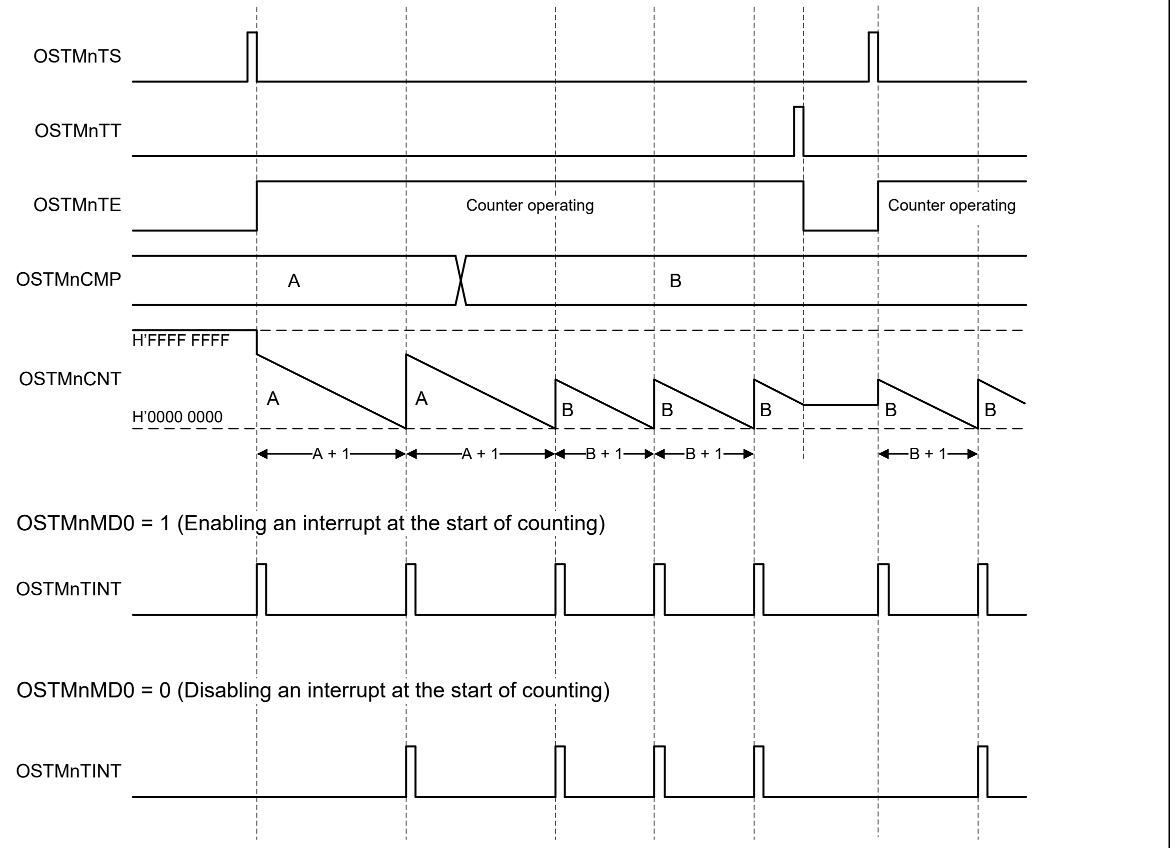

Figure 20.2 Generating an Interrupt when Counting Starts (in Interval Timer Mode)

20.3.4 Starting and Stopping the Timer

The General timer is started and stopped as follows.

Starting the timer

The timer is started in either of the following way:

- setting the OSTMnTS.OSTMnTSF bit to 1

Status bit OSTMnTE.OSTMnTE is set to 1.

The counter starts to count up or down in accord with the settings for operating mode.

Stopping the timer

Setting the OSTMnTT.OSTMnTT bit to 1 stops the timer.

This also clears the OSTMnTE.OSTMnTE status flag.

20.3.5 Interval Timer Mode

Select the interval timer mode when an General timer is to be used as a reference timer for generating interrupt requests at a fixed interval.

20.3.5.1 Basic Operation in Interval Timer Mode

In interval timer mode, the timer counts down from the value specified in the OSTMnCMP register. An OSTMnTINT interrupt request is generated when the counter reaches H’0000 0000.

Select interval timer mode by setting OSTMnCTL.OSTMnMD1 = 0.

New values can be written to the OSTMnCMP register at any time. If it is rewritten during count operation, the counter loads the new OSTMnCMP value when the next H’0000 0000 is reached.

Cycles of OSTMnTINT output

The cycle of OSTMnTINT output is as follows.

- OSTMnTINT generation cycle = counter-clock cycle × (OSTMnCMP + 1)

The following figure shows the basic operation of OSTM when counter-start interrupts is enabled in interval timer mode.

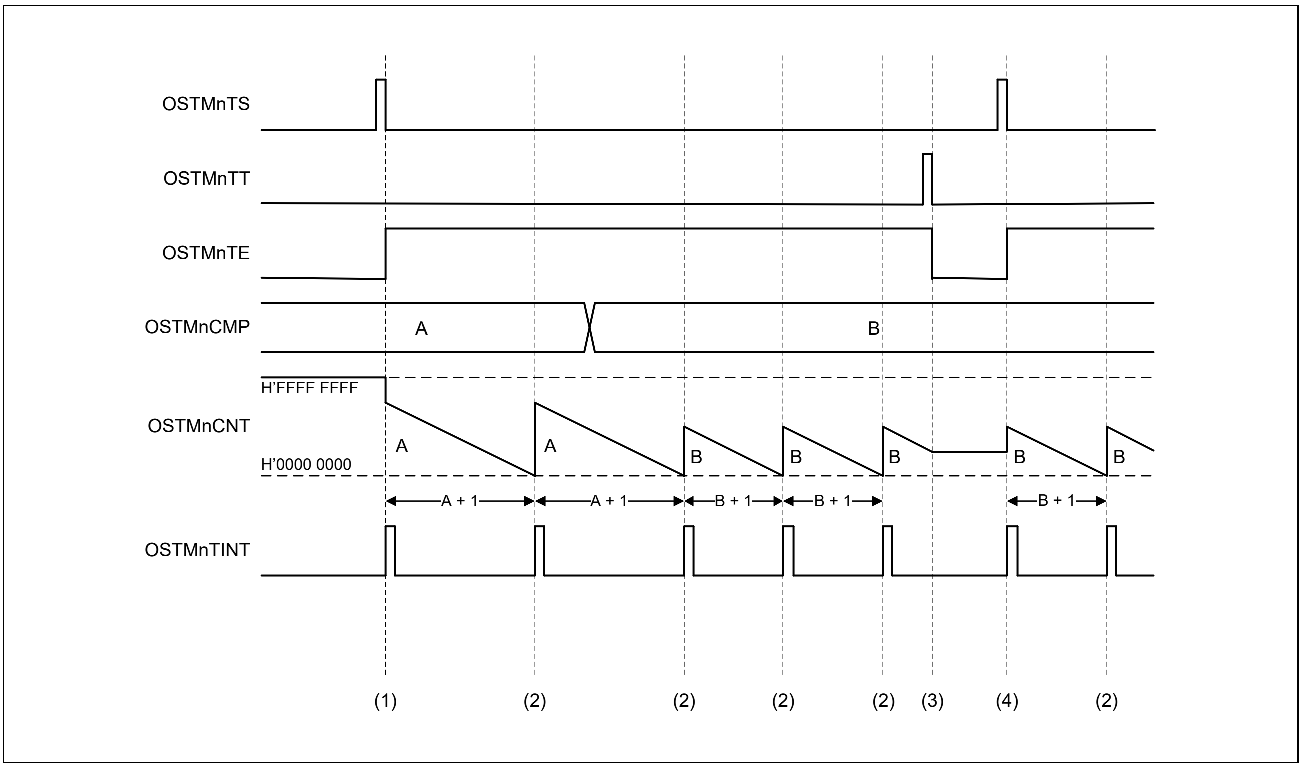

Figure 20.3 Timing Diagram of OSTM in Interval Timer Mode

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter.
The counter starts counting down from the value of OSTMnCMP.
If OSTMnCTL.OSTMnMD0 is 1, OSTMTINT interrupt requests are generated at the start of counting. The OSTMnCNT register contains the current value as the counter.

(2) When the counter reaches H’0000 0000, an OSTMTINT interrupt request is generated. The counter loads the new start value from OSTMnCMP and continues counting down.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.

(4) When counting is restarted (OSTMnTS.OSTMnTS = 1), the counter loads the new start value from OSTMnCMP and starts counting down.

Forced restart

The counter is forcibly restarted by setting OSTMnTS.OSTMnTS = 1 during counting.

The counter loads the start value from the OSTMnCMP register and continues to count down.

The following figure shows the forced restart of the General Timer in interval timer mode, with counter-start interrupts enabled (OSTMnCTL.OSTMnMD0 = 1).

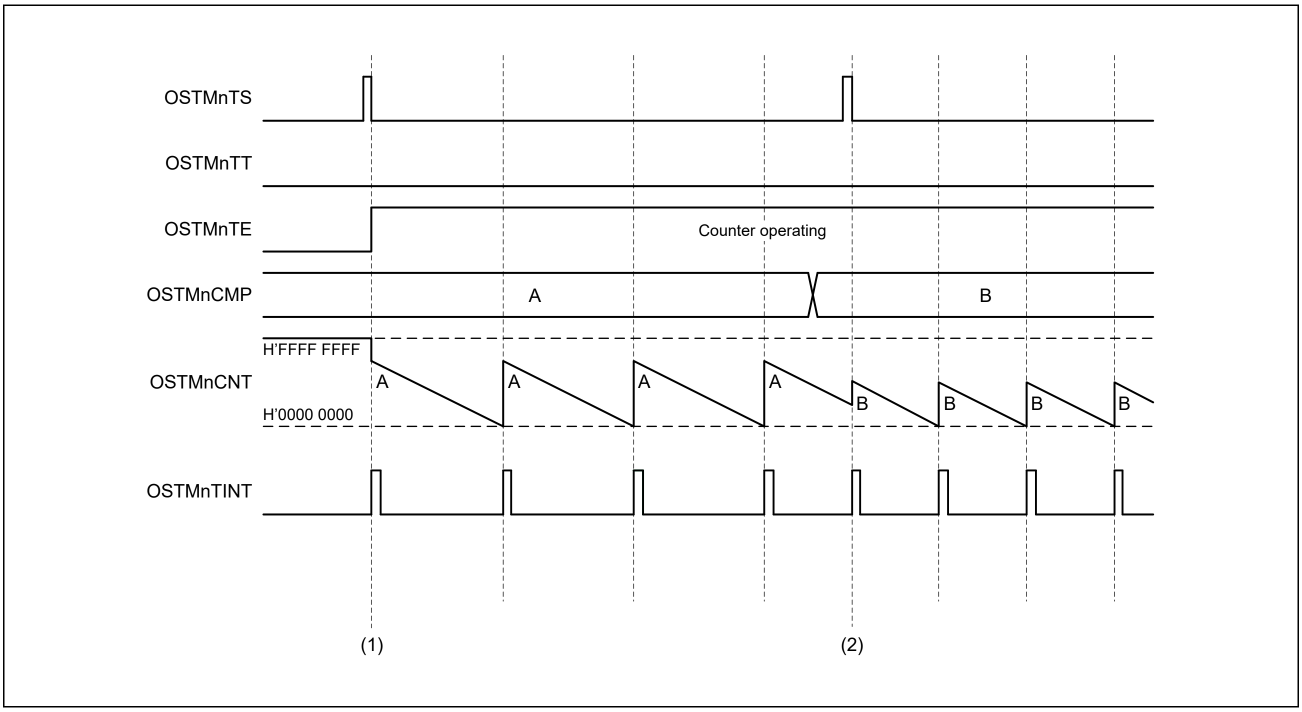

Figure 20.4 Timing Diagram of Forced Restart in Interval Timer Mode

Operations shown in the above timing diagram are as follows.

(1) The counter is started and stopped as described under **Figure 20.3, Timing Diagram of OSTM in Interval Timer Mode**.

(2) Setting OSTMnTS.OSTMnTS = 1 restarts the counter while counting is in progress (i.e. while OSTMnTE.OSTMnTE = 1).
The counter immediately restarts counting down, starting with the current value of OSTMnCMP.
When OSTMnCTL.OSTMnMD0 = 1, an OSTMTINT interrupt request is generated when counting starts.

20.3.5.2 Operation when OSTMnCMP = H’0000 0000

When OSTMnCMP = H’0000 0000, OSTM behaves as follows.

- When the counter is enabled, the OSTMTINT interrupt request is always set to 1.

The following figure shows operations of OSTM when OSTMnCMP = H’0000 0000, and counter-start interrupts are enabled.

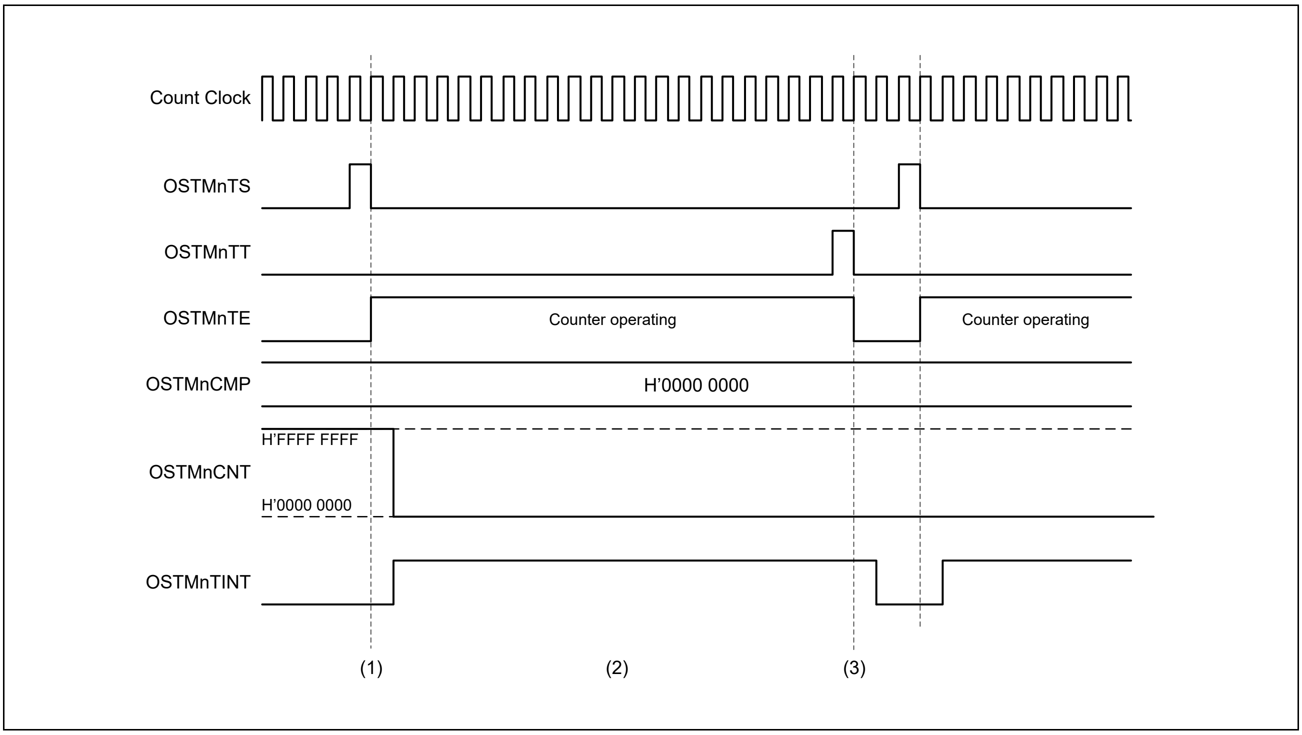

Figure 20.5 Timing Diagram when OSTMnCMP = H’0000 0000 in Interval Timer Mode

The timing diagram above shows the following operations:

(1) The counter is reloaded with the value in OSTMnCMP as soon as it starts counting, so the value H’0000 0000 is retained in OSTMnCMP.

(2) The OSTMTINT interrupt request is continuously asserted.

(3) After the counter stops, the OSTMTINT interrupt request signal is deasserted.

(4) When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

20.3.6 Free-Running Comparison Mode

20.3.6.1 Basic Operation in Free-Running Comparison Mode

In free-running comparison mode, the counter counts up from H’0000 0000 to H’FFFF FFFF. An OSTMnTINT interrupt request is output when the current value of the counter matches the value of the OSTMnCMP register. The free-running comparison mode is selected by setting the OSTMnCTL.OSTMnMD1 bit to 1.

New values can be written to the OSTMnCMP register at any time.

The following figure shows the basic operation of OSTM in free-run compare mode with the start of counting enabled (OSTMnCTL.OSTMnMD0 = 1).

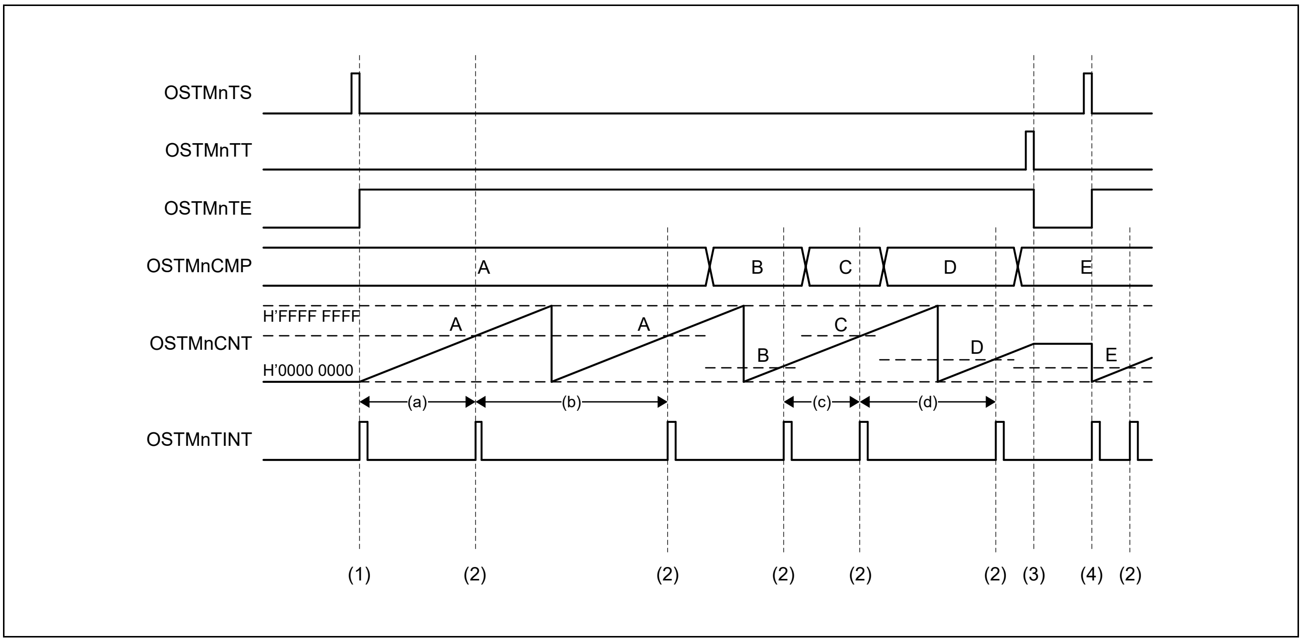

Figure 20.6 Timing Diagram of OSTM in Free-Run Compare Mode

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1.
The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter. The counter counts up from H’0000 0000 to H’FFFF FFFF. The OSTMnCNT register is the counter, so it contains the current value.
When OSTMnCTL.OSTMnMD0 = 1, an OSTMTINT interrupt request is generated at the start of counting.

(2) When the current counter value matches the value in the OSTMnCMP register, an OSTMTINT interrupt request is generated.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter.
The counter retains its current value until it is restarted.

(4) Counting by the counter restarts from H’0000 0000 when OSTMnTS.OSTMnTS = 1.

OSTMTINT period

The OSTMTINT generation period is different at the start of counting and depends on the old and new compare values if OSTMnCMP is rewritten during operation.

Table 20.5 OSTMTINT Generation Timing

Old Value for Comparison	New Value for Comparison	Counter Value at Time of Rewriting	Period of OSTMTINT Generation	Label in Timing Diagram
Counter starts			(A + 1) × counter clock period	(a)
A	A	No rewriting	(H'FFFF FFFF + 1) × counter clock period	(b)
B	C > B	B < counter value < C	(C – B) × counter clock period	(c)
C	D < C	Counter value > D,C	(H'FFFF FFFF – C + D + 1) × counter clock period	(d)

Forced restart

Forced restarting does not proceed during counting even if the OSTMnTS.OSTMnTS bit is set. The counter ignores the attempted setting and continues counting.

20.3.6.2 Operation when OSTMnCMP = H’0000 0000

The following figure shows the operation of OSTM when OSTMnCMP = H’0000 0000, and counter-start interrupts are enabled (OSTMnCTL.OSTMnMD0 = 1).

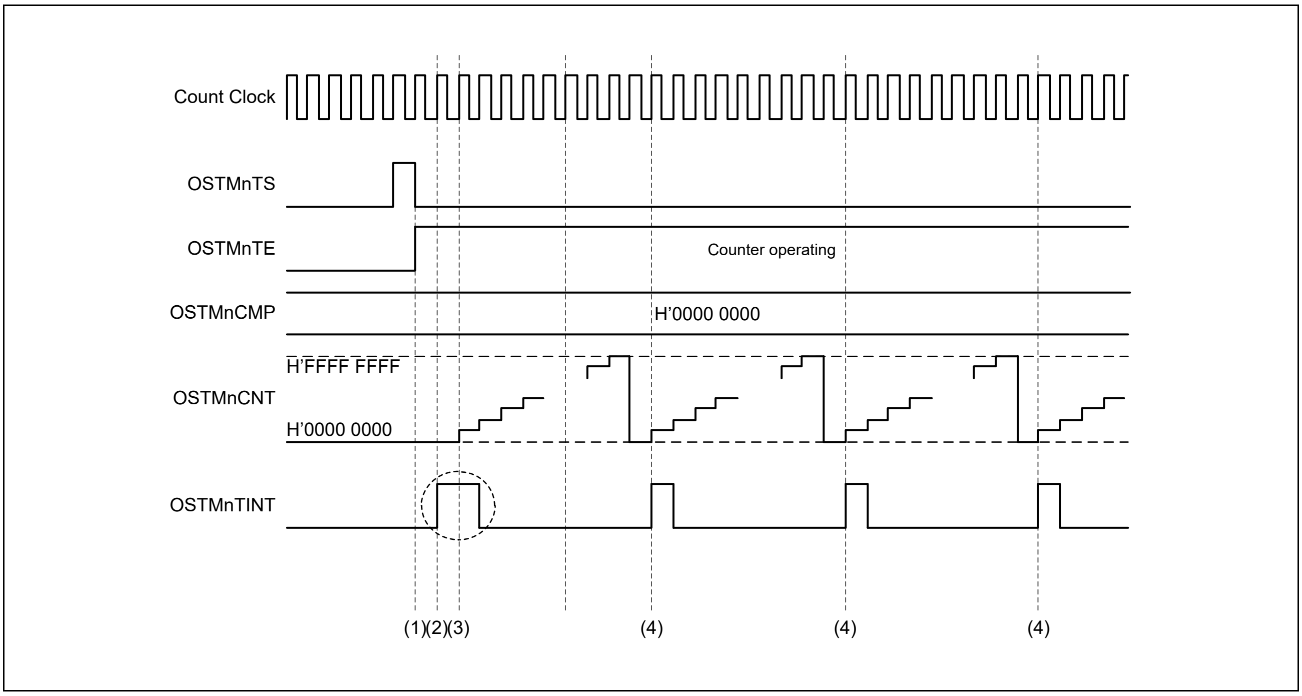

Figure 20.7 Timing Diagram when OSTMnCMP = H’0000 0000 in Free-Run Compare Mode

The timing diagram above shows the following operations.

(1) Once the counter starts, it counts up from H’0000 0000 to H’FFFF FFFF.

(2) An OSTMTINT interrupt request is generated when counting starts.

(3) If the current counter value matches OSTMnCMP, an OSTMTINT interrupt request is generated. If OSTMnCMP = H’0000 0000 in the above case, OSTMTINT is generated over two clock cycles.

(4) Every (H’FFFF FFFF + 1) clock cycles the OSTMTINT interrupt request is asserted.

When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

21. Watchdog Timer (WDT)

This LSI has 3 channels of watchdog timer as **Table 21.1** and generates a reset request signal when the counter value is not rewritten and overflows due to system runaway.

Table 21.1 WDT Channels

Channel	Functions
WDT CH0	WDT to check the operation of Cortex-A55-CPU Core0
WDT CH1	WDT to check the operation of Cortex-A55-CPU Core1
WDT CH2	WDT to check the operation of Cortex-M33 CPU

Also, a reset request signal or interrupt signal can be generated by inputting a parity error signal due to a parity error in the CPU of this LSI.

21.1 Features

All WDT modules have the following functions implemented in common as basic WDT functions.

21.1.1 Normal Watchdog Timer Function

- Bus interface: Compatible with AMBA® 2.0 APB.
- Operating frequency: Bus interface 100 [MHz], counter control 24 [MHz]
- The counter operation and the bus interface are asynchronous and can operate without depending on the size relationship of the clock cycles of each other.
- A 32-bit counter that operates with the clock (WDTn_CLK (n = 0, 1, 2)) input to this module.
- An interrupt request signal is generated every cycle set in the counter of this module.
- When WDTn_CLK (n = 0, 1, 2) = 24 MHz, the counter cycle can be set in 43.69 msec unit from 43.69 msec to 178956.97 msec.
- After the interrupt request signal is generated, if the software does not clear the watchdog timer until the next counter overflow, the reset request signal is generated.
- The set value of each register and the Elapsed time of the watchdog timer can be read.

21.1.2 Reset Request Function due to CPU Parity Error

- A reset request signal (WDTRSTB) or interrupt signal (PERROUT) is generated by inputting a parity error signal.
- The reset request signal is generated as the OR of the reset request of this module and the reset request of the parity error circuit.
- The polarity of the parity error signal can be set with this module.
- Function can be turned ON/OFF for each 32-bit parity error signal.
- The output of the reset request signal and the interrupt signal can be switched by inputting the parity error signal.
- It is possible to force a parity error to occur by register setting.

21.1.3 Internal Block Diagram

Figure 21.1 shows the internal block of WDT. WDT consists of a WDT-CORE part that implements the function of a normal watchdog timer and a part that detects a parity error.

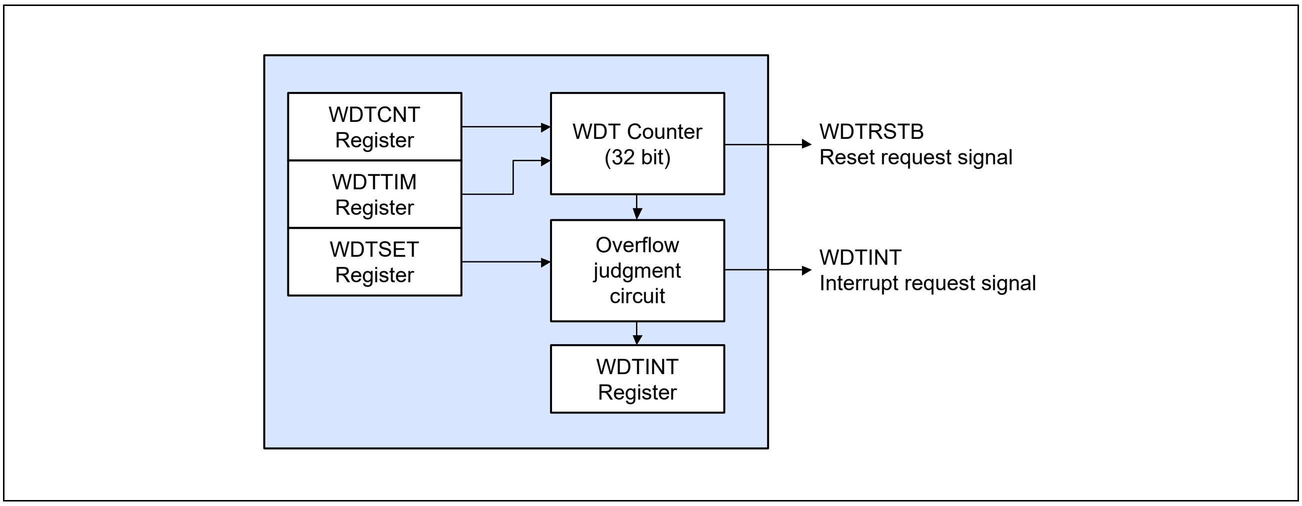

Figure 21.1 WDT_CORE Internal Block

In addition to the above WDT-Core function, WDT receives a parity error interrupt signal generated by the CPU when a Parity Error occurs in the CPU monitored by WDT and generates a reset request signal or interrupt request signal.

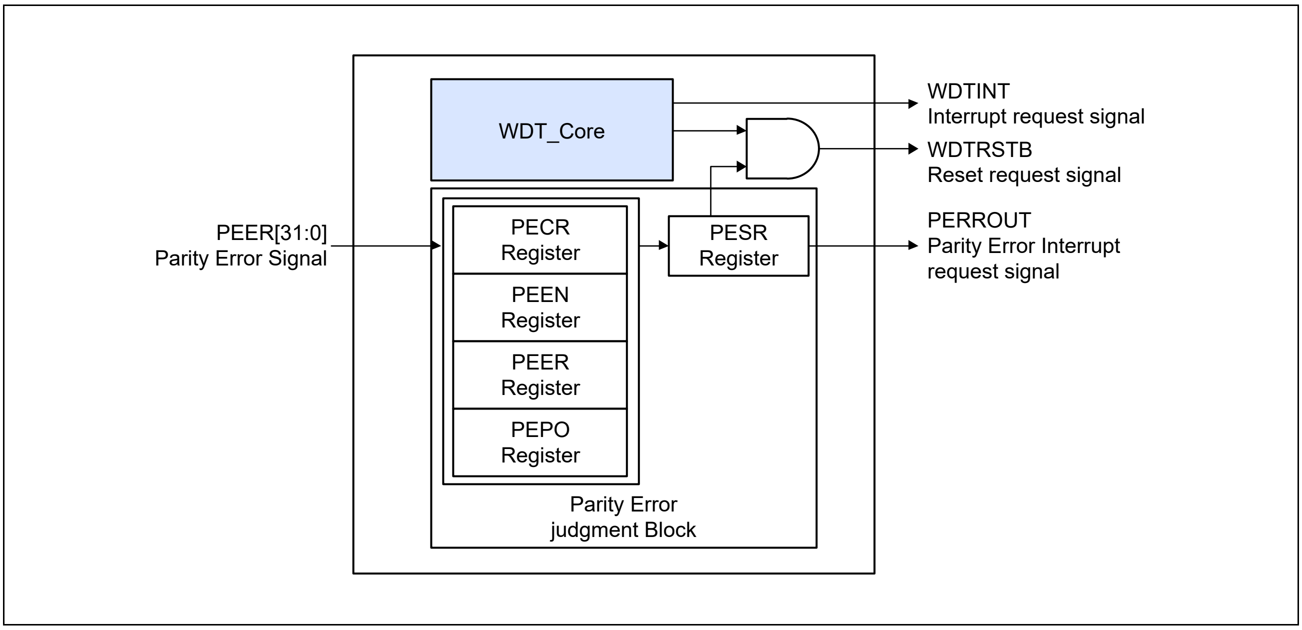

Figure 21.2 WDT_CORE and Parity Error handling block

21.1.4 Input/Output Pin

Table 21.2 shows the pin configuration.

Table 21.2 Pin Configuration

Watchdog timer overflow/ CPU parity error	WDTOVF_PERROUT#	Output	Watchdog timer counter overflow signal output/ Interrupt signal output when CPU parity error occurs

21.2 Register Configuration

Table 21.3 shows the base address for each WDT channel.

Table 21.3 Base Address for each WDT channel

	Channel	WDT	Base Address
Cortex-A55 Address Space	WDT CH0	WDT to check the operation of Cortex-A55-CPU Core0	H'0_1280_0800

21.3 Register Descriptions

21.3.1 WDT Control Register_n (WDTCNT_n) (n = 0, 1, 2)

This register sets the operation enable of the watchdog timer function. Once the software activates the watchdog timer, the watchdog timer does not stop*[1] until it is reset. Also, the setting register*[2] of the watchdog timer cannot be changed. The setting register change must be completed*[2] before enabling the watchdog timer operation.

Note 1. For debugging, the internal counter can be paused with the CNTSTOP signal.

Note 2. WDT cycle setting register (WDTSET) and WDT Elapsed time register (WDTTIM)

Note 3. When changing the setting register, wait until the write data value of the setting register is reflected before enabling the watchdog timer operation. The reflection time of the setting register is 6 × P0ϕ + 9 × OSCCLK or more. If this reflection time is not observed, the setting register value will not be reflected and will be ignored.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
0	WDTEN	0	R/W	Watchdog timer enable register 1: Watchdog timer operation enabled 0: Disabled

21.3.2 WDT Period Setting Register_n (WDTSET_n) (n = 0, 1, 2)

This register is used to set the cycle of the 32-bit counter that composes the watchdog timer. Writing is not possible while the watchdog timer is running. If you write continuously, the data written later will be valid. Calculate the watchdog timer cycle using the following formula.

$$\text{Watchdog timer cycle} = \text{WDTn\_CLK } (\text{n} = 0{,}1{,}2) \text{ cycle} \times 1024 \times 1024 \times (\text{WDTTIME setting value} + 1)$$

$$\text{WDTTIME setting value} = \frac{\text{WDT cycle}}{(\text{WDTn\_CLK } (\text{n} = 0{,}1{,}2) \text{ cycle} \times 1024 \times 1024) - 1}$$

For example, WDTn_CLK (n = 0, 1, 2) = 24 MHz, the counter cycle can be set in 43.69 msec unit from 43.69 msec to 178956.97 msec.

It can be set in units. The setting value of WDTTIME is the value set in WDTSET[31:20], and the value from H’000 to H’FFF can be set.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WDTTIME11	WDTTIME10	WDTTIME9	WDTTIME8	WDTTIME7	WDTTIME6	WDTTIME5	WDTTIME4	WDTTIME3	WDTTIME2	WDTTIME1	WDTTIME0	—	—	—	—
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	WDTTIME [11:0]	All 1	R/W	Watchdog timer period cycle setting It cannot be written while the watchdog timer is running.
19 to 0	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.

CAUTION

The value that the watchdog timer compares when an interrupt occurs is “WDTSET[31:0] + H’000F_FFFF”. Therefore, when the setting value of this register is H’0010_0000, the interrupt occurrence count is “H’001F_FFFF” (not H’0010_0000).

21.3.3 WDT Elapsed Time Register_n (WDTTIM_n (n = 0, 1, 2))

This register indicates the 32-bit count value that composes the watchdog timer. If the watchdog timer is read during operation, the Elapsed time from the time it is cleared to the time of reading can be read.

By writing to this register when the watchdog timer is stopped, the value at the start of counting can be set in the 32-bit counter that configures the watchdog timer. When a value larger than the counter cycle (value when clearing) set in the WDT cycle setting register is written and the watchdog timer operation is started, the 32-bit counter once overflows and returns to 0. It operates at the set correct cycle.

You cannot write while the watchdog timer is running. If you write continuously, the data written later will be valid.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRTTIME [31:0]	All 0	R/W	Watchdog timer count value. It cannot be written while the watchdog timer is running.

CAUTION

When setting a value in the WDTTIM register, do not set a value that is WDTSET[31:0] register + H’000F_FFFF.

21.3.4 WDT Interrupt Control Register_n (WDTINT_n (n = 0, 1, 2))

This register reads the interrupt status of the watchdog timer, clears interrupts, and clears the counters that compose the watchdog timer. Set the INTDISP bit of this register to “1” within the time set by WDTSET. If not set, the WDTINT pin is asserted. After that, within the time set by WDTSET

When the INTDISP bit is not set to “1”, the WDTRSTB pin is asserted.

When performing continuous write access to the WDTINT register, leave a write interval of 5 × P0ϕ + 5 × OSCCLK or more. If the write interval is not observed, the register will not be written.

31 to 0	PEPO [31:0]	All 0	R/W	Active polarity of parity 31-0 Set the Active polarity (H/L) of each parity error signal connected to PEERR. 0: Active High 1: Active Low

21.3.10 Register Setting Order for Each WDT Channel

The following shows the register setting sequence for controlling the watchdog timer and parity error circuit of each channel. The control of the original watchdog timer and the parity error circuit do not affect each other, so there is no restriction on the setting order in the following diagrams (1) and (2).

The parity error circuit cannot accept the parity error that occurred before setting PEER = 1. When rewriting PEEN from 0 to 1, it is possible to rewrite at any timing. However, when rewriting PEEN from 1 to 0, once PEER = 0 and (2) flow execution is required.

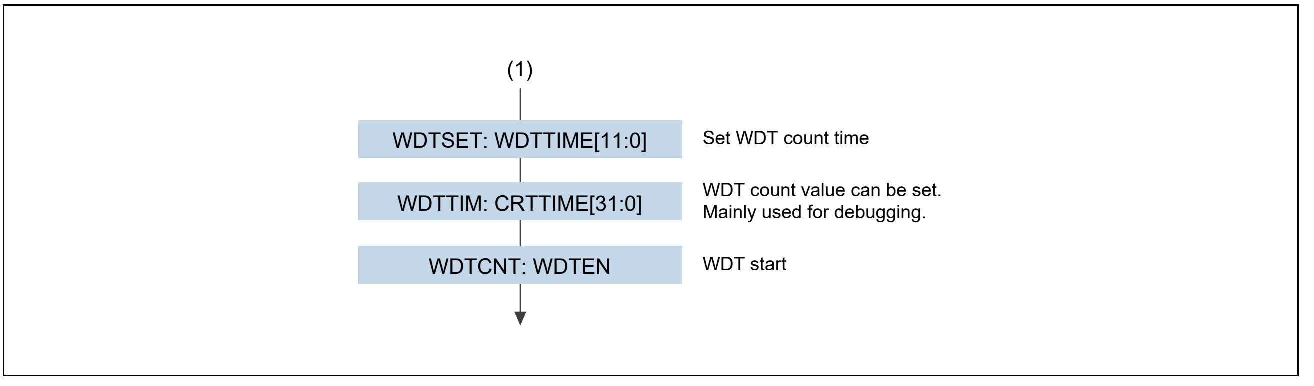

Figure 21.3 WDT Register Setting Order

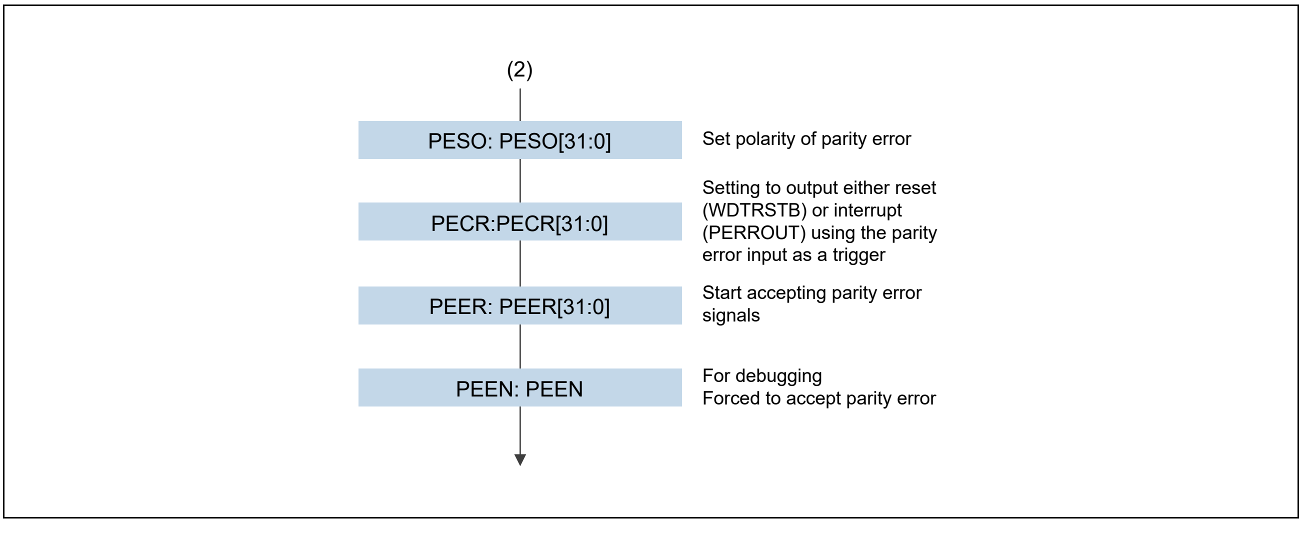

Figure 21.4 Parity Error Circuit Register Setting Order

21.4 Operation

21.4.1 WDT_CORE Operaton Timing

Figure 21.5 shows the operation diagram of the WDT-Core block. When 1 is set in Bit [0] of the WDTCNT register, the 32-bit internal counter WDT-Counter starts counting. If the counter value matches the value set in the WDTSET register, the counter becomes overflow, clears the counter to 0, and then generates an interrupt request signal.

An interrupt signal is output at the first counter overflow, and a reset request signal is output if the counter is not cleared and the second counter overflow occurs.

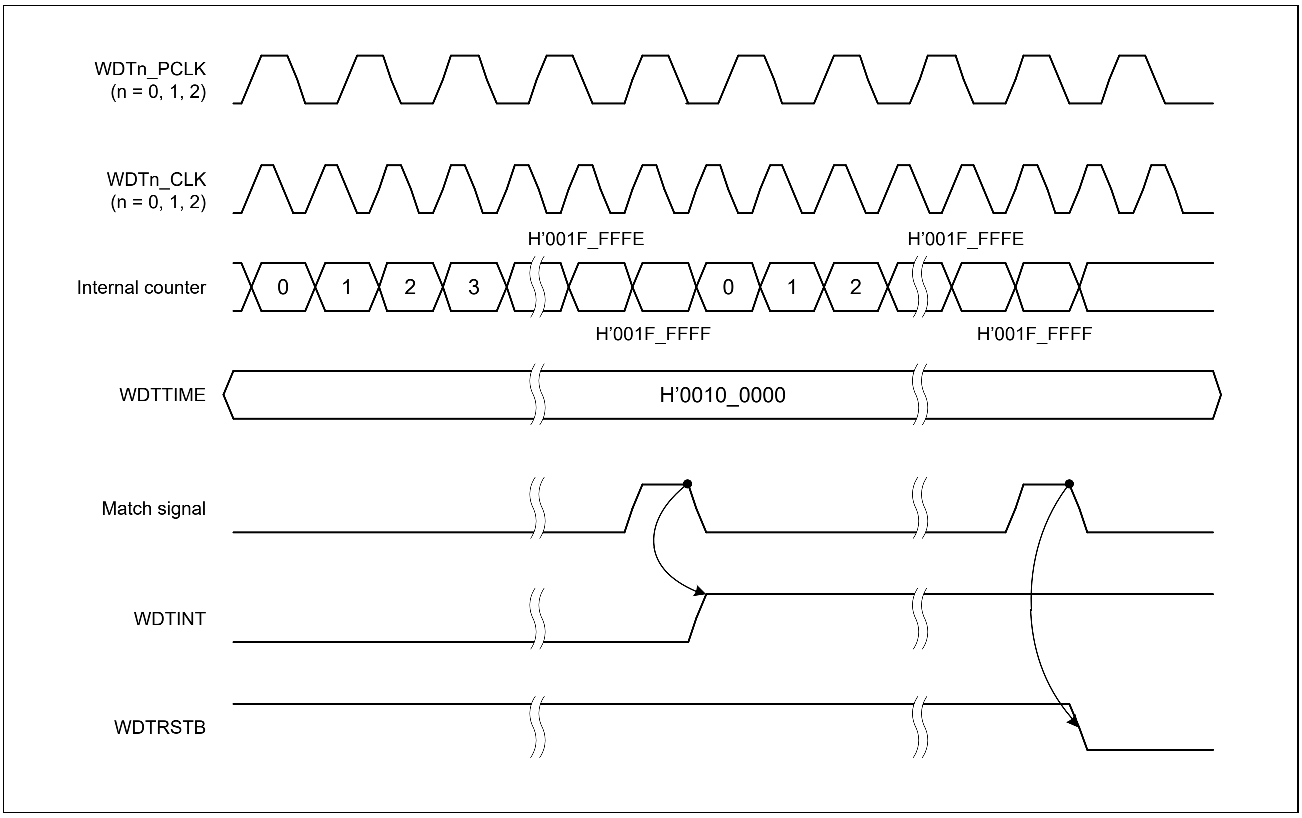

Figure 21.5 WDT Output Signal Operation Timing

21.4.2 WDT Interrupt Control Register (WDTINT) Specification for Write Access Interval

After the write access to the WDT interrupt control register is completed, the written data is synchronized with WDTn_CLK (n = 0, 1, 2), so a synchronization period is required. When performing write access to the WDTINT register, it is necessary to leave a write interval of 5 × P0ϕ + 5 × OSCCLK or more between the next write access.*1

Note 1. If the write interval is not observed, the interrupt request may not be cleared. In this case, after making a write access and confirming that the interrupt factor has been cleared, perform the following write access.

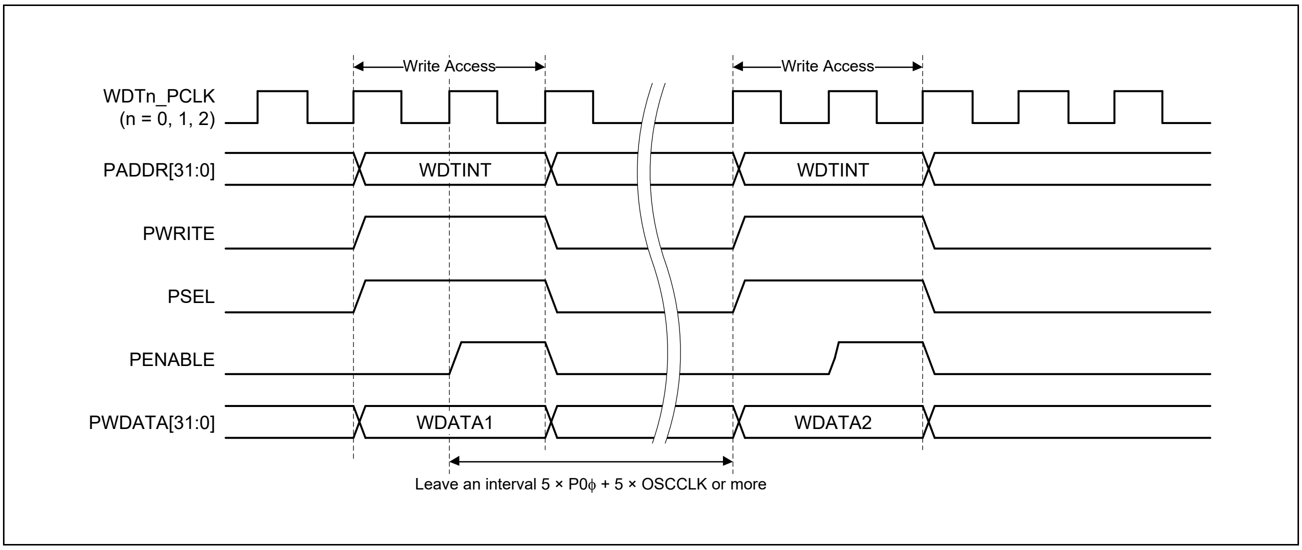

Figure 21.6 WDTINT Write Access Interval Regulation

21.4.3 Watchdog Timer Operation Reflection Timing of Register Setting Value

Each register other than the WDT interrupt control register (WDTINT) is always synchronized with WDTn_CLK (n = 0, 1, 2) at regular intervals. The timing at which the written data is reflected in the watchdog timer operation is in the range of small 2 × P0ϕ + 4 × OSCCLK) to large value (6 × P0ϕ +9 × OSCCLK).

Figure 21.7 (Watchdog timer operation reflection timing 1 of register setting value) shows how write data is small and synchronized.

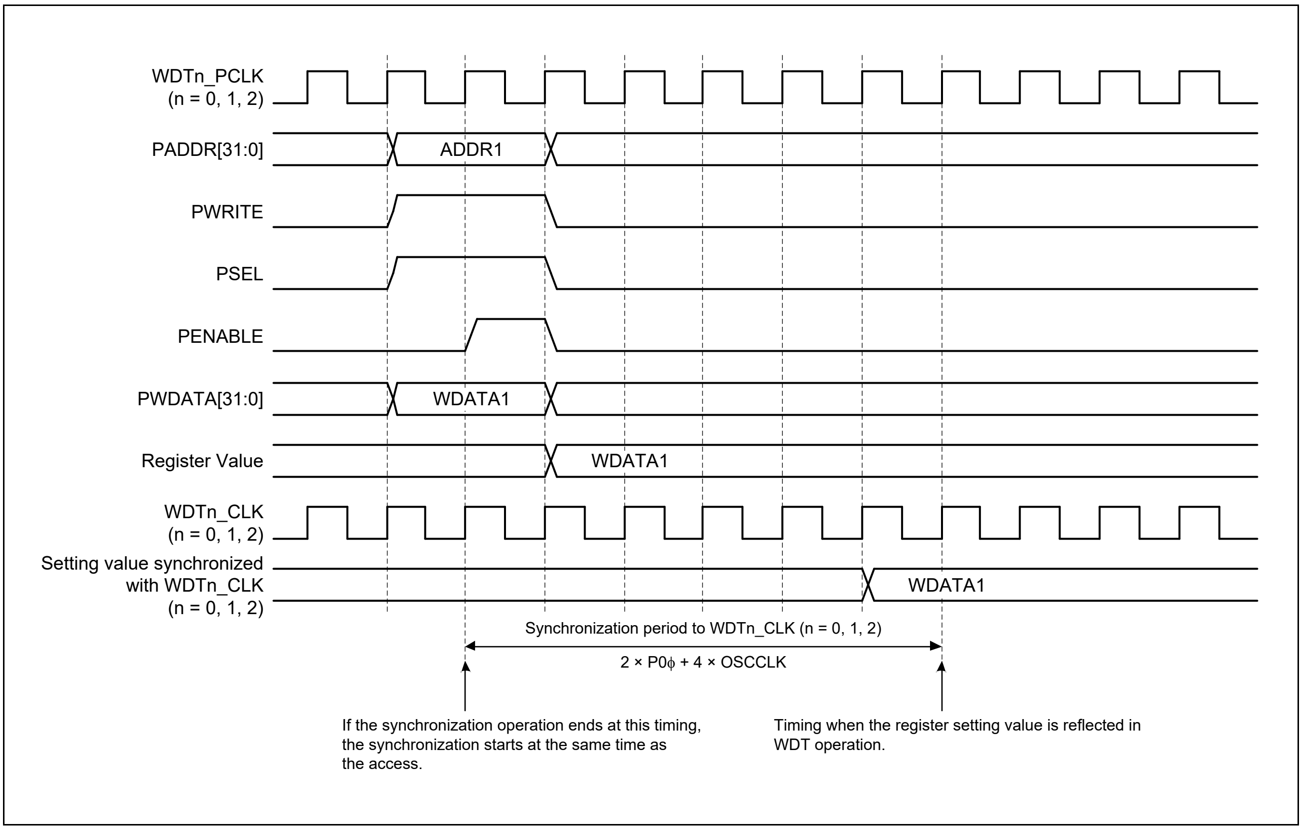

Figure 21.7 Watchdog Timer Operation Reflection Timing of Register Setting Value - 1

In addition, **Figure 21.8** (Watchdog timer operation reflection timing 2 of register setting value) shows how write data is large and synchronized.

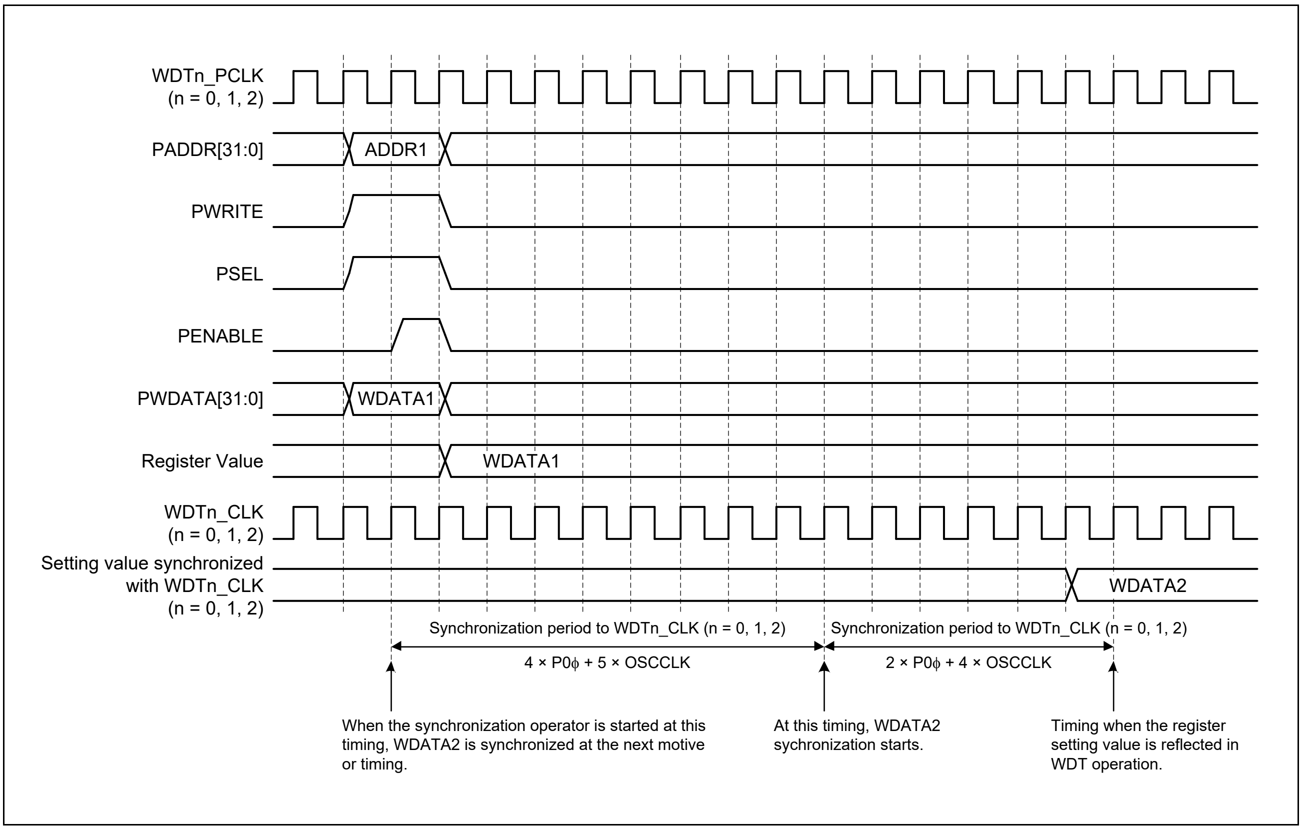

Figure 21.8 Watchdog Timer Operation Reflection Timing of Register Setting Value - 2

21.4.4 Timing of Reflecting WDT Counter Value to WDTTIM Register

The value stored in the WDTTIM register is the value obtained by synchronizing the counter value with P0φ. Therefore, the interval at which the value is updated in the WDTTIM register is 5 × OSCCLK+5 × P0ϕ at most, and the value before the actual counter value is read.

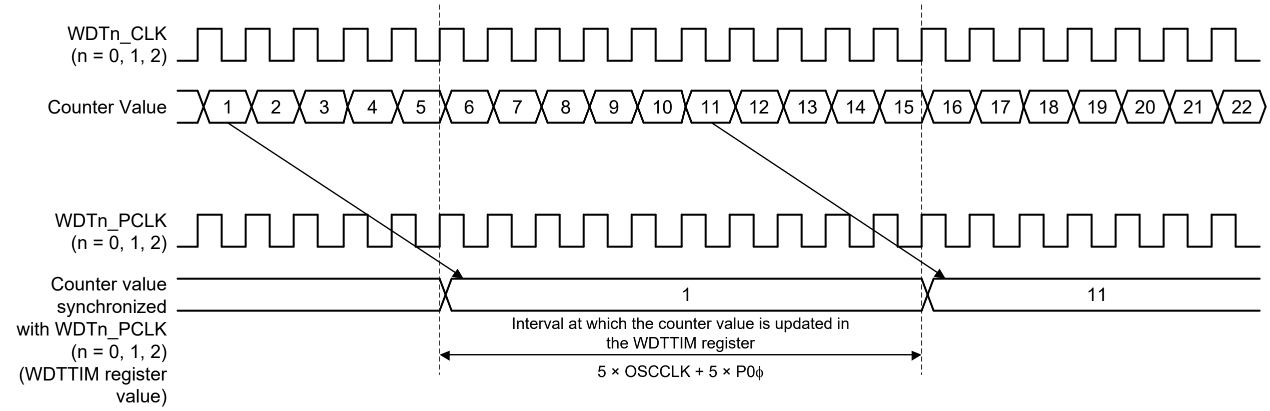

Figure 21.9 Timing of Reflecting the Counter Value to the WDTTIM Register

21.4.5 Conditions Under which WDTRSTB and PERROUT Operate

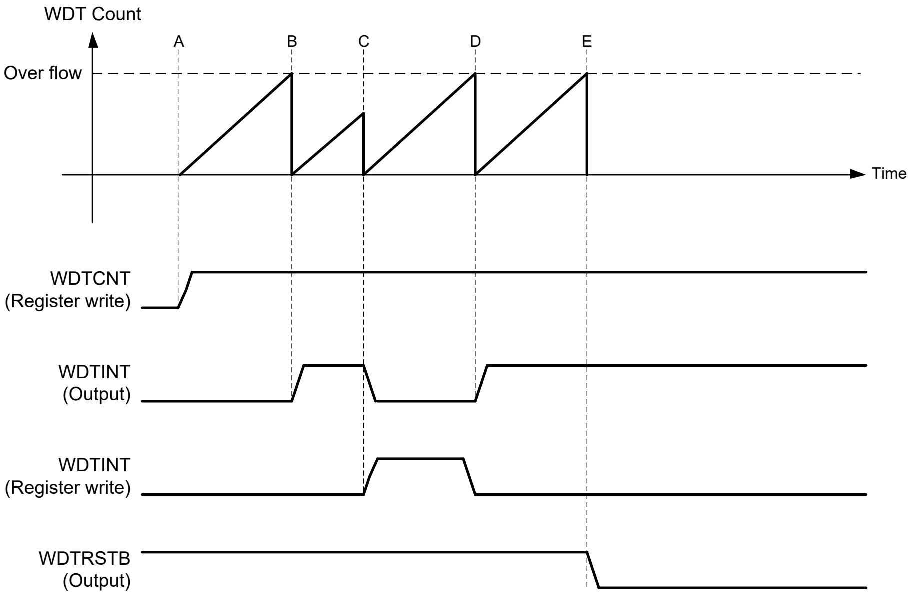
Table 21.5 shows the conditions under which WDTRSTB and PERROUT operate.

When PEER = 0, WDTRSTB follows the watchdog timer operation described in **Section 21.4.1** to **Section 21.4.5** regardless of the occurrence of parity error. PERROUT holds 0. (No. 1, No. 2) No. 3 to No. 6 show the operating conditions when the parity error input is enabled by PEER = 1. When a parity error occurs (No. 3, No. 4), PESR holds the error status, and WDTRSTB or PERROUT is asserted depending on the value of PECR. If no parity error occurs, PESR = 0, WDTRSTB propagates the WDT-Core logic, and PERROUT is in the unasserted state. (No. 5, No. 6) When PEEN = 1 forces a parity error to occur, WDTRSTB or PERROUT is asserted depending on the PECR value regardless of the parity error.

Table 21.5 WDTRSTB/PERROUT Operating Conditions

No.	PEERR	PEPO	PEER	PEEN	PECR	PESR	WDTRSTB	PERROUT
1	X	1/0	0	0	0	0 (Fixed)	Original WDT	0: de-assert
2		1/0	0	0	1	0 (Fixed)	Original WDT	0: de-assert
3	With parity	1/0	1	0	0	1	0: assert	0: de-assert
4		1/0	1	0	1	1	Original WDT	1: assert
5	No parity	1/0	1	0	0	0	Original WDT	0: de-assert
6		1/0	1	0	1	0	Original WDT	0: de-assert
7	X	X	X	1	0	X	0: assert	0: de-assert
8		X	X	1	1	X	Original WDT	1: assert

The timing waveforms for No. 1 to No. 4 in **Table 21.5** are shown below.



Note: A) Set WDTCNT = 1 to start WDT counting.

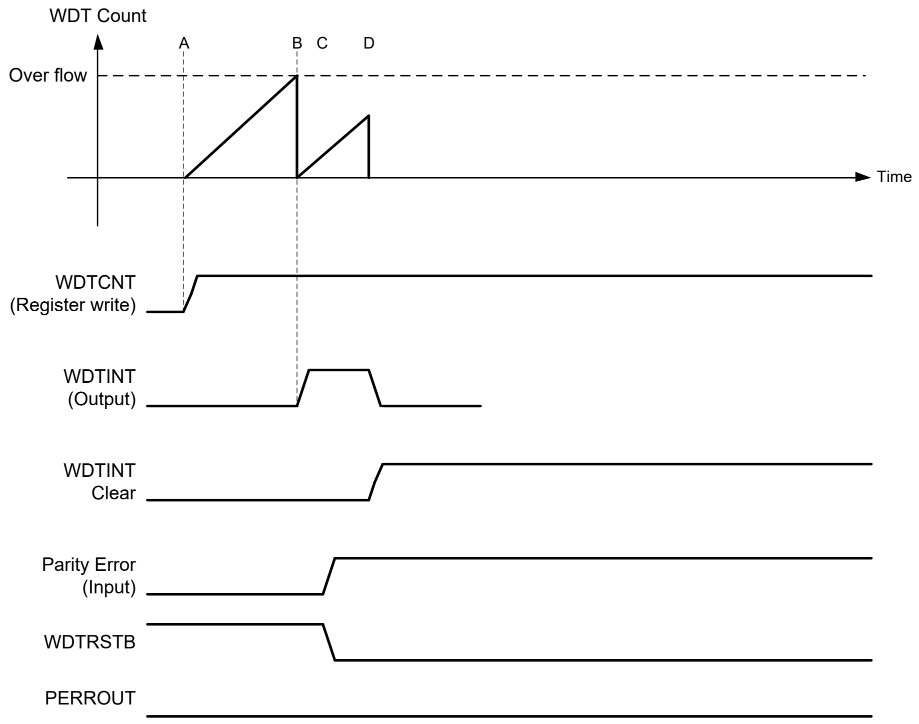
B) The interrupt request signal (WDTINT) is asserted at the first overflow of the WDT count.

C) If WDTINT (INTDISP) = 1 is written before the WDT count overflows, the interrupt request is cleared and the WDT count becomes zero.

D) Again, the interrupt request signal is asserted at the first overflow.

E) When the WDT count overflows for the second time, WDTRSTB is asserted.

Figure 21.10 Normal Watchdog Timer Operation No. 1/No. 2



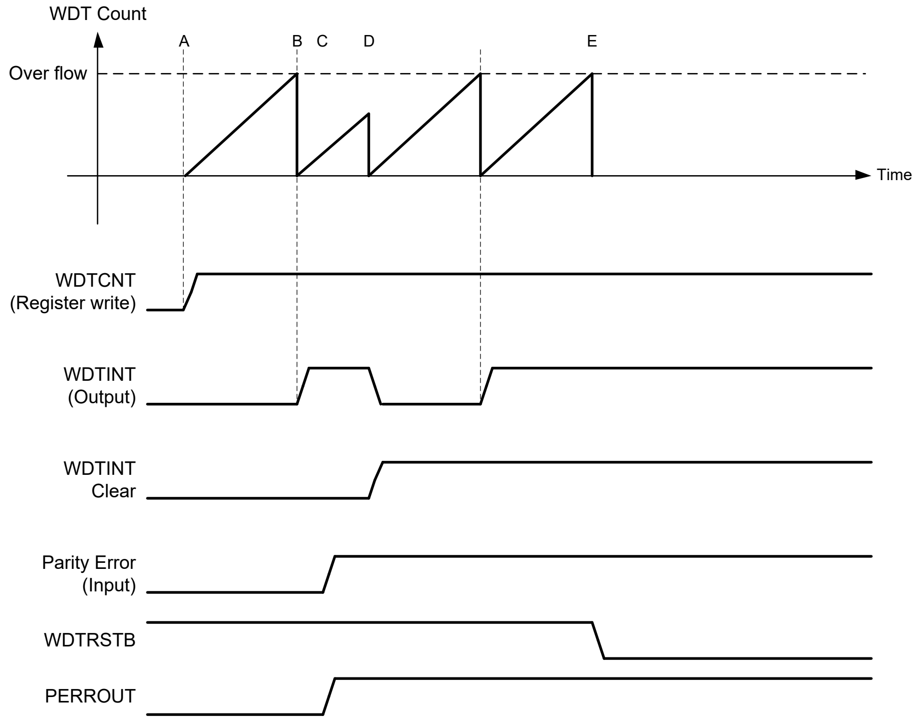
Note: A) Set WDTCNT = 1 to start WDT counting.

B) The interrupt request signal (WDTINT) is asserted at the first overflow of the WDT count.

C) When a parity error occurs, WDTRSTB = 0. At the same time, hold PERROUT = 0.

D) Even if WDT Count is reset by WDTINT = 1, WDTRSTB = 0 and PERROUT = 0 are retained.

Figure 21.11 Watchdog Timer Operation when a Parity Error Signal Occurs No. 3



Note: A) Set WDTCNT = 1 to start WDT counting.

B) The interrupt request signal (WDTINT) is asserted at the first overflow of the WDT count.

C) When a parity error occurs, WDTRSTB = 1. At the same time, hold PERROUT = 1.

D) Even if WDT Count is reset by WDTINT = 1, WDTRSTB = 1 and PERROUT = 1 are retained.

E) WDTRSTB = 0 is asserted due to WDT Count overflow.

Figure 21.12 Watchdog Timer Operation when a Parity Error Signal Occurs No. 4

21.5 Reset Control

21.5.1 WDTRST Control of Each WDT Channels

WDT CH0 generates WDTINT every cycle set in WDTSET. The CPU (Cortex-A55-Core0) receives the WDT CH0 interrupt signal WDTINT, clears the WDT CH0 counter at regular intervals, and suppresses the overflow of the WDT counter.

WDT CH1 generates WDTINT every cycle set in WDTSET. The CPU (Cortex-A55-Core1) receives the WDT CH1 interrupt signal WDTINT and clears the WDT CH1 counter at regular intervals to suppress the overflow of the WDT counter.

WDT CH2 generates WDTINT every cycle set in WDTSET. The CPU (Cortex-M33) receives the WDT CH2 interrupt signal WDTINT and clears the WDT CH2 counter at regular intervals to prevent the WDT counter from overflowing.

If the counter is not cleared before the cycle set for each WDT elapses, the uncleared WDT sends a reset request signal to the CPG. Based on the setting of the built-in register CPG_WDTRST_SEL, CPG can select whether to reset only the CPU corresponding to the WDT that caused the reset from the WDT reset request signal from each channel, or to reset the entire system. is. You can also choose whether to assert the WDTOVF_PERROUT# pin to notify the outside world that the entire system has been reset.

(For details about CPG_WDTRST_SEL register in CPG, refer to the CPG chapter.)

Table 21.6 WDT Reset Target by CPG_WDTRST_SEL Register

Bit	Initial Value	R/W	Reset Factor	Function
CPG_WDTRST_SEL[0]	0	R/W	WDT CH0	When the target WDT executes a reset request due to overflow etc. 0: Mask system reset 1: System reset implementation
CPG_WDTRST_SEL[1]	0	R/W	WDT CH1	
CPG_WDTRST_SEL[2]	0	R/W	WDT CH2	
CPG_WDTRST_SEL[4]	0	R/W	WDT CH0	When the target WDT executes a reset request due to overflow etc. 0: Mask WDTOVF_PERROUT assert 1: WDTOVF_PERROUT assert
CPG_WDTRST_SEL[5]	0	R/W	WDT CH1	
CPG_WDTRST_SEL[6]	0	R/W	WDT CH2	
CPG_WDTRST_SEL[8]	0	R/W	WDT CH0	When either WDT CH0 or WDT CH1 makes a reset request 0: Mask the Cold-Reset of Cortex-A55 1: Implemented Cortex-A55 Cold-Reset
CPG_WDTRST_SEL[9]	0	R/W	WDT CH1	
CPG_WDTRST_SEL[10]	0	R/W	WDT CH2	0: Mask the Cold reset of the paired Cortex-M33 1: Perform Cold reset

When the WDT system reset is executed, it is also possible to set the CPG_WDTRST_SEL[6:4] bit to notify the system outside the LSI from the WDTOVF_PERROUT# pin of the GPIO pin that the system reset has occurred due to the WDT overflow. When using WDTOVF_PERROUT# as a signal to notify the system reset to the outside, set the CPG_WDTRST_SEL[6:4] bit to 1 when CPG_WDTRST_SEL[2:0] is 1 as shown below.

CPG_WDTRST_SEL[4]	Set 1 when CPG_WDTRST_SEL[0] = 1
GPG_WDTRST_SEL[5]	Set 1 when CPG_WDTRST_SEL[1] = 1
CPG_WDTRST_SEL[6]	Set 1 when CPG_WDTRST_SEL[2] = 1

For example, if CPG_WDTRST_SEL[0] = 0 and WDTRST_SEL[4] = 1 are set, the system reset will not be executed even if WDT CH0 asserts a reset request because CPG_WDTRST_SEL[0] = 0, but WDTRST_SEL[4] = 1 so WDTOVF_PERROUT# pin will be asserted. In other words, the system reset execution status and WDTOVF_PERROUT do not match.

21.6 Usage Note

[Cautions]

- When setting a value in the WDTTIM register, do not set a value that is WDTSET register + H'F_FFFF.
- The reset request signal WDTRSTB and WDT interrupt signal WDTINT cannot be masked.

22. Serial Communications Interface with FIFO (SCIFA)

This LSI has five channels of serial communication interface (SCIFA) with FIFO that support both asynchronous and clock synchronous serial communication. The SCIFA has 16-stage FIFO buffers for transmission and reception, respectively, for each channel that enable this LSI to perform efficient high-speed continuous communication.

22.1 Overview

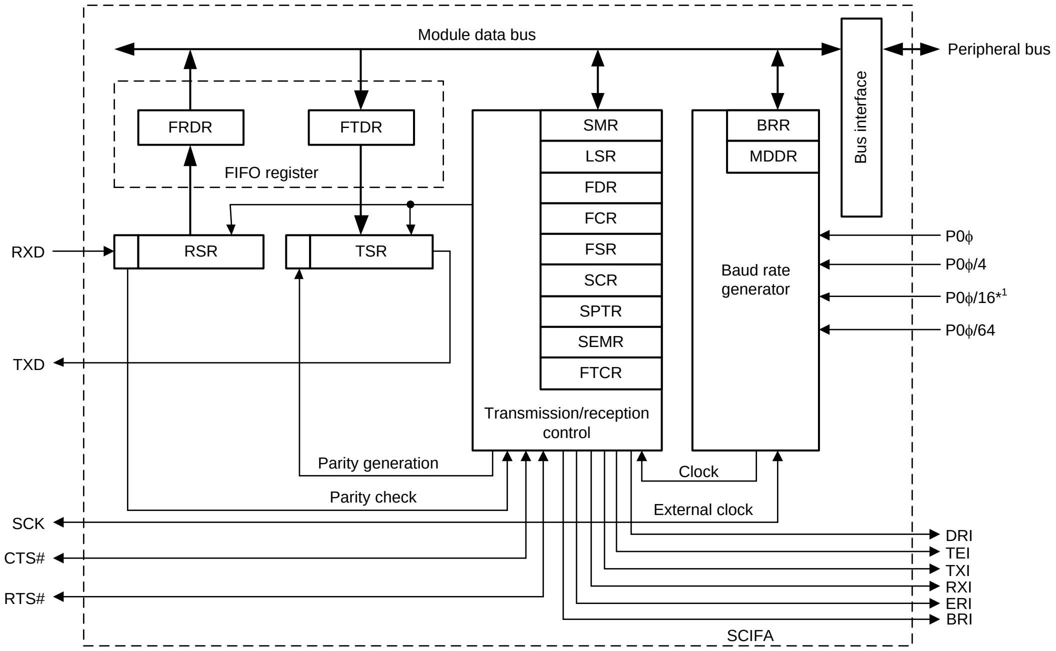
Table 22.1 lists the specifications of the SCIFA.

Table 22.1 Specifications of SCIFA

Item		Description
Channel		● 5 channels (ch 0,1,2,3,4) (RZ/G2L) ● 4 channels (ch 0,1,2,3) (RZ/G2LC)
Serial communication method		Asynchronous communication mode and clock synchronous communication mode
Transfer speed		Selectable bit rate with an on-chip baud rate generator
Full duplex communication		Transmitting section: realizes continuous data transmission using 16-stage FIFO buffer Receiving section: realizes continuous data reception using 16-stage FIFO buffer
Data transmission		Selectable either LSB-first or MSB-first transfer
Interrupt source		The following six sources: ● Transmit-end (TEIF) ● Transmit-FIFO-data-empty (TXIF) ● Receive-FIFO-data-full (RXIF) ● Receive-data-ready (DRIF)*1 ● Receive-error (ERIF) ● Break detection or overrun (BRIF)
Asynchronous communication mode	Character length	7 or 8 bits
	Transmission stop bit length	1 or 2 bits
	Parity	Even, odd, or none
	Receive error detection	Parity, overrun, and framing errors
	Hardware flow control	Controls data transmission and reception using the CTS# and RTS# pins. Not applicable to channel 3 (SCIF3) and channel 4 (SCIF4)
	Break detection	Break signal detection function by hardware.
	Clock source	Selectable from internal or external clock
	Noise cancellation	Incorporates a digital noise filter in the RXD pin input path.
Clock synchronous communication mode	Character length	8 bits
	Receive error detection	Detects an overrun error as a receive error.
	Clock source	Selectable either internal or external clock
Bit rate modulation		Enables errors to be decreased by correcting the output of the on-chip baud rate generator.

Note 1. Effective only for asynchronous communication mode

Figure 22.1 shows a block diagram of the SCIFA.



RSR: Receive shift register
FRDR: Receive FIFO data register
TSR: Transmit shift register
FTDR: Transmit FIFO data register
SMR: Serial mode register
SCR: Serial control register
FSR: Serial status register
MDDR: Modulation duty register

BRR: Bit rate register
SPTR: Serial port register
FCR: FIFO control register
FDR: FIFO data count register
LSR: Line status register
SEMR: Serial extended mode register
FTCR: FIFO trigger control register

Note 1. The P0ϕ/16 clock is not input in the case of the channel 0 interface.

Figure 22.1 Block Diagram of SCIFA

Table 22.2 lists the input/output pins of the SCIFA.

Table 22.2 Pin Configuration of the SCIFA

Channel	Item	Pin Name	I/O	Function
0 to 4 (n = 0-4)	Serial clock pin	SCIFn_SCK	I/O	Transmission/reception clock input/output, general output
	Receive data pin	SCIFn_RXD	Input	Receive data input
	Transmit data pin	SCIFn_TXD	Output	Transmit data output
0 to 2 (n = 0-2)	Transmission/reception start control pin	SCIFn_CTS#	I/O	Input for hardware flow control (transmission enable signal) / general output
		SCIFn_RTS#	Output	Output for hardware flow control (transmission request signal) / general output

Note: Channels of each pin is omitted.

22.2 Register Descriptions

Table 22.3 Base Address Table

Address Space	Channel 0	Channel 1	Channel 2	Channel 3	Channel 4
Cortex-A55 Address Space	H’0_1004_B800	H’0_1004_BC00	H’0_1004_C000	H’0_1004_C400	H’0_1004_C800
Cortex-M33 Address Space Non-Secure	H’4004_B800	H’4004_BC00	H’4004_C000	H’4004_C400	H’4004_C800
Cortex-M33 Address Space Secure	H’5004_B800	H’5004_BC00	H’5004_C000	H’5004_C400	H’5004_C800

Table 22.4 List of Registers

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
Serial mode register	SMR	R/W	H’0000	H’00	16
Bit rate register	BRR	R/W	H’FF	H’02	8
Modulation duty register	MDDR	R/W	H’FF	H’02	8
Serial control register	SCR	R/W	H’0000	H’04	16
Transmit FIFO data register	FTDR	W	Undefined	H’06	8
Serial status register	FSR	R/W	H’0020	H’08	16
Receive FIFO data register	FRDR	R	Undefined	H’0A	8
FIFO control register	FCR	R/W	H’0000	H’0C	16
FIFO data count register	FDR	R	H’0000	H’0E	16
Serial port register	SPTR	R/W	H’00xx	H’10	16
Line status register	LSR	R/W	H’0000	H’12	16
Serial extended mode register	SEMR	R/W	H’00	H’14	8
FIFO trigger control register	FTCR	R/W	H’1F1F	H’16	16

Note: BRR and MDDR are located in the same address. Setting the MDDRS bit of the SEMR register switches these registers.

22.2.1 Receive Shift Register (RSR)

The RSR register receives serial data and temporally stores the data. The SCIFA stores the serial data input via the RXD pin into the RSR register and converts the data to the parallel form. When one byte of data has been received, it is automatically transferred to the receive FIFO data register (FRDR).

The CPU cannot read from or write to the RSR register directly.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	0	0	0	0	0	0	0	0

22.2.2 Receive FIFO Data Register (FRDR)

The FRDR register is a 8-bit, 16-stage FIFO register that stores the received serial data. When the SCIFA receives one byte of serial data, it transfers the received data from the receive shift register (RSR) to the FRDR register and completes the receive operation. Continuous reception is possible until the received 16 bytes of data are stored. If the FRDR register is read when there is no received data in the FRDR register, an undefined value is read.

When the FRDR register is full of received data, subsequently received serial data is lost.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	0	0	0	0	0	0	0	0

22.2.3 Transmit Shift Register (TSR)

The SCIFA transfers the transmit data from the transmit FIFO data register (FTDR) to the TSR register, and then transmits the data serially to the TXD pin. After transmitting one byte of data, the SCIFA automatically transfers the next transmit data from the FTDR register into the TSR register and starts transmission.

The CPU cannot read from or write to the TSR register directly.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1

22.2.4 Transmit FIFO Data Register (FTDR)

The FTDR register is a 8-bit, 16-stage FIFO register that stores serial transmission data. When the SCIFA detects that the transmit shift register (TSR) is empty, it transmits data written in the FTDR register to the TSR register and starts serial transmission. Continuous serial transmission is executed until there is no transmit data left in the FTDR register. Writing the transmit data to the FTDR register should be done when a transmit data empty interrupt (TXI) request is generated. When the FTDR register becomes full of transmit data (16 bytes), no more data can be written. Even if new data is written, the data is ignored.

CPU can read from the FTDR register but cannot write to it.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1

22.2.5 Serial Mode Register (SMR)

The SMR register specifies the SCIFA serial communication format and selects the clock source for the baud rate generator.

The CPU can always read and write to the SMR register.

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	CM	CHR	PE	PM	STOP	—	CKS[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	CKS[1:0]	All 0	R/W	Clock Select b1 b0 0 0: 1 × P0ϕ[*1] 0 1: 1/4 × P0ϕ[*1] 1 0: 1/16 × P0ϕ[*1,*2] 1 1: 1/64 × P0ϕ[*1]
b2	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.
b3	STOP	0	R/W	Stop Bit Length 0: One stop bit 1: Two stop bits
b4	PM	0	R/W	Parity Mode 0: Even parity 1: Odd parity
b5	PE	0	R/W	Parity Enable 0: Parity bit addition or check is disabled. 1: Parity bit addition or check is enabled.
b6	CHR	0	R/W	Character Length 0: 8-bit data 1: 7-bit data[*3]
b7	CM	0	R/W	Communication Mode 0: Asynchronous mode 1: Clock synchronous mode
b15 to b8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. P0ϕ: SCIFn_CLK_PCK (n = 0 to 4)

Note 2. This setting is not applicable to channel 0. It is only applicable to channels 1 to 4.

Note 3. When 7-bit data is selected, the MSB (bit 7) of the transmit FIFO data register is not transmitted.

CKS[1:0] Bits (Clock Select)

Select an internal clock source for the on-chip baud rate generator. For further information on the clock source, bit rate register settings, and baud rates, see **Section 22.2.8, Bit Rate Register (BRR)**.

STOP Bit (Stop Bit Length)

Selects one bit or two bits as the stop bit length in asynchronous mode. This setting is used only in asynchronous mode. It is ignored in clock synchronous mode because no stop bits are added. When receiving, only the first stop bit is checked, regardless of the STOP bit setting. If the second stop bit is 1, it is treated as a stop bit, but if the second stop bit is 0, it is treated as the start bit of the next incoming character.

Note: When transmitting with one stop bit, a single 1 bit (stop bit) is added at the end of each transmission character.

Note: When transmitting with two stop bits, two 1 bits (stop bits) are added at the end of each transmission character.

PM Bit (Parity Mode)

Selects either the even or odd parity check. The setting of this bit is effective only when the parity enable (PE) bit of this register is set to 1 in asynchronous mode. The setting of this bit is ignored in clock synchronous mode, or when parity addition/check is disabled in asynchronous mode.

Note: If even parity is selected, the parity bit is added to data to be transmitted to make the total number of 1s even in the transmission character and parity bit combined. When receiving, the SCIFA verifies that the total number of 1s in the received character and parity bit combined is even.

Note: If odd parity is selected, the parity bit is added to data to be transmitted to make the total number of 1s odd in the transmission character and parity bit combined. When receiving, the SCIFA verifies that the total number of 1s in the received character and parity bit combined is odd.

PE Bit (Parity Enable)

Selects whether to add a parity bit on data transmission and whether to enable/disable the parity check on data reception in asynchronous mode. In clock synchronous mode, a parity bit is neither added nor checked, regardless of the setting of this bit.

Note: When this bit is set to 1, an even or odd parity bit specified in the PM bit is added to data to be transmitted. The SCIFA verifies whether the parity bit of the received data is even or odd as specified in the PM bit when receiving.

CHR Bit (Character Length)

Selects 7- or 8-bit data length in asynchronous mode. In clock synchronous mode, the data length is always 8 bits, regardless of the CHR setting.

CM Bit (Communication Mode)

Selects whether the SCIFA operates in asynchronous or clock synchronous mode.

22.2.6 Serial Control Register (SCR)

The SCR register enables or disables the SCIFA transmission/reception and interrupt requests, and selects the transmit/receive clock source. The CPU can always read from and write to the SCR register.

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	TIE	RIE	TE	RE	REIE	TEIE	CKE[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	CKE[1:0]	All 0	R/W	Clock Enable In asynchronous mode: b1 b0 0 0: Internal clock or SCK pin is used for input pin (input signal is ignored). The SCK pin state depends on the SCKIO and SCKDT bits in SPTR. 0 1: Internal clock or SCK pin is used for clock output (The output clock frequency is 16 or 8 times of the bit rate). 1 0: External clock or SCK pin is used for clock input (The input clock frequency is 16 or 8 times of the bit rate). 1 1: Setting prohibited In clock synchronous mode: b1 b0 0 0: Internal clock or SCK pin is used for synchronous clock output. 0 1: Internal clock or SCK pin is used for synchronous clock output. 1 0: External clock or SCK pin is used for synchronous clock input. 1 1: Setting prohibited
b2	TEIE*[1]	0	R/W	Transmit End Interrupt Enable 0: Transmit end interrupt (TEI) request is disabled. 1: Transmit end interrupt (TEI) request is enabled.
b3	REIE	0	R/W	Receive Error Interrupt Enable 0: Receive-error interrupt (ERI) and break interrupt (BRI) requests are disabled. 1: Receive-error interrupt (ERI) and break interrupt (BRI) requests are enabled.
b4	RE	0	R/W	Receive Enable 0: Data reception is disabled. 1: Data reception is enabled.
b5	TE	0	R/W	Transmit Enable 0: Data transmission is disabled. 1: Data transmission is enabled.
b6	RIE	0	R/W	Receive Interrupt Enable 0: Receive-FIFO-data-full interrupt (RXI), receive-data ready interrupt (DRI), receive-error interrupt (ERI), and break interrupt (BRI) requests are disabled. 1: Receive-FIFO-data-full interrupt (RXI), receive-data ready interrupt (DRI), receive-error interrupt (ERI), and break interrupt (BRI) requests are enabled.
b7	TIE	0	R/W	Transmit Interrupt Enable 0: Transmit-FIFO-data-empty interrupt request (TXI) is disabled. 1: Transmit-FIFO-data-empty interrupt request (TXI) is enabled.
b15 to b8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. TEI interrupt requests can be cleared by reading 1 from the TEND flag, and then clearing the setting to 0, or by setting the TEIE bit to 0.

CKE[1:0] Bits (Clock Enable)

Select the SCIFA clock source and enable or disable clock output from the SCK pin. Depending on the settings of these bits, the SCK pin can be used for serial clock output or serial clock input. If the SCK pin is set for the synchronous clock output in the clock synchronous mode, set the CM bit in the SMR register to 1, and then set the CKE[1:0] bits. The settings of the CKE[1:0] bits are listed in **Table 22.17**.

REIE Bit (Receive Error Interrupt Enable)

Specifies whether to enable or disable a receive-error interrupt (ERI) request and a break interrupt (BRI) request. The setting of this bit is only valid when the RIE bit is set to 0.

Note: ERI interrupt requests can be cleared by reading 1 from the ER bit in the FSR register, and then clearing the setting to 0, or by clearing both the RIE and REIE bits in this register to 0. BRI interrupt requests can be cleared by reading 1 from the BRK bit in the FSR register, or from the ORER flag in the LSR register, and then clearing the setting to 0, or by clearing both the RIE and REIE bits in this register to 0.

RE Bit (Receive Enable)

Specifies whether to enable or disable the serial data reception.

Note: Setting this bit to 0 does not affect the receive flags (DR, ER, BRK, RDF, FER, and PER in the FSR register, and ORER in the LSR register). These flags retain their previous values.

Note: Serial reception starts when a start bit is detected in asynchronous mode, or a synchronous clock input is detected in clock synchronous mode. Before setting this bit to 1, be sure to set the serial mode register (SMR) and the FIFO control register (FCR) to select the receive format and reset the receive FIFO.

TE Bit (Transmit Enable)

Specifies whether to enable or disable the serial data transmission.

Note: Serial transmission starts after writing of data to be transmitted into the FTDR register under this condition. Before setting this bit to 1, be sure to set the serial mode register (SMR) and the FIFO control register (FCR) to select the transmit format and reset the transmit FIFO.

RIE Bit (Receive Interrupt Enable)

Specifies whether to enable or disable a receive-FIFO-data-full (RXI) interrupt request when the RDF flag in the serial status register (FSR) is set to 1, a receive-data ready (DRI) interrupt request when the DR flag in the FSR register is set to 1, a receive-error (ERI) interrupt request when the ER flag in the FSR register is set to 1, and a break (BRI) interrupt request when the BRK flag in the FSR register or the ORER flag in the line status register (LSR) is set to 1.

Note: RXI interrupt requests can be cleared by reading 1 from the DR or RDF flag in the FSR register, then clearing the flag to 0, or by clearing the RIE bit to 0. DRI interrupt requests can be cleared by reading 1 from the DR flag in the FSR register, and then clearing the setting to 0, or by clearing the RIE bit in this register to 0. Receive error interrupt (ERI) requests and break interrupt (BRI) requests can be cleared by clearing both the RIE and REIE bits in this register to 0.

TIE Bit (Transmit Interrupt Enable)

Specifies whether to enable or disable a transmit-FIFO-data-empty interrupt (TXI) request when the serial transmit data is transferred from the transmit FIFO data register (FTDR) into the transmit shift register (TSR), the quantity of data in the transmit FIFO data register falls below the specified trigger number for transmission, and the TDFE flag in the serial status register (FSR) is set to 1.

Note: TXI interrupt requests can be cleared either by writing a greater quantity of transmit data than the specified transmission trigger number into the FTDR register, reading 1 from the TDFE flag, and then clearing the TDFE flag to 0, or by clearing this bit to 0.

22.2.7 Serial Status Register (FSR)

The FSR register is a 16-bit register. The 8 lower-order bits indicate the status flag representing the SCIFA operating state.

The CPU can always read and write to the FSR register, but cannot write 1 to the status flags (ER, TEND, TDFE, BRK, RDF, and DR bits) in this register. These flags can be only cleared to 0 when they have first been read (after being set to 1). b3 (FER) and b2 (PER) are read-only bits that cannot be written.

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	ER	TEND	TDFE	BRK	FER	PER	RDF	DR
Initial Value	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R(/W)*1	R(/W)*1	R(/W)*1	R(/W)*1	R	R	R(/W)*1	R(/W)*1

Bit	Bit Name	Initial Value	R/W	Description
b0	DR	0	R/(W)*1	Receive Data Ready Flag 0: Reception is in progress, or no received data has remained in the FRDR register after normally completed receiving. 1: Next receive data has not been received.
b1	RDF	0	R/(W)*1	Receive FIFO Data Full Flag 0: The quantity of receive data in the FRDR register falls below the specified reception trigger number. 1: The quantity of receive data written in the FRDR register is equal to or greater than the specified reception trigger number.
b2	PER	0	R	Parity Error Flag*4 0: No receive parity error occurred in the next receive data read from the FRDR register. 1: A receive parity error occurred in the next receive data read from the FRDR register.
b3	FER	0	R	Framing Error Flag*4 0: No receive framing error occurred in the next data read from the FRDR register. 1: A receive framing error occurred in the next data read from the FRDR register.
b4	BRK	0	R/(W)*1	Break Detect Flag 0: No break signal is received. 1: A break signal is received.*2
b5	TDFE	1	R/(W)*1	Transmit FIFO Data Empty Flag 0: The quantity of transmit data written in the FTDR register exceeds the specified transmission trigger number. 1: The quantity of transmit data written in the FTDR register is equal to or less than the specified transmission trigger number.*3
b6	TEND	0	R/(W)*1	Transmit End Flag 0: Transmission is in the waiting state or in progress. 1: Transmission is completed.
b7	ER	0	R/(W)*1	Receive Error Flag 0: Reception is in progress or has normally completed. 1: A framing error or parity error has occurred during reception.
b15 to b8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. 0 can be only written to clear the flag after 1 is read.

Note 2. When a break signal is detected, transfer of the receive data (H'00) to the FRDR register stops after the detection. When the break ends and the receive signal becomes mark state (high level), the transfer of receive data resumes.

Note 3. Since the FTDR register is a 16-byte FIFO register, the maximum quantity of data that can be written when TDFE is 1 is “16 minus the number of non-transmitted data units”. If additional data is written, the data is ignored. The quantity of data in the FTDR register is indicated by the 8 higher-order bits of the FDR register.

Note 4. When the DMAC is used to read data, the generation of errors cannot be checked by reading this flag.

DR Bit (Receive Data Ready Flag)

Indicates that the quantity of data stored in the receive FIFO data register (FRDR) falls below the specified reception trigger number, and that no next data has been received yet after the elapse of 15 ETUs from the last stop bit in asynchronous mode. In clock synchronous mode, this bit is not set to 1.

[Setting condition]

- DR is set to 1 when the FRDR register contains less data than the specified reception trigger number, and no next data has been received yet after the elapse of 15 ETUs*[1] from the last stop bit.

[Clearing conditions]

When either of the following is satisfied:

- DR is cleared to 0 when DR = 1 is read and then 0 is written to the DR flag.
- DR is cleared to 0 when all received data in the FRDR register are read.

Note 1. This is equivalent to one and a half (1.5) frames in the 8-bit format with one stop bit (ETU: elementary time unit).

Note: When the RE bit in SCR is cleared to 0, the DR bit is not affected and retains its previous value.

RDF Bit (Receive FIFO Data Full Flag)

Indicates that receive data has been transferred to the receive FIFO data register (FRDR), and the quantity of data in FRDR becomes equal to or greater than the specified reception trigger number.

[Setting condition]

- RDF is set to 1 when the quantity of receive data which is equal to or greater than the specified reception trigger number are stored in the FRDR register*[1].

[Clearing conditions]

- RDF is cleared to 0 when RDF = 1 is read and then 0 is written to this bit.
- RDF is cleared to 0 when the FRDR register is read.

Note 1. Since the FRDR register is a 16-byte FIFO register, the maximum quantity of data that can be read when this bit is 1 is equivalent to the specified reception trigger number. If an attempt is made to read after all the data in the FRDR register has been read, the read data is undefined. The quantity of receive data in the FRDR register is indicated by the 8 lower-order bits of the FDR register.

PER Bit (Parity Error Flag)

Indicates whether there is a parity error in the data read from the receive FIFO data register (FRDR) in asynchronous mode.

[Setting condition]

- PER is set to 1 when a parity error is present in the next data read from the FRDR register.

[Clearing condition]

- PER is cleared to 0 when no parity error is present in the next data read from the FRDR register.

FER Bit (Framing Error Flag)

Indicates whether there is a framing error in the data read from the receive FIFO data register (FRDR) in asynchronous mode.

[Setting condition]

- FER is set to 1 when a framing error is present in the next data read from the FRDR register.

[Clearing condition]

- FER is cleared to 0 when no framing error is present in the next data read from the FRDR register.

BRK Bit (Break Detect Flag)

Indicates that a break signal has been detected in receive data.

[Setting condition]

- BRK is set to 1 when data including a framing error is received, and the framing error is followed by at least one frame of data received at the space 0 level (low level).

[Clearing condition]

- BRK is cleared to 0 when software reads BRK after it has been set to 1 and then writes 0 to BRK.

TDFE Bit (Transmit FIFO Data Empty Flag)

Indicates that data has been transferred from the transmit FIFO data register (FTDR) into the transmit shift register (TSR), the quantity of data in the FRDR register becomes equal to or less than the specified transmission trigger number, and writing of transmit data to the FRDR register is enabled.

[Setting conditions]

When either of the following is satisfied:

- TDFE is set to 1 when the TE bit in SCR is 0.
- TDFE is set to 1 when the quantity of transmit data written in the FRDR register is equal to or less than the specified transmission trigger number.

[Clearing conditions]

- TDFE is cleared to 0 when 0 is written in the TDFE bit after reading TDFE = 1.
- When transmit data is written to the FTDR register

TEND Bit (Transmit End Flag)

Indicates that the FRDR register contains no more valid data and transmission is completed when transmitting the last bit of the transmit data.

[Setting condition]

When the following is satisfied:

- TEND is set to 1 when the FTDR register does not contain transmit data when the last bit of the serial transmission data is transmitted.

[Clearing conditions]

- When transmit data is written to the FTDR register
- When 0 is written to TEND after it has been read as 1

ER Bit (Receive Error Flag)

Indicates the occurrence of a framing error, or of a parity error when receiving the parity-added data*[1].

[Setting conditions]

When either of the following is satisfied:

- ER is set to 1 when the stop bit is found to be 0 after checking whether the stop bit of the received data is 1 at the end of one data receive operation*[1].
- ER is set to 1 when the total number of 1s in the received data and parity bit combined does not match the even or odd parity setting specified by the PM bit in the SMR register.

[Clearing condition]

- When 0 is written to ER after it has been read as 1

Note 1. Clearing the RE bit to 0 in the SCR register does not affect this bit, which retains its previous value. Even if a receive error occurs, the receive data is transferred to the FRDR register and the receive operation is continued. Whether the data read from the FRDR register includes a receive error can be detected by the FER and PER bits in the FSR register.

Note: In two stop bits mode, only the first stop bit is checked; the second stop bit is not checked.

22.2.8 Bit Rate Register (BRR)

The BRR register is an 8-bit register that, together with the baud rate generator clock source selected by the CKS[1:0] bits in the serial mode register (SMR), determines the serial transmit/receive bit rate.

This register is located in the same address as that of the MDDR register and selected when the MDDRS bit in SEMR is 0. The CPU can read and write to BRR. Writing to BRR should be executed when TE = RE = 0 in the SCR register.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The BRR setting is calculated using the following formulae.

[Asynchronous mode]

- When the baud rate generator is in normal mode (SEMR.BGDM = 0):

$$N = \frac{P0\phi}{64 \times 2^{2n-1} \times B} \times 10^6 - 1$$

(When operating on the base clock with a frequency 16 times the bit rate (SMER.ABCS0 = 0))

$$N = \frac{P0\phi}{32 \times 2^{2n-1} \times B} \times 10^6 - 1$$

(When operating on the base clock with a frequency 8 times the bit rate (SMER.ABCS0 = 1))

- When the baud rate generator is in double-speed mode (SEMR.BGDM = 1):

$$N = \frac{P0\phi}{32 \times 2^{2n-1} \times B} \times 10^6 - 1$$

(When operating on the base clock with a frequency 16 times the bit rate (SMER.ABCS0 = 0))

$$N = \frac{P0\phi}{16 \times 2^{2n-1} \times B} \times 10^6 - 1$$

(When operating on the base clock with a frequency 8 times the bit rate (SMER.ABCS0 = 1))

[Clock synchronous mode]

$$N = \frac{P0\phi}{8 \times 2^{2n-1} \times B} \times 10^6 - 1$$

B: Bit rate (bit/s)
N: Setting of the BRR register ($0 \leq N \leq 255$) (The setting must satisfy the electrical characteristics).
P0ϕ: Operating frequency for peripheral modules (MHz)
n: Baud rate generator clock source (n = 0, 1, 2, 3) (For the clock sources and values of n, see **Table 22.5**).

NOTE

The MDDR register is used to adjust the bit rate. For details, see **Section 22.2.9, Modulation Duty Register (MDDR)**.

Table 22.5 SMR Register Setting

n	Clock Source	SMR Register Settings	
		CKS1	CKS0
0	P0ϕ	0	0
1	P0ϕ/4	0	1
2	P0ϕ/16	1	0
3	P0ϕ/64	1	1

The bit rate error in asynchronous mode is calculated using the following formulae.

- When the baud rate generator is in normal mode (SEMR.BGDM = 0):

$$\text{Error (\%)} = \left\{\frac{\text{P0}\phi \times 10^6}{(\text{N}+1) \times \text{B} \times 64 \times 2^{2\text{n}-1}} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 16 times the bit rate (SMER.ABCS0 = 0))

$$\text{Error (\%)} = \left\{\frac{\text{P0}\phi \times 10^6}{(\text{N}+1) \times \text{B} \times 32 \times 2^{2\text{n}-1}} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 8 times the bit rate (SMER.ABCS0 = 1))

- When the baud rate generator is in double-speed mode (SEMR.BGDM = 1):

$$\text{Error (\%)} = \left\{\frac{\text{P0}\phi \times 10^6}{(\text{N}+1) \times \text{B} \times 32 \times 2^{2\text{n}-1}} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 16 times the bit rate (SMER.ABCS0 = 0))

$$\text{Error (\%)} = \left\{\frac{\text{P0}\phi \times 10^6}{(\text{N}+1) \times \text{B} \times 16 \times 2^{2\text{n}-1}} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 8 times the bit rate (SMER.ABCS0 = 1))

Table 22.6 list the examples of the BRR register setting in asynchronous mode, and **Table 22.7** list the examples of the BRR register setting in clock synchronous mode.

Table 22.6 Bit Rates and BRR Register Settings in Asynchronous Mode

Bit Rate (bps)	P0ϕ (MHz)		
	100		
	n	N	Error (%)
150	—	—	—
300	3	162	−0.15
600	2	80	0.47
1200	2	162	−0.15
2400	2	80	0.47
4800	1	162	−0.15
9600	1	80	0.47
14400	0	216	0.01
19200	0	162	−0.15
28800	0	108	−0.45
31250	0	99	0.00
38400	0	80	0.47
115200	0	26	0.47
500000	0	5	*1

Note: These values assume bits SEMR.ABCS0 and SEMR.BGDM are both 0.
When either the SEMR.ABCS0 bit or SEMR.BGDM bit is set to 1, the bit rate is doubled.
When bits SEMR.ABCS0 and SEMR.BGDM are both 1, the bit rate is quadrupled.
Configure settings so the range of error is no greater than 1%.

Note 1. Values for the blank cells in the table can be set using the MDDR register.
For details, see **Section 22.2.9, Modulation Duty Register (MDDR)** and the **Table 22.12**.

Table 22.7 Bit Rates and BRR Register Settings in Clock Synchronous Mode

Bit Rate (bps)	P0ϕ (MHz)	
	100	
	n	N
250	—	—
500	—	—
1000	—	—
2500	3	155
5000	3	77
10000	3	38
25000	1	249
50000	1	124
100000	0	249
250000	0	99
500000	0	49
1000000	0	24
2500000	0	9
5000000	0	4

Note: Continuous transmission or reception is not possible.
Set the BRR register so that the range of error can fall within 1% or less.

Remarks: —: Setting is prohibited.

Table 22.8 lists the maximum bit rates for various frequencies in asynchronous mode when the baud rate generator is used. **Table 22.9** lists the maximum bit rates for various frequencies in clock synchronous mode when the baud rate generator is used. **Table 22.10** and **Table 22.11** list the maximum rates for external clock inputs in asynchronous mode and clock synchronous mode, respectively.

Table 22.8 Maximum Bit Rates for Various Frequencies with Baud Rate Generator (in Asynchronous Mode)

P0ϕ (MHz)	Maximum Bit Rate (bit/s)	Settings	
		n	N
100	12500000	0	0

Note: These values assume bits SEMR.ABCS0 and SEMR.BGDM are both 1. When either the SEMR.ABCS0 bit or SEMR.BGDM bit is set to 1, the bit rate is 1/2. When bits SEMR.ABCS0 and SEMR.BGDM are both 1, the bit rate is 1/4.

Table 22.9 Maximum Bit Rates for Various Frequencies with Baud Rate Generator (in Clock Synchronous Mode)

P0ϕ (MHz)	Discontinuous Transmission/Reception			Continuous Transmission/Reception		
	Maximum Bit Rate (bit/s)	Settings		Maximum Bit Rate (bit/s)	Settings	
		n	N		n	N
100	25000000	0	0	12500000	0	1

Table 22.10 Maximum Bit Rates with External Clock Input (in Asynchronous Mode)

P0ϕ (MHz)	External Input Clock (MHz)	Maximum Bit Rate (bit/s)
100	25.00	3125000

Note: This is an example when the SEMR.ABCS0 bit is 1. When the ABCS0 bit is set to 0, the bit rate is 1/2.

Table 22.11 Maximum Bit Rates with External Clock Input (in Clock Synchronous Mode)

P0ϕ (MHz)	External Input Clock (MHz)	Maximum Bit Rate (bit/s)
100	8.33	8330000

22.2.9 Modulation Duty Register (MDDR)

The MDDR register corrects the bit rate adjusted by the BRR register. The value after reset of this register is H’FF. When the BRME bit in SEMR is set to 1, the bit rate generated by the on-chip baud rate generator is evenly corrected according to the settings of MDDR (MDDR/256). The relationship between the MDDR register setting and the bit rate (B) is given by the following formula. The MDDR register is located in the same address as that of the BRR register and is selected when the MDDRS bit in SEMR is 1. This register is only writable when TE = RE = 0 in the SCR register. b7 in this register is fixed to 1.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The formulae below show the relationships between the MDDR setting and the bit rate (B) when the bit rate modulation function is used.

[Asynchronous mode]

- When the baud rate generator is in normal mode (SEMR.BGDM = 0):

$$B = \frac{P0\phi \times 10^6}{64 \times 2^{2n-1} \times (256/MDDR) \times (N+1)}$$

(When operating on the base clock with a frequency 16 times the bit rate (SEMR.ABCS0 = 0))

$$B = \frac{P0\phi \times 10^6}{32 \times 2^{2n-1} \times (256/MDDR) \times (N+1)}$$

(When operating on the base clock with a frequency 8 times the bit rate (SEMR.ABCS0 = 1))

- When the baud rate generator is in double-speed mode (SEMR.BGDM = 1):

$$B = \frac{P0\phi \times 10^6}{32 \times 2^{2n-1} \times (256/MDDR) \times (N+1)}$$

(When operating on the base clock with a frequency 16 times the bit rate (SEMR.ABCS0 = 0))

$$B = \frac{P0\phi \times 10^6}{64 \times 2^{2n-1} \times (256/MDDR) \times (N+1)}$$

(When operating on the base clock with a frequency 8 times the bit rate (SEMR.ABCS0 = 1))

[Clock synchronous mode]

$$B = \frac{P0\phi \times 10^6}{8 \times 2^{2n-1} \times (256/MDDR) \times (N+1)}$$

When the bit rate modulation is used, the bit rate average error is given by the following formulae.

- When the baud rate generator is in normal mode (SEMR.BGDM = 0):

$$\mathrm{Error}\ (\%) = \left\{\frac{P0\phi \times 10^6}{B \times 64 \times 2^{2n-1} \times (256/MDDR) \times (N+1)} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 16 times the bit rate (SEMR.ABCS0 = 0))

$$\mathrm{Error}\ (\%) = \left\{\frac{P0\phi \times 10^6}{B \times 32 \times 2^{2n-1} \times (256/MDDR) \times (N+1)} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 8 times the bit rate (SEMR.ABCS0 = 1))

- When the baud rate generator is in double-speed mode (SEMR.BGDM = 1):

$$\mathrm{Error}\ (\%) = \left\{\frac{P0\phi \times 10^6}{B \times 32 \times 2^{2n-1} \times (256/MDDR) \times (N+1)} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 16 times the bit rate (SEMR.ABCS0 = 0))

$$\mathrm{Error}\ (\%) = \left\{\frac{P0\phi \times 10^6}{B \times 16 \times 2^{2n-1} \times (256/MDDR) \times (N+1)} - 1\right\} \times 100$$

(When operating on the base clock with a frequency 8 times the bit rate (SEMR.ABCS0 = 1))

B: Bit rate (bits/s)
N: BRR register setting ($0 \leq N \leq 255$)
The setting must satisfy the electrical characteristics).
P0ϕ: Operating frequency for peripheral modules (MHz)
MDDR: MDDR setting ($128 \leq MDDR \leq 256$)
n: Baud rate generator clock source (n = 0, 1, 2, 3) (For the clock sources and values of n, see **Table 22.5**).

Table 22.12 Bit Rates and BRR and MDDR Registers Settings in Asynchronous Mode

	P0ϕ (MHz)			
	100			
Bit Rate (bps)	n	N	MDDR	Error (%)
150	3	252	199	0.02
300	3	161	255	0.08
600	3	80	255	0.08
1200	2	161	255	0.08
2400	2	80	255	0.08
4800	1	161	255	0.08
9600	1	80	255	0.08
14400	—	—	—	—
19200	0	161	255	0.08
28800	0	107	254	0.08
31250	—	—	—	—
38400	0	80	253	0.08
115200	0	26	255	0.08
500000	0	5	246	0.10

Note: These values assume bits SEMR.ABCS0 and SEMR.BGDM are both 0. When either the SEMR.ABCS0 bit or SEMR.BGDM bit is set to 1, the bit rate is doubled. When bits SEMR.ABCS0 and SEMR.BGDM are both 1, the bit rate is quadrupled. Configure settings so the range of error is no greater than 1%.

22.2.10 FIFO Control Register (FCR)

The FCR register resets the quantity of data in the transmit FIFO data register (FTDR) and the receive FIFO data register (FRDR) and specifies the number of triggers. This register also specifies whether to enable the loop-back test.

The CPU can always read and write to the FCR register.

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	RSTRG[2:0]			RTRG[1:0]		TTRG[1:0]		MCE	TFRST	RFRST	LOOP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	LOOP	0	R/W	Loop-Back Test 0: Loop back test is disabled. 1: Loop back test is enabled
b1	RFRST	0	R/W	Receive FIFO Data Register Reset 0: Normal operation 1: Resets the FRDR register.
b2	TFRST	0	R/W	Transmit FIFO Data Register Reset 0: Normal operation 1: Resets the FTDR register.
b3	MCE	0	R/W	Modem Control Enable 0: Model signal is disabled.*1 1: Model signal is enabled.
b5, b4	TTRG[1:0]	All 0	R/W	Transmit FIFO Data Trigger Number Select b5 b4 0 0: 8 (8)*2 0 1: 4 (12)*2 1 0: 2 (14)*2 1 1: 0 (16)*2
b7, b6	RTRG[1:0]	All 0	R/W	Receive FIFO Data Trigger Number Select In asynchronous mode: b7 b6 0 0: 1 0 1: 4 1 0: 8 1 1: 14 In clock synchronous mode: b7 b6 0 0: 1 0 1: 2 1 0: 8 1 1: 14
b10 to b8	RSTRG[2:0]	All 0	R/W	RTS# Output Active Trigger Number Select b10 b8 0 0 0: 15 0 0 1: 1 0 1 0: 4 0 1 1: 6 1 0 0: 8 1 0 1: 10 1 1 0: 12 1 1 1: 14

Bit	Bit Name	Initial Value	R/W	Description
b15 to b11	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. The CTS# input level does not affect the transmit operation. Similarly, the RTS# input level does not affect the receive operation.

Note 2. Values in parentheses mean the number of empty bytes in the FTDR register when the TDFE flag is set to 1 and a transmit FIFO data empty interrupt (TXI) request is generated.

LOOP Bit (Loop-Back Test)

Internally connects between the transmit output pin (TXD) and the receive input pin (RXD) and between the RTS# pin and the CTS# pin, to perform loop-back testing.

RFRST Bit (Receive FIFO Data Register Reset)

Disables the receive data in the receive FIFO data register (FRDR) and makes the data to the empty state. If you set this bit to 1, be sure to clear it to 0 afterward.

TFRST Bit (Transmit FIFO Data Register Reset)

Disables the transmit data in the transmit FIFO data register (FTDR) and makes the data to the empty state. If you set this bit to 1, be sure to clear it to 0 afterward.

MCE Bit (Modem Control Enable)

Specifies whether to enable or disable the modem control signals, CTS# and RTS#. In clock synchronous mode, this bit should always be set to 0.

TTRG[1:0] Bits (Transmit FIFO Data Trigger Number Select)

Specify the reference quantity of data for transmission (i.e., the threshold number of entries to trigger the writing of further data for transmission) for setting of the TDFE flag in the serial status register (FSR). When the number of entries for transmission in the transmission FIFO, i.e. the number of entries written to the transmit FIFO data register (FTDR) that are yet to be transmitted, falls to or below the specified trigger number for transmission, the TDFE flag is set to 1 and a transmit FIFO data empty interrupt (TXI) request is generated.

The setting in these bits is valid when the TTRGS bit in the FTCR register is 0. When the TTRGS bit in the FTCR register is 1, the setting of the TFTC[4:0] bits in the FTCR register is valid.

RTRG[1:0] Bits (Receive FIFO Data Trigger Number Select)

Specify the reference quantity of receive data (i.e., the threshold number of entries to trigger the reading of received data) for setting of the RDF flag in the serial status register (FSR). When the number of entries in the reception FIFO, i.e. the number of entries yet to be read from the receive FIFO data register (FRDR), rises to or above the specified trigger number for reception, the RDF flag is set to 1 and a receive FIFO data full interrupt (RXI) request is generated.

The setting in these bits is valid when the RTRGS bit in the FTCR register is 0. When the RTRGS bit in the FTCR register is 1, the setting of the RFTC[4:0] bits in the FTCR register is valid.

RSTRG[2:0] Bits (RTS# Output Active Trigger Number Select)

When the number of entries in the reception FIFO, i.e. the number of entries yet to be read from the receive FIFO data register (FRDR), rises to or above the specified trigger number, the RTS# signal is in the high state.

The setting in these bits is only valid when a modem signal is enabled by the MCE bit in this register in asynchronous mode.

22.2.11 FIFO Data Count Register (FDR)

The FDR register indicates the quantity of data stored in the transmit FIFO data register (FTDR) and the receive FIFO data register (FRDR).

This register indicates the quantity of transmit data in the FTDR register with the 8 higher-order bits, and the quantity of receive data in the FRDR register with the 8 lower-order bits. The CPU can always read the FDR register.

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	T[4:0]					—	—	—	R[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
b4 to b0	R[4:0]	All 0	R	Receive Data Quantity in FRDR Indicate the quantity of receive data stored in the FRDR register.
b7 to b5	—	All 0	R	Reserved These bits are read as 0.
b12 to b8	T[4:0]	All 0	R	Non-Transmitted Data Quantity in FTDR Indicate the quantity of non-transmitted data stored in the FTDR register.
b15 to b13	—	All 0	R	Reserved These bits are read as 0.

R[4:0] Bits

Indicate the quantity of receive data stored in the FRDR register.

H’00 means no received data, and H’10 means that all of the received data is stored in the FRDR register.

T[4:0] Bits

Indicate the quantity of non-transmitted data stored in the FTDR register.

H’00 means no transmit data, and H’10 means that all of the data for transmission is stored in the FTDR register.

22.2.12 Serial Port Register (SPTR)

The SPTR register controls input/output and data of the pins multiplexed to SCIFA function. The CPU can always read and write to the SPTR register.

NOTE

b6, b4, b2, and b0 of this register respectively indicate the input status of their corresponding pins. See the descriptions for each bit for details. Writings to these bits in 1-bit unit are handled as read-modify-write, which may lead to undesired values to be written. To avoid this, when modifying the SPB2DT or SPB2IO bit, for example, write the other bit (the bit used in combination) at the same time.

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	RTS2IO	RTS2DT	CTS2IO	CTS2DT	SCKIO	SCKDT	SPB2IO	SPB2DT
Initial Value	0	0	0	0	0	0	0	0	0	x	0	x	0	x	0	x
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Remarks: x: Undefined

Bit	Bit Name	Initial Value	R/W	Description
b0	SPB2DT	x	R/W	Serial Port Break Data Select Controls the TXD pin in combination with the TE bit in the SCR register and the SPB2IO bit. See **Table 22.15**.
b1	SPB2IO	0	R/W	Serial Port Break Input/Output Controls the TXD pin in combination with the TE bit in the SCR register and the SPB2DT bit.
b2	SCKDT	x	R/W	SCK Port Data Select Controls the SCK pin in combination with the CM bit in the SMR register, the SCKIO bit, and the CKE1 and CKE0 bits in the SCR register. See **Table 22.17**.
b3	SCKIO	0	R/W	SCK Port Input/Output Controls the SCK pin in combination with the CM bit in the SMR register, the SCKDT bit, and the CKE1 and CKE0 bits in the SCR register. See **Table 22.17**.
b4	CTS2DT	x	R/W	CTS# Port Data Select Controls the CTS# pin in combination with MCE bit in FCR and CTS2IO bit. See **Table 22.14**. The SCIF 3 and SCIF 4 channels are not supported.
b5	CTS2IO	0	R/W	CTS# Port Output Specify Controls the CTS# pin in combination with MCE bit in FCR and CTS2IO bit. See **Table 22.14**. The SCIF 3 and SCIF 4 channels are not supported.
b6	RTS2DT	x	R/W	RTS# Port Data Select Controls the RTS# pin in combination with MCE bit in FCR and RTS2IO bit. See **Table 22.13**. The SCIF 3 and SCIF 4 channels are not supported.
b7	RTS2IO	0	R/W	RTS# Port Output Specify Controls the RTS# pin in combination with MCE bit in FCR and RTS2IO bit. See **Table 22.13**. The SCIF 3 and SCIF 4 channels are not supported.
b15 to b8	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Remarks: x: Undefined

SPB2DT Bit (Serial Port Break Data Select)

This bit specifies the output level of the TXD pin when the setting of the SCR.TE bit is 0. The RXD pin input status can be read from this bit regardless of the SPB2IO bit setting. However, the RXD pin function must have been selected with the general I/O port.

SPB2IO Bit (Serial Port Break Input/Output)

Controls the TXD pin in combination with the TE bit in the SCR register and the SPB2DT bit.

SCKDT Bit (SCK Port Data Select)

The SCK pin status can be read from this bit regardless of the SCKIO bit setting. (When the SCK pin is used for input, the input signal is invalid (has no means) but the pin status can be read.) However, the SCK pin function must have been selected with the general I/O port.

SCKIO Bit (SCK Port Input/Output)

Specifies input or output status of the SCK pin. This bit controls the SCK pin in combination with the SCKDT bit, the CM bit in the SMR register, and the CKE1 and CKE0 bits in the SCR register.

CTS2DT Bit (CTS# Port Data Select)

The status of the CTS# pin can be read from this bit regardless of the CTS2IO bit setting. However, the CTS# pin function must have been selected with the general I/O port.

RTS2DT Bit (RTS# Port Data Select)

The status of the RTS# pin can be read from this bit regardless of the RTS2IO bit setting. However, the RTS# pin function must have been selected with the general I/O port

Table 22.13 RTS# Pin Status

FCR.MCE Bit Setting	RTS2IO Bit Setting	RTS2DT Bit Setting	RTS# Pin Status
0	0	×	Setting prohibited*[1]
0	1	0	Low output
0	1	1	High output
1	×	×	Modem control output

Remarks: ×: Don’t care

Note 1. There is no problem with the initial setting if the RTS# pin is not used.

Table 22.14 CTS# Pin Status

FCR.MCE Bit Setting	CTS2IO Bit Setting	CTS2DT Bit Setting	CTS# Pin Status
0	0	×	Setting prohibited*[1]
0	1	0	Low output
0	1	1	High output
1	×	×	Modem control input

Remarks: ×: Don’t care

Note 1. There is no problem with the initial setting if the CTS# pin is not used.

Table 22.15 TXD Pin Status

SCR.TE Bit Setting	SPB2IO Bit Setting	SPB2DT Bit Setting	TXD Pin Status
0	0	×	Setting prohibited
0	1	0	Low output
0	1	1	High output
1	×	×	Transmit data output

Remarks: ×: Don’t care

22.2.13 Line Status Register (LSR)

The LSR register is a 16-bit register. The PER and FER bits indicate the number of receive errors in the receive FIFO data register. 1 cannot be written to the OREER status flag. The flag should be read as 1 prior to clearing it to 0.

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	PER[3:0]				—	—	FER[3:0]				—	ORER
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R(W)*1

Bit	Bit Name	Initial Value	R/W	Description
b0	ORER	0	R/(W) *1	Overrun Error Flag 0: Reception is in progress or has normally completed. 1: An overrun error has occurred during reception.
b1	—	0	R	Reserved This bit is read as 0.
b5 to b2	FER[3:0]	All 0	R	Framing Error Count Indicates the quantity of data with a framing error among the receive data stored in the receive FIFO data register (FRDR).
b7, b6	—	All 0	R	Reserved These bits are read as 0.
b11 to b8	PER[3:0]	All 0	R	Parity Error Count Indicates the quantity of data with a parity error among the receive data stored in the receive FIFO data register (FRDR).
b15 to b12	—	All 0	R	Reserved These bits are read as 0.

Note 1. To clear the flag, 0 can be only written after 1 is read.

ORER Bit (Overrun Error Flag)

Indicates that receive operation abnormally stops due to occurrence of an overrun error. This flag is not affected and retains its previous state if the RE bit in the serial control register (SCR) is cleared to 0. The receive FIFO data register (FRDR) retains the data before an overrun error occurred, and newly received data is lost. When the ORER bit is set to 1, the SCIFA cannot continue subsequent serial reception.

[Setting condition]

- When the next serial reception is completed with the receive FIFO in full state (16-byte data is received)

[Clearing condition]

- When 0 is written to ORER after being read as 1.

Note: When the internal clock is selected while the SCIFA is in clock synchronous mode, the amount of receive data can be controlled, so no overrun occurs.

FER[3:0] Bits (Framing Error Count)

The values of bits 5 to 2 indicate the quantity of data with a framing error after the ER bit in the FSR register is set. Reading 0000 from the FER[3:0] bits means all 16-byte receive data in the FRDR register have a framing error.

PER[3:0] Bits (Parity Error Count)

The values of bits 11 to 8 indicate the quantity of data with a parity error after the ER bit in the FSR register is set. Reading 0000 from the PER[3:0] bits means all 16-byte receive data in the FRDR register have a parity error.

22.2.14 Serial Extended Mode Register (SEMR)

The SEMR register specifies either LSB or MSB first, enables the noise cancellation, operation in normal or double-speed mode of the baud rate generator, and bit rate modulation, and selects the modulation register and the sampling count (either 8 or 16 times).

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	BGDM	—	BRME	MDDRS	DIR	NFEN	—	ABCS0
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	ABCS0	0	R/W	Asynchronous Base Clock Select 0: Operates on a frequency 16 times the transfer rate as the base clock. 1: Operates on a frequency 8 times the transfer rate as the base clock.
b1	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.
b2	NFEN	0	R/W	Noise Cancellation Enable 0: Noise cancellation for the RxD pin is disabled. 1: Noise cancellation for the RxD pin is enabled.
b3	DIR	0	R/W	Data Transfer Direction Select 0: Transmits the data in the FTDR register by the LSB-first method. The received data is stored in the FRDR register by the LSB- first method. 1: Transmits the data in the FTDR register by the MSB-first method. The received data is stored in the FRDR register by the MSB- first method.
b4	MDDRS	0	R/W	Modulation Duty Register Select 0: BRR register is accessible. 1: MDDR register is accessible.
b5	BRME	0	R/W	Bit Rate Modulation Enable 0: Bit rate modulation is disabled. 1: Bit rate modulation is enabled.
b6	—	0	R/W	Reserved This bit is read as 0. The write value should be 0.
b7	BGDM	0	R/W	Baud Rate Generator Double- Speed Mode Select 0: Baud rate generator normal mode: Baud rate generator operates on the clock signal produced by dividing the clock source by two. 1: Baud rate generator double-speed mode: Baud rate generator operates on the clock signal produced by the clock source (no frequency division).

ABCS0 Bit (Asynchronous Base Clock Select)

Selects the base clock for 1-bit period in asynchronous mode.

This bit setting is valid only in asynchronous mode (i.e., when the CM bit in the SMR register is 0).

NFEN Bit (Noise Cancellation Enable)

Reduces noise of the input to the RxD pin. This function is only valid in asynchronous mode. For details, see **Section 22.7, Noise Cancellation**.

In clock synchronous mode, this bit should always be set to 0.

DIR Bit (Data Transfer Direction Select)

Selects the serial communication format. This bit is valid only when the transmit/receive data is in 8-bit formats.*[1]

Note 1. Asynchronous mode or clock synchronous mode with the 8-bit data length

MDDRS Bit (Modulation Duty Register Select)

Selects the register to be enabled access to it.

BRME Bit (Bit Rate Modulation Enable)

Specifies whether to enable or disable the bit rate modulation.

BGDM Bit (Baud Rate Generator Double-Speed Mode Select)

Selects operating mode of the baud rate generator. When setting 1 in this bit, the baud rate generator included in the SCIFA operates in double-speed mode. The setting of this bit is only effective in asynchronous mode (SMR.CM bit = 0) when the internal clock is selected as the clock source (SCR.CKE[1:0] = 00b). Use normal mode under any other settings.

22.2.15 FIFO Trigger Control Register (FTCR)

The FTCR register is a 16-bit register that specifies FIFO trigger conditions. The CPU can always read from and write to the FTCR register.

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RTRGS	—	—	RFTC[4:0]					TTRGS	—	—	TFTC[4:0]				
Initial Value	0	0	0	1	1	1	1	1	0	0	0	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
b4 to b0	TFTC[4:0]	All 1	R/W	Transmit FIFO Data Trigger Number H’00: Transmit data trigger number is 0. H’0F: Transmit data trigger number is 15. Do not set H’10 to H’1F in these bits.
b6, b5	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b7	TTRGS	0	R/W	Transmit Trigger Select 0: TTRG[1:0] bits in FCR are valid. 1: TFTC[4:0] bits in FTCR are valid.
b12 to b8	RFTC[4:0]	All 1	R/W	Receive FIFO Data Trigger Number H’01: Receive data trigger number is 1. H’10: Receive data trigger number is 16. Do not set H’00 and H’11 to H’1F in these bits.
b14, b13	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
b15	RTRGS	0	R/W	Receive Trigger Select 0: RTRG[1:0] bits in FCR are valid. 1: RFTC[4:0] bits in FTCR are valid.

TFTC[4:0] Bits (Transmit FIFO Data Trigger Number)

Specify the reference quantity of data for transmission (i.e., the threshold number of entries to trigger the writing of further data for transmission) for setting of the TDFE flag in the serial status register (FSR).

When the number of entries for transmission in the transmission FIFO, i.e. the number of entries written to the transmit FIFO data register (FTDR) that are yet to be transmitted, falls to or below the specified trigger number for transmission, the TDFE flag is set to 1 and a transmit FIFO data empty interrupt (TXI) request is generated.

RFTC[4:0] Bits (Receive FIFO Data Trigger Number)

Specify the reference quantity of receive data (i.e., the threshold number of entries to trigger the reading of received data) for setting of the RDF flag in the serial status register (FSR).

When the number of entries in the reception FIFO, i.e. the number of entries yet to be read from the receive FIFO data register (FRDR), rises to or above the specified trigger number for reception, the RDF flag is set to 1 and a receive FIFO data full interrupt (RXI) request is generated.

22.3 Operation

22.3.1 Overview

For serial communication, the SCIFA can select either asynchronous mode in which characters are synchronized individually or a clock synchronous mode in which communication is synchronized with clock pulses.

The SCIFA has a 16-stage FIFO buffer for both transmission and receptions, reducing the overhead of the CPU and enabling continuous high-speed communication. The RTS# and CTS# signals are provided as modem control signals. Selection of a transmission/reception format is enabled with the serial mode register (SMR). **Table 22.16** shows the transmission format which can be selected in the serial mode register (SMR). As shown in **Table 22.17**, the SCIFA clock source can be selected by the combination of the CKE1 and CKE0 bits in the serial control register (SCR).

(1) Asynchronous Mode

- Data length is selectable either 7 or 8 bits
- Parity addition and 1- or 2-bit stop bit addition are selectable.
  (The combination of the preceding selections determines the transmission/reception format and character length).
- In reception, it is possible to detect framing errors, parity errors, receive FIFO data full, overrun errors, receive data ready, and breaks.
- The stored data quantities are indicated in the FIFO data count register (FDR), respectively for transmit and receive FIFO data.
- An internal or external clock can be selected as the SCIFA clock source.
  When an internal clock is selected, the SCIFA operates using the clock of on-chip baud rate generator and can output the clock with a frequency 16 (or 8) times the bit rate.
  When an external clock is selected, the external clock input must have a frequency 16 (or 8) times the bit rate. (The on-chip baud rate generator is not used.)

(2) Clock Synchronous Mode

- The transmission/reception format is fixed to the 8-bit data length.
- In reception, it is possible to detect overrun errors (ORER).
- An internal or external clock can be selected as the SCIFA clock source.
  When an internal clock is selected, the SCIFA operates using the clock of the on-chip baud rate generator, and outputs this clock to external devices as the synchronous clock.
  When an external clock is selected, the SCIFA operates on the input synchronous clock not using the on-chip baud rate generator.

Table 22.16 SMR Register Settings and SCIFA Communication Formats

SMR Register					SCIFA Transmission/Reception Format		
b7	b6	b5	b3				
CM	CHR	PE	STOP	Mode	Data Length	Parity Bit	Stop Bit Length
0	0	0	0	Asynchronous mode	8 bits	Not set	1 bit
			1				2 bits
		1	0			Set	1 bit
			1				2 bits
	1	0	0		7 bits	Not set	1 bit
			1				2 bits
		1	0			Set	1 bit
			1				2 bits
1	×	×	×	Clock synchronous mode	8 bits	Not set	None

Remarks: ×: Don’t care

Table 22.17 SMR, SCR, and SPTR Register Settings and SCIFA Clock Source Selection

SMR Register	SCR Register		SPTR Register				
b7	b1	b0	b3	b2			
CM	CKE1	CKE0	SCKIO	SCKDT	Mode	Clock Source	SCK Pin Function
0	0	0	0	×	Asynchronous mode	Internal	Input pin (input signal invalid) (Initial state)
			1	0			SCK pin state: Low
			1	1			SCK pin state: High
		1	×	×			Outputs a clock with frequency 16/8 times the bit rate*1
	1	0	×	×		External	Inputs a clock with frequency 16/8 times the bit rate*2
		1	×	×		Setting prohibited	
1	0	×	×	×	Clock synchronous mode	Internal	Outputs the synchronous clock
	1	0	×	×		External	Inputs the synchronous clock
		1	×	×		Setting prohibited	

Remarks: ×: Don’t care

Note 1. SEMR.ABCS0 = 0: Output a clock that has a frequency 16 times the bit rate. SEMR.ABCS0 = 1: Output a clock that has a frequency 8 times the bit rate.

Note 2. SEMR.ABCS0 = 0: Input a clock that has a frequency 16 times the bit rate. SEMR.ABCS0 = 1: Input a clock that has a frequency 8 times the bit rate.

22.3.2 Operation in Asynchronous Mode

In asynchronous mode, each transmitted or received character begins with a start bit and ends with a stop bit. Serial communication is synchronized one character at a time.

The transmitting and receiving sections of the SCIFA are independent, so full duplex communication is possible. The transmitter and receiver are 16-stage FIFO buffered, so data can be written and read while transmitting and receiving are in progress, enabling continuous transmission and reception.

Figure 22.2 shows the general format of asynchronous serial communication.

In asynchronous serial communication, the communication line is normally held in the mark (high) state. The SCIFA monitors the line and starts serial communication when the line goes to the space (low) state, considered as a start bit. One serial character consists of a start bit (low), data (LSB first when LSB-first transfer is selected), parity bit (high or low), and stop bit (high), in that order.

When receiving in asynchronous mode, the SCIFA synchronizes at the falling edge of the start bit. The SCIFA samples each data bit on the eighth pulse of a clock with a frequency 16 or 8 times the bit rate*[1]. Receive data is latched at the center of each bit.

Note 1. When the SEMR.ABCS0 bit = 0, data is sampled on the eighth pulse of a clock with a frequency 16 times the bit rate.
When the SEMR.ABCS0 bit = 1, data is sampled on the fourth pulse of a clock with a frequency 8 times the bit rate.

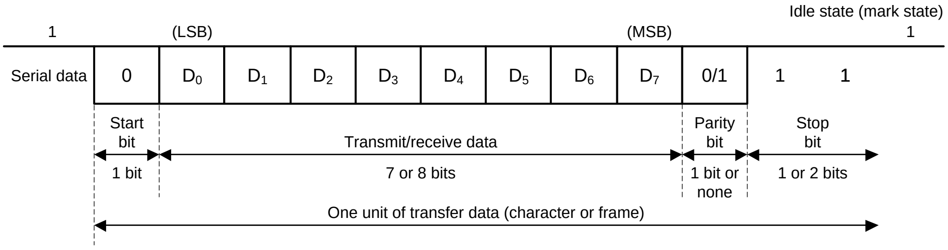


Figure 22.2 Data Format in Asynchronous Communication
(8-Bit Data with Parity and Two Stop Bits when LSB-First Transfer is Selected)

(1) Transmit/Receive Formats

Table 22.18 lists the eight communications formats that can be selected in asynchronous mode. The format is selected by setting in the serial mode register (SMR).

Table 22.18 Serial Communications Formats (in Asynchronous Mode)

SMR Setting			Serial Transmit/Receive Format and Frame Length											
CHR	PE	STOP	1	2	3	4	5	6	7	8	9	10	11	12
0	0	0	START	8-bit data								STOP		
		1	START	8-bit data								STOP	STOP	
	1	0	START	8-bit data								P	STOP	
		1	START	8-bit data								P	STOP	STOP
1	0	0	START	7-bit data							STOP			
		1	START	7-bit data							STOP	STOP		
	1	0	START	7-bit data							P	STOP		
		1	START	7-bit data							P	STOP	STOP	

Note: START: Start bit
STOP: Stop bit
P: Parity bit

(2) Clock

An SCIFA transmit/receive clock can be selected from two types of clock sources: the internal clock generated by the on- chip baud rate generator, the external clock input from the SCK pin. The clock source is selected by the settings of the CM bit in the serial mode register (SMR), the CKE[1:0] bits in the serial control register (SCR), and the ACS0 bit in the serial extended mode register (SEMR). For clock source selection, refer to **Table 22.17**.

When an external clock is input at the SCK pin, it must have a frequency equal to 16/8 times the desired bit rate.

When the SCIFA operates on an internal clock, it can output a clock signal on the SCK pin. The frequency of this output clock is 16/8 times the desired bit rate.

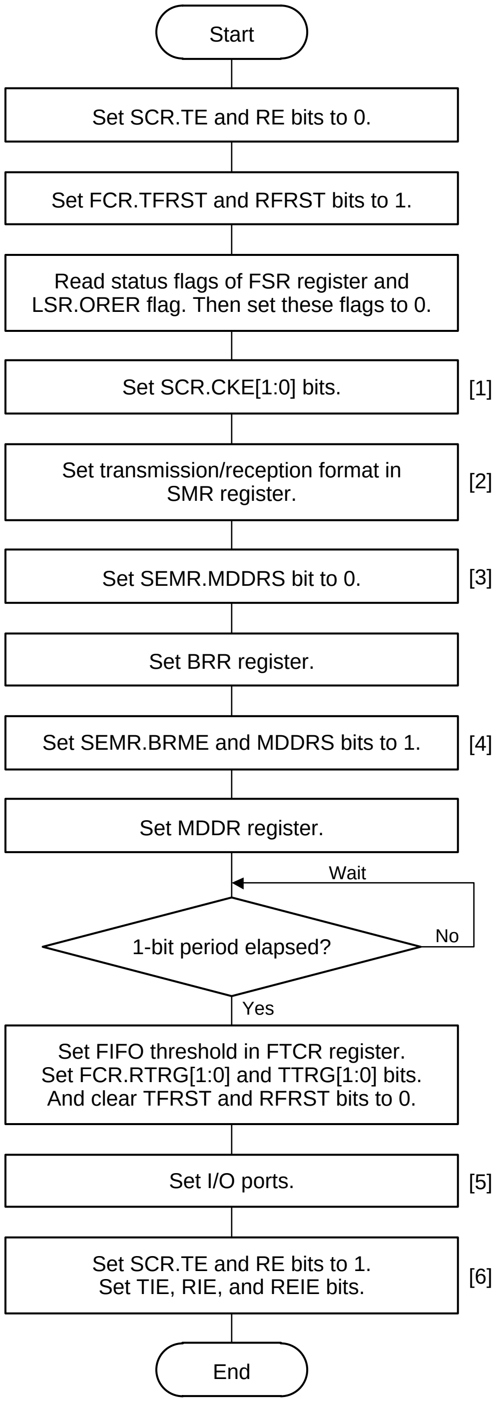
(3) Transmitting and Receiving Data

SCIFA Initialization (in Asynchronous Mode)

Before transmitting or receiving data, clear the TE and RE bits to 0 in the serial control register (SCR), and then initialize the SCIFA as follows.

When changing operating mode or communication format, always clear the TE and RE bits in the SCR register to 0 before following the procedure given below. Clearing TE to 0 initializes the transmit shift register (TSR). Clearing TE and RE to 0, however, does not initialize the serial status register (FSR), transmit FIFO data register (FTDR), or receive FIFO data register (FRDR), which retain their previous contents. Clear TE to 0 after all transmit data has been transmitted and the TEND flag in the FSR register is set. The TE bit can be cleared to 0 during transmission, but the transmit data (the TXD pin output level) after the TE bit is cleared to 0 depends on the settings of the SPB2IO and SPB2DT bits in the SPTR register. Set the TFRST bit in the FCR register to 1 and reset the FTDR register before TE is set to 1 again to start transmission.

When an external clock is used, the clock should not be stopped during initialization or subsequent operation. SCIFA operation becomes unreliable if the clock is stopped. **Figure 22.3** shows a sample flowchart for initializing the SCIFA in asynchronous mode.



[1] Set the TIE, RIE, TE, and RE bits in the SCR register to 0 before setting the CKE[1:0] bits.

[2] Set the transmission/reception format in the SMR register.

[3] Clear the SEMR.MDDRS bit to 0 and write a value corresponding to the bit rate in the BRR register. Not necessary if an external clock is used.

[4] Set the SEMR.BRME and MDDRS bits to 1 and write a value corresponding to the bit rate in the MDDR register. Not necessary if an external clock is used. Wait for at least 1-bit period before proceeding to the next step.

[5] Set I/O ports and the MPC register so that they can be used as the SCK, TXD, and RXD pins.

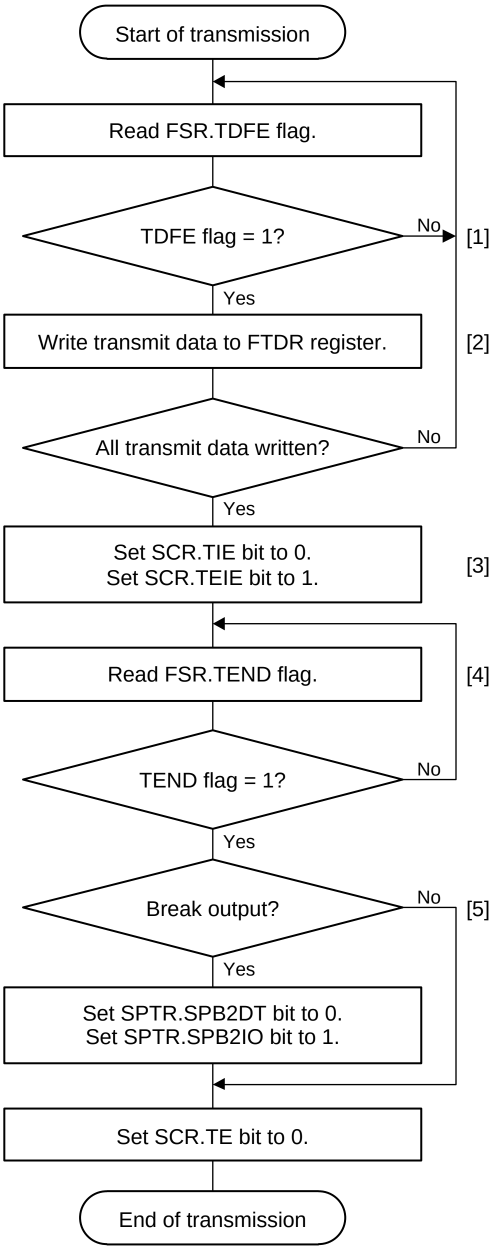
[6] After setting the MDDR register, wait for at least 1-bit period and then write 1 to the SCR.TE or RE bit. To permit interrupt requests, set TIE, RIE and REIE bits to 1. Setting the TE and RE bits to 1 makes the TXD and RXD pins available to be used. The TXD pin enters the mark state and the RXD pin enters the idle state waiting for a start bit.

Figure 22.3 Sample Flowchart for SCIFA Initialization in Asynchronous Mode

Transmitting Serial Data (in Asynchronous Mode)

Figure 22.4 shows a sample flowchart for serial transmission in asynchronous mode.

Follow the procedure given below for serial data transmission after enabling the SCIFA for transmission.



[1] Check the SCIFA status and write the transmit data:
Read the FSR register, confirm that the TDFE flag is set to 1, and then write the transmit data to the FTDR register. The transmit data quantity that can be written is “16 - FDR.T[4:0]”. A change of the TDFE flag from 0 to 1 can be known by a TXIF interrupt request.

[2] Serial transmission continuation procedure:
When transmit data is written to the FTDR register, the TDFE flag is automatically cleared to 0.

[3] Serial transmission end procedure (when TXIF or TEIF interrupt is used):
After the last transmission data is written to the FTDR register, set the TIE bit to 0 and the TEIE bit to 1 in the SCR register. If the DMAC is activated to write the transmit data to the FTDR register, enable the transmit end interrupt. This will generate a CPU interrupt request when the last transmit data is written in the FTDR register. The TIE and TEIE bit settings will be changed by the CPU interrupt process.
This procedure is unnecessary if the TXIF or TEIF interrupt is not used.

[4] Serial transmission end confirmation:
Read the FSR register and confirm that the TEND flag has changed to 1.
A change of the TEND flag from 0 to 1 can be known by a TEIF interrupt request.

[5] Break output during serial transmission:
To cause a break to be output during serial transmission, set the SPB2DT bit to 0 and the SPB2IO bit to 1 in the SPTR register. Then set the SCR.TE bit to 0.*[1]

In Step [1], the number of data bytes that can be written can be checked by the FDR.T[4:0] flag (non-transmitted data quantity in the FTDR register).

Note 1. The SPB2DT bit of the SPTR register indicates the input status of the RXD pin. Writings to the SPB2DT and SPB2IO bits of this register in 1-bit unit are handled as read-modify-write, which may lead to undesired values to be written to the SPB2DT bit. To avoid this, when modifying the SPB2DT or SPB2IO bit, for example, write the other bit (the bit used in combination) at the same time.

Figure 22.4 Sample Flowchart for Transmitting Serial Data in Asynchronous Mode

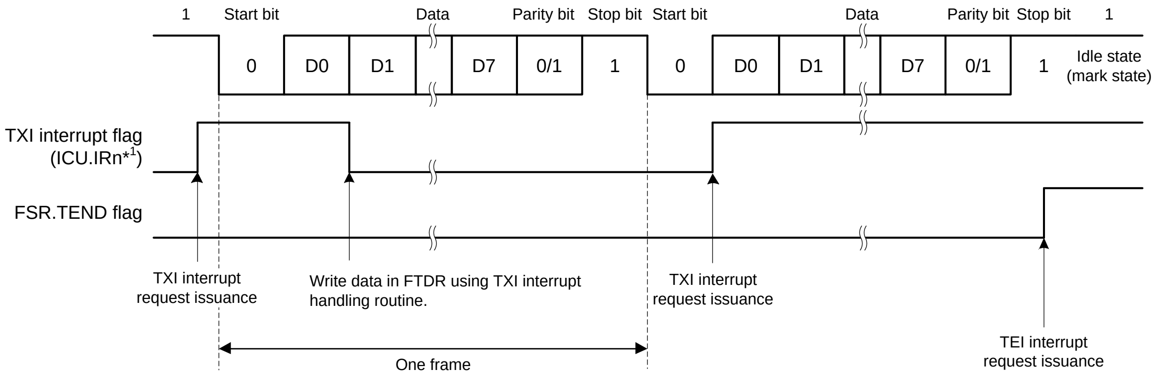
In asynchronous mode, the SCIFA performs serial transmission as described below.

1. When data is written into the transmit FIFO data register (FTDR) by the TXI interrupt processing routine, the SCIFA transfers the data from the FTDR register to the transmit shift register (TSR) and starts transmission. Confirm that the TDFE flag in the serial status register (FSR) is set to 1 before writing transmit data to the FTDR register. The number of data bytes that can be written is “16 minus the number of non-transmitted data units”.
2. When data is transferred from the FTDR register to the TSR register and transmission is started, consecutive transmit operations are performed until there is no transmit data left in the FTDR register. When the number of transmit data bytes in the FTDR register becomes equal to or less than the transmission trigger number specified in the FIFO control register (FCR) or FIFO trigger control register (FTCR), the TDFE flag is set. If the TIE bit in the serial control register (SR) is set to 1 at this time, a transmit-FIFO-data-empty interrupt (TXI) request is generated. The serial transmit data is output from the TXD pin in the following order.

a) Start bit:	One-bit 0 is output.
b) Transmit data:	8- or 7-bit data is output in LSB-first order (when LSB-first transfer is selected).
c) Parity bit:	One parity bit (even or odd parity) is output. (A format in which a parity bit is not output can also be selected.)
d) Stop bit(s):	One or two 1 bits (stop bits) are output.
e) Mark state:	1 is output continuously until the start bit that starts the next transmission is output.

3. The SCIFA checks the transmit data of the FTDR register at the timing for sending the stop bit. If data is present, the data is transferred from the FTDR register to the TSR register, the stop bit is output, and then serial transmission of the next frame is started. If there is no data to be transmitted, the TEND flag in the FSR register is set to 1, the stop bit is output, and then the SCIFA enters the mark state (high level) in which 1 is output continuously.

Figure 22.5 shows an example of the operation for transmission in asynchronous mode.



Note 1. For the corresponding interrupt number, see **Section 8, Interrupt Controller**.

Figure 22.5 Example of Transmit Operation in Asynchronous Mode
(8-Bit Data with Parity and One Stop Bit when LSB-First Transfer is Selected)

4. When modem control is enabled, transmission can be stopped/resumed by the input level to the CTS# pin. When a high level is input to the CTS# pin during transmission, the SCIFA enters the mark state (high level) after completion of one-frame data transmission. When a low level is input to the CTS# pin, output of the next data to be transmitted begins with a start bit. **Figure 22.6** shows an example of the operation for transmission when using the modem control function.

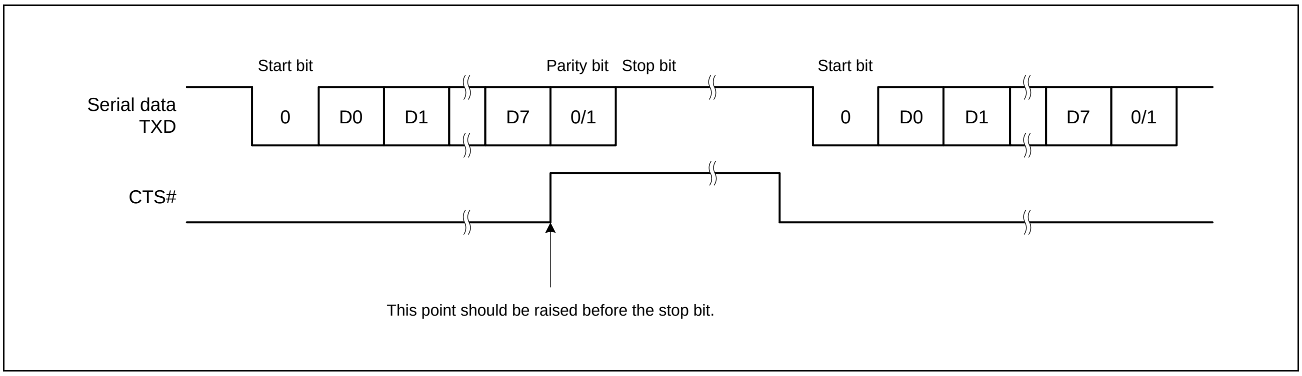


Figure 22.6 Example of Transmit Operation in Asynchronous Mode Using Modem Control Function (CTS#)

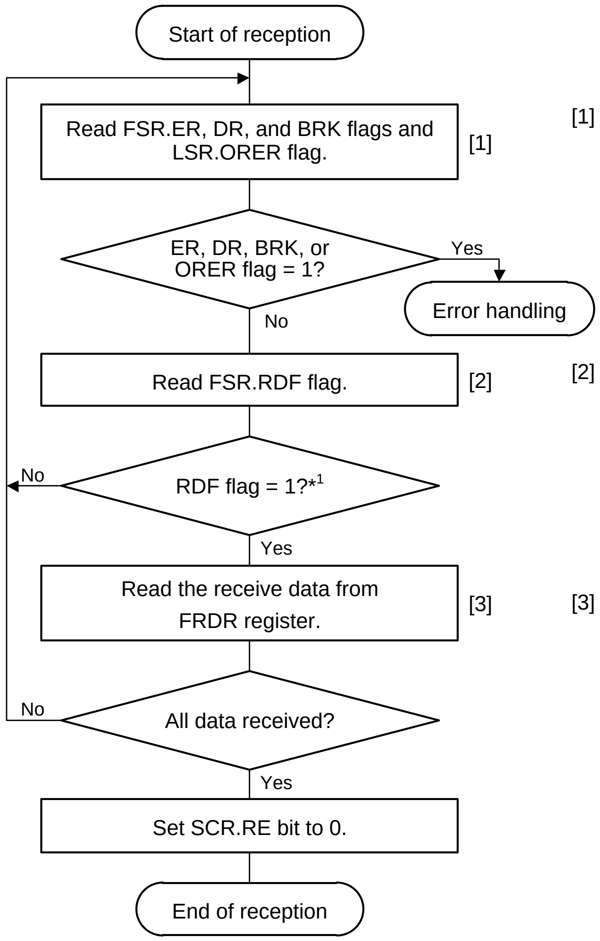
Receiving Serial Data (in Asynchronous Mode)

Figure 22.7 and **Figure 22.8** show sample flowcharts for serial reception in asynchronous mode. Follow the procedure given below for serial data reception after enabling the SCIFA for reception.



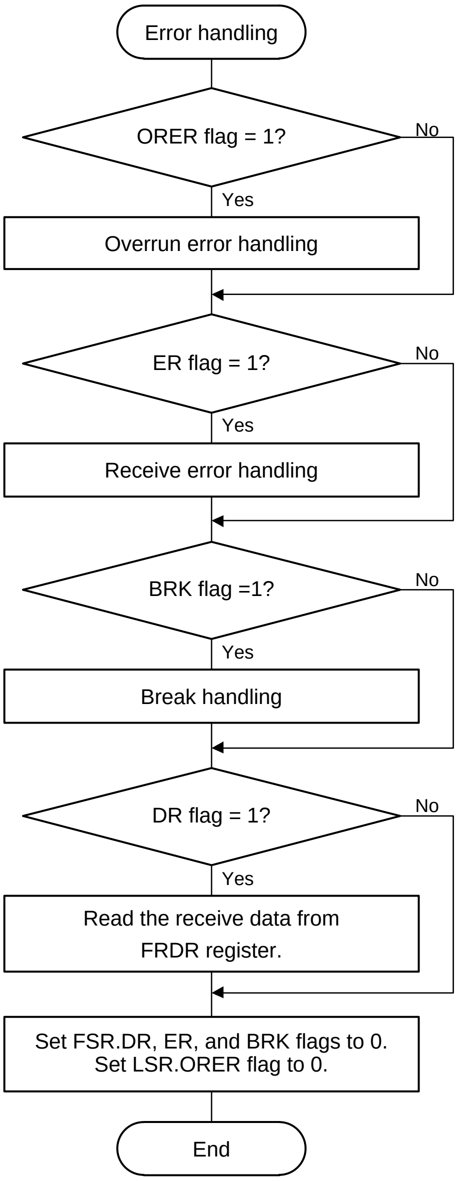
[1] Receive error handling and break detection:
When a receive error occurs, read the ER, DR, and BRK flags in the FSR register and the LSR.ORER flag to identify the error. After handling the error as specified, clear the ER, DR, BRK, and ORER flags to 0.
In the case where a framing error occurs, a break can be detected by reading the value of the RXD pin.
Error occurrence can be known by a BRIF, ERIF, or DRIF interrupt request.

[2] Check the SCIFA status and read the receive data:
Read the FSR register, confirm that the RDF flag is set to 1, and then read the receive data at least as much as the amount specified by the receive FIFO threshold from those stored in the FEDR register. The receive data quantity that can be read can be checked by the FDR.R[4:0] flag.
A change of the RDF flag from 0 to 1 can be known by an RXIF interrupt request.

[3] Serial reception continuation procedure:
When receive data is read from the FRDR register, the RDF flag is automatically cleared to 0.

Note 1. The number of all the received data units should be an integral multiple of the receive FIFO threshold. If not, process returns to Step [1] and enters an infinite loop. In this case, it is necessary to set the timeout processing using a timer.

Figure 22.7 Sample Flowchart for Receiving Serial Data in Asynchronous Mode (1)



- Whether a framing error or parity error has occurred in the received data that is read from the FRDR register can be checked with the FER and PER flags in the FSR register.
- When a break signal is received, the received data is not transferred to the FRDR register while the BRK flag is set to 1. However, note that the last data in the FRDR register is H'00 and the break data in which a framing error occurred is stored.

Figure 22.8 Sample Flowchart for Receiving Serial Data in Asynchronous Mode (2)

In asynchronous mode, the SCIFA performs serial reception as described below.

1. The SCIFA monitors the communication line, and if a 0 start bit is detected, it performs internal synchronization to start reception.
2. The received data is stored into the RSR register in LSB-to-MSB order (when LSB-first transfer is selected).
3. The parity bit and stop bit are received.
   After receiving these bits, the SCIFA carries out the following checks.
   a) Stop bit check: The SCIFA checks whether the stop bit is 1. If there are two stop bits, only the first is checked.
   b) The SCIFA checks whether receive data can be transferred from the receive shift register (RSR) to the receive FIFO data register (FRDR).
   c) Parity bit check: The SCIFA checks whether the parity bit is an expected value.
   d) Overrun error check: The SCIFA checks whether the ORER flag is 0, indicating that the overrun error has not occurred.
   e) Break check: The SCIFA checks whether the BRK flag is 0, indicating that the break state is not set.

If all the above checks are passed, the receive data is stored in the FRDR register.

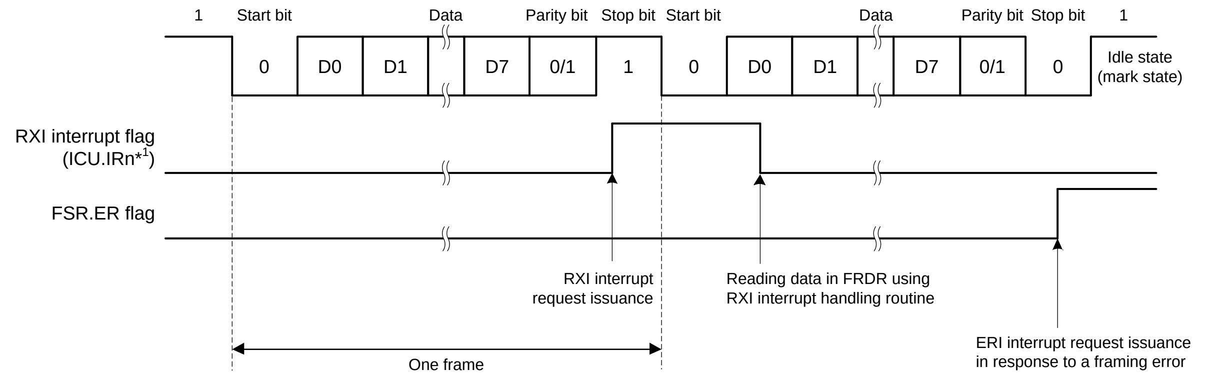
NOTE

When a parity error or a framing error occurs, reception is not suspended.

4. When receive data units equaling or exceeding the specified reception trigger number are stored in the receive FIFO data register (FRDR) and the RDF flag is changed to 1, a receive FIFO data full interrupt (RXI) request is generated while the RIE bit in the SCR register is set to 1. When the quantity of data in the FRDR register falls below the specified reception trigger number and the RIE bit in the SCR register is set to 1, a receive data ready interrupt (DRI) request is generated if no next data is received after the elapse of 15 ETUs*[1] from the last stop bit (the DR flag in the FSR register is 1). When the ER flag in the FSR register is changed to 1, a receive error interrupt (ERI) request is generated while the RIE or REIE bit in the SCR register is set to 1. When the BRK or ORER flag is changed to 1 in the FSR register, a break reception interrupt (BRI) request is generated while the RIE or REIE bit in the SCR register is set to 1.

Note 1. It is equivalent to 1 and half frames of 8-bit format with one stop bit (ETU: Element Time Unit).

Figure 22.9 shows an example of the operation for reception in asynchronous mode.



Note 1. For the corresponding interrupt number, see **Section 8, Interrupt Controller**.

Figure 22.9 Example of SCIFA Receive Operation in Asynchronous Mode
(8-Bit Data with Parity and One Stop Bit when LSB-First Transfer is Selected)

5. When modem control is enabled, the RTS# signal that indicates the FRDR register has space is output. When the RTS# pin is at low level, reception is possible. The RTS# pin being at the high level indicates that the number of entries in the FRDR register is equal to or greater than the threshold for output of the active level of the RTS# signal and that the transmission of further data needs to be suspended until the FRDR register has enough space. **Figure 22.10** shows an example of the operation for reception in asynchronous mode when using the modem control function.

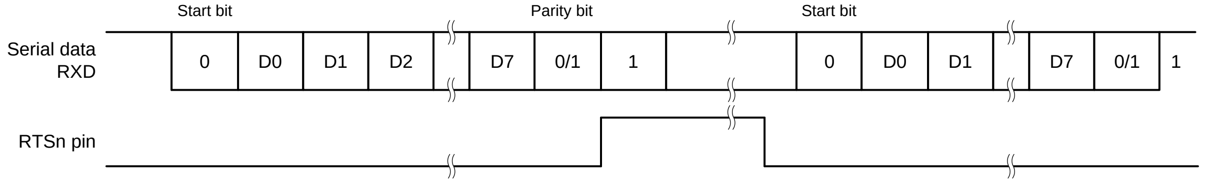


Figure 22.10 Example of SCIFA Receive Operation in Asynchronous Mode Using Model Control Function (RTS#)

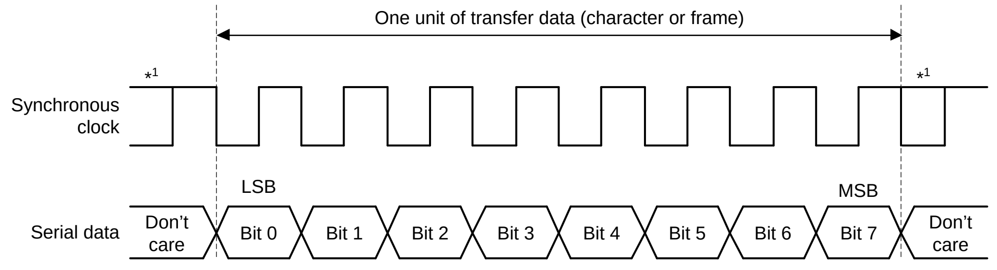
22.3.3 Operation in Clock Synchronous Mode

In clock synchronous mode, the SCIFA transmits and receives data in synchronization with clock pulses. This mode is suitable for high-speed serial communication.

Full-duplex communication is possible because the SCIFA transmitter and receiver are independent and share the same clock. Since the transmitter and the receiver have 16-stage FIFO buffers, respectively, continuous transmission or reception is possible by reading or writing data while transmission or reception is in progress.

Figure 22.11 shows the general format in clock synchronous serial communication.



Note 1. High level except in continuous transmission/reception

Figure 22.11 Data Format in Clock Synchronous Communication (when LSB-First Transfer is Selected)

In clock synchronous serial communication, each data bit is output on the communication line from one falling edge of the synchronous clock to the next. Data is guaranteed valid at the rising edge of the synchronous clock.

In each character, the serial data bits are transmitted in order from the LSB (first) to the MSB (last). After output of the MSB, the communication line remains in the state of the MSB (when LSB-first transfer is selected).

In clock synchronous mode, the SCIFA receives data by synchronizing with the rising edge of the synchronous clock.

(1) Transmit/Receive Formats

The data length is fixed at eight bits.

No parity bit can be added.

(2) Clock

An internal clock generated by the on-chip baud rate generator or an external clock input from the SCK pin can be selected as the SCIFA transmit/receive clock according to the settings of the CM bit in the serial mode register (SMR) and the CKE[1:0] bits in the serial control register (SCR).

When the SCIFA operates on an internal clock, it outputs the synchronous clock signal at the SCK pin. Eight synchronous clock pulses are output per transmitted or received character. Unless the SCIFA is transmitting or receiving, the synchronous clock signal remains in the high state. When the SCIFA only receives data on an internal clock, the internal clock signal outputs while the RE bit in the SCR register is 1 until the number of data units in the receive FIFO reaches the specified reception trigger number.

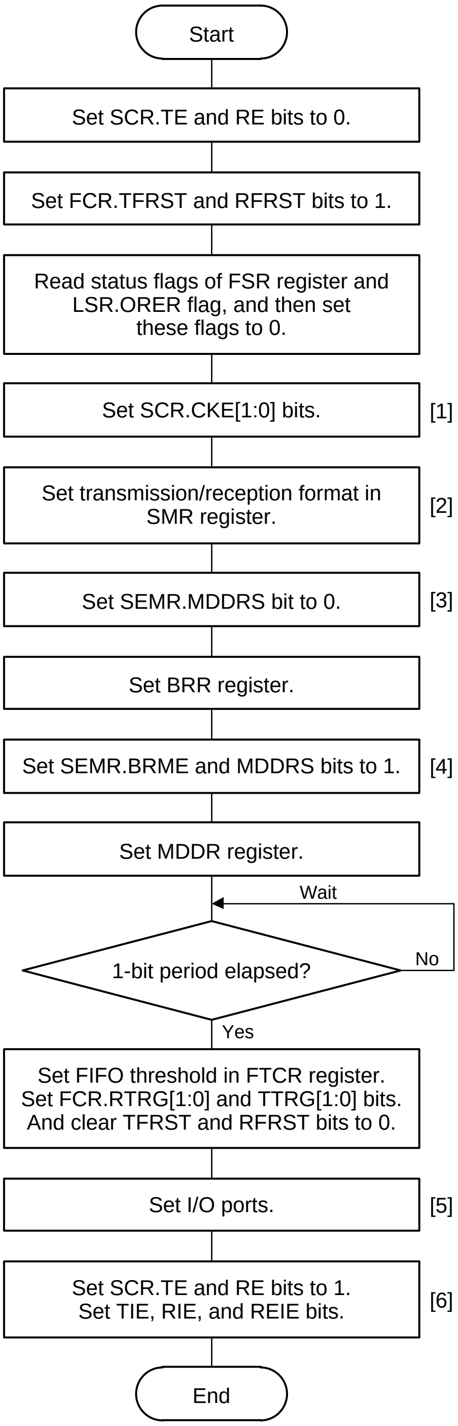
(3) Transmitting and Receiving Data

SCIFA Initialization (in Clock Synchronous Mode)

Before transmitting or receiving, clear the TE and RE bits to 0 in the serial control register (SCR), and then initialize the SCIFA by performing the following procedure.

Similarly, before changing the mode or communication format, clear the TE and RE bits to 0, and then change it by performing the following procedure. Clearing TE to 0 initializes the transmit shift register (TSR). Clearing RE to 0, however, does not initialize the RDF, PER, FER, and ORER flags and the receive FIFO data register (FRDR), which retain their previous contents.

Figure 22.12 shows a sample flowchart for initializing the SCIFA in clock synchronous mode.



[1] Set the TIE, RIE, TE, and RE bits in the SCR register to 0 before setting the CKE[1:0] bits.

[2] Set the transmission/reception format in the SMR register.

[3] Clear the SEMR.MDDRS bit to 0 and write a value corresponding to the bit rate in the BRR register. Not necessary if an external clock is used.

[4] Set the SEMR.BRME and MDDRS bits to 1 and write a value corresponding to the bit rate in the MDDR register. Not necessary if an external clock is used. Wait for at least 1-bit period before proceeding to the next step.

[5] Set I/O ports and the MPC register so that they can be used as the SCK, TXD, and RXD pin.

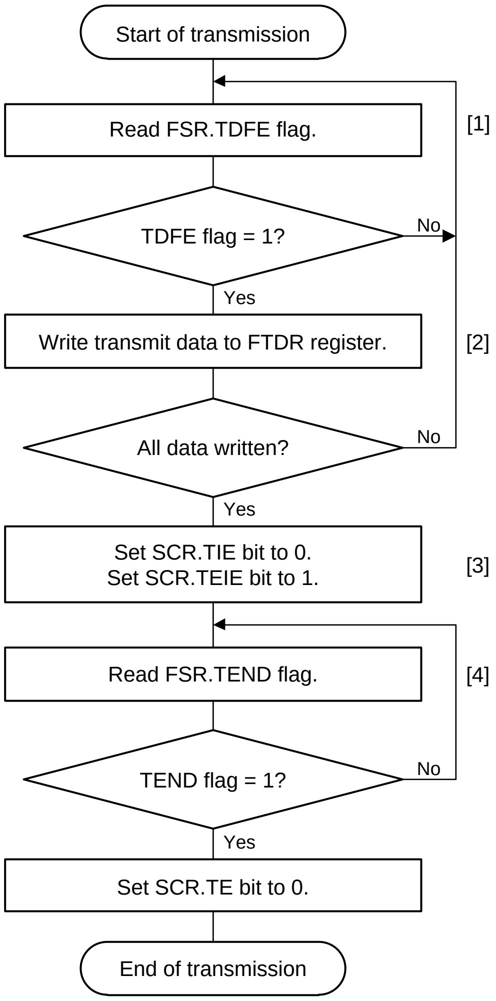
[6] After setting the MDDR register, wait for at least 1-bit, and then write 1 to the SCR.TE or RE bit. To permit interrupt requests, set TIE, RIE, and REIE bits to 1. Setting the TE and RE bits to 1 makes the TXD and RXD pins available to be used. In transmission, those pins enter the mark state, and in reception, they enter the idle state waiting for a start bit.

Figure 22.12 Sample Flowchart for SCIFA Initialization in Clock Synchronous Mode

Transmitting Serial Data (in Clock Synchronous Mode)

Figure 22.13 shows a sample flowchart for transmitting serial data in clock synchronous mode.

Follow the procedure given below for serial data transmission after enabling the SCIFA for transmission.



[1] Check the SCIFA status and write the transmit data:
Read the FSR register, confirm that the TDFE flag is set to 1, and then write the transmit data to the FTDR register. The transmit data quantity that can be written is “16 - FDR.T[4:0]”.
A change of the TDFE flag from 0 to 1 can be known by a TXIF interrupt request.

[2] Serial transmission continuation procedure:
When transmit data is written to the FTDR register, the TDFE flag is automatically cleared to 0.

[3] Serial transmission end procedure (when TXIF or TEIF interrupt is used):
After the last transmission data is written to the FTDR register, set the TIE bit to 0 and the TEIE bit to 1 in the SCR register. If the DMAC is activated to write the transmit data to the FTDR register, enable the transfer end interrupt. This will generate a CPU interrupt request when the last transmit data is written to the FTDR register. The TIE and TEIE bit settings will be changed by the CPU interrupt process.
This procedure is unnecessary if the TXIF or TEIF interrupt request is not used.

[4] Serial transmission end confirmation:
Read the FSR register and confirm that the TEND flag has changed to 1.
A change of the TEND flag from 0 to 1 can be known by a TEIF interrupt request.

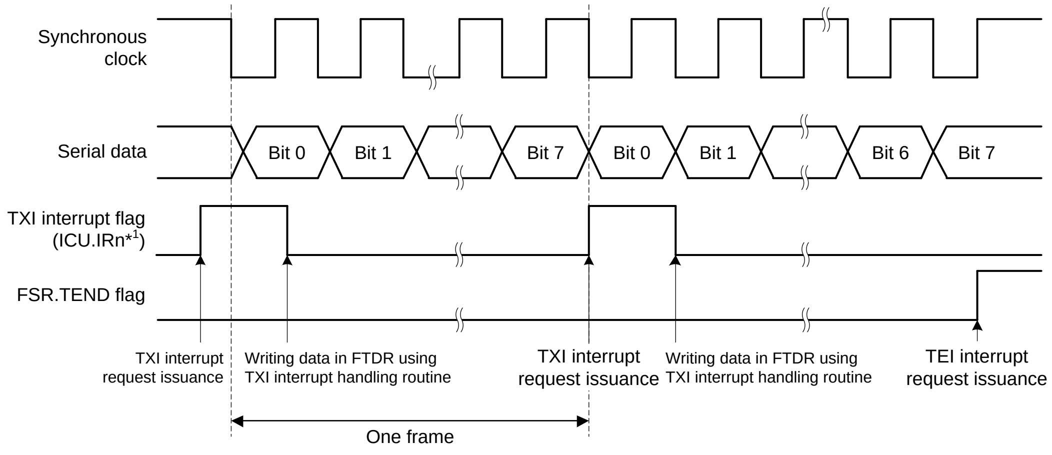
In Step [1], the number of data bytes that can be written can be checked by the FDR.T[4:0] flag (non-transmitted data quantity in the FTDR register).

Figure 22.13 Sample Flowchart for Transmitting Serial Data in Clock Synchronous Mode

In clock synchronous mode, the SCIFA performs serial transmission as described below.

1. When data is written into the transmit FIFO data register (FTDR) by the TXI interrupt processing routine, the SCIFA transfers the data from the FTDR register to the transmit shift register (TSR) and starts transmission. Confirm that the TDFE flag in the serial status register (FSR) is set to 1 before writing transmit data to the FTDR register. The number of data bytes that can be written is “16 minus the specified number of non-transmitted data units”.
2. When data is transferred from the FTDR register to the TSR register and transmission is started, consecutive transmit operations are performed until there is no transmit data left in the FTDR register. When the number of transmit data bytes in the FTDR register becomes equal to or less than the transmission trigger number set in the FIFO control register (FCR) or FIFO trigger control register (FTCR), the TDFE flag in the FSR register is set. If the TIE bit in the serial control register (SCR) is set to 1 at this time, a transmit-FIFO-data-empty interrupt (TXI) request is generated.
   If clock output mode is selected, the SCIFA outputs eight synchronous clock pulses. If an external clock source is selected, the SCIFA outputs data in synchronization with the input clock. Data is output from the TXD pin in order from the LSB (b0) to the MSB (b7) (when LSB-first transfer is selected).
3. The SCIFA checks the transmit data of the FTDR register at the timing for sending the MSB (bit 7). If data is present, the data is transferred from the FTDR register to the TSR register, and then serial transmission of the next frame is started. If there is no data, the TXD pin holds the output level of the last data after the TEND flag in the FSR register is set to 1 and the MSB (bit 7) is output.
4. After the end of serial transmission, the SCK pin is held in the high state.

Figure 22.14 shows an example of SCIFA transmit operation in clock synchronous mode.



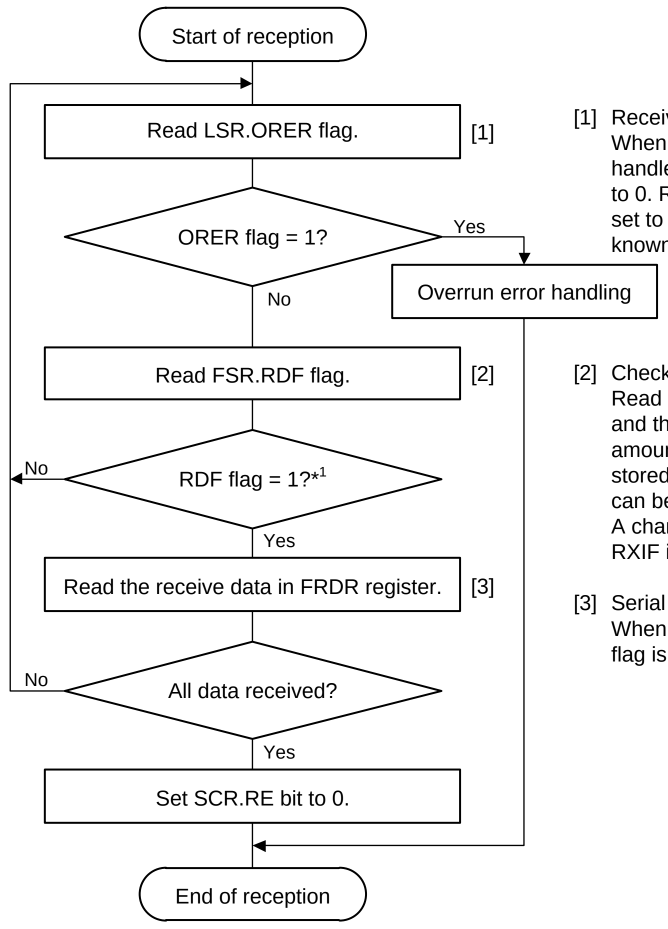
Note: For the corresponding interrupt number, see **Section 8, Interrupt Controller**.

Figure 22.14 Example of SCIFA Transmit Operation in Clock Synchronous Mode (when LSB-First Transfer is Selected)

Receiving Serial Data (in Clock Synchronous Mode)

Figure 22.15 and **Figure 22.16** show sample flowcharts for receiving serial data in clock synchronous mode.

Follow the procedure given below for serial data reception after enabling the SCIFA for reception. When switching from asynchronous mode to clock synchronous mode without SCIFA initialization, make sure that the ORER, PER, and FER flags in the line status register (LSR) are cleared to 0.



[1] Receive error handling:
When a receive error occurs, read the LSR.ORER flag and handles the error as specified, and then clear the ORER flag to 0. Reception cannot be restarted while the ORER flag is set to 1. A change of the ORER flag from 0 to 1 can be known by a BRIF interrupt request.

[2] Check the SCIFA status and read the receive data:
Read the FSR register, confirm that the RDF flag is set to 1, and then read the receive data at least as much as the amount specified by the receive FIFO threshold from those stored in the FRDR register. The receive data quantity that can be read can be checked by the FDR.R[4:0] flag.
A change of the RDF flag from 0 to 1 can be known by an RXIF interrupt request.

[3] Serial reception continuation procedure:
When receive data is read from the FRDR register, the RDF flag is automatically cleared to 0.

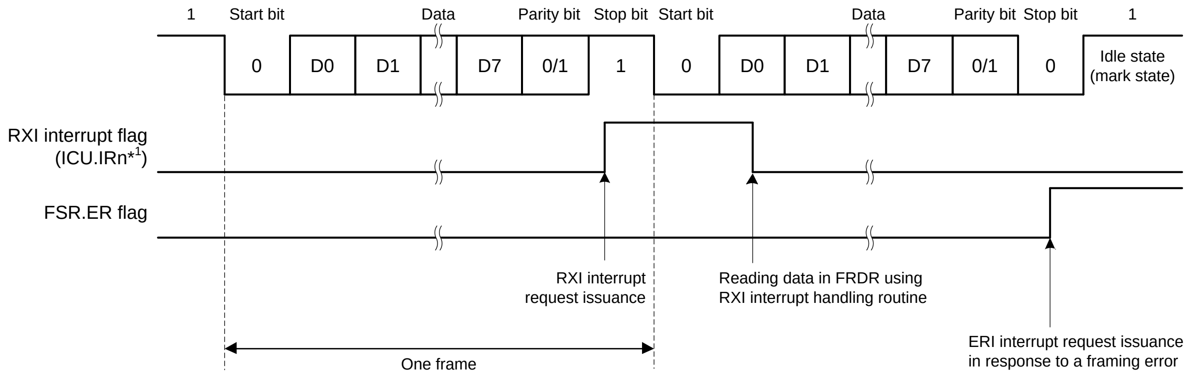
Note 1. The number of all the received data units should be an integral multiple of the receive FIFO threshold. If not, process returns to Step [1] and enters an infinite loop. In this case, it is necessary to set the timeout processing using a timer.

Figure 22.15 Sample Flowchart for Receiving Serial Data in Clock Synchronous Mode

In clock synchronous mode, the SCIFA performs serial reception as described below.

1. The SCIFA synchronizes with the synchronous clock input or output and starts reception.
2. Receive data is stored into the receive shift register (RSR) in order from the LSB to the MSB (when LSB-first transfer is selected). After receiving the data, the SCIFA checks whether the receive data can be transferred from the RSR register to the FRDR register. If data can be transferred, the SCIFA stores the received data in the FRDR register. If an overrun error is detected during the error check, further reception is not performed.
3. After the received data units equaling or exceeding the specified reception trigger number are stored in the FRDR register and the RDF flag is set to 1, a receive-data-full interrupt (RXI) request is generated when the RIE bit in the serial control register (SCR) is set to 1. When the ORER flag in the line status register (LSR) is set to 1 and the RIE or REIE bit in the SCR register is also set to 1, a break interrupt (BRI) request is generated.

Figure 22.16 shows an example of SCIFA receive operation in clock synchronous mode.



Note 1. For the corresponding interrupt number, see **Section 8, Interrupt Controller**.

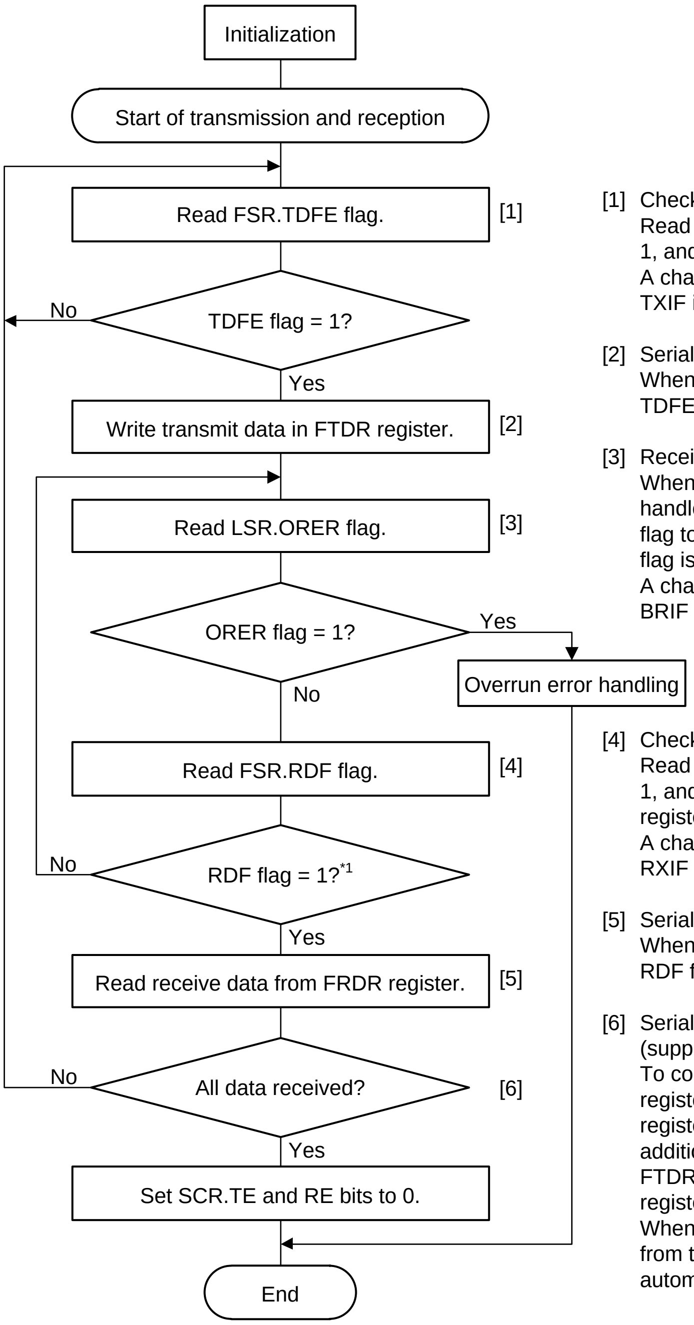
Figure 22.16 Example of SCIFA Receive Operation (when LSB-First Transfer is Selected)

Transmitting and Receiving Serial Data Simultaneously (in Clock Synchronous Mode)

Figure 22.17 shows a sample flowchart for transmitting and receiving serial data simultaneously in clock synchronous mode.

In simultaneous transmission/reception of serial data, number of receive data = number of transmit data = number of transmit data to be written to the FTDR register.

Follow the procedure given below for the simultaneous transmission/reception of serial data, after enabling the SCIFA for transmission/reception.



[1] Check the SCIFA status and write the transmit data:
Read the FSR register, confirm that the TDFE flag is set to 1, and then write the transmit data in the FTDR register.
A change of the TDFE flag from 0 to 1 can be known by a TXIF interrupt request.

[2] Serial transmission continuation procedure:
When transmit data is written to the FTDR register, the TDFE flag is automatically cleared to 0.

[3] Receive error handling:
When a receive error occurs, read the LSR.ORER flag and handles the error as specified, and then clear the ORER flag to 0. Reception cannot be restarted while the ORER flag is set to 1.
A change of the ORER flag from 0 to 1 can be known by a BRIF interrupt request.

[4] Check the SCIFA status and read the receive data:
Read the FSR register, confirm that the RDF flag is set to 1, and then read the receive data stored in the FRDR register.
A change of the RDF flag from 0 to 1 can be known by an RXIF interrupt request.

[5] Serial reception continuation procedure:
When receive data is read from the FRDR register, the RDF flag is automatically cleared to 0.

[6] Serial transmission/reception continuation procedure (supplementary):
To continue serial transmission/reception, read the FRDR register and clear the RDF flag to 0 before the FRDR register overflows and the ORER flag changes to 1. In addition, before the last bit of the last data written to the FTDR register is transmitted, write the data in the FTDR register and clear the TDFE flag to 0.
When writing data to the FTDR register or reading data from the FRDR register, the TDFE flag and RDF flag are automatically cleared to 0.

Note: When switching the operation from transmission or reception to the simultaneous transmission and reception, clear the TE and RE bits to 0 and then simultaneously set these bits to 1.

Note 1. The number of all the received data units should be an integral multiple of the receive FIFO threshold. If not, process returns to Step [1] and enters an infinite loop. In this case, it is necessary to set the timeout processing using a timer.

Figure 22.17 Sample Flowchart for Simultaneous Transmitting/Receiving Serial Data in Clock Synchronous Mode

22.4 Bit Rate Modulation

Using the bit rate modulation, the bit rate can be corrected by skipping the specified number of clock pulses input to the baud rate generator. To correct the bit rate, only the number of clock pulses specified in the MDDR register are enabled among 256 internal clock pulses specified by the CKS1 and CKS0 bits in the SMR register in a way that forms average intervals.

Figure 22.18 shows an example where P0φ is selected by the CKS[1:0] bits in SMR and BRR and MDDR are set to 0 and 160, respectively, in asynchronous mode. In this example, the cycle of the base clock is evenly corrected (256/160) and the bit rate is also corrected (160/256). Note that skipping an internal clock causes bias and expansion or contraction is generated in the pulse width of the base clock.

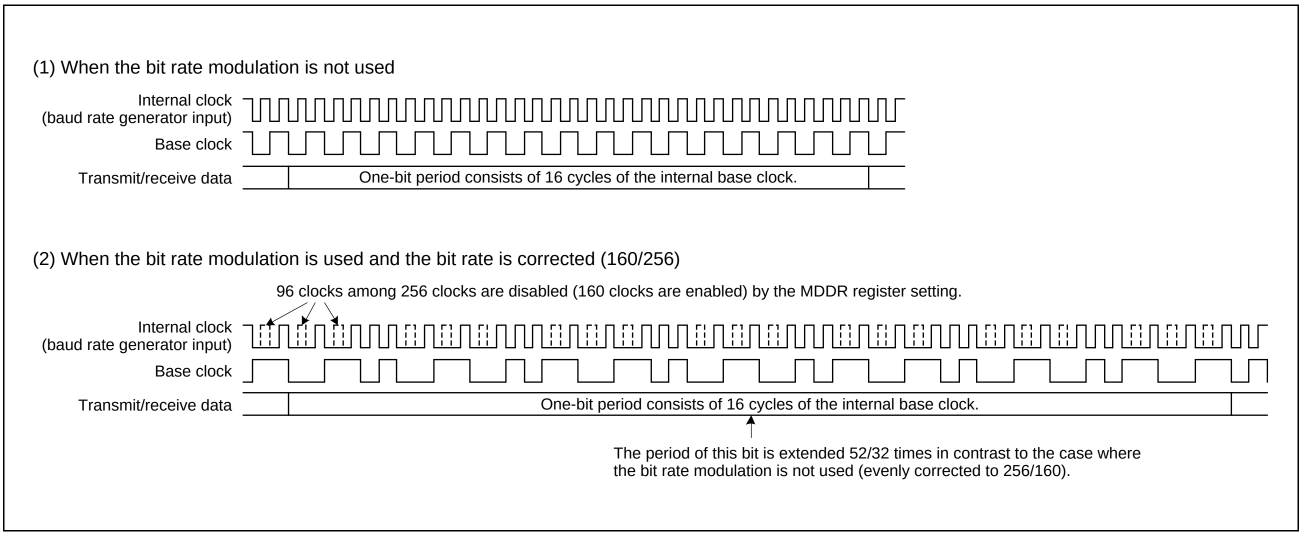


Figure 22.18 Example of Internal Base Clock when Bit Modulation is Used

22.5 Interrupt Sources

The SCIFA has six interrupt sources: transmit-FIFO-data-empty (TXI), receive-error (ERI), receive-FIFO-data-full (RXI), break (BRI), transmit-end (TEI), receive-data-ready (DRI). The TEI, DRI, ERI, and BRI interrupts share the same vector number.

Table 22.19 shows the interrupt sources and priority. The interrupt sources can be enabled or disabled using the TIE, RIE, REIE, TEIE bits in the SCR register and are separately input to the interrupt controller.

When the quantity of transmit data written in the FTDR register as a result of transmission is equal to or less than the specified transmission trigger number, the TDFE flag in the serial status register (FSR) is set to 1 and a TXI interrupt request is generated.

When the data units equaling or exceeding the specified transmission trigger number are stored in the receive FIFO register (FRDR) and the RDF flag in the FSR register is set to 1, a receive data full interrupt (RXI) request is generated. When the quantity of received data in the FRDR register is below the specified reception trigger number and no next data has been received yet even after the period of 15 ETUs elapsed*[1] from the last stop bit, the DR flag in the FSR register is set to 1 and a receive data ready interrupt (DRI) request is generated. In clock synchronous mode, a DRI interrupt request is not generated.

When the BRK flag in the FSR register or the ORER flag in the LSR register is set to 1, a BRI interrupt request is issued. When the ER flag in the FSR register is set to 1, an ERI interrupt request is issued.

When the TEND flag in the FSR register is set to 1, a TEI interrupt request is issued.

When the RIE bit is cleared to 0 and the REIE bit in the SCR register is set to 1, an ERI and a BRI interrupt requests are issued but an RXI interrupt request is not.

An TXI interrupt indicates that transmit data can be written and an RXI interrupt indicates that receive data is stored in the FRDR register.

Note 1. It is equivalent to 1 and half frames of 8-bit format with one stop bit (ETU: Element Time Unit).

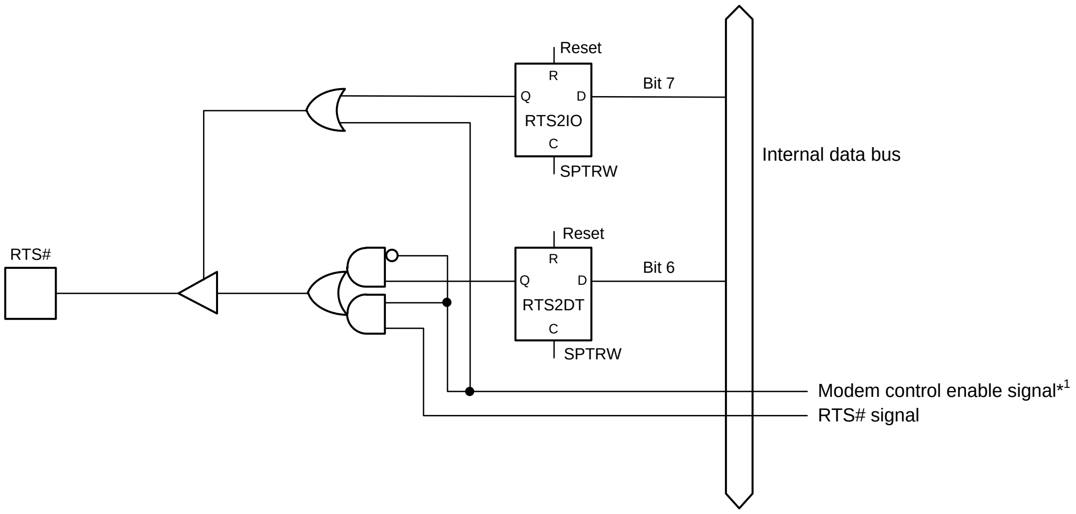
Table 22.19 SCIFA Interrupt Sources

Name	Level/Edge	Interrupt Source	Interrupt Enable Bit	DMAC Activation	Priority
BRI	Level	Interrupt caused by break (BRK) or overrun (ORER).	RIE or REIE	Impossible	High
ERI	Level	Interrupt caused by framing or parity (ER).	RIE or REIE	Impossible	↕
RXI	Level	Interrupt caused by receive FIFO data full (RDF).	RIE	Possible	
TXI	Level	Interrupt caused by transmit FIFO data empty (TDFE).	TIE	Possible	
TEI	Level	Interrupt caused by transmit end (TEND).	TEIE	Impossible	
DRI	Level	Interrupt caused by receive data ready (DR).	RIE	Impossible	Low

Note: The TEI and DRI interrupts share the same vector number.
The ERI and BRI interrupts share the same vector number.
If CPU processing is used, clear the flag after the block transfer. If the DMAC is activated, access to the flags is prohibited.

22.6 Serial Port Register (SPTR) and SCIFA-Related Pins

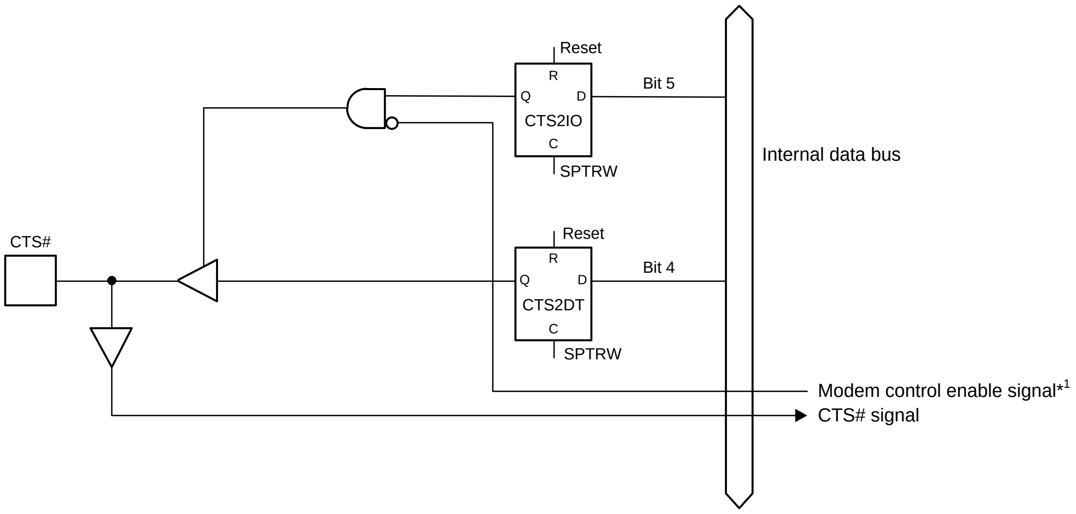
Figure 22.19 to **Figure 22.22** show the relationships between the SPTR register and the SCIFA-related pins.



Note: SPTRW: SPTR write

Note 1. These signals allow the RTS# pin to enter the modem control state with the MCE bits in FCR.

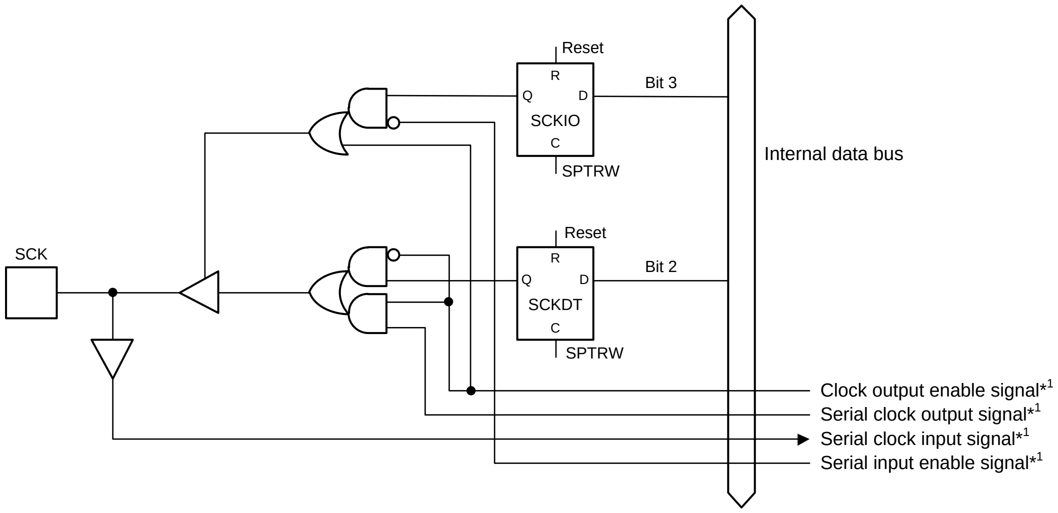
Figure 22.19 RTS2IO Bit and RTS2DT Bit in the SPTR Register, and RTS# Pin



Note: SPTRW: SPTR write

Note 1. These signals allow the CTS# pin to enter the modem control state with the MCE bits in FCR.

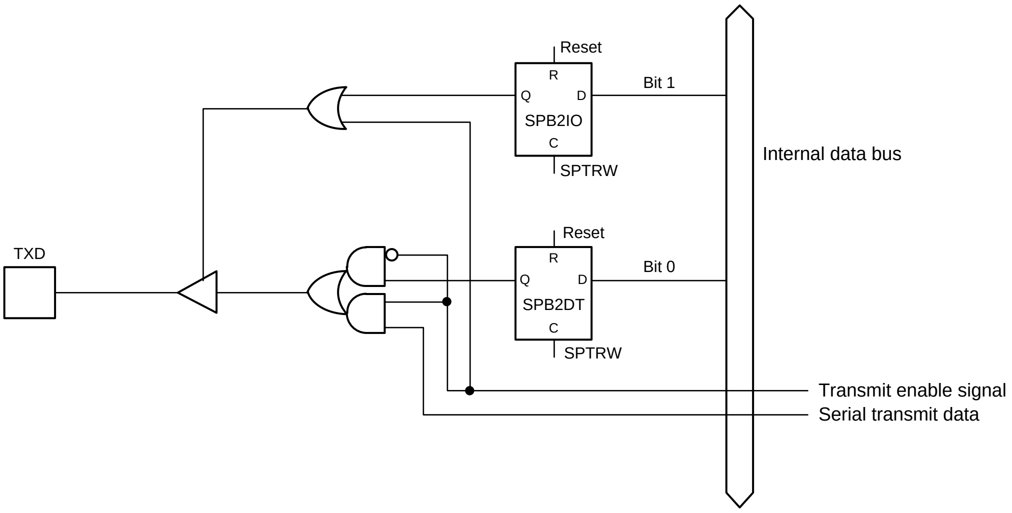
Figure 22.20 CTS2IO Bit and CTS2DT Bit in the SPTR Register, and CTS# Pin



Note: SPTRW: SPTR write

Note 1. These signals control the SCK pin according to the settings of the CM bit in SMR and CKE[1:0] bits in SCR.

Figure 22.21 SCKIO Bit and SCKDT Bit in the SPTR Register, and SCK Pin



Note: SPTRW: SPTR write

Figure 22.22 SPB2IO Bit and SPB2DT Bit in the SPTR Register, and TXD Pin

22.7 Noise Cancellation

Figure 22.23 shows the configuration of the noise filter used for noise cancellation. The noise filter consists of a two-stage flip-flop circuits and a match detection circuit. When the input signals of the noise filter and the output signals of the two-stage flip-flop circuits completely match, the matched level is conveyed as an internal signal. Unless otherwise matched, the previous value is retained. (When the levels sampled on three consecutive cycles of the sampling clock of the noise filter match, the signal is considered valid. If three consecutive sampled values do not match, the signal is considered to be noise rather than a received signal).

In asynchronous mode, the noise cancellation can be applied to the receive signal input to the RXDn pin. The receive level of the RXDn pin is taken in the flip-flop circuit of the noise filter on the base clock (the clock with a frequency 16 or 8 times the transfer rate*[1]).

If the base clock is stopped once with the noise filter enabled and then the base clock input is restarted again, the noise filter operation resumes from the state where the clock was stopped. When SCR.RE is set to 0 during input of the base clock, the noise filter outputs 0 as the internal RxDn signal. The internal match detector continues operating even while operations for reception are stopped, and the result from the last time previous consecutive samples matched is output at the same time as operations for reception are resumed.

Note 1. A frequency 16 times bit rate when the SEMR.ABCS0 bit and the SEMR.BGDM bit are both 0, and a frequency 8 times bit rate when either the SEMR.ABCS0 bit or the SEMR.BGDM bit is 1.

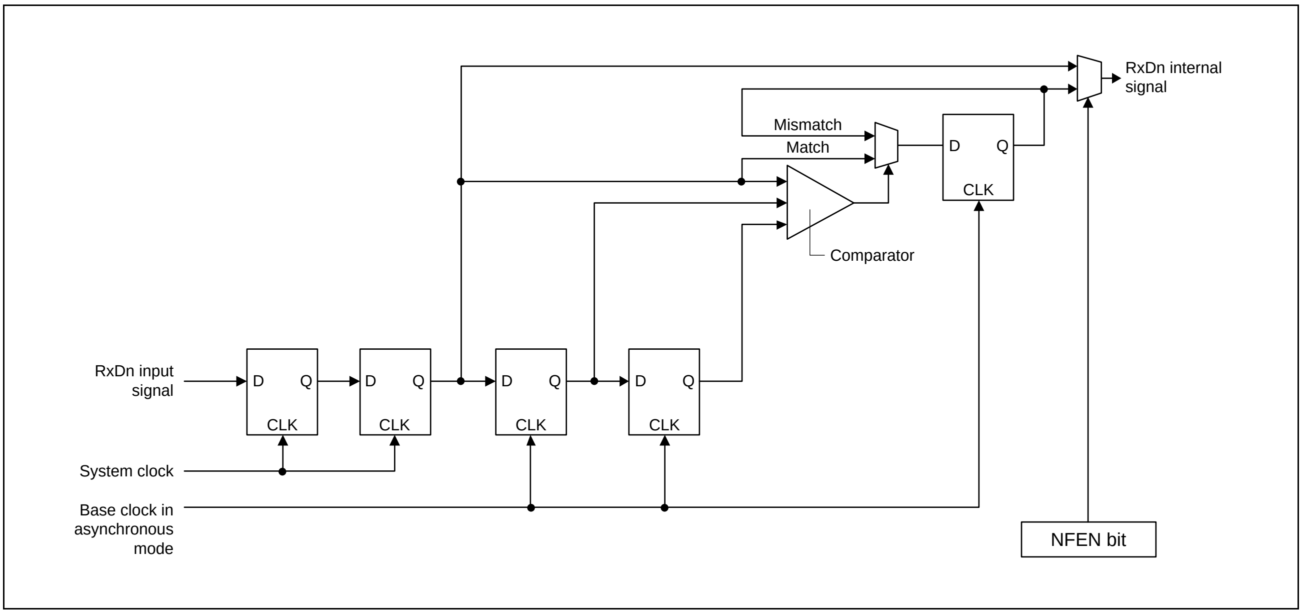


Figure 22.23 Block Diagram of Digital Noise Filter Circuit

22.8 Usage Notes

The following is the notes on using the SCIFA.

22.8.1 FTDR Register Writing and TDFE Flag

The TDFE flag in the serial status register (FSR) is set when the number of transmit data bytes written in the transmit FIFO data register (FTDR) has fallen below the transmission trigger number set by bits TTRG[1:0] in the FIFO control register (FCR) or bits TFTC[4:0] in the FIFO trigger control register (FTCR). After the TDFE flag is set, transmit data up to the number of empty bytes in the FTDR register can be written, allowing efficient continuous transmission.

However, if the number of data bytes written in the FTDR register is equal to or less than the specified transmission trigger number, the TDFE flag will be set to 1 again even after being read as 1 and cleared to 0.

The number of transmit data bytes in the FTDR register can be checked by the 8 higher-order bits of the FIFO data count register (FDR).

22.8.2 FRDR Register Reading and RDF Flag

The RDF flag in the serial status register (FSR) is set when the number of receive data bytes in the receive FIFO data register (FRDR) has become equal to or greater than the reception trigger number set by bits RTRG[1:0] in the FIFO control register (FCR) or bits RFTC[4:0] in the FIFO trigger control register (FTCR). After the RDF flag is set, receive data equivalent to the trigger number can be read from the FRDR register, allowing efficient continuous reception.

However, if the number of data bytes in the FRDR register exceeds the reception trigger number, the RDF flag will be set to 1 again even after being read as 1 and cleared to 0.

The number of receive data bytes in the FRDR register can be checked by the 8 lower-order bits of the FIFO data count register (FDR).

22.8.3 Break Detection and Processing

When a framing error (FER) is detected, a break signal can be detected by reading the RXD pin value directly. In a break, the input from the RXD pin becomes all low. Therefore, the FER flag in the serial status register (FSR) is set to 1 and the parity error flag (PER) may also be set to 1.

Upon detection of a break signal, the SCIFA stops the received data transfer to the FRDR register but continues the receive operation.

22.8.4 Writing to the SPTR Register

b6, b4, b2, and b0 of the SPTR register respectively indicate the input status of their corresponding pins. (See the description of each bit of **Section 22.2.12, Serial Port Register (SPTR)** for details.)

Writings to these bits in 1-bit unit are handled as read-modify-write, which may lead to undesired values to be written. To avoid this, when modifying the SPB2DT or SPB2IO bit, for example, write the other bit (the bit used in combination) at the same time.

22.8.5 Break Signal Transmission

The output signal from the TXD pin is determined by the SPB2IO bit and the SPB2DT bit in the serial port register (SPTR). The break signal can be sent by using these bits.

The TXD pin does not function as a transmit data output pin during the period from when the SCIFA is initialized to when the TE bit in the SCR register is set to 1 (transmission possible). The TXD pin status during this period is replaced by the SPB2DT bit value. Therefore, the SPB2IO and SPB2DT bits in the SPTR register must have been set to 1 (high output) at first (mark (high) status).

To transmit the break signal during serial transmission, set the SPB2IO bit in the SPTR register to 1, clear the SPB2DT bit to 0 (specify a low level), and then clear the TE bit in the SCR register to 0 (transmission stop). Clearing the TE bit to 0 initializes the transmitter regardless of the current transmission status, and outputs a low level from the TXD pin.

22.8.6 Receive Data Sampling Timing and Receive Margin in Asynchronous Mode

The SCIFA operates on a base clock with a frequency 16 times the transfer rate*[1]. In reception, the SCIFA internally latches the received data at the rising edge of the eighth base clock pulse*[1]. The timing is shown in **Figure 22.24**.

Note 1. This is an example when the SEMR.ABCS0 bit is 0. When the ABCS0 bit is 1, a frequency of 8 times the bit rate is used as a base clock and receive data is sampled at the rising edge of the 4th pulse of the base clock. The receive margin in asynchronous mode can therefore be expressed as shown in equation 1.

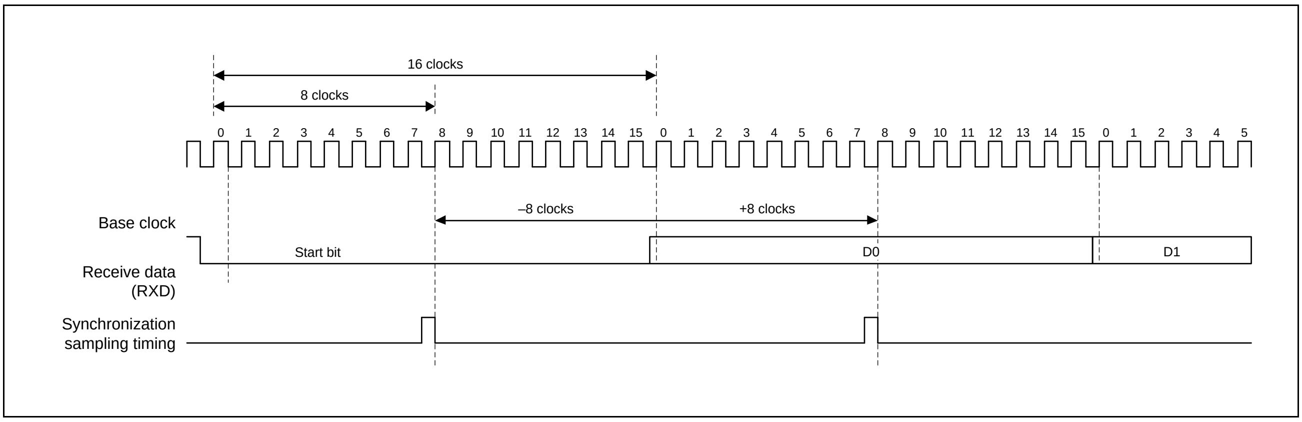

Figure 22.24 Receive Data Sampling Timing in Asynchronous Mode

The receive margin in asynchronous mode can therefore be expressed as shown in equation 1.

[Equation 1]

$$M = \{0.5 - \frac{1}{2N} - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F)\} \times 100[\%]$$

Where: M: Receive margin (%)

N: Ratio of clock frequency to bit rate (N = 16)

D: Clock duty (D = 0 to 1.0)

L: Frame length (L = 9 to 12)

F: Absolute deviation of clock frequency

From equation 1, if F = 0 and D = 0.5, the receive margin is 46.875%, as given by equation 2.

[Equation 2]

When D = 0.5 and F = 0:

$$M = (0.5 - 1/(2 \times 16)) \times 100\% = 46.875\%$$

This is a theoretical value. A reasonable margin to allow in system designs is 20% to 30%.

22.8.7 Note on FER Flag and PER Flag in Serial Status Register (FSR)

The FER flag and PER flag in the serial status register (FSR) are status flags that apply to next entry to be read from the receive FIFO data register (FRDR). After the CPU or DMAC reads the receive FIFO data register, the flags of framing errors and parity errors in the receive data will be cleared. To check the received data for the states of framing errors and parity errors, only read the receive FIFO data register after reading the serial status register.

22.8.8 Notes on External Clock Input in Clock Synchronous Mode

Before setting the TE and RE bits in the serial control register (SCR) to 1, wait for four or more cycles of the peripheral operating clock after the external clock (SCK) is changed from 0 (low) to 1 (high). To input the external clock (SCK) (to start communication), wait for one or more cycles of the external clock after the TE and RE bits in the SCR register are set to 1.

22.8.9 Module Standby Mode Setting

SCIFA operation can be disabled or enabled using the standby control register. As the initial setting, the SCIFA operation is halted. Register access is enabled by clearing module standby mode. For details, refer to **Section 42, Low Power Mode**.

22.8.10 Notes on Operation for Reception when an Internal Clock is Selected in Clock Synchronous Mode

When an internal clock is selected as the clock for reception in clock-synchronous mode, if the number of data stored through the receive FIFO data register (FRDR) becomes equal to or greater than the specified reception trigger number, the RDF flag is set, the RXI interrupt request is generated and, at the same time, output of the synchronizing clock and reception of serial data are stopped. Once the number of data are again less than the specified reception trigger number, output of the synchronizing clock and the reception of serial data are restarted. In addition, if an internal clock is selected for reception in clock synchronous mode, the ORER flag is not set to 1 since no overrun occurs. Accordingly, overruns (indicated by the ORER flag) cannot be used as a BRI interrupt source.

23. Serial Communications Interface (SCIg)

This MCU has two independent serial communications interface (SCI) channels. The SCIs consist of the SCI0 and SCI1 modules, referred to in common as “SCIg modules”.

The SCIg modules (SCI0 and SCI1) can handle both asynchronous and clock synchronous serial communications. Asynchronous serial data communications can be carried out with standard asynchronous communications chips such as a Universal Asynchronous Receiver/Transmitter (UART) or Asynchronous Communications Interface Adapter (ACIA). As an extended function in asynchronous communications mode, the SCI also supports smart card (IC card) interfaces conforming to ISO/IEC 7816-3 (standard for Identification Cards).

23.1 Overview

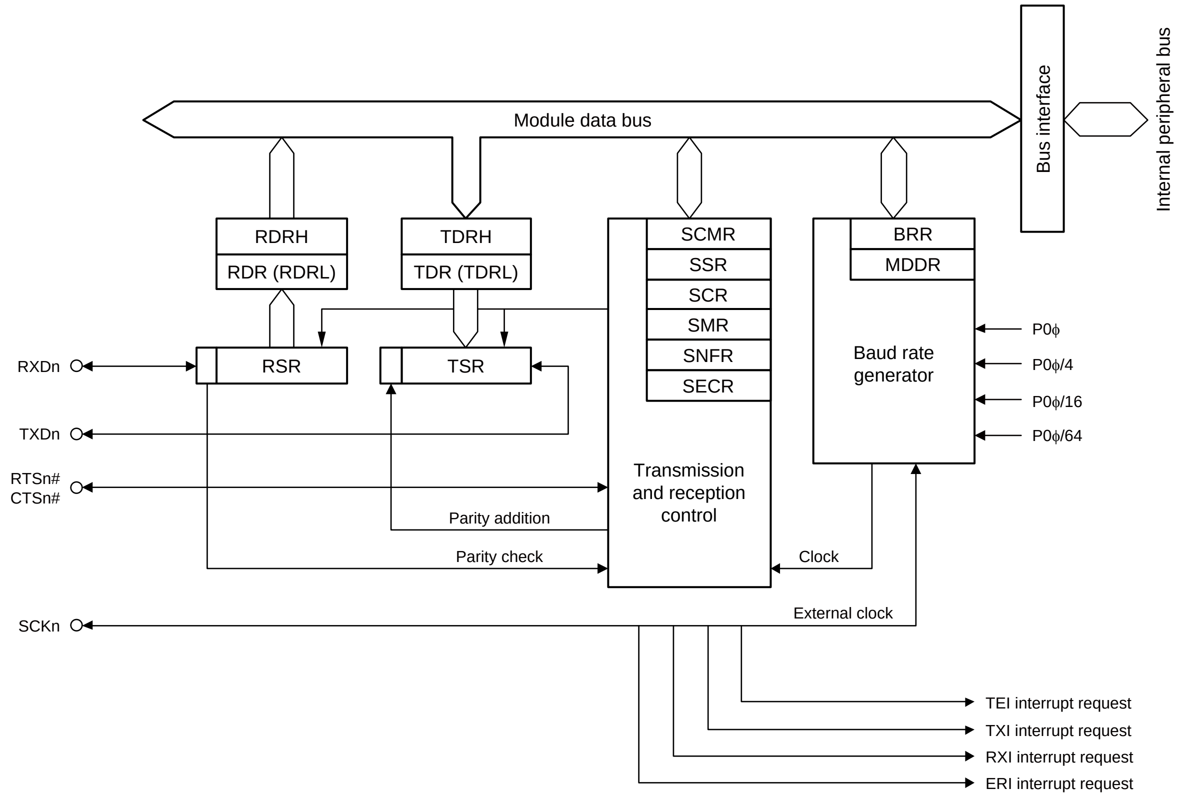
Table 23.1 lists the specifications of the SCIg modules. **Figure 23.1** shows the block diagram of the SCI0 and SCI1 modules.

Table 23.1 SCIg Specifications (1/2)

Item		Description
Serial communications modes		● Asynchronous ● Clock synchronous ● Smart card interface ● IrDA (only for channel 0)
Transfer speed		Bit rate specifiable with the on-chip baud rate generator.
Full-duplex communications		Transmitter: Continuous transmission possible using double-buffer structure. Receiver: Continuous reception possible using double-buffer structure.
I/O pins		See **Table 23.2**.
Data transfer		Selectable as LSB first or MSB first transfer
Interrupt sources		Transmit end, transmit data empty, receive data full, and receive error
Low power consumption function		Module stop state can be set for each channel.
Asynchronous mode	Data length	7, 8, or 9 bits
	Transmission stop bit	1 or 2 bits
	Parity	Even parity, odd parity, or no parity
	Receive error detection	Parity, overrun, and framing errors
	Hardware flow control	CTSn# and RTSn# pins can be used in controlling transmission/reception.
	Start-bit detection	Low level or falling edge is selectable.
	Break detection	When a framing error occurs, a break can be detected by reading the RXDn pin level directly.
	Clock source	An internal or external clock can be selected.
	Double-speed mode	Baud rate generator double-speed mode is selectable.
	Multi-processor communications function	Serial communication among multiple processors
	Noise cancellation	The signal paths from input on the RXDn pins incorporate digital noise filters.
Clock synchronous mode	Data length	8 bits
	Receive error detection	Overrun error
	Hardware flow control	CTSn# and RTSn# pins can be used in controlling transmission/reception.

Table 23.1 SCIg Specifications (2/2)

Item		Description
Smart card interface mode	Error processing	An error signal can be automatically transmitted when detecting a parity error during reception
		Data can be automatically retransmitted when receiving an error signal during transmission
	Data type	Both direct convention and inverse convention are supported.
Bit rate modulation function		Correction of outputs from the on-chip baud rate generator can reduce errors.



RSR: Receive shift register
RDR: Receive data register
TSR: Transmit shift register
TDR: Transmit data register
SMR: Serial mode register
SCR: Serial control register
SSR: Serial status register
SCMR: Smart card mode register
BRR: Bit rate register

MDDR: Modulation duty register
SEMR: Serial extended mode register
SNFR: Noise filter setting register
SECR: Extended function control register
RDRH: Receive data register H
RDRL: Receive data register L
TDRH: Transmit data register H
TDRL: Transmit data register L

Figure 23.1 Block Diagram of SCIg (SCI0 and SCI1)

Table 23.2 lists the pin configuration of the SCIs for the individual modes.

Table 23.2 SCI Pin Configuration in Asynchronous Mode and Clock Synchronous Mode

Channel	Pin Name	I/O	Function
SCI0	SCI0_SCK	I/O	SCI0 clock input/output
	SCI0_RXD	Input	SCI0 receive data input
	SCI0_TXD	Output	SCI0 transmit data output
	SCI0_CTS#/RTS#	I/O	SCI0 transfer start control input/output
SCI1	SCI1_SCK	I/O	SCI1 clock input/output
	SCI1_RXD	Input	SCI1 receive data input
	SCI1_TXD	Output	SCI1 transmit data output
	SCI1_CTS#/RTS#	I/O	SCI1 transfer start control input/output

23.2 Register Descriptions

	Modulation Duty Register	MDDR	R/W	H’FF	BASE(ch1) + H’0012	8

Note 1. Partly, R only

23.2.1 Receive Shift Register (RSR)

RSR is a shift register which is used to receive serial data input from the RXDn pin and converts it into parallel data. When one frame of data has been received, it is automatically transferred to the RDR register.

The RSR register cannot be directly accessed by the CPU.

23.2.2 Receive Data Register (RDR)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

RDR is an 8-bit register that stores receive data.

When one frame of serial data has been received, the received serial data is transferred from RSR to RDR. Then the RSR register can receive the next data.

Since RSR and RDR function as a double buffer in this way, continuous receive operations can be performed.

Read RDR only once after a receive data full interrupt (RXI) has occurred. Note that if next one frame of data is received before reading receive data from RDR, an overrun error occurs.

RDR cannot be written to by the CPU.

23.2.3 Receive Data Register H, L, HL (RDRH, RDRL, RDRHL)

Receive Data Register H (RDRH)

Receive Data Register L (RDRL)

Receive Data Register HL (RDRHL)

	SCIn.RDRHL															
	SCIn.RDRH								SCIn.RDRL							
Bit	b7	b6	b5	b4	b3	b2	b1	b0	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

RDRH and RDRL are 8-bit registers that store receive data. Use these registers when asynchronous mode and 9-bit data length are selected.

RDRL is the shadow register of RDR; i.e. access to RDRL is equivalent to access to RDR.

After one frame of data is received, the received data is transferred from the RSR register to these registers, thus allowing the RSR register to receive the next data.

The RSR, RDRH and RDRL registers have a double-buffered construction to enable continuous reception.

Read RDRH and RDRL should be performed only once in the order from RDRH to RDRL when a receive data full interrupt (RXI) request is issued. Note that an overrun error occurs when the next frame of data is received before the received data has been read from RDRL.

The CPU cannot write to the RDRH and RDRL registers. Bits 0 to 7 in RDRH are fixed to 0. These bits are read as 0. The write value should be 0.

The RDRHL register can be accessed in 16-bit units.

23.2.4 Transmit Data Register (TDR)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

TDR is an 8-bit register that stores transmit data.

When the SCI detects that TSR is empty, it transfers the transmit data written in TDR to TSR and starts transmission. The double-buffered structures of TDR and TSR enable continuous serial transmission. If the next transmit data has already been written to TDR when one frame of data is transmitted, the SCI transfers the written data to TSR to continue transmission.

The CPU is able to read from or write to TDR at any time. Only write transmit data to TDR once after each instance of the transmit data empty interrupt (TXI).

23.2.5 Transmit Data Register H, L, HL (TDRH, TDRL, TDRHL)

Transmit Data Register H (TDRH)

Transmit Data Register L (TDRL)

Transmit Data Register HL (TDRHL)

	SCIn.TDRHL															
	SCIn.TDRH								SCIn.TDRL							
Bit	b7	b6	b5	b4	b3	b2	b1	b0	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

TDRH and TDRL are 8-bit registers that store transmit data. Use these registers when asynchronous mode and 9-bit data length are selected.

TDRL is the shadow register of TDR; i.e. access to TDRL is equivalent to access to TDR.

When empty space is detected in the TSR register, the transmit data stored in the TDRH and TDRL registers is transferred to TSR; i.e., transmitting is started.

The TSR, TDRH and TDRL registers have a double-buffered construction to realize continuous reception. When the next data to be transmitted is stored in TDRL after one frame of data has been transmitted, the transmitting operation is continued by transfer to the TSR register.

The CPU can read and write to the TDRH and TDRL registers. Bits 0 to 7 in RDRH are fixed to 1. These bits are read as 1. The write value should be 1.

Writing transmit data to the TDRH and TDRL registers should be performed only once in the order from TDRH to TDRL when a transmit data empty interrupt (TXI) request is issued.

The TDRHL register can be accessed in 16-bit units.

23.2.6 Transmit Shift Register (TSR)

TSR is a shift register that transmits serial data.

To perform serial data transmission, the SCI first automatically transfers transmit data from TDR to TSR, and then sends the data to the TXDn pin.

TSR cannot be directly accessed by the CPU.

23.2.7 Serial Mode Register (SMR)

NOTE

Some bits in SMR have different functions in smart card interface mode and non-smart card interface mode.

(1) Non-Smart Card Interface Mode (SCMR.SMIF = 0)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	CM	CHR	PE	PM	STOP	MP	CKS[1:0]	
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W*4	R/W*4	R/W*4	R/W*4	R/W*4	R/W*4	R/W*4	R/W*4

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	CKS[1:0]	00b	R/W*4	Clock Select b1 b0 0 0: P0ϕ clock (n = 0)*1 0 1: P0ϕ/4 clock (n = 1)*1 1 0: P0ϕ/16 clock (n = 2)*1 1 1: P0ϕ/64 clock (n = 3)*1
b2	MP	0b	R/W*4	Multi-Processor Mode (Valid only in asynchronous mode) 0: Multi-processor communications function is disabled 1: Multi-processor communications function is enabled
b3	STOP	0b	R/W*4	Stop Bit Length (Valid only in asynchronous mode) 0: 1 stop bit 1: 2 stop bits
b4	PM	0b	R/W*4	Parity Mode (Valid only when the PE bit is 1) 0: Selects even parity 1: Selects odd parity
b5	PE	0b	R/W*4	Parity Enable (Valid only in asynchronous mode) ● When transmitting 0: Parity bit addition is not performed 1: The parity bit is added ● When receiving 0: Parity bit checking is not performed 1: The parity bit is checked
b6	CHR	0b	R/W*4	Character Length (Valid only in asynchronous mode*2) Selects in combination with the SCMR.CHR1 bit. CHR1 CHR 0 0: Transmit/receive in 9-bit data length 0 1: Transmit/receive in 9-bit data length 1 0: Transmit/receive in 8-bit data length (initial value) 1 1: Transmit/receive in 7-bit data length*3
b7	CM	0b	R/W*4	Communications Mode 0: Asynchronous mode 1: Clock synchronous mode

Note 1. n is the decimal notation of the value of n in BRR (refer to **Section 23.2.11, Bit Rate Register (BRR)**).

Note 2. In other than asynchronous mode, this bit setting is invalid and a fixed data length of 8 bits is used.

Note 3. LSB first is fixed and the MSB (bit 7) in TDR is not transmitted in transmission.

Note 4. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).

CKS[1:0] Bits (Clock Select)

These bits select the clock source for the on-chip baud rate generator.

For the relation between the settings of these bits and the baud rate, refer to **Section 23.2.11, Bit Rate Register (BRR)**.

MP Bit (Multi-Processor Mode)

Disables/enables the multi-processor communications function. The settings of the PE bit and PM bit are invalid in multi-processor mode.

STOP Bit (Stop Bit Length)

Selects the stop bit length in transmission.

In reception, only the first stop bit is checked regardless of this bit setting. If the second stop bit is 0, it is treated as the start bit of the next transmit frame.

PM Bit (Parity Mode)

Selects the parity mode (even or odd) for transmission and reception. The setting of the PM bit is invalid in multi-processor mode.

PE Bit (Parity Enable)

When this bit is set to 1, the parity bit is added to transmit data, and the parity bit is checked in reception. Irrespective of the setting of the PE bit, the parity bit is not added or checked in multi-processor format.

CHR Bit (Character Length)

Selects the data length for transmission and reception. Selects in combination with the CHR1 bit in SCMR.

In other than asynchronous mode, a fixed data length of 8 bits is used.

(2) Smart Card Interface Mode (SCMR.SMIF = 1)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	GM	BLK	PE	PM	BCP[1:0]		CKS[1:0]	
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W*2	R/W*2	R/W*2	R/W*2	R/W*2	R/W*2	R/W*2	R/W*2

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	CKS[1:0]	00b	R/W*2	Clock Select b1 b0 0 0: P0ϕ clock (n = 0)*1 0 1: P0ϕ/4 clock (n = 1)*1 1 0: P0ϕ/16 clock (n = 2)*1 1 1: P0ϕ/64 clock (n = 3)*1
b3, b2	BCP[1:0]	00b	R/W*2	Base Clock Pulse Selects the number of base clock cycles in combination with the SCMR.BCP2 bit. **Table 23.4** lists the combinations of the SCMR.BCP2 bit and SMR.BCP[1:0] bits.
b4	PM	0b	R/W*2	Parity Mode (Valid only when the PE bit is 1) 0: Selects even parity 1: Selects odd parity
b5	PE	0b	R/W*2	Parity Enable When this bit is set to 1, a parity bit is added to transmit data, and the parity of received data is checked. Set this bit to 1 in smart card interface mode.
b6	BLK	0b	R/W*2	Block Transfer Mode 0: Normal mode operation 1: Block transfer mode operation
b7	GM	0b	R/W*2	GSM Mode 0: Normal mode operation 1: GSM mode operation

Note 1. n is the decimal notation of the value of n in BRR (refer to **Section 23.2.11, Bit Rate Register (BRR)**).

Note 2. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).

CKS[1:0] Bits (Clock Select)

These bits select the clock source for the on-chip baud rate generator.

For the relationship between the settings of these bits and the baud rate, refer to **Section 23.2.11, Bit Rate Register (BRR)**.

BCP[1:0] Bits (Base Clock Pulse)

These bits select the number of base clock cycles in a 1-bit data transfer time in smart card interface mode. Set these bits in combination with the SCMR.BCP2 bit.

For details, refer to **Section 23.6.4, Receive Data Sampling Timing and Reception Margin**.

Table 23.4 Combinations of the SCMR.BCP2 Bit and SMR.BCP[1:0] Bits

SCMR.BCP2 Bit	SMR.BCP[1:0] Bits		Number of Base Clock Cycles for 1-Bit Transfer Period
0	0	0	93 clock cycles (S = 93)*[1]
0	0	1	128 clock cycles (S = 128)*[1]
0	1	0	186 clock cycles (S = 186)*[1]
0	1	1	512 clock cycles (S = 512)*[1]
1	0	0	32 clock cycles (S = 32)*[1] (Initial Value)
1	0	1	64 clock cycles (S = 64)*[1]
1	1	0	372 clock cycles (S = 372)*[1]
1	1	1	256 clock cycles (S = 256)*[1]

Note 1. S is the value of Base Clock Cycles for 1-bit Period in BRR (refer to **Section 23.2.11, Bit Rate Register (BRR)**, **Table 23.8 Base Clock Settings in Smart Card Interface Mode**).

PM Bit (Parity Mode)

Selects the parity mode for transmission and reception (even or odd).

For details on the usage of this bit in smart card interface mode, refer to **Section 23.6.2, Data Format (Except in Block Transfer Mode)**.

PE Bit (Parity Enable)

Set the PE bit to 1.

The parity bit is added to transmit data before transmission, and the parity bit is checked in reception.

BLK Bit (Block Transfer Mode)

Setting this bit to 1 allows block transfer mode operation.

For details, refer to **Section 23.6.3, Block Transfer Mode**.

GM Bit (GSM Mode)

Setting this bit to 1 allows GSM mode operation.

In GSM mode, the SSR.TEND flag set timing is put forward to 11.0 etu (elementary time unit = 1-bit transfer time) from the start and the clock output control function is appended. For details, refer to **Section 23.6.6, Serial Data Transmission (Except in Block Transfer Mode)** and **Section 23.6.8, Clock Output Control**.

23.2.8 Serial Control Register (SCR)

NOTE

Some bits in SCR have different functions in smart card interface mode and non-smart card interface mode.

(1) Non-Smart Card Interface Mode (SCMR.SMIF = 0)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TIE	RIE	TE	RE	MPIE	TEIE	CKE[1:0]	
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W*2	R/W*2	R/W	R/W	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	CKE[1:0]	00b	R/W*1	Clock Enable ● For SCI0 and SCI1 (Asynchronous mode) b1 b0 0 0: On-chip baud rate generator The SCKn pin functions as I/O port. 0 1: On-chip baud rate generator The clock with the same frequency as the bit rate is output from the SCKn pin. 1 x: External clock The clock with a frequency 16 times the bit rate should be input from the SCKn pin. Input a clock signal with a frequency eight times the bit rate when the SEMR.ABCS bit is 1. (Clock synchronous mode) b1 b0 0 x: Internal clock The SCKn pin functions as the clock output pin. 1 x: External clock The SCKn pin functions as the clock input pin.
b2	TEIE	0b	R/W	Transmit End Interrupt Enable 0: A TEI interrupt request is disabled 1: A TEI interrupt request is enabled
b3	MPIE	0b	R/W	Multi-Processor Interrupt Enable (Valid in asynchronous mode when SMR.MP = 1) 0: Normal reception 1: When the data with the multi-processor bit set to 0 is received, the data is not read, and setting the status flags ORER and FER in SSR to 1 is disabled. When the data with the multi-processor bit set to 1 is received, the MPIE bit is automatically cleared to 0, and normal reception is resumed.
b4	RE	0b	R/W*2	Receive Enable 0: Serial reception is disabled 1: Serial reception is enabled
b5	TE	0b	R/W*2	Transmit Enable 0: Serial transmission is disabled 1: Serial transmission is enabled
b6	RIE	0b	R/W	Receive Interrupt Enable 0: RXI and ERI interrupt requests are disabled 1: RXI and ERI interrupt requests are enabled

Bit	Bit Name	Initial Value	R/W	Description
b7	TIE	0b	R/W	Transmit Interrupt Enable 0: A TXI interrupt request is disabled 1: A TXI interrupt request is enabled

Remarks: x: Don't care

Note 1. Writable only when TE = 0 and RE = 0.

Note 2. 1 can be written only when TE = 0 and RE = 0, while the SMR.CM bit is 1. After setting TE or RE to 1, only 0 can be written to TE and RE. While the SMR.CM bit is 0 and the SIMR1.IICM bit is 0, writing is enabled under any condition.

CKE[1:0] Bits (Clock Enable)

These bits select the clock source and SCKn pin function.

The combination of the settings of these bits and of the SEMR.ACS0 bit sets the internal TMR clock.

TEIE Bit (Transmit End Interrupt Enable)

Enables or disables a TEI interrupt request.

A TEI interrupt request is disabled by setting the TEIE bit to 0.

MPIE Bit (Multi-Processor Interrupt Enable)

When this bit is set to 1 and the data with the multi-processor bit set to 0 is received, the data is not read and setting the status flags ORER and FER in SSR to 1 is disabled. When the data with the multi-processor bit set to 1 is received, the MPIE is automatically cleared to 0, and normal reception is resumed. For details, refer to **Section 23.4, Multi-Processor Communications Function**.

When the receive data includes the MPB bit is SSR set to 0, the receive data is not transferred from the RSR to the RDR, a receive error is not detected, and setting the flags ORER and FER to 1 is disabled.

When the receive data includes the MPB bit set to 1, the MPB bit is set to 1, the MPIE bit is automatically cleared to 0, the RXI and ERI interrupt requests are enabled (if the RIE bit in SCR is set to 1), and setting the flags ORER and FER to 1 is enabled.

MPIE should be set to 0 if multi-processor communications function is not to be used.

RE Bit (Receive Enable)

Enables or disables serial reception.

When this bit is set to 1, serial reception is started by detecting the start bit in asynchronous mode or the synchronous clock input in clock synchronous mode. Note that SMR should be set prior to setting the RE bit to 1 in order to designate the reception format.

Even if reception is halted by setting the RE bit to 0, the ORER, FER, and PER flags in SSR are not affected and the previous value is retained.

TE Bit (Transmit Enable)

Enables or disables serial transmission.

When this bit is set to 1, serial transmission is started by writing transmit data to TDR. Note that SMR should be set prior to setting the TE bit to 1 in order to designate the transmission format.

RIE Bit (Receive Interrupt Enable)

Enables or disables RXI and ERI interrupt requests.

An RXI interrupt request is disabled by setting the RIE bit to 0.

An ERI interrupt request can be canceled by reading 1 from the ORER, FER, or PER flag in SSR and then setting the flag to 0, or setting the RIE bit to 0.

(2) Smart Card Interface Mode (SCMR.SMIF = 1)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TIE	RIE	TE	RE	MPIE	TEIE	CKE[1:0]	
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W*2	R/W*2	R/W	R/W	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	CKE[1:0]	00b	R/W*1	Clock Enable ● When SMR.GM = 0 b1 b0 0 0: Output disabled (The SCKn pin is available for use as an I/O port according to the I/O port settings.) 0 1: Clock output 1 x: (Setting prohibited) ● When SMR.GM = 1 b1 b0 0 0: Output fixed low x 1: Clock output 1 0: Output fixed high
b2	TEIE	0b	R/W	Transmit End Interrupt Enable This bit should be 0 in smart card interface mode.
b3	MPIE	0b	R/W	Multi-Processor Interrupt Enable This bit should be 0 in smart card interface mode.
b4	RE	0b	R/W*2	Receive Enable 0: Serial reception is disabled 1: Serial reception is enabled
b5	TE	0b	R/W*2	Transmit Enable 0: Serial transmission is disabled 1: Serial transmission is enabled
b6	RIE	0b	R/W	Receive Interrupt Enable 0: RXI and ERI interrupt requests are disabled 1: RXI and ERI interrupt requests are enabled
b7	TIE	0b	R/W	Transmit Interrupt Enable 0: A TXI interrupt request is disabled 1: A TXI interrupt request is enabled

Remarks: x: Don’t care

Note 1. Writable only when TE = 0 and RE = 0.

Note 2. 1 can be written only when TE = 0 and RE = 0. After setting TE or RE to 1, only 0 can be written in TE and RE.

For details on interrupt requests, refer to **Section 23.8, Interrupt Sources**.

CKE[1:0] Bits (Clock Enable)

These bits control the clock output from the SCKn pin.

In GSM mode, clock output can be dynamically switched. For details, refer to **Section 23.6.8, Clock Output Control**.

TEIE Bit (Transmit End Interrupt Enable)

This bit should be 0 in smart card interface mode.

MPIE Bit (Multi-Processor Interrupt Enable)

This bit should be 0 in smart card interface mode.

RE Bit (Receive Enable)

Enables or disables serial reception.

When this bit is set to 1, serial reception is started by detecting the start bit. Note that SMR should be set prior to setting the RE bit to 1 in order to designate the reception format.

Even if reception is halted by setting the RE bit to 0, the ORER, FER, and PER flags in SSR are not affected and the previous value is retained.

TE Bit (Transmit Enable)

Enables or disables serial transmission.

When this bit is set to 1, serial transmission is started by writing transmit data to TDR. Note that SMR should be set prior to setting the TE bit to 1 in order to designate the transmission format.

RIE Bit (Receive Interrupt Enable)

Enables or disables RXI and ERI interrupt requests.

An RXI interrupt request is disabled by setting the RIE bit to 0.

An ERI interrupt request can be canceled by reading 1 from the ORER, FER, or PER flag in SSR and then setting the flag to 0, or setting the RIE bit to 0.

23.2.9 Serial Status Register (SSR)

Some bits in SSR have different functions in smart card interface mode and non-smart card interface mode.

(1) Non-Smart Card Interface Mode (SCMR.SMIF = 0)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TDRE	RDRF	ORER	FER	PER	TEND	MPB	MPBT
Initial Value	1	0	0	0	0	1	0	0
R/W	R/(W)^{*2}	R/(W)^{*2}	R/(W)^{*1}	R/(W)^{*1}	R/(W)^{*1}	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	MPBT	0b	R/W	Multi-Processor Bit Transfer Sets the multi-processor bit for adding to the transmission frame 0: Data transmission cycles 1: ID transmission cycles
b1	MPB	0b	R	Multi-Processor Value of the multi-processor bit in the reception frame 0: Data transmission cycles 1: ID transmission cycles
b2	TEND	1b	R	Transmit End Flag 0: A character is being transmitted. 1: Character transfer has been completed.
b3	PER	0b	R/(W)^{*1}	Parity Error Flag 0: No parity error occurred 1: A parity error has occurred
b4	FER	0b	R/(W)^{*1}	Framing Error Flag 0: No framing error occurred 1: A framing error has occurred
b5	ORER	0b	R/(W)^{*1}	Overrun Error Flag 0: No overrun error occurred 1: An overrun error has occurred
b6	RDRF	0b	R/(W)^{*2}	Receive Data Full Flag 0: When data is transferred from RDR 1: When data has been received normally, and transferred from RSR to RDR
b7	TDRE	1b	R/(W)^{*2}	Transmit Data Empty Flag 0: When data is transferred to TDR 1: When data is transferred from TDR to TSR

Note 1. Only 0 can be written to this bit, to clear the flag.

Note 2. Write 1 when writing is necessary.

MPB Bit (Multi-Processor)

Holds the value of the multi-processor bit in the reception frame. This bit does not change when the SCR.RE bit is 0.

TEND Flag (Transmit End Flag)

Indicates completion of transmission.

[Setting conditions]

- When the SCR.TE bit is set to 0 (serial transmission is disabled)
  When the SCR.TE bit is changed from 0 to 1, the TEND flag is not affected and retains the value 1.
- When the TDR register is not updated at the time of transmission of the tail-end bit of a character being transmitted

[Clearing condition]

- When transmit data are written to the TDR register while the SCR.TE bit is 1

PER Flag (Parity Error Flag)

Indicates that a parity error has occurred during reception in asynchronous mode and the reception ends abnormally.

[Setting condition]

- When a parity error is detected during reception
  Although receive data when the parity error occurs is transferred to RDR, no RXI interrupt request occurs. Note that when the PER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to PER after reading PER = 1
  Even when the SCR.RE bit is set to 0 (serial reception is disabled), the PER flag is not affected and retains its previous value.

FER Flag (Framing Error Flag)

Indicates that a framing error has occurred during reception in asynchronous mode and the reception ends abnormally.

[Setting condition]

- When the stop bit is 0
  In 2-stop-bit mode, only the first stop bit is checked whether it is 1 but the second stop bit is not checked. Note that although receive data when the framing error occurs is transferred to RDR, no RXI interrupt request occurs. In addition, when the FER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to FER after reading FER = 1
  Even when the SCR.RE bit is set to 0, the FER flag is not affected and retains its previous value.

ORER Flag (Overrun Error Flag)

Indicates that an overrun error has occurred during reception and the reception ends abnormally.

[Setting condition]

- When the next data is received before receive data is read from RDR
  In RDR, receive data prior to an overrun error occurrence is retained, but data received after the overrun error occurrence is lost. When the ORER flag is set to 1, subsequent serial reception cannot be performed. Note that, in clock synchronous mode, serial transmission also cannot continue.

[Clearing condition]

- When 0 is written to ORER after reading ORER = 1
  Even when the SCR.RE bit is set to 0, the ORER flag is not affected and retains its previous value.

RDRF Flag (Receive Data Full Flag)

Indicates whether RDR has received data.

[Setting condition]

- When data has been received normally, and transferred from RSR to RDR

[Clearing condition]

- When data is transferred from RDR

TDRE Flag (Transmit Data Empty Flag)

Indicates whether TDR has data to be transmitted.

[Setting condition]

- When data is transferred from TDR to TSR

[Clearing condition]

- When data is transferred to TDR

(2) Smart Card Interface Mode (SCMR.SMIF = 1)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	TDRE	RDRF	ORER	ERS	PER	TEND	MPB	MPBT
Initial Value	1	0	0	0	0	1	0	0
R/W	R/(W)*2	R/(W)*2	R/(W)*1	R/(W)*1	R/(W)*1	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	MPBT	0b	R/W	Multi-Processor Bit Transfer This bit should be set to 0 in smart card interface mode.
b1	MPB	0b	R	Multi-Processor This bit is not used in smart card interface mode. It should be set to 0.
b2	TEND	1b	R	Transmit End Flag 0: A character is being transmitted. 1: Character transfer has been completed.
b3	PER	0b	R/(W) *1	Parity Error Flag 0: No parity error occurred 1: A parity error has occurred
b4	ERS	0b	R/(W) *1	Error Signal Status Flag 0: Low error signal not responded 1: Low error signal responded
b5	ORER	0b	R/(W) *1	Overrun Error Flag 0: No overrun error occurred 1: An overrun error has occurred
b6	RDRF	0b	R/(W) *2	Receive Data Full Flag 0: When data is transferred from RDR 1: When data has been received normally, and transferred from RSR to RDR
b7	TDRE	1b	R/(W) *2	Transmit Data Empty Flag 0: When data is transferred to TDR 1: When data is transferred from TDR to TSR

Note 1. Only 0 can be written to this bit, to clear the flag.

Note 2. Write 1 when writing is necessary.

TEND Flag (Transmit End Flag)

With no error signal from the receiving side, this bit is set to 1 when further data for transfer is ready to be transferred to the TDR register.

[Setting conditions]

- When the SCR.TE bit = 0 (serial transmission is disabled)
  When the SCR.TE bit is changed from 0 to 1, the TEND flag is not affected and retains the value 1.
- When a specified period has elapsed after the latest transmission of 1 byte, the ERS flag is 0, and the TDR register is not updated
  The set timing is determined by register settings as listed below.
  When SMR.GM = 0 and SMR.BLK = 0, 12.5 etu after the start of transmission
  When SMR.GM = 0 and SMR.BLK = 1, 11.5 etu after the start of transmission
  When SMR.GM = 1 and SMR.BLK = 0, 11.0 etu after the start of transmission
  When SMR.GM = 1 and SMR.BLK = 1, 11.0 etu after the start of transmission

[Clearing condition]

- When transmit data are written to the TDR register while the SCR.TE bit is 1

PER Flag (Parity Error Flag)

Indicates that a parity error has occurred during reception in asynchronous mode and the reception ends abnormally.

[Setting condition]

- When a parity error is detected during reception
  Although receive data when the parity error occurs is transferred to RDR, no RXI interrupt request occurs. Note that when the PER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to PER after reading PER = 1
  Even when the SCR.RE bit is set to 0 (serial reception is disabled), the PER flag is not affected and retains its previous value.

ERS Flag (Error Signal Status Flag)

[Setting condition]

- When a low error signal is sampled

[Clearing condition]

- When 0 is written to ERS after reading ERS = 1
  Even when the SCR.RE bit is set to 0, the ERS flag is not affected and retains its previous value.

ORER Flag (Overrun Error Flag)

Indicates that an overrun error has occurred during reception and the reception ends abnormally.

[Setting condition]

- When the next data is received before receive data is read from RDR
  In RDR, the receive data prior to an overrun error occurrence is retained, but data received following the overrun error occurrence is lost. When the ORER flag is set to 1, subsequent serial reception cannot be performed.

[Clearing condition]

- When 0 is written to ORER after reading ORER = 1
  Even when the SCR.RE bit is set to 0, the ORER flag is not affected and retains its previous value.

RDRF Flag (Receive Data Full Flag)

Indicates whether RDR has received data.

[Setting condition]

- When data has been received normally, and transferred from RSR to RDR

[Clearing condition]

- When data is transferred from RDR

TDRE Flag (Transmit Data Empty Flag)

Indicates whether TDR has data to be transmitted.

[Setting condition]

- When data is transferred from TDR to TSR

[Clearing condition]

- When data is transferred to TDR

23.2.10 Smart Card Mode Register (SCMR)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	BCP2	—	—	CHR1	SDIR	SINV	—	SMIF
Initial Value	1	1	1	1	0	0	1	0
R/W	R/W*1	R/W	R/W	R/W*1	R/W*1	R/W*1	R/W	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b0	SMIF	0b	R/W*1	Smart Card Interface Mode Select 0: Non-smart card interface mode (Asynchronous mode, clock synchronous mode,) 1: Smart card interface mode
b1	—	1b	R/W	Reserved This bit is read as 1. The write value should be 1.
b2	SINV	0b	R/W*1	Transmitted/Received Data Invert 0: TDR contents are transmitted as they are. Receive data is stored as it is in RDR. 1: TDR contents are inverted before being transmitted. Receive data is stored in inverted form in RDR.
b3	SDIR	0b	R/W*1	Transmitted/Received Data Transfer Direction This bit can be used in the following modes. ● Smart card interface mode ● Asynchronous mode (multi-processor mode) ● Clock synchronous mode 0: Transfer with LSB first 1: Transfer with MSB first
b4	CHR1	1b	R/W*1	Character Length 1 (Only valid in asynchronous mode)*2 Selects in combination with the SMR.CHR bit. CHR1 CHR 0 0: Transmit/receive in 9-bit data length 0 1: Transmit/receive in 9-bit data length 1 0: Transmit/receive in 8-bit data length (initial value) 1 1: Transmit/receive in 7-bit data length*3
b6, b5	—	1b	R/W	Reserved These bits are read as 1. The write value should be 1.
b7	BCP2	1b	R/W*1	Base Clock Pulse 2 Selects the number of base clock cycles in combination with the SMR.BCP[1:0] bits. **Table 23.5** lists the combinations of the SCMR.BCP2 bit and SMR.BCP[1:0] bits.

Note 1. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).

Note 2. The setting is invalid and a fixed data length of 8 bits is used in modes other than asynchronous mode.

Note 3. LSB first should be selected and the value of MSB (b7) in TDR cannot be transmitted.

SMIF Bit (Smart Card Interface Mode Select)

When this bit is set to 1, smart card interface mode is selected.

When this bit is set to 0, non-smart card interface mode, i.e., asynchronous mode (including multi-processor mode), clock synchronous mode is selected.

SINV Bit (Transmitted/Received Data Invert)

Inverts the transmit/receive data logic level. This bit does not affect the logic level of the parity bit. To invert the parity bit, invert the PM bit in SMR.

CHR1 bit (Character Length 1)

Selects the data length of transmit/receive data. Selects in combination with the CHR bit in SMR.

A fixed data length of 8 bits is used in modes other than asynchronous mode.

BCP2 Bit (Base Clock Pulse 2)

Selects the number of base clock cycles in a 1-bit data transfer time in smart card interface mode. Set this bit in combination with the SMR.BCP[1:0] bits.

Table 23.5 Combinations of the SCMR.BCP2 Bit and SMR.BCP[1:0] Bits

SCMR.BCP2 Bit	SMR.BCP[1:0] Bits		Number of Base Clock Cycles for 1-Bit Transfer Period
0	0	0	93 clock cycles (S = 93)*1
0	0	1	128 clock cycles (S = 128)*1
0	1	0	186 clock cycles (S = 186)*1
0	1	1	512 clock cycles (S = 512)*1
1	0	0	32 clock cycles (S = 32)*1 (Initial Value)
1	0	1	64 clock cycles (S = 64)*1
1	1	0	372 clock cycles (S = 372)*1
1	1	1	256 clock cycles (S = 256)*1

Note 1. S is the value of Base Clock Cycles for 1-bit Period BRR (refer to **Section 23.2.11, Bit Rate Register (BRR)**, **Table 23.8 Base Clock Settings in Smart Card Interface Mode**).

23.2.11 Bit Rate Register (BRR)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

BRR is an 8-bit register that adjusts the bit rate.

As each SCI channel has independent baud rate generator control, different bit rates can be set for each. **Table 23.6** shows the relationship between the setting (N) in the BRR and the bit rate (B) for normal asynchronous mode, multi-processor communication, clock synchronous mode, and smart card interface mode.

The initial value of BRR is H'FF.

BRR can be read from by the CPU, but it can be written to only when the TE and RE bits in SCR are 0.

Table 23.6 Relationship between N Setting in BRR and Bit Rate B

Mode	SEMR Setting		BRR Setting	Error
	BGDM Bit	ABCS Bit		
Asynchronous or multi-processor communication	0	0	$N = \frac{P0\phi \times 10^6}{64 \times 2^{2n-1} \times B} - 1$	$\text{Error}\ (\%) = \{\frac{P0\phi \times 10^6}{B \times 64 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$
	0	1	$N = \frac{P0\phi \times 10^6}{32 \times 2^{2n-1} \times B} - 1$	$\text{Error}\ (\%) = \{\frac{P0\phi \times 10^6}{B \times 32 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$
	1	0		
	1	1	$N = \frac{P0\phi \times 10^6}{16 \times 2^{2n-1} \times B} - 1$	$\text{Error}\ (\%) = \{\frac{P0\phi \times 10^6}{B \times 16 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$
Clock synchronous			$N = \frac{P0\phi \times 10^6}{8 \times 2^{2n-1} \times B} - 1$	
Smart card interface			$N = \frac{P0\phi \times 10^6}{S \times 2^{2n-1} \times B} - 1$	$\text{Error}\ (\%) = \{\frac{P0\phi \times 10^6}{B \times S \times 2^{2n-1} \times (N+1)} - 1\} \times 100$

Remarks: B: Bit rate (bps)
N: BRR setting for on-chip baud rate generator (0 ≤ N ≤ 255)
P0ϕ: Operating frequency (MHz)
n and S: Determined by the settings of the SMR and SCMR registers as listed in the table below.

Table 23.7 Clock Source Settings

SMR.CKS[1:0] Bit Setting	Clock Source	n
0 0	P0ϕ clock	0
0 1	P0ϕ/4 clock	1
1 0	P0ϕ/16 clock	2
1 1	P0ϕ/64 clock	3

Table 23.8 Base Clock Settings in Smart Card Interface Mode

SCMR.BCP2 Bit Setting	SMR.BCP[1:0] Bit Setting	Base Clock Cycles for 1-bit Period	S
0	0 0	93 clock cycles	93
0	0 1	128 clock cycles	128
0	1 0	186 clock cycles	186
0	1 1	512 clock cycles	512
1	0 0	32 clock cycles	32
1	0 1	64 clock cycles	64
1	1 0	372 clock cycles	372
1	1 1	256 clock cycles	256

Table 23.9 lists examples of N settings in BRR in normal asynchronous mode. **Table 23.10** lists the maximum bit rate settable for each operating frequency. Examples of BRR (N) settings in clock synchronous mode are listed in **Table 23.12**. Examples of BRR (N) settings in smart card interface mode are listed in **Table 23.14**. In smart card interface mode, the number of base clock cycles S in a 1-bit data transfer time can be selected. For details, refer to **Section 23.6.4, Receive Data Sampling Timing and Reception Margin**. **Table 23.11** and **Table 23.13** list the maximum bit rates with external clock input.

When either the asynchronous mode base clock select bit (ABCS) or the baud rate generator double-speed mode select bit (BGDM) in the serial extended mode register (SEMR) is set to 1 in asynchronous mode, the bit rate becomes twice that listed in **Table 23.9**. When both of those registers are set to 1, the bit rate becomes four times the listed value.

Table 23.9 Examples of BRR Settings for Various Bit Rates (Asynchronous Mode)

	Operating Frequency P0ϕ (MHz)		
	100		
Bit Rate (bps)	n	N	Error (%)
110	—	—	—
150	—	—	—
300	3	162	−0.15
600	3	80	0.47
1200	2	162	−0.15
2400	2	80	0.47
4800	1	162	−0.15
9600	1	80	0.47
19200	0	162	−0.15
31250	0	99	0.00
38400	0	80	0.47

Note: This is an example when the ABCS and BGDM bits in SEMR are 0.
When either the ABCS bit or BGDM bit is set to 1, the bit rate doubles.
When both ABCS and BGDM bits in SEMR are set to 1, the bit rate increases four times.

Table 23.10 Maximum Bit Rate for Each Operating Frequency (Asynchronous Mode)

	SEMR Settings				
P0ϕ (MHz)	BGDM Bit	ABCS Bit	n	N	Maximum Bit Rate (bps)
100	0	0	0	0	3125000
		1	0	0	6250000
	1	0	0	0	6250000
		1	0	0	12500000

Table 23.11 Maximum Bit Rate with External Clock Input (Asynchronous Mode)

	Maximum Bit Rate (bps)		
P0ϕ (MHz)	External Input Clock (MHz)	SEMR.ABCS Bit = 0	SEMR.ABCS Bit = 1
100	25.000	1562500	3125000

Table 23.12 BRR Settings for Various Bit Rates (Clock Synchronous Mode)

	Operating Frequency P0ϕ (MHz)	
	100	
Bit Rate (bps)	n	N
110	—	—
250	—	—
500	—	—
1 k	—	—
2.5 k	3	155
5 k	3	77
10 k	2	155
25 k	1	249
50 k	1	124
100 k	0	249
250 k	0	99
500 k	0	49
1 M	0	24
2.5 M	0	9
5 M	0	4
7.5 M	0	2

Note: Continuous transmission or reception is impossible. After transmitting or receiving one frame of data, there is an interval of a 1-bit period before starting transmitting or receiving the next frame of data. The output of the synchronization clock is stopped for a 1-bit period. For this reason, it takes 9 bits worth of time to transfer one frame (8 bits) of data, and the average transfer rate is 8/9 times the bit rate.

Remarks: Space: Setting prohibited.
—: Can be set, but an error will occur.

Table 23.13 Maximum Bit Rate with External Clock Input (Clock Synchronous Mode)

P0ϕ (MHz)	External Input Clock (MHz)	Maximum Bit Rate (Mbps)
100	16.6667	16.6667

Table 23.14 BRR Settings for Various Bit Rates (Smart Card Interface Mode, n = 0, S = 372)

Bit Rate (bps)	P0ϕ (MHz)	n	N	Error (%)
9600	100	0	13	0.01

Table 23.15 Maximum Bit Rate for Each Operating Frequency (Smart Card Interface Mode, S = 32)

P0ϕ (MHz)	Maximum Bit Rate (bps)	n	N
100.00	1562500	0	0

Table 23.16 Maximum Bit Rate for Each Operating Frequency (Smart Card Interface Mode, S = 372)

P0ϕ (MHz)	Maximum Bit Rate (bps)	n	N
100.00	134409	0	0

23.2.12 Modulation Duty Register (MDDR)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Initial Value	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

MDDR corrects the bit rate adjusted by the BRR register.

When the BRME bit in SEMR is set to 1, the bit rate generated by the on-chip baud rate generator is evenly corrected according to the settings of MDDR (M/256). The relationship between the MDDR setting (M) and the bit rate (B) is given in **Table 23.17**.

The initial value of MDDR is H'FF. Bit 7 in this register is fixed to 1.

The CPU can read the MDDR register, but this register is only writable when the TE and RE bits in SCR are 0.

Table 23.17 Relationship between MDDR Setting (M) and Bit Rate (B) When Bit Rate Modulation Function is Used

	SEMR	Setting		
Mode	BGDM Bit	ABCS Bit	BRR Setting	Error
Asynchronous or multi-processor communication	0	0	$N=\frac{P0\emptyset\times10^{6}}{64\times2^{2n-1}\times(256/M)\times B}-1$	$\text{Error}\,(\%)=\{\frac{P0\emptyset\times10^{6}}{B\times64\times2^{2n-1}\times(256M)\times(N+1)}-1\}\times100$
	0	1	$N=\frac{P0\emptyset\times10^{6}}{32\times2^{2n-1}\times(256/M)\times B}-1$	$\text{Error}\,(\%)=\{\frac{P0\emptyset\times10^{6}}{B\times32\times2^{2n-1}\times(256M)\times(N+1)}-1\}\times100$
	1	0		
	1	1	$N=\frac{P0\emptyset\times10^{6}}{16\times2^{2n-1}\times(256/M)\times B}-1$	$\text{Error}\,(\%)=\{\frac{P0\emptyset\times10^{6}}{B\times16\times2^{2n-1}\times(256M)\times(N+1)}-1\}\times100$
Clock synchronous			$N=\frac{P0\emptyset\times10^{6}}{8\times2^{2n-1}\times(256/M)\times B}-1$	
Smart card interface			$N=\frac{P0\emptyset\times10^{6}}{S\times2^{2n-1}\times(256/M)\times B}-1$	$\text{Error}\,(\%)=\{\frac{P0\emptyset\times10^{6}}{B\times S\times2^{2n-1}\times(256M)\times(N+1)}-1\}\times100$

Note: Do not use this function in clock synchronous mode with the highest speed setting (SMR.CKS[1:0] = 00b, SCR.CKE[1] = 0, and BRR = 0).

Remarks: B: Bit rate (bps)
M: MDDR setting (128 ≤ MDDR ≤ 256)
N: BRR setting for baud rate generator (0 ≤ N ≤ 255)
P0ϕ: Operating frequency (MHz)
n and S: Determined by the settings of the SMR and SCMR registers as listed in **Table 23.7** and **Table 23.8**, **Section 23.2.11, Bit Rate Register (BRR)**.

23.2.13 Serial Extended Mode Register (SEMR)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	RXDESEL	BGDM	NFEN	ABCS	—	BRME	—	ACS0
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W*1	R/W	R/W*1	R/W*1	R/W	R/W	R/W	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
b0	ACS0	0b	R/W*1	Asynchronous Mode Clock Source Select (Valid only in asynchronous mode) 0: External clock input 1: Reserved bit
b1	—	0b	R/W	Reserved This bit is read as 0. The write value should be 0.
b2	BRME	0b	R/W	Bit Rate Modulation Enable 0: Bit rate modulation function is disabled. 1: Bit rate modulation function is enabled.
b3	—	0b	R/W	Reserved This bit is read as 0. The write value should be 0.
b4	ABCS	0b	R/W*1	Asynchronous Mode Base Clock Select (Valid only in asynchronous mode) 0: Selects 16 base clock cycles for 1-bit period. 1: Selects 8 base clock cycles for 1-bit period.
b5	NFEN	0b	R/W*1	Digital Noise Filter Function Enable (In asynchronous mode) 0: Noise cancellation function for the RXDn input signal is disabled. 1: Noise cancellation function for the RXDn input signal is enabled.
b6	BGDM	0b	R/W	Baud Rate Generator Double-Speed Mode Select (Only valid the CKE[1] bit in SCR is 0 in asynchronous mode). 0: Baud rate generator outputs the clock with normal frequency. 1: Baud rate generator outputs the clock with doubled frequency.
b7	RXDESEL	0b	R/W*1	Asynchronous Start Bit Edge Detection Select (Valid only in asynchronous mode) 0: The low level on the RXDn pin is detected as the start bit. 1: A falling edge on the RXDn pin is detected as the start bit.

Note 1. Writable only when TE in SCR = 0 and RE in SCR = 0 (both serial transmission and reception are disabled).

SEMR selects the clock source for 1-bit period in asynchronous mode.

ACS0 Bit (Asynchronous Mode Clock Source Select)

Selects the clock source in the asynchronous mode.

The ACS0 bit is valid in asynchronous mode (CM bit in SMR = 0) and when an external clock input is selected (CKE[1:0] bits in SCR = 10b or 11b).

Set the ACS0 bit to 0 in other than asynchronous mode.

BRME bit (Bit Rate Modulation Enable)

Enables and disables the bit rate modulation function. The bit rate generated by on-chip baud rate generator is evenly corrected when this function is enabled.

NFEN Bit (Digital Noise Filter Function Enable)

This bit enables or disables the digital noise filter function.

When the function is enabled, noise cancellation is applied to the RXDn input signal in asynchronous mode. In any mode other than above, set the NFEN bit to 0 to disable the digital noise filter function.

When the function is disabled, input signals are transferred as is, as internal signals.

BGDM bit (Baud Rate Generator Double-Speed Mode Select)

Selects the cycle of output clock for the baud rate generator.

This bit is valid when the on-chip baud rate generator is selected as the clock source (SCR.CKE[1] = 0) in asynchronous mode (SMR.CM = 0). For the clock output from the baud rate generator, either normal or doubled frequency can be selected. The base clock is generated by the clock output from the baud rate generator. When the BGDM bit is set to 1, the base clock cycle is halved and the bit rate is doubled. Set this bit to 0 in modes other than asynchronous mode.

RXDESEL Bit (Asynchronous Start Bit Edge Detection Select)

Selects the detection method of the start bit for reception in asynchronous mode. When a break occurs, data receiving operation depends on the settings of this bit. Set this bit to 1 when reception should be stopped while a break occurs or when reception should be started without retaining the RXDn pin input at high level for the period of one data frame or longer after completion of the break.

Set this bit to 0 in modes other than asynchronous mode.

23.2.14 Noise Filter Setting Register (SNFR)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	NFCS[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W*[1]	R/W*[1]	R/W*[1]

Bit	Bit Name	Initial Value	R/W	Description
b2 to b0	NFCS[2:0]	All 0	R/W*[1]	Noise Filter Clock Select In asynchronous mode, the standard setting for the base clock is as follows. b2 b0 0 0 0: The clock signal divided by 1 is used with the noise filter. Settings other than above are prohibited.
b7 to b3	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Writing to these bits is only possible when the RE and TE bits in the SCR are 0 (serial reception and transmission disabled).

NFCS[2:0] Bits (Noise Filter Clock Select)

These bits select the sampling clock for the digital noise filter. To use the noise filter in asynchronous mode, set these bits to 000b.

23.2.15 Extended function control register (SECR)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	CTSE	—
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W*1	R/W

Bit	Bit Name	Initial Value	R/W	Description
b0	—	0b	R/W	Reserved This bit is read as 0. The write value should be 0.
b1	CTSE	0b	R/W*1	CTS Enable 0: CTS function is disabled (RTS output function is enabled). 1: CTS function is enabled.
B7 to b2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Note 1. Writing to the bit is only possible when the SCR.RE and SCR.TE bits are 0.

SECR is used to select the extension settings in asynchronous and clock synchronous modes.

CTSE Bit (CTS Enable)

Set this bit to 1 if the SSn# pin is to be used for inputting of the CTS control signal to control of transmission and reception. The RTS signal is output when this bit is set to 0. Set this bit to 0 in smart card interface mode. Do not set both the CTSE and SSE bits to enabled (even if this setting is made, operation is the same as that when these bits are set to 0).

23.3 Operation in Asynchronous Mode

Figure 23.2 shows the general format for asynchronous serial communications.

One frame consists of a start bit (low level), transmit/receive data, a parity bit, and stop bits (high level).

In asynchronous serial communications, the communications line is usually held in the mark state (high level).

The SCI monitors the communications line. When the SCI detects a low, it regards that as a start bit and starts serial communication.

Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communications. Both the transmitter and the receiver also have a double-buffered structure, so that data can be read or written during transmission or reception, enabling continuous data transmission and reception.

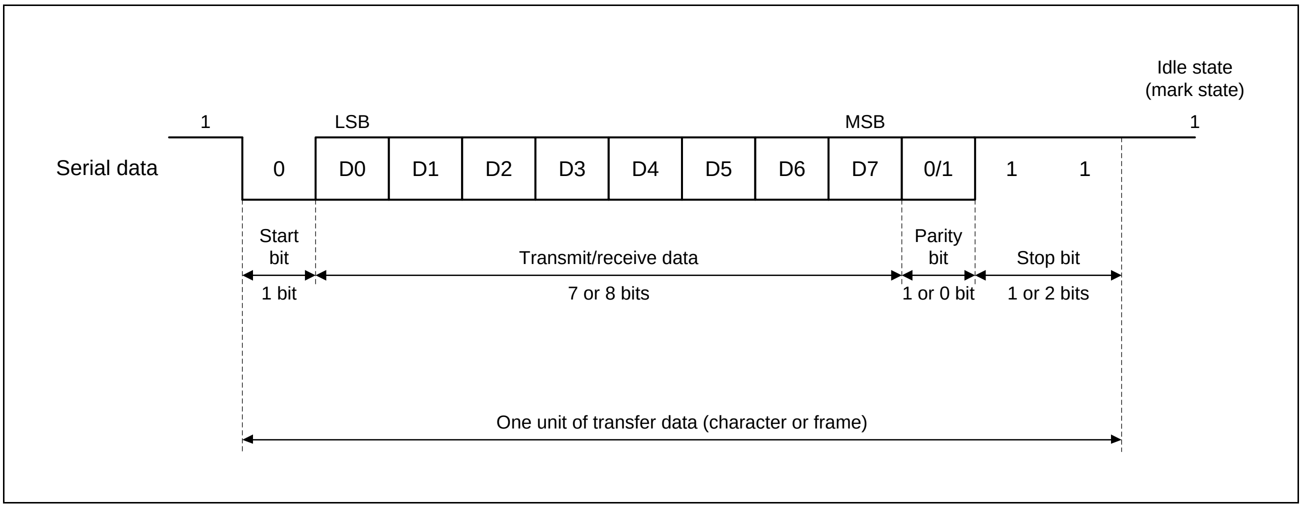

Figure 23.2 Data Format in Asynchronous Serial Communications (Example with 8-Bit Data, Parity, 2 Stop Bits)

23.3.1 Serial Data Transfer Format

Table 23.18 lists the serial data transfer formats that can be used in asynchronous mode.

Any of 18 transfer formats can be selected according to the SMR and SCMR setting. For details of multi-processor function, refer to **Section 23.4, Multi-Processor Communications Function**.

Table 23.18 Serial Transfer Formats (Asynchronous Mode)

SCMR Setting	SMR Setting				Serial Transfer Format and Frame Length												
CHR1	CHR	PE	MP	STOP	1	2	3	4	5	6	7	8	9	10	11	12	13
0	0	0	0	0	S	9-bit data									STOP		
0	0	0	0	1	S	9-bit data									STOP	STOP	
0	0	1	0	0	S	9-bit data									P	STOP	
0	0	1	0	1	S	9-bit data									P	STOP	STOP
1	0	0	0	0	S	8-bit data								STOP			
1	0	0	0	1	S	8-bit data								STOP	STOP		
1	0	1	0	0	S	8-bit data								P	STOP		
1	0	1	0	1	S	8-bit data								P	STOP	STOP	
1	1	0	0	0	S	7-bit data							STOP				
1	1	0	0	1	S	7-bit data							STOP	STOP			
1	1	1	0	0	S	7-bit data							P	STOP			
1	1	1	0	1	S	7-bit data							P	STOP	STOP		
0	0	—	1	0	S	9-bit data									MPB	STOP	
0	0	—	1	1	S	9-bit data									MPB	STOP	STOP
1	0	—	1	0	S	8-bit data								MPB	STOP		
1	0	—	1	1	S	8-bit data								MPB	STOP	STOP	
1	1	—	1	0	S	7-bit data							MPB	STOP			
1	1	—	1	1	S	7-bit data							MPB	STOP	STOP		

Note: S: Start bit
STOP: Stop bit
P: Parity bit
MPB: Multi-processor bit

23.3.2 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode

In asynchronous mode, the SCI operates on a base clock with a frequency of 16 times*[1] the bit rate.

In reception, the SCI samples the falling edge of the start bit using the base clock, and performs internal synchronization. Since receive data is sampled at the rising edge of the 8th pulse*[1] of the base clock, data is latched at the middle of each bit, as shown in **Figure 23.3**. Thus the reception margin in asynchronous mode is determined by formula (1) below.

$$M = \left|(0.5 - \frac{1}{2N}) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F)\right| \times 100\ [\%] \cdots \text{Formula (1)}$$

M: Reception margin
N: Ratio of bit rate to clock (N = 16 when ABCS in SEMR = 0, N = 8 when ABCS in SEMR = 1)
D: Duty cycle of clock (D = 0.5 to 1.0)
L: Frame length (L = 9 to 13)
F: Absolute value of clock frequency deviation

Assuming values of F = 0 and D = 0.5 in formula (1), the reception margin is determined by the formula below.

$$M = \{0.5 - 1/(2 \times 16)\} \times 100\ (\%) = 46.875\%$$

However, this is only the computed value, and a margin of 20% to 30% should be allowed in system design.

Note 1. This is an example when the ABCS bit in SEMR is 0. When the ABCS bit is 1, a frequency of 8 times the bit rate is used as a base clock and receive data is sampled at the rising edge of the 4th pulse of the base clock.

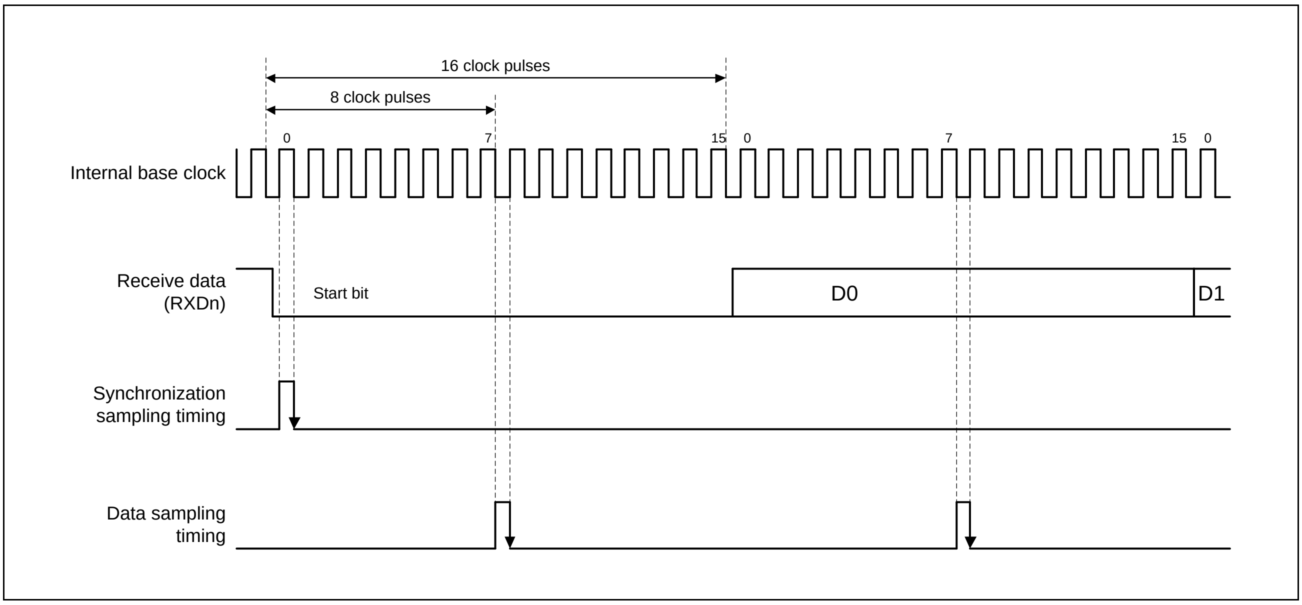

Figure 23.3 Receive Data Sampling Timing in Asynchronous Mode

23.3.3 Clock

Either an internal clock generated by the on-chip baud rate generator or an external clock input to the SCKn pin can be selected as the SCI's transfer clock, according to the setting of the CM bit in SMR and the CKE[1:0] bits in SCR. When an external clock is input to the SCKn pin, the clock frequency should be 16 times the bit rate (when ABCS in SEMR = 0) and 8 times the bit rate (when ABCS in SEMR = 1).

When the SCI is operated on an internal clock, the clock can be output from the SCKn pin. The frequency of the clock output in this case is equal to the bit rate, and the phase is such that the rising edge of the clock is in the middle of the transmit data, as shown in **Figure 23.4**.

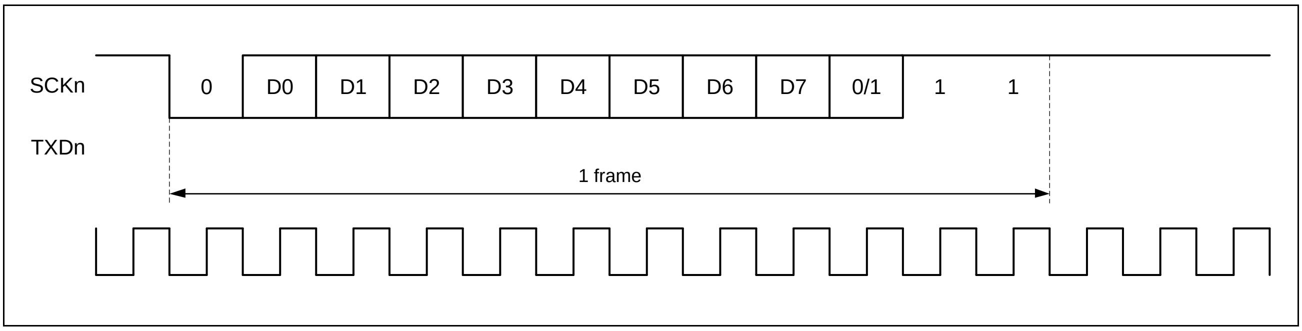

Figure 23.4 Phase Relationship between Output Clock and Transmit Data
(Asynchronous Mode: SMR.CHR = 0, PE = 1, MP = 0, STOP = 1)

23.3.4 Double-Speed Mode

The output clock frequency of the on-chip baud rate generator is doubled by setting the SEMR.BGDM bit to 1, enabling high-speed communication at a doubled bit rate. If the SEMR.ABCS bit is set to 1 under the above condition, the number of base clock cycles changes from 16 to 8, so the bit rate becomes four times faster than the initial state.

As shown by Formula (1) in **Section 23.3.2, Receive Data Sampling Timing and Reception Margin in Asynchronous Mode**, setting the SEMR.ABCS bit to 1 changes the number of cycles to 8, and the sampling interval becomes longer. This causes the reception margin to decrease. Therefore, setting the SEMR.BGDM bit to 1 and the SEMR.ABCS bit to 0 is recommended instead of setting the SEMR.BGDM bit to 0 and the SEMR.ABCS bit to 1 for high-speed operation at a doubled bit rate.

23.3.5 CTS and RTS Functions

The CTS function is the use of input on the CTSn# pin in transmission control. Setting the SECR.CTSE bit to 1 enables the CTS function. When the CTS function is enabled, placing the low level on the CTSn# pin causes transmission to start.

Applying the high level to the CTS# pin while transmission is in progress does not affect transmission of the current frame, which continues.

In the RTS function, by using the function of output on the RTSn# pin, a low level is output when reception becomes possible. Conditions for output of the low and high level are shown below.

[Conditions for low-level output]

Satisfaction of all conditions listed below

- The value of the RE bit in the SCR is 1
- Reception is not in progress
- There are no received data yet to be read
- The ORER, FER, and PER flags in the SSR are all 0

[Condition for high-level output]

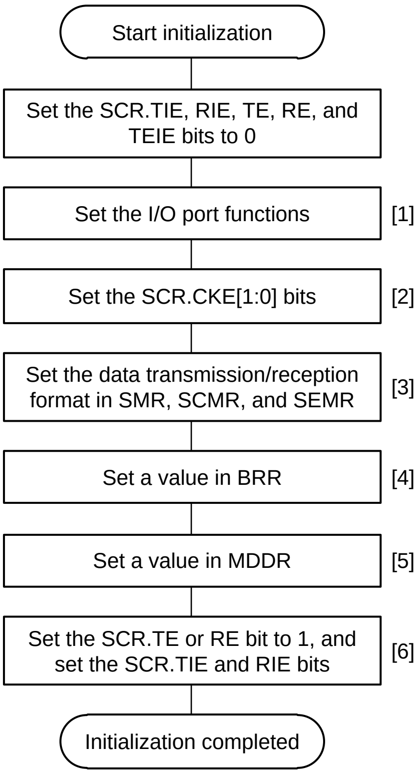
- The conditions for low-level output have not been satisfied.

23.3.6 SCI Initialization (Asynchronous Mode)

Before transmitting and receiving data, start by writing the initial value H’00 to SCR and then continue through the procedure for SCI given in **Figure 23.5**. Whenever the operating mode or transfer format is changed, SCR must be initialized before the change is made.

When the external clock is used in asynchronous mode, ensure that the clock signal is supplied even during initialization. Note that setting the SCR.RE bit to 0 initializes neither the ORER, FER, and PER flags in SSR nor RDR, RDRH, and RDRL.

Moreover, note that switching the value of the SCR.TE bit from 1 to 0 or 0 to 1 while the SCR.TIE bit is 1 leads to the generation of a TXI interrupt request.



[1] Make I/O port settings to enable input and output functions as required for TXDn, RXDn, and SCKn pins.

[2] Set the clock selection in SCR.
When the clock output is selected in asynchronous mode, the clock is output immediately after SCR settings are made.

[3] Set data transmission/reception format in SMR, SCMR, and SEMR.

[4] Write a value corresponding to the bit rate to BRR. This step is not necessary if an external clock is used.

[5] Write the value obtained by correcting a bit rate error in MDDR. This step is not necessary if the BRME bit in SEMR is set to 0 or an external clock is used.

[6] Set the SCR.TE or RE bit to 1. Also set the SCR.TIE and RIE bits.
Setting the TE and RE bits allows TXDn and RXDn to be used.

Figure 23.5 Sample SCI Initialization Flowchart (Asynchronous Mode)

23.3.7 Serial Data Transmission (Asynchronous Mode)

Figure 23.6 to **Figure 23.8** show an example of the operation for serial transmission in asynchronous mode. In serial transmission, the SCI operates as described below.

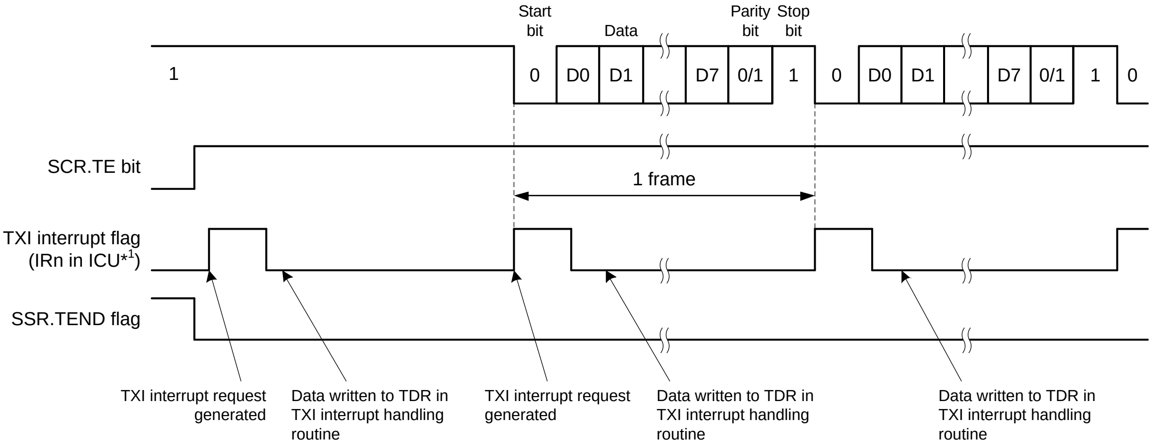
1. The SCI transfers data from TDR*[1] to TSR when data is written to TDR*[1] in the TXI interrupt handling routine. The TXI interrupt request at the beginning of transmission is generated when the TE bit in SCR is set to 1 after the TIE bit in SCR is set to 1 or when these 2 bits are set to 1 simultaneously by a single instruction.
2. Transmission starts after the CTSE bit in SECR is set to 0 (CTS function is disabled) and a low level on the CTSn# pin causes data transfer from TDR*[1] to TSR. If the TIE bit in SCR is 1 at this time, a TXI interrupt request is generated. Continuous transmission is obtainable by writing the next transmit data to TDR*[1] in the TXI interrupt handling routine before transmission of the current transmit data is completed. When TEI interrupt requests are in use, set the SCR.TIE bit to 0 (a TXI interrupt request is disabled) and the SCR.TEIE bit to 1 (a TEI interrupt request is enabled) after the last of the data to be transmitted are written to the TDR*[1]*[2] from the handling routine for TXI requests.
3. Data is sent from the TXDn pin in the following order: start bit, transmit data, parity bit or multi-processor bit (may be omitted depending on the format), and stop bit.
4. The SCI checks for updating of (writing to) TDR*[3] at the time of stop bit output.
5. When TDR*[3] is updated, setting of the CTSE bit in SECR to 0 (CTS function is disabled) or a low level input on the CTSn# pin cause the next transfer of the next transmit data from TDR*[1] to TSR and sending of the stop bit, after which serial transmission of the next frame starts.
6. If TDR*[3] is not updated, the TEND flag in SSR is set to 1, the stop bit is sent, and then the mark state is entered in which 1 is output. If the TEIE bit in SCR is 1 at this time, the TEND flag in SSR is set to 1 and a TEI interrupt request is generated.

Note 1. Write data not to TDR but to the TDRH and TDRL registers when 9-bit data length is selected.

Note 2. Write data in the order from TDRH to TDRL when 9-bit data length is selected.

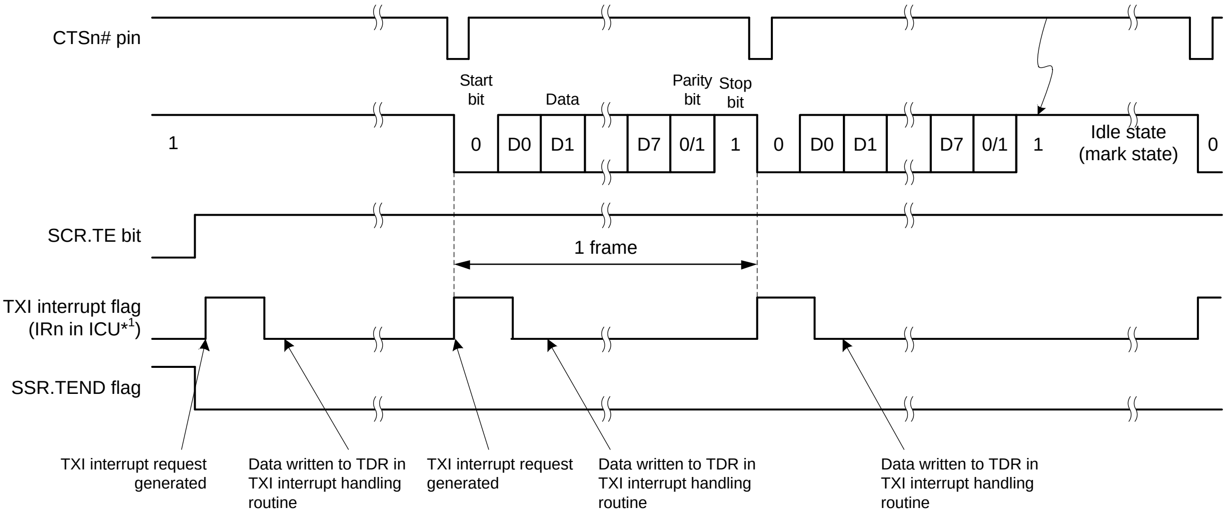
Note 3. The SCI checks for updating of the TDRL register only and does not check for updating of the TDRH register when 9-bit data length is selected.

Figure 23.9 shows a sample flowchart for serial transmission in asynchronous mode.



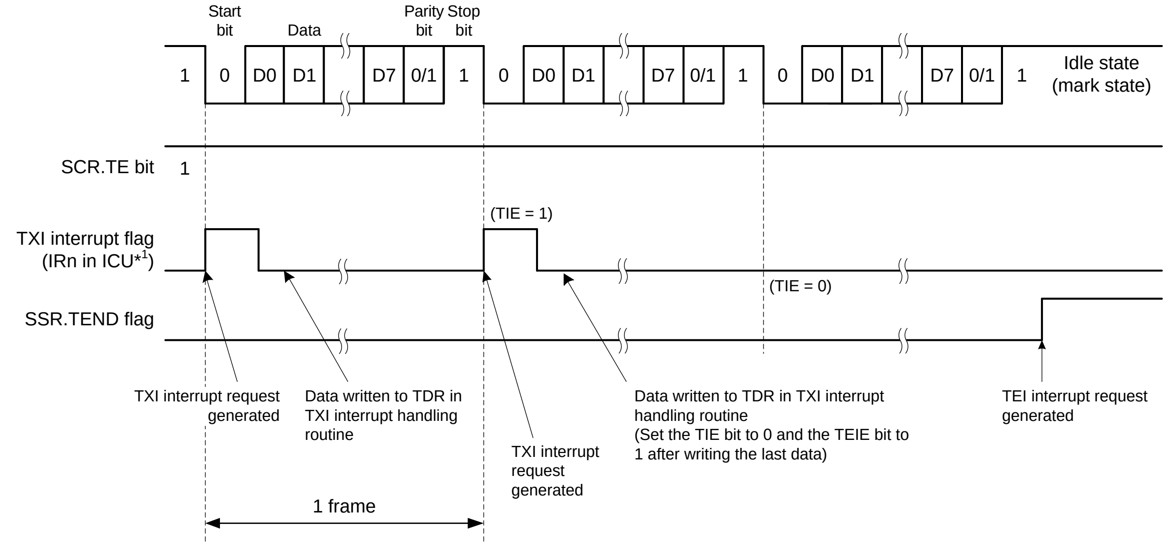
Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.6 Example of Operation for Serial Transmission in Asynchronous Mode (1)
(with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Not Used, at the Beginning of Transmission)



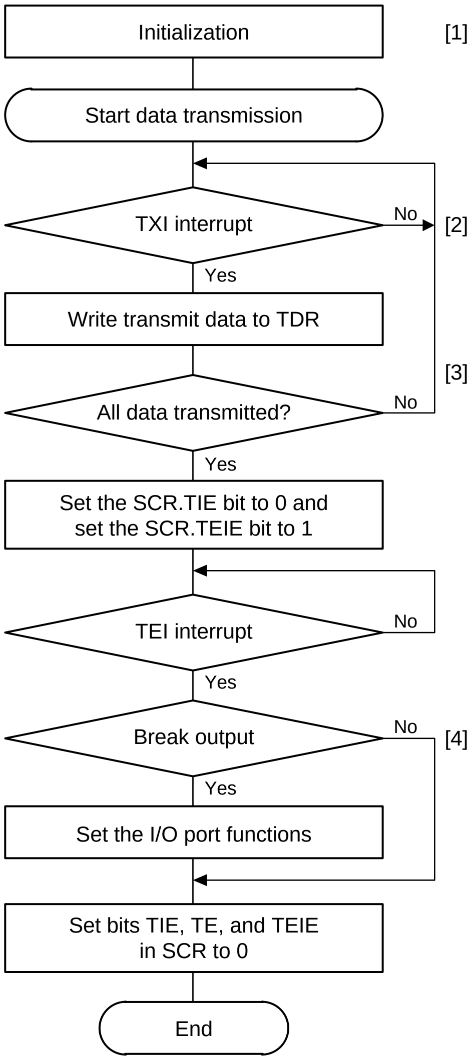
Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.7 Example of Operation for Serial Transmission in Asynchronous Mode (2)
(with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Used, at the Beginning of Transmission)



Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.8 Example of Operation for Serial Transmission in Asynchronous Mode (3) (with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Not Used, from the Middle of Transmission until Transmission Completion)



[1] SCI initialization:
Set data transmission.
After the TE bit in SCR is set to 1, 1 is output for a frame, and transmission is enabled.

[2] Transmit data write to TDR by a TXI interrupt request:
When transmit data is transferred from TDR to TSR, a transmit data empty interrupt (TXI) request is generated.
Write transmit data to TDR once in the TXI interrupt handling routine.

[3] Serial transmission continuation procedure:
To continue serial transmission, write transmit data to TDR once using a TXI interrupt request.
Transmit data can also be written to TDR by activating the DMAC.
When TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted are written to the TDR.

[4] Break output at the end of serial transmission:
To output a break in serial transmission, set the I/O port function corresponding to the TXDn pin (corresponding to output of the low level), and after switching the TXDn pin to the general I/O port function, set the TE bit in the SCR to 0.

Note: The TDR register becomes the TDRH and TDRL registers when 9-bit data length is selected. Write data in the order from TDRH to TDRL.

Figure 23.9 Example of Serial Transmission Flowchart in Asynchronous Mode

23.3.8 Serial Data Reception (Asynchronous Mode)

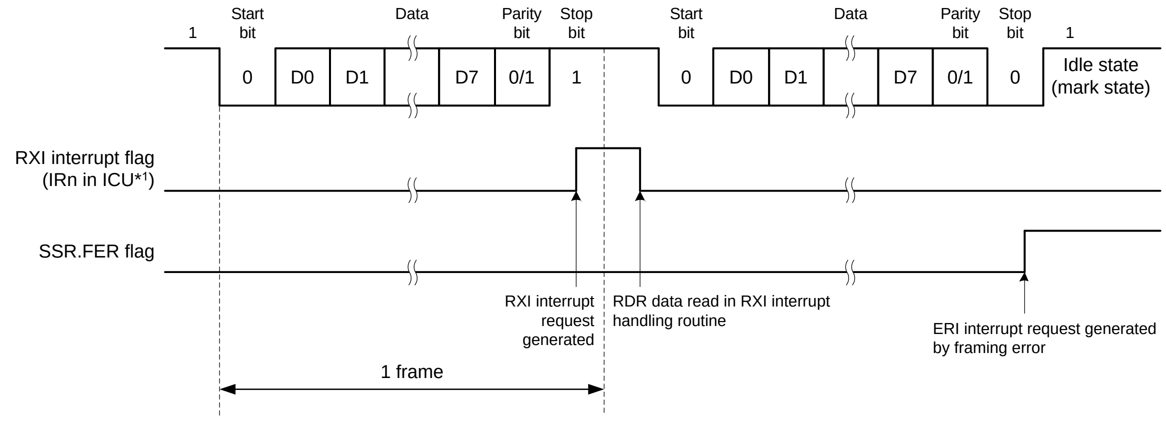
Figure 23.10 and **Figure 23.11** show an example of the operation for serial data reception in asynchronous mode. In serial data reception, the SCI operates as described below.

1. When the value of the RE bit in SCR becomes 1, the output signal on the RTSn# pin goes to the low level.
2. When the SCI monitors the communications line and detects a start bit, it performs internal synchronization, stores receive data in RSR, and checks the parity bit and stop bit.
3. If an overrun error occurs, the ORER flag in SSR is set to 1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Receive data is not transferred to RDR*[1].
4. If a parity error is detected, the PER bit in SSR is set to 1 and receive data is transferred to RDR*[1]. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated.
5. If a framing error (when the stop bit is 0) is detected, the FER bit in SSR is set to 1 and receive data is transferred to RDR*[1]. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated.
6. When reception finishes successfully, receive data is transferred to RDR*[1]. If the RIE bit in SCR is 1 at this time, an RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to RDR*[1] in this RXI interrupt handling routine before reception of the next receive data is completed. Reading the received data that have been transferred to RDR*[1] causes the RTSn# pin to output the low level.

Note 1. Read data not in RDR but in the RDRH and RDRL registers when 9-bit data length is selected.

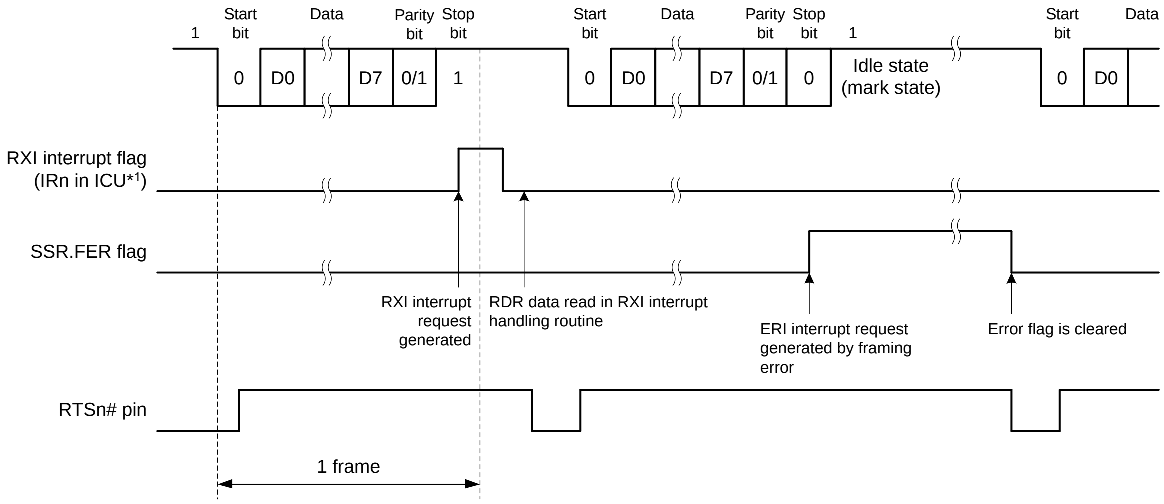
NOTE

The SCI checks for reading of the RDRL register only and does not check for reading of the RDRH register when 9-bit data length is selected.



Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.10 Example of SCI Operation for Serial Reception in Asynchronous Mode (1) (When RTS Function is Not Used) (Example with 8-Bit Data, Parity, 1 Stop Bit)



Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.11 Example of SCI Operation for Serial Reception in Asynchronous Mode (2) (When RTS Function is Used) (Example with 8-Bit Data, Parity, 1 Stop Bit)

Table 23.19 lists the states of the flags in the SSR status register and receive data handling when a receive error is detected.

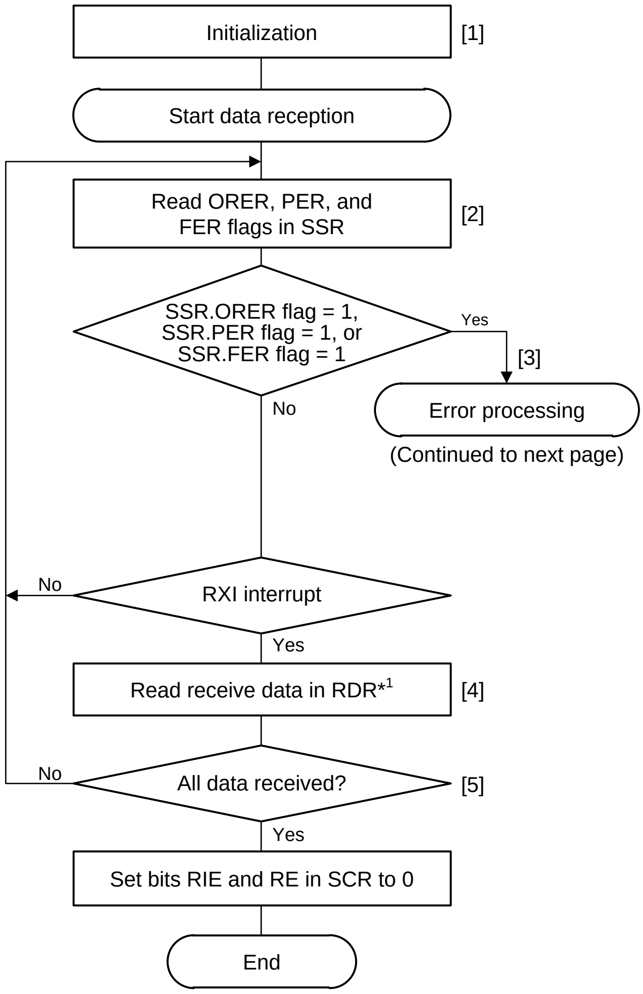
If a receive error is detected, an ERI interrupt request is generated but an RXI interrupt request is not generated. Data reception cannot be resumed while the receive error flag is 1. Accordingly, set the ORER, FER, and PER bits to 0 before resuming reception. Moreover, be sure to read the RDR (or the RDRL) during overrun error processing. When a reception is forcibly terminated by setting the SCR.RE bit to 0 during operation, read the RDR (or the RDRL) register because received data which has not yet been read may be left in RDR (or the RDRL).

Figure 23.12 and **Figure 23.13** show samples of flowcharts for serial data reception.

Table 23.19 Flags in the SSR Status Register and Receive Data Handling

Flags in the SSR Status Register			Receive Data	Receive Error Type
ORER	FER	PER		
1	0	0	Lost	Overrun error
0	1	0	Transferred to RDR*1	Framing error
0	0	1	Transferred to RDR*1	Parity error
1	1	0	Lost	Overrun error + framing error
1	0	1	Lost	Overrun error + parity error
0	1	1	Transferred to RDR*1	Framing error + parity error
1	1	1	Lost	Overrun error + framing error + parity error

Note 1. Read data not in RDR but in the RDRH and RDRL registers when 9-bit data length is selected.



[1] SCI initialization:
Set data reception.

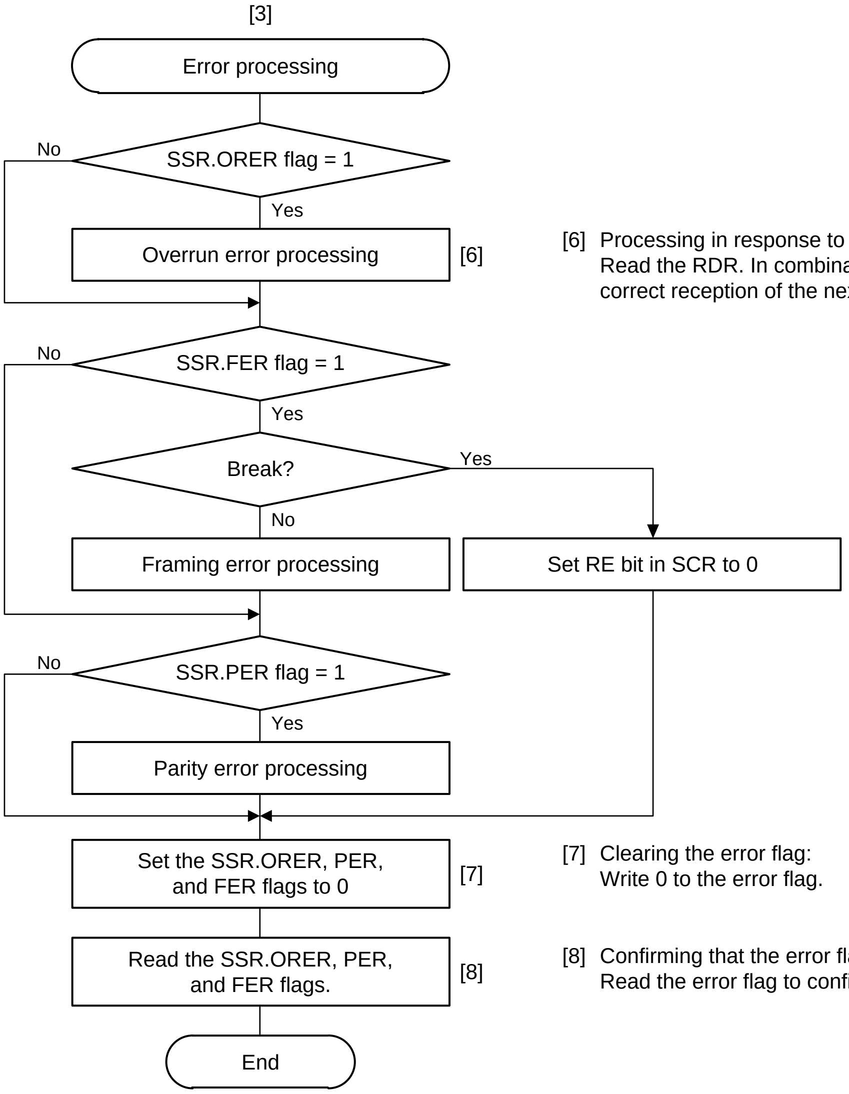
[2][3] Receive error processing and break detection:
If a receive error occurs, an ERI interrupt is generated. An error is identified by reading the ORER, PER, and FER flags in SSR. After performing the appropriate error processing, be sure to set the ORER, PER, and FER flags to 0. Reception cannot be resumed if any of these flags is set to 1. In the case of a framing error, a break can be detected by reading the value of the input port corresponding to the RXDn pin.

[4] Read the receive data in RDR once in the RXI interrupt handling routine.

[5] Serial reception continuation procedure:
To continue serial reception, before the stop bit of the current frame is received, read data from RDR in the RXI interrupt processing routine.
The RDR data can also be read by activating the DMAC.

Note 1. The RDR register becomes the RDRH and RDRL registers when 9-bit data length is selected. Read data in the order from RDRH to RDRL.

Figure 23.12 Example Flowchart of Serial Reception in Asynchronous Mode (1)



[6] Processing in response to an overrun error:
Read the RDR. In combination with step [7], this will make correct reception of the next frame possible

[7] Clearing the error flag:
Write 0 to the error flag.

[8] Confirming that the error flag is cleared:
Read the error flag to confirm that its value is 0.

Note 1. The RDR register becomes the RDRL register when 9-bit data length is selected. Reading the RDRH register is not necessary.

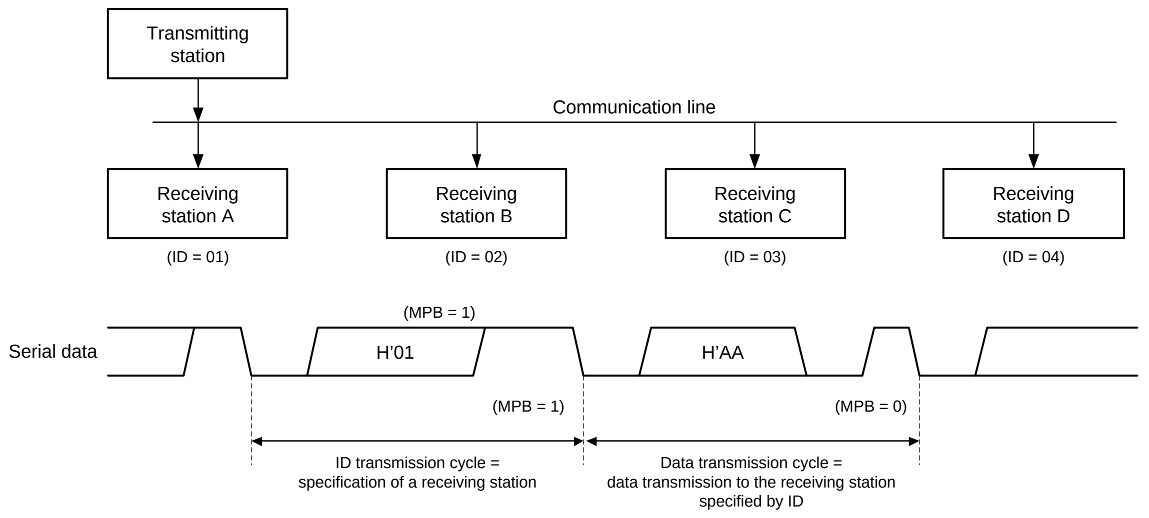
Figure 23.13 Example Flowchart of Serial Reception in Asynchronous Mode (2)

23.4 Multi-Processor Communications Function

Using the multi-processor communication functions enables to transmit and receive data by sharing a communication line between multiple processors by using asynchronous serial communication in which the multi-processor bit is added. In multi-processor communication, a unique ID code is allocated to each receiving station. Serial communication cycles consist of an ID transmission cycle to specify the receiving station and a data transmission cycle to transmit data to the specified receiving station. The multi-processor bit is used to distinguish between the ID transmission cycle and the data transmission cycle. When the multi-processor bit is set to 1, it indicates the ID transmission cycle and when the multi- processor bit is set to 0, it indicates the data transmission cycle. **Figure 23.14** shows an example of communication between processors by using a multi-processor format. First, a transmitting station transmits communication data in which the multi-processor bit set to 1 is added to the ID code of the receiving station. Next, the transmitting station transmits the communication data in which the multi-processor bit set to 0 is added to the transmit data. Upon receiving the communication data in which the multi-processor bit is set to 1, the receiving station compares the received ID with the ID of the receiving station itself and if the two match, receives the communication data that is subsequently transmitted. If the received ID does not match with the ID of the receiving station, the receiving station skips the communication data until again receiving the communication data in which the multi-processor bit is set to 1.

For supporting this function, the SCI provides the MPIE bit in SCR. When the MPIE bit is set to 1, transfer of receive data from the RSR to the RDR (the RDRH and RDRL registers when 9-bit data length is selected), detection of a receive error, and setting the respective status flags ORER and FER in SSR are disabled until reception of data in which the multi-processor bit is set to 1. Upon receiving a reception character in which the multi-processor bit is set to 1, the MPBT bit in SSR is set to 1 and the MPIE bit in SCR is automatically cleared, thus returning to a normal reception operation. During this time, an RXI interrupt is generated if the RIE bit in SCR is set.

When the multi-processor format is specified, specification of the parity bit is disabled. Apart from this, there is no difference from the operation in the normal asynchronous mode. A clock which is used for the multi-processor communication is also the same as the clock used in the normal asynchronous mode.

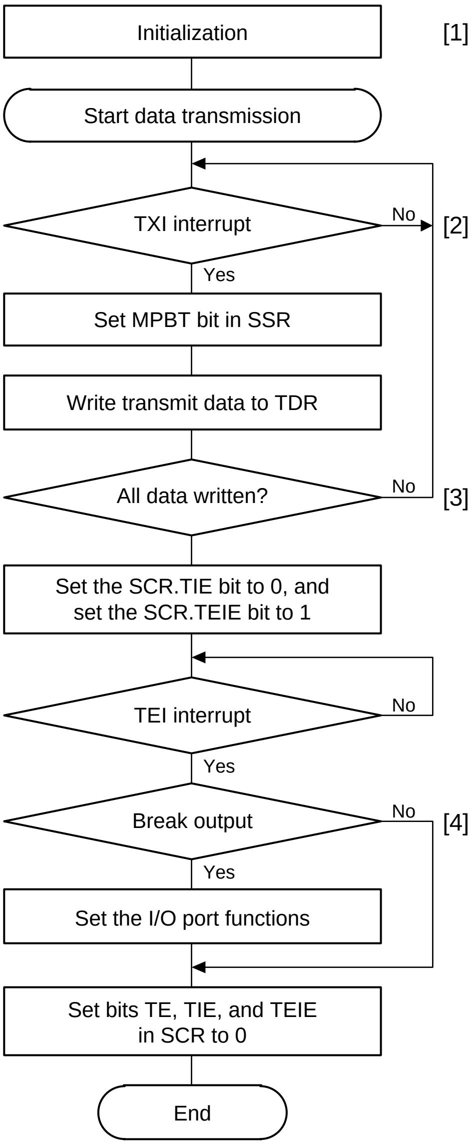


Note: MPB: Multi-processor bit

Figure 23.14 An Example of Communication using the Multi-Processor Format
(Example of Transmission of Data H'AA to Receiving Station A)

23.4.1 Multi-Processor Serial Data Transmission

Figure 23.15 is a sample flowchart of multi-processor data transmission. In the ID transmission cycle, the ID should be transmitted with the MPBT bit in SSR set to 1. In the data transmission cycle, the data should be transmitted with the MPBT bit set to 0. The other operations are the same as the operations in asynchronous mode.



[1] SCI initialization:
Set data transmission.
After the TE bit in SCR is set to 1, 1 is output for a frame, and transmission is enabled.

[2] TXI interrupt request:
When transmit data is transferred from TDR to TSR, a transmit data empty interrupt (TXI) request is generated.
Set the MPBT bit in SSR to 0 or 1, and write transmit data to TDR once in the TXI interrupt handling routine.

[3] Serial transmission continuation procedure:
To continue serial transmission, write transmit data to TDR once using a TXI interrupt request.
Transmit data can also be written to TDR by activating the DMAC.
When TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted are written to the TDR.

[4] Break output at the end of serial transmission:
To output a break in serial transmission, set the I/O port function corresponding to the TXDn pin (corresponding to output of the low level), and after switching the TXDn pin to the general I/O port function, set the TE bit in the SCR to 0.

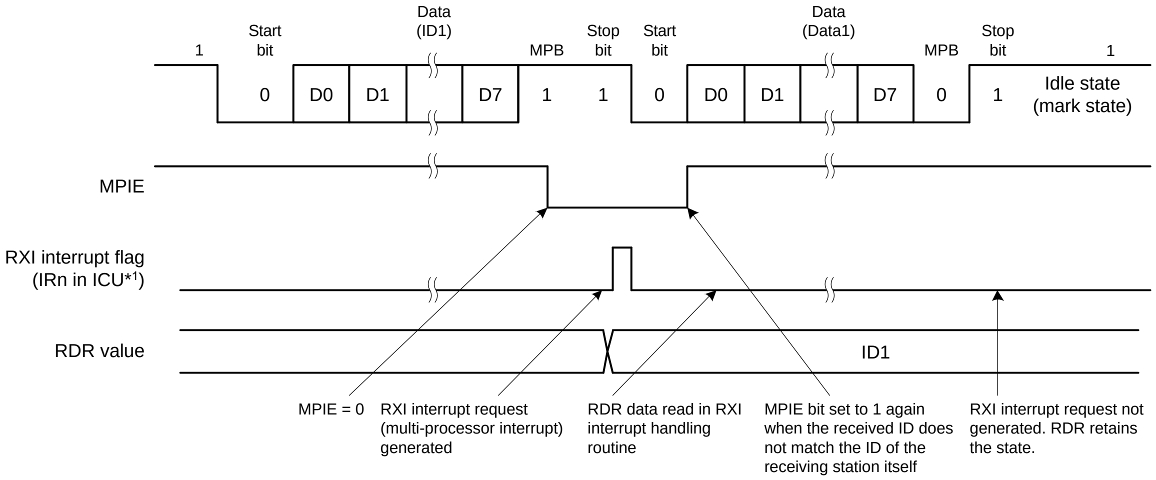
Note: The TDR register becomes the TDRH and TDRL registers when 9-bit data length is selected. Write data in the order from TDRH to TDRL.

Figure 23.15 Example of Multi-Processor Serial Transmission Flowchart

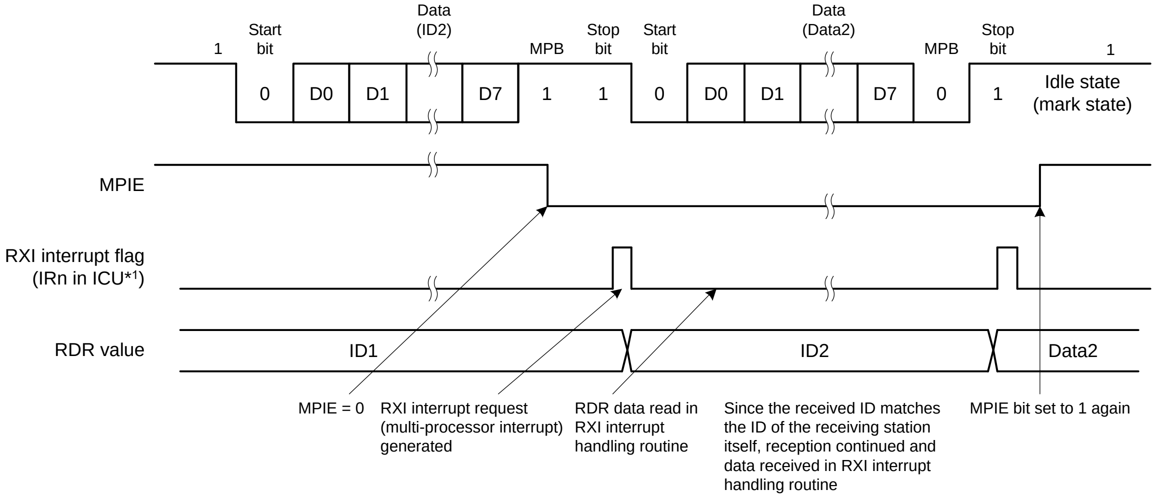
23.4.2 Multi-Processor Serial Data Reception

Figure 23.17 and **Figure 23.18** are sample flowcharts of multi-processor data reception. When the MPIE bit in SCR is set to 1, reading the communication data is skipped until reception of the communication data in which the multi-processor bit is set to 1. When the communication data in which the multi-processor bit is set to 1 is received, the received data is transferred to RDR (the RDRH and RDRL registers when 9-bit data length is selected). During this time, the RXI interrupt request is generated. The other operations are the same as the operations in asynchronous mode.

Figure 23.16 is the example of operation for reception.



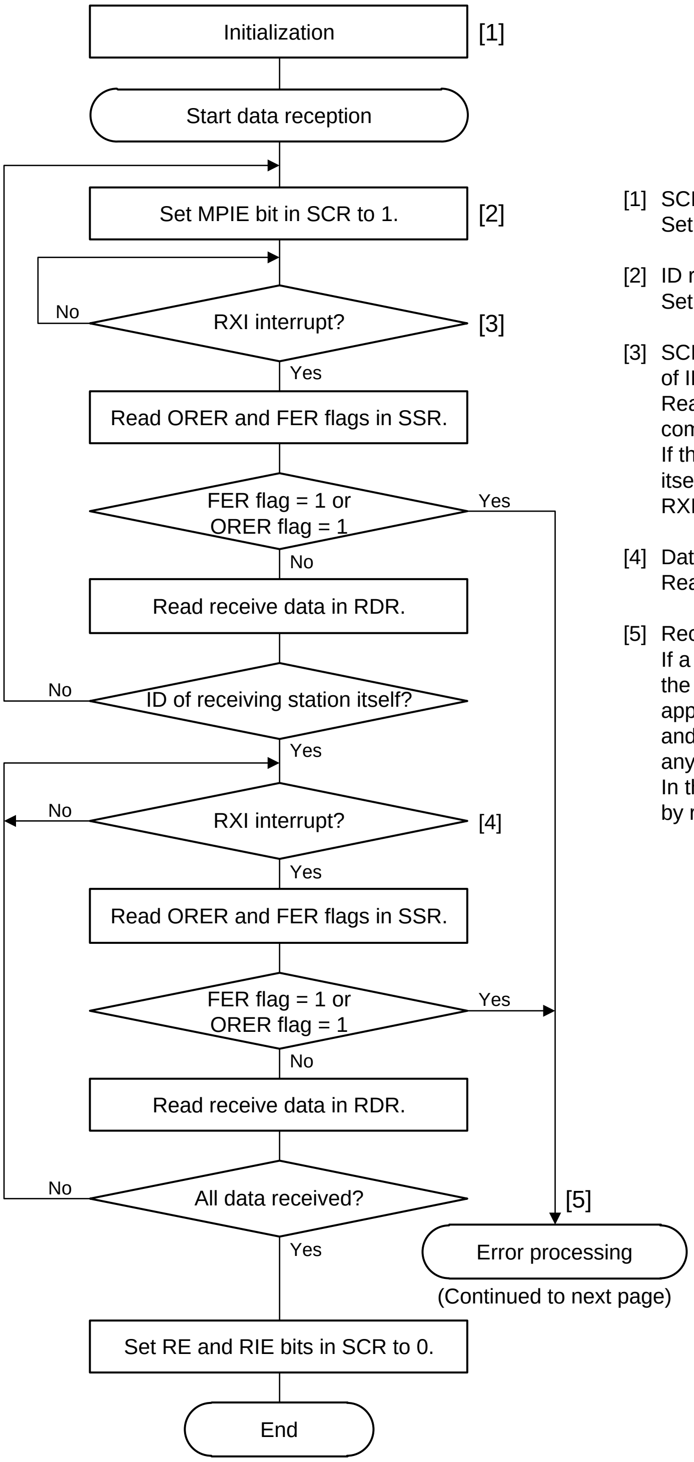
(a) When the received ID does not match the ID of the receiving station itself



(b) When the received ID matches the ID of the receiving station itself

Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.16 Example of SCI Reception (8-Bit Data/Multi-Processor Bit/1 Stop Bit)



[1] SCI initialization:
Set data reception.

[2] ID reception cycle:
Set the MPIE bit in SCR to 1 and wait for ID reception.

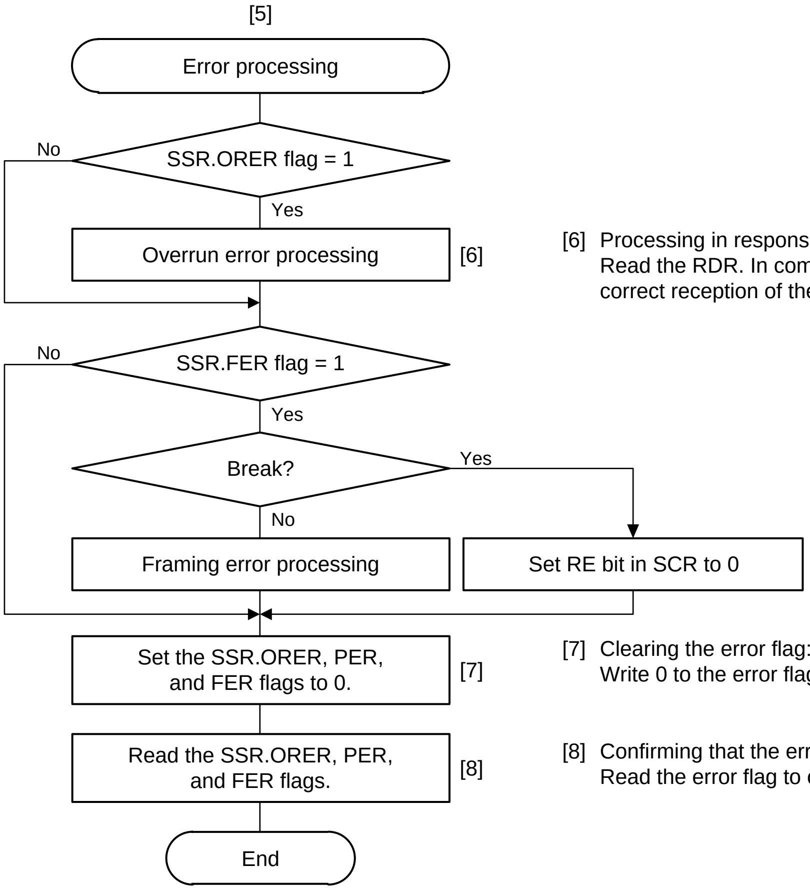
[3] SCI status confirmation and reception and comparison of ID:
Read data in RDR at the first RXI interrupt, and compare it with the ID of the receiving station itself.
If the ID does not match the ID of the receiving station itself, set the MPIE bit to 1 again, and wait for another RXI interrupt RXI interrupt request.

[4] Data reception at an RXI interrupt:
Read data in RDR once in the RXI interrupt routine.

[5] Receive error processing and break detection:
If a receive error occurs, an error is identified by reading the ORER and FER flags in SSR. After performing the appropriate error processing, be sure to set the ORER and FER flags to 0. Reception cannot be resumed if any of these flags is set to 1.
In the case of a framing error, a break can be detected by reading the value of the RXDn pin.

Note: The RDR register becomes the RDRH and RDRL registers when 9-bit data length is selected. Read data in the order from RDRH to RDRL.

Figure 23.17 Example of Multi-Processor Serial Reception Flowchart (1)



[6] Processing in response to an overrun error:
Read the RDR. In combination with step [7], this will make correct reception of the next frame possible.

[7] Clearing the error flag:
Write 0 to the error flag.

[8] Confirming that the error flag is cleared:
Read the error flag to confirm that its value is 0.

Note: The RDR register becomes the RDRH and RDRL registers when 9-bit data length is selected. Read data in the order from RDRH to RDRL.

Figure 23.18 Example of Multi-Processor Serial Reception Flowchart (2)

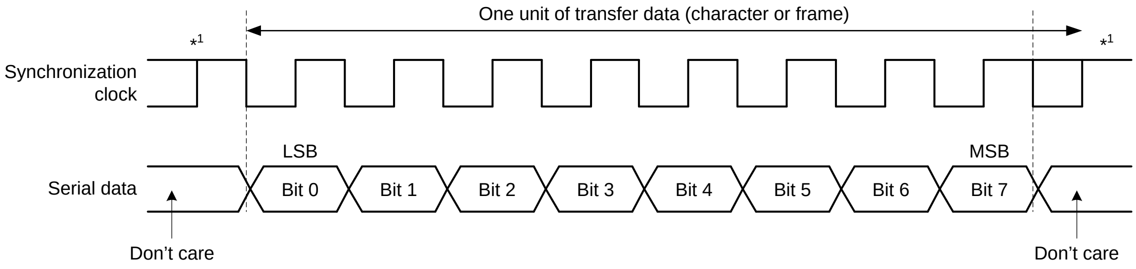
23.5 Operation in Clock Synchronous Mode

Figure 23.19 shows the data format for clock synchronous serial data communications.

In clock synchronous mode, data is transmitted or received in synchronization with clock pulses. One character in transfer data consists of 8-bit data. In clock synchronous mode, no parity bit can be added.

In data transmission, the SCI outputs data from one falling edge of the synchronization clock to the next. In data reception, the SCI receives data in synchronization with the rising edge of the synchronization clock. After 8-bit data is output, the communication line holds the last bit output state.

Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communications by use of a common clock. Both the transmitter and the receiver also have a double-buffered structure, so that the next transmit data can be written during transmission or the previous receive data can be read during reception, enabling continuous data transfer.



Note 1. Holds a high level except during continuous transfer.

Figure 23.19 Data Format in Clock Synchronous Serial Communications (LSB First)

23.5.1 Clock

Either an internal clock generated by the on-chip baud rate generator or an external synchronization clock input at the SCKn pin can be selected, according to the setting of the SCR.CKE[1:0] bits.

When the SCI is operated on an internal clock, the synchronization clock is output from the SCKn pin. Eight synchronization clock pulses are output in the transfer of one character, and when no transfer is performed the clock is held high. However, when only data reception is performed while the CTS function is disabled, the synchronization clock output is started at the same time when the SCR.RE bit set to 1. The synchronization clock is stopped at the high level when an overrun error occurs or the SCR.RE bit is set to 0.

When only data reception is performed and the CTS function is enabled, the clock output is not started even when the SCR.RE bit set to 1 if the CTSn# pin input is high when the SCR.RE bit is 0. The synchronization clock output is started when the SCR.RE bit is set to 1 and the CTSn# pin input is low. After that, if the CTSn# pin input is high on completion of the frame reception, the synchronization clock output is stopped at the high level. If the CTSn# pin input continues to be low, the synchronization clock is stopped at the high level when an overrun error occurs or the SCR.RE bit is set to 0.

23.5.2 CTS and RTS Functions

In the CTS function, CTSn# pin input is used to control reception/transmission start when the clock source is the internal clock. Setting the SECR.CTSE bit to 1 enables the CTS function.

When the CTS function is enabled, placing the low level on the CTSn# pin causes reception/transmission to start.

In the RTS function, RTSn# pin output is used to request reception/transmission start when the clock source is an external synchronizing clock. A low level is output when serial communications become possible. Conditions for output of the low and high level are shown below.

[Conditions for low-level output] Satisfaction of all conditions listed below

- The value of the RE or TE bit in the SCR is 1
- Neither transmission nor reception is in progress
- There are no received data yet to be read (when the SCR.RE bit is 1)
- Transmit data has been written (when the SCR.TE bit is 1)
- ORER flag in SSR is 0

[Condition for high-level output]

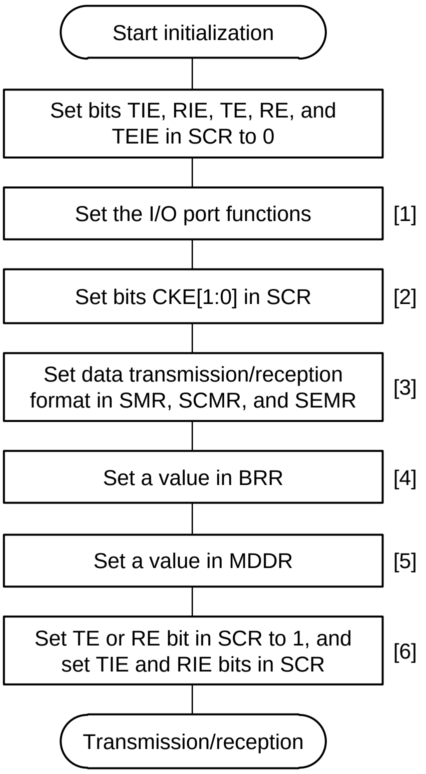
- The conditions for low-level output have not been satisfied.

23.5.3 SCI Initialization (Clock Synchronous Mode)

Before transmitting and receiving data, start by writing the initial value H'00 to the SCR and then continue through the procedure for SCI given in **Figure 23.20**. Whenever the operating mode or transfer format is changed, the SCR must be initialized before the change is made.

Note that setting the SCR.RE bit to 0 initializes neither the ORER, FER, and PER flags in SSR nor RDR.

Moreover, note that switching the value of the SCR.TE bit from 1 to 0 or 0 to 1 while the SCR.TIE bit is 1 leads to the generation of a TXI interrupt request.



[1] Make I/O port settings to enable input and output functions as required for TXDn, RXDn, and SCKn pins.

[2] Set the clock selection in SCR.
When an internal clock is selected, the SCK pin functions as the clock output pin.

[3] Set the data transmission/reception format in SMR, SCMR, and SEMR.

[4] Write a value corresponding to the bit rate to BRR. This step is not necessary if an external clock is used.

[5] Write the value obtained by correcting a bit rate error in MDDR. This step is not necessary if the BRME bit in SEMR is cleared to 0 or an external clock is used.

[6] Set the TE bit or RE bit in SCR to 1. Also set the TIE and RIE bits in SCR.
Setting the TE and RE bits allows TXDn and RXDn to be used.

Note: In simultaneous transmit and receive operations, the TE and RE bits in SCR should both be set to 0 or 1 simultaneously.

Figure 23.20 Example of SCI Initialization Flowchart (Clock Synchronous Mode)

23.5.4 Serial Data Transmission (Clock Synchronous Mode)

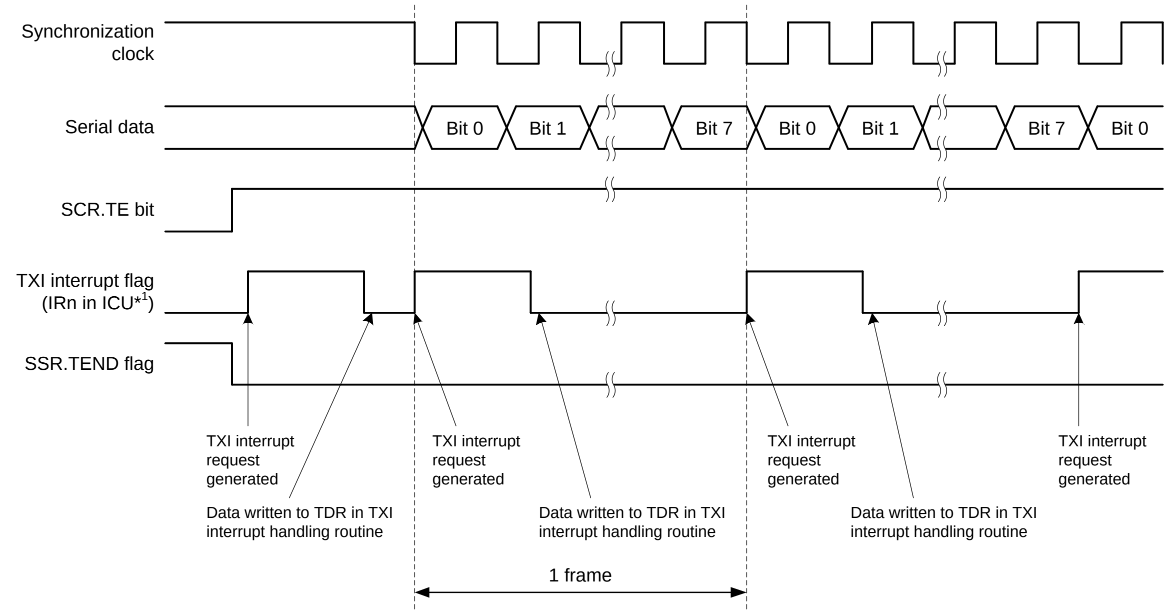
Figure 23.21, **Figure 23.22**, and **Figure 23.23** show an example of the operation for serial transmission in clock synchronous mode.

In serial data transmission, the SCI operates as described below.

1. The SCI transfers data from TDR to TSR when data is written to TDR in the TXI interrupt handling routine. The TXI interrupt request at the beginning of transmission is generated when the TE bit in SCR is set to 1 after the TIE bit in SCR is set to 1 or when these 2 bits are set to 1 simultaneously by a single instruction.
2. After transferring data from TDR to TSR, the SCI starts transmission. When the SCR.TIE bit is set to 1 at this time, a TXI interrupt request is generated. Continuous transmission is enabled by writing the next transmit data to TDR in this TXI interrupt handling routine before transmission of the current transmit data has finished. When TEI interrupt requests are in use, set the SCR.TIE bit to 0 (a TXI interrupt request is disabled) and the SCR.TEIE bit to 1 (a TEI interrupt request is enabled) after the last of the data to be transmitted are written to the TDR from the handling routine for TXI requests.
3. 8-bit data is sent from the TXDn pin in synchronization with the output clock when clock output mode has been specified and in synchronization with the input clock when use of an external clock has been specified. Output of the clock signal is suspended until the input CTS signal is at the low level while the CTSE bit in SECR is 1 (CTS function is enabled).
4. The SCI checks for updating of (writing to) the TDR at the time of the last bit output.
5. When TDR is updated, the next transmit data is transferred from TDR to TSR, and serial transmission of the next frame is started.
6. If TDR is not updated, set the SSR.TEND flag to 1 and the TXDn pin retains the output state of the last bit. If the TEIE bit in SCR is 1 at this time, a TEI interrupt request is generated. The SCKn pin is held high.

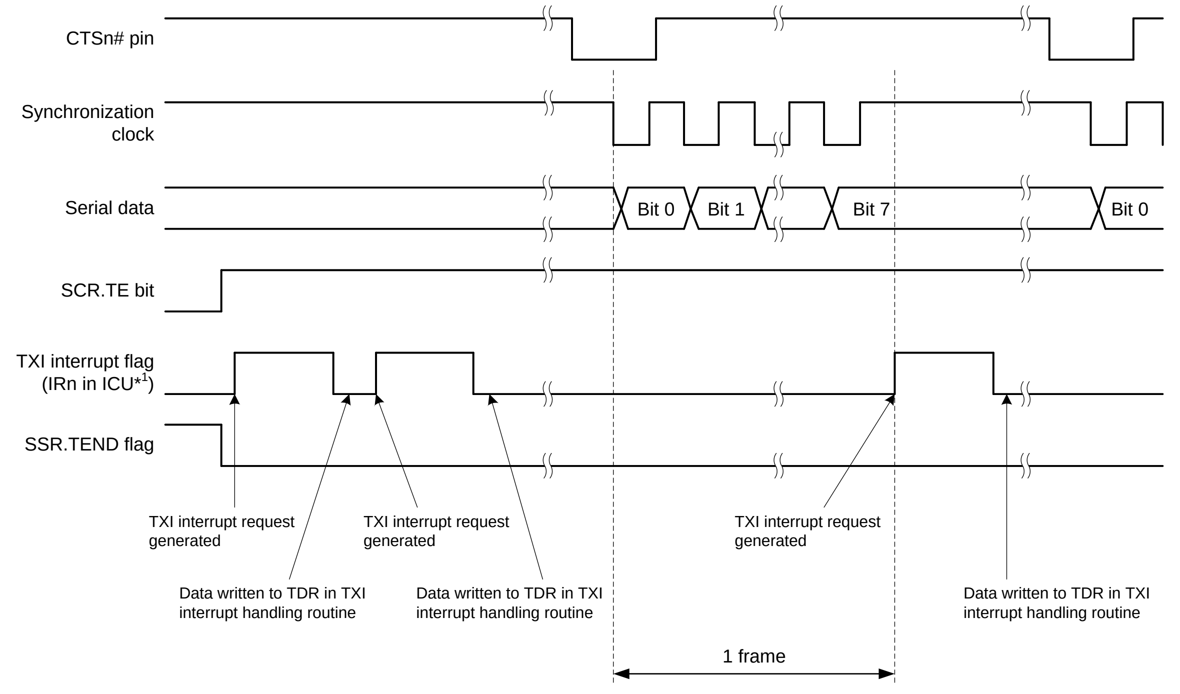
Figure 23.24 shows a sample flowchart of serial data transmission.

Transmission will not start while a receive error flag (ORER, FER, or PER in SSR) is set to 1. Be sure to set the receive error flags to 0 before starting transmission. Note that setting the RE bit in SCR to 0 does not clear the receive error flags.



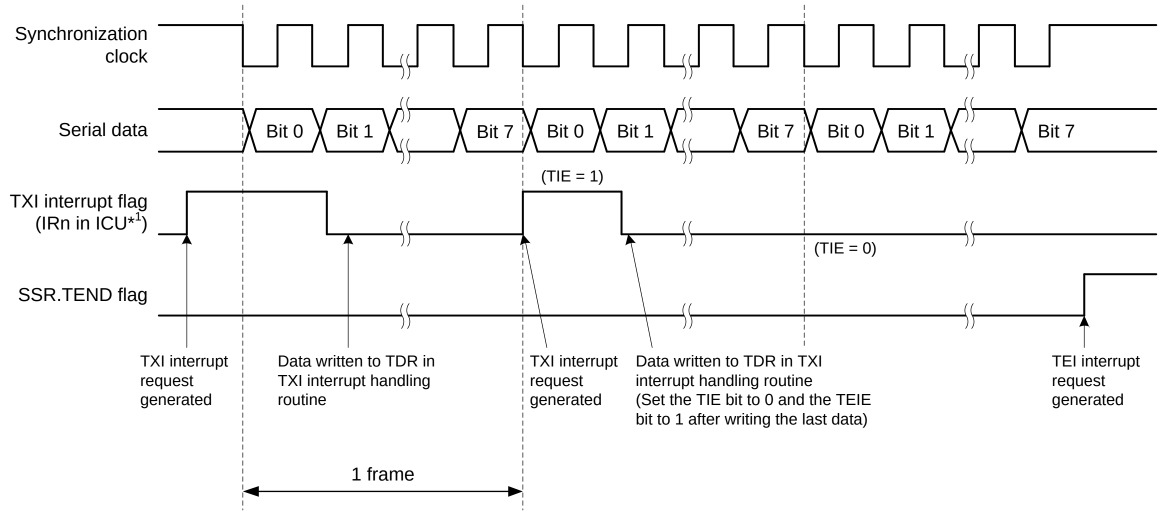
Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.21 Example of Serial Data Transmission in Clock Synchronous Mode (1)
(When the CTS Function is Not Used at the Beginning of Transmission)



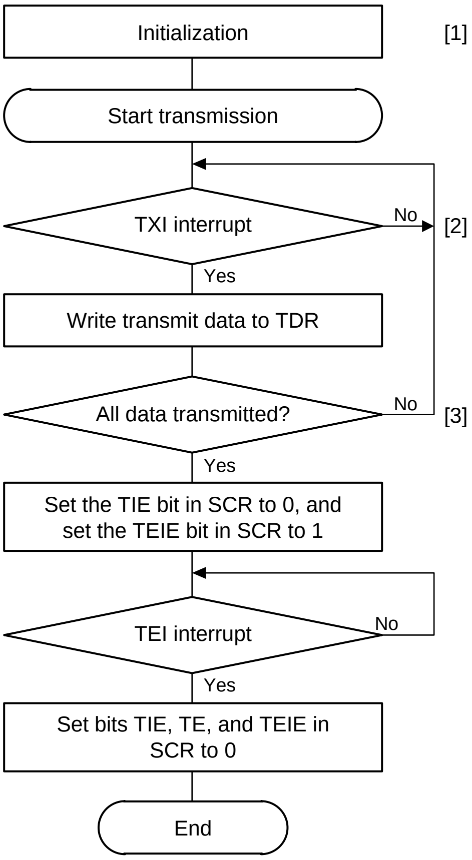
Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.22 Example of Serial Data Transmission in Clock Synchronous Mode (2) (When the CTS Function is Used at the Beginning of Transmission)



Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.23 Example of Serial Data Transmission in Clock Synchronous Mode (3)
(From the Middle of Transmission until Transmission Completion)



[1] SCI initialization:
Set data transmission.

[2] Writing transmit data write to TDR by a TXI interrupt request:
When transmit data is transferred from TDR to TSR, a transmit data empty interrupt (TXI) request is generated.
Transmit data is written to TDR once from the handling routine for TXI requests.

[3] Serial transmission continuation procedure:
To continue serial transmission, write transmit data to TDR upon accepting a transmit data empty interrupt (TXI) request. Transmit data can also be written to TDR by activating the DMAC by the TXI interrupt request. When TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted are written to the TDR.

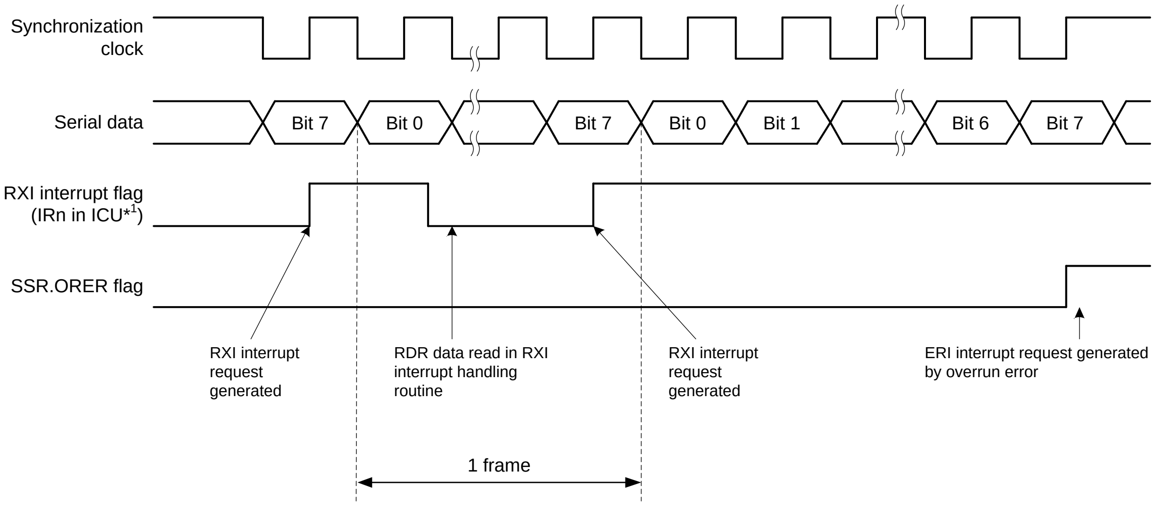
Note: When the external clock is in use (the value of the SCR.CKE[1:0] bits is 10b or 11b), the rising edge on the SCK pin for the last bit sets the SSR.TEND flag to 1. Setting the SCR.TE bit to 0 immediately after this may lead to insufficient received-data hold time on the receiver side.

Figure 23.24 Example Flowchart of Serial Transmission in Clock Synchronous Mode

23.5.5 Serial Data Reception (Clock Synchronous Mode)

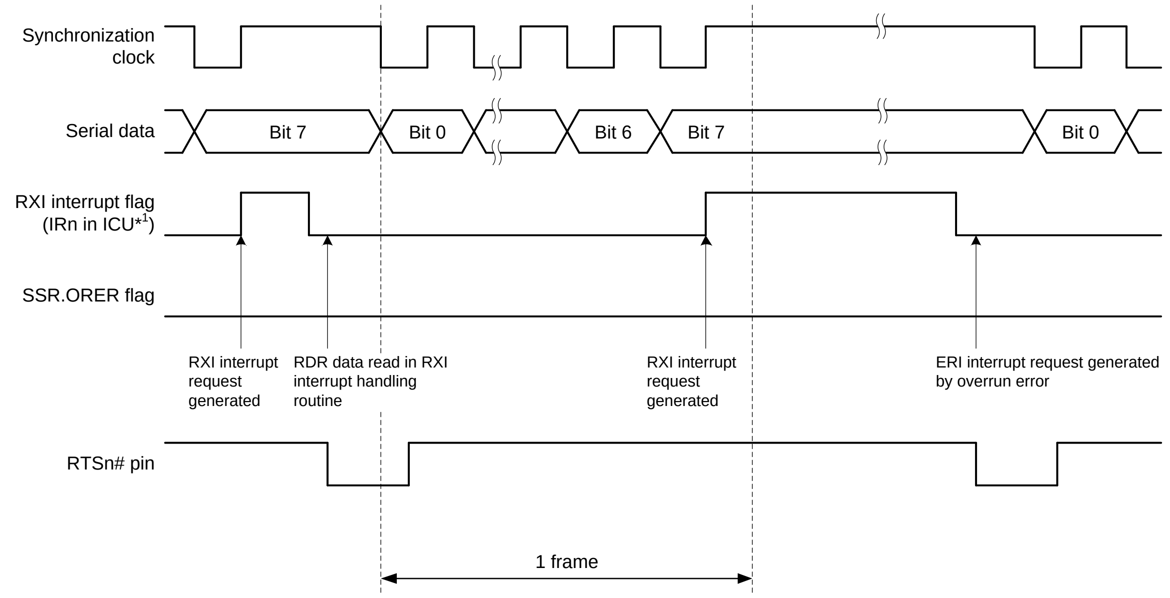
Figure 23.25 and **Figure 23.26** show an example of SCI operation for serial reception in clock synchronous mode. In serial data reception, the SCI operates as described below.

1. The value of the RE bit in SCR becoming 1 places the signal output on the RTSn# pin at the low level (when the RTS function is in use).
2. The SCI performs internal initialization and starts receiving data in synchronization with a synchronization clock input or output, and stores the receive data in RSR.
3. If an overrun error occurs, the ORER bit in SSR is set to 1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Receive data is not transferred to RDR.
4. When reception finishes successfully, receive data is transferred to RDR. If the RIE bit in SCR is 1 at this time, an RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to RDR in this RXI interrupt handling routine before reception of the next receive data is completed. Reading out the received data that have been transferred to RDR causes the RTSn# pin to output the low level (when the RTS function is in use).



Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.25 Example of Operation for Serial Reception in Clock Synchronous Mode (1) (When RTS Function is Not Used)

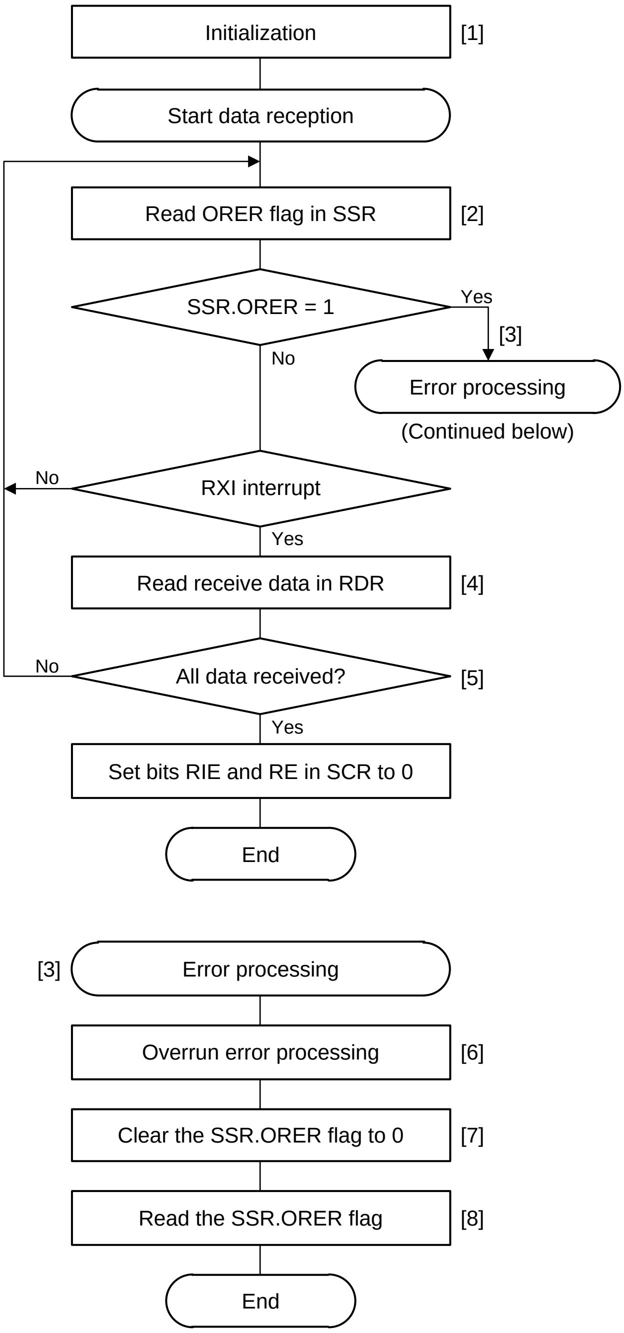


Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.26 Example of Operation for Serial Reception in Clock Synchronous Mode (2) (When RTS Function is Used)

Data transfer cannot be resumed while a receive error flag is 1. Accordingly, clear the ORER, FER, and PER bits in SSR to 0 before resuming reception. Moreover, be sure to read the RDR during overrun error processing. When a reception is forcibly terminated by setting the SCR.RE bit to 0 during operation, read RDR because received data which has not yet been read may be left in RDR.

Figure 23.27 shows a sample flowchart for serial data reception.



[1] SCI initialization:
Make input port-pin settings for pins to be used as RXDn pins.

[2][3] Receive error processing:
If a receive error occurs, read the ORER flag in SSR, perform the relevant error processing, and then set the ORER flag to 0. Data reception cannot be resumed while the ORER flag is 1.

[4] Read the receive data in RDR once in the receive data full interrupt (RXI) request handling routine.

[5] Serial reception continuation procedure:
To continue serial reception, before the MSB (bit 7) of the current frame is received, finish reading the receive data in RDR. The RDR data can also be read by activating the DMAC by an RXI interrupt request.

[6] Processing in response to an overrun error: Read the RDR. In combination with step [7], this will make correct reception of the next frame possible.

[7] Clearing the error flag:
Write 0 to the error flag.

[8] Confirming that the error flag is cleared:
Read the error flag to confirm that its value is 0.

Figure 23.27 Example Flowchart of Serial Reception in Clock Synchronous Mode

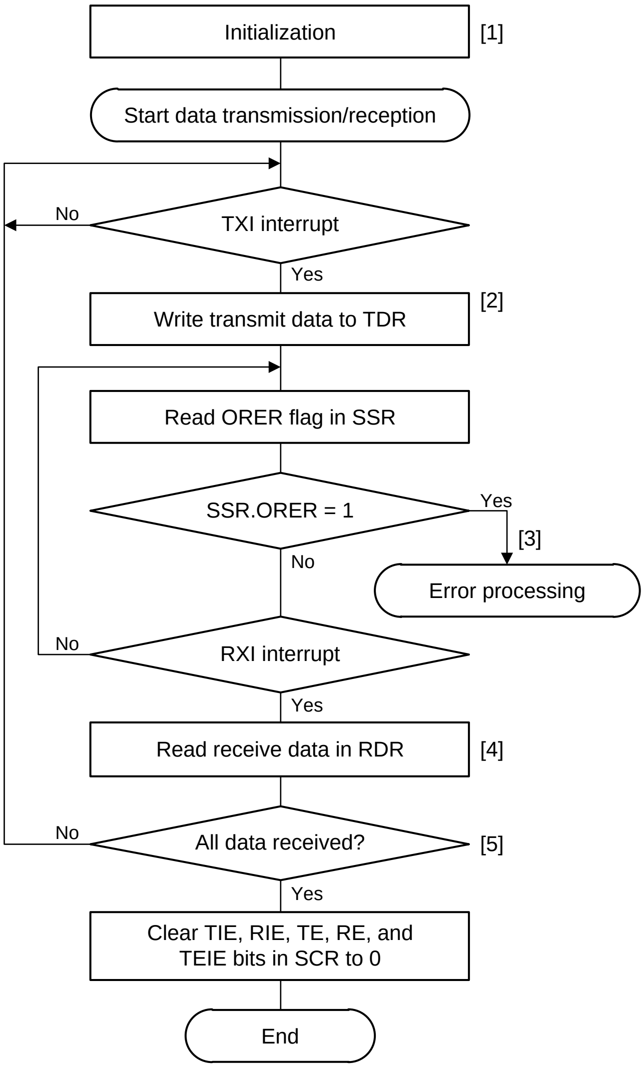
23.5.6 Simultaneous Serial Data Transmission and Reception (Clock Synchronous Mode)

Figure 23.28 shows a sample flowchart for simultaneous serial transmit and receive operations in clock synchronous mode.

After initializing the SCI, the following procedure should be used for simultaneous serial data transmit and receive operations.

To switch from transmit mode to simultaneous transmit and receive mode, check that the SCI has finished transmission by reading that the TEND flag in SSR is 1, and then initialize the SCR register. Then set the TIE, RIE, TE, and RE bits in SCR to 1 simultaneously by a single instruction.

To switch from receive mode to simultaneous transmit and receive mode, check that the SCI has finished reception, and then set the RIE and RE bits to 0. Then check that the receive error flags (ORER, FER, and PER in SSR) are 0, and then set the TIE, RIE, TE, and RE bits in SCR to 1 simultaneously by a single instruction.



[1] SCI initialization:
The TXDn pin can act as the output pin for transmitted data and the RXDn pin can act as the input pin for received data at the same time.

[2] Transmit data write:
Write transmit data to TDR once in the TXI interrupt handling routine.

[3] Receive error processing:
If a receive error occurs, read the ORER flag in SSR, perform the relevant error processing, and then set the ORER flag to 0. Data reception cannot be resumed while the ORER flag is 1.

[4] Reading receive data:
Read the receive data in RDR once in the RXI interrupt request handling routine.

[5] Serial transmission/reception continuation procedure:
To continue serial transmission and reception, before the MSB (bit 7) of the current frame is received, finish reading the receive data in RDR by the RXI interrupt. Also, before the MSB (bit 7) of the current frame is transmitted, write data to TDR by the TXI interrupt.
Transmit data can also be written to TDR by activating the DMAC by a transmit data empty interrupt (TXI) request. Similarly, the RDR data can also be read by activating the DMAC by a receive data full interrupt (RXI) request.

Note: When switching from transmit or receive operation to simultaneous transmit and receive operations first set the TIE, RIE, TE, RE, and TEIE bits in SCR to 0, and then set TIE, RIE, TE, and RE bits to 1 simultaneously.

Figure 23.28 Example Flowchart of Simultaneous Serial Transmission and Reception in Clock Synchronous Mode

23.6 Operation in Smart Card Interface Mode

The SCI supports smart card (IC card) interfaces conforming to ISO/IEC 7816-3 (standard for Identification Cards), as an extended function of the SCI.

Smart card interface mode can be selected using the appropriate register.

23.6.1 Sample Connection

Figure 23.29 shows a sample connection between a smart card (IC card) and this MCU.

As in the figure, since this MCU communicates with an IC card using a single transmission line, interconnect the TXDn and RXDn pins and pull up the data transmission line to VCC using a resistor.

Setting the TE and RE bits in SCR to 1 with an IC card disconnected enables closed transmission/reception allowing self-diagnosis.

To supply an IC card with the clock pulses generated by the SCI, input the SCKn pin output to the CLK pin of an IC card. The output port of this MCU can be used to output a reset signal.

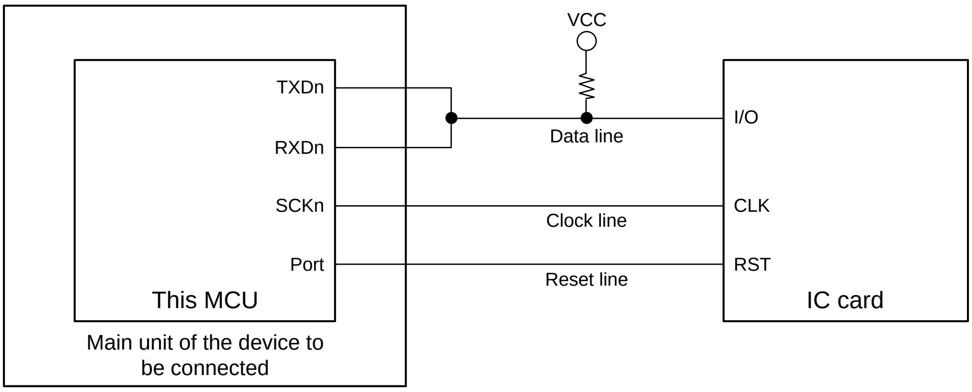


Figure 23.29 Sample Connection with a Smart Card (IC Card)

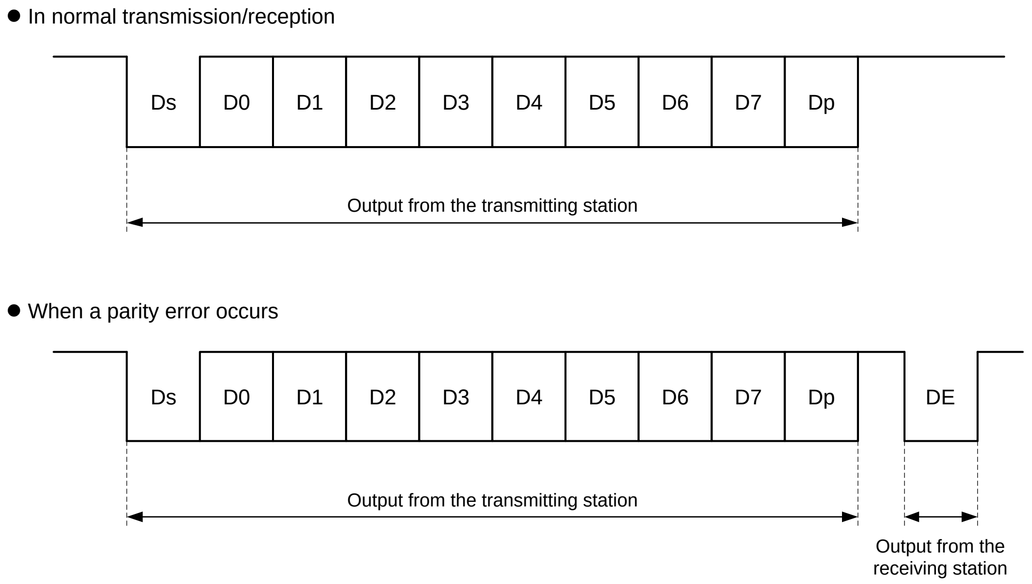
23.6.2 Data Format (Except in Block Transfer Mode)

Figure 23.30 shows the data transfer formats in smart card interface mode.

- One frame consists of 8-bit data and a parity bit in asynchronous mode.
- During transmission, at least 2 etu (elementary time unit: time required for transferring 1 bit) is secured as a guard time from the end of the parity bit until the start of the next frame.
- If a parity error is detected during reception, a low-level error signal is output for 1 etu after 10.5 etu has passed from the start bit.
- If an error signal is sampled during transmission, the same data is automatically retransmitted after at least 2 etu.



Note: Ds: Start bit
D0 to D7: Data bits
Dp: Parity bit
DE: Error signal

Figure 23.30 Data Formats in Smart Card Interface Mode

For communications with IC cards of the direct convention type and inverse convention type, follow the procedure below.

(1) Direct Convention Type

For the direct convention type, logic levels 1 and 0 correspond to states Z and A, respectively, and data is transferred with LSB first as the start character, as shown in **Figure 23.31**. Therefore, data in the start character in the figure is H’3B.

When using the direct convention type, write 0 to both the SDIR and SINV bits in SCMR. Write 0 to the PM bit in SMR in order to use even parity, which is prescribed by the smart card standard.

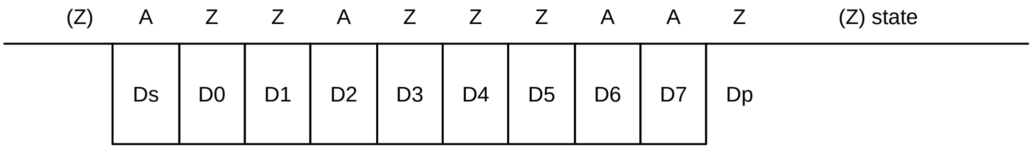


Figure 23.31 Direct Convention (SDIR in SCMR = 0, SINV in SCMR = 0, PM in SMR = 0)

(2) Inverse Convention Type

For the inverse convention type, logic levels 1 and 0 correspond to states A and Z, respectively and data is transferred with MSB first as the start character, as shown in **Figure 23.32**. Therefore, data in the start character in the figure is H’3F. When using the inverse convention type, write 1 to both the SDIR and SINV bits in SCMR. The parity bit is logic level 0 to produce even parity, which is prescribed by the smart card standard, and corresponds to state Z. Since the SINV bit of this MCU only inverts data bits D7 to D0, write 1 to the PM bit in SMR to invert the parity bit for both transmission and reception.

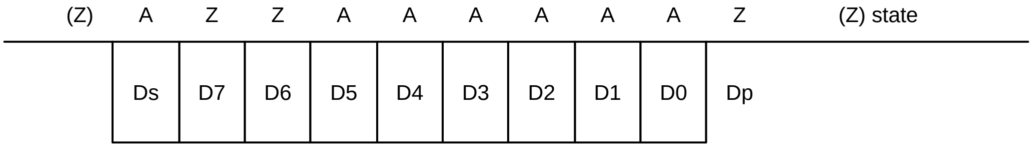

Figure 23.32 Inverse Convention (SDIR in SCMR = 1, SINV in SCMR = 1, PM in SMR = 1)

23.6.3 Block Transfer Mode

Block transfer mode is different from normal smart card interface mode in the following respects.

- Even if a parity error is detected during reception, no error signal is output. Since the PER bit in SSR is set by error detection, clear the PER bit before receiving the parity bit of the next frame.
- During transmission, at least 1 etu is secured as a guard time from the end of the parity bit until the start of the next frame.
- Since the same data is not retransmitted during transmission, the TEND flag in SSR is set 11.5 etu after transmission start.
- In block transfer mode, the ERS flag in SSR indicates the error signal status as in normal smart card interface mode, but the flag is read as 0 because no error signal is transferred.

23.6.4 Receive Data Sampling Timing and Reception Margin

Only the internal clock generated by the on-chip baud rate generator can be used as a transfer clock in smart card interface mode.

In this mode, the SCI can operate on a base clock with a frequency of 32, 64, 372, 256, 93, 128, 186, or 512 times the bit rate according to the settings of the BCP2 bit in SCMR and the BCP[1:0] bits in SMR (the frequency is always 16 times the bit rate in normal asynchronous mode).

For data reception, the falling edge of the start bit is sampled with the base clock to perform internal synchronization. Receive data is sampled on the 16th, 32nd, 186th, 128th, 46th, 64th, 93rd, and 256th rising edges of the base clock so that it can be latched at the middle of each bit as shown in **Figure 23.33**. The reception margin here is determined by the following formula.

$$M = \left| \left(0.5 - \frac{1}{2N}\right) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100\ [\%]$$

M: Reception margin (%)
N: Ratio of bit rate to clock (N = 32, 64, 372, 256) D: Duty cycle of clock (D = 0 to 1.0)
L: Frame length (L = 10)
F: Absolute value of clock frequency deviation

Assuming values of F = 0, D = 0.5, and N = 372 in the above formula, the reception margin is determined by the formula below.

$$M = \{0.5 - 1/(2 \times 372)\} \times 100\ [\%] = 49.866\%$$

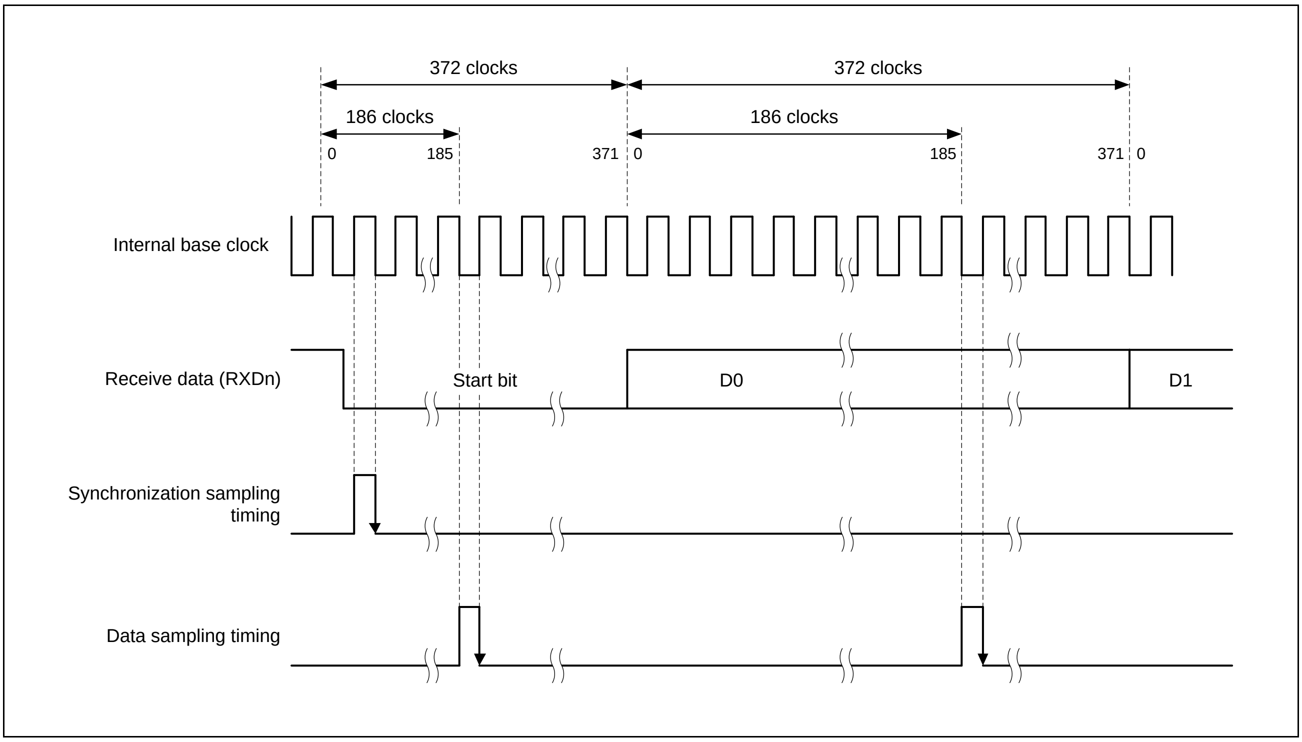

Figure 23.33 Receive Data Sampling Timing in Smart Card Interface Mode (When Clock Frequency is 372 Times the Bit Rate)

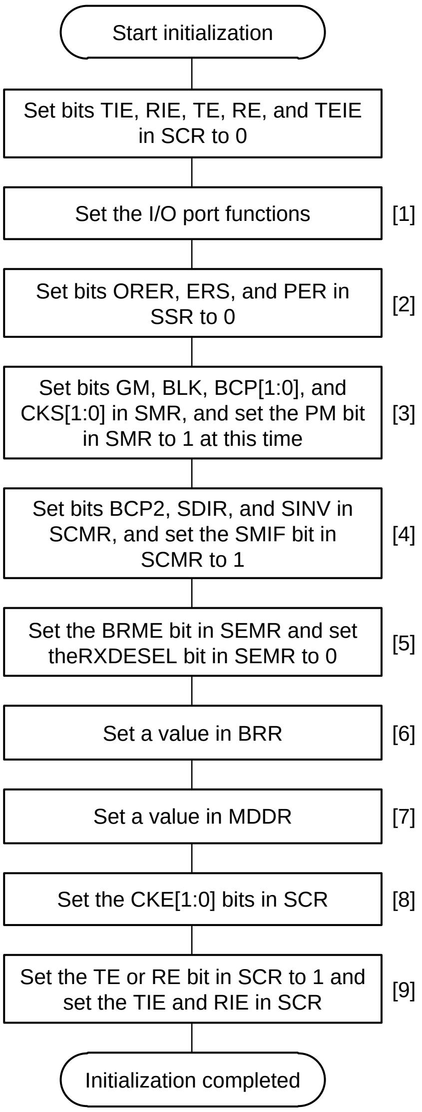
23.6.5 SCI Initialization (Smart Card Interface Mode)

Initialize the SCI following the example of flowchart shown in **Figure 23.34**.

Be sure to initialize the SCI before switching from transmission mode to reception mode and vice versa. Even if the RE bit is set to 0, the RDR register is not initialized.

To change reception mode to transmission mode, first check that reception has completed, and then initialize the SCI. At the end of initialization, set TE = 1 and RE = 0. Reception completion can be verified by reading the RXI request, ORER, or PER flag in SSR.

To change transmission mode to reception mode, first check that transmission has completed, and then initialize the SCI. At the end of initialization, set TE = 0 and RE = 1. Transmission completion can be verified by reading the TEND flag in SSR.



[1] Set the I/O ports so that the necessary pin functions can be enabled among the TXDn, RXDn, and SCKn pins.

[2] Set the ORER, ERS, and PER bits in SSR to 0.
After reading SSR, write 0 in the target bits.

[3] Set the transmission/reception format in SMR.

[4] Set the transmission/reception format in SCMR.
The TXDn and RXDn pins enter the high-impedance state.

[5] Set the BRME bit in SEMR and set the RXDESEL bit in SEMR to 0.

[6] Write the value corresponding to the bit rate in BRR.

[7] Write the value obtained by correcting a bit rate error in MDDR. This step is not necessary if the bit rate modulation function is not used.

[8] Set the CKE[1:0] bits in SCR.
When the CKE[0] bit is set to 1, the clock is output from the SCKn pin.

[9] Set the TE or RE bit in SCR to 1 and set the TIE, and RIE bits in SCR.
Do not simultaneously set the TE and RE bits to 1 if self-diagnosis is not used.

Figure 23.34 Example of SCI Initialization Flowchart (Smart Card Interface Mode)

23.6.6 Serial Data Transmission (Except in Block Transfer Mode)

Serial data transmission in smart card interface mode (except in block transfer mode), in that an error signal is sampled and data can be retransmitted, is different from that in non-smart card interface mode. **Figure 23.35** shows the data retransfer operation during transmission.

1. When an error signal from the receiver end is sampled after one-frame data has been transmitted, the ERS flag in SSR is set to 1. If the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Clear the ERS flag to 0 before the next parity bit is sampled.
2. For a frame in which an error signal is received, the TEND flag in SSR is not set. Data is retransferred from TDR to TSR allowing automatic data retransmission.
3. If no error signal is returned from the receiver, the ERS flag is not set to 1.
4. In this case, the SCI judges that transmission of one-frame data (including retransfer) has been completed, and the TEND flag is set. If the TIE bit in SCR is 1 at this time, a TXI interrupt request is generated. Writing transmit data to TDR starts transmission of the next data.

Figure 23.37 shows a sample flowchart of serial transmission. All the processing steps are automatically performed using a TXI interrupt request to activate the DMAC.

When the TEND flag in SSR is set to 1 in transmission, if the TIE bit in SCR is 1, a TXI interrupt request is generated. The DMAC is activated by a TXI interrupt request if the TXI interrupt request is specified as a source of DMAC activation beforehand, allowing transfer of transmit data. The TEND flag is automatically set to 0 when the DMAC transfers the data.

If an error occurs, the SCI automatically retransmits the same data. During this retransmission, the TEND flag is kept to 0 and the DMAC is not activated. Therefore, the SCI and DMAC automatically transmit the specified number of bytes, including retransmission in the case of error occurrence. However, since the ERS flag is not automatically cleared, set the RIE bit to 1 beforehand to enable an ERI interrupt request to be generated at error occurrence, and clear the ERS flag to 0. When transmitting/receiving data using the DMAC, be sure to make settings to enable the DMAC before making SCI settings.

For DMAC settings, refer to **Section 14, Direct Memory Access Controller**.

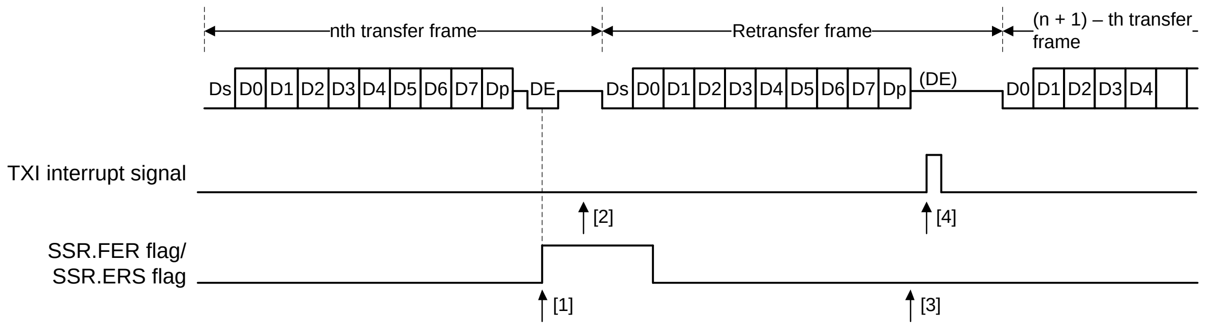


Figure 23.35 Data Retransfer Operation in SCI Transmission Mode

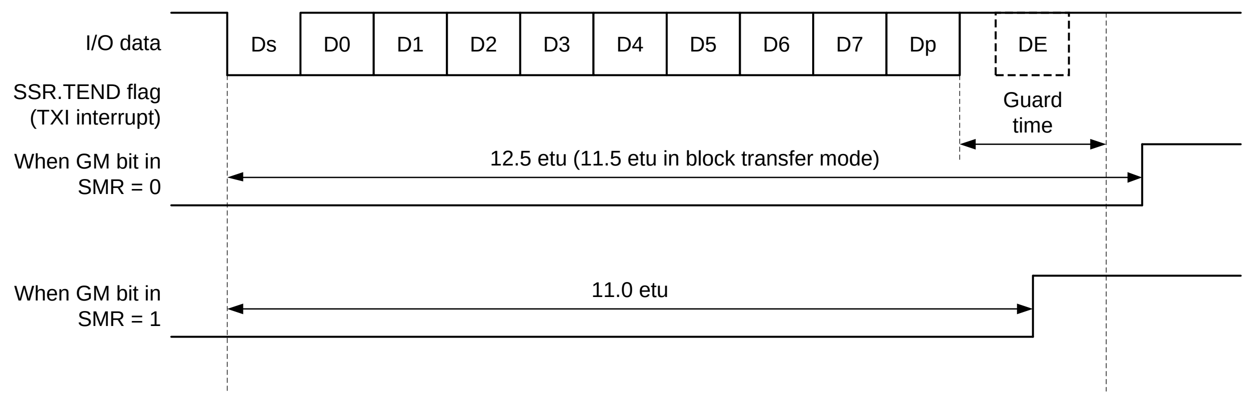
Note that the SSR.TEND flag is set in different timings depending on the GM bit setting in SMR. **Figure 23.36** shows the TEND flag generation timing.



Note: Ds: Start bit
D0 to D7: Data bits
Dp: Parity bit
DE: Error signal

Figure 23.36 SSR.TEND Flag Generation Timing during Transmission

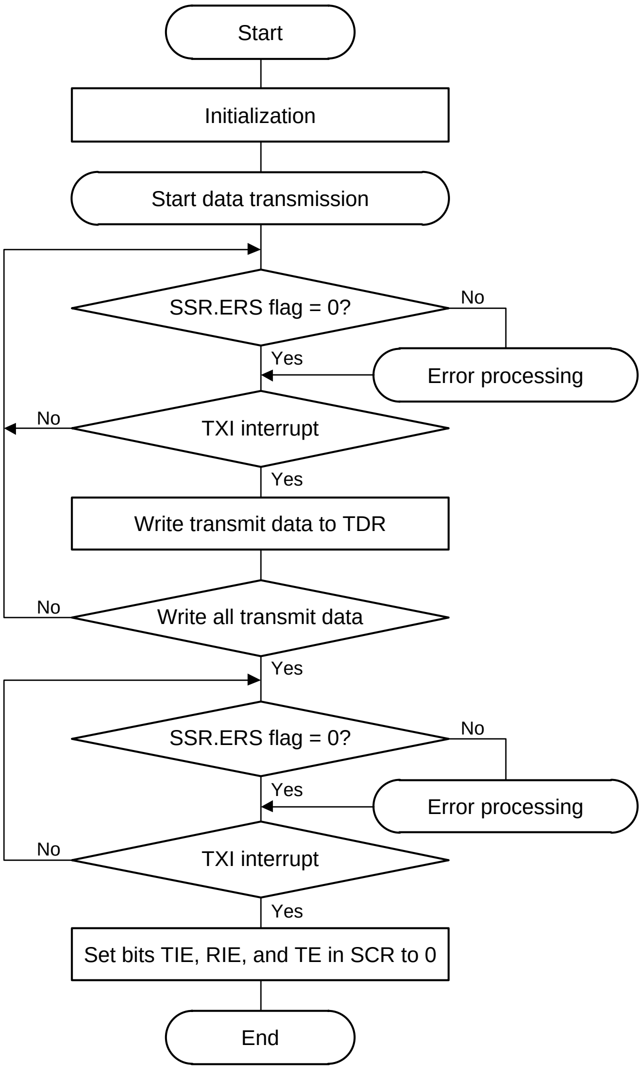


Figure 23.37 Sample Smart Card Interface Transmission Flowchart

23.6.7 Serial Data Reception (Except in Block Transfer Mode)

Serial data reception in smart card interface mode is similar to that in non-smart card interface mode. **Figure 23.38** shows the data retransfer operation in reception mode.

1. If a parity error is detected in receive data, the PER flag in SSR is set to 1. When the RIE bit in SCR is 1 at this time, an ERI interrupt request is generated. Clear the PER flag to 0 before the next parity bit is sampled.
2. For a frame in which a parity error is detected, no RXI interrupt is generated.
3. When no parity error is detected, the PER flag in SSR is not set to 1.
4. In this case, data is determined to have been received successfully. When the RIE bit in SCR is 1, an RXI interrupt request is generated.

Figure 23.39 shows a sample flowchart for serial data reception. All the processing steps are automatically performed using an RXI interrupt request to activate the DMAC.

In reception, setting the RIE bit to 1 allows an RXI interrupt request to be generated. The DMAC is activated by an RXI interrupt request if the RXI interrupt request is specified as a source of DMAC activation beforehand, allowing transfer of receive data.

If an error occurs during reception and either the ORER or PER flag in SSR is set to 1, a receive error interrupt (ERI) request is generated. Clear the error flag after the error occurrence. If an error occurs, the DMAC is not activated and receive data is skipped. Therefore, the number of bytes of receive data specified in the DMAC is transferred.

Even if a parity error occurs and the PER flag is set to 1 during reception, receive data is transferred to RDR, thus allowing the data to be read.

When a reception is forcibly terminated by setting the RE bit in SCR to 0 during operation, read the RDR register because the received data which has not yet been read may be left in RDR.

NOTE

For operations in block transfer mode, refer to **Section 23.3, Operation in Asynchronous Mode**.

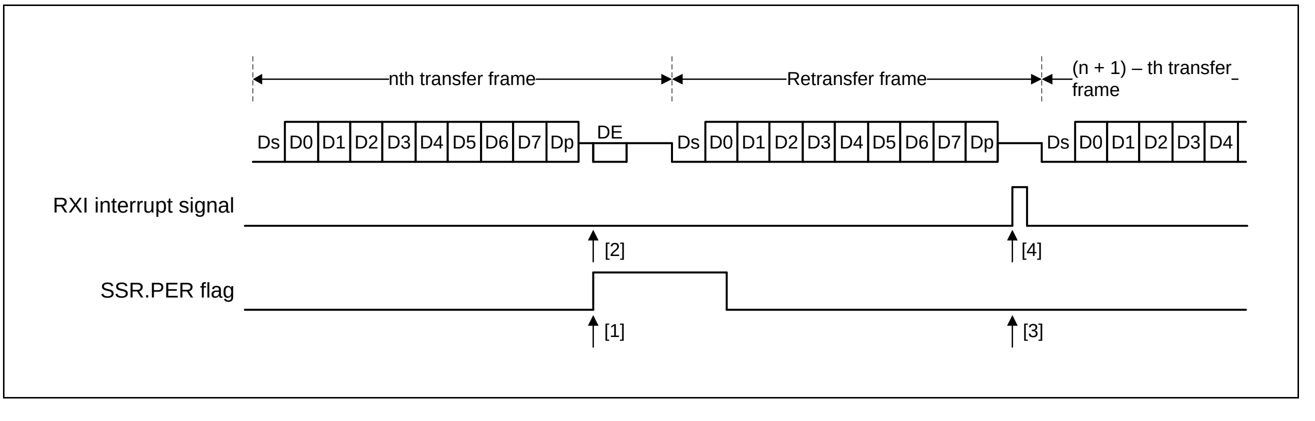

Figure 23.38 Data Retransfer Operation in SCI Reception Mode (Data Retransfer Operation during Reception)

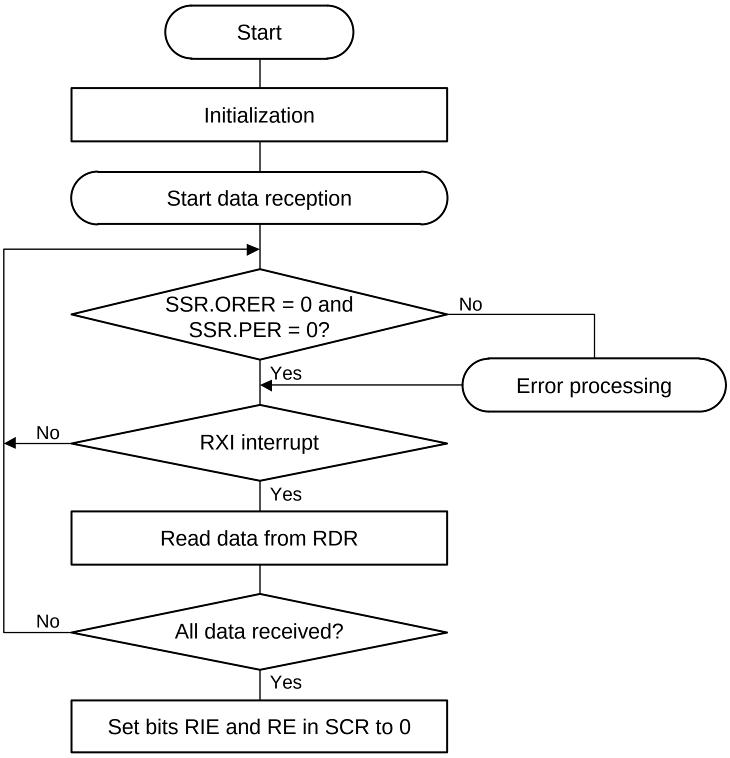

Figure 23.39 Sample Smart Card Interface Reception Flowchart

23.6.8 Clock Output Control

Clock output can be fixed using the CKE[1:0] bits in SCR when the GM bit in SMR is 1. Specifically, the minimum width of a clock pulse can be specified.

Figure 23.40 shows an example of clock output fixing timing when the CKE[0] bit is controlled with GM = 1 and CKE[1] = 0.

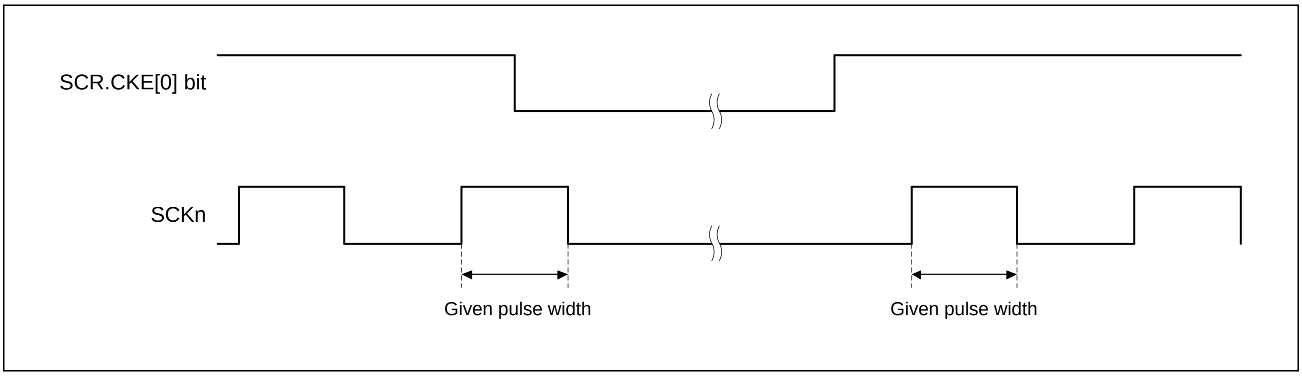

Figure 23.40 Clock Output Fixing Timing

At power-on, use the following procedure to secure the appropriate clock duty cycle.

(1) At Power-On

To secure the appropriate clock duty cycle simultaneously with power-on, use the following procedure.

1. Initially, port input is enabled in the high-impedance state. To fix the potential level, use a pull-up or pull-down resistor.
2. Fix the SCKn pin to the specified output by setting the SCR.CKE[1] bit and I/O port functions.
3. Set SMR and SCMR to enable smart card interface mode.
4. Set the SCR.CKE[0] bit to 1 to start clock output.

23.7 Noise Cancellation Function

Figure 23.41 shows the configuration of the noise filter used for noise cancellation. The noise filter consists of two stages of flip-flop circuits and a match-detection circuit. When the level on the pin matches in three consecutive samples taken at the set sampling interval, the matching level continues to be conveyed internally until the level on the pin again matches in three consecutive samples.

In asynchronous mode, the noise cancellation function can be applied on the RXDn input signal. The period of the base clock (1/16th of a bit-period when SEMR.ABCS = 0 and 1/8th of a bit-period when SEMR.ABCS = 1) is the sampling interval.

If the base clock is stopped with the noise filter enabled and then the clock input is started again, the noise filter operation resumes from where the clock was stopped. If SCR.TE and SCR.RE are set to 0 during base clock input, all of the noise filter flip-flop values are initialized to 1. Accordingly, if the input data is 1 when reception operation resumes, it is determined that a level match is detected and is conveyed to the internal signal. When the level being input corresponds to 0, the initial output of the noise filter is retained until the level matches in three consecutive samples.

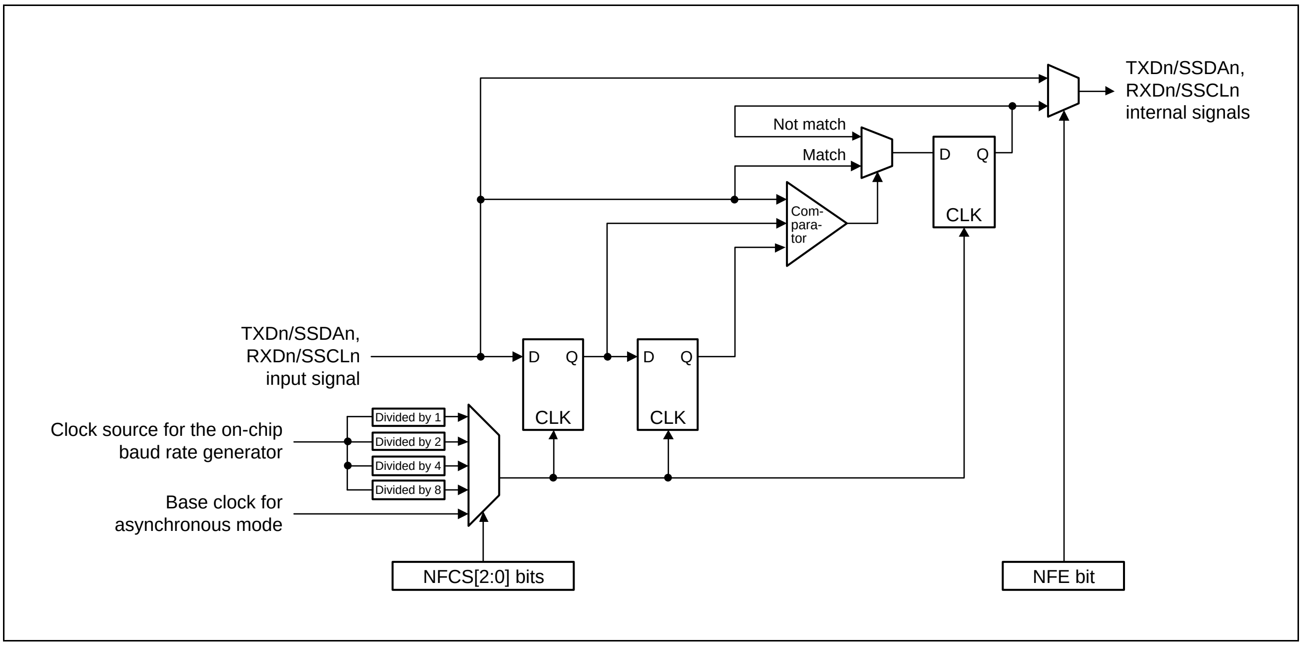

Figure 23.41 Block Diagram of Digital Noise Filter Circuit

23.8 Interrupt Sources

23.8.1 Buffer Operations for TXI and RXI Interrupts

If the conditions for a TXI and RXI interrupt are satisfied while the interrupt status flag in the interrupt controller is 1, the interrupt controller does not output the interrupt request but retains it internally (with a capacity for retention of one request per source).

When the value of the interrupt status flag in the interrupt controller becomes 0, the interrupt request retained within the interrupt controller is output. The internally retained interrupt request is automatically discarded once the actual interrupt is output. Clearing of the corresponding interrupt enable bit (the TIE or RIE bit in the SCR) can also be used to discard an internally retained interrupt request.

23.8.2 Interrupts in Asynchronous Mode and Clock Synchronous Mode

Table 23.20 lists interrupt sources in asynchronous mode and clock synchronous mode. A different interrupt vector is assigned to each interrupt source, and individual interrupt sources can be enabled or disabled with the enable bits in SCR. If the SCR.TIE bit is 1, a TXI interrupt request is generated when transmit data is transferred from the TDR or TDRL register*[1] to the TSR. A TXI interrupt request can also be generated by setting the SCR.TE bit to 1 after setting the SCR.TIE bit to 1 or by using a single instruction to set the SCR.TE and SCR.TIE bit to 1 at the same time. A TXI interrupt request can activate the DMAC to handle data transfer.

A TXI interrupt request is not generated by setting the SCR.TE bit to 1 while the setting of the SCR.TIE bit is 0 or by setting the SCR.TIE bit to 1 while the setting of the SCR.TE bit is 1.*[1]

When new data is not written by the time of transmission of the last bit of the current transmit data and the setting of the SCR.TEIE bit is 1, the SSR.TEND flag becomes 1 and a TEI interrupt request is generated. Furthermore, when the setting of the SCR.TE bit is 1, the SSR.TEND flag retains the value 1 until further transmit data are written to the TDR or TDRL register*[1], and setting the SCR.TEIE bit to 1 leads to the generation of a TEI interrupt request.

Writing data to the TDR or TDRL register*[1] leads to clearing of the SSR.TEND flag and, after a certain time, discarding of the TEI interrupt request.

If the SCR.RIE bit is 1, an RXI interrupt request is generated when received data is stored in the RDR. An RXI interrupt request can activate the DMAC to handle data transfer.

Setting of any from among the ORER, FER, and PER flags in the SSR to 1 while the SCR.RIE bit is 1 leads to the generation of an ERI interrupt request. An RXI interrupt request is not generated at this time. Clearing all three flags (ORER, FER, and PER) leads to discarding of the ERI interrupt request.

Note 1. In the case where asynchronous mode and 9-bit data length are selected

NOTE

To temporarily prohibit TXI interrupts at the time of transmission of the last of the data and so on when you wish a new round of transmission to start after handling of the transmission-completed interrupt, control prohibiting and permitting of the interrupt by using the interrupt request enable bit in the interrupt controller rather than using the SCR.TIE bit. This can prevent the suppression of TXI interrupt requests in the transfer of new data.

Table 23.20 Interrupt Sources

Name	Interrupt Source	Interrupt Flag	DMAC Activation	Priority
ERI	Receive error	ORER, FER, or PER	Not possible	High
RXI	Receive data full	—	Possible	↑
TXI	Transmit data empty	—	Possible	↑
TEI	Transmit end	TEND	Not possible	Low

23.8.3 Interrupts in Smart Card Interface Mode

Table 23.21 lists interrupt sources in smart card interface mode. A transmit end interrupt (TEI) request cannot be used in this mode.

Table 23.21 SCI Interrupt Sources

Name	Interrupt Source	Interrupt Flag	DMAC Activation	Priority
ERI	Receive error or error signal detection	ORER, PER, or ERS	Not possible	High
RXI	Receive data full	—	Possible	↑
TXI	Transmit data empty	TEND	Possible	Low

Data transmission/reception using the DMAC is also possible in smart card interface mode, similar to in the normal SCI mode. In transmission, when the TEND flag in SSR is set to 1, a TXI interrupt request is generated. This TXI interrupt request activates the DMAC allowing transfer of transmit data if the TXI request is specified beforehand as a source of DMAC activation. The TEND flag is automatically set to 0 when the DMAC transfers the data.

If an error occurs, the SCI automatically retransmits the same data. During the retransmission, the TEND flag is kept to 0 and the DMAC is not activated. Therefore, the SCI and DMAC automatically transmit the specified number of bytes, including retransmission in the case of error occurrence. However, the ERS flag in SSR is not automatically cleared to 0 at error occurrence. Therefore, the ERS flag must be cleared by previously setting the RIE bit in SCR to 1 to enable an ERI interrupt request to be generated at error occurrence.

When transmitting/receiving data using the DMAC, be sure to make settings to enable the DMAC before making SCI settings. For DMAC settings, refer to **Section 14, Direct Memory Access Controller**.

In reception, an RXI interrupt request is generated when receive data is set to RDR. This RXI interrupt request activates the DMAC allowing transfer of receive data if the RXI request is specified beforehand as a source of DMAC activation. If an error occurs, the error flag is set. Therefore, the DMAC is not activated and an ERI interrupt request is issued to the CPU instead; the error flag must be cleared.

23.9 Usage Notes

23.9.1 Break Detection and Processing

When a framing error is detected, a break can be detected by reading the RXDn pin value directly. In a break, the input from the RXDn pin becomes all 0s, and so the FER flag in SSR is set to 1 (framing error has occurred), and the PER flag in SSR may also be set to 1 (parity error has occurred). The SCI continues the receive operation even after a break is received. Therefore, note that even if the FER flag is set to 0 (no framing error occurred), it will be set to 1 again. When the SEMR.RXDESEL bit is 1, the SCI sets the SSR.FER flag to 1 and stops receiving operation until a start bit of the next data frame is detected. If the SSR.FER flag is set to 0 at this time, the SSR.FER flag retains 0 during the break.

When the RXDn pin is set to 1 and the break ends, detecting the beginning of the start bit at the first falling edge of the RXDn pin allows the SCI to start the receiving operation.

23.9.2 Mark State and Production of Breaks

When the SCR.TE bit is 0 (serial transmission is disabled), setting the I/O port function makes selection of the level and direction (input or output) of the TXDn pin possible. If this is done, the TXDn pin can be placed in the mark state to send a break at the time of data transmission. Until the SCR.TE bit is set to 1 (serial transmission is enabled), the I/O port function is used to set the TXDn pin to output 1 and set the pin mode to a general I/O port pin, and thus place the communication line in the mark state (state of having the value 1). On the other hand, to output a break at the time of data transmission, set the TXDn pin to output 0 and make the pin mode settings for a general I/O port pin. When the SCR.TE bit is set to 0, the transmitter is initialized regardless of the current state of transmission.

23.9.3 Receive Error Flags and Transmit Operations (Clock Synchronous Mode)

Transmission cannot be started when a receive error flag (ORER) in SSR is set to 1, even if data is written to TDR. Be sure to set the receive error flags to 0 before starting transmission. Note also that the receive error flags cannot be set to 0 even if the RE bit in SCR is set to 0 (serial reception is disabled).

23.9.4 Writing Data to TDR

Data can be written to TDR, TDRH, and TDRL. However, if new data is written to TDR, TDRH, and TDRL when transmit data is remaining in TDR, TDRH, and TDRL, the previous data in TDR, TDRH, and TDRL is lost because it has not been transferred to TSR yet. Be sure to write transmit data to TDR, TDRH, and TDRL in the TXI interrupt request handling routine.

23.9.5 Restrictions on Clock Synchronous Transmission (Clock Synchronous Mode)

When the external clock source is used as a synchronization clock, the following restrictions apply.

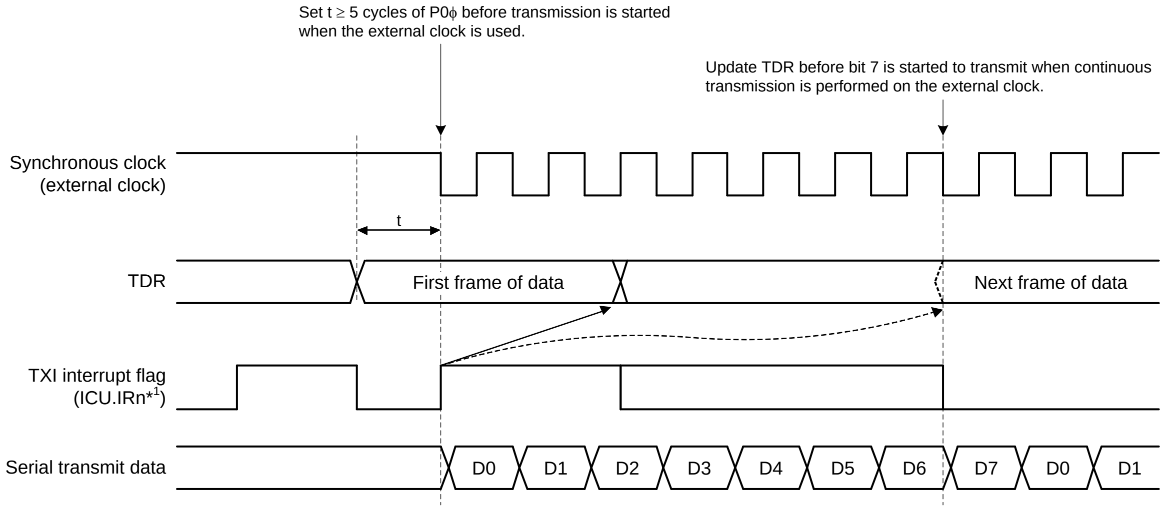
(1) Start of transmission

Update TDR by the CPU or DMAC and wait for at least five P0ϕ cycles before allowing the transmit clock to be input (see **Figure 23.42**).

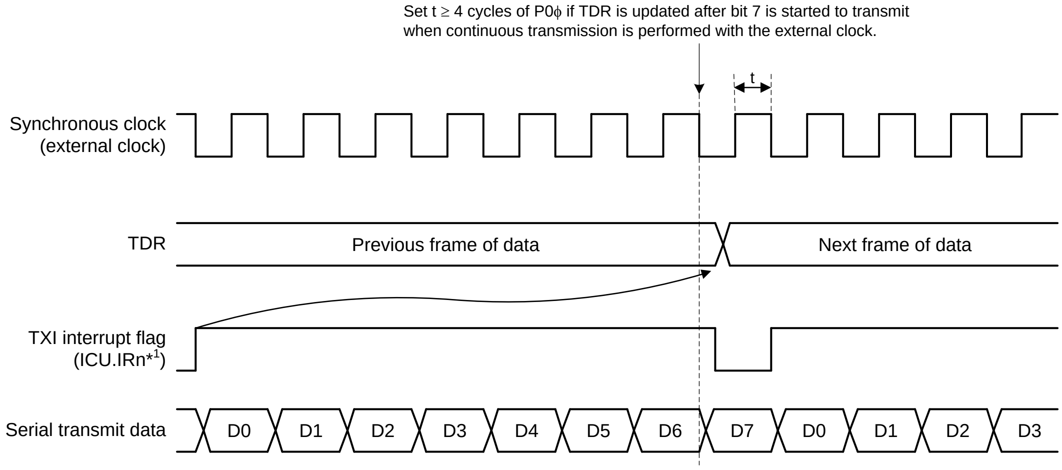
(2) Continuous transmission

(a) Write the next transmit data to TDR or TDRL before the falling edge of the transmit clock (bit 7) (see **Figure 23.42**).

(b) When updating TDR after bit 7 has started to transmit, update TDR while the synchronization clock is in the low-level period, and set the high-level width of the transmit clock (bit 7) to four P0ϕ cycles or longer (see **Figure 23.42**).



(a) Start of transmission and Continuous transmission (1)



(b) Continuous transmission (2)

Note 1. Refer to **Section 8, Interrupt Controller** for details on the corresponding interrupt vector number.

Figure 23.42 Restrictions on Use of External Clock in Clock Synchronous Transmission

23.9.6 Restrictions on Using DMAC

When using the DMAC or DTC to read RDR, RDRH, and RDRL, be sure to set the receive data full interrupt (RXI) as the activation source of the relevant SCI.

23.9.7 Notes on Starting Transfer

At the point where transfer starts when the interrupt status flag (IRn.IR bit) in the interrupt controller is 1, follow the procedure below to clear interrupt requests before permitting operations (by setting the SCR.TE or SCR.RE bit to 1). For details on the interrupt status flag, refer to **Section 8, Interrupt Controller**.

- Confirm that transfer has stopped (the setting of the SCR.TE or SCR.RE bits is 0).
- Set the corresponding interrupt enable bit (SCR.TIE or SCR.RIE) to 0.
- Read the corresponding interrupt enable bit (SCR.TIE or SCR.RIE bit) to check that it has become 0.
- Set the interrupt status flag (IRn.IR bit) in the interrupt controller to 0.

23.9.8 External Clock Input in Clock Synchronous Mode

In clock synchronous mode, the external clock SCKn must be input as follows:

High-pulse period, low-pulse period = 2 P0ϕ cycles or more, period = 6 P0ϕ cycles or more

23.9.9 Note on Transmit Enable Bit (TE bit)

When setting the SCR.TE bit to 0 (serial transmission is disabled) while the pin function is “TXDn”, output of the pin becomes high impedance.

Prevent the TXDn line from becoming high impedance by any of the following ways:

(1) Connect a pull-up resistor to the TXDn line.

(2) Change the pin function to “general-purpose I/O port, output” before setting the SCR.TE bit to 0. Set the SCR.TE bit to 1 before changing the pin function to “TXDn”.

23.10 IrDA Communications

The channel 0 serial communications interface (SCI) is capable of working with the Infrared Data Association (IrDA) module to handle transfer through IrDA communications in conformance with version 1.0 of the IrDA protocol.

Using the IRE bit in IRCR to enable the IrDA function leads to encoding and decoding of the SCI0_TXD and SCI0_RXD signals of the channel 0 serial communications interface, respectively, to convert them to and from waveforms in conformance with version 1.0 of the IrDA protocol. Infrared transfer in conformance with version 1.0 of the IrDA protocol can be handled by connecting a transceiver for use in infrared communications.

In version 1.0 of the IrDA protocol, IrDA transfer starts at a transfer rate of 9600 bps. The transfer rate is changeable during transfer as required. The IrDA module itself does not have a function for automatically changing the transfer rate. Accordingly, change the transfer rate by changing that for the serial communications interface.

A block diagram and pin configuration for IrDA transfer are shown in **Figure 23.43** and **Table 23.22**, respectively.

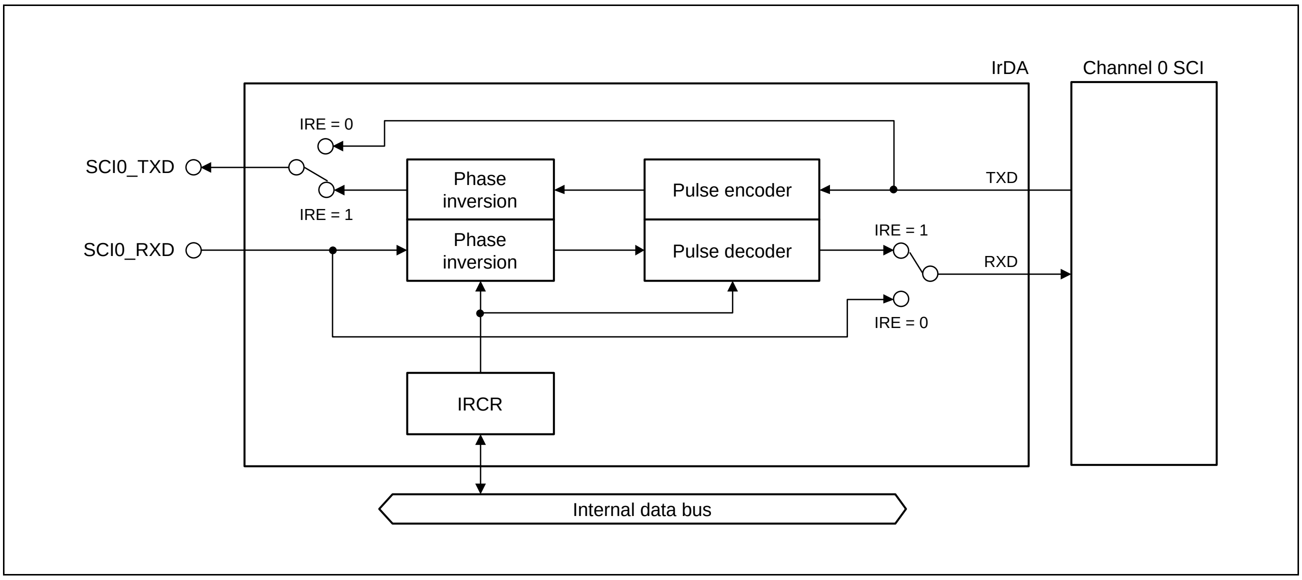


Figure 23.43 Block Diagram

Table 23.22 Pin Configuration

Pin Name	Symbol	I/O	Function
IrDA data transmission pin	SCI0_TXD	Output	IrDA data transmission output
IrDA data reception pin	SCI0_RXD	Input	IrDA data reception input

23.11 Description of the IrDA Register

Table 23.23 shows the register configuration.

BASE Address (Cortex-A55 Address Space): H’0_1004_CC00
BASE Address (Cortex-M33 Address Space Non-Secure): H’4004_CC00
BASE Address (Cortex-M33 Address Space Secure): H’5004_CC00

Table 23.23 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
IrDA Control Register	IRCR	R/W	H’00	H’0_1004_CC00	8

23.11.1 IrDA Control Register (IRCR)

IRCR sets the operation of the IrDA module.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
	IRE	IRCKS[2:0]			IRTXINV	IRRXINV	—	—
Initial Value	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
b1, b0	—		R	Reserved These bits are read as 0. The write value should be 0.
b2	IRRXINV		R/W	SCI_RXD0 Data Level Switching Sets inversion of the logic level of inputs on SCI0_RXD. 0: The input on SCI0_RXD is used without change as the received data. 1: The input on SCI0_RXD is inverted before it is treated as the received data.
b3	IRTXINV		R/W	SCI_TXD0 Data Level Switching Sets inversion of the logic level of outputs on SCI0_TXD. 0: Data for transmission is output without change to SCI0_TXD. The pulse-width setting in the IRCKS bits determines the period over which the pulses are at the high level. 1: Data for transmission is inverted before being output to SCI0_TXD. The pulse-width setting in the IRCKS bits determines the period over which the pulses are at the low level.
b6 to b4	IRCKS[2:0]		R/W	IrDA Clock Select Selects the pulse width for use in encoding output pulses from SCI0_TXD when the setting of the IRE bit is 1. 000: Bit rate × 3/16 Settings other than above are prohibited.
b7	IRE		R/W	IrDA Enable Sets the function for use with the SCI0_TXD and SCI0_RXD pins as normal serial or IrDA. 0: Disables the IrDA function. Data from the TXD pin of the channel 0 serial communications interface is output without change to SCI0_TXD. Data on SCI0_RXD is output without change to the RXD pin of the channel 0 serial communications interface. 1: Enables the IrDA function. Data from the TXD pin of the channel 0 serial communications interface is encoded before being output through SCI0_TXD. Data on SCI0_RXD is decoded before being output to the RXD pin of the channel 0 serial communications interface.

23.12 IrDA Operation

23.12.1 Flow of Settings for IrDA Operation

Set up IrDA operation by following the procedure listed below.

1. Make the general-purpose I/O port-pin settings.
2. Set the IRCR register.
3. Set the registers related to the serial communications interface.

23.12.2 Transmission

In transmission with the IrDA function enabled, serial data (UART frames of data) from the TXD pin of the serial communications interface are converted to IR frames (see **Figure 23.44**). If the IRTXINV bit is set to 0, when the value of the serial data is 0, a high-level pulse with the width equivalent to three sixteenths of the bit period is output to the SCI0_TXD pin by default. In the IrDA protocol, the specifiable high-level pulse widths are from a minimum of 1.41 µs to a maximum of (3/16 + 2.5%) × bit period or (3/16 × bit period) + 1.08 µs. On the other hand, if the value of the serial data is 1, no high-level pulse is output.

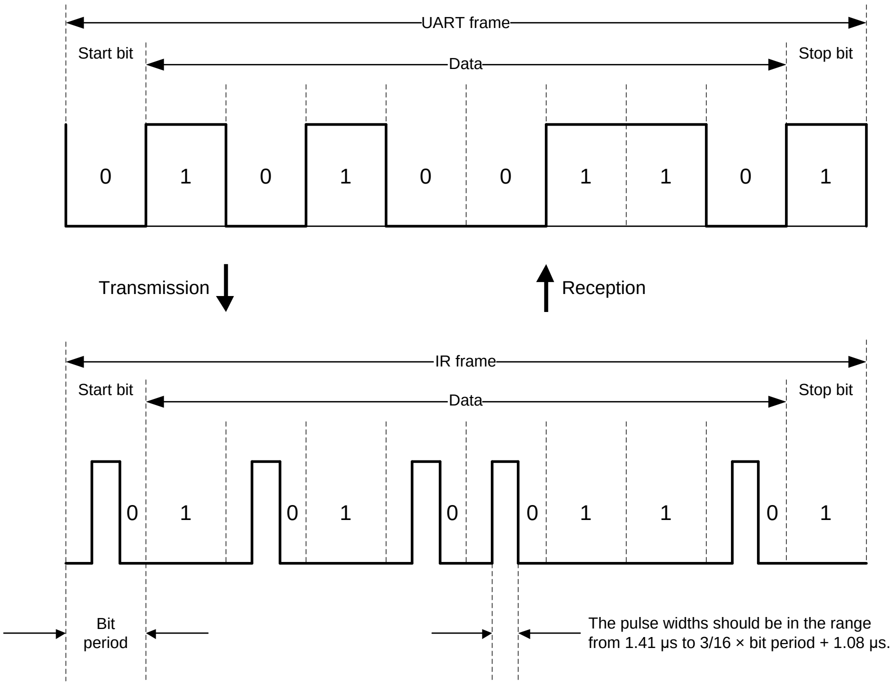

Figure 23.44 Example of the Operation in IrDA Transfer

23.12.3 Reception

In reception with the IrDA function enabled, IR frames of data from the SCI0_RXD pin are converted to serial data and output to the RXD pin of the serial communications interface. If the setting of the IRRXINV bit is 0, the value 0 is output when a high-level pulse is detected and the value 1 is output when no high-level pulse is detected during each bit period. Note that pulses with a width shorter than the minimum pulse width of 1.41 μs cannot be recognized.

23.12.4 Relationship between Bit Rate and High-Level Pulse Width

The relationship between the Bit Rate during transmission and the High-Level Pulse is shown in **Table 23.24**.

Table 23.24 Upper Row: Bit Rate (bps); Lower Row: Bit Period × 3/16 (μs)

2400	9600	19200	38400	57600	115200
78.13	19.53	9.77	4.88	3.26	1.63

23.13 Note on IrDA Usage

23.13.1 Minimum Pulse Width in Reception

Pulses with a width shorter than the minimum pulse width of 1.41 μs cannot be recognized

23.13.2 Base Clock in Asynchronous Mode for the Serial Communications Interface

The IrDA module works with the serial communications interface by receiving the base clock with a frequency 16 times the bit rate for communications from the interface. For the serial communications interface, either 16 or 8 cycles of the base clock are selectable as the bit period. On the other hand, the IrDA module is only capable of operation when the setting for the bit period of the serial communications interface is 16 cycles of the base clock.

24. Renesas Serial Peripheral Interface

This LSI circuit includes three independent Renesas serial peripheral interfaces.

This module is capable of full-duplex synchronous serial communication.

24.1.1 Features

This module has the following features.

SPI transfer functions

- Use of MOSI (master out/slave in), MISO (master in/slave out), SSL (slave select), and RSPCK (SPI clock) signals allows for serial communications through SPI operation (four-wire method).
- Capable of serial communications in master/slave mode
- Supports mode fault error detection (only in SPI slave mode)
- Supports overrun error detection (only in SPI slave mode)
- Switching of the polarity of the serial transfer clock
- Switching of the clock phase of serial transfer

Data format

- MSB-first/LSB-first selectable
- Transfer bit-length is selectable as 8, 16, or 32 bits.

Bit rate

- RSPCK can be divided by a maximum of 4096 in master mode
- RSPCK can be generated by dividing P0ϕ by the on-chip baud rate generator.
- An externally input clock can be used as a serial clock.

Buffer configuration

- 8 bytes for transmission and 32 bytes for reception

SSL control function

- One SSL signal for each channel
    - In master mode, outputs SSL signal.
    - In slave mode, inputs SSL signal.
- Controllable delay from SSL output assertion to RSPCK operation (RSPCK delay)
    - Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units)
- Controllable delay from RSPCK stoppage to SSL output negation (SSL negation delay)
    - Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units)
- Controllable wait for next-access SSL output assertion (next-access delay)
    - Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units)
- Function for changing SSL polarity

Control in master transfer

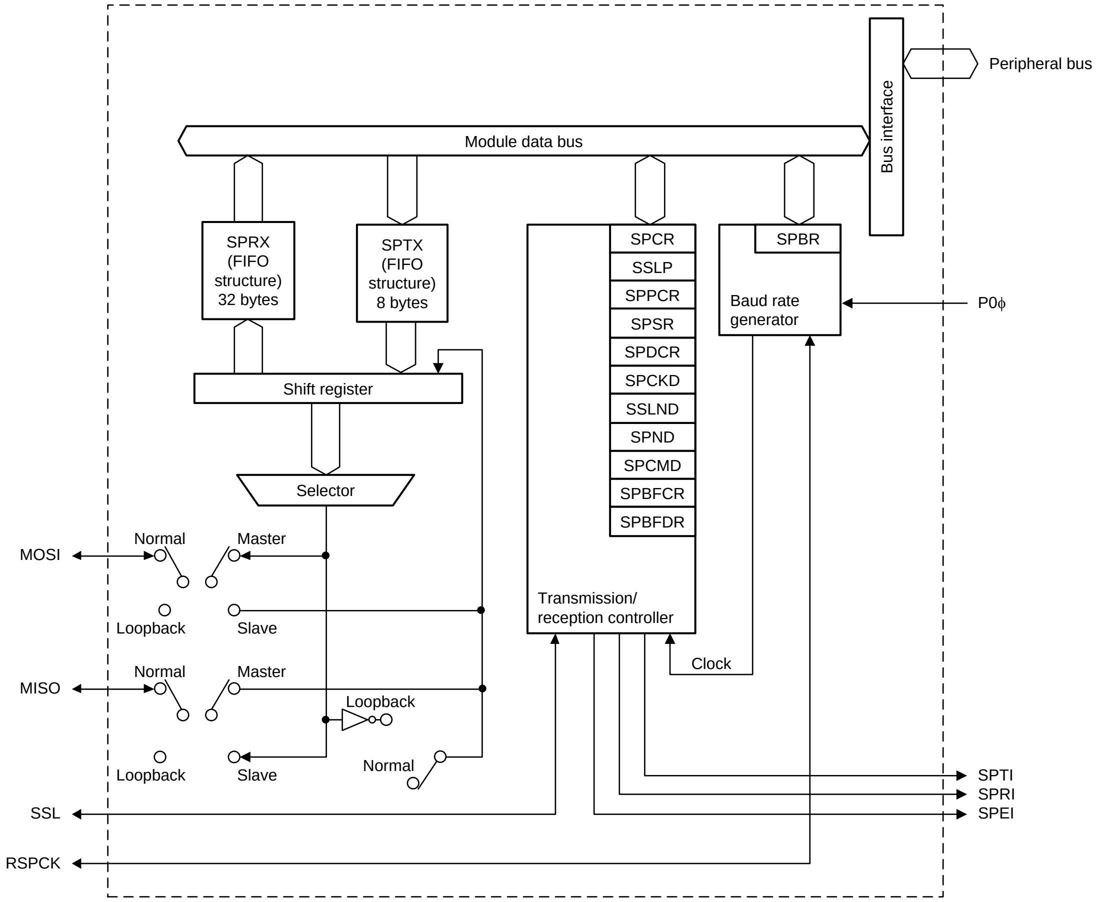
- A transfer of up to four commands can be executed sequentially in looped execution.
- For each command, the following can be set:
  - SSL signal value, bit rate, RSPCK polarity/phase, transfer data length, LSB/MSB first, burst, RSPCK delay, SSL negation delay, and next-access delay.
  - A transfer can be initiated by writing to the transmit buffer.
  - A transfer can be initiated by clearing the SPTEF bit.
  - MOSI signal value specifiable in SSL negation

Interrupt sources

- Maskable interrupt sources:
  - Receive interrupt (receive buffer full)
  - Transmit interrupt (transmit buffer empty)
  - Error interrupt (mode fault, overrun)

Others

- Provides loop back mode
- Provides a function for disabling (initializing) this module



[Legend]

SPCR: Control register

SSLP: Slave select polarity register

SPPCR: Pin control register

SPSR: Status register

SPSCR: Sequence control register

SPSSR: Sequence status register

SPDCR: Data control register

SPCKD: Cock delay register

SSLND: Slave select negate delay register

SPND: Next-access delay register

SPCMD: Command register

SPBR: Bit rate register

SPTX: Transmission buffer (Data register write side)

SPRX: Receive buffer (Data register read side)

SPBFCR: Buffer control register

SPBFDR: Buffer data count setting register

SPTI: Transmit interrupt

SPRI: Receive interrupt

SPEI: Error interrupt

Figure 24.1 Block Diagram (for One Channel)

24.2 Input/Output Pins

Table 24.1 shows the pin configuration. This module automatically switches the input/output direction of the SSL pin. SSL is set as an output in master mode and as an input in slave mode. Pins RSPCK, MOSI, and MISO are automatically set as inputs or outputs according to the setting of master or slave and the level input on SSL (see **Section 24.4.2, Pin Control**).

Table 24.1 Pin Configuration

Channel	Pin Name	Pin Name	I/O	Function
0	Clock pin	RSPI0_CK	I/O	Clock input/output
	Master transmit data pin	RSPI0_MOSI	I/O	Master transmit data
	Slave transmit data pin	RSPI0_MISO	I/O	Slave transmit data
	Slave select 0 pin	RSPI0_SSL	I/O	Slave selection
1	Clock pin	RSPI1_CK	I/O	Clock input/output
	Master transmit data pin	RSPI1_MOSI	I/O	Master transmit data
	Slave transmit data pin	RSPI1_MISO	I/O	Slave transmit data
	Slave select 0 pin	RSPI1_SSL	I/O	Slave selection
2	Clock pin	RSPI2_CK	I/O	Clock input/output
	Master transmit data pin	RSPI2_MOSI	I/O	Master transmit data
	Slave transmit data pin	RSPI2_MISO	I/O	Slave transmit data
	Slave select 0 pin	RSPI2_SSL	I/O	Slave selection

Note: In the description of the pins, the channel is omitted, and pin names are described as RSPCK, MOSI, MISO, and SSL.

24.3 Register Descriptions

Table 24.2 shows the register configuration. The address of the RSPI register is represented by the offset address from the base address. RSPI base address is as follows:

Base address: H’0_1004_0000 (Overall Address Space)
Base address: H’5004_0000 (Cortex-M33 Address Space Secure)
Base address: H’4004_0000 (Cortex-M33 Address Space Non-Secure)

Table 24.2 Register Configuration (1/2)

Channel	Register Name	Abbreviation*[1]	R/W	Initial Value	Offset Address	Access Size
0	Control register_0	SPCR_0	R/W	H’00	H’AC00	8
	Slave select polarity register_0	SSLP_0	R/W	H’00	H’AC01	8

Note 1. In the description of the register names, the channel is omitted.

Note 2. Only 0 can be written to clear the flag.

24.3.1 Control Register (SPCR)

SPCR sets the operating mode. If the MSTR and MODFEN bits are changed while the function of this module is enabled by setting the SPE bit to 1, subsequent operations cannot be guaranteed.

Bit	7	6	5	4	3	2	1	0
	SPRIE	SPE	SPTIE	SPEIE	MSTR	MODFEN	—	—
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	SPRIE	0	R/W	Receive Interrupt Enable Enables or disables generation of receive interrupt requests (SPRI) when the number of receive data units in the receive buffer (SPRX) is equal to or greater than the specified receive buffer data triggering number and the SPRF flag in SPSR is set to 1. 0: Disables the generation of receive interrupt requests. 1: Enables the generation of receive interrupt requests.
6	SPE	0	R/W	Function Enable Setting this bit to 1 enables the module function. When the MODF bit in the status register (SPSR) is 1, the SPE bit cannot be set to 1 (see **Section 24.4.6, Error Detection**). Setting the SPE bit to 0 disables the module function, and initializes a part of the module function (see **Section 24.4.7, Initialization**). 0: Disables the module function. 1: Enables the module function.
5	SPTIE	0	R/W	Transmit Interrupt Enable Enables or disables generation of transmit interrupt requests (SPTI) when the number of transmit data units in the transmit buffer (SPTX) is equal to or less than the specified transmit buffer data triggering number and the SPTEF flag in SPSR is set to 1. 0: Disables the generation of transmit interrupt requests. 1: Enables the generation of transmit interrupt requests.
4	SPEIE	0	R/W	Error Interrupt Enable Enables or disables the generation of error interrupt requests when this module detects a mode fault error and sets the MODF bit in the status register (SPSR) to 1, or when this module detects an overrun error and sets the OVRF bit in SPSR to 1 (see **Section 24.4.6, Error Detection**). 0: Disables the generation of error interrupt requests. 1: Enables the generation of error interrupt requests. *Note*: This bit is valid only in SPI slave mode.
3	MSTR	0	R/W	Master/Slave Mode Select Selects master/slave mode. According to MSTR bit settings, this module determines the direction of the RSPCK, MOSI, MISO, and SSL pins. 0: Slave mode 1: Master mode
2	MODFEN	0	R/W	Mode Fault Error Detection Enable Enables or disables the detection of a mode fault error (see **Section 24.4.6, Error Detection**). 0: Disables the detection of a mode fault error. 1: Enables the detection of a mode fault error. *Note*: This bit is valid only in SPI slave mode. When master mode is specified with the MSTR bit, this bit should always be cleared to 0.
1, 0	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.

24.3.2 Slave Select Polarity Register (SSLP)

SSLP sets the polarity of the SSL signal. If the contents of SSL0P are changed while the function of this module is enabled by setting the SPE bit in the control register (SPCR) to 1, subsequent operations cannot be guaranteed.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SSL0P
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
0	SSL0P	0	R/W	SSL Signal Polarity Setting Sets the polarity of the SSL signal. The value of SSL0P indicates the active polarity of the SSL signal. 0: SSL signal 0-active 1: SSL signal 1-active

24.3.3 Pin Control Register (SPPCR)

SPPCR sets the modes of the pins. If the contents of this register are changed while the function of this module is enabled by setting the SPE bit in the control register (SPCR) to 1, subsequent operations cannot be guaranteed.

Bit	7	6	5	4	3	2	1	0
	—	—	MOIFE	MOIFV	—	—	—	SPLP
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
5	MOIFE	0	R/W	MOSI Idle Value Fixing Enable Fixes the MOSI output value when this module in master mode is in an SSL negation period (including the SSL retention period during a burst transfer). When MOIFE is 0, this module outputs the last output value from the previous serial transfer during the SSL negation period to the MOSI pin. (The value is undefined when CPHA is 0). When MOIFE is 1, this module outputs the fixed value set in the MOIFV bit to the MOSI pin. 0: MOSI output value equals the last output value from previous transfer. (The value is undefined when CPHA is 0). 1: MOSI output value equals the value set in the MOIFV bit.
4	MOIFV	0	R/W	MOSI Idle Fixed Value If the MOIFE bit is 1 in master mode, this module, according to MOIFV bit settings, determines the MOSI signal value during the SSL negation period (including the SSL retention period during a burst transfer). 0: MOSI Idle fixed value equals 0. 1: MOSI Idle fixed value equals 1.
3 to 1	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
0	SPLP	0	R/W	Loopback When the SPLP bit is set to 1, this module shuts off the path between the MISO pin and the shift register, and between the MOSI pin and the shift register, and connects (reverses) the input path and the output path for the shift register. 0: Normal mode 1: Loopback mode

24.3.4 Status Register (SPSR)

SPSR indicates the operating status.

Bit	7	6	5	4	3	2	1	0
	SPRF	TEND	SPTEF	—	—	MODF	—	OVRF
Initial Value	0	1	1	0	0	0	0	0
R/W	R	R	R	R	R	R/(W)*1	R	R/(W)*1

Note 1. Only 0 can be written to clear the flag after reading 1.

Bit	Bit Name	Initial Value	R/W	Description
7	SPRF	0	R	Receive Buffer Full Flag Indicates that the number of receive data units in the receive buffer (SPRX) is equal to or greater than the receive buffer data triggering number specified in the buffer control register (SPBFCR). 0: The number of receive data units in the receive buffer is less than the receive buffer data triggering number. 1: The number of receive data units in the receive buffer is equal to or greater than the receive buffer data triggering number. [Clearing conditions] ● The receive buffer data is read until the number of data units in the receive buffer becomes less than the specified receive buffer data triggering number. ● Receive buffer data reset is enabled. ● Power-on reset [Setting condition] ● The number of data units in the receive buffer is equal to or greater than the specified receive buffer data triggering number.
6	TEND	1	R	Transmit End This bit is set to 1 when transmission is completed, and this bit is 0 when transmission is not completed. [Clearing condition] ● When transmit data are transferred from the transmit register to the shift register. [Setting condition] ● When the number of data units in the transmit buffer (SPTX) is zero when a serial transfer is completed. *Note*: This bit is valid only in SPI master mode.
5	SPTEF	1	R	Transmit Buffer Empty Flag Indicates that the number of transmit data units in the transmit buffer (SPTX) is equal to or less than the transmit buffer data triggering number specified in the buffer control register (SPBFCR). 0: The number of transmit data units in the transmit buffer is equal to or greater than the specified transmit buffer data triggering number. 1: The number of transmit data units in the transmit buffer is less than the specified transmit buffer data triggering number. [Clearing condition] ● When data is written to the transmit buffer until the number of transmit data units in the transmit buffer exceeds the specified transmit buffer data triggering number. [Setting conditions] ● When the number of transmit data units in the transmit buffer is less than the specified transmit buffer data triggering number. ● When transmit buffer data reset is enabled. ● Power-on reset
4, 3	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
2	MODF	0	R/(W)*1	Mode Fault Error Flag Indicates the occurrence of a mode fault error. If the MODFEN bit is set to 1 when this module is in slave mode and the SSL pin is negated before the RSPCK cycle necessary for data transfer ends, this module detects a mode fault error. The active level of the SSL signal is determined by the SSL0P bit in the slave select polarity register (SSLP). [Clearing conditions] ● SPSR is read when the MODF bit is 1, and then 0 is written to the MODF bit. ● Power-on reset 0: No mode fault error occurred 1: A mode fault error occurred *Note*: This bit is valid only in SPI slave mode.
1	—	0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
0	OVRF	0	R/(W)*1	Overrun Error Flag Indicates the occurrence of an overrun error. If a serial transfer ends when there is not enough space for receiving the specified length of data in the receive buffer (SPRX), this module detects an overrun error, and sets the OVRF bit to 1. [Clearing conditions] ● SPSR is read when the OVRF bit is 1, and then 0 is written to the OVRF bit. ● Power-on reset 0: No overrun error occurred 1: An overrun error occurred *Note*: This bit is valid only in SPI slave mode.

Note 1. Only 0 can be written to clear the flag after reading 1.

24.3.5 Data Register (SPDR)

SPDR is a buffer that holds data for transmission and reception.

The transmit buffer (SPTX) and receive buffer (SPRX) are independent and are mapped to SPDR.

SPDR should be read or written to in byte, word, or longword units according to the access width specification bit (SPLW) in the data control register (SPDCR).

The bit length to be used is determined by the data length specification bits (SPB3 to SPB0) in the command register (SPCMD).

The access width set by SPDCR must agree with the data length set by SPCMD.

When data is written to SPDR, the data will be written to the transmit buffer from SPDR if the transmit buffer has a space equal to or more than the SPDR access width. If there is not enough space, data will not be written to the transmit buffer. Even if an attempt is made to write data to the buffer, the data is ignored.

When data is read from SPDR, receive data in the receive buffer will be read. If SPDR is read when there is no receive data in the receive buffer, the read value is undefined.

When SPDR is written to with the longword-, word-, or byte-access width, the transmit data should be written to address 0 irrespective of the access width. If data is written to the other addresses, the data is not guaranteed.

When SPDR is read with the longword-, word-, or byte-access width, the receive data should be read from address 0. If data is read from the other addresses, the data is not guaranteed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

24.3.6 Sequence Control Register (SPSCR)

SPSCR sets the sequence control method when this module operates in master mode. If the contents of SPSCR are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

Bit	7	6	5	4	3	2	1	0

Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
1	SPSLN1	0	R/W	Sequence Length Specification These bits specify a sequence length when this module in master mode performs sequential operations. This module in master mode changes command registers 0 to 3 (SPCMD0 to SPCMD3) to be referenced and the order in which they are referenced according to the sequence length that is set in the SPSLN1 and SPSLN0 bits. The relationship among the setting of bits SPSLN1 and SPSLN0, sequence length, and SPCMD0 to SPCMD3 referenced by this module is shown below. In slave mode, SPCMD0 is always referenced. Sequence Length / Referenced SPCMD # 00: 1 0 → 0 → … 01: 2 0 → 1 → 0 → … 10: 3 0 → 1 → 2 → 0 → … 11: 4 0 → 1 → 2 → 3 → 0 → …
0	SPSLN0	0	R/W	

24.3.7 Sequence Status Register (SPSSR)

SPSSR indicates the sequence control status when this module operates in master mode.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SPCP1	SPCP0
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
1	SPCP1	0	R	Command Pointer During sequence control, these bits indicate one of the command registers 0 to 3 (SPCMD0 to SPCMD3) that is currently pointed to by the pointer. The relationship between the setting of SPCP1 and SPCP0 and SPCMD0 to SPCMD3 is shown below. For the sequence control, see **Section 24.4.8(1)(c), Sequence Control**. 00: SPCMD0 01: SPCMD1 10: SPCMD2 11: SPCMD3
0	SPCP0	0	R	

24.3.8 Bit Rate Register (SPBR)

SPBR sets the bit rate in master mode. If the contents of SPBR are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

Bit	7	6	5	4	3	2	1	0
	SPR7	SPR6	SPR5	SPR4	SPR3	SPR2	SPR1	SPR0
Initial Value	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

When this module is used in slave mode, the bit rate depends on the bit rate of the input clock regardless of the settings of SPBR and BRDV.

The bit rate is determined by combinations of SPBR settings and the bit settings in the BRDV1 and BRDV0 bits in the command registers (SPCMD0 to SPCMD3). The equation for calculating the bit rate is given below. In the equation, n denotes an SPBR setting (0, 1, 2, …, 255), and N denotes a BRDV1 and BRDV0 bit setting (0, 1, 2, 3).

$$\text{Bit rate} = \frac{\mathrm{f}\,(\mathrm{P0}\phi)}{2 \times (\mathrm{n} + 1) \times 2^{\mathrm{N}}}$$

Table 24.3 shows examples of the relationship between the SPBR register and BRDV1 and BRDV0 bit settings.

Table 24.3 Relationship between SPBR and BRDV1 and BRDV0 Settings

SPBR (n)	BRDV[1:0] (N)	Division Ratio	Bit Rate*1
			P0ϕ = 100 MHz
0	0	2	Not Available
1	0	4	25.00 Mbps
2	0	6	16.67 Mbps
3	0	8	12.50 Mbps
4	0	10	10.00 Mbps
5	0	12	8.33 Mbps
5	1	24	4.17 Mbps
5	2	48	2.08 Mbps
5	3	96	1.04 Mbps
255	3	4096	24.41 Kbps

Note 1. Decide the bit rate to be actually used in the system considering timing specifications.

24.3.9 Data Control Register (SPDCR)

SPDCR selects the width to access SPDR from longword-, word-, and byte-width, and enables or disables dummy data transmission for the master mode operation.

If the contents of SPDCR are changed while bit TEND in the status register (SPSR) indicates that transmission is not completed, the subsequent operation cannot be guaranteed.

Bit	7	6	5	4	3	2	1	0
	TXDMY	SPLW1	SPLW0	—	—	—	—	—
Initial Value	0	0	1	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	TXDMY	0	R/W	Dummy Data Transmission Enable Enables or disables dummy data transmission. When communication is performed with this bit set to 1, dummy data is transmitted from the MOSI pin and a serial communication can be performed even if there is no transmit data in the transmit buffer. Specifically, if there is no transmit data in the transmit buffer and this bit is set to 1, dummy data is transferred to the shift register. Data previously transmitted from the pin is used as dummy data. If this bit is set to 1 after the initialization and a transfer is performed, the transmitted dummy data is undefined. 0: Disables dummy data transmission. 1: Enables dummy data transmission. *Note*: This bit is valid only in the master mode.
6	SPLW1	0	R/W	Access Width Specification Specifies the width for accessing the data register (SPDR). If the length of data transferred to SPDR does not agree with these bit settings, operation is not guaranteed.*[1] 00: Setting prohibited 01: SPDR is accessed in bytes (8 bits). 10: SPDR is accessed in words (16 bits). 11: SPDR is accessed in longwords (32 bits).
5	SPLW0	1	R/W	
4 to 0	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.

Note 1. The data length is specified by the SPB3 to SPB0 bits in the command register (SPCMD). See **Section 24.3.5, Data Register (SPDR)**.

24.3.10 Clock Delay Register (SPCKD)

SPCKD sets a period from the beginning of SSL signal assertion to RSPCK oscillation (RSPCK delay) when the SCKDEN bit in the command register (SPCMD) is 1. If the contents of SPCKD are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

When using this module in slave mode, set 000b to SCKDL2 to SCKDL0.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	SCKDL 2	SCKDL 1	SCKDL 0
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
2	SCKDL2	0	R/W	RSPCK Delay Setting These bits set an RSPCK delay value when the SCKDEN bit in SPCMD is 1. The relationship between the setting of SCKDL2 to SCKDL0 and the RSPCK delay value is shown below. 000: 1 RSPCK 001: 2 RSPCK 010: 3 RSPCK 011: 4 RSPCK 100: 5 RSPCK 101: 6 RSPCK 110: 7 RSPCK 111: 8 RSPCK
1	SCKDL1	0	R/W	
0	SCKDL0	0	R/W	

24.3.11 Slave Select Negation Delay Register (SSLND)

SSLND sets a period (SSL negation delay) from the transmission of a final RSPCK edge to the negation of the SSL signal during a serial transfer by this module in master mode. If the contents of SSLND are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

When using this module in slave mode, set 000b to SLNDL2 to SLNDL0.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	SLNDL2	SLNDL1	SLNDL0
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
2	SLNDL2	0	R/W	SSL Negation Delay Setting These bits set an SSL negation delay when the SLNDEN bit in SPCMD is 1. The relationship between the setting of SLNDL2 to SLNDL0 and the SSL negation delay value is shown below. 000: 1 RSPCK 001: 2 RSPCK 010: 3 RSPCK 011: 4 RSPCK 100: 5 RSPCK 101: 6 RSPCK 110: 7 RSPCK 111: 8 RSPCK
1	SLNDL1	0	R/W	
0	SLNDL0	0	R/W	

24.3.12 Next-Access Delay Register (SPND)

SPND sets a non-active period (next-access delay) after termination of a serial transfer when the SPNDEN bit in the command register (SPCMD) is 1. If the contents of SPND are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

When using this module in slave mode, set 000b to SPNDL2 to SPNDL0.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	SPNDL 2	SPNDL 1	SPNDL 0
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
2	SPNDL2	0	R/W	Next-Access Delay Setting These bits set a next-access delay when the SPNDEN bit in SPCMD is 1. The relationship between the setting of SPNDL2 to SPNDL0 and the next-access delay value is shown below. 000: 1 RSPCK + 2 P0ϕ 001: 2 RSPCK + 2 P0ϕ 010: 3 RSPCK + 2 P0ϕ 011: 4 RSPCK + 2 P0ϕ 100: 5 RSPCK + 2 P0ϕ 101: 6 RSPCK + 2 P0ϕ 110: 7 RSPCK + 2 P0ϕ 111: 8 RSPCK + 2 P0ϕ
1	SPNDL1	0	R/W	
0	SPNDL0	0	R/W	

24.3.13 Command Register (SPCMD)

Each channel has four command registers (SPCMD0 to SPCMD3). SPCMD0 to SPCMD3 are used to set a transfer format for master mode operation. Some of the bits in SPCMD0 are used to set a transfer mode for slave mode operation. In master mode, this module sequentially references SPCMD0 to SPCMD3 according to the settings in bits SPSLN1 and SPSLN0 in the sequence control register (SPSCR), and executes the serial transfer that is set in the referenced SPCMD. While bit TEND in the status register (SPSR) indicates that transmission is not completed, correct operation of this module cannot be guaranteed if SPCMD is changed that is referred by this module. SPCMD referenced by this module in master mode can be checked by means of bits SPCP1 and SPCP0 in the sequence status register (SPSSR). When the function of this module in slave mode is enabled, operation cannot be guaranteed if the value set in SPCMD0 is changed.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SCKDEN	SLNDEN	SPNDEN	LSBF	SPB3	SPB2	SPB1	SPB0	SSLKP	—	—	—	BRDV1	BRDV0	CPOL	CPHA
Initial Value	0	0	0	0	0	1	1	1	0	0	0	0	1	1	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	SCKDEN	0	R/W	RSPCK Delay Setting Enable Sets the period from the point this module in master mode activates the SSL signal until the RSPCK starts oscillation (RSPCK delay). If the SCKDEN bit is 0, this module sets the RSPCK delay to 1 RSPCK. If the SCKDEN bit is 1, this module starts the oscillation of RSPCK at an RSPCK delay in compliance with the clock delay register (SPCKD) settings. To use this module in slave mode, the SCKDEN bit should be set to 0. 0: An RSPCK delay of 1 RSPCK 1: An RSPCK delay equal to SPCKD settings.
14	SLNDEN	0	R/W	SSL Negation Delay Setting Enable Sets the period from the point this module in master mode stops RSPCK oscillation until this module sets the SSL signal inactive (SSL negation delay). If the SLNDEN bit is 0, this module sets the SSL negation delay to 1 RSPCK. If the SLNDEN bit is 1, this module negates the SSL signal at an SSL negation delay in compliance with the slave select negation delay register (SSLND) settings. To use this module in slave mode, the SLNDEN bit should be set to 0. 0: An SSL negation delay of 1 RSPCK 1: An SSL negation delay equal to SSLND settings.
13	SPNDEN	0	R/W	Next-Access Delay Enable Sets the period from the point this module in master mode terminates a serial transfer and sets the SSL signal inactive until this module enables the SSL signal assertion for the next access (next-access delay). If the SPNDEN bit is 0, this module sets the next-access delay to 1 RSPCK + 2P0ϕ. If the SPNDEN bit is 1, this module inserts a next-access delay in compliance with the next-access delay register (SPND) settings. To use this module in slave mode, the SPNDEN bit should be set to 0. 0: A next-access delay of 1 RSPCK + 2 P0ϕ 1: A next-access delay equal to SPND settings.
12	LSBF	0	R/W	LSB First Sets the data format in master mode or slave mode to MSB first or LSB first. 0: MSB first 1: LSB first

Bit	Bit Name	Initial Value	R/W	Description
11	SPB3	0	R/W	Data Length Setting These bits set a transfer data length in master mode or slave mode. 0100 to 0111: 8 bits 1111: 16 bits 0010, 0011: 32 bits Others: Setting prohibited
10	SPB2	1	R/W	
9	SPB1	1	R/W	
8	SPB0	1	R/W	
7	SSLKP	0	R/W	SSL Signal Level Keeping When this module in master mode performs a serial transfer, this bit specifies whether the SSL signal level for the current command is to be kept or negated between the SSL negation timing associated with the current command and the SSL assertion timing associated with the next command. To use this module in slave mode, the SSLKP bit should be set to 0. 0: Negates the SSL signal upon completion of transfer. 1: Keeps the SSL signal level from the end of the transfer until the beginning of the next access.
6 to 4	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
3	BRDV1	1	R/W	Bit Rate Division Setting These bits are used to determine the bit rate. A bit rate is determined by combinations of bits BRDV1 and BRDV 0 and the settings in the bit rate register (SPBR) (see **Section 24.3.8, Bit Rate Register (SPBR)**). The settings in SPBR determine the base bit rate. The settings in bits BRDV1 and BRDV0 are used to select a bit rate which is obtained by dividing the base bit rate by 1, 2, 4, or 8. In the bits SPCMD0 to SPCMD3, different BRDV1 and BRDV0 settings can be specified. This permits the execution of serial transfers at a different bit rate for each command. 00: Select the base bit rate. 01: Select the base bit rate divided by 2. 10: Select the base bit rate divided by 4. 11: Select the base bit rate divided by 8.
2	BRDV0	1	R/W	
1	CPOL	0	R/W	RSPCK Polarity Setting Sets an RSPCK polarity in master or slave mode. When data communication is performed between the Renesas serial peripheral interface module and the other modules, the same RSPCK polarity should be set for both modules. 0: RSPCK = 0 when idle 1: RSPCK = 1 when idle
0	CPHA	1	R/W	RSPCK Phase Setting Sets an RSPCK phase in master or slave mode. When data communication is performed between the Renesas serial peripheral interface module and the other modules, the same RSPCK phase should be set for both modules. 0: Data sampling on odd edge, data variation on even edge 1: Data variation on odd edge, data sampling on even edge

24.3.14 Buffer Control Register (SPBFCR)

SPBFCR resets the number of data units in the transmit buffer (SPTX) or receive buffer (SPRX) and sets the number of triggering data units.

Bit	7	6	5	4	3	2	1	0
	TXRST	RXRST	TXTRG[1:0]		—	RXTRG[2:0]		
Initial Value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	TXRST	0	R/W	Transmit Buffer Data Reset Resets the transmit buffer to an empty state. Transmit data in the transmit buffer becomes invalid when this bit is set to 1. 0: Disables the reset operation.*[1] 1: Enables the reset operation *Note 1.* The reset operation is performed after a power-on reset.
6	RXRST	0	R/W	Receive Buffer Data Reset Resets the receive buffer to an empty state. Receive data in the receive buffer becomes invalid when this bit is set to 1. 0: Disables the reset operation.*[1] 1: Enables the reset operation *Note 1.* The reset operation is performed after a power-on reset.
5, 4	TXTRG[1:0]	00	R/W	Transmit Buffer Data Triggering Number*[2] Specifies the timing at which the transmit buffer empty state is determined, that is when the SPTEF flag in the status register is set. When the number of bytes of data in the transmit buffer (SPTX) is equal to or less than the specified triggering number, the SPTEF flag is set to 1. 00: 7 bytes (1)*[1] 01: 6 bytes (2)*[1] 10: 4 bytes (4)*[1] 11: 0 bytes (8)*[1] *Note 1.* The value in the parenthesis shows the number of available bytes in the transmit buffer (SPTX). *Note 2.* When transferring the data by using DMA, set the following values according to the data transfer length. (The data transfer length is set in SPBn (n = 0-3) of the command register (SPCMD)). 1) Data transfer length is 1 byte SPBFCR (TXTRG): 01 (6 bytes) or 10 (4 byte) or 11 (0 byte) 2) Data transfer length is 2 bytes SPBFCR (TXTRG): 10 (4 bytes) or 11 (0 byte) 3) Data transfer length is 4bytes SPBFCR (TXTRG): 11 (0 byte)
3	—	0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	RXTRG[2:0]	000	R/W	Receive Buffer Data Triggering Number Specifies the timing at which the receive buffer full state is determined, that is when the SPRF flag in the status register is set. When the number of bytes of data in the receive buffer (SPRX) is equal to or greater than the specified triggering number, the SPRF flag is set to 1. 000: 1 byte (31)*1 001: 2 bytes (30)*1 010: 4 bytes (28)*1 011: 8 bytes (24)*1 100: 16 bytes (16)*1 101: 24 bytes (8)*1 110: 32 bytes (0)*1 111: 5 bytes (27)*1 *Note 1.* The value in the parenthesis shows the number of available bytes in the receive buffer (SPRX).

24.3.15 Buffer Data Count Setting Register (SPBFDR)

SPBFDR indicates the number of data units stored in the transmit buffer (SPTX) and receive buffer (SPRX). The upper eight bits indicate the number of transmit data units in SPTX and the lower eight bits indicate the number of receive data units in SPRX.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	T[3:0]				—	—	R[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
11 to 8	T[3:0]	0000	R	Indicates the number of bytes of data to be transmitted in SPTX. 0000b indicates that SPTX is empty. 1000b indicates that SPTX is full.
7, 6	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
5 to 0	R[5:0]	000000	R	Shows the number of bytes of received data in SPRX. 000000b indicates that SPRX is empty. 100000b indicates that SPRX is full.

24.4 Operation

In this section, the serial transfer period means a period from the beginning of driving valid data to the fetching of the final valid data.

24.4.1 Overview of Operations

This module is capable of serial transfers in slave mode and master mode. A particular mode of this module can be selected by using the MSTR bit in the control register (SPCR). **Table 24.4** gives the relationship between the modes and SPCR settings, and a description of each mode.

Table 24.4 Relationship between Modes and SPCR and Description of Each Mode

Mode	Slave (SPI Operation)	Master (SPI Operation)
MSTR bit setting	0	1
MODFEN bit setting	0 or 1	0
RSPCK signal	Input	Output
MOSI signal	Input	Output
MISO signal	Output/Hi-Z	Input
SSL signal	Input	Output
SSL polarity modification function	Supported	Supported
Transfer rate	Up to P0ϕ/8	Up to P0ϕ/2 (Up to P0ϕ/4 when P0ϕ is 100 MHz)
Clock source	RSPCK input	On-chip baud rate generator
Clock polarity	Two	Two
Clock phase	Two	Two
First transfer bit	MSB/LSB	MSB/LSB
Transfer data length	8, 16, or 32 bits	8, 16, or 32 bits
Burst transfer	Possible (CPHA = 1)	Possible (CPHA = 0, 1)
RSPCK delay control	Not supported	Supported
SSL negation delay control	Not supported	Supported
Next-access delay control	Not supported	Supported
Transfer activation method	SSL input active or RSPCK oscillation	Transmit buffer is written when SPE = 1
Sequence control	Not supported	Supported
Transmit buffer empty detection	Supported	Supported
Receive buffer full detection	Supported	Supported
Overrun error detection	Supported	Not Supported
Mode fault error detection	Supported (MODFEN = 1)	Not supported

24.4.2 Pin Control

According to the MSTR bit in the control register (SPCR), this module can automatically switch pin directions and output modes. **Table 24.5** shows the relationship between pin states and bit settings.

Table 24.5 Relationship between Pin States and Bit Settings

Mode	Pin	Pin State*[1]
Master mode (SPI operation) (MSTR = 1)	RSPCK	CMOS output
	SSL	CMOS output
	MOSI	CMOS output
	MISO	Input
Slave mode (SPI operation) (MSTR = 0)	RSPCK	Input
	SSL	Input
	MOSI	Input
	MISO*[1]	CMOS output/Hi-Z

Note 1. When SSL is at the non-active level or the SPE bit in SPCR is cleared to 0, the pin state is Hi-Z.

This module in master mode (SPI operation) determines MOSI signal values during the SSL negation period (including the SSL retention period during a burst transfer) according to MOIFE and MOIFV bit settings in SPPCR, as shown in **Table 24.6**.

Table 24.6 MOSI Signal Value Determination during SSL Negation Period

MOIFE	MOIFV	MOSI Signal Value during SSL Negation Period
0	0, 1	Last output value from previous transfer (The value is undefined when CPHA is 0)
1	0	Always 0
1	1	Always 1

24.4.3 System Configuration Example

(1) Master/Slave (with This LSI Acting as Master)

Figure 24.2 shows a master/slave system configuration example when this LSI is used as a master. In master/slave configuration, the SSL output of this LSI (master) is not used. The SSL input of the slave is fixed to the low level, and the slave is always maintained in a selected state. In the transfer format corresponding to the case where the CPHA bit in the control register (SPCR) is 0, there are slave devices for which the SSL signal cannot be fixed to the active level. In situations where the SSL signal cannot be fixed, the SSL output of this LSI should be connected to the SSL input of the slave device.

This LSI (master) always drives the RSPCK and MOSI. The slave always drives the MISO.

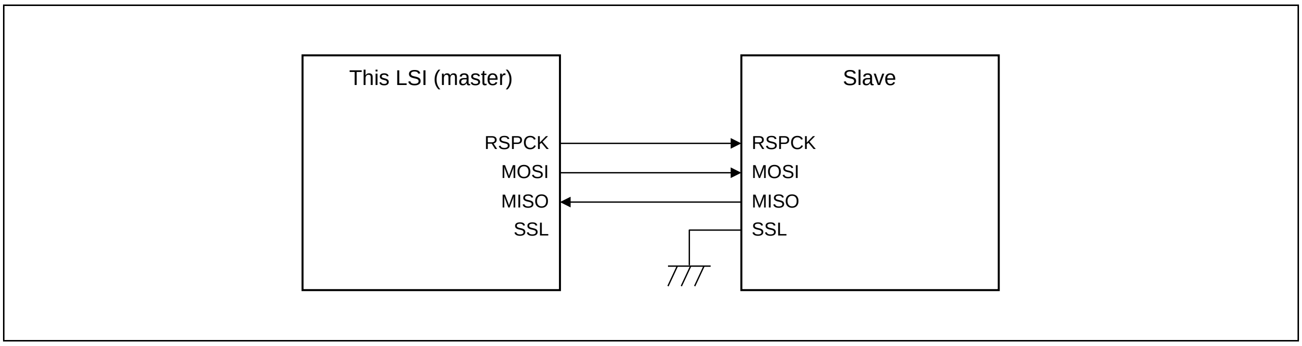

Figure 24.2 Master/Slave Configuration Example (This LSI = Master)

(2) Master/Slave (with This LSI Acting as Slave)

Figure 24.3 shows a master/slave system configuration example when this LSI is used as a slave. When this LSI is to operate as a slave, the SSL pin is used as SSL input. The master always drives the RSPCK and MOSI. This LSI (slave) always drives the MISO. When SSL is at the non-active level, the pin state is Hi-Z.

In the slave configuration in which the CPHA bit in the command register (SPCMD) is set to 1, the SSL input of this LSI (slave) is fixed to the 0 level, this LSI (slave) is always maintained in a selected state, and in this manner it is possible to execute serial transfer (**Figure 24.4**).

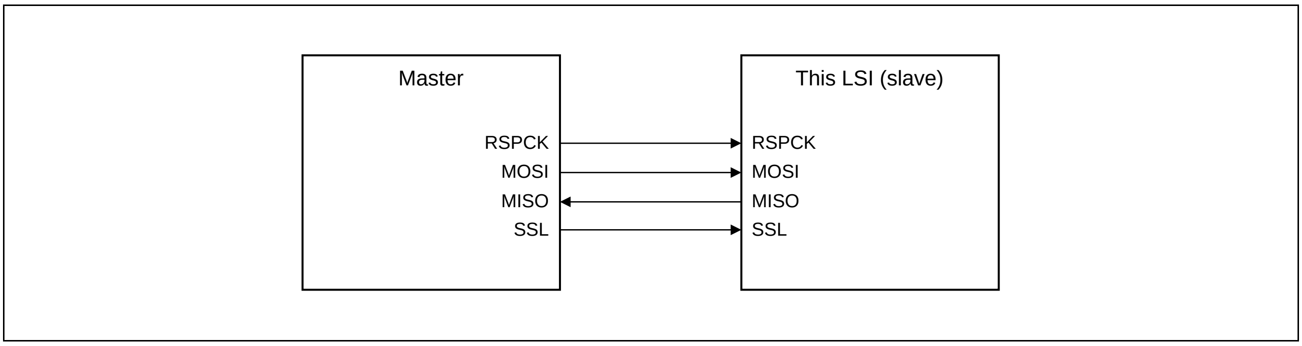

Figure 24.3 Master/Slave Configuration Example (This LSI = Slave)

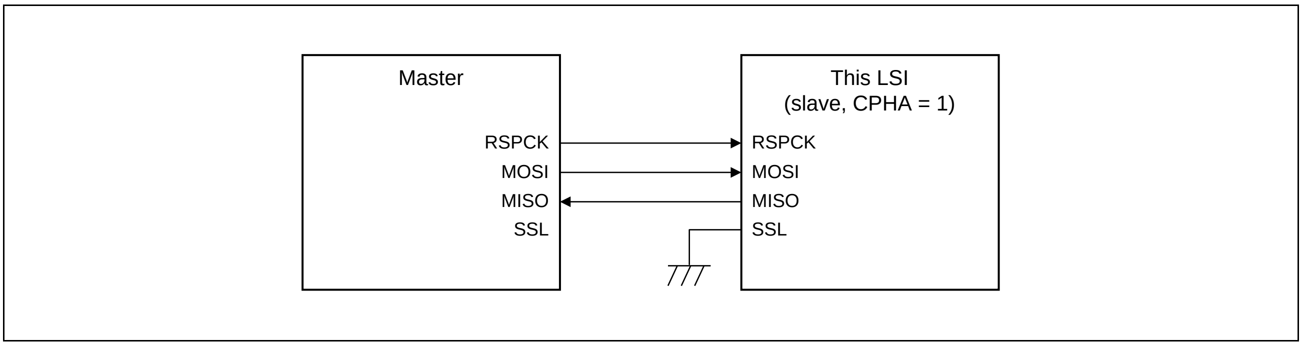

Figure 24.4 Master/Slave Configuration Example (This LSI = Slave, CPHA = 1)

(3) Master/Multi-Slave (with This LSI Acting as Slave)

Figure 24.5 shows a master/multi-slave system configuration example when this LSI is used as a slave. In the example of **Figure 24.5**, the system is comprised of a master and two LSIs (slave X and slave Y).

The RSPCK and MOSI outputs of the master are connected to the RSPCK and MOSI inputs of the LSIs (slave X and slave Y). The MISO outputs of the LSIs (slave X and slave Y) are all connected to the MISO input of the master. SSLX and SSLY outputs of the master are connected to the SSL inputs of the LSIs (slave X and slave Y), respectively.

The master always drives RSPCK, MOSI, SSLX, and SSLY. Of the LSIs (slave X and slave Y), the slave that receives low level input into the SSL0 input drives MISO.

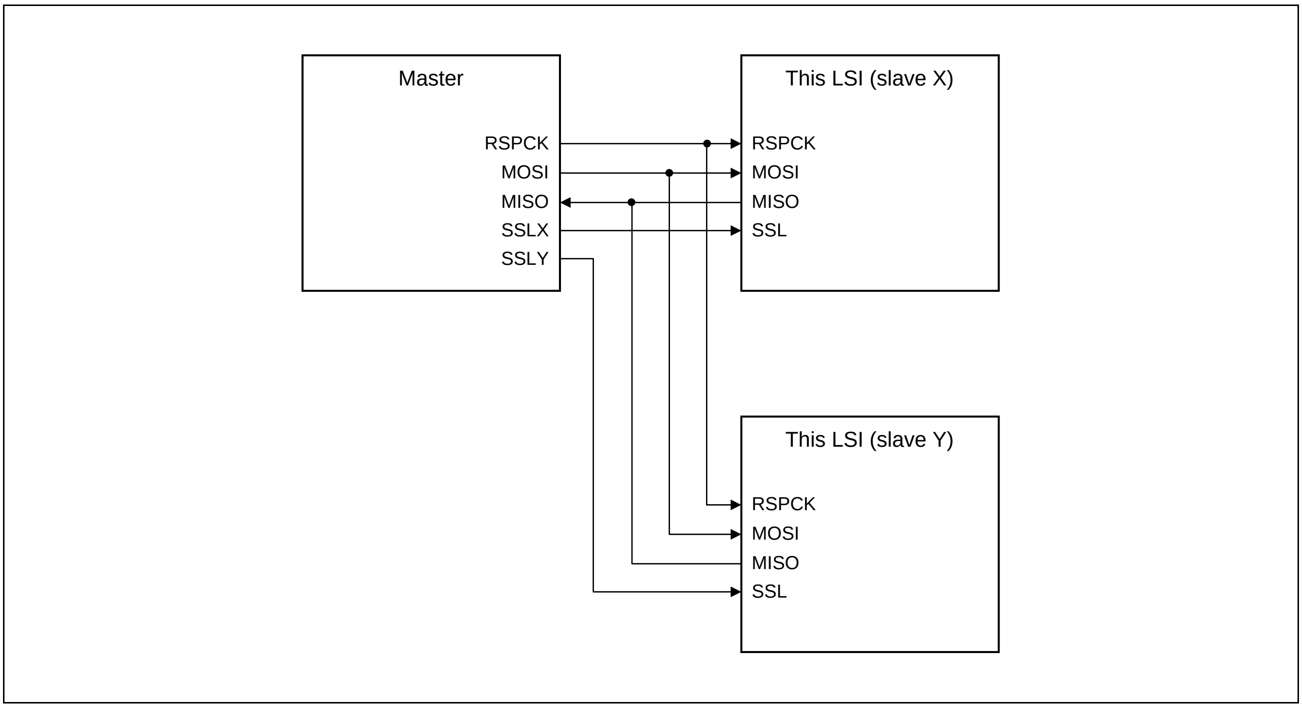

Figure 24.5 Master/Multi-Slave Configuration Example (This LSI = Slave)

24.4.4 Transfer Format

(1) CPHA = 0

Figure 24.6 shows a sample transfer format for the serial transfer of 8-bit data when the CPHA bit in the command register (SPCMD) is 0. In **Figure 24.6**, RSPCK (CPOL = 0) indicates the RSPCK signal waveform when the CPOL bit in SPCMD is 0; RSPCK (CPOL = 1) indicates the RSPCK signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which this module fetches serial transfer data into the shift register. The input/output directions of the signals depend on the settings of this module. For details, see **Section 24.4.2, Pin Control**.

When the CPHA bit is 0, the driving of valid data to the MOSI and MISO signals commences at an SSL signal assertion timing. The first RSPCK signal change timing that occurs after the SSL signal assertion becomes the first transfer data fetching timing. After this timing, data is sampled at every 1 RSPCK cycle. The change timing for MOSI and MISO signals is always 1/2 RSPCK cycle after the transfer data fetch timing. The settings in the CPOL bit do not affect the RSPCK signal operation timing; they only affect the signal polarity.

t1 denotes a period from an SSL signal assertion to RSPCK oscillation (RSPCK delay). t2 denotes a period from the cessation of RSPCK oscillation to an SSL signal negation (SSL negation delay). t3 denotes a period in which SSL signal assertion is suppressed for the next transfer after the end of serial transfer (next-access delay). t1, t2, and t3 are controlled by a master device running on the system. For a description of t1, t2, and t3 when this module is in master mode, see **Section 24.4.3(1), Master/Slave (with This LSI Acting as Master)**.

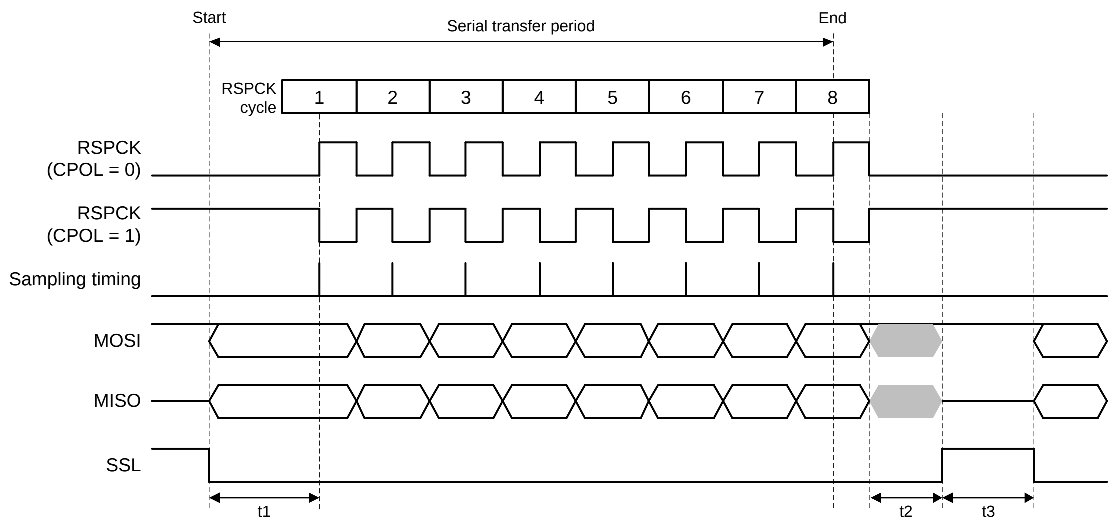

Figure 24.6 Transfer Format (CPHA = 0)

(2) CPHA = 1

Figure 24.7 shows a sample transfer format for the serial transfer of 8-bit data when the CPHA bit in the command register (SPCMD) is 1. In **Figure 24.7**, RSPCK (CPOL = 0) indicates the RSPCK signal waveform when the CPOL bit in SPCMD is 0; RSPCK (CPOL = 1) indicates the RSPCK signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which this module fetches serial transfer data into the shift register. The input/output directions of the signals depend on the modes (master or slave). For details, see **Section 24.4.2, Pin Control**.

When the CPHA bit is 1, the driving of invalid data to the MOSI and MISO signals commences at an SSL signal assertion timing. The driving of valid data to the MOSI and MISO signals commences at the first RSPCK signal change timing that occurs after the SSL signal assertion. After this timing, data is updated at every 1 RSPCK cycle. The transfer data fetch timing is always 1/2 RSPCK cycle after the data update timing. The settings in the CPOL bit do not affect the RSPCK signal operation timing; they only affect the signal polarity.

t1, t2, and t3 are the same as those in the case of CPHA = 0. For a description of t1, t2, and t3 when this module is in master mode, see **Section 24.4.3(1), Master/Slave (with This LSI Acting as Master)**.

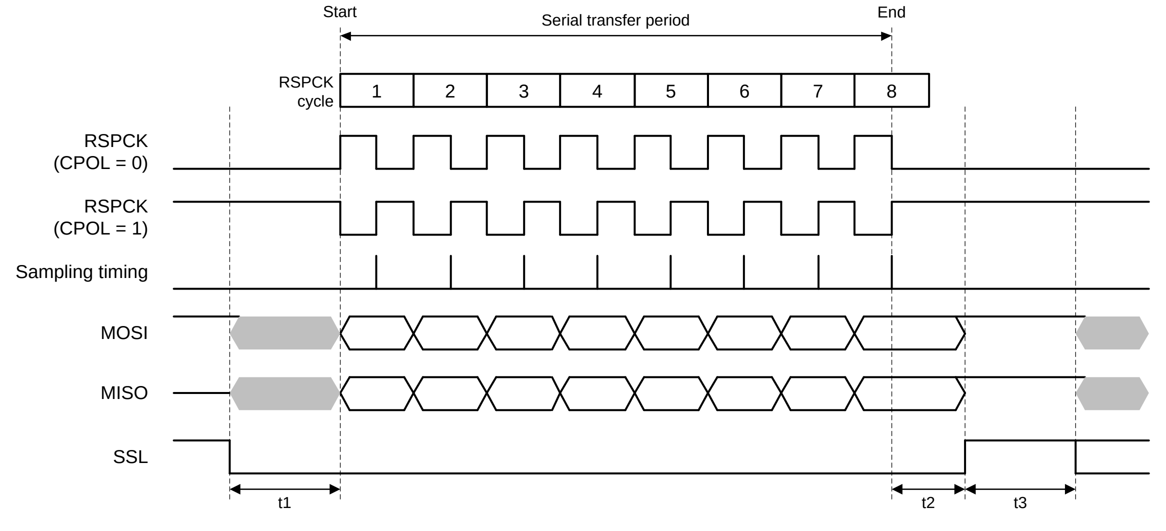

Figure 24.7 Transfer Format (CPHA = 1)

24.4.5 Data Format

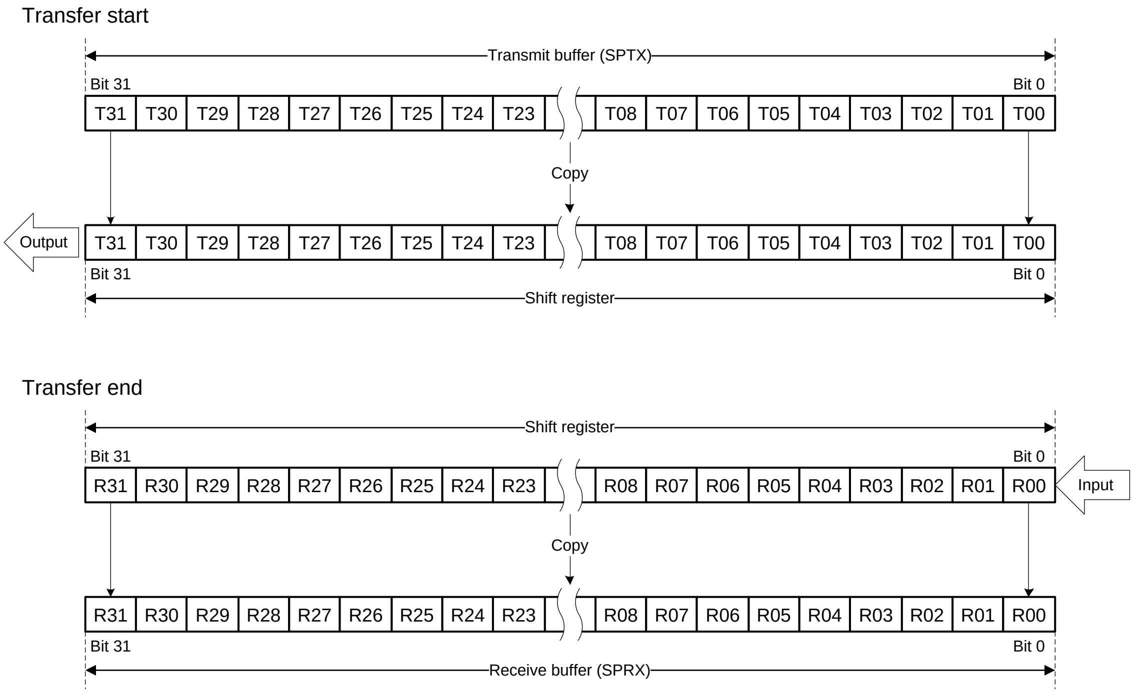
The data format depends on the settings in the command register (SPCMD). Irrespective of MSB/LSB first, this module treats the range from the LSB of the data register (SPDR) to the assigned data length as transfer data.

(1) MSB First Transfer (32-Bit Data)

Figure 24.8 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 32-bit data length MSB-first data transfer.

The CPU or direct memory access controller writes T31 to T00 to the transmit buffer of SPDR. If the shift register is empty, this module copies the data in the transmit buffer to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 32 bits has passed, data R31 to R00 is stored in the shift register. In this state, this module copies the data from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after the receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer, received data R31 to R00 is shifted out from the shift register.



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

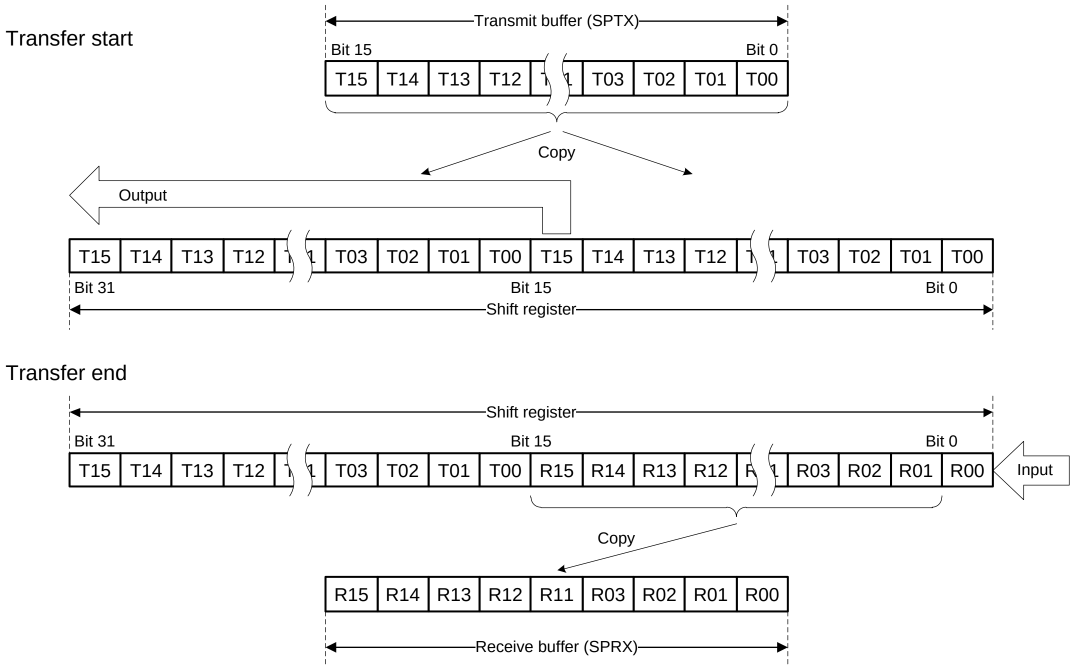
Figure 24.8 MSB First Transfer (32-Bit Data)

(2) MSB First Transfer (16-Bit Data)

Figure 24.9 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 16-bit data length MSB-first data transfer.

The CPU or direct memory access controller writes T15 to T00 to the transmit buffer. If the shift register is empty, this module copies the data in the transmit buffer to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from bit 15 in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 16 bits has passed, received data R15 to R00 is stored in bits 15 to 0 in the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 31 to 16 in the shift register. In this state, this module copies the data from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer, received data R15 to R00 is shifted out from the shift register.



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

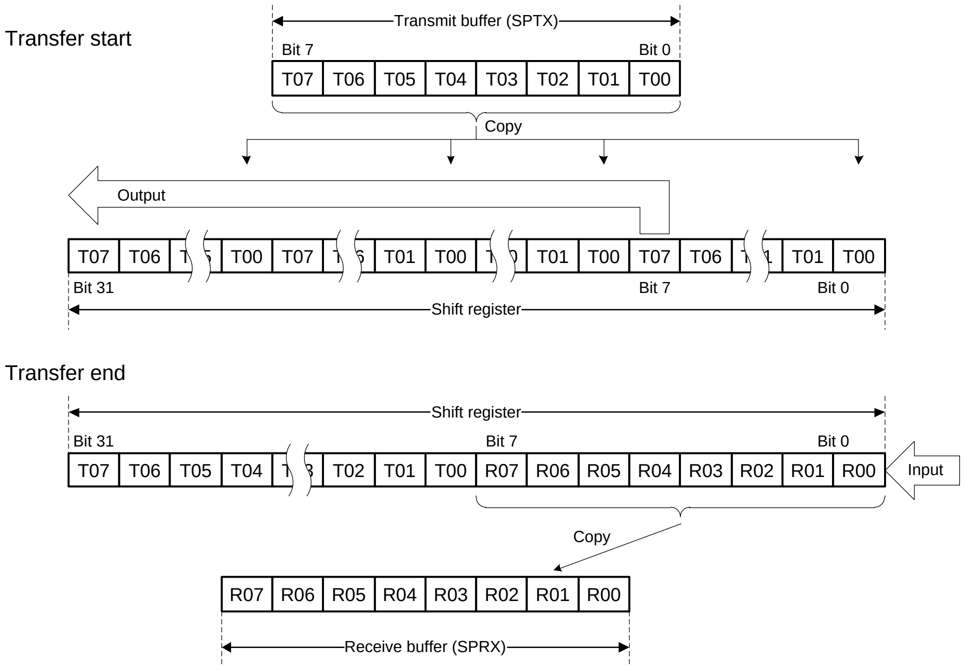
Figure 24.9 MSB First Transfer (16-Bit Data)

(3) MSB First Transfer (8-Bit Data)

Figure 24.10 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs an 8-bit data length MSB-first data transfer.

The CPU or direct memory access controller writes T07 to T00 to the transmit buffer. If the shift register is empty, this module copies the data in the transmit buffer to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from bit 7 in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 8 bits has passed, received data R07 to R00 is stored in bits 7 to 0 in the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 31 to 8 in the shift register. In this state, this module copies the data from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary area in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer, received data R07 to R00 is shifted out from the shift register.



Note: Output = MOSI (master)/MISO (slave), input = MOSI (master)/MISO (slave)

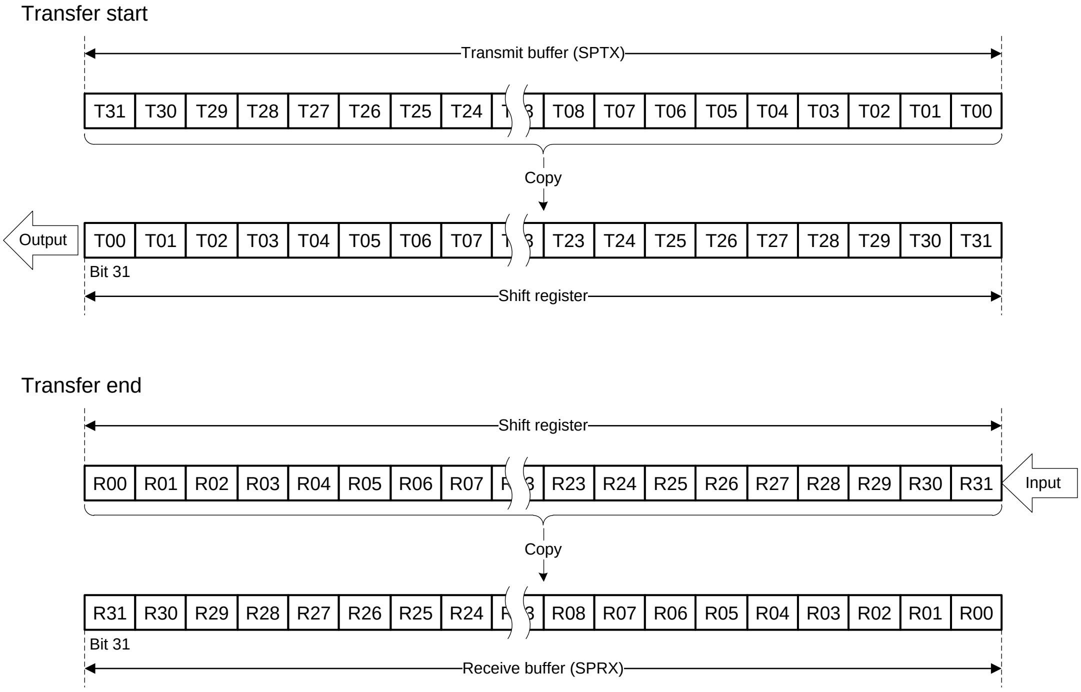
Figure 24.10 MSB First Transfer (8-Bit Data)

(4) LSB First Transfer (32-Bit Data)

Figure 24.11 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 32-bit data length LSB-first data transfer.

The CPU or direct memory access controller writes T31 to T00 to the transmit buffer. If the shift register is empty, this module reverses the order of the bits of the data in the transmit buffer, copies it to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from the LSB (bit 0) in the shift register. When the RSPCK cycle required for the serial transfer of 32 bits has passed, data R00 to R31 is stored in the shift register. In this state, this module copies the data, in which the order of the bits is reversed, from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer of the SPDR, received data R00 to R31 is shifted out from the shift register.



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

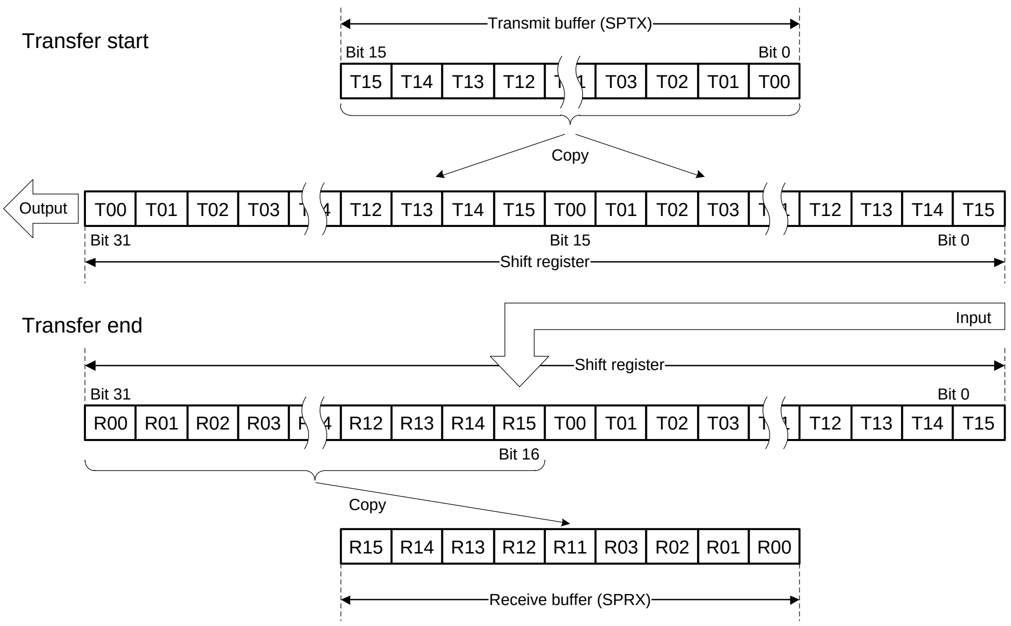
Figure 24.11 LSB First Transfer (32-Bit Data)

(5) LSB First Transfer (16-Bit Data)

Figure 24.12 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 16-bit data length LSB-first data transfer.

The CPU or direct memory access controller writes T15 to T00 to the transmit buffer. If the shift register is empty, this module reverses the order of the bits of the data in the transmit buffer, copies it to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from bit 16 in the shift register. When the RSPCK cycle required for the serial transfer of 16 bits has passed, received data R00 to R15 is stored in bits 31 to 16 in the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 15 to 0 in the shift register. In this state, this module copies the data, in which the order of the bits is reversed, from the shift register to the receive buffer of SPDR, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer of SPDR, received data R00 to R15 is shifted out from the shift register.



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

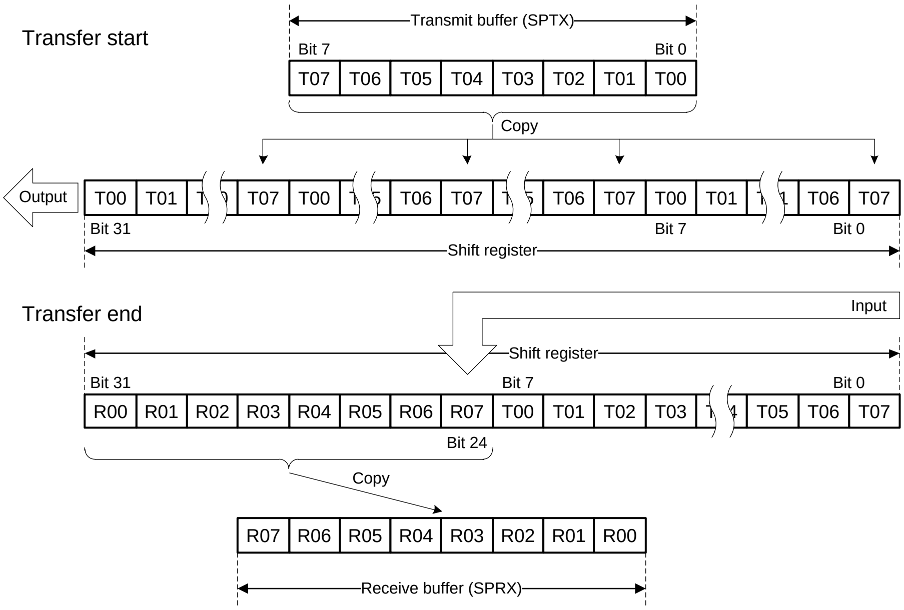
Figure 24.12 LSB First Transfer (16-Bit Data)

(6) LSB First Transfer (8-Bit Data)

Figure 24.13 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs an 8-bit data length LSB-first data transfer.

The CPU or direct memory access controller writes T07 to T00 to the transmit buffer. If the shift register is empty, this module reverses the order of the bits of the data in the transmit buffer, copies it to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) in the shift register, and shifts in the data from bit 24 in the shift register. When the RSPCK cycle required for the serial transfer of 8 bits has passed, received data R00 to R07 is stored in bits 31 to 24 of the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 23 to 0 in the shift register. In this state, this module copies the data, in which the order of the bits is reversed, from the shift register to the receive buffer of SPDR, and empties the shift register. If the receive buffer does not have a space for the receive data length after the receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer of SPDR, received data R00 to R07 is shifted out from the shift register.



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

Figure 24.13 LSB First Transfer (8-Bit Data)

24.4.6 Error Detection

In the normal serial transfer, the data written to the transmit buffer of the data register (SPDR) is serially transmitted, and the serially received data can be read from the receive buffer of SPDR. If access is made to SPDR, depending on the status of the transmit buffer/receive buffer or the status at the beginning or end of serial transfer, in some cases non-normal transfers can be executed.

If a non-normal transfer operation occurs, this module detects the event as an overrun error or a mode fault error. **Table 24.7** shows the relationship between non-normal transfer operations and the error detection function.

Table 24.7 Relationship between Non-Normal Transfer Operations and Error Detection Function

	Occurrence Condition	Operation	Error Detection
A	SPDR is written when the transmit buffer is full.	Missing write data.	None
B	Serial transfer is started in slave mode when transmit data is still not loaded on the shift register.	Data received in previous serial transfer is serially transmitted.	None
C	SPDR is read when the receive buffer is empty.	The output data is undefined.	None
D	Serial transfer terminates when the receive buffer is full.	Missing serial receive data.	Overrun error (only in slave mode)
E	The SSL input signal is negated during serial transfer in slave mode.	Serial transfer suspended. Missing send/receive data. Operation disabled.	Mode fault error

On operation A shown in **Table 24.7**, this module does not detect an error. Whether SPDR can be written to or not can be checked using the T[3:0] bits in the buffer data count setting register (SPBFDR).

Likewise, this module does not detect an error on operation B. In a serial transfer that was started before the shift register was updated, this module sends the data that was received in the previous serial transfer, and does not treat the operation indicated in B as an error. Note that the received data from the previous serial transfer is retained in the receive buffer of SPDR, thus it can be correctly read.

Similarly, this module does not detect an error on operation C. To prevent extraneous data from being read, the number of receive data units stored in the receive buffer should be read from the R[5:0] bits in the buffer data count setting register (SPBFDR).

An overrun error shown in D is described in **Section 24.4.6(1), Overrun Error**. A mode fault error shown in E is described in **Section 24.4.6(2), Mode Fault Error**.

(1) Overrun Error

If serial transfer ends when the receive buffer of the data register (SPDR) is full, this module detects an overrun error, and sets the OVRF bit in SPSR to 1. When the OVRF bit is 1, this module does not copy data from the shift register to the receive buffer so that the data prior to the occurrence of the error is retained in the receive buffer. To reset the OVRF bit in SPSR to 0, either perform a power-on reset, or write a 0 to the OVRF bit after SPSR has been read with the OVRF bit set to 1.

Figure 24.14 shows an example of operation of the SPRF and OVRF bits in SPSR. The SPSR and SPDR accesses shown in **Figure 24.14** indicate the condition of accesses to SPSR and SPDR, respectively, where I denotes an idle cycle, W a write cycle, and R a read cycle. In the example of **Figure 24.14**, this module performs an 8-bit serial transfer in which the CPHA bit in the command register (SPCMD) is 1, and CPOL is 0. The numbers given under the RSPCK waveform represent the number of RSPCK cycles (i.e., the number of transferred bits).

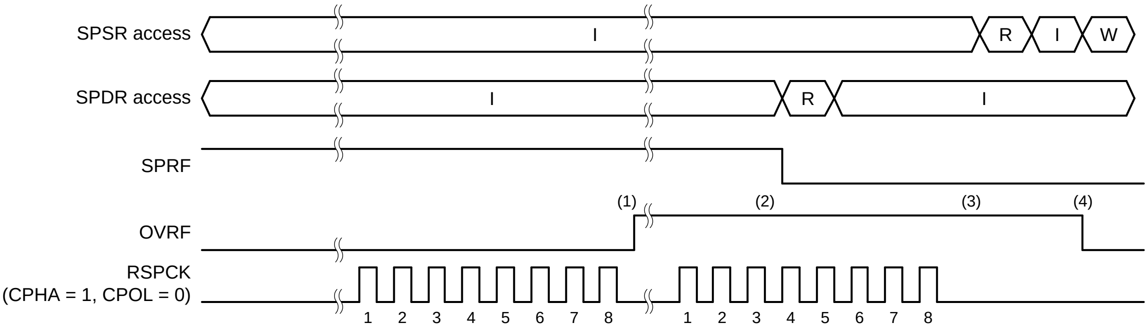


Figure 24.14 SPRF and OVRF Bit Operation Example

The operation of the flags at the timing shown in steps (1) to (4) in the figure is described below.

1. If a serial transfer terminates when the receive buffer does not have a space for the receive data length, this module detects an overrun error, and sets the OVRF bit to 1. This module does not copy the data in the shift register to the receive buffer.
2. The OVFR bit is not cleared even when SPDR is read and thus the number of data bytes in the receive buffer becomes less than the number of the receive buffer data triggering number specified by the RXTRG bits.
3. If the serial transfer terminates in an overrun error state, this module determines that the shift register is empty; in this manner, data transfer is enabled from the transmit buffer to the shift register.
4. If 0 is written to the OVRF bit after SPSR is read with OVRF = 1, this module clears the OVRF bit.
